More. What goes unsaid, and maybe unnoticed, in the debate about health care, is that it is hard to have decent health care (that is, decent health) when those in charge don't know what they're doing. The stomach-ulcer-etiology problem is a small example of a big thing. In case I'm not being blunt enough, let me be even more blunt: This example illustrates that the average doctor, the average med school professor, and at least two Nobel-Prize-winning med school professors (not to mention those who award Nobel Prizes) have a lot of room for improvement in their interpretation of simple facts. [3]My previous example of the infectious-disease expert (a med school professor) who overlooked the immune system is another example of vast room for improvement. It's hard to get good health care from people whose understanding of health is terribly incomplete yet don't realize this.

Nathan Myers (2009-09-10 16:54:51)

If wiping out *H. pylori* cures ulcers, why can't we say it causes them? Otherwise you might as well say women walking alone (without, perhaps, learning karate first?) causes rape. Your intestines are heavily innervated. The trillions of individuals of hundreds or thousands of bacterial species in your gut are fully equipped to apply operant conditioning to you. They are also equipped, in principle, to produce any conceivable drug or mind altering substance. They have been demonstrated to respond to common hormones, and can probably tell a great deal about your condition from chemistry and nerve activity. Why should we not conclude that they have learned of your influence and are forcing you to speak on their behalf?

Anthony (2009-09-10 17:20:27)

Nathan said: "Why should we not conclude that they have learned of your influence and are forcing you to speak on their behalf?" Finally, the truth comes out about "Seth" (aka Bacteria Collective) and "his" (their) blog. We must stop this before they take control of other leading academics and scientists!! Now ... I ... Must. Have. My. Daily. Yogurt. Farewell. For now. Fellow. Humans ...

seth (2009-09-10 17:26:13)

"If wiping out *H pylori* cures ulcers, why can't we say it causes them?" Huh? I don't follow the logic. Lots of solutions don't involve the true cause. For example, patching a tire fixes a leak. It doesn't follow that lack of a patch caused the leak.

Nathan Myers (2009-09-10 17:59:33)

Anthony: It's worse than that; they can make him *want* to speak on their behalf, and be motivated to come up with imaginative presentations that promote their goals. Note, too, that many of the bacteria in Seth's gut are (mostly) genetically identical to those in your gut and mine. In a real evolutionary sense, they are part of the same extended individual as the ones in mine,

and yours. What benefits mine, and yours, benefits the same genes as are expressed in his. (Apparently they all feel a need for more omega-3 fats.) Seth: It doesn't follow, but carrying a patch kit is easier than avoiding every pointy thing when you're out riding. The cause of the leak was a hole. The cause of the hole was a nail. The cause of the nail was somebody's carelessness... Or maybe the hole is because the tire was too thin. It sounds like you're arguing something akin to Aristotle's material, efficient, formal, and final causes, which always devolves into mush. If you think ulcers are better to prevent than to treat, that's a claim that seems objectively supportable.

Nathan Myers (2009-09-10 18:50:23)

... the big question, though, is how did Seth's bacteria, uniquely, learn to use operant conditioning? They have observed him performing it, and lecturing about it, but lots of psych professors do that. Maybe he's just the first, of those, who started out kindly disposed toward them.

Anthony (2009-09-10 19:00:46)

@Nathan, Suddenly, it's all becoming clear. Humans are just a way for certain Lactobacillaceae (who know who they are) to reproduce themselves! We've just been an unwitting extended phenotype! Now, where's my flax-seed oil? For some reason I have a craving for it ... Seriously, Wading into the causality debate. Typically when people talk about 'the' cause, the implication is that there is just one cause, but there are almost always multiple things you can change to bring about an effect (or to not bring about an effect). I think that what we want are causes that make more sense to focus on, are easier to change, have less deleterious side-affects, and so on.

Anthony (2009-09-10 19:01:47)

@Nathan, Perhaps it's a unique mutation in Seth's bacterial population?

Nathan Myers (2009-09-10 22:21:32)

I feel obliged to add this: <http://www.partiallyclips.com/pclipslite.php?id=1623>

Alex C. (2009-09-11 06:37:08)

And speaking of inappropriate Nobel prizes, let's not forget that Portuguese neurologist Ant3nio Caetano de Abreu Freire Egas Moniz won the Nobel Prize for physiology or medicine in 1949. What was his contribution to society? Well, he invented and popularized the pre-frontal leucotomy, a variation of lobotomy. For more information, see this excellent book called "Great and Desperate Cures: The Rise and Decline of Psychosurgery and Other Radical Treatments for Mental Illness", by Elliot Valenstein: <http://www.amazon.com/Great-Desperate-Cures-Psychosurgery-Treatments/dp/0465027113/> There is also a movement (unsuccessful, so far) to strip Egas Moniz of his prize: <http://www.psychosurgery.org/news-opinion/why-nobel-should-rescind-the-prize/>

Les Jones (2009-09-11 07:48:37)

"Marshall famously drank a flask full of *H. pylori* and didn't get an ulcer, yet took this to support his theory." This simply shows that the presence of *H. pylori* is necessary, but not sufficient, to cause the ulcer. That seems to be true of most germs. We're all of us exposed to all kinds of disease-related germs every day, but don't necessarily contract every disease to which we're exposed. Review Koch's postulates of the germ theory of disease: [http://en.wikipedia.org/wiki/Koch's\\_Postulates](http://en.wikipedia.org/wiki/Koch's_Postulates) Koch's postulates are: 1. The microorganism must be found in abundance in all organisms suffering from the disease, but should not be found in healthy animals. 2. The microorganism must be isolated from a diseased organism and grown in pure culture. 3. The cultured microorganism should cause disease when introduced into a healthy organism. 4. The microorganism must be reisolated from the inoculated, diseased experimental host and identified as being identical to the original specific causative agent. However, Koch abandoned the universalist requirement of the first postulate altogether when he discovered asymptomatic carriers of cholera[1] and, later, of typhoid fever. Asymptomatic or subclinical infection carriers are now known to be a common feature of many infectious diseases, especially viruses such as polio, herpes simplex, HIV and hepatitis C. As a specific example, all doctors and virologists agree that poliovirus causes paralysis in just a few infected subjects, and the success of the polio vaccine in preventing disease supports the conviction that the poliovirus is the causative agent. The third postulate specifies "should", not "must", because as Koch himself proved in regard to both tuberculosis and cholera,[2] not

all organisms exposed to an infectious agent will acquire the infection. Noninfection may be due to: chance or to the host's immune system successfully repulsing the invading pathogen; acquired immunity, as from previous exposure or vaccination; or genetic immunity, as with the resistance to malaria conferred by possessing at least one sickle cell allele. The second postulate may also be suspended for certain microorganisms which we cannot (at the present time) grow in pure culture, such as some viruses. In summary, a body of evidence that satisfies Koch's postulates is sufficient but not necessary to establish causation.

Ronald Mignery (2009-09-11 09:54:53)

For *H. pylori* to cause ulcers, recent research suggests that it must first set up residence in the vacuoles of phagocytes: [http://www.eurekalert.org/pub\\_releases/2009-01/sfeb-hpc012709.php](http://www.eurekalert.org/pub_releases/2009-01/sfeb-hpc012709.php). The presence of *H. pylori* in the stomach is then a necessary but not a sufficient cause of ulcers. Clearing *H. pylori* from the vacuoles of phagocytes could then cure the disease even without clearing it from the stomach.

seth (2009-09-11 16:54:03)

These comments about "necessary but not sufficient" and Koch's postulates suggest to me that Warren and Marshall's confusing use of "causes" (in "*H. pylori* causes ulcers") has been a distraction – the question most helpful to answer is why a few people infected with *H. pylori* get ulcers yet almost all of them don't. As far as I can tell, Koch's postulates and studies of phagocytes don't help us figure that out.

Jeff (2009-09-12 11:44:11)

Seth, This sentence borders on the misleading, hopefully not intentionally so. "Marshall famously drank a flask full of *H. pylori* and didn't get an ulcer, yet took this to support his theory." Marshall had gastritis after drinking the *H. pylori*. And gastritis can lead to ulcers. It hardly seems necessary for him to proceed all the way to developing an ulcer for the sake of that experiment. You can disagree with the current paradigm about *H. pylori* and ulcers and still acknowledge Marshall's experiment accurately. Jeff p.s. I'm not a doctor but the gastritis -> ulcer relationship seems to be mentioned at reputable websites.

seth (2009-09-12 16:34:58)

"It hardly seems necessary for him to proceed all the way to developing an ulcer for the sake of the experiment." That's where I disagree. His theory was about ulcers, not gastritis. If you can show me evidence that gastritis always leads to ulcers, I'll revise my opinion.

anonymous (2009-09-12 20:55:46)

smoking does not always result in lung cancer, therefore it can't "cause" it?

seth (2009-09-12 23:19:05)

So what if smoking one cigarette per month doesn't cause lung cancer? I fail to see the relevance.

Sean (2009-09-13 09:49:27)

I think the word interaction may apply here.

Seth's blog » Blog Archive » Modern Biology = Cargo-Cult Science? (2009-10-08 01:37:04)

[...] Shameless. Note the utter absence of even one disease in one person cured or prevented. Not one. And this is supposed to be the most beneficial discovery in medicine. It's the top prize in medicine and biology! Last year the prize was given for HIV. Do we have an HIV vaccine? No. The year before that, HPV. Do we have an HPV vaccine? No. A few years before that, the discovery that a certain bug "causes" stomach ulcers — the award that showed that the medical community and the Nobel Prize committee have a weak grasp of the concept of causality. The biologists think they do everything right — but the planes don't land. The biologists who do this research aren't able to solve actual problems. (Some people do — those who discovered that smoking causes cancer, for example — but they don't get Nobel Prizes.) Could something important be missing from their view of the world? I think so. [...]

## More Med School Profs Behaving Badly: Professor Lila Nachtigall (2009-09-11 06:33)

New York University professor of obstetrics and gynecology Lila Nachtigall, [1]whom I mentioned recently, [2]said nice things about estrogen replacement therapy to a Newsday reporter. The story fails to say that she gets money and ghostwriting from Wyeth, which makes the pill used in that therapy.

1. <http://www.blog.sethroberts.net/2009/09/09/med-school-profs-as-drug-company-lackeys/>

Spell Checker (2009-09-11 13:41:52)

Your link is not working, there is an extra "h" at the end of the url. The corret URL is [http://www.cjr.org/the\\_audit/reporter\\_fed\\_pill\\_story\\_swallo.php](http://www.cjr.org/the_audit/reporter_fed_pill_story_swallo.php)

Timothy Beneke (2009-09-12 12:12:54)

I wonder if med school profs are worse than other profs because they typically have to raise much or most of their salaries. I know at the Colorado med school, professors had to raise 75 % of their salaries on their own. My experience with a friend who had unexplained stomach pain was instructive. She saw 6 "experts", 3 who worked for fixed salaries at institutions (Kaiser, Stanford, etc.) and 3 who were in the marketplace getting paid based on what they brought in each year. The three who were on fixed salaries were professionally cordial, and openly admitted that they could not say with confidence what was causing her pain. The three who were not on fixed salaries were very touchy feely and charming and spoke with complete confidence about the cause. I don't think this was accidental; I'd love to see formal research on this...

Tom in TX (2009-09-12 12:34:38)

Timothy, I wonder who should do the formal research - someone on a fixed salary or someone who is paid for the results? 8-)

Seth's blog » Blog Archive » The Ethical Stupidity of Med School Professors: Plagiarism Very Very Bad, Ghostwriting Okay (2009-09-18 06:21:07)

[...] Whereas medical school professors haven't managed to figure that ghostwriting is plagiarism (taking someone's words and ideas as yours without acknowledgment). And it happens all the time. NYU med school Professor Lila Nachtigall, as I've noted, considered the deed so minor she forgot that she'd done it. Apparently using a different word confuses them. A recent article in Nature reveals the befuddlement of the entire medical establishment about this. We're not sure what to do about it, journal editors say. As Tony Soprano's mom would say: Poor you. [...]

## More Schoolgirl Science (2009-09-11 20:43)

[1]Two New Zealand teenagers humbled GlaxoSmithKline, one of the world's biggest food companies:

Their school science experiment found that [GlaxoSmithKline's] ready-to-drink Ribena contained almost no trace of vitamin C.

Students Anna Devathan and Jenny Suo tested the blackcurrant cordial against rival brands to test their hypothesis that cheaper brands were less healthy.

Instead, their tests found that the Ribena contained a tiny amount of vitamin C, while another brand's orange juice drink contained almost four times more. . . .

GSK said the girls had tested the wrong product, and it was concentrated syrup which had four times the vitamin C of oranges. But when the commerce commission investigated, it found that although blackcurrants have more vitamin C than oranges, the same was not true of Ribena. It also said ready-to-drink Ribena contained no detectable level of vitamin C.

The students used [2]iodine titration to determine Vitamin C levels. Why had the students managed to see something important that the food giant overlooked? My guess is that an unusual processing step (e.g., high storage temperature) destroyed the Vitamin C and those who knew about the anomaly didn't want to consider the possibility that it had done damage. The possibility that someone outside the company might notice didn't occur to them. Just as those who mislabel fish in New York restaurants and markets never realized that [3]two students could uncover their deception. I found that [4]the omega-3 in a Chinese brand of flaxseed oil was probably destroyed before it got to me.

1. <http://www.guardian.co.uk/world/2007/mar/27/schoolsworldwide.foodanddrink>

2. <http://www.abc.net.au/7.30/content/2007/s1882263.htm>

---

Kevin Miller (2009-09-12 04:33:12)

I'm curious about what you're doing/did in Beijing now to try to get something that might really be flaxseed oil high in Omega 3s.

seth (2009-09-12 16:51:12)

Kevin, I bought a lot of flaxseed oil in America and dragged it here. (Literally dragged it. The duffel bag was too heavy to carry.)

Kevin Miller (2009-09-12 20:11:10)

I was afraid of that :

Kevin Miller (2009-09-12 20:13:37)

My effort to put in an emoticon seems to have truncated this. Thanks for the info. Do you try to keep it refrigerated, or aren't you worried about deterioration? For me, the purchase of a Kindle has greatly lowered the weight of my luggage when I go to China. I guess flaxseed oil can now take the place of print...

seth (2009-09-12 23:22:50)

Yes, I try to keep it refrigerated.

Nathan Myers (2009-09-14 15:30:49)

I have a bottle of flaxseed oil that has been continuously refrigerated since I bought it, including one week in an ice chest in 2005 while I drove cross-country. Its expiration date says November 2001. (Not a joke.) I wonder if it would be useful to

anybody for research on deterioration rates or something.

## Perverse Incentives in Medicine (2009-09-12 16:47)

The three who were not on fixed salaries were very touchy-feely and charming and spoke with complete confidence about the cause.

Wow. This reminds me of my surgeon, Eileen Consorti, telling me that the operation she recommended would help me, that there was evidence for this, and then – when I couldn't find any evidence – [2]telling me she would find it and never doing so. She would have gotten thousands of dollars for that operation. It also reminds me of my dermatologist prescribing a medicine that didn't work and, until I did an experiment that showed it didn't work, having no idea it didn't work. He got paid in any case.

1. <http://www.blog.sethroberts.net/2009/09/11/more-med-school-profs-behaving-badly-professor-lila-nachtigall/#comment-342503>

2. <http://www.blog.sethroberts.net/2008/09/13/the-case-of-the-missing-evidence/>

---

Dennis Mangan (2009-09-13 06:19:27)

The Kaiser-type doctors will be happy to tell you that they don't know what's going on, but then they'll quit trying to find the answer. At Kaiser, if you don't fit their algorithms, you've got a problem. The for-profit docs will keep trying so long as you're paying them.

dgm (2009-09-13 13:55:56)

My PCP started out determined to discover what had been causing me to suffer mysterious wild twitching in my legs and chest muscles, preceded by migraine auras without headaches, and only at night. He listened patiently, asked a lot of questions, looked at notes I'd kept, really puzzled over it. He even called me a few times to get more info. He seemed genuinely intrigued. Then he decided to start me on Requip for Restless Legs Syndrome even though, as I noted to him, my symptoms were inconsistent with RLS. "Yes, but if it doesn't work we can rule it out," was his response. Well sure, we could spend a lot of time ruling out different drugs! Instead, I obtained all my medical records from the various doctors I'd seen over a few months (all of whom were mystified, including a Stanford-trained neurologist), reviewed my notes about the occurrences–time, severity, foods I'd eaten, etc., did a lot of Googling, and solved the problem myself. Turned out, blood tests had shown my magnesium was low so I . . . started taking magnesium. Problem solved.

seth (2009-09-13 16:38:04)

that's a great great story, dgm and that's a very good point, Dennis. It's been said that without being wildly overoptimistic nothing would get done because everything turns out to be so difficult. Without wild overoptimism nobody would start

anything. too bad there isn't a third type of doctor: satisfaction guaranteed. No pay unless the problem is solved.

Clyde Adams III (2009-09-15 10:32:29)

"Cure Guaranteed" was the motto of Dr. Leo Schutzmacher, a minor character in G. Bernard Shaw's 1906 play The Doctor's Dilemma. It's on page 94 of the Google Books online copy, in Act I. <http://books.google.com/books?id=wmhIAAAAMAAJ&pg=PA94#v=onepage&q=&f=false>

### More about the Effects of Flaxseed Oil (2009-09-13 16:28)

Commenting on [1]an earlier post, Jack Rusher [2]reports:

Like Anonymous, I'm an MMA [Mixed Martial Arts] enthusiast. My experience with 3 T/day of flaxseed oil have been more or less identical to his. Before: high doses of NSAIDs [non-steroidal anti-inflammatory drugs] just to survive training, constant soreness and fatigue, etc. After: no joint pain at all, complete discontinuation of NSAIDs, lower frequency and severity of injury.

Dental results: my hygienist made strong comments regarding the improvement of my gums on my first post-flax visit, attributing it to changes in my oral care behavior . . . of which there were none.

Ashish (2009-09-13 18:13:47)

Is this re: oil pulling, or actually drinking the stuff?

Anthony (2009-09-13 18:59:13)

Seth, here's more anecdotal evidence about the effects of flaxseed oil, but on a different aspect. Before taking flaxseed oil, I rarely would catch things I had knocked over or as they were falling. Now, after several months, usually taking 2-3 tablespoons per day, my reflexes seem significantly better. Here are 2 typical examples, from yesterday: 1. I brushed a partially full wine glass, sending it wobbling on it's way to shortly careening off the table. I reached out, calmly, but with what in retrospect seemed like preying mantis-like reflexes, grabbing hold of the glass just before disaster, with only a drop of wine spilling from the incident. 2. I was driving and talking to someone in the passenger seat at the same time. Some folded papers began to fall off the dashboard due to the acceleration. They were not floating but falling like most any solid object. I calmly and casually caught them mid-fall, and placed them in the back seat. In both cases, there was a 'happening in slow motion' aspect to it, where it seemed I was seeing things happen slower than it would usually be processed.

seth (2009-09-13 22:41:12)

Anthony, I noticed the same thing. I catch stuff that pre-flaxseed-oil would have fallen.

Nathan Myers (2009-09-14 15:37:36)

I've already mentioned to Seth the improvement in my pinball scores mere minutes after eating a couple of tablespoons of flaxseed oil. The effect occurs much too quickly to be a metabolic consequence, i.e., conversion from 18-base to 20-base fatty acid, incorporation into membranes. It seems to me it must be interpreted as a drug-like effect, more akin to taking caffeine than tocopherols. I have no idea whether it's actually the n3 fat involved; flaxseed oil has lots of components.

Henri Deschaux (2009-11-16 18:30:05)  
Is it okay to take the flaxseed oil capsules?

rex (2010-02-25 18:41:17)

Why eat omega-3 fatty acids from flax seed? Dietary deficiency of omega-3 fatty acids can cause long term damage to human health. The Food and Drug Administration (FDA) has recognized the importance of omega-3 to public health and their importance to coronary health. Here is a problem: The omega-3 in American diet has decreased gradually over time with the increased consumption of processed foods. On the other hand dietary levels of Omega-6 fatty acids have increased due to consumption of oils that are rich in omega-6 fatty acids. This dietary imbalance of omega fatty acids has created unfavorable ratio of omega 3:omega 6 in our body. It is not just the amount of omega-3 consumed but the amount of omega-3 in relation to the amount of omega-6 oils consumed that is important to keep the ratio to a favorable level of 1:4 (omega 3:omega 6). Solution: Flaxseed provides one of the only non-animal sources of omega-3 that contains significantly more omega-3 than omega-6. About 57 % of total oil in flaxseed is in the form of alpha-linolenic acid (ALA), an Omega-3 fatty acid that is essential for human health. To improve omega-3 levels and ratio between omega 3 and Omega 6, it is important to consume foods that contain significantly higher levels of omega-3 than omega-6. There are very few foods that do that " Flaxseed is one of them. The ALA is converted by the body into eicosapentaenoic acid (EPA) and docosahexaenoic acid (DHA) omega-3s that are found in fish oils. The EPA and DHA are also essential omega-3 fatty acids for human health. The conversion of ALA to EPA and DHA is not a very efficient process in body but remember a diet rich in flax seed, will provide all three omega-3 fatty acids that are essential to healthy human health.

## Advances in Cooking: Chocolate Chip Cookies (2009-09-14 07:31)

Toni Rivard, a Dallas dessert caterer, makes one of the best chocolate-chip cookies in America, [1]according to Forbes Traveller. She ages her cookie dough about three days. She says it improves the texture. I wonder if it improves the flavor, too:

Rivard's secret? "I like to age my cookie dough and feel that it makes for a better texture in cookies. As a result, the aptly-named OMG! [which is what customers have actually said when they taste one] chocolate chip cookies at Creme de la Cookie are soft and chewy with a deep rich flavor.

Fermenting cookie dough should certainly improve the flavor, although chocolate already supplies a lot of complexity. My experience has been that cooking delicious stuff became a lot easier when I started using fermentation to help (e.g., miso soup instead of soups flavored without fermented ingredients).

Thanks to David Archer.

1. <http://www.forbestraveler.com/food-drink/best-cookies-2009-story.html>

---

Laura (2009-09-14 08:04:26)

Yes, yes, yes! Aging cookie dough seriously improves the flavor of cookies. I discovered this by accident some years ago. I'd made John Thorne's "best cookie in the world" recipe and was unimpressed by the first batch, so I stuck the remaining dough in the fridge and forgot about it. Being terminally cheap, when I remembered it several days later, I baked the rest of the cookies rather than pitching out the dough. THESE \*were\* the best cookies in the world, orders of magnitude better than the first batch. Since then, the New York Times has published an article on how aging cookie dough affects taste and texture (<http://www.nytimes.com/2008/07/10/travel/10iht-09chip.14376338.html>). Similar principles are used by many artisan bread bakers to excellent result.

Nathan Myers (2009-09-14 15:42:11)

Of course chocolate is itself fermented; the good stuff is fermented in-pod for a few days on the forest floor, in a heap under leaves. Likewise, good butter is fermented. In the U.S. you have to find "european style" butter to get this. One mark of good chocolate-chip cookies is not to have too many chips. There should be only one chip per bite.

Stacey (2009-09-14 18:31:26)

Aging cookie dough really does make the cookies taste better. I discovered this for myself when I made the chocolate chip cookies per the recipe in the NYT. (See: [http://www.nytimes.com/2008/07/09/dining/09chip.html?pagewanted=2&\\_r=1&ref=dining](http://www.nytimes.com/2008/07/09/dining/09chip.html?pagewanted=2&_r=1&ref=dining)) I'm sure fermentation has something to do with it . . . according the article, hydration is also an important factor contributing to texture and taste. The longer the dough sits, the more hydrated the flour becomes and the bigger and more complex the flavor. If you are looking for a good aged cookie recipe to try, definitely make it these choc chip cookies - they are heavenly!

Tim Buczak (2009-09-14 18:32:14)

Makes sense. There are several "No knead" bread making techniques that involve leaving the bread dough to rise for several days in the fridge. I'm not a biologist, but I think it involves the process of autolysis where the flour, water and yeast form the gluten over time versus by kneading. This method of leaving the bread dough for over two weeks to let the natural

fermentation process take place. (<http://www.artisanbreadinfive.com/>) . I haven't tried it but It seems to make sense with your fermented food ideas. So it makes sense for the gluten to form in cookies as well. I wonder if the baking powder/baking soda would break down in the wet dough.

Stephen M (Ethesis) (2009-09-19 19:09:50)

A number of cookie recipes require letting the cookies sit at least overnight. I'd never thought about why before, other than it does let the fluids distribute better.

Toni Rivard (2009-10-25 10:42:11)

It truly does improve the flavor. The color of the cookie will also be affected - the dough darkens and the cookie even looks tastier, which it is.....

Scott Bishop (2009-11-20 05:41:52)

Hmmm...sounds interesting. Worth a try!

Deborah M (2010-03-24 21:35:40)

Can one go too far with this? I left some really fine oatmeal raisin cookie dough in the fridge for maybe two weeks. I had previously aged some for a few days, and found a really interesting change in the flavor—a kind of almond effect, very subtle. This time it got more fermented—parts of it even got wet, as if turning, all of the dough a slight tang in the smell, nothing terrible. I made the cookies small and thin and baked them about double the usual time, and they are delicious—very crisp and delicate. Nutritionists out there—can this be dangerous? When does fermentation become breakdown?

Glyka Tammam (2011-05-25 06:11:06)

Will try this one out for sure, thanks!

## **Are We Running Out of Omega-3? (2009-09-14 18:23)**

[1]Apparently. The obvious source is fish but we are running out of fish:

In 2006, aquaculture production was 51.7 million metric tons, and about 20 million metric tons of wild fish were harvested for the production of fishmeal. "It can take up to 5 pounds of wild fish to produce 1 pound of salmon, and we eat a lot of salmon," said Naylor, the William Wrigley Senior Fellow at Stanford's Woods Institute for the Environment and Freeman Spogli Institute for International Studies. [via [2]Future Pundit]

This is why Jared Diamond's *Collapse* is so unfortunate. Diamond is a good writer and the question he tried to answer in that book is extremely important. But he whiffed. Suppose I write a book about obesity. I give a list of ten reasons people are fat: 1. Too much Food X. 2. Too much Food Y. And so on. (Just as Diamond gave a list of eight-odd reasons societies collapse.) Such a book would be far less helpful than a book with a correct theory about obesity, a theory that explains why Foods X, Y, etc. cause obesity. The theory could be used to find new, better, flexible ways of avoiding obesity. The list of foods to avoid cannot. In *The Economy of Cities*, Jane Jacobs (whom Diamond doesn't mention) said that collapse happens for one overarching reason: The society is too resistant to new ways of doing things. The crucial struggle in any society, said Jacobs, isn't between the rich and the poor or between owners and labor; it's between those who benefit from the status quo and those who benefit from change.

Thanks to Peter Spero.

1. [http://www.eurekalert.org/pub\\_releases/2009-09/su-hot090409.php](http://www.eurekalert.org/pub_releases/2009-09/su-hot090409.php)
2. <http://www.futurepundit.com/archives/006529.html>

---

Steve G. (2009-09-15 08:42:20)

A couple of random thoughts: 1. The Jacobs position sounds somewhat like Arnold Toynbee's theory of 'challenge and response' from his A Study of History. Does she cite him? 2. Issues of response to rapidly rising health care costs and global climate change, to name just two current issues, seem to me to illustrate this problem. Entrenched interests and commitments to established ways of doing things seems to prevent needed action to avert looming-perhaps catastrophic- problems.

seth (2009-09-15 16:31:13)

Steve G., no Jacobs doesn't mention Toynbee anywhere, as far as I know. I completely agree about health care and global climate change. And I agree about lumping them together: If a society is too status-quo-oriented in one area, it is likely to be the same way in other areas. America's response to the financial crisis is a third example: the underlying features that caused the crisis are still there because there is a strong bias against change.

Nathan Myers (2009-09-15 21:27:35)

I don't see any reason to dump on Diamond here. Tracing out the paths to destruction of a series of societies is instructive by itself. Speculating on how each might have been saved would not have strengthened his book. Those that *did* stave off collapse provided examples of what a society must be capable of if it is to survive.

david (2009-09-16 07:08:13)

34,000 years ago humans were making stuff from flax. I wonder if they ate the seeds too.  
<http://www.physorg.com/news171811682.html>

Nansen (2009-09-18 14:49:30)

I still think you may be missing a larger point about Diamond: he has lost his confidence in technology (i.e. "new ways of doing things") as a solution, because of 1) its track record of unintended consequences, and 2) time has run out for it. See Chapter 16 of Collapse. His pessimism seems to go so far as to make any status-quo resistance irrelevant.

seth (2009-09-18 16:52:08)

Nansen, thanks for the comment. Maybe Chapter 16 was omitted from the audiobook version of Collapse. The next time I get a printed copy I will look at it.

Stephen M (Ethesis) (2009-09-19 19:11:17)

Speaking of medical care, does China have Wal-Mart medical clinics? In states that allow them, they are spreading as the low-cost alternative to other sources of care. Too bad they are not being discussed in the current debates here in America.

Tom in TX (2009-09-20 21:12:26)

I heard a guy on the radio about a month ago being interviewed about this sort of thing. He had written a book, but I can't remember his name or the title. The book was about the future of medicine. He was very much in favor of the kind of treatment given at urgent care clinics like CareNow and others. They have a list of 35-40 conditions they will treat. When a patient comes in, they make a go/no-go decision of whether the patient has one of those conditions. If he does, he is treated according to a predetermined list of steps. He said that these clinics have had zero suits for malpractice. Did I hear that right?

Zero? It sounds amazing. The author believed that it would be possible for medical knowledge to expand in the next few years so that more and more conditions could be treated like this. It would bring costs down and free up hospitals to treat more difficult cases. If anyone knows the name of the book/author, please chime in.

seth (2009-09-21 00:12:00)

One of my favorite authors, T R Reid, has just published a book called "The Healing of America" which is about health care around the world. However, I don't think that's who you mean.

Robert Ratcliff (2009-12-26 05:56:09)

Hey Seth Great Blog! The concern with fish oil is they are dealing with toxins and contaminants, not to mention the fish supplies in the world diminishing. Yet Mila is a sustainable resource. Fish Oil people have a major concern with Mila from Lifemax because they market that you need the EPA and DHA that are not really essential. Here is the kicker, Mila provides ALA that is essential and supplies what your body doesn't produce, but your body converts from the ALA to the needed EPA and DHA if that was even a concern, go figure! Dr. Wayne Coates has spent the last twenty years of his life researching Mila, perfecting it and finding the optimal growing conditions. Crops can be increased and there is plenty of land with the requirements needed. Sincerely, Robert and Sharri Ratcliff

Robert Ratcliff (2009-12-26 05:57:02)

Where is your RSS Full Feed so I can be following you?

### **Beijing Wal-Mart (2009-09-15 17:03)**

To buy a refrigerator, a friend suggested I try a store called Vollna, to which I found references online. When I got to the right subway station, however, no one had heard of it. She'd meant Wal-Mart. The Beijing Wal-Mart has many interesting features:

1. They sell live turtles.
2. A whole display case is devoted to sea cucumbers.
3. Like any upscale American or Beijing supermarket, they have a sushi case. The prices are half what they'd be in America, but the pieces of fish are much thinner.
4. They cut up meat in front of you. A whole pig was being butchered on a table. A roast duck was being sliced for packaging.
5. They had pairs of escalators (actually sloped moving walkways) going in the same direction. For heavy traffic, I guess. I've never seen such a thing anywhere else.
6. It's extremely convenient, right next to a subway station. In America, as all Americans know, Wal-Marts are almost never convenient. Which is why I've been to an American Wal-Mart only twice, in spite of the large selection and low prices.
7. The refrigerators were hidden behind large stacks of what looked like flour.
8. After I bought a blood pressure monitor, the salesperson added batteries and showed me how to use it. Such product verification/education has happened before to me in Beijing, never in America.
9. A staggering number of food samples. Maybe a hundred. Other Beijing supermarkets are like big-city American supermarkets; some have samples, some don't. This was a full-court press. Every possible sample. The roast

duck was the best, the yellow kiwi (sweeter than green kiwi) the most unusual. I got tired of sampling and stopped. I can't remember that happening before.

10. The prices were ordinary Chinese prices. Not unusually low. To bring flaxseed oil to China I'd bought a very large duffel bag from Land's End, so large I had to drag it. (Which ruined it.) It cost \$70 plus shipping. Wal-Mart had a more reasonably-sized large duffel bag, better-made and with wheels for \$20. Ugh. It was the wheels, not available at Land's End, rather than the \$50 difference, that pissed me off. My too-heavy duffel bag was a pain in the butt because I had to drag it (at the same time carrying other luggage). This made me never want to shop in America again for anything I could get in China.
11. Cigarettes are in a special booth off to the side. About 200 choices.

They can't compete on price in China, of course. So my guess is that they are trying to compete on selection, convenience, and customer service (thus all the sampling). That you can return stuff was very clear.

---

Glen Raphael (2009-09-15 20:27:10)

Yep, I always bought luggage in China. Although nowadays I think you can find pretty similar stuff for not \*that\* much more in your local chinatown area in the US. Regarding the personal service component in #8, I have two suggestions: (1) get a haircut. (2) buy a pair of jeans. The haircut is likely to be cheap \*and\* include a significant massage component. If you buy jeans, there is likely to be somebody there who will tailor them on the spot for you for free while you wait - hem, inseam, any change you might expect from someone selling suits here, but this is on a \$25 pair of jeans with immediate turnaround.

Aaron Blaisdell (2009-09-16 08:44:17)

"I got tired of sampling and stopped. I can't remember that happening before." I'll say! When we've gone to farmer's markets together, I was amazed at how many samples you consumed. I thought you'd get full by the end of the shopping trip. I agree with Glen. I bought a baby stroller in Hong Kong and though it wasn't cheap, it was at least half the price of a comparable stroller in the US. And it was very well designed, light, compact, and durable (we're currently using it with our second child and it's held up the best of all of our strollers). I also second Glen's suggestion to get a hair cut. I love getting a hair cut in Hong Kong (in the Chinese areas where my wife's family live). It's almost like a mini spa treatment. I get pampered, including a long hair wash with a soothing scalp massage. And the prices are dirt cheap! You may have to ask for the massage to ensure that you get one.

The Writing On The Wal » Blog Archive » FROM AN AMERICAN IN BEIJING... (2009-09-17 11:40:34)

[...] We haven't heard much from China in recent months. Blogger Seth shares his list of eleven interesting features he observed at the Walmart in Beijing, China, while in search for a new (cheap plastic?) refrigerator. My favorites is No. 9: A staggering number of food samples. Maybe a hundred. Other Beijing supermarkets are like big-city American supermarkets; some have samples, some don't. This was a full-court press. Every possible sample. The roast duck was the best, the yellow kiwi (sweeter than green kiwi) the most unusual. I got tired of sampling and stopped. I can't remember that happening before. [...]

Mike (2009-09-17 12:04:13)

Chinese Walmart (Wer-mah) is so much better than American Walmart. The only downside when I was there two years ago was the paltry toy section, which I'm sure they've improved. Who'd think Walmart dim sum would kick so much ass. And they have a liquor section!

The Writing On The Wal » Blog Archive » At Walmart in China, they still cut meat in house. (2009-09-17 12:05:56)

[...] Yes, I know Jeff beat me to this, but I still want to write about my favorite: They cut up meat in front of you. A whole pig was being butchered on a table. A roast duck was being sliced for packaging. [...]

marc (2009-09-18 09:58:42)

There are lots of tandem or even three-at-once (in a single direction) escalators in hong kong. I think maybe there is a 6 laner (at least!) in Central MTR station. Brilliantly, the directions of the escalators changes depending on usage patterns – may be balanced 3/3 or 4/2, or sometimes one or two are turned off. This paradigm is used throughout Hong Kong, especially on the 3-laners where 2 are going one way and 1 is going the other.

The Writing On The Wal » Blog Archive » BAD PRODUCTS... BAD WALMART... (2009-09-18 12:20:13)

[...] Yesterday Jonathan and I both took note of Seth's 11 interesting finds in the Beijing Walmart. Today at Mental Floss, Ethan Trex notes 11 things Walmart has banned. But what I found amazing is what Trex missed; what should have been No. 1. [...]

Erika (2009-09-18 12:33:59)

Mexico-Walmart had free vodka samples. And booze galore.

Laolao (2009-09-18 18:34:44)

Walmart is doing fine in China, I guess, except when beating the customer (or was it a shoplifter?) to death. See: <http://news.bbc.co.uk/2/hi/asia-pacific/8244561.stm> The news has more or less been silenced. If you google the event from Beijing, you'll find the links to news stories about this blocked. Anyway, I'll abstain from shopping at Walmart.

Stephen M (Ethesis) (2009-09-19 19:08:47)

That was really interesting, as is the fact that the newer Wal-Marts are very convenient in location (e.g. several in Plano where I live). Interesting how things evolve.

lee (2009-09-20 03:22:15)

I think the selection at Wal-mart in China is terrible. The clothes are too small and they don't even have simple things like aspirin, mustard, french dressing, croutons, pickles, waffles, measuring cups, deodorant, syrup, Kool Aid, Frito's, pita bread, English muffins, bagels, hot dog buns, taco shells, root beer, or all-purpose flour. Parents in China allow kids to pee and poop on the floor of stores, too.

seth (2009-09-20 06:35:41)

Lee, until I got to the last sentence I thought you were joking. I have never seen a kid pee or poop on the floor at a store (in the street, yes) but you clearly know more about this than I do. There are no measuring cups anywhere, not just Wal-Mart. There is a huge selection of pickles (perhaps 30 kinds) at the Beijing Wal-Mart but they don't look like American pickles. As for the baked goods, they have a big selection.

Janne (2009-09-21 21:03:20)

The Walmart I visited in China had western toiletries and some foods, but for very high price. The only negative was the luggage I bought from there for \$20 or so broke on it's maiden voyage.

JJC (2009-09-23 21:28:58)

Yes, in the USA the Wal-Marts are very much inconveniently located if you are a backpacker or (caution 70's lingo ahead) a hippie type on foot! As a red blooded, job working, wage earning, tax paying, car driving American I thank God every-day for this... LMAO! Now if they can figure out how to keep out the 17 other catagories of undesirable shoppers I would be in heaven. Hopefully they will not go to the 18th catagory, because that includes me... LMAO I love visiting American chains overseas, regardless of the type of business. It is very interesting to take note of how the service and or merchandise is tweaked to suit the local taste and or cultural norms. You can learn a lot about a local culture this way

because you have a mental baseline to measure the deviation. Because of this I am now so curious I am going to visit the Beijing Wal-Mart this afternoon and have a look around! Any Costcos in the area? Loved visiting them in Taiwan and comparing.

Seth's blog » Blog Archive » Beijing Subway Security in Action (2009-10-03 18:12:35)

[...] Have I told you about the time I took a cleaver on the Beijing Subway? The Beijing Subway has security: They screen all bags. It started before the Olympics and, after the Olympics ended, kept going. At Wal-Mart, I bought a cleaver/cutting board/chopstick set (enclosed in plastic), put it in my laptop bag, and entered the subway. I was stopped. The cleaver had shown up on the scanner screen. The guard was pleasant and after I showed her what it was I was quickly sent on my way. [...]

madmilk (2009-10-10 11:04:41)

People in America need to realize just what got America in this shape—cheap—yes so-called cheap items from a foreign land. quote\*Wal-Mart firmly believes in local procurement. We recognize that by purchasing quality products, we can generate more job opportunities, support local manufacturing and boost economic development. Over 95 % of the merchandise in our stores in China is sourced locally. We have established partnerships with nearly 20,000 suppliers in China. \*end quote! Now! if there be 182 countries making items for the world to buy and they have only 5 % of the pie in China—duh! This company makes the nice people of China support their currency(yuan) by keeping it in their country working for the people there—but with the yuan going up in value and the US dollar going down—all the foreign items that the American consumer buys thinking it is cheap has went up in price. People—it's all about the currency and to keep a currency strong you got to keep it floating around the country you live in so it can work for you. For the past 12 years all them US dollars are being shipped overseas to a foreign bank and with the American worker not making anything for the foreigner to buy the—we the people—have to turn to the—second—largest employer in America(Uncle Sam) to sell—we the people—debt in order to get all them dollars back! 50 years ago a foreigner would have given their left nut for a US dollar or a Hershey's chocolate bar and today the same foreigner has got Uncle Sam and the American consumer by both all the while Hershey is moving the chocolate factory to Mexico. Wake up! America and think —MADE IN AMERICA.— quote\*”Considering that there are over 30,000 ships at sea this morning,” writes James Carlton, director of the Williams College-Mystic Seaport Maritime Studies Program, in an e-mail, “the total number of organisms and species in this global 'bioflow' on the morning your readers read your piece could be staggering - billions of individuals, and thousands of species.” Indeed, scientists have long considered ballast water the primary way invasive aquatic organisms are introduced. From the zebra mussel's arrival in the Great Lakes, to an American jellyfish severely disrupting Black Sea fisheries, the potential costs of accidental introduction of a species to new homes can be tremendous. Aquatic invasives cost the US \$9 billion yearly, according to estimates by David Pimentel, professor emeritus of ecology and evolutionary biology at Cornell University in Ithaca, N.Y. Zebra and quagga mussels (a cousin to the zebra) alone cost the \$1 billion annually.\*end quote! that is \$9 billion a year in hidden taxes to all Americans... cheap ain't chic and it cost America.....jobs!

... (2009-11-17 23:00:46)

Lee, I agree! It is shocking for a Wal-Mart in China not have name brand Western products prominently displayed. It's almost like those things aren't universal staples.

clarissa (2009-12-27 05:46:38)

Hi Seth; I came upon your website after I googled the words "Walmart in Beijing" along with "subway" and just dropped by to read what your blog had to say about it. I was just wondering, what's the nearest metro/subway station for any branch of Wal-mart in Beijing (preferably the one nearest the Tiannamen West subway station)? I am currently on a holiday here till Tuesday afternoon and would like to since it did not mention in this particular entry. Would appreciate any info. Thanks on adv. and keep blogging :)

seth (2009-12-27 06:18:06)

The Walmart I visited is one stop south of Wudaokou on the #13 line. It's right next to the station. I think the station is called Zhichunlu but I'm not sure about that.

slimdrea (2011-05-10 20:45:56)

Great read! I've just moved to Beijing and am sooo excited to go to Walmart today. I am a born and raised New Yorker who only got to visit Walmarts a few times a year when I went out of state. I can't believe now that I live on the other side of the world, I have one so readily available to me. This will be added to my list of reasons why I am loving Beijing (I am sure after my honeymoon period I will have an accompanying list of reason why I don't like Beijing too...hehe). Thanks!

marcus (2011-06-13 21:00:28)

Does Walmart in Beijing accept American Express credit cards? I've been here for quite some time now and am still finding difficulty finding stores accepting american express.

Seth Roberts (2011-06-14 04:58:57)

I doubt that Beijing Walmart accepts American Express. At Walmart, I used a debit card from a Chinese bank.

Dew (2011-11-16 22:47:40)

AE is not accepted in a lot of places worldwide because AE's charging a lot more than other credit cards. But local bank cards are accepted everywhere and even in HK.

Dew (2011-11-16 22:49:56)

But where can you get a good refrigerator in Beijing anyway? We just moved here from Canada and desperately need a good size fridge and a oven / microwave but can't find a reasonable usable one

Seth Roberts (2011-11-16 23:52:18)

Looking for a refrigerator? Try an appliance store, such as Goma.

## **How Dangerous Are Cell Phones? (2009-09-16 17:22)**

[1]A new report has come out that says that cell phones probably do cause cancer, as several people, such as [2]David Servan-Schreiber, have argued. But the news is not all bad:

The design of the study is fundamentally flawed, as well-documented by "Cell Phones and Brain Tumor." For example, users of cordless phones only were treated as unexposed. But, two independent studies found users of cordless phones had an increased risk of brain tumors. So, excluding such users underestimates the risk of brain tumors. This flaw suggests either ignorance or dishonesty on the part of the researchers running the Interphone Study. Then, there's the suspicious finding from some parts of the Interphone Study which concluded the use of a cell phone for less than ten years lowers your risk of brain tumors. This suggests the bias was so strong it eliminated enough tumor risk to show decreased incidence. The Interphone studies did find more brain tumor risk after more than ten years of cell phone use. The report notes that the risk was so great it could not be camouflaged even by the bias of the study.

Emphasis added. The person who wrote that hasn't heard of [3]hormesis.

1. <http://www.emfacts.com/weblog/?p=1154>

2. <http://www.truthout.org/article/twenty-appeal-against-cell-phone>

3. <http://www.blog.sethroberts.net/2009/05/12/the-dose-response-revolution-and-fermented-food/>

---

Caleb (2009-09-17 05:02:36)

What'd be interesting is to see the data broken down by how often a person uses a cell phone. I imagine we'd see those who use their phones only every now and then for short calls would have less brain cancer due to hormesis. Here's to being an antisocial guy:) Now if we just knew where the dose response peaked: "Sorry honey, I'm going to cut you off; I'm over my allotted radiation regime for today."

Dave (2009-09-25 14:49:02)

Forget hormesis. What about the irony of someone suggesting that a study must be biased because its results don't fit his pre-conceived notions?

seth (2009-09-25 16:09:49)

Dave, that's a very interesting comment. In my experience, to test Theory X you can never arrange a pure test: a test of Theory X and nothing else. You need several additional assumptions, which I'll bundle together and call Theory Y. So what's tested is Theory X and Theory Y taken together. If the prediction of the combined theories is false, you tend to say Theory Y is at fault. At least you consider that possibility. Only after the predictions of Theories X and Z, X and A, and so on (tests based on other supporting assumptions) turn out to be false do you start to believe Theory X is wrong. It might be ironic, but it's reasonable.

### **Best Thing About Learning Chinese (2009-09-17 18:49)**

It is easy to make people laugh. Yesterday at a faculty meeting I answered a question (asked in English) in Chinese. Everyone laughed.

---

David (2009-09-17 20:03:42)

So what did you say and what were you trying to say?

JLD (2009-09-18 00:31:47)

HÃ©, hÃ©, tonal languages are treacherous. I have been told that in Vietnamese "vagina" and "tomato" differ only by the tone. Don't exercise your new language skills at the supermarket...

seth (2009-09-18 03:18:53)

I said "I don't know" in Chinese. They were amused not because I actually said something else (I think . . . ) but because it was unexpected.

### **The Ethical Stupidity of Med School Professors: Plagiarism Very Very Bad, Ghostwriting Okay (2009-09-18 06:20)**

Do medical school professors live in a different ethical world than the rest of us? Apparently. A friend of mine just entered grad school at Tsinghua. She was required to attend four different lectures about how academic dishonesty is wrong. (The last one, she said, was good; the speaker told a lot of stories.) China has a huge plagiarism problem, sure, but at least they say that plagiarism is wrong.

Whereas medical school professors haven't managed to grasp that ghostwriting is plagiarism (taking someone's words and ideas as yours without acknowledgment). And it happens all the time. NYU med school Professor Lila Nachtigall, [1]as I've noted, considered the deed so minor she forgot that she'd done it. Apparently using a different word confuses them. [2]A recent article in Nature reveals the befuddlement of the entire medical establishment about this. We're not sure what to do about it, journal editors say. As Tony Soprano's mom would say: Poor you.

What's so nauseating about this is that ghostwriting is certainly worse than the garden-variety plagiarism that American undergraduates and [3]the odd Harvard professor engage in. (And at least they are embarrassed, unlike Nachtigall, when caught.) Garden-variety plagiarism is merely self-serving; you save time, get a higher grade. Whereas drug-company ghostwriting makes drugs appear better than they are. Which harms millions of sick people.

Although American universities publicly condemn plagiarism and other types of cheating, in practice they allow them. (Believe me, I know. When I tried to stop cheating in my Intro Psych class at Berkeley, the chairman of my department told me, "We're not in that business.") And the student cheaters – having been told by university blind-eye-turning that cheating is okay – grow up to be med school professors who [4]do horrible things routinely. That's my theory.

Thanks to Dave Lull.

Tom (2009-09-20 10:04:20)

I don't understand why this behavior doesn't make these doctors liable under racketeering laws. They are taking money to help their employers perpetrate a gigantic fraud – one that also affects the public health. (Of course, I am pre-supposing a government that has an interest in prosecuting campaign donors.)

Anonymous (2009-09-23 13:08:32)

What about when a prominent politician participate in plagiarism for an important speech supporting the ill-advised American Iraq war? See story about Canadian Prime Minister Harper at: [http://www.ctv.ca/servlet/ArticleNews/story/CTVNews/20080929/election2008\\_speech\\_080930/20080930?s\\_name=election2008](http://www.ctv.ca/servlet/ArticleNews/story/CTVNews/20080929/election2008_speech_080930/20080930?s_name=election2008)

## **What Causes Hypothyroidism? (2009-09-19 06:07)**

In [1]an earlier post I wrote, "Hypothyroidism is so common I suspect an environmental cause." In fact, I suspect that all common diseases are caused (= made much more likely by) differences between modern life and Stone-Age life. Since then, thanks to comments and email, I have learned more about hypothyroidism. [2]According to Dennis Mangan, it has become a lot more common during the last 100 years, which implies an environmental cause. [3]The most common type of hypothyroidism is called Hashimoto's thyroiditis. It is an autoimmune disorder where the immune system attacks the thyroid, damaging it. A reader with hypothyroidism wrote me:

When I was first tested for thyroid levels, part of the test (which I think is standard protocol) was to test the level of antibodies to thyroid. My levels were off the charts.

This supports what I said. I'm sure that autoimmune diseases are caused by one particular difference from Stone Age life: lack of bacteria in our food. The immune stimulation the harmless bacteria provided can be provided in other ways – [4]bee stings, for example. But I don't think Stone-Age people got a lot more bee stings than we do.

## **How to Talk to Strangers (2009-09-20 12:42)**

A friend asked me how to strike up conversations with strangers. I told her what I've said many times. Three things make it easier:

1. Recognition. If you recognize someone (and presumably they recognize you) it will be easier to start a conversation.
2. Real question. If you have a real question – a question to which you really want the answer – it will be easier to start a conversation.
3. Shared suffering. If the two of you (you and the person you wish to speak to) have suffered together – bad weather, stuck in a long line – it will be easier to start a conversation. Living in Beijing and not speaking Chinese is another example of what I mean by "suffering"; another name for this factor could be shared predicament.

Those are the main factors that matter. In everyday life, they vary a lot. Another factor is minor:

4. Forced proximity. If you are forced to be near each other – in an elevator, say – it will be easier to start a conversation.

If none of these factors are true, it will be very hard to start a conversation. If one is true, it will be somewhat hard. If two are true it will be easy. If three are true it will be inevitable.

In my experience, local culture makes a small difference, somewhere between zero to one on this scale. Most places are zero. A place where people are really friendly would be worth one.

---

Timothy Beneke (2009-09-21 10:36:49)

Don't forget shared pleasure, saying, "Boy it's a gorgeous day!" And smiling, not in an overbearing way, but in a respectful non-intrusive way... I'm guessing dropping something and letting the other person pick it up and then making a face-saving comment or joke and laughing will work also. It depends on how manipulative you are willing to be... I wonder if social psychologists have done experiments on this...

seth (2009-09-21 14:25:36)

Have social psychologists done experiments on this? Not as far as I know.

Nile (2009-09-22 01:19:07)

I travel widely and have no problem starting conversations even though I consider myself introverted. Two tips - comment on the obvious - weather, buildings, traffic, anything. This gives the other person an excuse to talk to you and if there is one thing most people like to do it is talk - say almost anything and give the other person a chance. The second tip is to introduce yourself and ask the other person's name. This way the next time you meet you will be on a first name basis. The more people you introduce yourself to the more friends you will have - it is an odds game. If you can't remember names buy a memory book. I agree with Seth - culture has very little to do with it.

### **Advances in Nose-Clipping: A New Use For Pantyhose (2009-09-21 01:45)**

[1]In the Shangri-La Diet forums, Maychi has posted about a new way of nose-clipping (eliminating the smell of food) that is socially-acceptable: Putting tiny pieces of pantyhose in your nose. They are invisible. Her husband and son wouldn't eat with when she wore noseclips.

I started this on 1st August. After about five days I got AS [appetite suppression] I had never managed to achieve with sugar or oil or anything else.

She eats about 95 % of her calories this way. It doesn't entirely block smells but perhaps it changes them enough so that they aren't recognized or are less recognized. Maychi started losing weight and so did [2]someone else who tried it.

One little problem: [3]You have to be careful what you say.

It's not possible to produce certain sounds. So in order to not sound like you have a horribly blocked nose, you have to say "delicious!" instead of "yummm!" and and "super!" instead of "Nice!"

1. <http://boards.sethroberts.net/index.php?topic=7254.0>
2. <http://boards.sethroberts.net/index.php?topic=7254.msg91454#msg91454>
3. <http://boards.sethroberts.net/index.php?topic=7254.msg91480#msg91480>

---

david (2009-09-21 08:00:51)

I tried nose clipping a few times with modest results (i.e. nothing like the big effect I got from sugar water). I noticed that some kinds of food were hard to eat nose clipped because breathing through the mouth at the while chewing was difficult. E.g. eating yogurt was easy to eat nose clipped, but a cereal like bite sized shredded wheat (which requires lots of chewing) hard.

karky (2009-09-21 15:24:09)

I wouldn't want to explain in the ER why I had pantyhose stuck in my nostrils. My cousin smelled terrible when she was a small child. No one could figure out why. Until they discovered she had a piece of a sponge stuck in her nose, rotting.

### **The Financial Crisis and Self-Experimentation (2009-09-21 04:51)**

They are closely related. I've been reading [1]James Stewart's excellent blow-by-blow of the early days of the crisis. As Nassim Taleb has emphasized, the crisis happened because the people running the financial system didn't understand how it works. They vastly overrated their understanding – their ability to predict. (As Taleb has also emphasized, they still fail to grasp their ignorance.)

Surely it isn't just the financial system. Surely we don't overrate our knowledge just here. Much more likely, we overrate our knowledge about everything. This creates a great opportunity. It goes like this: 1. We overrate our knowledge about a large thing (the financial system). 2. We probably overrate our knowledge about everything. 3. We probably overrate our knowledge about small things. 4. There is more to be learned from studying small things than we realize. 5. Small things can be studied experimentally – an especially effective learning method.

Self-experimentation is an example of studying small things experimentally. These experiments taught me far more than I ever expected. Because I knew less than I thought. (Without realizing this fact.) Here are three examples:

1. Acne. I discovered that my beliefs about the two medicines my dermatologist has prescribed were exactly wrong. The one I thought worked, didn't work; the one I thought didn't work, did work.

2. Sleep. My self-experimentation led to new ideas about the control of sleep that no one had thought of. I didn't know experimentation could do that so often. (I thought that such discoveries were very rare.)

3. Mood. [2]My conclusions about mood are really different than what researchers usually say. I never expected to learn anything so radical.

These examples cover three dimensions. In the acne example, I learned I was completely wrong very quickly – that's speed of learning. The sleep example is about number of discoveries; the mood example is about the "size" of one discovery.

2. <http://repositories.cdlib.org/postprints/117/>

---

Liu Xiao (2009-09-21 06:27:46)

I agree with you that people do overrate their understandings. But I don't think the financial crisis was brought by people who didn't understand the financial market. I believe that deregulation is responsible for it. The governing institutions didn't understand the strategy utilized by bankers and the leverage ratio has gone beyond a safe level. That may be the key reason.

peter (2009-09-21 09:04:14)

Professor Shiller of Yale, in *Irrational Exuberance*, talks about a fundamental mistake that investors make (especially retail investors); it's call magical thinking (essentially wishful thinking). it's why most retail investors think they can pick individual stocks and compete against professional investors in a zero sum game. this magical thinking apparently is at work in all areas. It occurs to me that given the cacophony of information some people unconsciously avoid trying to sift through all of it, and just fall back on what they want to believe, i.e., magical or wishful thinking.

epistemocrat (2009-09-21 10:03:54)

Great points, Seth. As Nassim Taleb says, the 'elephant in the room' for our economic system is still debt—we are still leveraged too thin—and the 'elephant in the room' for our healthcare system, as Michael Pollan also recently said, is nutrition. We need debt detox and nutrition rehab: self-experimenting with nutrition would hopefully lead people to discover a bricolage of diet-based preventions and even cures to chronic illness problems. Namely, folks would hopefully stumble upon 'good bacteria', would detox from sugar and 'ditto foods' (goodbye, metabolic syndrome), and would convert their personal health 'debt' (inflammation and disease) into equity with high market value (thriving physiologies). Nassim calls for the conversion of debt into equity. I call for the parallel move in healthcare. We need detox in both spheres. Self-experimenting exposes us to positive Black Swan opportunities. Cheers, Brent

Nathan Myers (2009-09-22 23:07:01)

We've always had wishful thinking. It doesn't explain the collapse. Certainly some people understood what was going on, but it didn't matter. What mattered was that it was in no one's interest to pull the plug. Anybody in a position to have any effect and tried would be replaced instantly by somebody who wouldn't. In effect, they constructed a machine that could not but proceed to the state it reached. The only way to fix it is to give the machine different operating rules that keep it from getting there again. What individuals understand or want has no effect unless the machine is programmed to respond to them.

Nansen (2009-09-24 13:38:04)

On the subject of sleep, here's an article from the Wall Street Journal about a new home sleep monitor:

### **Tsinghua Curiosities: First Day of Class (2009-09-22 02:28)**

I am teaching a seminar-like class called something like New Topics in Psychology. Most of the students are freshmen because this is the first year the psychology department has accepted undergraduates. Some unusual things happened on the first day of class:

- A graduate student volunteered to be a teaching assistant. (She was the second person to do so. A grad student in automation had volunteered a week earlier.)
- A freshman had her picture taken with me.

- I mentioned Caltech, where I was a freshman. Someone asked if Randy Pausch was a Caltech professor. (He was at Carnegie-Mellon.)
- The students did brief introductions. Many students appeared to think that one student's Chinese name was humorous. This was briefly explained to me but I still have trouble believing it. Maybe I misunderstood.
- There was uncertainty about the length of the class. It lasted only the first two-thirds of a longer period. (The basic unit is 45 minutes class plus 5 minutes break.)
- The students were seated in the usual rectangular way. Moving from front row to back row, the students' English appeared to get worse.
- The (first) teaching assistant advised them to not say "My English is not good" but to say "My English is on the way".

---

### **NYU Begins to Look Very Bad (2009-09-22 14:10)**

Nine months ago, [1]the New York Times reported that Lila Nachtigall, a New York University professor of obstetrics and gynecology, put her name on an article ghost-written for her by a drug company. The article, when published, failed to disclose the ghost-writing. In response, New York University officials have done nothing, as far as I can tell.

[2]In response to the same fact about one of their professors, McGill University opened an investigation. The same document that revealed what Nachtigall had done showed that Barbara Sherwin, a professor of psychology, obstetrics and gynecology, had done the same thing. Supporting my idea that [3]medical school professors have different ethical standards than the rest of us, an article about the McGill case by Montreal Gazette reporter Peggy Curran used the word plagiarism. One comment was "plagiarism, pure and simple." Does NYU president John Sexton find plagiarism completely acceptable? Apparently.

Thanks to Anne Weiss

### **Why are the Japanese Healthier than Americans? (2009-09-23 06:47)**

T. R. Reid has just published a new book called The Healing of America that compares American health care to health care in other countries. [1]One comparison is with Japan:

The world champion at controlling medical costs is Japan, even though its aging population is a profligate consumer of medical care. On average, the Japanese go to the doctor 15 times a year, three times the U.S. rate. They have twice as many MRI scans and X-rays. Quality is high; life expectancy and recovery rates for major diseases are better than in the United States. And yet Japan spends about \$3,400 per person annually on health care; the United States spends more than \$7,000.

Life expectancy is better. Even though the Japanese smoke more than Americans. Is it all those MRI scans? (Which in Japan cost a small fraction of what they cost in America?) Or all those trips to the doctor (where, by American standards, nothing appears to happen – that is, expensive drugs are rarely prescribed – judging by overall costs)?

I believe that that Japanese do so much better because of a factor that Reid probably doesn't consider: They eat tons more fermented food than Americans do. In a Tokyo restaurant, the woman sitting next to me, a nurse, said she believes that regular consumption of fermented foods is important for health. Does everyone in Japan think this? I asked. A large minority, she said.

The eating habits of the Japanese, as far as I could tell, bear this out. On [2]a Japanese food blog, the writer described a breakfast that had five fermented foods: pickles, miso, yogurt, natto, and kimchi. The Japanese eat miso at every meal, more or less. They also eat lots of pickles. Natto is popular in some parts of the country but not others. They eat lots of yogurt; they are the country that gave us Yakult. They drink vinegar drinks. (Whereas in America only health nuts drink apple cider vinegar.) In other words, their diet is loaded with fermented foods. If I'm right about this, Japanese rates of autoimmune diseases should be much lower than American rates.

When people get sick much less, health care costs go way down.

1. [http://www.washingtonpost.com/wp-dyn/content/article/2009/08/21/AR2009082101778\\_2.html](http://www.washingtonpost.com/wp-dyn/content/article/2009/08/21/AR2009082101778_2.html)

2. <http://tokyostation-yukari.blogspot.com/>

---

Steve G. (2009-09-23 07:19:59)

Seth, I think that you've spotted the elephant—or perhaps an elephant—in the room where the U.S. health care debate is being held. We aren't very healthy for a variety of reasons, but if we took better care of ourselves, we'd spent a whole lot less on medical care and enjoy life more. Beyond potable water and mass inoculations, a healthy diet (we know more about what it isn't than perhaps what it is) and even modestly more exercise are probably the greatest overall measures increasing public health. This doesn't address the built-in biases of the health care system arising from the business angle, but it could make a huge difference, and Japan seems to provide an excellent model. Thanks for the info!

richard (2009-09-23 07:34:02)

Do you know of any cross country comparisons on auto immune diseases?

Mary (2009-09-23 09:10:18)

If they are getting sick less often, as you suggest, why are they going to the doctor on average 15 times a year (vs. US average of 3 times per year)? Shouldn't "A (fermented) apple a day keep the doctor away" if your theory is right?

Mary (2009-09-23 09:13:30)

To follow up, your data suggests that Japanese health care utilization is much greater than US utilization, so it certainly doesn't explain lower health care costs in Japan. You do note that MRI scans in Japan cost a small fraction of what they do here, and cost differences of that sort could explain lower Japanese spending on health care, but it's hard to see why eating fermented

food makes an MRI scan cost less per unit.

Tom in TX (2009-09-23 09:37:55)

Are the pickles in grocery stores in the USA a good fermented food? Or have they been processed in some way that makes them less effective?

Eugene (2009-09-23 12:08:34)

As a result of rigid cost control measures, Japanese medical device manufacturers developed the Toyota Corolla of MRI scanners. Also because of compensation practices, doctors in Japan will schedule multiple visits to cover what one visit would accomplish in the U.S. and more readily hospitalize patients and keep them there longer. The Walgreens-style dispensing pharmacy is rare in Japan (until recently did not exist), so people go to a clinic or hospital to get access to the pharmacy. Doctors in Japan still make considerably less than their U.S. counterparts, though medical students are matriculated into a six-year program straight out of high school.

seth (2009-09-23 16:16:41)

Tom, I don't know how average American pickles – the kind you get in supermarkets – are made. There may be some quick-pickling process that replaces fermentation with something else – I don't know. If your health depends mainly on what you eat and do (e.g., exercise, not smoke), then rigid cost control measures for medicine (which makes little difference) make plenty of sense.

JLD (2009-09-23 17:59:25)

Off topic (not entirely), sensible ideas slowly go [1]mainstream

1. [http://www.nytimes.com/2009/09/22/health/22real.html?\\_r=1&em](http://www.nytimes.com/2009/09/22/health/22real.html?_r=1&em)

Ashish (2009-09-23 20:37:24)

Seth, your blog post seems to suggest not that Japanese are healthier than Americans (because of their diet), but rather that the Japanese medical establishment must be much more efficient than the American system at delivering care per dollar/yen.

seth (2009-09-23 22:24:24)

Ashish, how does my post suggest this? I say, or at least tried to say, that I believe Japan's health care costs are lower than America's because the Japanese are healthier to begin with – because they eat a better diet (more fermented food). A more complete answer would have said that Japan has cost controls.

Ashish (2009-09-24 08:29:16)

Seth, the fact I read in your post are: 1) Japanese smoke more than Americans do. 2) Japanese make much greater use of healthcare than Americans do. 3) Japanese have greater life expectancy than Americans do. 4) Japanese spend much less on healthcare, per capita, than Americans do. 5) Japanese eat much more fermented foods. Without any prior bias about fermented foods, my tentative conclusion would be that Japanese doctors are better, and cheaper, than American doctors. (If Japanese made much LESS use of healthcare than Americans did, while smoking more and living longer, then maybe I'd make a different conclusion.)

seth (2009-09-24 17:00:08)

Ashish, you make a good point. Taken by itself my blog post would seem mysterious and illogical. I have blogged many times about the benefits of fermented foods – not small benefits, big ones – and in the context of those posts this one makes more sense. I believe we need bacteria in our food just as much as we need vitamins.

Lotus (2009-09-25 02:13:13)

Eugene's comments are correct. My experience, however, was that Japanese doctors are not superior to American doctors

as Ashish surmises. There seems to be greater variability in training and knowledge among Japanese doctors. I believe that residency requirements are less stringent for new doctors in Japan, which could be the reason. I know there are some excellent doctors in Japan, but outside of the best hospitals the care could be pretty hit or miss. I have a lot of sinus and allergy problems and I was unable to find adequate care when I lived there 15 years ago and I ultimately had to return to the States to get proper treatment. While it is true that Japanese eat a lot of fermented food and that probably makes a difference, personally I think the largest factor in better health among Japanese is that people walk a LOT more. Everyone uses public transportation and walks/bikes to and from train stations everywhere they go. Also, you often need to use stairs to get to your train, sometimes at a sprint to catch your connection. So the daily commute is a bit of a workout and the correlation between regular exercise and health is pretty well established. Another big difference is that Japanese have nearly universal health insurance, either through employers or the national plan and people freely visit a doctor for just about anything little thing - stuff that we in the States would just go to a pharmacy for. Maybe all of those doctor's visits for small things like a common cold means better preventative care? It is interesting how culturally influenced the practice of medicine really is. And cost consciousness is important in Japan. People are always looking for ways to pinch pennies, especially in the workplace, so that must influence how medicine is practiced. You would think that medicine is very scientific and would be more standardized. But in reality culture influences the patient-doctor relationship, the willingness to take risks with new treatments and what treatments are prescribed. Japanese doctors may not prescribe a lot of expensive pills, but they do prescribe a lot of pills and usually do not tell you what they are. So maybe Japanese doctors are prescribing a lot of inexpensive placebos and it works well in many cases because patients have absolute faith in their doctors? Interestingly, when I lived in Japan there was much less awareness of allergies, especially food allergies. However, on a more recent trip back to Japan food allergens were listed on menus of all the chain restaurants, so now there is much more awareness of food allergies as a problem. So, have food allergies increased as the diet has become more factory-produced or is it just that awareness has increased? Anyway, I would attribute the better health/lower cost in Japan to a combination of factors, with excellent public transportation being a very important one. I'm curious to read that book now, I'll have to look for it.

Eugene (2009-09-25 10:48:07)

Here's another correlation that comes from living in a country with an efficient mass transit system: along with all that walking, exposure to sunlight. I wonder how natural vitamin D levels compare? Japan doesn't go on daylight saving time, so in summer you get a pretty good blast of sunlight walking to the subway station in the morning. Almost all elementary school students walk to school.

### **Anti-Depressants Associated With Birth Defects (2009-09-23 22:47)**

In the latest BMJ, [1] a group of epidemiologists reports that SSRI's (selective serotonin reuptake inhibitors, a commonly-prescribed type of anti-depressant) are associated with a certain type of birth defect when the mom takes the drug early in pregnancy:

There is an increased prevalence of septal heart defects among children whose mothers were prescribed an SSRI in early pregnancy,

We have a health care system built on dangerous drugs – and those drugs are poorly tested for safety. It isn't in the drug companies' interest to do so, of course. In this particular case, I wonder if the drugs were safety-tested on pregnant rats and if so what happened.

1. [http://www.bmj.com/cgi/content/abstract/339/sep23\\_1/b3569?paper=1](http://www.bmj.com/cgi/content/abstract/339/sep23_1/b3569?paper=1)

---

thehova (2009-09-23 23:24:47)

really, I want to believe that anti-depressants improve mental health of those who need it. But more and more, the studies produce a lot of disturbing stuff.

Andrew Gelman (2009-09-24 03:06:34)

Seth: Ob/gyns tell women to stop taking antidepressants if they're thinking of getting pregnant. I understand your intensity here, but the medical system isn't always as evil as you think.

NM4 (2009-09-24 04:51:53)

Andrew, How many pregnant women took SSRIs early in pregnancy before OB/GYNs began telling them not to?

seth (2009-09-24 06:12:46)

Andrew, the very fact of this association reveals that many pregnant women took these drugs. I wouldn't use the word "evil" to describe the system but the crummy safety tasting of dangerous drugs is highly beneficial to drug companies and horrible for everyone else. And what fraction of research psychiatrists are seeking perfectly safe alternatives to SSRIs? Uh, zero?

Anthony (2009-09-24 11:53:33)

The part that bothers me the most is that run of the mill depression seems to come in the large majority of cases from basic human needs not being met. That is, in the large majority of cases with depressed people, there are obvious basic needs not being met adequately (physical and emotional security, status within a peer group, friendship, emotional intimacy, a sense of growth and learning, and so on). Meet the basic needs -> depression goes away. SSRI's treat the symptoms (however well and with whatever negative side affects), instead of addressing the causes. See here [http://www.amazon.co.uk/depression-Fast-Human-Givens-Approach/dp/1899398414/ref=sr\\_1\\_1?ie=UTF8&s=books&qid=1253818349&sr=8-1](http://www.amazon.co.uk/depression-Fast-Human-Givens-Approach/dp/1899398414/ref=sr_1_1?ie=UTF8&s=books&qid=1253818349&sr=8-1) for example.

Andrew Gelman (2009-09-24 12:14:22)

Hi, Seth. I think you're putting the medical establishment in a damned-if-they-do, damned-if-they-don't position. Pregnant women are warned about these drugs. But what if they were forbidden to take the drugs? Then you might be slamming the paternalistic medical system for not letting people try things out on their own. And I don't know anything about research in these drugs, but I'd be surprised if there were no work being done on making safer versions. If, for no other reason, than that women-who-might-become-pregnant represent a large potential market share. NM4: The pregnant women I've known have been very concerned about taking unapproved drugs. Not everyone will follow warnings-heck, you still see pregnant women smoking and drinking-but people generally want to avoid risks.

Yvan (2009-09-24 15:16:46)

Hi, Having been through the episode of depression, I am healing with the practice of vipassana meditation and I questioned the validity of the research with the myth of the chemical imbalance and found this: Antidepressant drugs don't work ½ Official study link <http://tinyurl.com/dhu8yj> and link <http://www.badsience.net/2008/02/619/> and from PloS research in the comments section from an Epidemiologist and Assistant Professor, <http://tinyurl.com/ydqy76a> Omega-3 fatty acids as a first line intervention for depression? Quote» So what can we learn from these two meta-analyses? First, it is important to remember that meta-analysis does not really "prove" anything. No two trials are identical and there is heterogeneity among the trial results. However, one interesting hypothesis based on these data is that while antidepressant drugs are certainly effective, if we take into account cost, side effects, and relative effectiveness, patients with mild to moderate depression may be better off increasing their intake of omega-3 fatty acids (especially EPA) rather than taking antidepressant drugs. We state this as an hypothesis to be tested, not as a conclusion Quote Should doctor or GP prescribe Omega-3 as a first line of treatment <http://tinyurl.com/csznr5> Have good day Yvan F

seth (2009-09-24 18:28:22)

Andrew, in the case of this particular study, the prescriptions were issued – given to the women by doctors – while the women were pregnant. They weren't taking them against medical advice; they were taking them to follow medical advice. I am saying the current system favors crummy safety testing while at the same time relying almost exclusively on drugs that are surely dangerous. I don't think that argument is an example of damned-if-you-do damned-if-you-don't. I would not damn the drug industry if they did better safety testing, nor would I damn the entire medical establishment if they grasped the value of prevention (my interest in fermented foods – not shared by the medical establishment, with a few exceptions – is an example of how prevention might work). This is one example of a long-standing big problem: Popular drugs are discovered to be more dangerous than anyone was told. I'm less sure than you are that there is now research being done to find safer versions. Advertising such versions might destroy the market for the current versions.

### **Chinese High Schools (2009-09-25 02:03)**

Last night at dinner I met a Beijing high school student. He wants to finish high school in America. "Was that your idea or your parents?" I asked.

"Both," he said.

"What's the reason?" I said

"Chinese high school is too stressful," he said. "The test [tests?] is too hard."

He left the dinner early to study for the TOEFL.

---

### **Smoking and SLD: "Maybe the Shangri-La Diet Curbs All Kinds of Appetites?" (2009-09-25 15:52)**

This is from [1]Confessions of a Nicotine Addict:

Smoked like a chimney this weekend.

But on Tuesday I started the "Shangri La Diet," as outlined in the book of the same name by Seth Roberts. It's a strangely easy plan and I may be too obtuse to understand how it works, but my appetite was noticeably down all day. (Ok, I had a headache & nasty nausea – but not hungry!)

And I had very few urges to smoke. In fact, I went almost the whole day without nico fix. The thought of smoking was utterly distasteful. Really gross. Now, for the past couple months I've been working on all kinds of visualizations & relaxation techniques, but I really think this weird-ass diet had something to do with it. I ended up giving in at the end of the day, but I only smoked a couple. Yesterday was about the same; today, too.

Maybe the Shangri La Diet curbs all kinds of appetites?

So well put!

Maybe it does. Here are two possible explanations: 1. The mental effort it took to fight off the urge to eat is no longer necessary, leaving it available to fight off the urge to smoke. This story contradicts this explanation – the urge to smoke went down.Â 2. Addictions are self-medication. You feel bad, the addicting substance provides relief. If you feel less bad – less hungry, say – then you need less relief. This story doesn't support this explanation either; nothing is said about relief from overwhelming and unpleasant urges to eat. There is certainly some truth to this basic idea, however – witness the term addictive personality.

However, in this case I'd put my money on Explanation #3: Addictions are heavily linked to the environment. The environment triggers a craving. It's Pavlovian learning. [2]Shepard Siegel, a psychology professor at McMaster University, originated this explanation and has collected a lot of supporting data. You take Drug A in Environment B. After a while experience B triggers a desire for A. (Obviously it makes sense that we learn to become hungry when food is available.Â That's how appetizers work.) In this case SLD changed her environment. She felt different.

1. <http://nicoaddict.wordpress.com/>

2. <http://www.science.mcmaster.ca/psychology/index.php/people/202-dr-shepard-siegel.html>

---

Nile (2009-09-25 20:01:26)

Nicotine raises blood sugar levels. One way to cut the craving for a cig is to have something sweet, for example, a hard candy. If setpoint is down, less need for elevated blood sugar and thus less need for nicotine.

LemmusLemmus (2009-09-26 03:32:10)

The craving for cigarettes is particularly pronounced after eating. Less eating > less craving.

Nansen (2009-09-26 14:32:59)

Exclaiming "but not hungry!" sounds like an expression of relief, supporting your Explanation #2.

seth (2009-09-26 16:22:44)

good point, Nansen

bennetta (2009-09-27 23:44:37)

I experienced the same thing. Although I never really smoked all that much (once, maybe twice a day at most), for some reason, smoking became disgusting while on SLD. In fact, I'd argue that it was more effective at helping me quit smoking than as a way to get me to lose weight. I have not lost as much weight as I'd like since starting in January, but have not had a cigarette since late January. The author's words encapsulate exactly what I went through. Smoking became completely and utterly foul for some reason. I thought maybe it was related to having an empty palate for so long (not having an empty palate covered up the disgusting taste), but was never able to explain it. Regardless, who am I to complain?

## **Sleep and Standing on One Foot (2009-09-26 06:52)**

Someone read this blog and [1]wrote this:

The one that was most interesting to me was "standing on one foot", because I've definitely felt a difference in sleep after doing lots of

work. Â (I used to sleep really well when I did a 54-mile commute on my bike.) Â Maybe standing on one foot (knee bent) until failure causes the muscles to send similar chemical signals to intense exercise which are picked up elsewhere? Â Whatever, it was free, easy, and safe, so I tried it. Â You can't do a double-blind experiment on yourself, of course, but at least some of the time when I've tried it I definitely felt as though I slept more soundly when I got up the next day.

I still do this. Lately I have been varying the dose – how many times I stand on one leg. So far three (e.g., right leg, left leg, right leg) produces slightly worse sleep than four (right leg, left leg, right leg, left leg). If I eat plenty of meat, my legs get stronger and stronger; if I eat little meat, they don't.

1. [http://groups.google.com/group/alt.support.marriage/browse\\_thread/thread/8f7847c416e68fa0/88f84c53d6984913](http://groups.google.com/group/alt.support.marriage/browse_thread/thread/8f7847c416e68fa0/88f84c53d6984913)

---

Nansen (2009-09-28 13:13:03)

so when you eat little meat, then you need less one-legged standing time to get the desired effect?

### **A Problem With Soft Drinks (2009-09-27 00:41)**

Some have phosphoric acid, which leaches calcium from your bones. [1]Not all soft drinks have phosphoric acid:

In a survey designed to measure the amount of phosphoric acid in twenty different soft drinks, the following were found to contain the highest amounts: Tab, Coke, Diet Coke, caffeine-free Coke, and Mr. Pibb. The formulas may have been changed for the better since this survey was conducted. . . . Pepsi Free, Diet Pepsi Free, Like Cola, 7-Up, and Mountain Dew had no phosphoric acid.

[2]Female Fertility and the Body-Fat Connection (2004) by Rose Frisch, an excellent book, tells about a 25-year-old college tennis player nicknamed Miss Tab because she drank 8-10 bottles of Tab a day.

When her bone mass was measured, her tennis arm was normal for a 25-year-old woman (it should have been a greater mass from the exercise) and her other arm had the bone mass of a 70-year-old woman.

I started drinking Diet Coke a week ago. Oops. I will switch to Diet Pepsi. Eventually I will learn the Chinese for phosphoric acid.

1. <http://life.familyeducation.com/nutrition-and-diet/healthy-lifestyle/36000.html>

2. <http://books.google.com/books?id=0rz7M3QwKt8C&dq=body-fat+set+point+kennedy&q=Miss+Tab#v=snippet&q=Miss%20Tab&f=false>

---

Eric (2009-09-27 12:59:55)

Maybe it's different in China, but Diet Pepsi has phosphoric acid here in North America. Maybe you meant you were going to switch to those other Pepsi products (Pepsi Free or Diet Pepsi Free) that I haven't seen myself? [http://www.pepsiproductfacts.com/infobyproduct.php?brand\\_fam\\_id=1051 &brand\\_id=1000 &product=Diet %20Pepsi &prod\\_type=1026](http://www.pepsiproductfacts.com/infobyproduct.php?brand_fam_id=1051 &brand_id=1000 &product=Diet%20Pepsi &prod_type=1026)

### **Exercise and Its Confounds: The London Bus Study (2009-09-28 06:31)**

The Financial Times recently ran [1]an article about Jerry Morris, a London epidemiologist who did the most famous study of the effect of exercise. He compared London bus drivers with the ticket takers on the same buses. The ticket takers got a lot more exercise than the drivers. The health differences between them were attributed to exercise:

“There was a striking difference in the heart-attack rate. The drivers of these double-decker buses had substantially more, age for age, than the conductors [= ticket takers].” [said Morris]

The data were so telling because drivers and conductors were men of much the same social class. There was only one obvious difference between them. “The drivers were prototypically sedentary,” explains Morris, “and the conductors were unavoidably active. We spent many hours sitting on the buses watching the number of stairs they climbed.” The conductors ascended and descended 500 to 750 steps per working day. And they were half as likely as the drivers to drop dead of a sudden heart attack.

Morris found that bus conductors had fewer heart attacks than sedentary drivers

Today, almost everyone understands that physical exercise can help prevent heart disease, as well as cancer, diabetes, depression and much else besides. But on that day in 1949 when Morris looked at the bus data, he was the first person to see the link. He had inadvertently – “mainly luck!” – “stumbled on a great truth about health: exercise helps you live longer.

It's not that simple. There are two big confounds in the study (two other differences between drivers and ticket takers) that surely caused Morris to overestimate the benefits of exercise. One is well-known to epidemiologists: [2]Bus driving is very stressful. Much more stressful than a dozen other equally sedentary jobs. Stress certainly causes heart disease. The other is based on [3]my discovery that standing a lot improves sleep. (The standing needn't involve movement.) I don't know if better sleep specifically reduces heart disease but [4]it certainly increases resistance to infection and heart disease seems to have an infectious component. The ticket takers were on their feet all day, the drivers were not.

You may remember that James Fixx, a famous advocate of jogging, died of a heart attack.

Thanks to Dave Lull.

---

Aaron Blaisdell (2009-09-28 08:05:19)

I was thinking of those confounding factors while reading your blog, too. I thought of one more that I'm surprised you didn't mention: seeing faces/social interaction. Bus drivers are notoriously asocial (at least all the ones I've encountered were). They generally don't even make eye contact with passengers getting on and off the bus (except when looking in their rear-view mirror). The ticket collectors, on the other hand, were engaged in highly social interactions. Even if they only actually talked to one out of every 10 or 20 or 50 passengers, that would be quite a bit of social interaction for a day. This blog brings to mind Taleb's statement about how much things we don't see matter just as much as, if not more than, things we do see. The researchers (and journalists reporting on the research, and readers reading the media reports on the research) all see the difference in activity, but they don't even consider all of the co-varying factors that could also account for some or all of the differences in measured effects (in this case heart attacks).

seth (2009-09-28 12:23:50)

Good point, Aaron.

Rajiv Mehta (2009-09-29 09:53:38)

Just last week I had read about studies of bus drivers and hypertension, work by Berkeley's Lenonard Syme, that highlights those confounding factors. Here's a brief excerpt: Syme points to his study of hypertension in San Francisco bus drivers as an example of how easy it is to miss the forest for the trees. While investigating the unusually high rates of hypertension in this group, the research team found that bus drivers also complained of back pain and gastrointestinal and respiratory difficulties. The team designed interventions to address these issues, but none were effective. Then the researchers learned more about the bus drivers' daily routine. Drivers had to adhere to a rigid schedule that was determined by a computer, and they were penalized for late arrivals. However, there was a shortage of buses, which meant drivers often were not given enough time to get from one stop to the next. They raced into fast food restaurants for meals to stay on schedule. Because they were so often late, they faced irate passengers and traffic problems daily, and often did not have time to return home between morning and evening shifts. The problem, says Syme, was that the researchers were focusing on the specific diseases rather than the fundamental problem: the job.

seth (2009-09-29 16:43:21)

It was from Syme that I learned about the stressful lives and special health problems of bus drivers.

### Effects of Probiotics on Kids (2009-09-29 02:13)

As I [1]previously blogged, [2]a recent study in Shanghai found that schoolchildren given milk with added bacteria had fewer colds than children given milk without added bacteria. The study was funded by Danisco, a Wisconsin company that makes bacteria-containing ("probiotic") capsules. Obviously they want to sell more of their product. But ordinary yogurt probably produces the same result. Aaron Blaisdell told me this:

Since introducing yogurt into my daughter Maggie's diet on a daily basis about 5 months ago, she's gotten far fewer colds, and those she did get were milder.

I asked him for details.

Maggie is 4 years old. She eats a bowl of Traderspoint Creamery whole milk yogurt (from grassfed cows) each day. She started day care since 4-months old and now goes to a pre-school. She used to get a cold about every other month (6-8 per year), but since we introduced yogurt daily to her diet about 6 months ago, she's only had one cold as far as I can remember and it was very mild. Even the cough which used to last a month or two after she recovered lasted only about a week or two.

How much yogurt was she eating before that?

I think she had yogurt once or twice a week for the six months prior to introducing it daily. Before that it was even rarer. We introduced it a few times between the ages of 2 and 3 years old, and after initially liking it for a day or two she would then reject it thereafter. The reason she eats it every day now is because I put Ovaltine in it (about a teaspoon).

Did he make other changes at the same time?

I also try to sneak fermented high-vitamin cod liver oil into the yogurt, but I can only do this if I make it while she isn't looking. I also put 2-4k vitamin D3 (Carlson's drops) into it if she isn't looking when I make it. Also starting at the beginning of this year I switched from organic pasteurized milk to raw milk. I can't think of any other significant changes in diet, except that I continue to try to cut down on the amount of cereal and crackers she eats and increase the amount of eggs and cheese instead.

Let's hope she doesn't read this!

1. <http://www.blog.sethroberts.net/2009/08/07/probiotics-prevent-colds/>

2. <http://pediatrics.aappublications.org/cgi/content/full/124/2/e172?maxtoshow=&HITS=10&hits=10&RESULTFORMAT=&fulltext=Probiotic+Effects+on+Cold+and+Influenza-Like+Symptom+Incidence+and+Duration+in+Children&searchid=1&FIRSTINDEX=0&sortspec=relevance&resourcetype=HWCIT>

---

Aaron Blaisdell (2009-09-29 06:57:30)

Doh, I forgot to mention that she started drinking Yakult probiotic drink (she calls it her "yogurt drink") almost daily starting about the same time that we introduced the yogurt+Ovaltine mix (this all started around February 2009).

Uwe Reinhardt (2009-09-29 09:17:02)

She may just be getting stronger as she grows. The best way to test this would be to discontinue feeding her the yogurt for a few months and see if she starts gets sick again.

Andrew Gelman (2009-09-29 14:27:40)

Seth: You write, "Let's hope she doesn't read this!" I doubt that many 4-year-olds are up to the task of reading your blog!

seth (2009-09-29 16:49:00)

Uwe, yesterday a student of yours quoted you to me. You said: "Our health care system was designed by the Devil." When you lose your job is when you need to buy your own insurance – just when you don't have much money. I said: Right on.

Lila (2009-10-03 12:30:33)

Could it be the vitamin D? I've seen a lot of articles recently about the potential effect of vitamin D on colds. See for example: <http://www.scientificamerican.com/article.cfm?id=cell-defenses-and-the-sunshine-vitamin>

## Health Care: Why Problems Have Piled Up Unsolved (2009-09-29 04:49)

In [1]an amusing comment on health care, Jonathan Rauch (via [2]Marginal Revolution) imagines an airline system as archaic and inefficient as our health care system.

"Cynthia, I have filled out my travel history half a dozen times already this year. I've told six different airlines that I flew to Detroit twice and Houston once. Every time I fly, I answer the same battery of questions. At least a dozen airlines have my travel history. Why don't you get it from them?"

"We have no way we could do that. We do not have access to other companies' records, and our personnel have our own system for collecting travel history."

The health care system, in other words, is full of problems that have built up unsolved. Solutions exist – the problems are not impossible – but haven't been implemented. Jane Jacobs's great point, in *The Economy of Cities*, is that this is what happens when those who benefit from the status quo have too much power relative to those who benefit from change. The stagnation in American health care is profound. It isn't solved by universal health insurance. There would remain the horrible dependence on expensive dangerous drugs that don't work very well (e.g., antidepressants, Accutane) and the complete lack of interest in prevention. The underlying problem, the source of many visible problems, is too little innovation.

1. [http://www.nationaljournal.com/njmagazine/st\\_20090926\\_4826.php](http://www.nationaljournal.com/njmagazine/st_20090926_4826.php)

---

Seth's blog » Blog Archive » "Some of Them Will Have the Wrong Answer" (2009-10-31 08:29:39)

[...] In a previous post, I said there is great stagnation in health care. Obesity and mental illness are the examples most obvious to me, but there are many other problems on which our health care system has made little progress for a long time. (Sure, we should have universal health care but the idea that this will do much about the obesity epidemic, the autoimmune disease epidemic, the autism epidemic, and so on, is absurd. Doctors don't know how to get people to lose weight. A reasonable health care system would focus on prevention. That is something the current batch of doctors doesn't know how to do.) I added that a reasonable health policy would empower those who benefit from change. [...]

### **Deliberate Anachronism in Mad Men? (2009-09-29 17:10)**

In the latest episode of Mad Men, one of Betty Draper's friends wants to know who someone is. She consults a book. Oh, he's a bigshot, she says.

Was this deliberate? A not-very-in-joke? In the 1960s – even in the 1980s! – there was no Google-like book that said who living people are. You had to go to the library. It used to be fun to read the New Yorker Christmas poem ("Greetings, friends!") and try to learn about the people you couldn't identify. It was hard.

More In light of the first seven comments below I reviewed the scene. The mystery man, an advisor to Governor Rockefeller (not in advertising), is listed in a thin spiral-bound notebook. Who's Who was much thicker and never spiral-bound. [1]Here is the 1962 New York Social Register – much thicker and not spiral-bound. A later comment suggested the notebook contained "a copy" of the Register. No way – there were no Xerox machines back then. The woman who looks the mystery man up in the notebook tears his page out of the notebook and hands it to Betty – just like sending someone a link.

1. <http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=300349822869>

---

Ryan Holiday (2009-09-29 17:18:00)

I saw that too - I assumed she had some sort of Who's Who book but that might not make sense.

Steve Rothman (2009-09-29 17:21:02)

I didn't see the episode, but of course there were such books in the 60s. Besides Who's Who there would have been directories of major players in the ad business, such as members in various advertising associations.

Dewb (2009-09-29 17:25:45)

It's not at all unreasonable that an officer of the Junior League would have brought a staff list for the governor's office, or even an entire org chart of the state executive branch, to a meeting that would specifically concern lobbying the governor to stop a development project. I'd have to check but I thought the object being consulted was a binder.

Nathan Myers (2009-09-29 18:04:36)  
People paid to be in them.

Maryrose (2009-09-29 18:04:43)  
It was probably the New York Social Register [http://en.wikipedia.org/wiki/Social\\_Register](http://en.wikipedia.org/wiki/Social_Register) Seth, in my work (research for fund raising) I still use books like these.

Maryrose (2009-09-29 18:06:31)  
PS. Usually if you are in it, you have a copy.

Andrew Gelman (2009-09-30 01:22:35)  
I'm warning ya: One more spoiler and I'm going to have to stop reading your blog!

Socktopi (2009-09-30 17:08:28)  
I just assumed it was a notebook the woman had assembled of the people they could lobby, but reading the comments here, it seems clear it was something like a copy of the annual New York Social Register, which you can see a copy of on ebay: <http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=300349822869>

Rachel P. (2009-10-05 19:08:42)  
I believe they're referring to the NY State Directory, informally called the "The Red Book." #### **In Academia, High Status = Useless (2009-09-30 06:42)**

In [1] a good article about what caused the financial crisis, John Cassidy quotes an economist:

During the past few decades, much economic research has "tended to be motivated by the internal logic, intellectual sunk capital and esthetic puzzles of established research programmes rather than by a powerful desire to understand how the economy works" let alone how the economy works during times of stress and financial instability," notes Willem Buiter, a professor at the London School of Economics who has also served on the Bank of England's Monetary Policy Committee.

It isn't just "the past few decades" and it isn't just "much economic research," it's all academia. Thorstein Veblen made this point a hundred years ago in *The Theory of the Leisure Class*. Academics show their high status by doing useless research. Useful research is low status. When, as a professor, you see this in your own department – the uselessness of what people do – you think surely other departments are different. They aren't. As a Berkeley grad student in engineering said to me, "95 % of what goes on in Cory [Hall – where her department is] will never be used."

1. [http://www.newyorker.com/reporting/2009/10/05/091005fa\\_fact\\_cassidy?currentPage=all](http://www.newyorker.com/reporting/2009/10/05/091005fa_fact_cassidy?currentPage=all)

---

August (2009-09-30 08:11:46)

Or they go beyond uselessness an into manipulation: <http://bishophill.squarespace.com/blog/2009/9/29/the-yamal-implosion.html>

John (2009-09-30 08:50:08)

Just yesterday I was talking to someone who was asked to provide a biosketch for a grant application. This is an indispensable person, a programmer who holds many research projects together. But on the biosketch form he's a zero: no publications, no presentations, no grants. He has decades of engineering experience, but that doesn't fit on the form.

Ernie (2009-09-30 09:30:25)

Ah, but define useful research. You mean industrial payoffs? Immediate commercial potential? How do you know the cure for AIDS isn't coming from something people once called useless?

thehova (2009-09-30 11:35:57)

I remember considering this when I decided not to pursue a PHD in history (spending my life writing papers on an obscure moment of time for a small group of people doesn't sound too appealing). I didn't understand that in academia, this phenomenon extends to other fields.

thehova (2009-09-30 16:34:33)

Greg Mankiw (economics blogger) indirectly touched on this subject here: <http://gregmankiw.blogspot.com/2007/12/career-advice-from-david-brooks.html>

seth (2009-09-30 16:36:47)

"Define useful research." Good question. I mean research that is clearly useful. The saving grace of the system is that research with no obvious use turns out to be useful in an unexpected way. And the less prestigious your position, the more you are willing to do useful research. That's another way useful research gets done.

Nathan Myers (2009-09-30 17:20:30)

"Useful research" must have some possibility of telling you something you don't already know.

Phoebe (2010-03-18 00:50:28)

Just came out of an academic workshop of tourism. All bullshit. They all show off and nothing is really useful

## **What the Government – Any Government – Isn't Telling You About Swine Flu (2009-09-30 20:09)**

[1]How weak it is:

By any measure A/H1N1 is a benign flu virus. According to official statements, New Zealand, for example, usually has 400 deaths from flu each year. This year there were 17, so it could be argued that the pandemic has resulted in 383 lives being saved, which makes it more effective than any flu vaccine.

It is always good politics to scare people. Create a danger from which you protect them. It's such an old and common ploy it's curious how well it still works. Maybe the gullibility is hard-wired.

1. [http://www.bmj.com/cgi/content/extract/339/sep29\\_3/b3959?paper=1](http://www.bmj.com/cgi/content/extract/339/sep29_3/b3959?paper=1)

---

Chris (2009-09-30 23:28:49)

<http://www.medpagetoday.com/InfectiousDisease/URItheFlu/16220> - interesting - that there may be a role for bacteria too

Kevin Miller (2009-10-01 06:06:02)

Two points you're overlooking: 1. The consequences for being wrong are pretty serious, and asymmetrical. I lived in Beijing during the SARS crisis and it was really devastating (talk to some of your grad students who were undergraduates then). For about 5 months you didn't see any children, students were locked on their campuses, classes were canceled so there was little for them to do, and economic activity ground to a halt (on the positive side, the air pollution dramatically diminished). It was a real crisis of legitimacy for the regime, although they were ultimately strengthened by it (Only the Communist Party can defeat SARS, as a poster in Haidian said). 2. Although H1N1 seems not to be severe, it spreads really easily (40-50 students a day at the U. of Michigan showing symptoms last week, including about 1/10 of my class so far). Bird flu is very serious, but does not spread easily. In people who have both, they can swap DNA and you could end up with something that was very serious and spreads easily. So you can see why a place like China, with a really dysfunctional medical system (even compared to ours) is really worried about H1N1. They have bird flu, they've had a searing recent experience with SARS, and there's a plausible nightmare scenario. Not to go all Dick Cheney on you, but what percentage risk of the nightmare scenario would you want there to be before you started worrying, if \*you\* were the government of any of the countries involved?

seth (2009-10-01 06:24:50)

That is the first I've heard of the nightmare scenario. Policy makers are taking it seriously? as for your question, maybe 0.1 % - but I find it hard to believe the odds could be determined with any precision.

Andre Vellino (2009-10-01 06:36:39)

Check out CBC's White Coat Black Art from September 19th (podcast here: [http://podcast.cbc.ca/mp3/whitecoat\\_20090919\\_20419.mp3](http://podcast.cbc.ca/mp3/whitecoat_20090919_20419.mp3)) "We've heard a LOT about the global pandemic of swine flu in recent months. Experts are predicting a deadly second wave of the illness this fall. Accordingly, Canadian health officials are scrambling to put plans in place to handle the expected health crisis. It's costing us millions and millions of dollars. But not everyone believes it's necessary. This week, we ask the question: could this be a pandemic about nothing?"

Chris (2009-10-01 09:32:52)

Any chance that all the paranoia is actually saving those lives in New Zealand? Here in Japan loads of schools are cancelled with teachers acting like postmen now. They go to the houses of their students drop off and pick up assignments from mailboxes without human contact. In addition every company, sporting event etc requires people entering buildings to use alcohol on their hands. Since these steps also prevent regular flu it could lead to a drop in mortality. Of course the general attention probably has many more people checking with their doctors instead of trying to fight it off alone. But according to the Umami hypothesis maybe all these actions will hurt immune response. We live in interesting times :)

Nathan Myers (2009-10-01 14:28:10)

The "Spanish flu" started out benign, too. (I gather it started as an epidemic at an army training camp in Kansas.) It's the similarities to that flu, which preferentially killed young people with strong immune systems, that has people worried. Seth, if your immune system is as pumped-up as you hope, that should make you the more concerned. Really, the mortality rate of Spanish Flu was much lower than plague or smallpox. It was just that so many people got it, each percentage point meant millions.

Anthony (2009-10-01 14:50:37)

Can someone explain what it means for a flu to "preferentially" kill people with strong immune systems? It almost sounds like a contradiction.

Nathan Myers (2009-10-01 18:43:51)

Anthony: Lots of people are killed by their own immune system (e.g., look up lupus). Spanish flu victims died from lung congestion produced by their body's response to the flu. The more vigorous the response, the more congestion.

Kevin Miller (2009-10-01 20:52:09)

Seth - I think so. Here's the first thing I got when I searched "swine flu + bird flu" - <http://www.cbsnews.com/stories/2009/05/0-8/health/main5001182.shtml>, which isn't the best source, but it's something. One problem is that when people hear the word "pandemic" they think it means "we're all going to die." It means many people will have the disease, which gives it more opportunities to mutate into something possibly worse. One possible piece of good news is the idea that many of the dead in the 1918 flu pandemic were people who also had tuberculosis (because TB rates fell quite a bit afterwards, and stayed down). Nathan - I don't know that Seth thinks his immune system is "pumped up." Rather, probiotic kinds of bacteria can reduce the overall level of inflammation and so decrease the chance that you'll have the kind of overactive immune response that ends up producing auto immune attacks. Finally, there certainly is no way of quantifying much of any of this. Which makes me more sympathetic to the people who have to make decisions about public policy in this arena.

seth (2009-10-02 05:41:23)

Anthony, the second wave of Spanish flu preferentially killed young adults, unlike other flu strains. These young adults had stronger immune systems than the very old and very young. They differed in a thousand other ways as well so the notion that the Spanish flu preferred them because of their "strong" immune system is quite a stretch. Because there was a world war going on, the Spanish flu went through a very unusual selection phase where flu variants that did well among young men had a better chance of spreading than flu variants that did well among the very old and very young. Most of the time flu variants that do well among schoolchildren have a better chance of spreading because schoolchildren are together a lot. (Like soldiers during a war.) Thus they do well against young children. They do well against the old because a larger fraction of the old are already in poor shape.

Aaron Blaisdell (2009-10-02 07:13:57)

Dr. Weston Price and Dr. Mellanby both showed (back in the 1930s) that ingestion of fat-soluble vitamins (A, D, and likely K2) imbued protective immunity against infections. I'm not worrying about flu shots or avoiding people with flu-like symptoms (like an undergrad in my lab yesterday). Rather, I'm upping my dose of D3, getting more mid-day sunlight, eating pastured eggs (much richer in vitamins A and D), eating more fermented foods (FAGE yogurt, kefir, kimchee, raw-milk cheese), and putting Thorne's K2 drops in my beef stock. I'm also making kombu broth this morning. And I'm trying to get plenty of rest. I think this has been shown to be a much more effective approach to protecting oneself against communicable infections.

seth (2009-10-02 07:32:02)

Kevin, I agree with Aaron's approach: try to boost immunity (which will have many other benefits). Whereas attempts to reduce exposure have many negative side effects. Since public health officials ignore such a simple and basic point, I find it hard to be sympathetic.

Kevin Miller (2009-10-04 05:05:01)

I agree with it, too. But I think we use "boost immunity" in two different ways. One is the idea that you'll have a stronger immune response. The other, which, probiotics might do, is to enlist other organisms into your immune system, so they're outcompeting what might come in. If I understand this correctly, in one sense this means you have a weaker immune system, or at least a quieter immune system, because you have less inflammation and therefore a higher threshold for your immune system to go on the attack. But you're less likely to get sick, which would be why you could say you have a stronger immune

system. If problems arise when your immune system is too busy, it makes sense to distinguish between these two senses of having a "stronger" immune system.

### **Bad Review of the Shangri-La Diet (2009-09-30 23:32)**

A professor in the Berkeley nutrition department recently told a friend of mine he knew about the Shangri-La Diet. He advised:

Don't try it. He's a psychologist, not a nutritionist.

As if weight control didn't involve the brain. Perhaps my friend was talking to Marc Hellerstein, who [1]told a student reporter that the theory behind the diet makes "no sense."Â The theory says we stock up on energy when it's cheap.

1. <http://sciencereview.berkeley.edu/articles.php?issue=11&article=bookreview>

---

Ryan Holiday (2009-10-01 00:09:05)

The thing about snark is that it is much more about the scorn and not the logic. It's said with such conviction and derisiveness that I think people are often afraid to point out the obvious mistakes in it.

JLD (2009-10-01 02:47:13)

*Don't try it* Sure, that's the best way to stay unbiased about the topic! I just stumbled upon this same joke [1]elsewhere (in french, sorry). BTW, it works, 4kg in 1 1/2 month, 3 spoons canola oil.

1. <http://a10.idata.over-blog.com/400x550/0/01/87/11/ottopics2/4emecouv-jademediaweb.jpg>

Toni H (2009-10-01 12:44:27)

I tried e-mailing you, but the domain shrangiladiet.com doesn't apparently exist, so I'll just paste my idea to you here: You've written interesting stuff on how we should get bacteria to feed our immune system. Have you ever thought what a great way to get bacteria it is to eat your fingernails or the skin next to them? Whenever I travel abroad, I instantly get a small diarrhea because of my habit, but after a couple of days it passes and I don't have any problems with local foods (I travel a lot and eat a lot of shady stuff, e.g. street vendors in small chinese rural villages).

seth (2009-10-01 15:55:02)

it's shangriladiet.com not shrangiladiet.com. eating your fingernails, no but I did speculate that this is why cats lick themselves. That's interesting that the location-specific bacteria would be found on your fingernails.

Nathan Myers (2009-10-01 18:40:54)

Surely the fact of whether it works trumps any amount of theorizing about why it ought to work, or ought not to work. If you're really a scientist, anyway. This professor reveals he is no scientist. There should be consequences for that, if you're in a position meant to be held by a scientist. There are plenty of real scientists looking for work.

Nadav Manham (2009-10-02 04:50:42)

The quoted professor also seems to misunderstand the concept of the word "try."

Seth's blog » Blog Archive » Nassim Taleb on Incompetent Experts (2009-11-05 18:42:13)

[...] Second, self-experimentation allows researchers such as myself to do innovative research in some area without getting permission from experts in that area. Self-experimentation is very cheap; no grant is required. A self-experimenter can be as heretical as he cares to be. My research on weight control has been breezily dismissed by nutrition professors, for example. Obviously they wouldn't fund it. The Animal Care and Use Committee at UC Berkeley turned down my application to do rat research about it — my ideas couldn't possibly be true, they said. My research on mood isn't just utterly different than what clinical psychologists and psychiatrists say to each other in meetings and papers; it also, at first glance, sounds absurd. Self-experimentation allowed me to do it. That's another sort of filtering: control of what research gets done. [...]

## 4.10 October

### Sour Fish Soup (2009-10-01 21:59)

For lunch in a campus restaurant I had sour fish soup. The soup is made sour by the addition of fermented cabbage – several kinds of cabbage that have been fermented about a month. It is a dish from Sichuan or Guizhou Province. It's an example of how our liking for sour tastes causes us to eat more harmless bacteria.

---

### Chinese Yogurt Maker (2009-10-02 06:29)

I got a Chinese yogurt-making machine. [1]Here is an example of what it looks like. I got the ACA VSN-15B but the 15A is almost the same and far more available (in Beijing). It cost about \$20; the simpler VSN-15A costs about \$10. You put 1000 ml of milk plus 50 ml yogurt starter (e.g., commercial yogurt) into a container and just start it. You can ferment it as long as you want. The instructions recommend 8-12 hours.

What interests me is (a) how easy it is and (b) the high quality of the result. I've made yogurt dozens of times without a special machine. It's not hard, exactly, but it isn't easy, either. You need to preheat the milk to denature the proteins, then let it cool before adding the starter. The denaturing phase takes a few hours and a different heating system (microwave oven) than the fermentation phase (ordinary oven). The final result isn't as thick as I like unless I add milk powder – another not-quite-easy step. (Given problems with Chinese milk, I would never use Chinese milk powder.) Using the yogurt machine the texture is excellent (thick and creamy) without adding any milk powder. I suspect the final product is so much better because the proteins are more completely denatured. Maybe 2 hours at 150 degrees denatures a much larger fraction of the protein than 180 degrees for 5 minutes, for example. Another possibility is that I was using too much starter and that less starter produces better results. (How could that be? Perhaps with less starter you get more genetic diversity as it grows, which allows it to become better adapted to the particular milk and temperature you are using.) Perhaps a steadier temperature allows better adaptation to the temperature. You add hot water around the container to help steady the temperature.

I still need to experiment to get it as sour as I like but I can get it as thick as I want just by draining it. It's not exactly the universal condiment but it's close; tonight I had it on leftover dumplings.

All in all, a ten-fold improvement over what I'd done before. The big improvements: 1. So easy I can do smaller more frequent batches (in Berkeley I did at least 2 quarts at once), thus need less storage space. I also suspect the bacteria are more active soon after fermentation, so more frequent is better. 2. Requires much less attention. The mental cost of each batch is less. 3. Produces much better yogurt. 4. No more milk powder. 5. More energy efficient. (Using the microwave, I nearly boiled the milk, then heated an entire oven just to keep the yogurt warm while fermenting.)

1. <http://browse.woye.com/Yogurt-machine/161400-15-1.htm?tag=new>

---

Ashish M (2009-10-02 08:14:57)

For your next business venture ... importing a few of these babies back to the Bay Area? (Hint, hint.)

David (2009-10-02 08:33:29)

I see a half dozen different model available here in the US. <http://google.com/search?q=yogurt+maker>

david (2009-10-02 09:52:58)

Interesting. I doubt I would ever have gone to the trouble of making yogurt the manual way you describe, the the machine sounds pretty easy. I notice they have them at Amazon for \$30- \$40: [http://www.amazon.com/EuroCuisine-YM80-Yogurt-Maker/dp/B000Q4Y8OY/ref=acc\\_glance\\_ktch\\_ai\\_-1\\_3\\_tit](http://www.amazon.com/EuroCuisine-YM80-Yogurt-Maker/dp/B000Q4Y8OY/ref=acc_glance_ktch_ai_-1_3_tit) David

Aaron (2009-10-02 13:16:23)

is there a comparable American model- can i buy the Chinese one in the US? websites? thanks for interesting post!

seth (2009-10-02 19:02:31)

I haven't been able to find a comparable American model. Nor any way to buy the Chinese one in America. If you buy it in China the current is wrong. David, the amazon products you link to are different. They use small cups to hold the milk/starter mixture. That means they use space less efficiently, require two more steps (mix starter and milk in separate dish, wash separate dish), and may not heat as evenly. Because of it's one-big-container design, the Chinese machine can use hot water to improve temperature constancy. That might be important. Ashish, the Chinese model is designed for Chinese house current, which differs from American current. I will however see if it works with American current.

David (2009-10-02 21:10:06)

How about this one: <http://www.amazon.com/Euro-Cuisine-2qt-Yogurt-Maker/dp/B002KBFO6C/> It showed up in the ad bar on the right side of this post.

seth (2009-10-03 00:01:54)

David, that has the single container, yes, but everything else is worse. It weighs 4 pounds; mine weighs one pound. It's much bigger. The capacity is needlessly large, at least for my purposes. How the thermometer tells you when it's done isn't clear.

david (2009-10-03 04:49:37)

Not to change the subject, but I'm drinking Kombucha from my first batch of homebrew. I got the scoby from a neighbor. It tastes good! Now I need to experiment and learn to add flavors (citrus, ginger, fruit, etc). I drink 16oz / day and it was getting expensive.

seth (2009-10-03 06:23:19)

It's easy to get the scoby (starter culture) needed for kombucha. Just buy a bottle of unpasteurized kombucha, open it, and let it sit at room temperature, covered with a paper towel, for a week or so. A scoby will form at the top.

Aaron (2009-10-03 08:50:57)

seth- i noticed the difference in the little cups right away! if for any reason you ever see a comparable model in america- please post it!

Aaron (2009-10-03 09:15:40)

btw- this is an interesting one: <http://www.healthytraders.com/miracle-exclusives-newest-electric-yogurt-maker-model-me72-p-2055.html> can't beat the ease of use here-

nr (2009-10-04 10:14:07)

has anyone figured out how to order a yogurt maker like that in or with shipping to the US?

Dan (2009-10-04 13:44:21)

Kefir seems easier to make. No machines. No heating anything. Is yogurt better than kefir or just different?

Ashish M (2009-10-05 11:20:32)

Amazon reviews are instructive. The point about the small cups is that many people feel that cooking/storing in glass is preferable to cooking/storing in cheap plastic. Time to do some retail therapy ...

seth (2009-10-05 13:29:27)

Yogurt is easier to make than kefir, in my experience. Ashish, yeah, I agree that glass is better than plastic for cooking and storing. Good point.

Seth's blog » Blog Archive » Yogurt-Making Results (2009-10-07 05:41:00)

[...] I've been steadily using my new yogurt maker. It's like a microscope: I can see things I never saw before. I started with the recommended fermentation time: 12 hours. Then I did batches at 16, 20, 24, and 28 hours. The yogurt grew steadily more sour. The increase was remarkably clear. I am unable to find this crucial info anywhere on the web — that 28 hours produces more sour yogurt than 24 hours, etc. By making my yogurt much more sour than commercial yogurt I'm getting a lot more of the crucial ingredient (bacteria). [...]

Mark Frauenfelder (2009-10-13 15:02:00)

I don't like preheating the milk for making yogurt. Even though I use a makeshift double-boiler to heat the milk to 180 degrees F the saucepan gets scalded. For the last two batches, I just made the yogurt without preheating the milk. It's a little runnier, but still tasty and I like it better runny anyway. I wonder if the bacteria count is reduced when I make yogurt without preheating the milk.

collin (2010-09-06 16:22:21)

I'm planning to setup a yogurt. Where can I purchase a commercial yogurt maker?

## **Miso Shopping in Beijing (2009-10-03 04:12)**

In Beijing I have no kitchen, just a microwave oven. Which is enough to make miso soup. Which I can eat happily day after day.

But I need miso. In Tokyo I bought miso far better than what I used in Berkeley and now cheap miso isn't good

enough for me. Finding high-quality miso in Beijing is turning out to be hard, even though there are many Japanese students in my neighborhood. Today I went to a Japanese-owned department store with a food market. They had hundreds of Japanese foods, including plum wine, natto, Japanese pickles, sushi ingredients, seaweed crackers, and black milk (whatever that is). But they didn't have miso. I have no explanation; the local hypermarket (Carrefour) had low-quality miso.

If you know where to get good miso in Beijing, please let me know.

---

### **Gatekeeper Drugs: Drugs that Require Gatekeepers (2009-10-03 06:58)**

A friend of mine suffered from depression. Like so many depressed persons, he went to sleep very late – maybe 3 am. I told him that was a very bad sign, no one should go to sleep that late. He started going to sleep earlier and waking up earlier and felt better. He wondered why none of the many psychologists and psychiatrists he'd seen about his problem had told him what I said. The first time he asked I think my answer was that I cared more than they did about the relation of depression and sleep.

Recently he asked again: Why didn't they tell him something so simple and helpful? Maybe I learned something in the intervening years because my answer was different. I said all health care professionals – not just doctors, all therapists/healers, mainstream, alternative, Western, non-Western – have no interest in treatments that they are not needed to administer. If all you need to do is to get up earlier in the morning, you don't need a psychiatrist. Therefore a psychiatrist won't tell you to do that. The only advice they are likely to give is advice they are needed to administer.

I could give dozens of examples. Does the Chinese herbalist tell my friend with an infection to eat fermented foods to boost his immune system? No, because that wouldn't involve the herbalist. Instead he prescribes herbs that probably do the same thing. Does a dermatologist tell a teenager that his acne is caused by diet? No, dermatologists make the absurd claim that diet isn't involved. Because if it were you wouldn't need them. You'd just figure out what foods are causing your acne, and avoid those foods. Why do medical schools fail to teach nutrition? Because you don't need a doctor to eat better. Why is prevention almost completely ignored? Because prevention doesn't require any gatekeepers.

The economic term is rent seeking: health care professionals act in ways that require you to pay them. The usual economic examples of rent-seeking cause a kind of overhead you have to pay but the rent-seeking engaged in by the entire health care industry shortens our lives. Simple cheap safe solutions are ignored in favor of expensive and dangerous ones that don't work as well. Our entire health system centers on gatekeeper drugs: drugs that require gatekeepers. The usual name is prescription drugs; their danger is part of their appeal to the doctors that prescribe them. Because it makes the doctor necessary.

EDM (2009-10-03 12:14:51)

I don't agree with the use of the term rent-seeking. The psychiatrist that doesn't recommend sleep to a depressed patient is acting in his own self interest. He doesn't have an incentive to recommend a therapy that will solve the problem without repeat visit. He didn't go to school for god knows how long to tell people to get better sleep. He went to school to make people better through the narrow lens of his specialty. Now, something like the AMA controlling who gets to be a doctor, that is a form of rent seeking. They are the gatekeepers and the member doctors benefit from that constraint on who can practice medicine. -Ed

Anthony (2009-10-03 15:30:12)

Seth, here's a checklist of emotional needs that also might help your friend (or anyone who is depressed). It is useful for people with anxiety or depression (and probably other things): <http://anthny.com/2009/05/16/emotional-needs-fulfilled-contentment-fulfillment-well-being/>

seth (2009-10-03 16:43:33)

EDM, I don't follow your argument. Rent seeking is one way to act in one's self interest. Here's a definition:

rent seeking occurs when an individual, organization or firm seeks to earn income by capturing economic rent through manipulation or exploitation of the economic environment

Psychiatrists earn income by ignoring remedies that don't involve them. I'm assuming that the therapeutic environment (what therapies are available and advertised and advised) and research environment (what research is done) are part of the economic environment. They affect what is and isn't for sale.

EDM (2009-10-03 21:46:10)

Seth, I agree with your greater point. I only quibble with describing it as rent-seeking. Rent-seeking happens by manipulating the political environment outside of normal market competition. I think the distinction I am trying to make is that I believe rent-seeking is active. In this example it would be psychiatrists actively working to marginalize alternative remedies. I don't think the passive, "not looking for" alternatives rises to rent-seeking... -Ed

Nathan Myers (2009-10-03 22:01:20)

EDM is right that we need a correct name for the practice that Seth is describing. "Rent-seeking" isn't it; that's already well defined. There might be a name already, but it doesn't come readily to mind. I recall a story about a free health clinic that moved to the same floor as a legal aid society. They ended up referring a big fraction of their patients to legal aid instead.

seth (2009-10-03 23:15:57)

It's true that the "seeking" in rent-seeking implies activity; whereas the activity I'm talking about appears passive to onlookers. The discouragement of prevention research is subtle.

Nansen (2009-10-05 16:46:47)

In the case of depression, there is a complication to your argument. Sleep problems are seen as a symptom of depression by conventional medical wisdom - just try googling "symptoms of depression". It is unrealistic to expect the typical practitioner to offer treatments that run counter to the conventional wisdom. I use your discovery about early-morning faces every day, and my doctors are amazed at my condition. But they have zero interest in acting as "research doctors" with respect to their other clients. Can you really blame them?

Karina (2009-10-08 18:28:48)

Wow, I couldn't disagree more with the example. And the comment, "The psychiatrist that doesn't recommend sleep to a depressed patient is acting in his own self interest." Yikes. They want to keep their patients depressed?! Why do we have the medical profession in the first place? Do they give just partial chemotherapy to keep the cancer patient from going into remission, too? Having participated in a number of fora for depression/mental illness and having both personal and anecdotal experience with depression, I can say that most mental health practitioners (psychiatrists and psychologists) are deeply

concerned with making their patients well. And that includes inquiring about sleep issues, and educating on sleep hygiene, and (yes) prescribing sleep medications when needed. Some are faster to prescribe medication than others. If your friend was making the unwise step of going to a general practitioner (GP) for depression treatment, then yes, I wouldn't expect them to go through a complete lifestyle assessment. But any mental health professional worth their degree will check crucial things like sleep, relationships, exercise, and alcohol use, both as symptoms and as lifestyle factors that should be addressed as part of treatment. Frankly, demand for mental health services is robust and nobody is worried about "running out of patients", so even if a psychiatrist didn't have simple compassion, there's no reason to drag out treatment. I'm not saying anything about pharmaceutical-pushing/marketing, though; that's a whole other can of worms.

Seth's blog » Blog Archive » How to Eliminate/Prevent a Skin Infection and What It Means (2009-10-11 11:24:27)  
[...] Gatekeeper Drugs. How to Avoid Infection: Something I Didn't Know. [...]

Seth's blog » Blog Archive » How to Eliminate/Prevent a Skin Infection and What It Means (continued) (2009-10-13 13:55:04)  
[...] A brief summary of my previous post is all I needed to do to cure/prevent a skin infection was buy more socks. Instead of buying 5 pairs every 6 months, buy 20 pairs every two years. That's all. Costs nothing. No drugs. No special treatment of the socks. No special cycle on the washing machine. No following a hundred (or ten) instructions about how to avoid infection. Like my depressed friend, I had the reaction: Why didn't my doctor tell me this? He didn't tell me because he didn't know, I realize. Why he didn't know . . . is a harder question. [...]

Seth's blog » Blog Archive » More About Faces and Mood (2009-10-15 07:46:38)  
[...] A friend with bipolar disorder writes: When I wrote in your blog that I use your discovery daily, it means that every day I look in a mirror for an hour, starting at approximately 6:30 a.m. I have the mirror about 20 inches from my face because I have read that a mirror image is half the size of the object reflected. [Life-size faces appear to work best. Using a mirror means the face you see is perfectly life-size, allowing for distance. TV faces can be larger or smaller than life-size.] To keep from being bored while looking at my face in the mirror, I mostly listen to tapes of C-SPAN programs. Sometimes I listen to music. Once or twice a week I may just think, or plan my day. That does get boring after about 30 minutes. [...]

## **Rent Seeking and Our Health-Care System (2009-10-03 16:58)**

Does our health-care system (including researchers) engage in rent-seeking when they ignore simple cheap remedies, including prevention?

Here's a simple example of rent-seeking. Some friends and I went to visit the Great Wall. On the path up to the wall was a man sitting in a chair. He demanded 30 cents to let us pass. There was no gate. He wasn't a government official – just a man and a chair. There was a path to a goal. It was blocked unless we paid.

In the case of health there are many paths to the goal. Many ways to become healthier – many ways to relieve depression, for example. Prevention is one way, cure another. There are cheap cures and expensive cures. By ignoring prevention and cheap cures, the profession of psychiatry is blocking those paths (by failing to clear them) and thereby forcing us to take their expensive path (dangerous drugs), usage of which they control. It's more subtle than the man with the chair but it amounts to the same thing.

Rent-seeking is annoying. I was annoyed by the man in the chair. The rent-seeking of our health-care system is disguised, not easy to make out. This makes it less of a problem for health-care professionals, such as doctors; I think few people are aware of it. (For example, most people with acne don't realize it is probably caused by their food.) But my friend with depression was annoyed, deeply annoyed, when he learned of a simple cheap (partial) solution to his problem.

---

Mary (2009-10-03 17:51:43)

Not ALL psychiatrists are like that. Check out this psychiatrist's blog: <http://www.beforeyoutakethatpill.com/> By the way, this psychiatrist is a professor at Emory, which wasn't very happy about his blog, and tried to make him delete references to the fact that he was affiliated with Emory from his blog. The blogosphere supported him in protesting this muzzling, and Emory relented. He also has a novel in progress about a psychiatrist doing research on the link between accutane (the acne drug) and suicide, which is understandably unpopular with the drug's maker. The psychiatrist-protagonist is based at Emory, where some of his colleagues aren't too happy with the research either. I think you'd find the blog and the novel interesting. Not all psychiatrists think that drugs are the answer to every problem.

seth (2009-10-03 18:27:34)

Thanks, Mary. I like his blog and added it to my blogroll. That's surprising that Emory would try to make him delete references to the fact that he was affiliated with Emory. More bad public relations....

Kevin Miller (2009-10-04 04:59:45)

Good points, although those of us in higher education should probably light the irony lamp when we talk about rent-seeking (not to imply that you aren't aware that we're the poster children of this phenomenon).

## **Beijing Subway Security in Action (2009-10-03 18:12)**

[1]A comment on BoingBoing:

I cannot believe that I am still being asked to take my goddamn shoes off every time I want to go on an airplane, but I am able to board mass transit trains without anyone checking me for explosives at all.

Have I told you about the time I took a cleaver on the Beijing Subway? The Beijing Subway has security: They screen all bags. It started before the Olympics and, after the Olympics ended, kept going.[2] At Wal-Mart, I bought a cleaver/cutting board/chopstick set (enclosed in plastic), put it in my laptop bag, and entered the subway. I was stopped. The cleaver had shown up on the scanner screen. The guard was pleasant and after I showed her what it was I was quickly sent on my way.

1. <http://www.boingboing.net/2009/10/02/olympic-committee-me.html#comment-604153>

## **Hidden Bonus of the L Prize: Better Sleep, Better Mood (2009-10-04 23:55)**

The Department of Energy has a prize, called the L Prize, for a new light bulb that gives off same light as a 60-watt incandescent bulb but uses much less energy. [1]Philips has submitted what it believes will be the winning entry. For 2050

the last decade, I've tried to avoid fluorescent lights at night. Ordinary fluorescent lamps emit light with far more blue than incandescent lamps and mess up my circadian-timing system. That systems appears insensitive to incandescent light. [2]Squirrels are like me, a study suggests.

Fluorescent lights are close enough to sunlight to affect our circadian system; incandescent lights, being much cooler than the sun, are invisible to it. The timing of exposure matters if it varies from day to day; exposure to fluorescent lights at varying times is like travelling back and forth across time zones. Everybody grasps that travelling across time zones makes it hard to sleep at the right time; what is less understood is that time-zone-crossing travel affects the depth of sleep because it reduces the amplitude of the circadian oscillation. If you are exposed to fluorescent lights at night now and then, you will sleep less deeply. So I try hard to avoid fluorescent lights at night. I avoid supermarkets and subways, for example.

I discovered all this when I discovered [3]the effects of morning faces on my mood. After I travelled back and forth across time zones, the effect took three weeks to fully return. Nothing else had changed. I conclude that it took three weeks in the same place for my circadian oscillator to return to maximum amplitude. And one evening in which I was exposed to an hour of fluorescent light was enough to get rid of the faces effect for a few weeks. The ubiquity of fluorescent lighting has made it hard to study this effect in other people.

2. <http://www.nature.com/nature/journal/v308/n5955/pdf/308186a0.pdf>
3. <http://repositories.cdlib.org/postprints/117/>

---

Dennis Mangan (2009-10-05 06:26:07)

Maybe fluorescent lighting is behind some of the dreadful effects on sleep of shift work.

Duncan (2009-10-05 13:17:02)

A couple of links claiming connections between cancers and night-time artificial lighting, presumably by disruption of circadian rhythms: <http://www.sciencedaily.com/releases/2009/02/090203135015.htm> <http://www.rd.com/living-healthy/artificial-light-a-hidden-cancer-risk/article128447.html> (The Science Daily page says that energy-efficient light bulbs are much brighter than incandescent lights. I'm not sure what they mean by that. Obviously they're brighter watt-for-watt, but that's the whole point.) My personal bugbear is bright ceiling lighting. Having something shining intensely down on me from overhead when it's dark outside really unsettles me. That said, I don't think it much affects the amount or quality of sleep I get, but I haven't gathered any halfway decent data to support that claim.

Anthony (2009-10-05 13:34:51)

This is really interesting. I instinctively dislike fluorescent lighting. Now that you mention it, I especially dislike them at night (perhaps because they're more obvious then). Libraries, for example, with their flickering, buzzing lighting, I find horrible. I find I like the 'warmth' of incandescents. This is why the idea of making incandescents illegal makes me angry. I will start up a trade in illegal incandescent lightbulbs before I start using fluorescents (alternately, I would move to candle-light before using fluorescents).

John (2009-10-05 20:01:18)

Hmmm... My flat-screen monitor is internally lit by a fluorescent bulb. I wonder if that is having an effect on my sleep. After all, I'm staring directly at it for an hour or two before bed.

Nicolas (2009-10-16 08:00:00)

My personal researches shows that pc monitors or tv are NOT effects on your sleep. So John is right. Also "..claiming connections between cancers and night-time artificial lighting, presumably by disruption of circadian rhythms.." - it's just a.. mmmm.. errm... it's not true.

James (2009-11-02 19:32:14)

Have you considered trying daylight-spectrum CFLs? Also, talk about burying the lead in that article - the only place early on where it's mentioned the Philips bulb is LED based is in the caption.

## **Probiotic Health Claims Dismissed (2009-10-05 00:26)**

From [1]BBC News:

General health claims for "probiotic" drinks and yogurts have been dismissed by a team of experts from the European Union.

Their opinions will now be voted on by an EU Committee which is drawing up a list of permitted health claims.

Scientists at the European Food Safety Agency (EFSA) looked at 180 health claims for the supplements.

They rejected 10 claims and said a further 170 had not provided enough evidence of their effects.

The manufacturers of best-selling yogurt drinks Actimel and Yakult have submitted claims that will be considered at a later stage.

The difference between "rejecting" a claim and saying "not enough evidence" isn't clear.

## **Slaves of California (2009-10-05 04:06)**

A famous short story by Tama Janowitz, called "[1]The Slaves in New York" (a short-story collection called "Slaves of New York" was made into a movie), was about New York City renters who couldn't afford to move because rents were so high. Whatever their relationship with their roommate, they were stuck.

[Eleanor] lives with her boyfriend Stash in the Village. Stash is a graffiti artist who complains a lot, while Eleanor makes him elaborate meals. One night she goes to a party and meets Mikell, a handsome South African writer. They make a date and meet at the White Horse Tavern. It turns out that Mikell lives with a woman named Millie, who owns a co-op. Millie and Mikell fight as much as Eleanor and Stash do but, because neither can afford their own apartment, they are trapped.

Now, due to the huge decline in house prices, many Californians face a similar slavery. As a friend of mine put it,

Anyone like my parents, who paid cash for their houses, are kinda stuck living where they are, or they'll take a giant financial hit.

1. [http://www.newyorker.com/archive/1984/12/31/1984\\_12\\_31\\_022\\_TNY\\_CARDS\\_000342229](http://www.newyorker.com/archive/1984/12/31/1984_12_31_022_TNY_CARDS_000342229)

---

Anthony (2009-10-05 13:29:24)

"Anyone like my parents, who paid cash for their houses, are kinda stuck living where they are, or they'll take a giant financial hit." I don't understand this. Haven't they \*already\* taken a giant financial hit?

### **China and Tibet: The Other Side (2009-10-05 16:47)**

In my experience, most Americans know little about Tibet but that doesn't prevent some of them from having strong opinions about the Chinese takeover. (A crime against humanity, they say.) At a dinner in Berkeley, I made this point to some friends. One of them asked politely, "What is the other side?" She had no idea what it was.

Yes, Chinese students are brainwashed about this. (When I googled "Tibet slavery" and tried to follow the links, all of sudden nothing worked.) But the smartest among them know more about it than [1]smart American students who have been brainwashed the other way. Here's what one of them told me about the Chinese side of the argument:

1. Before China took over, Tibet was ruled by a religious elite. It is this elite, personified by the Dalai Lama, that now has influential Americans (e.g., Richard Gere, Robert Thurman) on their side. While the elite are incredibly pissed off by the Chinese takeover – just as rich Cubans were by Castro – the rest of the country, having been oppressed by this elite, doesn't agree.
2. Before China took over, there was widespread slavery in Tibet. You could incur a debt that basically made you a slave, it took so long to pay off. Of course this makes a mockery of the Dalai Lama's books. Here are some details:

Until 1959, when the Dalai Lama last presided over Tibet, most of the arable land was still organized into manorial estates worked by serfs. These estates were owned by two social groups: the rich secular land-lords and the rich theocratic lamas. Even a writer sympathetic to the old order allows that "a great deal of real estate belonged to the monasteries, and most of them amassed great riches." Much of the wealth was accumulated "through active participation in trade, commerce, and money lending."

Drepung monastery was one of the biggest landowners in the world, with its 185 manors, 25,000 serfs, 300 great pastures, and 16,000 herdsmen. The wealth of the monasteries rested in the hands of small numbers of high-ranking lamas. Most ordinary monks lived modestly and had no direct access to great wealth. The Dalai Lama himself "lived richly in the 1000-room, 14-story Potala Palace."

Secular leaders also did well. A notable example was the commander-in-chief of the Tibetan army, a member of the Dalai Lama's lay Cabinet, who owned 4,000 square kilometers of land and 3,500 serfs. Old Tibet has been misrepresented by some Western admirers as "a nation that required no police force

because its people voluntarily observed the laws of karma.” In fact, it had a professional army, albeit a small one, that served mainly as a gendarmerie for the landlords to keep order, protect their property, and hunt down runaway serfs.

Runaway serfs. I find these paragraphs vastly more believable than anything I've heard Richard Gere or the Dalai Lama say about the situation. Here's how one Free-Tibeter answers these facts:

The old Tibet was backward in its technological and social systems. Nobody denies this. If, however, you look at the faces of those Tibetans who were born and grew up in that society, you can easily notice their genuine smile. When compared with other communities, the Tibetans were generally quite peaceful and warm-hearted. If they were really as cruel as the Chinese claim, then I think the people who were born and grew up under those circumstances would be different. The people living at the time were happier and calmer than the people in this new generation. At that time, unfortunately, there were people who were used by the landlords. Now the whole nation has become a slave.

3. Tsinghua students sometimes volunteer to work in Tibet as teachers for a year. They teach primary school. The education system in Tibet is very poor; there is a shortage of good teachers.

I don't have an opinion about this. It is the invisibility of gaps in knowledge that interests me here, the way smart Americans don't realize they've been brainwashed.

1. <http://www.blog.sethroberts.net/2008/12/10/when-is-science-helpful/>

---

Jeff (2009-10-05 17:21:59)

I guess what's frustrating is how invisibility of gaps of knowledge are somehow accepted in some topics, but not in others. I'm a scientist whose colleagues take great joy in pointing out gaps in knowledge in, say, anti-evolutionists, or the anti-vaccine people, or whatever. But they disregard their own gaps in knowledge when they have a knee-jerk response against, say, the field of parapsychology – something I don't have much of an opinion for either way, but which, whether we like it or not, has produced interesting and statistically significant data. In terms of scientists, I prefer thinkers like Richard Feynman (recognized his own gaps in knowledge), and less like James Watson (dogmatically Newtonian). I know this post was about Tibet, but the fundamental problem (invisibility in gaps in knowledge) is epidemic in my line of scientific work, though probably much less so than in something like politics! :)

seth (2009-10-05 19:35:01)

the following comment was accidentally deleted by me: Awesome post!

NM4 (2009-10-05 20:14:14)

There are many gaps in my knowledge of Tibetan Buddhism and the Dalai Lama, but I do believe that the historical Buddha himself was one of the great self-experimenting psychologists in history.

Nathan Myers (2009-10-05 20:44:27)

It seems important to mention here the million Tibetans killed by the Chinese. On the subject of gaps, we have the infamous Rumsfeld quote,

... as we know, there are known knowns; there are things we know we know. We also know there are known unknowns; that is to say we know there are some things we do not know. But there are also unknown unknowns – the ones we don't know we don't know.

How differently things might have gone if he had been inclined to acknowledge the things we think we know that are not, in fact, so.

Gian (2009-10-06 02:09:37)

I suppose social evils existed in China as well (and still exist). So I guess it is OK for US to annex China forcibly. Also it is not simply that China annexed Tibet but Maoist China did so. Maoist are a murderous nation-wrecking gang– they did wreck Old China pretty thoroughly.

seth (2009-10-06 05:47:28)

Gian, what do you think about the U.S. Civil War? Let me repeat I don't have an opinion about the China/Tibet stuff. I'm not saying what China did was okay; I'm not saying it was not okay.

MT (2009-10-06 13:49:55)

I encountered a similar example of misconceptions about how idealistic Tibet was when I was in Nepal at a Tibetan Buddhist monastery. Speaking of the crimes perpetrated by the Chinese, one of the monks described how extensive logging had destroyed the watershed, with repercussions for Nepal where water levels were lower as runoff was no longer captured by the forest. I later read Heinrich Harrer's "Seven Years in Tibet" (a great book) written well before the Chinese invasion where he described the extensive clear-cutting he witnessed in Tibet. This was when the current Dalai Lama was still a youth. Similarly, he describes a rigidly stratified society obsessed with social status, which is in stark contrast to Buddhist teachings and reveals how powerful Thorstein Veblen's insights were. The world is too complex for certainty so we need to act without definitive knowledge. This is generally adaptive as it creates behaviours which, while often reprehensible, are successful – such as the tendency to support in-group behaviours regardless of their hypocrisy. For all people in at least some settings cognition is shaped more by the physiology of emotion than by reason. And for many of us, cognition is almost exclusively a by-product of emotional responses.

Chris (2009-10-06 17:56:35)

Intention plays a part too. The Tibet rationalization is almost like saying there was a little boy who loved his puppy so much that he dedicated his life to his puppy always tending to it's every need. But the boy was allergic to the puppy and it caused him some nasty symptoms. So when mom killed the puppy after it walked on her garden she freed her son from allergies and enslavement from the puppy. The outcome may be better but it's still reprehensible. If china was run by the nationalists instead of the communists like Taiwan was the Chinese people would probably be even better off. And of course nobody can say that Tibet would have maintained it's social structure.

thehova (2009-10-06 23:51:09)

Obama took the wise but unpopular decision to not meet with the Dalai Lama. <http://tinyurl.com/ya376c9> It should help relations between China and the US. The Tibetan love in the US gets ridiculous.

milieu (2009-10-07 04:46:20)

I am not an American but I do believe that what is being done in Tibet is worth publicizing. I don't believe that Tibet was a paradise before which was taken over by China and converted into a colony. The Tibetans have got benefits too, but the question is should they be prevented from voicing the genuine grievances they have. I believe that there are some physical and cultural constraints which will not allow Tibet to be sinified that quickly. And until that happens there will be vocal opposition from Tibetans inside and outside. Just writing to emphasize that there is a tragedy underneath which might be responsible for all the media hype in America.

MT (2009-10-07 10:37:07)

In case my above comments regarding hypocrisy within Tibetan Buddhist practices be misinterpreted I do consider the Chinese to have unjustly invaded a sovereign nation and to be an occupying force. Given the geopolitics, I never expect this situation to be resolved in favour of the Tibetans, but I do think that the world should continue to support the Tibetan people and the Dalai Lama, their exiled political and spiritual leader, including through meetings with the highest political leaders such as Obama. This opinion is formed recognizing the shortcomings of both sides, familiarity with the historical arguments advanced, firsthand conversations with Tibetans and Chinese, and a willingness to support whichever position seems stronger or to hold no opinion if there is insufficient evidence. Most people whom I've spoken to that hold opinions on this subject – including Chinese, Tibetans, Americans, etc – hold those opinions with one or more biases, as Seth has described.

Gian (2009-10-08 00:36:54)

I am surprised that people that are so loud over US invasion of Iraq see nothing objectionable in Chinese invasion and consequent murder of a million Tibetans plus cultural devastation. What if there were even a thousand social wrongs in Tibet. Who says Tibet was a paradise, but they were a free people and now they are not.

contemplationist (2009-10-14 23:38:13)

Here is my argument. Assume all of that is true. What was happening in China in 1959? Anyone remember Mao? Cultural Revolution? Giant Leap Forward? The great flaw of the Chinese propaganda is to compare pre-invasion Tibetan conditions to PRESENT Chinese conditions as opposed to those 50 years ago with all those horrors yet to come, which would make a mockery of their comparison. One need posit only one counterfactual hypothetical. Assuming the absence of the Chinese invasion, would Tibet have moved gradually towards a more 'modern' system of governance? Or at least reduction of those artifacts of extreme feudalism? If your answer is no, then you have to balance the utility of those laboring under that backward feudal system to the hundreds of thousands killed raped and maimed in the invasion and living under communist repression till mild liberalisation + utility added by the better living standards of today's Tibet. THAT is the relevant comparison. I'm not convinced that those comparisons turn out favorable to China.

Barbara (2009-12-09 04:14:16)

altho you make some interesting points, I believe you are missing the MAIN point. You speak about apples and oranges! Whatever Tibet was like in the past, has no bearing on China taking Tibet over. No nation should take over another nation. If Tibet had internal problems, then Tibet needed to solve those problems. Internal problems do not get solved from without!

seth (2009-12-09 06:29:35)

"No nation should take over another nation." Tell that to the slaves who were freed.

Joe A (2010-12-21 18:30:23)

Super interesting, I had no idea about this, although I shouldve come to the conclusion that a beautiful giant palace couldnt have been built without some form of slave labor. this seems to be a common theme b/t religions (at least christianity and tibetan buddhism)

### **"Very Happy" (2009-10-05 22:43)**

[1]To see faces early in the morning, I have a one-hour Chinese lesson every day at 6 a.m. Today my teacher said, "I feel very happy."

"Why?" I asked.

"I don't know," she said.

"It's because you see my face every morning," I said.

"No, it isn't that," she said.

1. <http://repositories.cdlib.org/postprints/117/>

---

Nansen (2009-10-07 16:28:30)

Have you found that the effect on your mood is different when you see another's face, compared to when you see your mirror-image?

seth (2009-10-07 17:21:56)

No I haven't found a difference.

Dean (2009-12-28 22:46:20)

Another type of self-experiment available is working with one's hands to lessen depression. Kelly Lambert talks about this in her book *Lifting Depression*. A personal example for her is that vacuuming helped resolve her depression. She cites many cultures that work a lot with their hands, for example the Amish, that have much lower incidences of depression. I have never knit before, but today I went to a yarn store and bought knitting needles and yarn to make a scarf. I plan to track the hours I spend knitting and any change in mood.

### **Instant Willpower (2009-10-07 05:03)**

From [1]a review of The Shangri-La Diet:

Seth Roberts, the diet founder and book author, attempts to explain the science behind how this works, but I won't even begin to try to explain it here. I will admit that it is both counterintuitive and at times seems contradictory, but since there was little risk involved I was willing to give it a try.

I was nervous to add the calories into my diet (approximately 120 per tablespoon of olive oil), when all my life experience told me that I should be cutting fat and calories. However, I have only been following the plan for about a week and am amazed at the results. After just one day it was like having instant willpower.

1. <http://www.helium.com/items/1607887-what-is-the-shangri-la-diet>

### **Yogurt-Making Results (2009-10-07 05:40)**

I've been steadily using [1]my new yogurt maker. It's like a microscope: I can see things I never saw before. I started with the recommended fermentation time: 12 hours. Then I did batches at 16, 20, 24, and 28 hours. The yogurt grew

steadily more sour. The increase was remarkably clear. I am unable to find this crucial info anywhere on the web – that 28 hours produces more sour yogurt than 24 hours, etc. By making my yogurt much more sour than commercial yogurt I'm getting a lot more of the crucial ingredient (bacteria).

The results are so clear, I think, because I'm starting with a hyper-pasteurized product (which can be stored at room temperature) and the yogurt maker holds the fermentation temperature very constant. Constancy of temperature means constancy of selection means greater population. (The theory behind the Shangri-La Diet says the main reason for the obesity epidemic is that we're eating food with exactly the same flavor from one instance to the next – from one can of Coke to the next, for example.) If the temperature is 120 there is selection for bacteria that grow best at 120; if the temperature goes down to 110 many of those bacteria die and are replaced by bacteria that grow best at 110. If the temperature goes back up to 120, those bacteria die . . . and so on. More temperature variation means more diversity of bacteria but less number of bacteria. I'll get my diversity of bacteria elsewhere – from kombucha, say.

I suspect that commercial yogurt makers are time-limited. If they fermented twice as long they could only make half as much. The average yogurt buyer has no idea that more sour = more healthy, so they couldn't charge more.

Although the yogurt maker's box shows the machine set to 32 hours, the actual maximum time is 24 hours. To get 28 hours I reset it during the process.

The official website of the National Yogurt Association, [2]aboutyogurt.com, contains nothing about how to make yogurt.

The [3]Salton Yogurt Maker might be the best yogurt maker available in America. I can't tell if you have to preheat the milk – the worst part.

More Does more sour = more healthy? I agree with the two commenters who suggest that the number of live bacteria probably goes down after a certain point as the mixture becomes more acidic. The number of live+dead bacteria, however, probably continues to increase. My guess is that the total live+dead is maximized when the yogurt is most sour; the number of live bacteria is maximum around the time that the acidity is most quickly increasing, somewhere in the middle. I think the digestive benefits come only from live bacteria but that the immunostimulatory benefits come from both live and dead bacteria. I find it hard to believe that the immune system can tell whether bacteria it encounters are alive or dead.

---

Eric (2009-10-07 05:54:25)

"the average yogurt buyer has no idea that more sour=more healthy..." I don't quite see how you know this either. There seem to be too many variables involved to really draw much of a conclusion (i.e. does it really matter how many individual bacteria you eat, is the sourness/bacteria count correlation always positive, is there more than one or two species of bacteria capable of surviving in yogurt culture with *L. acidophilus*, etc)

seth (2009-10-07 06:14:55)

My basis for my belief that more sour = more healthy is that more sour = more bacteria (the bacteria multiply) and more bacteria = more healthy. The second conclusion I base on all the evidence for the umami hypothesis – see all those posts for the data. It's true I can't make a dose-response function; at some point more bacteria won't do any more good. But I truly doubt that a single serving of weak yogurt (= commercial yogurt) is optimal.

Eric (2009-10-07 06:28:03)

im not so sure that more sour = more bacteria forever. more alcohol doesnt equal more yeast, for a counterexample.

Kevin Miller (2009-10-07 07:19:52)

We have one of these yogurt makers and found it works great with a round 2-quart (I think) plastic container of the kind sold for use with frozen juice. We don't preheat the milk, although we use powdered milk and use warm water to reconstitute it. The recipe couldn't be simpler – fill the container halfway with milk powder, fill up the rest with water (you need to add some water, and then whisk it around to mix it up, add 1/4 cup of the last batch of yogurt, mix it around as best you can with a whisk, and then leave it all day or over night. If only you could readily get powdered whole milk in the U.S. (you can buy some imported from Mexico, but it's expensive), it would be the perfect way to make yogurt. On the sourness issue, I note the increasingly prevalence of "tart" frozen yogurt places in my college town. Perhaps it's a sign of changing tastes (or, more cynically, perhaps it's a way to allow people to add more sugar without noticing).

josh (2009-10-07 08:40:15)

I've also been making my own yogurt lately, and I ferment for at least 24 hours due to my lactose intolerance. When I try to use that yogurt as a starter for the next batch, however, the results are not good. Instead, I pull some of the yogurt out after 6-12 hours and save that as a starter for the next batch. I think the problem might be that the lactic acid that makes the yogurt more sour might also kill off bacteria at some point. In any case, if my yogurt fermented for 24 hours had more bacteria than yogurt fermented for 6, wouldn't it be at least as good as a starter?

SB (2009-10-07 08:54:29)

<http://ezinearticles.com/?Instructions-For-Salton-Yogurt-Maker&id=1192702> Instructions for the Salton yogurt maker. You do have to preheat the milk. It also says "allow the yogurt to incubate 6-12 hours. The longer it is heated, the more tart the taste".

Jim Breed (2009-10-07 09:05:11)

<http://www.williams-sonoma.com/products/e096/index.cfm> # I got one of these yogurt makers from Williams-Sonoma for Father's day. I preheat the milk to 180, put in some powdered milk, add some yogurt for starter, and 10 hours later I have 7 6 oz containers ready for the fridge. My best results are with Whole Foods low fat organic yogurt for starter and organic whole milk for my milk. The best batch so far used a gradual cooling from the 180 heat cycle and a 10 hour cycle. The result was very smooth, very sour yogurt. Previous efforts at an ice bath to quickly cool the mix and 12 hour cycle yielded yogurt that felt grittier on my tongue but not as sour. YMMV, Jim Breed

Ashish M (2009-10-07 10:12:20)

It should really be called the "National Association of Industrial Yogurt Manufacturers."

Matt Goff (2009-10-07 12:24:49)

The salton maker I used (which looks like the one in the link) was basically an incubator that maintained a constant temperature, so all the prep work of getting the yogurt started had to be done. I found it frustrating to only do one quart at a time, so I gave the maker away and use a large canning pan where I can have several quart jars going at the same time in a water bath. I've found that having a small burner set on medium-low maintains the temperature at a constant 110 or so (at least for the depth of water bath I tend to use), and I typically let that go for 24+ hours (I prefer a more sour taste apart from whether it confers additional health benefits or not). Having two kids and using the yogurt to make yogurt cheese (which I use in ways not unlike cream cheese), it's pretty easy to go through a quart a day (which clearly doesn't work so well one quart at a time).

Vlemmix (2009-10-07 12:50:56)

I make yoghurt myself a couple of times last months. Did not use a yoghurt maker, but the oven in my home. Taste was a bit different each time, and it tends to become better after a few days. Even used the sun's heat last summer, but temperature was still to low to turn the milk into yoghurt in a day, the taste wasn't right. I just kept the milk/yoghurt in the fridge, and somethink like 5-6 days later the taste was good! I'm not making my own yoghurt right now. It's a bit of a hassle and keeping the oven on all-night, nah. I could buy a yoghurt maker, but I'm now buying yoghurt from a smaller-scale company located in a small town in The Netherlands with some 400 residents. They ferment the "real farmers' yoghurt" for 18 hours. The yoghurt is quite thick compared with the normal yoghurt you can find in the stores and the taste is very nice, close to what I made myself a couple of times.

Charles (2009-10-07 20:05:27)

I've made yogurt before, but I really didn't want the hassle of yogurt with all the worrying about temperature, so I started making KEIFER. Much simpler. I just put some of the kefir "grains" (they look like cottage cheese) into a mason jar with some milk, put a loose cover on, and stick it in a cupboard for 2-3 days. I don't have to worry about temperature or anything else. Warmer is better, but it's not critical either way. And the longer you leave it, the more fermentation happens, so time is not an issue. The research I've done indicated that it actually has more kinds of bacteria than yogurt, though I wouldn't bet the farm on that. Here's a brief discussion of that which echoes other sources: <http://www.kefir.net/kefiryogurt.htm> You can have a couple going if you want, but I use a quart-sized mason jar, and that works out perfectly for me. And the grains/starter just keep growing and multiplying, so you can give the extra away, or just toss it. I've been making kefir from the original batch of grains for almost 6 months now. Apparently, they pretty much last forever. I got on to this whole bacteria kick from you, Seth, so I appreciate you continuing to discuss this.

seth (2009-10-08 02:43:07)

I tried making kefir. It was too hard to get the grains. And they didn't seem to multiply as they are supposed to. In Beijing it would be even harder to get kefir grains than in Berkeley. I'll just say yogurt = kefir for dummies.

mike (2009-10-08 19:44:45)

Seth, This year I cured my seasonal allergies thanks to yogurt, which I started eating regularly due to following this blog. I use a yogurt maker that was sitting in my in-laws attic, unused. Very easy: I just mix two tablespoons of yogurt and a half gallon of milk. The machine only goes for 8 hours (the instructions say it's done then), but I run it a few times, between 24 - 36 hours - less than 24 results in noticeably less sour yogurt. For the past 3 years or so, a co-worker and I would suffer spring allergies together. We seemed to be allergic to the same thing, bc we'd start and stop at the same times. This year, we both got whacked hard late April. Desperate, I started eating yogurt (breyers mostly, some danactive and stonyfield) every day, sometimes twice, after reading your blog and doing some research. About 8 - 10 days later, I noticed I had no symptoms. My friend had light symptoms, so I thought maybe it was just a lull. Then about 2 weeks later, my friend got pummeled by allergies again, very badly; he could hardly work. I had NO symptoms. I didn't even realize it was a bad day for allergies until he showed up to work. I haven't had any allergies since. So now I make my own yogurt, to save money, and bc it's so easy. Next, I'm trying to do sourdough bread, but the starter is taking me a while to get going. Thanks for your blog and sharing your personal results! Mike

Seth's blog » Blog Archive » Yogurt and Seasonal Allergies (2009-10-08 23:53:09)

seth (2009-10-08 23:54:36)

you're welcome. thanks for letting me know about this.

Charles (2009-10-09 02:01:20)

"Iâ€™ll just say yogurt = kefir for dummies" I had to read that a couple of times until I was sure I wasn't being insulted. Funny! But I think it's the other way around. I hate having to deal with temperature issues, and having another electrical appliance. When you get back to the states, email me, and I'll send you some grains. Mine multiply like crazy, and I end up throwing them away. Starting out with good grains is definitely the key, and the ones I have are prolific. They have essentially doubled every 3 or so batches.

seth (2009-10-09 07:18:35)

Charles, thanks for your offer of kefir grains. I'll take you up on it so long as I can remember. I think yogurt may be the most popular fermented food – leaving aside beer and wine – just because it can be made the fastest. I would like more variety in the fermented food I eat.

Hallucinogen (2012-04-02 16:28:28)

Listen listen guys ! You got the right idea that sourer is better, and then it hits a plateau where and when it becomes too acidic for the bacteria that make lactic acid to continue to be able to survive in the pH, OR they simply consume all the food available to make lactic acid and then when they run out of food and there is most lactic acid around, = sourer, then they stop feeding and slowly die off, the lactic acid however remains behind, but it slowly dissipates, because it's probably buffered by something else in it like calcium, then it gradually becomes less and less sour, allowing pathogenic bacteria to multiply more easily... So to simply put, it's true, - wait for your yogurt to get quite sour, but don't wait for more than 24-32 hours per batch, Lactic Acid is one of the most amazing molecules in our body, - it provides DiRECT energy to the neurons in our brain, after it's converted from glucose ( wikipedia ) So that's another main reason why sour is healthy, just make sure it's lactic acid and not acetic acid ( you can taste the difference ! (: ENJOY ! - For Your Health . Seth: yes, 24-32 hours/batch is a good length of time, based on my experience. The yogurt gets more sour up to about 30 hours, then doesn't get any more sour.

## **Modern Biology = Cargo-Cult Science? (2009-10-08 01:36)**

At first I thought the title of [1]this article was "Taking Back The Nobel Prizes". My eyes widened. Someone at the New York Times has a radical thought, it appeared. I was wrong. The title is "Taking Back Nobel Prizes"; the article is about the less-than-radical idea that Henry Kissinger did not deserve a Peace Prize. Then I thought it was too bad that Richard Feynman isn't alive. If he were, I would ask him if modern biology – the sort that wins Nobel Prizes – is an example of what he called cargo-cult science in [2]a famous graduation speech. I would be a good person to ask that question, I thought, because he considered rat psychology cargo-cult science. Yet I used rat psychology to come up with the Shangri-La Diet, which has helped many people lose weight in counter-intuitive ways.

Cargo-cult science, according to Feynman, was activities that have the superficial trappings of science but don't actually accomplish anything. You do all the right things, or so you think, but the planes don't land. The sort of biology that wins Nobel Prizes has a long history of this. This year's prize went to research that found that telomeres shorten with age. [3]The press release, forced to say how this is useful (the Nobel Prize is supposed to be for research that benefits mankind), says

These discoveries had a major impact within the scientific community. Many scientists speculated that

telomere shortening could be the reason for ageing, not only in the individual cells but also in the organism as a whole. But the ageing process has turned out to be complex [shocking!] . . . Research in this area remains intense.

. . . It was therefore proposed that cancer might be treated by eradicating telomerase. Several studies are underway in this area, including clinical trials evaluating vaccines directed against cells with elevated telomerase activity.

Some inherited diseases are now known to be caused by telomerase defects, including certain forms of congenital aplastic anemia, in which insufficient cell divisions in the stem cells of the bone marrow lead to severe anemia. Certain inherited diseases of the skin and the lungs are also caused by telomerase defects.

In conclusion, the discoveries by Blackburn, Greider and Szostak have added a new dimension to our understanding of the cell, shed light on disease mechanisms, and stimulated the development of potential new therapies.

Shameless. Note the utter absence of even one disease in one person cured or prevented. Not one. And this is supposed to be the most beneficial discovery in medicine. It's the top prize in medicine and biology! Last year the prize was given for HIV. Do we have an HIV vaccine? No. The year before that, HPV. Do we have an HPV vaccine? No. A few years before that, the discovery that a certain bug "causes" stomach ulcers – the award that showed that the medical community and the Nobel Prize committee have [4] a weak grasp of the concept of causality. The biologists think they do everything right – but the planes don't land. The biologists who do this research aren't able to solve actual problems. (Some people do – those who discovered that smoking causes cancer, for example – but they don't get Nobel Prizes.) Could something important be missing from their view of the world? I think so.

Cargo-cult activities aren't worthless, so long as you learn from your mistakes. The cargo cultists could see that the planes didn't land and eventually figure out that something was missing. That's actual knowledge, humble but useful. Feynman's criticisms of rat psychology were reasonable. Those doing rat psychology learned from their mistakes, I think, and eventually the field improved and produced the research behind the Shangri-La Diet. Modern biology isn't worthless, just as cargo cults aren't worthless. Obviously "useless" knowledge can eventually become useful, as has happened many times. But these overblown claims for the value of modern biology truly cost the rest of us – a great deal, I believe. Because the first step in getting somewhere, as Feynman liked to say, is to confront reality. At least in their public statements about the value of their research, modern biologists are living in a dream world. It's always "potential" this and "future" that and "insight into disease mechanisms" – without ever curing or preventing a disease.

Thanks to Eric Meltzer.

---

Eric (2009-10-08 05:44:22)

Err, I still don't really agree with this account of things. I don't think you can say something is missing from the worldview of people doing fundamental research because you don't like how the prize is handed out—rather, you should talk about the

worldview of the prize-critters.

NE1 (2009-10-08 07:18:57)

So... you think they're doing something wrong and need to see the error of their ways? This rant is bizarre. Diseases can't be cured with the current science. Antibiotics don't defeat HIV, chemotherapy doesn't eliminate cancer. If there is to be any chance of defeating these ailments, we must know the science of why they persist. Since these scientists have worked hard and rather successfully to investigate the pathways involved in runaway tumor growth, we now have a few possible ways to address cancer.

Peter (2009-10-08 08:39:18)

Isn't Gardasil an HPV vaccine?

rich (2009-10-08 08:44:59)

So for the record: there IS an HPV vaccine and the stunning decrease in cervical cancer deaths due to the recognition of cervical cancer as a disease with an infectious origin is one of the greatest public health achievements of the last 25 years. You're simply way off base on this one. I'd love to have seen some of the public health people involved get credit, but, whatever, discovering HPV causes cervical cancer was really important. Additionally, while no vaccine is available for HIV (or not, depending on the results of the vaccine in Thailand) discovery of the virus was necessary to find therapeutic treatments that have lengthened the lifespan of survivors exponentially.

vish (2009-10-08 14:52:02)

Seth, you hate modern medicine, but biology has nothing to do with medicine's failings. You're just wrong here. Its like blaming particle physicists for the fact that we dont have flying cars yet.

Jeff (2009-10-08 15:24:41)

At least it's not as ridiculous as the Nobel prize in economics.

Nathan Myers (2009-10-08 16:27:33)

The biologists I know are excellent scientists. No offense intended, but your own grasp of causality is nothing to write home about. You're fortunate to have other, sterling, qualities that make up for it.

seth (2009-10-08 18:08:46)

Nathan, your 'excellent scientist' friends – how do they explain the fact that this year's Nobel Prize in Medicine was given for research that has had no clear practical application? Vish, I disagree that there is no connection. Modern biologists seem to believe (at least in their public statements) that their research will lead to cures for this and that. They reinforce a medical system focussed on cure rather than prevention. Rich and Peter, thanks for the correction. I will look into it. Apparently I was wrong about the HPV research. But there are a lot of other examples I could give, such as the claim that oncogenes cause cancer. Many years later, this idea has yet to have practical benefits. Cancer, heart disease, diabetes, obesity, depression, stroke, schizophrenia – where is the Nobel-Prize-winning research that has led to a reduction in how much we suffer from these problems? The discovery of insulin was long ago. NE1, "if there is any chance of curing these problems, we must know the science of why they persist." In fact, scurvy was cured without any detailed understanding of its mechanisms. The discovery that smoking caused lung cancer didn't require a detailed understanding of lung cancer. The discovery that folate reduces birth defects was made without any detailed understanding of how birth defects arise.

Nathan Myers (2009-10-08 18:35:08)

The biologists I know stand no chance of getting a Nobel, howsoever good their science, because there's no Nobel for biology. It's for medicine. Your beef is with followers of "medical science", not biology. It would probably be easy to get agreement even from the Nobel committee members that the institutional biases of the "medical science" community are very much for expensive treatments, with little interest in systemic or cultural causation. We are lucky they don't just award the prize for actual pills.

seth (2009-10-08 19:02:59)

Nathan, the work that got this year's Nobel Prize in Medicine and Physiology is usually called biology, not medicine. I'm sure that David Baltimore considers himself a biologist, not a medical researcher. Sometimes the prize is given for medicine rather than biology, that's true. Certainly the CAT scan wasn't biology.

Nathan Myers (2009-10-08 20:12:05)

I agree that the prize was awarded for biochemical work, and that the committee was probably stretching its charter. That doesn't make the work "cargo cult science": we really did learn important details about how cells work. It just wasn't, strictly, "medicine". People who develop cures for diseases aren't scientists, they're engineers. People who treat patients aren't scientists, they're technicians. It's customary to look down on engineers and technicians, and resist calling high-status physicians that, but it's just snobbishness. Much of the body of scientific knowledge originates in the work of technicians and engineers, usually without proper credit, and much of the social good that people trained to be scientists do isn't really science at all. To say something is cargo cult science is to say people do the things they see scientists doings – getting grants, publishing papers – but we don't learn anything. The most visible current example is String Theory. Much of cosmology qualifies.

seth (2009-10-08 23:42:39)

"People who develop cures for diseases aren't scientists, they're engineers." That's an interesting idea. Obviously the person who invented the laser printer was an engineer rather than a scientist. In the life sciences I think it is more complicated. What about those who develop prevention – scientists or engineers? And what about me? I developed the Shangri-La Diet. It was based on a new theory of weight control. Surely my new theory was science. And then I went further and used my new theory to develop new weight-loss methods, playing engineer, you would say. But at least my theory had a concrete practical application. My criteria for "real science" is higher than what Feynman was talking about, true – higher than "publishing papers" and "learning something". My criteria is: solve everyday problems.

Eric (2009-10-09 00:48:51)

I think your criteria is so different than most people's as to be worth defining at the outset of your argument. It seems to me you have a really good point in "it is a Good Thing to create new techniques for ameliorating human suffering" and the point is well supported by the examples of scurvy and smoking. Why not just make that argument, instead of saying do this stuff instead of doing basic, not immediately useful research? I don't see how they are mutually exclusive at all–the argument then is that the nobel prize committee (and the world at large) should start giving this sort of practical pursuit more prestige.

Nathan Myers (2009-10-09 01:58:38)

Solving everyday problems is technical work. Inventing solutions that can be applied by anybody who learns them to solve everyday problems is engineering. Science is something that has only a glancing connection with problems. Doing engineering is the most reliable source of insights that lead to scientific theories, just as doing technical work is the most reliable source of insights that lead to sound engineering solutions. Scientists like to pretend the flow runs the other way.

Tom (2009-10-09 15:13:55)

@Nathan Myers Thanks for two of the most thought-provoking paragraphs I've ever read.

---

solon (2009-10-11 11:45:57)

A few years ago, I was diagnosed with irritable bowel syndrome. I didn't have symptoms constantly, but when they did occur—maybe every 3-4 weeks—it was terrible. About six months ago I started eating yogurt every day. I also eat Indian food 2-3 times a week with large amounts of raita. Raita is more sour than typical commercial yogurt, so I assume it has more bacteria. I haven't had any IBS symptoms since I started the fermented foods.

Libby (2009-10-13 20:42:57)

I have a question about cooking with fermented food. My husband and I have developed an appetite for umami, and we often use fermented foods to flavor our cooking - kim-chi in a stir-fry, fermented tofu in scrambled eggs, etc. It tastes great, but it must kill off most of the bacteria, right? Are we reaping any benefit (besides gustatory) from eating cooked/dead bacteria? Thanks for a great blog!

seth (2009-10-13 20:49:40)

I think dead bacteria stimulate the immune system. I can't think of any reason they wouldn't and lots of dead stuff improves immune function (e.g., hormesis). Unlike live bacteria, dead bacteria don't improve digestion.

## Book Recommendations: Hedges, Yes, Dalai Lama, No (2009-10-09 18:23)

Thumbs up: Chris Hedges, [1]Empire of Illusion. Hedges writes about how Americans are delusional in their beliefs about how wonderful their country is and how rich and powerful they are. One of his targets is academia, which he says turns out graduates who are far too respectful of authority. (He doesn't mention molecular biologists, but [2]they're another example.)

Thumbs down: His Holiness the Dalai Lama and Howard Cutler, [3]The Art of Happiness in a Troubled World. Two words: [4]runaway serfs.

---

Jeff (2009-10-09 18:47:16)

I have a lot of respect for the Dalai Lama, have even had a conversation with him in a private audience. I like a lot of his ideas, but I think a lot of the nuances and subtleties are lost in translation. As a result, his messages often feel watered down and simplistic. With that said, I remember reading the Art of Happiness. I kept thinking to myself, "won't this psychologist just shut the hell up?" (The book was written by the psychologist Howard Cutler, though half the text is quotations from the DL from a series of private conversations between the two—nevertheless, Cutler is barely a scientist, certainly no philosopher, and has no sense of artful subtlety). Thumbs down indeed.

MT (2009-10-09 19:34:34)

The post you direct to in giving thumbs down to the book "The Art of Happiness" does not offer an explanation of what you find wrong with the content of the book – can you clarify what you intended with this post? Why are you giving the book a thumbs down and why the cryptic reference to an earlier post, which seems to be a critique of people making judgments about situations they are poorly informed (or misinformed) on?

seth (2009-10-09 23:14:50)

MT, the Dalai Lama – in pre-Chinese-takeover Tibet – was at the top of a system that rested on a great deal of human slavery. For someone like that to be telling the rest of us how to be happy or anything else (except how to be good at public relations) is absurd. Regardless of what that advice is. Jeff, thanks for your comment. I never read The Art of Happiness but I heard other people talk about it. When you know the Dalai Lama's slave-holding past one quote I heard – "you choose your own happiness" – has a very unpleasant tinge to it. As if his slaves chose to be slaves.

Chris (2009-10-10 05:02:33)

Seth Roberts. Culturally revolutionized. The dalai lama inherited his societal system when he was a kid. He didn't create it for his people. Buddhism teaches that freedom is in the mind. There are plenty of people in the world that are slaves to debt, their families, their jobs, their governments, the weather, their mothers, ther wives, their schools, etc. The quesion is what you do in those circumstances. And the commnists were more likely to round you up and kill you.

seth (2009-10-10 06:49:20)

What does thinking slavery is awful – and indefensible – have to do with the Cultural Revolution? "He didn't create it for his people." True. What did he do to get rid of it?

david (2009-10-10 10:38:33)

Seth, I don't know the details of the issue, but you sound like a propagandist (i.e. as opposed to an informed person giving a balanced opinion).

MT (2009-10-10 13:28:08)

It is no better to pillory the Dalai Lama without knowing his record, simply to feel subversive, than it is to laud him without knowing his record. Both are misplaced expressions of moral superiority. Your position seems to be that Tibet=Slavery=Evil=Dalai Lama. This is fallacious reasoning. The feudal history of Tibet does not justify the blanket condemnation of the Dalai Lama, and it is disingenuous to try to equate him with slavery – he is on public record denouncing Tibet's feudal history, denouncing slavery, supporting human rights, etc. Among the considerations you ignore in arriving at your judgment are what his thoughts on this subject were at the time he held power - did he support or approve of this system? Did he try to change it? Were

there constraints on his power or was it unlimited? Even if he supported those traditions at the time (and please provide evidence for it if you have it) does that mean he supports them now? He was told he had divine right to rule Tibet since he was four years old – yet he advocates for democracy in Tibet and elsewhere. That suggests as much intellectual independence from his culture as Weston Price had for American nutritional culture - they both rejected the traditions they were raised in. Your criticism is conflating the flaws of historical Tibet and flaws of poorly informed pro-Tibet spokespeople with personal shortcomings of the Dalai Lama. They are not the same thing. A litany of the horrors of Tibet by Michael Parenti can be found here: <http://www.michaelparenti.org/Tibet.html> Hitchens' critiques (also critiquable) of the Dalai Lama are here: [http://en.wikipedia.org/wiki/Christopher\\_Hitchens'\\_critiques\\_of\\_specific\\_individuals#Tenzin\\_Gyatso.2C\\_the\\_14th\\_Dalai\\_Lama](http://en.wikipedia.org/wiki/Christopher_Hitchens'_critiques_of_specific_individuals#Tenzin_Gyatso.2C_the_14th_Dalai_Lama) The Dalai Lama has recognised the horrors of Tibet's past and condemned them, acknowledged the hypocrisy in some of those who claim to be Buddhist, and works tirelessly to champion compassion and human rights in his contemporary work. He is not perfect, but on balance he is trying to improve the world and deserves his reputation as a moral authority more than most public figures.

seth (2009-10-10 16:51:17)

MT, you ask: What were his thoughts when he was in power? Thoughts? I'd like to know what his actions were. To be anti-slavery now costs him nothing. He had ten years in power when he could have done something about it, as far as I can tell. What did he do? How many slaves did he free? As far as I can tell, the answers are: Nothing and Zero. Because I am in China, it isn't easy to research this. If I am missing something, please let me know. To be fair to the Dalai Lama, he is merely the personification of a system much larger than him. He didn't invent what he now teaches. The larger point is that in Tibet, the monasteries were built on slavery. Their high-minded religious ideals were drastically contradicted by their vast numbers of slaves. Their statements that "you choose your happiness" – as if their slaves chose to be slaves – are nauseating. That saying that religion is the opium of the masses? In this case it was the opium of the elites.

Vince (2009-10-10 23:25:28)

What's the chronology here? According to Wikipedia, the Dalai Lama was born in 1935 and proclaimed the next "Dalai Lama" at age 2. He became the head of Tibet's government on November 17, 1950, at the age of 15, in the midst of a war with China. China won that war and took over Tibet in the agreement signed on May 23, 1951, but Tibet was supposed to retain a high degree of autonomy. China left the Dalai Lama in power, with authority over central Tibet, but the Chinese continued to occupy Tibet and they peeled off some of its territory, where they instituted reforms including land redistribution. There were violent Tibetan uprisings against the Chinese, and after a major uprising was put down in March 1959, the Dalai Lama fled into exile at age 23. Then there was more violence and China started changing things throughout Tibet. So he was never really in charge before the Chinese came in, but I guess we're judging the Dalai Lama based on what he did from 1950-1959, when the Chinese basically left him in charge of part of Tibet. Wikipedia doesn't give much detail about that decade, and I'd want to know a lot more before judging him too harshly for what he did or failed to do then, given his age and the circumstances\*. But, at least according to [1]this interview, he claims to have instituted some major reforms, including abolishing inheritable debt and establishing an independent judiciary. \*For example: how much power did he have at that age or was he more of a figurehead? Would the Chinese have let him transform society or would they have prevented him from rocking the boat? How feasible was it to institute dramatic changes in the midst of the occupation/insurrection? Did the fact that China was instituting its own reforms in parts of what had been Tibet limit his ability to pursue his reforms?

1. <http://www.johannhari.com/archive/article.php?id=399>

seth (2009-10-11 03:59:06)

Vince, those are good points. I agree that a 21-year-old surrounded by older advisors, not to mention the Chinese government, is probably not very powerful. But I have a funny feeling he could have freed a few slaves, had he wanted to. And his supporters are curiously quiet about what he did during that decade. As I said earlier, my complaint is really about Tibet Buddhism being considered a wonderful source of wisdom when its main practitioners lived as they did – on the backs of thousands of slaves. Who somehow, according to their overlords, chose to be slaves. In the interview you link to the Dalai Lama says that disabled children are being punished for past sins ("of course"). At which point an advisor ends the interview. As the interviewer is leaving, the Dalai Lama calls him fat.

MT (2009-10-11 08:34:19)

More than being influenced by advisors when he took power, he was isolated from early childhood and raised exclusively by people who taught him that he was a god-like reincarnation with divine right to rule Tibet, and further that Tibet was a perfect system. His physical and intellectual isolation continued, for the most part, until he left Tibet. If he failed to transcend the beliefs of his society under such conditions it would not be surprising. What is more relevant is how he has conducted himself since, and what his thinking has been in the interim, when he has had intellectual freedom to a greater extent. If you read his books and other public statements it is clear that he has transcended many of these beliefs. It seems he still believes in reincarnation. Other people believe an invisible, omnipotent being created the world in six days and rested on the seventh. While I reject both of those beliefs, I don't need to dismiss everything else that they say, do, or write. You express the position that the Dalai Lama did not free any slaves during his reign – and presumably you also hold the opinion that he didn't make comparable improvements in the conditions of slaves – where are you getting this information from?

milieu (2009-10-11 09:52:04)

I am afraid that apart from cultural revolutionized, there is also a bit of cultural blindness here. Seth is looking at the 21- year old Dalai Lama from a western perspective which is not fair to the man. In many parts of Asia, what you call slavery was very commonplace. But it wasn't a physical bondage in most places. Eg in India, the lower castes were completely beholden to the upper castes in many places because of a sort of brainwashing of their place on earth. I suspect something similar to that in Tibet than an outright physical slavery. So from where do you think the reforms to that should have come. It seems a bit strange to accuse the 21 year old Dalai of not having condemned slavery when that would have looked like the only possible system in the world.

Anthony (2009-10-11 10:17:24)

@milieu and @seth, The moral judgment against slavery is easy, given today's political landscape. Many people who advocated slavery in the past believed it a good, though, given the options. Most slavery in history wasn't like the slavery of U.S. blacks. Even there, mistaken or not, many people argued in favor of that kind of slavery because they thought blacks would be worse off if freed. They might have been wrong, but they were doing what they thought was the moral thing. It's easy to make anachronistic judgments that lack context about this issue.

seth (2009-10-11 11:34:41)

MT, I am getting my info from him and his supporters – who fail to mention it. And justify slave-holding because the slaves were happy. Or, if they weren't happy, had done something bad in a past life – there are multiple justifications. For example, see that interview linked to by Vince.

MT (2009-10-11 13:05:59)

The interview directly counters your criticisms – he describes himself as an ignorant child when he took power, says "there were many things wrong with our society" and that he wouldn't want to return to it, says he eliminated inheritable debt (the source of the "slavery" you say he did nothing about) because it was "the scourge of the peasant and rural community", notes that he freed the state's prisoners while still in power (perhaps he freed slaves as well, possible though I don't know), says he wants to renounce his temporal powers (not mentioned here is that he established an elected parliament – I think in 1960), and says that he and the Tibetan people are karmically being "punished for feudalism," meaning that feudalism and its sins (like having serfs) was a cosmic wrong. You suggest the Dalai Lama has said that slave-holding is justified (either because the slaves were happy or because they had done something bad in a past life) – please supply a link or reference as this is in striking contrast to anything I've read. Quite possibly, you have misunderstood the principles of Karmic Law he is presenting (which I don't believe in, incidentally). In the Buddhist Karmic view, current circumstances are explained by past actions – and in this view, we are all suffering on earth because we have all transgressed in past lives. Accordingly we must not judge others, but extend compassion both to them, and to ourselves. But not compassion in thought only, compassion through deeds. Compassion not only to our loved ones, or those we perceive as innocent, but even to our enemies or those we may feel morally superior to. Which explains why he is critical of the slave-holding past of Tibet, and openly comments on the changes it required and which he has made – as he does in the linked article you suggested.

Steve G. (2009-10-11 18:32:24)

Seth, Several points: 1. While I don't have access to sufficient information to critique the DL about his rule from 1950 to 1959, what he has said and done since that time is relevant. Speech is a form of action. 2. I am not sure, but not all forms of slavery are equal, although I would endorse no form! For instance, as I recall from my undergraduate days (so long ago!), American chattel slavery was a much harsher institution than the contemporary slavery in Latin America. What was the nature of the slavery in Tibet? 3. What do you make of Hedges' critique of psychology (Seligman, et al.) in Empire of Illusions? My sense is that he inputs greater claims to this perspective than it claims for itself.

Anthony (2009-10-11 19:13:29)

Being an \*employee\* in certain situations would qualify as a form of slavery.

thehova (2009-10-12 14:10:06)

"Chris Hedges, Empire of Illusion. Hedges writes about how Americans are delusional in their beliefs about how wonderful their country is and how rich and powerful they are." The United States is mind-blowingly rich. The state of California has a GDP roughly equal to France with only half the population. It's just not distributed well.

thehova (2009-10-12 17:04:23)

Uggghhhh. Hedges book sounds sort of apocalyptic. Will the WWF really cause the downfall of society? Most people today don't read Moby Dick. Will that bring us down? Tyler Cowen counters such arguments in "Create Your Own Economy". Here's the product description which just makes Hedges sound paranoid: Product Description Pulitzer prizeâ€“winner Chris Hedges charts the dramatic and disturbing rise of a post-literate society that craves fantasy, ecstasy and illusion. Chris Hedges argues that we now live in two societies: One, the minority, functions in a print-based, literate world, that can cope with complexity and can separate illusion from truth. The other, a growing majority, is retreating from a reality-based world into one of false certainty and magic. In this â€œother society,â€ serious film and theatre, as well as newspapers and books, are being pushed to the margins. In the tradition of Christopher Laschâ€™s The Culture of Narcissism and Neil Postmanâ€™s Amusing Ourselves to Death, Hedges navigates this culture â€” attending WWF contests as well as Ivy League graduation ceremonies â€” exposing an age of terrifying decline and heightened self-delusion. -This text refers to an out of print or unavailable edition of this title.

## **The Monster Is Asleep (2009-10-10 19:27)**

[1]This old comment made me laugh me when I reread it recently:

It was slightly embarrassing when friends would ask how long I had been on [the Shangri-La Diet]. I lied and said a day - it had only been eight hours but, hey, without SLD, I normally would have done a great deal of damage in those 8 hours. It's now been a week and I've lost three pounds. I love the luxury of choosing finer foods now that I'm no longer compelled to eat everything in sight when dinnertime comes around. The Monster has been rocked to sleep

Diet Dude (2009-11-13 04:23:22)

Damn! I just typed a whole long comment and then the screen went funny when I hit the submit button. Is it in moderation or do i have to type it all out again?

seth (2009-11-13 05:33:35)

sorry, you have to type it all out again.

## **How to Eliminate/Prevent a Skin Infection and What It Means (2009-10-11 11:24)**

Several years ago, during a routine checkup, my primary-care doctor pointed to some white lines on my right foot. (Curiously only one foot had them.) Fungus, he said. I had a fungus infection. What should I do? I asked. He suggested over-the-counter anti-foot-fungus medications, sold in every drugstore.

I tried a few of them. They didn't work. The problem persisted.

A month ago I noticed the problem had gotten much worse. Yikes. What had gone wrong? I realized that in the previous few weeks I had changed two things:

- Instead of putting my wash through an extra wash cycle without soap (to rinse it better), I had started doing my wash the way the rest of the world does it. I had stopped doing the extra cycle because I was no longer worried about becoming allergic to the soap.
- I had bought 5 new pairs of socks and had been cycling through 4 of the new pairs again and again (washing them between wearings, of course), ignoring the rest of my socks.

This suggested a theory: My skin infection was due to my socks. The infectious agents get on my socks and are not completely removed by the washing machine. They survive a few days on the shelf. To wear socks with the infectious agent already present gives the infection a boost. Maybe my new socks supported the infectious agent better than the socks they replaced.

Based on this theory, I did three things:

- Resumed putting my wash through an extra cycle without soap.
- Took off my socks earlier in the evening.
- Bought 12 new pairs of socks and made sure every sock went a long time (e.g., 3 weeks) between wearings.

I saw improvement right away. (The morning after I wore new socks.) A month later, the infection, present for at least several years, is entirely gone. It took about a month for it to clear up completely.

The essence of my discovery is that the infectious agent could survive my socks being washed conventionally (in a washing machine) and live for a few days without contact with my feet. Whereas a few weeks away from my skin killed it. I have been unable to find this info anywhere else. A very minor discovery, but unlike the work that won the most recent Nobel Prize in Medicine, useful right now. Cost: zero. I would have had to buy new socks anyway.

In *Cities and the Wealth of Nations*, Jane Jacobs tells about a reporter interviewing someone in an oil-rich Middle East country (Iran?). During the interview the interviewee tries to cut an apple with a knife. The knife breaks. We can't even make knives, the interviewee says. That's how backward our economy is. To develop economically, MIT professors had advised his country's government to build a dam, at great expense. The MIT advisors thought that building a dam would be good for economic development. They were wrong, it turned out. Jacobs thought it was

telling that after all that money invested, the local economy still couldn't make something as basic as a good knife. Many industrial processes require cutting tools.

This is the same thing. Preventing and eliminating infection is at the core of medicine, just as cutting is at the core of manufacturing. My discovery reveals that my doctor – and by implication, the whole health care establishment – failed to know something basic and simple about this. If they understood what I figured out, there would be no need for anti-foot-fungus medicine. A gazillion dollars a year is spent on medical research, medical schools and research institutes around the world are full of faculty doing research – and they haven't figured out something as basic and simple as this.

[1]Gatekeeper Drugs. [2]How to Avoid Infection: Something I Didn't Know.

1. <http://www.blog.sethroberts.net/2009/10/03/gatekeeper-drugs-drugs-that-require-gatekeepers/>

2. <http://www.blog.sethroberts.net/2009/08/17/how-to-avoid-infection-something-i-didnt-know/>

---

Aaron (2009-10-11 14:32:06)

I noticed that curing myself of foot fungal problems consisted of 2 things: 1: Wearing new "breathable" shoes every 3-6 months

george (2009-10-11 15:04:35)

must have been a very rare form of fungus. for 99 % of all forms, lamisil kills them in very short time (sometimes they're completely gone after a week).

Kaitlin Duck Sherwood (2009-10-11 15:29:43)

You could also try dampening your socks and tossing them in the microwave for a minute before putting them in the wash. That will probably kill the nasties dead dead dead dead.

James (2009-10-11 20:34:03)

All the anti-fungal stuff I've used also says to change clothing to prevent reinfection. E.g. <http://mydr.com.au/medicines/cm15/daktarin-cream> \* Keep a separate face washer and towels for your own use to avoid infecting other people. \* Regularly change clothing, which comes into contact with the infected areas to avoid reinfecting yourself. \* Clean the site of infection twice daily to prevent build up of fungal cells. \* Keep the areas of infection well ventilated. Do not apply moisturisers to the site of infection as this will promote the growth of fungus. If infection involves the feet, footwear that make the feet perspire should be avoided.

Darrin Thompson (2009-10-11 20:40:52)

My late model washing machine has a "sanitize" cycle that heats the water to some much higher than normal temp. It takes almost 2 hours, most of which is spent in that hot water, best I can tell.

seth (2009-10-11 22:36:58)

James, I'd heard all that. I did all that. It was unhelpful. What really helped was waiting long enough before wearing the same sock again. Which isn't on that list.

Sam (2009-10-11 23:29:28)

Seth, in medieval times people used to iron their clothing and bedspread to sanitize them - maybe ironing your socks would have helped, too?

seth (2009-10-11 23:36:26)

Sam, it is much easier to do nothing than to iron.

Seth's blog » Blog Archive » How to Eliminate/Prevent a Skin Infection and What It Means (continued) (2009-10-13 13:54:33)  
[...] I Recommend The Man Who Would Be Queen by Michael Bailey Mindless Eating by Brian Wansink The Shangri-La Diet by Seth Roberts « How to Eliminate/Prevent a Skin Infection and What It Means [...]

Walter (2009-10-13 14:24:35)

Interesting thread and I must try it out. Aaron-what was the second thing that helped?

David (2009-10-13 18:31:04)

I have a Samsung washing machine that has a "silver ion" mode. It supposedly uses a bar of silver and runs an electrolysis cycle to generate silver ions. I wonder if using that mode would be equal in effectiveness to the long cycle time you discovered.

Zooko (2009-10-14 11:29:05)

Hey, the same thing happened to me. I tried all sorts of different over-the-counter antifungals which seemed to reduce but not completely eliminate the infection. This problem persisted for a couple of years I think. Then I noticed that it was worse when I had been wearing certain socks. I bought a lot more of the kind of socks that did not worsen it and started going barefoot frequently and changing socks frequently. Problem solved!

seth (2009-10-14 11:36:06)

n = 2

david (2009-10-15 07:47:58)

Seth, A version of your trick works for sandal odor too. I noticed that when I had one only pair of sandals, as the summer, sandal odor would become harder and harder to control. Scrubbing with "Paxton's Sandal Saver" didn't even help. Then I realized that since I wore them so frequently in the summer, the bacteria colony never had time to die off. So I bought a second pair of sandals and started rotating them. Now, no odor problem. If there's a "Sock and Sandal Retailers Association of America" they might be interested in funding some more formal research on this subject since it would certainly drive sales for them. Of course the Lamsil people and the people who make the fancy germ killing heat cycle washing machines would team up to try to discredit the research :-)

Simon (2009-10-19 06:36:08)

Sample size of 1. No control. Not double blind. Not even single blind. Even worse, the subject was the one trying to prove the hypothesis... You can't seriously think you've proved anything here. Come on. Imagine what it would be like if the medical establishment switched over to your method of 'medical research'. "Common cold cured! Local man says 'I eat a tree root, and my cold cleared up within 3 days!'"... It's not even as if you'd \*need\* a proper medical trial to establish something like whether fungus on socks survives washing; just a few socks, a few breeds of fungus, a washing machine, and a microscope. Finally, what makes you so sure this \*isn't\* known? Thousands of medical studies are published every month; how many do you think your doctor reads? Getting information about medical research to front-line doctors is a huge problem and a known problem, and one that a lot of resources are going into. Finally finally... Err, the fact that a normal washing cycle won't remove a lot of pathogens \*is\* well known. E.g. the standard recommendations for soiled hospital laundry are "...the temperature of light laundry loads (i.e. those below 560 grams per litre of main wash) are maintained at 65°C (150°F) for not less than 14 minutes or preferably at 71°C (160°F) for not less than 7 minutes. In order to assure disinfection an additional "mixing time" of 8 minutes should be added to these times for loads above 560 grams per litre." (Source: UK NHS executive). It's not like this is some obscure thing that's kept from doctors. "Heat kills pathogens" is pretty damn well known (hence Sam (above)'s pointing out that traditional folk advice about ironing socks. You omitted to say at what temperature you were washing your socks.

seth (2009-10-19 07:20:01)

"Proved"? I found an easy free way to get rid of an infection that I had been trying to get rid of for years. And that medications are sold for. I had no idea that my socks were causing trouble – nor did my doctor suggest that possibility – so I saw no reason to care how I washed them (in cold water). My point is not that "heat kills pathogens". My point is that a few weeks at room temperature kills the pathogen responsible in this case. If you can find a citation for this knowledge please let me know. I have been unable to find one.

Tom (2009-10-19 08:03:22)

How do you label or otherwise distinguish your socks?

seth (2009-10-19 13:32:05)

I spread my socks out on a shelf. I put the freshly-washed ones on the far right (pushing the rest over a little) and take the ones I will wear from the far left.

Ramfis Tunon (2009-10-20 10:05:57)

Hi all. I discover something like that but to prevent bad odor on feet. 1. Have a bunch of socks [normally white-colored ones] 2. Wash them using machine but adding some some chlorine [we name it "Clorox"] 3. Of course, use a fresh pair everyday, no matter if one pair looks "clean" 4. I always use flips-flops at home. I have never had feet fungus on my life.

Stephen M (Ethesis) (2009-10-20 17:02:31)

*I spread my socks out on a shelf. I put the freshly-washed ones on the far right (pushing the rest over a little) and take the ones I will wear from the far left.* I've done things like that.

Evelyn (2009-10-21 10:22:27)

I noticed something similar to this two times I took a long vacation. I had fewer than usual number of socks and underwear, and by the end of the month, I had a fungus infection. With a more normal number of each in the rotation (approximately double), I don't have such a problem. I knew it was related to clothing, but I thought it was related to the change in washing style due to being away from home, not the number of garments available. I'm going to try the labeled slots for inventory, Thanks!

puffin (2009-12-04 13:32:47)

"My discovery reveals that my doctor " and by implication, the whole health care establishment " failed to know something basic and simple about this." "A gazillion dollars a year is spent on medical research... and they haven't figured out something as basic and simple as this." Not shy of making bold claims eh Seth? Let's gloss over the fact that the spores of such skin fungi (dermatophytes) can live for months even years... (<http://en.wikipedia.org/wiki/Dermatophyte>). Instead, let us concentrate on the fact that you may simply have stumbled across regression to the mean ([http://en.wikipedia.org/wiki/Regression\\_toward\\_the\\_mean](http://en.wikipedia.org/wiki/Regression_toward_the_mean)), a phenomenon that those researchers you were so quick to belittle know well. Same applies for your transient-eye-infection-goes-away-after-changing-pillowcase "experiment" Hate to say it, but for a blog about self-experimentation and scientific method you seem a little, um, weak on the basics...! Perhaps I might humbly suggest some homework next time you feel like slagging the medical and research professions? <http://www.badsience.net/>

seth (2009-12-04 15:09:02)

It's not regression to the mean. When you have a problem for several years, it stays roughly constant over that time, an incidental observation suggests trying X, you try X, the problem goes away within days – that's not regression to the mean. Do you have another alternative explanation of what I observed?

puffin (2009-12-04 16:08:00)

I could have a thousand alternative explanations - and you could have a thousand rebuttals - that's not really the point. The point is that your post is post hoc ergo propter hoc reasoning [http://en.wikipedia.org/wiki/Post\\_hoc\\_ergo\\_propter\\_hoc](http://en.wikipedia.org/wiki/Post_hoc_ergo_propter_hoc)

based on a single observation, does not establish [and, importantly, cannot EVER] establish a causal link between your new sock regime and the clearing of your foot infection. (BTW, I am pleased to hear it cleared up, whatever the actual cause) PS. regression to the mean of a naturally time-limited complaint still seems a likely explanation to me.

Jason (2009-12-04 17:09:40)

Very cool. I'll have to keep that in mind. I go through phases of having fungal infections, the next time around I'll watch which socks I'm using!

seth (2009-12-04 20:25:32)

Puffin, it isn't regression to the mean. My observations were a single time series (several times/day for several years), not "a single observation." You seem to be saying that a single time series "cannot EVER establish a causal link". I would love to see evidence for that.

Anthony (2009-12-04 21:21:40)

Puffin, what do you mean by "establish"? It seems pretty suggestive to me. I'm interested in hearing your suggestions for an equally compelling explanation (much less 1,000 of them!).

Anthony (2009-12-04 21:26:32)

I.e., why do you think it's equally compelling to say it's coincidence?

puffin (2009-12-05 09:21:35)

@ Seth: You promote yourself as a man of science, <http://sethroberts.net/about/> yet you apparently fail to understand that multiple measurements ("several times/day for several years") on THE SAME PERSON, mean that you still only have information from a single person. To illustrate, if my mum says 1000 times that I am a good-looking lad (thanks mum), it alas, does not have the same weight as if 1000 independent people say it (which, to date sadly, they have not). Secondly, for someone so apparently evidence-based ("I would love to see evidence for that" you say), you provide none to back your own key assertions - for example: (1) "it isn't regression to the mean" (the onus is on you my friend to demonstrate this, not me - I just have to call it); or (2) "a few weeks at room temperature kills the pathogen responsible" (did you check that the microscopic fungal spores had died, or do you just assume they did because you can't see them with your eyes and the infection went away?).

puffin (2009-12-05 10:07:50)

@ Anthony: Why do I believe that the more likely explanation is chance? Well, coincidences happen all the time. Literally millions (?billions) of people on this good planet have fungal foot infections. At any one time, probably many thousands of these infections are clearing up (as most minor ailments do). In all of these cases the getting better might coincidentally follow a change in behavior. For Seth it was his socks... for someone else it might be eating an extra apple a day. Who knows? Humans are good at seeing patterns, but poor at recognizing randomness (eg, the iPod shuffle feature seeming to have favorites <http://preview.tinyurl.com/y99yo8e> ). For this reason, eliminating the reasonable doubt that your observation might simply be a coincidence is the first step towards "establishing causality" (apologies for the jargon). To better support his claims, Seth would therefore have to demonstrate that in all likelihood the sock regime was the only reason the infection went away, and that the improvement didn't happen simply because it was going to anyway or because of some other unknown factor that has instead mistakenly been ascribed to the power of the sock. This requires much more rigorous evidence than Seth currently provides. <http://en.wikipedia.org/wiki/Causality> The little evidence Seth does provide is known as a case report (ie, an observation from a single person) [http://en.wikipedia.org/wiki/Case\\_report](http://en.wikipedia.org/wiki/Case_report) Although they are one of the least persuasive forms of medical evidence, [http://en.wikipedia.org/wiki/Evidence-based\\_medicine](http://en.wikipedia.org/wiki/Evidence-based_medicine) case reports CAN (as you correctly stated) help SUGGEST new ideas. In most medical research (which after all, is the field that Seth was mocking when he crowed "they haven't figured out something as basic and simple as this"), the gold-standard for proving causality is a randomized controlled trial involving many people (ranging from hundreds to tens of thousands - many more than here!) [http://en.wikipedia.org/wiki/Randomized\\_controlled\\_trial](http://en.wikipedia.org/wiki/Randomized_controlled_trial) Lastly, please note that despite my ongoing skepticism, Seth may well be proved right (and good luck to him). 'Sock rotation' (copyright, puffin 2009-eternity) may indeed be the

cure to fungal foot infections. All I am saying is that the evidence that he currently provides falls woefully short of being sufficient to justify his pompous and arrogant claims to have "figured out" something that doctors with their "gazillion dollars a year" have failed to do so. If you're interested in learning more, I highly suggest reading Dr Ben Goldacre's excellent book: <http://amzn.com/B002BIMNDQ>

seth (2009-12-05 15:04:19)

Puffin, I asked for evidence because I was trying to understand why you believe what you do. I agree, I should have made it sound less argumentative. You have been kind enough to read my blog and comment on it, I am trying to learn from your comments. Let me try to get at the same goal a different way: Where does your understanding of regression to the mean come from?

Mark (2009-12-05 15:45:30)

I've tried those over the counter creams, and no, they don't work. The ones I get from my doctor work within a day. I think the over the counter stuff is just so diluted that they are essentially placebos. Sock rotation may also work, but if you really want to get rid of it, go to a dermatologist.

Matt (2009-12-07 13:31:42)

I ran into the problem of athlete's foot (foot fungus) a few years ago and went about searching for the cure. The cause and the cure are closely related: moisture. The reason you get foot fungus in the first place is because the fungus gets into your skin and proceeds to eat the dead skin off your foot. the burning itch is the fungus trying to grow into your dermal layers. This typically happens when you have damp feet all the time. The fungus needs moist conditions to live and thrive in. The best practical cure to athlete's foot is to change into fresh dry socks any time your feet feel sweaty or humid. After you get out of the shower, take a hot air dryer to your feet to dry out the skin between your toes. If your feet are dry, the fungus can't grow. Sweaty feet and poor changes of socks result in athlete's foot, so dry feet and fresh socks is the easiest solution. For me, sprays, cremes, and powders didn't work. It was fresh dry socks that eventually made the itching go away. Haven't had a problem since.

## **How to Eliminate/Prevent a Skin Infection and What It Means (continued) (2009-10-13 13:54)**

A brief summary of [1]my previous post is all I needed to do to cure/prevent a skin infection was buy more socks. Instead of buying 5 pairs every 6 months, buy 20 pairs every two years. That's all. Costs nothing. No drugs. No special treatment of the socks. No special cycle on the washing machine. No following a hundred (or ten) instructions about how to avoid infection. Like [2]my depressed friend, I had the reaction: Why didn't my doctor tell me this? He didn't tell me because he didn't know, I realize. Why he didn't know . . . is a harder question.

The whole practice of health care is called medicine, so focused is it on cure rather than prevention. There are medical schools, which turn out doctors. Schools of public health are the closest thing we have to schools based on prevention but they don't even train nutritionists. Nor do they do experiments, in most cases. (They do little data collection besides epidemiology.) And they get much less money than medical schools. Scurvy and Vitamin C are the first examples of the new way of dealing with illness I'm talking about - finding the environmental deficiency and fixing that, which is inevitably extremely safe and extremely cheap. After the discovery of Vitamin C, similar examples were discovered and the broader term vitamin was coined. But I think there is a need for a similar term that includes non-vitamins. It would mean aspects of everyday life, food and non-food, that we need to be healthy.

Like Vitamin C, my discovery that more socks eliminates skin infection points to a cure/prevention agent that is perfectly safe and extremely cheap. So do all my posts about fermented foods. It costs basically nothing to let food ferment. You lose nothing and gain a lot. Yet bacteria are not vitamins - and it isn't all bacteria we need, just the 99.999 % that are harmless. (And other foreign stuff, like bee venom, can substitute for bacteria.) I began thinking there are non-food vitamin-like things (things we need to be healthy) when I discovered the effects of standing on sleep and morning faces on mood. So we need several things to sleep well, including morning light, and at least one

thing for proper mood regulation. Insomnia and depression are non-infectious problems, like scurvy. We think of vitamins as preventing/curing non-infectious problems, so the analogy was obvious. And these examples (sleep and mood) involved the brain. So there were vitamins for the brain, you could say. But the socks/foot infection example and the fermented foods/many illnesses example both do not involve the brain and do involve infectious diseases and auto-immune diseases (which, although non-infectious, are quite different from scurvy). So the idea that there are bunch of extremely cheap, perfectly safe things we need to be healthy expands to cover more of health.

Vast amounts of money are spent on health research, much much more on the consequences of poor health, and truly incalculable suffering comes about because we don't know what these things are. (Depression alone causes vast suffering. Now add to that poor sleep, autoimmune problems, much infectious disease . . . ) Yet because studying these things (a) will make money for no one, (b) won't produce a steady stream of published papers and (c) is useful (= low status), they are nearly impossible to study.

1. <http://www.blog.sethroberts.net/2009/10/11/how-to-eliminateprevent-a-skin-infection-and-what-it-means/>
2. <http://www.blog.sethroberts.net/2009/10/03/gatekeeper-drugs-drugs-that-require-gatekeepers/>

---

epistemocrat (2009-10-13 16:59:37)

Kaiser Permanente, seems like the most apt health system in NorCal-nationally, perhaps-to embrace nutritional bricolage and cheap health options since Kaiser's model integrates the financing and delivery of medical care under one roof/feedback loop. Kaiser has a financial incentive to exhaust low-cost, high-benefit modalities. Someone just needs to get in touch with CEO George Halvorson and get his buy-in and support. lol. They do their own internal research-published in The Permanente Journal-so that avenue exists as well.

Jeff (2009-10-13 17:25:43)

Does using more socks cure everyone's foot fungus? We have no idea. So we don't know if all of the other techniques are necessary too. Having an  $n$  greater than 1 would be useful. Jeff

seth (2009-10-13 19:00:22)

Jeff,  $n > 1$  is always useful. My telling what happened to me is one way to try to get there.

epistemocrat (2009-10-13 20:21:01)

$n=1$  is the startup to initiate momentum for a community of  $n=1$  self-experiments. New ideas have to start somewhere ...

Nathan Myers (2009-10-13 20:24:42)

Most of the scientists I know (and Wikipedia editors) would say that your research doesn't exist because it's not published in a refereed journal. The work that gave us the ability to solve differential equations was published by an engineer, Oliver Heaviside, in a city newspaper. It was later backdated and renamed the "Laplace transform" to sanitize it. That done, it could then be used by mathematicians and scientists.

seth (2009-10-13 20:51:16)

"Doesn't exist until published in a refereed journal." You're probably right, they would say that. And other evidence snobs would say it is worthless until demonstrated useful in a double-blind placebo-controlled clinical trial. It's just more black-and-white thinking, familiar to us from organized religion. It's interesting the way some scientists imitate religious behavior.

Andrew Gelman (2009-10-14 02:07:06)

Seth: I think you're on stronger ground discussing science than religion. Requiring double-blind placebo-controlled clinical trials may or may not be a good idea, but I don't see it having much to do with religion, at least not with the religions that I've heard of. I think you'd be hard pressed to find a double-blind placebo-controlled clinical trial in the Bible, for example. There people often get their religious inspirations directly from God, and any testing of hypotheses is more anecdotal, if at that. If you don't like black-and-white thinking, that's fine, but I don't see such attitudes as being particularly associated with religion.

Darrin Thompson (2009-10-14 04:52:52)

I need an effective means for self experimentation at home with my Autism squad. We try new interventions every few months, but we don't have an effective way to gather enough data to be sure about the efficacy of the things we try. We do evals every few months. We need something lighter to do daily. It needs to be better than just observing and "using the gut" and it needs to survive physical exhaustion of the researchers and little OCD hands. Maybe we just need to measure our own well being since it is so tied to the kids' behavior on any given day. I always know how I feel. And don't knock my washing machine you...

seth (2009-10-14 04:58:06)

Andrew, when I associate religions with black-and-white thinking, I was thinking of three things: (a) division of the world into us (believers) and them (non-believers); (b) the many rules associated with most religions: Do this, do that, you must X, you must Y; and (c) the certainty with which many statements are made – as if the truth and the difference between right and wrong were so clear-cut. Religions sell certainty. I knew someone who became an Orthodox Jew, I believe, at least partly because it told him how to live. You're right that each of these three things can be found outside religions, so the association is hardly perfect. And you might say that the black-and-white thinking came first, it merely found a home in various religions as well as in other places (such as in these scientists' belief systems). But the religions I'm familiar with certainly encourage black-and-white thinking. It doesn't fit very well with science, but there it is anyway.

Aaron Blaisdell (2009-10-14 07:08:35)

Inoculations are one type of prevention the medical community does seem to have embraced. Brent the healthcare epistemocrat and you have both described consumption of fermented foods as an inoculation of sorts against bad bacteria. The Western medical community is starting to look at probiotics (judging from the increase in scientific medical literature on the subject), but Eastern medicine has embraced it for eons. On the topic of science as religion: I constantly see scientists who are dogmatic, elitist, and condescending when discussing alternative frameworks to their own deep-seated beliefs. Sounds like a kind of religion to me. I also know many scientists, however, who are NOT like this. No black-and-white here (or in academia, or in the university setting) either.

epistemocrat (2009-10-14 08:07:29)

Darrin, "I need an effective means for self experimentation at home" Check out Facet of Life: <http://facetoflife.com> It's a barebones, simple platform to help you capture and track your 'clinical trials' at home. My friend built it. Email me if you have any questions. Best, Brent

lance (2009-10-14 08:09:27)

What Seth is pointing to is the invisibility of opportunity. An infected foot is a problem with a cure, a prevented infection is not a problem or a cure. Missed opportunities (or opportunity costs) are not part of GAAP accounting.

seth (2009-10-14 11:31:20)

True, it's much harder to measure prevented infections than cured infections. But in all of the cases I mention, the treatment method (used to cure) is the same as the prevention method (used to prevent). Just as Vitamin C both cures scurvy and prevents it.

Jeff (2009-10-14 19:50:57)

My objection isn't to doing  $n=1$  experiments, which I agree is useful. It's to the forcefulness with which Seth proclaims things. He cured allergies! He cured foot fungus. He cured X. Or, every doctor is like this. Every biologist is like that. The entire field of public health is like this. Jeff

seth (2009-10-14 23:14:59)

Jeff, what's an example? You might be right but it's hard to know without an example.

Simon B (2009-10-15 04:30:38)

It sounds like you're aligning with the Natural Hygienists - whose use of the term means something like "living in a way that doesn't make you ill". So your changes in sleep pattern to help with depression, changes in sock washing to help with foot fungus, standing to help with sleeping, might be Hygeinic solutions. Although the modern use of the term means 'sterile' which is a bit misleadingly close.

### **Secrets of Infomercials (2009-10-14 13:14)**

[1]Here is a long list of reasons, by Steve Dworman, who makes them for a living, why infomercials are the way they are. One big reason is data: you can easily do an experiment that compares two different versions of the same commercial. It is much harder to measure the effectiveness of other forms of advertising. (The lack of data involved in most advertising choices is easy to see on Mad Men.) Self-experimentation has the same advantage: It's so much easier to test an idea.

One of his points is about the use of celebrities: It must work, or else they wouldn't do it. (Because there is data behind how things are done.) I think this points to something hard-wired: We want to learn from other people. That's the default. If we have a question, we search for someone who will answer it. Learning from our own experience - such as self-experimentation - is a last resort. It feels wrong, we don't like it. I remember feeling this way when I bought a camera. Sure, I could do extensive research about which camera is best. But that would be hard. Better to ask a friend. And then the purchase would be a link between us.

1. <http://itreallyworks.tv/articles.html>

---

Dan (2009-10-14 15:32:24)

I've been in the business for 25 years. You use celebs to stop people when they are tuning around the channels. They are a recognizable face. Also might be some trust involved but that depends of the celeb. There are plenty of shows that worked without celebs. It's the demos and the product benefits that matter along with testimonials from real users. People like to hear from others that something works, like you said. Testimonials are a very important part of direct response ads. As for data, while this always distinguished direct response, TV doesn't come close to the data now available using online forms like web sites. Testing is key to direct response, but online testing is cheaper and faster than TV testing. With TV you need more money to produce a show and run the ads, so you need a much more mainstream product for it to work. Online is different. You still have to spend some money and have the right story, but you can do it with less upfront expense. This means you can try less mainstream product ideas and concepts and they can still work. Dan

Nadav Manham (2009-10-14 17:29:50)

Seth, I'm surprised you didn't comment on this bullet point: "Prevention-oriented products never seem to sell. I've seen some amazingly produced shows that have tried to do this and failed miserably."

Scot (2009-10-14 20:25:47)

Re: wanting to learn from other people. Maybe it's adaptive. Dan Gilbert, in "Stumbling on Happiness" makes the point that if I want to know how I'll feel after a future event, it's best to consult someone else in that exact same situation now, instead of trying to imagine how I will feel after said event occurs. This is because we are basically rotten forecasters of our own future happiness. Our reactions to bad events are never really as bad as we imagine they will be, nor are good events ever as good as we expect they will be.

Darrin Thompson (2009-10-15 06:04:50)

What you are saying matches up nicely to a few office stories that have puzzled me over the years. I'll add though, that if we want to learn from other people, we only want to learn from certain other people. Certain as defined not always rationally by us. Certainly explains my compulsive blog reading. Also explains why I've seen executives ignore problems in their organizations, especially when their own people point them out and do everything ask to "prove". But I'm not bitter.

seth (2009-10-15 06:35:58)

Darrin, what are those puzzling office stories?

epistemocrat (2009-10-15 07:13:06)

Re: Learning from others ... Coach Wooden's latest book, 'A Game Plan for Life: The Power of Mentoring': [http://happybirthdayjohnwooden.com/guestbook/?page\\_id=9](http://happybirthdayjohnwooden.com/guestbook/?page_id=9) "Mentors are all around us; they are everywhere we look. Anywhere there is a sharing of knowledge or a teaching of experience, there is a mentor. Anywhere there is an individual with life lessons to impart to an audience" more often than not, just an audience of one" there is a mentor. I think if you truly understand the meaning of mentoring, you understand it is as important as parenting; in fact, it is just like parenting. As my father often said, "There is nothing you know that you haven't learned from someone else." Everything in the world has been passed down. Every piece of knowledge is something that has been shared by someone else. If you understand it as I do, mentoring becomes your true legacy. It is the greatest inheritance you can give to others. It is why you get up every day to teach and be taught." It's ancestral mimicry.

Dan (2009-10-15 08:13:37)

Prevention doesn't usually work because there is no B & A, that's before and after. This is a very strong piece of marketing used not only in infomercials but with all kinds of selling. Diets and exercise routines work great on TV because of B & A. Prevention can work but it needs to include benefits that are immediate as well. Air purifiers. It's really about preventing disease but they sell because of the smoke enclosed room demo. You see it working. If I can do a demo, I can usually sell it. Read Ron Popeil's book. His most important message is you learn how to sell a product by listening to what people ask. This tells you what benefits customers value most, then you incorporate that into your selling. Getting in front of a group of people with your product and pitching it is one of the most important parts to making it a success.

Darrin Thompson (2009-10-15 16:23:22)

Seth asked for my puzzling office story. I'm working away at this coding project. President is initially really excited by the project. Puts money in it. But he has no clue about programming and tech projects so he can't lead it to profit. So eventually he quits letting anyone spend anything so were left to fend and bring ourselves to profitability with what we had. That wasn't going to succeed. One day the Prez holds a conference call and introduces, let's call him Carl, the new boss. New boss will take over immediately. Old boss is not fired. Note that. Carl will run this special project and all IT operations for the entire organization. Turns out Carl has the technical skills to make web sites backed by dbase on Windows. Carl is suspicious of our use of database servers for the organization's contact data and this special operations critical data. Carl thinks dbase and file replication would work better. Also Carl has a web site where he resells notebooks. Carl is, can't remember his exact age. Was

it 18 or 16? One of those numbers was actually correct. I am not exaggerating. Now that I think about it, I'm pretty sure it was 16. Long story short, eventually old boss was running the show again (loyalty) and I left for organizations manged less badly. Easy conclusion, the Prez is a fool. Inconvenient fact, the Prez is no fool. Nope. This is a big organization that he started from scratch. It's a non profit and he can tell the story and raise money like he was born for it. What he did here and many many other times was, yes, Very Stupid(tm) but he is no fool. That's what I found puzzling. So now Seth brings up this really neat idea that there are two ways people learn. People like to learn from other people. People learn best from gathering data. So, hint, pick the data one. If management problem solving is learning (it is, for the sake of argument) then there are two ways to do it. You can do it the hard way, experimentation within the business system, or trying to figure out who really "knows" and try learning from people. Hint, pick the experimenty data one. That particular office story strikes me as the Prez couldn't hack the experimentation when he wasn't raising money (really really well) and turned to the people way. Only he never paid attention to anyone already close to an internal problem. They were the problem in his mind. So he always learned from the wrong people. He was constantly looking for heroes. Preferably inexpensive ones. He's 16 and has a \_web \_ site on the \_internet \_? (It was like 1999 ish...) Hero! CEO's pulling in 80 million for having a confident demeanor strikes me as a similar blunder. Deming's quality systems were were a kind of collaborative self experiment within a business. The scrum software development method features measurement of sprint "velocity" and retrospective meetings after each sprint to discuss and plan possible improvements. I could go on and on. If the theory holds: When business fails to experiment well, it inevitably turns to hero worship. Kinda the same.

seth (2009-10-15 19:16:31)

yes, I see the point very clearly. Great examples. It does explain why Deming had such a big effect – because there was so much resistance to data and it was so easy to rely on heros.

Evelyn (2009-10-21 10:51:57)

It seems to me that figuring out what to test is more of a problem than implementing the test. It's easy to pick "safe hypothesis", or to be overwhelmed by the huge number of factors that differ between two situations. Here's a website that has some real data on A/B testing of websites. <http://www.abtests.com/> Adwords allows you to test lots of different combinations of each of the 4 lines of an ad. And, will automatically show better performing ads more than worse performing ads. Seth, you've got a real talent for picking the right experiment. Do you have any suggestions on how to improve skill in this area?

seth (2009-10-21 14:08:23)

Thanks, Evelyn.How to pick the right experiment? My advice is to do the simplest easiest experiment that will tell you something. This is inevitably much simpler and easier than others recommend. In my experience, researchers, like everyone else, (a) underestimate the difficulty of their plan and (b) overestimate their knowledge of what will happen. The pleasant corollary of (b) is that you can learn much more easily than you think.

## **More About Faces and Mood (2009-10-15 07:46)**

A friend with bipolar disorder writes:

When [1]I wrote in your blog that I use your discovery daily, it means that every day I look in a mirror for an hour, starting at approximately 6:30 a.m. I have the mirror about 20 inches from my face because I have read that a mirror image is half the size of the object reflected. [[2]Life-size faces appear to work best. Using a mirror means the face you see is perfectly life-size, allowing for distance. TV faces can be larger or smaller than life-size.] To keep from being bored while looking at my face in the mirror, I mostly listen to tapes of C-SPAN programs. Sometimes I listen to music. Once or twice a week I may just think, or plan my day. That does get boring after about 30 minutes.

Sorry, I definitely was exaggerating when I wrote "doctors are amazed". "My doctors" refers only to my psychiatrist and psychotherapist; at best, they seem "impressed" by my condition. My therapist regularly says that I'm doing "great" (variously referring to social relations, self-awareness, and general functioning) – "especially considering my situation" and my psychiatrist once exclaimed that my bipolar disorder was in "complete remission", albeit when we were composing an online personal ad. I do think both of them are at least mildly surprised that I seem to be doing alright on half the standard therapeutic dose of Depakote, and a low dose of Prozac.

There was an actual experience that weakly supports my claim about practitioners having no interest in utilizing your idea. I once asked my therapist to suspend his disbelief, and just imagine that your treatment does work as a strong antidepressant. Then would he mention the treatment to his other patients, or give a talk at a conference, or write up a report, or tell his colleagues? In all cases, he said "no". Although he agreed that ideas for clinical trials have to come from somewhere, evidently that somewhere was not part of his concern.

I stress that my therapist is compassionate and reasonably intelligent, and he has helped me deal with many important practical problems. And of course in your blog even you have admitted that your idea, on the face of it, sounds way too crazy. It's to my therapist's credit that he claims to believe your treatment works to some degree – adding positively, "whatever works for you". Unfortunately, that addition implies that your treatment is somehow working "psychologically" for me (e.g., as a kind of meditation) rather than working "biologically" in a way that, presumably, would work for most people.

If my doctors were following my particular case as closely as they pretend to, then they ought to be amazed. Instead, my sense is that they see me through the lens of their diagnosis. Without actually dismissing the sheer statistical improbability of my having been off of drugs and without a hospitalization for four years, they do seem to forget that fact when we discuss drug therapy. When I mention those four years, they sometimes play the skeptic, offering up alternative possibilities: it was a fluke, or I was in remission anyway, or something else. I don't try anymore to persuade anyone, not even family, about the treatment – it's not worth the effort.

I suppose the bigger picture is that there is little credibility to the testimony of a bipolar person who has experienced psychosis. (Perhaps my case is not helped by dramatic pronouncements of mine such as, "History will judge you. People will wonder, "why didn't they listen to him?") Too, I'm not paying my doctors enough to get lengthy consultations. If I were paying enough, and if I made the case with details to my psychiatrist, she might be persuaded that there is a big effect. She has a high opinion of you; in fact, she's the person who told me of the report in The SF Chronicle (5/30/06) about the SLD diet. And, she gives some credence to Dr. Stoll's results with omega-3 for treating bipolar. Nevertheless, for what it's worth, I would stand by my original opinion about her not changing her practice.

1. <http://www.blog.sethroberts.net/2009/10/03/gatekeeper-drugs-drugs-that-require-gatekeepers/#comment-349374>
2. <http://repositories.cdlib.org/postprints/117/>

---

Nathan Myers (2009-10-15 11:03:44)

There's something else going on, as well. The psychiatrist and psychotherapist he mentions are clinicians, acting in the role of technicians. Observations of technicians in all fields are routinely discounted, particularly if they conflict with common theory. To the degree that these people also, occasionally, present themselves as scientists, their credibility is at stake if they offer the wrong *kind* of idea. In medical fields there is somewhat less segregation among technicians (of certain sorts), engineers (never

called that) and scientists than in others. Airline pilots typically report uncatalogged meteorological phenomena over and over for decades before they are acknowledged by meteorologists. A third thread is legal. It's one thing to acknowledge that something a patient is doing helps. Suppose, though, this psychiatrist recommended it to another patient, and reduced the drug dosage, and then the patient (as depressed patients do) committed suicide. What would that psychiatrist say in court? They need to be able to point at professionally approved documents justifying the treatment. Getting from "it works" to "it's officially approved" is very expensive. If no money needs to change hands when "it works", who is to pay for the process? With drugs, there's a ready source of funding for the process. This is an argument for public funding of therapies. The problem, then, is how to ensure that the money is mostly spent on therapies that end up demonstrated to work. If whoever does the work gets paid just as much for any old quackery, it's easy to find quackery to get paid to test. The Free Software movement has bridged the gap from "it works" to "officially approved". Often it is able to take advantage of public funding, but more usually not. Alternative therapeutics ought to be able to adapt some lessons from Free Software.

seth (2009-10-15 20:16:29)

Nathan, I tend to agree. But consider this: When a SF doctor figured out that her patients were getting mercury poisoning from fish, she told them. She didn't worry about being sued because this was a new idea. Not only she told them, she wrote about it. Had a big effect. Obviously mercury poisoning is a far more conventional diagnosis than "not enough morning faces". But it is possible for clinicians to have new ideas, to learn from their patients.

MT (2009-10-15 20:21:20)

This is interesting, but it would be good to hear the context – how long was this person suffering what symptoms, when did they try the intervention (four years ago?), what level of remission since (half the "normal" dosage of Depakote – presumably half their previous dosage?)... it sounds like there is some backstory here that would be useful to hear. Additionally, bipolar includes mania, so if this intervention has been helpful then the mirror-strategy isn't only anti-depressant, but mood stabilizing. Another option might be to incorporate meditation into the morning-faces strategy, as mindfulness meditation is also, separately, used as a preventive for depression – Mindfulness Based Cognitive Therapy. There is research on this, showing mixed results, but I think the mixed results comes from the structure of the studies rather than the efficacy or lack thereof for meditation as a technique. If one were able to combine the two – staring at one's face while meditating – perhaps it would offer another benefit – calming the mind so experiences like aversion, attraction, and boredom can be experienced with equanimity. There is also a form of compassionate meditation that people find useful for such problems.

Mindfulness Based Stress Reduction Techniques | My Blog (2009-10-31 22:10:35)

[...] Comment on More About Faces and Mood by MT [...]

Dean (2009-12-26 16:43:57)

The original post states "I have the mirror about 20 inches from my face because I have read that a mirror image is half the size of the object reflected. [Life-size faces appear to work best. Using a mirror means the face you see is perfectly life-size, allowing for distance." Does anyone have more comments regarding mirrors and face image size? For example, I would be interested in answers to the following questions: Why is a distance of 20 inches, and not some other distance, correct for perceiving a life-size face image? How about using a 2X mirror? Wouldn't such a mirror scale the half-size image to a life-size image? Is anyone else using a different mirror method, such as a 2X mirror, and also achieving good results?

seth (2009-12-27 05:28:21)

Dean, when you look at a face in the mirror it will always be life-sized so long as distance is taken into account. In my studies of this I found that distance matters – so distance is taken into account. The best distance was roughly a conversational distance.

## The Price of an Unnecessary Operation (2009-10-16 04:21)

A few years ago, a Berkeley surgeon named Eileen Consorti, to whom I was referred by my primary-care doctor, recommended that I have an operation to repair a hernia so small I couldn't detect it. [1]I have already written about how she kept saying there was evidence such operations were beneficial but as far as I can tell no such evidence exists. (Dr. Consorti has yet to provide the evidence [2]she still seems to think exists.) Okay, she overstated benefits. What about costs?

During a conversation about whether the operation was a good idea, I said operations are dangerous. I didn't want to have one unless there was a clear benefit. She replied that nobody had died from anesthesia during one of her operations. But of course death is only one of the things that can go wrong. It turns out the general category of bad things happening during anesthesia is called undesirable events and the rate of undesirable events has been measured. In [3]this study, the rate was 100-150 undesirable events per 1000 hours of anesthesia. My operation was simple; I estimate it would have taken one hour. So my chances of having something bad happening to me as a result of an operation without any clear benefit to me – but considerable financial benefit to Dr. Consorti – was about 10 %!

In a discussion of the costs and benefits of the operation, she didn't tell me this.

---

kate (2009-10-19 20:58:58)

One undesirable event caused by anesthesia is the triggering of mitochondrial disease; one of my very young students died of it last year, caused by a routine tonsillectomy. She was ten.

Kirk (2009-10-22 13:35:58)

The study discusses problems seen by trainees, with more incidents seen at the beginning of the school year. My guess is that incidents would be lower for professionals who have been on the job for years and working under a known and established routine. But that is speculation. I don't know where one finds the information about the number of incidents per hernia operation performed by professionals. Another useful number would describe the count of threatening incidents per untreated hernia (of the type of hernia you have). This is not an easy decision. I had one of those undesirable anesthesia events during my most recent hernia operations and it was alarming. On the other hand, many years ago I had an emergency hernia operation (diagnosed at 2PM, under the knife at 6PM), and it was bracing to hear later, from a co-worker, that a good friend of hers had died due to an untreated (incarcerated or strangulated) hernia. In conclusion, I think you need more information to make your risk management decision. Unfortunately, I don't know where you get the information, especially if your body isn't sending any signals. Good luck.

## Beijing Air (2009-10-16 14:14)

Yesterday was really windy. Lots of bikes fell over, including mine. I thought my sheets, hung to dry outside my apartment window, had blown away. I searched for them around the building. I eventually found them – in my closet. I

got a piece of dirt in my eye that I noticed for several hours. It was my first significant bad encounter with Beijing air this time around (since August). I was in Beijing last fall, too, and then the dirty air really bothered me. I felt better after I got an air filter for my apartment.

When I was a freshman at Caltech, Richard Feynman came to our dorm for dinner. I asked the first question: "What do you think of the air?" He looked at me as if it was a stupid question. I think his answer was, "You get used to it." After living in Beijing last year, I said over and over I liked everything except the air. Now I find it hard to complain about the air. In my apartment I have [1]one big air filter per room that runs constantly; they are quiet and turn red if the air is dirty. They hardly ever turn red. Last year, after a week without dusting, you could write "lung cancer" in the fine black dust that had accumulated. Now it isn't there. Through my window the visibility is usually pretty good; I can see the lights of buildings in the distance.

Yesterday someone told me Beijing air has gotten much much better. "Ten years ago your hair would get filthy" from coal dust, he said. The hutongs had coal-burning heaters. Now they are gone. Measures of air quality have even improved since last year, I think he said. I met someone recently arrived who was bothered by the air but she felt much better after I gave her an air filter.

Overall, I think four things have changed: 1. The air in my apartment, where I spend most of my time, is much better (compared to unfiltered). 2. Outside air is somewhat better. 3. Due to fermented foods, my overall health is better. 4. Due to learning about [2]hormesis, I don't worry about a small amount of air pollution.

Ricardo Niederberger Cabral (2009-10-29 06:24:40)

just curious, if you spend most of your time in your apartment, why are you in China?

### **Fire Your Doctor! (2009-10-17 06:07)**

I came across [1]Fire Your Doctor! How to Be Independently Healthy by Andrew Saul while searching for info on natural hygiene, mentioned in a comment. I liked this story:

I had acne . . . It peaked when I was seventeen. . . Then I went overseas to study, was more than a bit stressed, and took my already considerable chocolate, sugar, meat, and greasy-food eating habits to new heights. My broken-out skin broke out still worse. Eventually, having failed to see any improvement otherwise, I changed my diet, and the acne went away.

Of course I support this non-gatekeeper approach to health. What about the book? Pro: Well-written, a reasonable amount of evidence. Con: No discussion of actual cases. What actually happens when you treat problems this way (often with vitamins and other supplements) is very important to know.

I found nothing about fermented foods, omega-3, or sleep (neither sleep problems nor the value of sleep for health). This isn't really a weakness of the book, which is about a certain way of doing things; it's a weakness of the way of doing things.

### **The Bike: X Invented It. Y Perfected It. (2009-10-19 01:36)**

The bicycle is far from the most influential invention ever – that would be the printing press – but it might be the most perfect, at least where I live. As I rode home last night I reflected how curiously great it is (where I live):

1. Low cost. A friend gave me hers for free. Perhaps it would have sold for \$5. A new bike costs as little as \$20.
2. Durable. They never wear out, although parts need replacing. I could have the bike I have now 20 years from now.
3. Ages well. Unlike almost all commercial products, bikes improve with age. They look less and less desirable so the probability of theft goes down. My bike, which looks worthless, will never be stolen. (As my students confirmed for me today.) I took to fake-locking it because I couldn't get the key out of the lock. One day someone managed to get the key out leaving my bike locked and possessing the key. Whoever did that didn't bother to take the bike. I got the lock sawed off a block away for \$1. I bought a new lock for \$2.
4. Great service. When something goes wrong, I can bring it to a bike shop that will fix it in minutes. There are lots of bike shops in my neighborhood.
5. Convenient. You can always park your bike close to where you're going.
6. Green. Zero pollution, zero fossil fuel.
7. Exercise.
8. Quiet. The Tsinghua campus is full of bikes yet is always quiet. Because of the bikes, cars are banned from large chunks of the campus.
9. Safe. My neighborhood, like elsewhere in Beijing (but unlike some Chinese cities), has plenty of bike lanes. It feels perfectly safe to ride in them. In Berkeley I wear a bike helmet but at least in my neighborhood I haven't been able to see the need – it would be like wearing a helmet while walking.
10. Facilitates exploration. Most of Beijing is no fun to walk in – things are too far apart. But it is fun to bike around. You can easily bike from one interesting place to the next and whenever you get somewhere interesting you can get

off your bike and walk around it.

---

JLD (2009-10-19 04:10:48)

No, bike [1]isn't safe it's **much worse** even than car and foot travel.

1. [http://en.wikipedia.org/wiki/Air\\_safety#Statistics](http://en.wikipedia.org/wiki/Air_safety#Statistics)

seth (2009-10-19 04:19:23)

JLD, those statistics are averages over many places. Where I live it is much safer than usual. There are wide bike lanes and there are many bikes. Because there are so many bikes, people expect them and look for them. This makes them much safer than in places where bikes are less common and where there are no bike lanes. Which is most places.

intellectual yokel (2009-10-19 07:38:47)

Freeman Dyson on bikes: You can't possibly get a good technology going without an enormous number of failures. It's a universal rule. If you look at bicycles, there were thousands of weird models built and tried before they found the one that really worked. You could never design a bicycle theoretically. Even now, after we've been building them for 100 years, it's very difficult to understand just why a bicycle works - it's even difficult to formulate it as a mathematical problem. But just by trial and error, we found out how to do it, and the error was essential.

## **What Do Officer and Anchorage Have in Common? (2009-10-19 16:59)**

[1]Anchorage, of course, is the title of Michelle Shocked's great song – one of her great songs. She writes to a childhood friend and the answer comes back from Anchorage: I've got a husband, two kids, a house . . . Anchorage: state of being anchored.

Yesterday I asked one of my Chinese students what his parents did. "They're officers," he said. He meant they worked in an office.

## **Cosmic Radiation Makes Trees Grow Faster (2009-10-20 12:36)**

[1]Trees grow faster during periods of greater cosmic radiation from the sun:

During a number of years, the trees' growth also particularly slowed. These years correlated with periods when a relatively low level of cosmic rays reached the Earth's surface. When the intensity of cosmic rays reaching the Earth's surface was higher, the rate of tree growth was faster. . .

Cosmic rays are actually energetic particles, mainly protons, as well as electrons and the nuclei of helium atoms, that stream through space before hitting the Earth's atmosphere. The levels of cosmic rays reaching the Earth go up and down according to the activity of the Sun, which follows an 11-year cycle.

As [2]someone pointed out, this may be another example of [3]radiation hormesis. Although some examples of hormesis may be due to immune-system stimulation, you can also see hormesis with single cells, which don't have an immune system, of course. They do have repair mechanisms.

From my point of view this is interesting because it helps to show what a big effect hormesis is. I'm sure we need daily stimulation of our repair systems to be our healthiest but this isn't a part of standard teaching about health. It goes against what people are usually taught (e.g., all germs are bad, all air pollution is bad, keep from getting sick by avoiding contagion) roughly as much as does the Shangri-La Diet. The scientists who discovered the tree effect appear to not know about hormesis ("As for the mechanism, we are puzzled").

The success of the Shangri-La Diet teaches that the obesity epidemic is due to eating too much food that has exactly the same flavor (smell) each time – from one can of Coke to the next, for example. In practice, this too-constant food is food from a package (food made in a factory) and food from a restaurant. My umami hypothesis says that the epidemic of autoimmune diseases has the same source. Food in a package is more sterile than other food because bacteria reduce shelf life so preservatives are added and/or manufacturing steps (e.g., pasteurization) kill bacteria. Food from a restaurant has usually been freshly cooked (killing bacteria) and all sorts of precautions ("food safety") are taken to make sure it remains low in bacteria.

Thanks to David Cramer.

---

Nathan Myers (2009-10-20 16:27:02)

Sorry, Seth, this is BS. Yes, there is a correlation between cosmic radiation exposure and tree growth. There's also a correlation between sunspots and tree growth, and between tree growth and hemlines. Might tree growth control hemlines? Might tree growth control the sunspot cycle? It will take enormously more evidence to demonstrate any connection whatsoever between this phenomenon and radiation hormesis. All we can say now is that such an effect may be possible, but we could just as well have said so before, with just as much reason. Do you wonder why we say you're not the go-to guy on causation?

seth (2009-10-20 17:49:09)

Nathan, I don't know what you mean by "this correlation is BS". Nor do I have any idea why you believe this.

Tom in TX (2009-10-20 18:12:03)

Hormesis is not the only possible explanation of the correlation. Another could be found in the book *The Chilling Stars* [http://www.amazon.com/Chilling-Stars-2nd-Cosmic-Climate/dp/1840468661/ref=sr\\_1\\_1?ie=UTF8&s=books&qid=1256087000&sr=8-1](http://www.amazon.com/Chilling-Stars-2nd-Cosmic-Climate/dp/1840468661/ref=sr_1_1?ie=UTF8&s=books&qid=1256087000&sr=8-1) The authors claim that cosmic radiation affects the amount of cloud cover over the earth, which in turn affects global temperatures. This could have an effect on the growth rate of trees.

Nathan Myers (2009-10-20 18:59:55)

The correlation is not BS. The causative chain leading you to radiation hormesis, though, is stage after stage of pure speculation, what Simon Singh got in trouble in the UK for calling "bogus". That doesn't mean our immune systems don't need frequent jostling, or that we don't benefit from fomenting population battles among our gut flora, which might not be the same thing. It just has nothing demonstrable to do with them. Confirmation bias isn't your friend. Aaron, I expect you've explained this to Seth before.

seth (2009-10-20 19:25:04)

Nathan, you say "the causative chain leading [me] to radiation hormesis is stage after stage of pure speculation." It was someone else's idea, not mine, that this result could be explained by radiation hormesis. The pure speculation here is your description of their reasoning. There is something to what you say, in the sense that bacteria (found in fermented food) are highly unlikely to damage cells the same way cosmic rays or other radiation does. The value of hormesis for my argument isn't that the mechanism is exactly the same (bacteria work outside cells, stimulating the immune system; at least some hormesis has an intracellular explanation) but that hormesis makes the general point that biological repair systems can benefit from a low level of damage, because it stimulates them. Tom, yes it certainly isn't the only explanation proposed. For me the interesting question is whether the dosages match up – whether the cosmic radiation dose is similar to the dosages that produce hormesis under laboratory conditions. Hormesis is obtained under a narrow range of dosages – too little and there's no effect, too much and the cell or plant or whatever is harmed.

Seth's blog » Blog Archive » Winter Swimming (2009-10-26 07:31:28)

[...] The cosmic ray effect I mentioned earlier — that trees grow more when there is more cosmic radiation — occurred with older trees but not younger trees. [...]

## Med School Interview Questions (2009-10-20 18:59)

Here is what Brent Pottenger was asked during a recent interview at USC medical school:

- What drives/motivates you?
- Describe a challenge you overcame?
- Describe a fulfilling experience that made you want to be a physician?
- Why USC?
- What do you bring to the entering class?
- What area of medicine are you interested in?
- What would you do for health reform?
- What do you do outside of school for fun?
- If you could improve something about yourself, what would that be?
- What are you looking for in a medical program?

NE1 (2009-10-21 14:02:52)

### **Interview with Professor David Jentsch about Not Taking Drug Company Money (2009-10-21 13:36)**

Dr. J. David Jentsch is a professor of psychology at UCLA; his research area is psychopharmacology. I contacted him because Aaron Blaisdell told me that he had decided to stop accepting research money from drug companies. This is unusual; I wondered why.

1. What is your research about? What portions of it have been funded by drug-company money?

My own research over the past 12 years has focused on the etiology of mental disorders (how genetic factors influence brain chemistry and behavioral functions) and how psychoactive substances work to normalize behavior through working on those very pathophysiological mechanisms. In particular, I study the brain systems and molecular pathways in control of cognitive functions, with a very specific focus on using that knowledge to generate insights about cognitive enhancement for schizophrenia, addictions and AD/HD. I study rodents and primates.

I have received funds from drug companies for two reasons. 1) The companies appreciated my work and funded efforts to discover new mechanisms that might inform what they ultimately did. 2) The companies provided funds to my laboratory so that I could investigate how novel potential candidate mechanisms that they developed influence cognition in laboratory models.

When one does work like I do, one wants to know that information learned is moving from the bench to the real world. That always requires a connection to a drug company – they make drugs/universities do not. That being said, I've always been of the opinion that having the best and most rigorous academic labs undertake these collaborations is in everyone's best interest (the quality of the work is ensured). In my case, this was always a tiny part of what I did; therefore, the quality was good, my objectivity was unquestionable and the answers were certain.

Because top scientists are increasingly withdrawing from collaborative partnerships (in part because of the negative attitudes about them), this work gets left to less competitive scientists whose objectivity may be less clear because they rely upon this type of support more heavily. I think that is quite unfortunate.

2. How does one get drug-company money for research?

Generally speaking, a company representative approaches you because of your reputation and invites you to propose a study to accomplish a mutual goal (see my answer to #1 above). A study design is drawn up, circulated and discussed and finally approved.

3. How much easier is it to get drug-company money than to money from other sources (for the same research)?

It's hard to say. Fewer people receive drug company funds. If a company is interested in your work and approaches you, it's not that difficult to obtain the funds. But it is difficult to be recognized to do this kind of work.

4. When did you start getting drug-company money for your research? If you're comfortable saying how much it has been over the years (per year), that would help clarify the implications of your decision.

As a graduate student, the laboratory in which I trained participated in some studies. As a faculty member myself, I have participated in two such efforts. The total amount of funding I have received from pharmaceutical companies in all my years at UCLA (a total of 8 years) is less than the budget I obtain in a single year on my RO1 grant. It is not an immense amount, and it certainly is not the kind of funding that I would need to sustain my research program.

Because of the negative perception of these sorts of activities, it is not worth continuing to engage in them. I don't require those funding sources. That being said, I find it a bit unfortunate. Again, it's in everyone's best interest if the TOP scientists did those collaborations to ensure their quality and rigor. When I don't do them, it is possible that a less objective party does. Second, every concept I have about novel treatments that isn't pursued because of lack of such a relationship is a potential delay in moving basic science to real use.

5. What are some examples of how the animal-rights activists publicized and complained about your use of drug-company money?

After the bombing [his car was bombed in March 2009], statements were made on the web and in the press by animal rights groups saying that people such as me used animals needlessly in a drug-company-fueled manic process of animal killing in order to get rich. As I already mentioned, this is not the case, if only because people like me often have relatively few such grants, and their size is not large (again, usually not larger than a single year of funding on an RO1 grant). Because of this, I simply decided not to take any such grants in the future.

6. The car bombing (on top of other attacks) led to the decision to stop taking drug company money?

As you can discern from the fact that I only have accepted two such awards in 8 years, I already placed a good number of criteria on accepting them. I wanted them to be only projects that I considered to be of very high scientific merit, and I wanted them to be logically and obviously related to our broader research projects.

Additionally, there is already a good deal of "negative perception" of research funded by drug companies within academic circles, and so I had already batted around the question in my mind about whether I should accept further awards. When the extremist attack on me happened in March of this year (2009), I had not had such an award in some time. That was not because I had taken a decision about the matter - simply that I hadn't found a situation I wanted to pursue. At that point, the decision solidified.

7. Your decision to not take drug company money - what effect do you think it will have or hope it will have?

I am certain a situation will arise where I will have an idea about a novel therapeutic based upon my research that I will be unable to pursue without such a relationship to a company. What is more, the compounds in development by companies are not being evaluated by me, so they may well be evaluated by someone with a little bit less rigor and objectivity.

I believe strongly that the academic enterprise gives a crucial "objective" check on novel therapeutics when leading scientists who are not "dependent" on drug company money examine them. The alternative is that others who are more dependent, and therefore less objective, will do it.

---

MT (2009-10-22 06:35:10)

While Dr. Jentsch sounds like he is approaching the issue with integrity, I think his concerns that he will not be able to pursue a novel treatment strategy due to his stand are dwarfed by the general misallocation of funds toward psychopharmacological interventions generally. The only reason research has been driven in this direction is because of the combination of a patent system and a corporate-driven research sector. If it weren't for these factors we would be looking for solutions to mental health problems in environmental considerations – but there is no money in these areas, because they can't be patented. The current system is not supporting public health unfortunately. The meta-analysis of SSRIs by Irvine Kirsch at Hull showing them largely indistinguishable from placebo is one example of the colossal waste of psychopharmacology, the worse outcomes for schizophrenics in developed countries (drug-intensive) versus developing countries (often drug-free) is another. If society were run on cost-benefit analysis we would have pulled the plug on most psychopharmacological research a couple decades ago. Unfortunately, there are multiple agency and moral hazard problems in public and private institutions that perpetuate this wasteful research. It isn't 100 % bad – maybe 97 %. Consistent with themes from this blog, for instance, consider the Barker Hypothesis regarding the role of in-utero nutrition in health problems. If you could patent healthy fetal development, we would be far closer to solving problems related to health and mental health.

seth (2009-10-22 12:34:27)

MT, that's really interesting about better outcomes for schizophrenics in poorer countries. Can you provide a link or something?

MT (2009-10-24 14:30:13)

From a WHO study entitled "Schizophrenia and public health," published in 1998 and available here: [http://www.who.int/entity/mental\\_health/media/en/55.pdf](http://www.who.int/entity/mental_health/media/en/55.pdf) "A substantial body of evidence shows a more benign course and better outcome in developing countries." "The factors that underlie higher improvement rates in developing countries, however, remain ill-defined..." I just found this as an example citation – I originally read of the phenomenon in the book "Unsafe at any dose" by Bob Johnson, a UK psychiatrist who worked with imprisoned violent offenders and managed (according to his self-reported data) to dramatically reduce violent incidents and also lower psychopharmaceutical drug use in the most violent prison population in the UK. He claims to be able to get these results using talk therapy, and further that the various psychopharmaceuticals judiciously prescribed do more harm than good. Johnson attributes the difference in outcomes for schizophrenics between the two regions to be due to the prescribing of drugs studied for acute treatment of psychosis on a chronic basis. As we have such a strong pro-pill culture, and belief in the superiority of Western medicine, I doubt his theory will be tested any time soon. It would threaten too many shibboleths in the psychiatric community. I wish Gary Taubes would do his next book on psychopharmaceuticals!

## **eConspicuous Waste (2009-10-22 12:28)**

The term conspicuous consumption got more attention but Thorstein Veblen, in [1]the same book, also coined the term conspicuous waste. The purpose of conspicuous consumption was conspicuous waste. Show how rich you are.

Fine. So what do we do now, when driving a car with hood ornaments would make you look like an idiot rather than a rich person?

The creators of [2]Paperless Post have not taken Veblen into account:

Paperless Post takes the e-invite into a civilized age, letting you design and send custom invitations and announcements expediently online. Created by siblings Alexa and James Hirschfeld, the site cleverly allows subscribers to choose among a dizzying array of card styles, fonts and design flourishes that perfectly mimic the heft and look of elegant stationary, complete with envelopes that open with a click. In addition to feeling good about your carbon footprint, youâ€™re also easily able to monitor as recipients receive their invitations, and manage their replies.

Fancy invitations were an example of conspicuous waste. They were expensive. Everyone could see that. Here's my suggestion: Sell these e-invites by the card and to each card add a donation to charity per card. Stated on the card. Let's say the donation is \$2. So 100 cards sent = \$200 to some charity. That way the sender shows that he or she is rich.

## How Effective are Flu Vaccines? (2009-10-23 15:19)

[1]An article in The Atlantic, based on research by Lisa Jackson, questions the conclusion that flu vaccines work. Here is the essence of her argument from [2]a letter to the editor by Jackson and others in The New England Journal of Medicine:

In an 8-year study of a similar population of members of a health maintenance organization, we found risk reductions among vaccinated elderly persons during the influenza season to be essentially identical to those reported by Nichol et al. (Table 1).<sup>1</sup> However, we also found even greater reductions before the influenza season.

Emphasis added. The lack of specificity suggests that those who get vaccinated are in better health to begin with than those that don't. Other comparisons supported this conclusion.

Thanks to JR Minkel.

1. <http://www.theatlantic.com/doc/print/200911/brownlee-h1n1>
2. <http://content.nejm.org/cgi/reprint/357/26/2728.pdf>

---

Jeff (2009-10-23 18:21:45)

I think vaccine discussions are much more fun when both sides are yelling "JUST LOOK AT THE SCIENCE!" As if interpreting data and slowly digesting the myriad of subtleties in hundreds peer-reviewed publications were a trivial exercise. On a related note, the posted article was a good read.

Nathan Myers (2009-10-23 23:22:22)

What I got was that people who wouldn't die from flu are less likely to catch it if stuck, but that people who can die from it catch it despite being stuck, and die anyway. Also, so many people skip getting stuck and catch it and spread it that the people who don't because they were stuck don't help. Probably if everybody healthy got vaccinated, the difference would be enough to avoid exposing the weak (who get no direct benefit from being stuck), but you never get more than 50 % coverage. 50 % coverage just isn't enough to provide cover for anything virulent.

Seth's blog » Blog Archive » Effect of Animal Fat on Sleep? (2009-10-24 13:34:06)

[...] 3. American culture demonizes animal fat. The conclusion that animal fat is bad rests on epidemiology. Once something becomes heavily recommended or discouraged, a big problem for epidemiologists arises: the people who follow the advice are likely to be different (e.g., more disciplined, better off) than those that don't (the healthy-user bias). As I blogged yesterday, an example is vaccine effectiveness: Those who get vaccinated are different than those who don't. [...]

David (2009-10-25 01:22:28)

Amazing article. So the flu vaccine has never been tested in a double blind trial? That is astounding. Seth, you are probably familiar with this blog, but I wasn't (self experimentation with giving up coffee): <http://www.kk.org/quantifiedself/2009/10-/the-false-god-of-coffee.php>

JR Minkel (2009-10-30 08:48:10)

Interesting discussion on Effect Measure: [http://scienceblogs.com/effectmeasure/2009/10/the\\_atlantic\\_article\\_sur\\_re-but.php](http://scienceblogs.com/effectmeasure/2009/10/the_atlantic_article_sur_re-but.php) Main points: 1) Evidence does exist for efficacy of seasonal flu vaccination: <http://www.ncbi.nlm.nih.gov/pmc/articles/PMC2638553/?tool=pubmed> 2) There's a longstanding controversy over efficacy of seasonal flu vaccine in the elderly, which doesn't apply to swine flu.

## **Bryan Caplan on Barbara Ehrenreich (2009-10-24 01:56)**

[1]In his blog, Bryan Caplan makes some amusing and reasonable points about Barbara Ehrenreich's criticism of some happiness research. My eyes widened as I read. This is so much better than what's usually in the New York Times, The New Yorker, and other publications. It reminded me of Spy, except the level of thought is deeper. It's as if blogs allow and encourage intelligent people to say what they really think about stuff. Whereas in any mainstream venue there are tremendous constraints.

1. [http://econlog.econlib.org/archives/2009/10/wolfers\\_ehrenre.html](http://econlog.econlib.org/archives/2009/10/wolfers_ehrenre.html)

---

david (2009-10-24 10:19:17)

I saw Ehrenreich on the Daily Show and the focus in that interview was on things like \_The Secret\_, where she certainly has a point. As for happiness research, if someone could convince me that "happiness" (defined in a way that it's something I care

about) can be reliably measured, I'd take it seriously. The happiness research I've been exposed to so far has left me with the impression that the researchers haven't had any first hand experience with happiness themselves.

Nathan Myers (2009-10-24 12:11:48)

Geoff Pullum, over at Language Log, has been debunking these "happiness gap" articles for years now. They keep repeating the same claims, and he keeps going to the raw data and finding nothing there but noise.

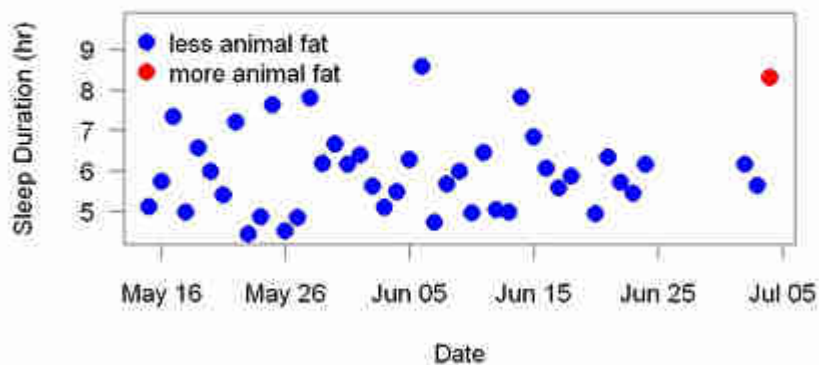

### Effect of Animal Fat on Sleep? (2009-10-24 13:33)

Recently I listened to [1]Robert Spector discuss his book *The Mom & Pop Store: How the Unsung Heroes of the American Economy are Surviving and Thriving*. He had a personal connection to the subject: His father was a butcher. "As I watched him trim the meat . . . " he said at one point. I thought: Oh-oh. To "trim" meat is to cut fat off of it.

Last spring, I bought \$80 of organic grass-raised pork from a farmer near Berkeley. My order included a variety of cuts. I cooked the ones I was familiar with, leaving one I'd never seen before: pork belly. Pork belly is used to make bacon. I've never seen it for sale in America. Ugh, I thought. Fat. It's 80-90 % fat. I too trim the fat off meat. It sat in my freezer for a long time. Finally I decided I shouldn't waste it. I cut it into chunks which I put in miso soup and had for lunch.

That night I slept much longer than usual (8.3 hr) and woke up feeling unusually well-rested. Here is a graph that shows my sleep duration for that night and several preceding nights:

[2]

Sleeping 8.3 hours was less common than this graph may suggest. I'd moved back to Berkeley in January and from then until the miso soup had measured how long I slept on 130 nights. I'd slept more than 8.3 hours on 2 of them (2 %). Even rarer was how energetic I felt the day after the miso soup. I couldn't quantify it, but it was very rare – once in 10 years?

Was it a coincidence – that on the very day I ate far more animal fat than usual I also slept much longer than usual and had much more energy than usual the next day? Or was it cause and effect? Here's why the second explanation – which implies that for best health I need much more animal fat than I usually get – is plausible:

1. As Spector said, butchers cut the fat off meat. The odds that our Stone-Age ancestors, living when food was sometimes scarce, did the same thing: Zero. Perhaps our meat is unnaturally low in fat. If for a long time in our evolutionary past we ate a lot of animal fat it makes sense that our bodies would be shaped to work best with that much fat.

2. Many video games, which boys enjoy, resemble hunting. I think this reflects an evolutionary past in which men hunted. If so, for a long time humans ate meat. That they ate a lot of meat is suggested by the fact that when big game went extinct (probably due to hunting) human health got worse.

3. American culture demonizes animal fat. The conclusion that animal fat is bad rests on epidemiology. Once something becomes heavily recommended or discouraged, a big problem for epidemiologists arises: the people who follow the advice are likely to be different (e.g., more disciplined, better off) than those that don't (the healthy-user bias). [3]As I blogged yesterday, an example is vaccine effectiveness: Those who get vaccinated are different than those who don't.

4. Fat tastes good. Which implies we need it. We like whipped cream, butter on toast, milk in tea, and so on. Butter vastly improves toast even with my nose clipped. Long ago, when this fat-pleasure connection evolved, dietary fat was mostly animal fat and fish oil.

All this makes it plausible that animal fat is good for us. That's not surprising. Based on Weston Price's observations plus these four arguments, I already believed this. Many people believe this. The interesting idea suggested by my data is the possibility of measuring its benefits quickly, by measuring brain function. My experience suggested that animal fat improves brain function quickly. Brain function is easier to measure than the functioning of other parts of the body. By measuring my sleep, my energy, or something else controlled by the brain, maybe I can figure out the optimal amount of animal fat. This is what happened with omega-3. The idea that omega-3 is good wasn't new; the novelty was the ability to measure its benefits quickly. ([4]At first I measured my balance, later other things controlled by the brain.) With a fast measure I could determine the optimal amount. It's likely that what's optimal for the brain is optimal for the rest of the body, just as all the electric appliances in your house work best with the same house current. If you figure out the best current for one appliance, you are probably simultaneously optimizing all of them.

NotInChinanow (2009-10-24 14:12:31)

I'd like to report that pork belly's are available in America or at least they are in the midwest. They're also available in California at least in the asian markets; I can't comment on general markets since I've never looked for them there. However, I found most of the store packaged variety contain too much salt at least according to my test, so I still have to ask the butcher for them.

MT (2009-10-24 14:46:33)

According to the chart you noticed this effect in July – have you gathered more data to support or reject this hypothesis in the interim?

Max (2009-10-24 17:49:17)

You mention "grass-fed" pork. So, when you are talking about animal fat being good for you, is your theory that only grass-fed (high in omega-3) and not corn-fed meat would have the positive effect? Also, what about the supposed links between meat consumption and cancer?

John (2009-10-24 19:10:21)

Animals, including all their fat, are the species appropriate diet of humans. I eat mostly that and I have never felt and performed better.

seth (2009-10-24 19:46:59)

Max, I already get plenty of omega-3. It wasn't the omega-3 in the fat that made the difference. As for the supposed links between meat consumption and cancer, I'll trust my experiments over epidemiology any day of the week. I'm not saying what I'm posting here is the final word, of course not. I am saying that it suggests the subject of how much animal fat to eat may be subject to experimental investigation. MT, yes I have gathered more data. I will eventually post it.

MT (2009-10-24 19:57:19)

Regarding your first point about the historical levels of fat in our human diets, one of the theories I've read is that we would have evolved scavenging first, and had a particular advantage cracking open the skulls of carrion due to our ability to use tools – which other scavengers lack. This would give us access to the brains, which are 60-70 % fat (mostly saturated), and may have contributed to our rapid evolution to hunters with our shorter digestive tracts and our own larger brains. It does seem likely to me that higher levels of animal fat in the diet is healthy.

CCS (2009-10-24 20:45:45)

Hi Seth - I just heard about this thing called the "fitbit" which can track your sleep while you wear it. I guess it has some kind of algorithm for figuring this out from your movement so it lists how long you laid in bed before sleep plus actual sleeping. It also tracks movement like a pedometer but is supposedly more accurate. It might make some of this data collection easier for you and be a useful tool for self-experimentation if it actually works well.

Aaron Blaisdell (2009-10-24 21:19:57)

I didn't realize pigs ate grass. They're not ruminants like cows, goats, and sheep. They're domesticated from forest-dwelling omnivores (just like humans) with a diet much closer to humans.

Jarno Virtanen (2009-10-24 23:36:12)

I don't remember you mentioning whether your sleeping habits are such that you don't usually accumulate sleep debt. I'm assuming this is the case, based on your descriptions of your general sleeping habits. I'm saying this because sleep debt, if it's anywhere near significant, has far greater effect on alertness than anything else. Also, how well-rested one feels right after waking up is not necessarily a good measure of the quality of the sleep. Say when one has significant amount of sleep debt and starts to sleep it back, one starts to feel more drowsy in the morning for a while, but the day-time alertness still increases. In general, all of these effects on the feeling on "well-restedness" in the morning probably require one to be close free of sleep debt. I'd guess someone with significant sleep debt wouldn't notice any effect from, say, standing on one foot just because the effects of the sleep debt would mask any other effect.

michael vassar (2009-10-25 00:16:27)

Note that its grass fed organic pork. I ate a grass-fed beef meal a month ago and it was immediately casually apparent to my wife and I that the subjective well-being afterwards was much greater than it would have been after a typical beef meal. Also,

I'd note that pre-domestication, wild animals had much less fat than today's domestic animals have. It's probably pretty close to nutritionally optimal to eat bison in the natural ratios of all of the meats they are composed of.

Richard Nikoley (2009-10-25 11:56:43)

Seth: You can indeed get pork belly pretty easily at lots of places here in the south Bay Area (Lunardy's is a favorite here in San Jose). At any rate, a friend & I cooked some up a few weeks and it was excellent. We've since done it again. Pics: <http://freetheanimal.com/2009/09/no-fear-pork-belly-its-whats-for-dinner.html> I can definitely attest to the benefits of high animal fat (I average 70 % energy from natural fats). While I have not logged my sleeping hours, I do know that I sleep far, far longer on average than ever before in my life. I used to average 6 hours per night and now it's about 7-8 almost every night. And very restful sleep. Another very welcome change over the last couple of years I've gradually upped the fat in response to feeling better and better as I have done so is that I can now enjoy laying in bed in a kind of "drift in & out" thing. I could never do that before. I would get antsy and have to get up. It's quite enjoyable now to be resting but not asleep in the early morning. An

seth (2009-10-25 15:46:07)

Aaron, thanks for the correction. Michael, the pig was raised at a boutique small farm but it wasn't actually grass-fed. What you say is very interesting, though. In Beijing I can compare high- and low-priced pork, which corresponds to the distinction you're making. Jarno, that's right, I don't have any sleep debt. I always sleep as long as I want. Richard, that's great to know about the connection between your sleep and your change in diet.

Ashish (2009-10-25 21:16:52)

Seth - did you cook the pork belly pieces before putting them into your miso soup? If not, do you imagine I would experience a similar benefit by dropping raw fatty bacon into my soup, or perhaps rendered bacon fat?

seth (2009-10-25 22:33:02)

Ashish, yes, I cooked the pork belly pieces for a long time before adding the uncooked miso. The miso is added last and not cooked at all. I suspect raw bacon has the same benefit. In America, where I couldn't get pork belly, I often ate raw bacon, although only certain brands were acceptable. I think the bacon is fine because the large surface/volume ratio makes it easy to digest. Yeah bacon fat should have the same effect. Except you'd need a lot of it. I think it is hard to eat pure fat but a bacon-like ratio of fat to meat is acceptable.

Tom Moertel (2009-10-26 08:58:10)

Is it animal fat itself that is good for us? Or is animal fat a carrier for nutrients that are hard for our bodies to source elsewhere? The way I see it, humans probably ate a good bit of animal fat for most of their pre-history (until agriculture became widespread). Natural selection, therefore, had time to optimize humans for an environment in which animal fat was consistently part of the diet, and humans may have become dependent on some of the things that animal fat provides in abundance but other food sources do not. In the last few millennia, if humans stopped eating animal fat, or if the nutrient composition of that fat changed (say because the animals in the human diet became farm raised and grain fed), natural selection would not have had enough time to optimize humans for the changes, and, as a result, humans on a modern diet wouldn't get enough of the nutrients they used to get from eating the fat of wild animals. So, adding some animal fat to your diet, especially if that fat approximates the fat of wild animals of yesteryear, is very likely to provide your body with some nutrients you're not getting enough of in modern times.

Peter McDonnell (2009-10-26 10:05:22)

Here's a link <http://high-fat-nutrition.blogspot.com/> to a blog called Hyperlipid that I find interesting reading. Another contrary fellow like Seth. :)

Aaron Blaisdell (2009-10-26 15:22:02)

Seth, I found this relevant discussion on Ryan Koch's Matters to Me blog (<http://ryan-koch.blogspot.com/>) post in which he discusses a Farley Mowet book "The People of the Deer" describing Mowet's life among a group of Inuit. "It doesn't take Mowat long to identify the key ingredient of the Ilhalmiut diet: fat. From his own experience on lean meat for an extended

period of time, he describes the vast importance of fat in an all-meat diet through his battle with an affliction which he names, for want of a better term, mal de caribou, also known by a great many arctic explorers, prisoners of war, and human carnivores as rabbit starvation: ... persistent diarrhea was only part of the effect of mal de caribou. I was [also] filled with a sick lassitude, an increasing loss of will to work that made me quite useless ... Mowat's guide – a half-Eskimo, half-white man named Franz – prepared and administered a peculiar remedy: ... he took out a half-pound of precious lard, melted it in a frying pan, and, when it was lukewarm and not yet congealed, he ordered me to drink it. Strangely, I was greedy for it ... I drank a lot of it, then went to bed; and by morning I was completely recovered ... I was suffering from a deficiency of fat and did not realize it. (p. 88)"

seth (2009-10-26 17:58:05)

Thanks, Aaron.

David (2009-10-28 23:44:55)

Crazy coincidence...I posted on your boards this morning about starting a carnivorous diet (zero-carb, mostly meat), and one of the more surprising side effects was improved sleep. After a few days of 60-70 % animal fat/ 30 % protein and negligible carbs, I sleep like a little baby. There's a small community of people (<http://zerocarbforlife.com/>) out there that believe that all your body needs is meat and water. I'm not sure if I agree with their fanaticism 100 %, but testing their theory makes for an interesting experiment.

## The Campaign Against Medical Hypotheses (2009-10-24 19:30)

[1]Dennis Mangan writes here about the campaign to destroy the journal Medical Hypotheses because its editor dared to publish an article by Peter Duesberg and others questioning that HIV causes AIDS.

The campaign is associated with [2]AIDSTruth.org, which says it is about "the scientific evidence for HIV/AIDS." A dead giveaway. When I was a senior in college, I wrote a paper called "The Scientific \_ \_ \_ \_ \_" in which I said that use of the term scientific is a sign that the writer or writers don't know what they're talking about. Calling this or that "scientific" amounts to calling something else "unscientific" – which isn't an argument, it's abuse. The term scientific is often just a way to sneer at other people. Like the word nigger and many other derogatory names and adjectives.

Animal Farm put it well: You become what you are supposedly against. Holocaust denial is strange, yes, but then there are the people who get really really upset by it. Who would have guessed that the solution to intolerance (German intolerance of Jews) is . . . more intolerance? And that is what the campaign against Medical Hypotheses is in favor of: more intolerance.

1. <http://mangans.blogspot.com/2009/10/international-campaign-to-destroy.html>

2. <http://www.aidstruth.org/>

---

Nathan Myers (2009-10-24 23:34:46)

I don't know from Aidstruth, but Duesberg had a full hearing years ago. All his arguments were transparently tendentious, essentially ignoring the details of all the evidence.. There's nothing wrong with Medical Hypotheses printing them yet again, as long as they don't publish falsehoods or half-truths, but it's also no reason to pay attention.

David (2009-10-25 01:15:11)

The scientific consensus has been wrong innumerable times in the past. On this issue, certainly there is intense economic motivation from the AIDS research community to keep things on track. Real science should be open to all ideas and debate them on their merits. This seems suspiciously anti-debate.

Peter Smith (2009-10-25 14:08:59)

dude – what the fuck? you couldn't think of another word in the american lexicon to get your point across?

Link Dump « Rhymes With Cars & Girls (2009-10-25 20:57:12)

[...] Seth Roberts makes a point more universally applicable: ...use of the term scientific is a sign that the writer or writers don't know what they're talking about. Calling this or that "scientific" amounts to calling something else "unscientific" – which isn't an argument, it's abuse. The term scientific is often just a way to sneer at other people. Possibly related posts: (automatically generated)Stark raving lunaticBooks, books and more booksWhy We Don't Think ClearlyLewis Black on his new special, The Daily Show, and the Root of All Evil [...]

Jason (2009-10-26 05:48:19)

Seconding Peter Smith and Nathan Myers.

Mac (2009-10-26 06:26:29)

Seth, What is your gut instinct (no pun intended) about the distribution around the mean of effects on different people of things like probiotics (or any of the other regimens you discuss in your blog? It seems to me that any "consensus" assumes that the variance around the mean is pretty small. I.e., what works for one person works more or less the same for everyone. Based on everything you have seen, done, and read, how idiosyncratic do you believe people are in their responses to regimens? And - in what proportion of cases do you believe that a significant part of the distribution has a coefficient with a different sign (negative or positive effect)? I know that there is no easy answer to this, but wonder how much you and others have thought about it.

seth (2009-10-26 07:09:26)

Mac, I believe everybody needs bacteria in their food just the same way everyone needs Vitamin C in their food. Just as Vitamin C cures everyone with scurvy . . . etc. There is nobody for whom Vitamin C makes scurvy worse. Specific applications always introduce variance. Although Vitamin C cures all scurvy, some fruits may have less Vitamin C than others, etc.

Andrew Gelman (2009-10-27 07:09:56)

Seth: Do you really think it's strange that people "get really really upset" by Holocaust denial? Look-you got really really upset by some dude in Canada who published obscure papers on fake nutritional experiments. Sure, the guy shouldn't have done it, but it's pretty minor. If you can be upset by that, how can you be surprised that someone can be upset when people minimize or deny the killing of millions of people? Science is important-I'm glad you've spent time exposing scientific fraud-but history is important too. If misrepresentation of major historical events doesn't bother you, fine, but to call that "intolerance"-well, that's just silly. The next step would be to call mathematicians intolerant for not allowing mathematical mavericks to put the "2+2=5 theory" in math journals and algebra textbooks. I also don't think the word "scientific" is really comparable to the so-called N-word (or even to the much milder F-word). But maybe you use the word "scientific" in a different way than other people do!

Anthony (2009-10-27 17:07:39)

@Andrew, There's a difference between people who intentionally deceive, and people who are trying to do honest investigation into (in this case) an historical event. Some of them are intentionally misleading, and in that case, it's probably warranted to get upset by what they're doing. Some are not - they believe rather they \*they\* are being misled (and they believe that this explains why people aren't allowed to investigate it freely, are imprisoned for questioning the official narrative, and so on).

seth (2009-10-27 18:03:27)

Andrew, there are many differences between criticizing Ranjit Chandra, as Saul Sternberg and I did, and criticizing holocaust deniers. Here's one of them: the information value. Whereas >99 % of the world believed Chandra, who had received the Order of Canada, I'd guess that <1 % of the world believes holocaust deniers. Whatever the exact percentage, it is very low. If holocaust denial got serious traction, I'd agree with you that it is worth pointing out the problems. But it never has so the inflamed passions, in my opinion, are unwise. It's not my use of "scientific" I'm talking about; it's how AIDSTruth.org uses it. They plainly use it as a way of placing themselves above other people, the way a thousand derogatory terms are used. It doesn't fit the definition of "derogatory", of course, but it is used to the same effect.

rich (2009-10-27 20:31:06)

The real tragedy here is that the aidstruth people didn't recognize the journal 'medical hypotheses' for what it is; namely, EXACTLY the journal Deusberg should be publishing in. I'm a regular reader of their abstracts, solely for comedic content. The regular articles hypothesizing why one testicle hangs lower than the other are my favorites! the journal is kind of crappy, deusberg's ideas are kind of crappy. its really a match made in heaven!

seth (2009-10-28 01:02:25)

"Solely for the comedic content"? Solely? Care to comment on this article? Dennis Mangan, A case report of niacin in the treatment of restless legs syndrome, Medical Hypotheses, In Press, Corrected Proof, Available online 30 June 2009, ISSN 0306-9877, DOI: 10.1016/j.mehy.2009.05.048. Andrew Gelman (2009-10-28 01:28:40)

You write, ">99 % of the world believed Chandra." Actually, I think we can be pretty sure that >99 % of the world has never heard of Chandra or his research. As you discussed in your debunking of Chandra, one reason for his success is that he worked in an obscure area that nobody bothered to check. In contrast, genocide remains a live issue, and a big rhetorical strategy of mass murderers is to deny that they've done it, or to claim that they've done it in self-defense. So fighting false historical revisionism is a good thing to do, I'd say. And, of course people get "really really upset" by Holocaust deniers: to have your relatives killed, and then have people trying to get their killers off the hook, yes, that's horrible. Regarding the HIV/Aids thing: Duesberg's writings give me the impression that he enjoys pissing people off. I'm not surprised that, yes, he succeeds at this task. I don't think that people responding, perhaps intemperately, to a provocation is comparable to the flinging of racial slurs at people who are just minding their own business.

seth (2009-10-28 03:34:29)

Well, I guess we agree that it is intemperate to try to get a journal abolished because it published a paper you disagree with. Chandra's research was not in "an obscure area". One thing he studied was how old people can avoid memory loss. His work on that topic was covered in the New York Times – taken completely seriously by the Times. Another area in which Chandra worked was what to feed babies. His work was taken entirely seriously by Nestle executives and many other people. His anti-breast-milk (fabricated) results may have harmed thousands if not millions of babies. Every dollar he got in grant money – and he got millions – harmed the scientists who therefore failed to get that money. By ">99 % of the world believed Chandra" I didn't mean >99 % of the world had heard of him. (I wish.) I meant >99 % of those who encountered his work believed it. I don't remember saying he got away with it because he worked in an area where no one bothered to check. People did check – and got different results. The politics of science is why he got away with it – the price of pointing it out was too high. It was because his work wasn't obscure that he got caught: It reached the notice of two people – Saul and me – who were outside his sphere of influence. Yeah, fury at holocaust deniers surely has something to do with revenge, as you say. (The more polite term for revenge is justice.) You want the killers to be named as killers; anything that gets in the way of that is infuriating. Fine. Human nature, I agree. But genocide has a large revenge component as well, as Amy Chua has shown in World on Fire. That's my point: You become what you say you are against.

Tom in TX (2009-10-28 09:02:29)

@Nathan: I read about Duesberg years ago, but did not keep up with the debate. What is the best refutation of his view of AIDS?

Mac (2009-10-28 16:34:58)

Seth, Sorry I was unclear in my question. The question is about regimens and treatments in general, not just probiotics. The variance of responses around the mean is obviously bigger than zero. The bigger it is, the less relevant are "generally accepted practices." For some treatments, the effect on say 60 % of the population could be positive (to various degrees), the effect on 20 % could be zero, and the effect on 20 % could be negative. Obviously this variance is different for different treatments. I was just wondering how to think about this phenomenon and its implications.

## **Use of Probiotics in Hospitals (2009-10-25 15:54)**

[1]A Canadian company named Bio-K+ makes lactobacilli-based probiotics – mainly a fermented milk drink, like Yakult but with different bacteria – that hospitals can use to reduce antibiotic-related diarrhea (a common side effect of antibiotics) and C. difficile infection, a less common but far more serious side effect. In [2]this 2007 study, the probiotics reduced the rate of diarrhea by half and reduced the rate of C. difficile infection by a factor of 7 (from 7 cases to 1 case).

[3]How the company started. Thanks to Anne Weiss.

Dan (2009-10-25 17:17:06)

That marketing article was interesting but it's missing some important research from my perspective as a person making his own milk Kefir daily. I would certainly liked to have seen a comparison of 44 patients who were given freshly made Kefir, perhaps one, two, four and eight cups per day and compare those results with the very expensive Bio-K product. If it works better, more power to it. But it's hard for me to be convinced a packaged product is of superior value until I see the research backing it up. Also interesting to me is this. That scientist from Paris, the one that "discovered" this great new probiotic with so-called healing powers. This person didn't follow up with the new found knowledge or spread the word so all of mankind could benefit because he couldn't "market it" ? Yeah, that's my kind of guy.

seth (2009-10-26 03:33:15)

Yes, who would pay for a study comparing an expensive probiotic with cheap kefir? No one. I agree that's a big problem. We are now stuck with a weird kind of public-health science where the most important study – does cheap stuff like kefir and yogurt help? – can't possibly be done and all we have instead are studies of expensive imitations. It's like a taxi system where the shortest route from A to B is prohibited; you must take a much longer route.

bgc (2009-10-26 07:25:51)

@seth: "We are now stuck with a weird kind of public-health science where the most important study – does cheap stuff like kefir and yogurt help? – can't possibly be done and all we have instead are studies of expensive imitations. It's like a taxi system where the shortest route from A to B is prohibited; you must take a much longer route. " Even worse, the failure to fund trials is combined with a suffocating dominance of the perspective of self-styled 'evidence-based medicine' (EBM) - including the groundless notion that only mega-trials should be taken seriously. <http://trialsjournal.com/content/2/1/2> The combination of misunderstanding and consequently overvaluing the function of large trials, with the ignorant denigration of other sources of medical knowledge, means: 1. that progress is only recognized when it is via mega-trials, and therefore 2. he who controls megatrial funding controls 'authoritative' medical knowledge. Since the vast majority of randomized trials are industry funded, EBM has meant that industry has a de facto monopoly on 'reputable' therapeutic knowledge. Delivering us into the hands of Big Pharma was not - of course - intended by the socialistic founders of EBM, but it has happened nonetheless. However, so long as they get their paychecks and power, the EBM leadership aren't protesting about the fact. <http://charltonteaching.blogspot.com/2009/08/zombie-science-of-evidence-based.html>

Dan (2009-10-26 10:22:48)

Lately there's been a lot of talk about newspapers looking into going non profit and/or finding a large foundation or single rich guy to support them, just to stay alive, (of course they brought this on themselves but I digress). The idea is that the republic "needs" big newspapers. This is hogwash but a discussion for another day. It's the same thing as lobbyists in Washington trying to hold on to their own self interests for the corporations they represent. The same initiative however, could be directed to a more noble and moral cause, toward finding a foundation to support research into alternative health cures using food or suppliments. This seems like a good group somebody should start up. The rub on alternative health, from juicing to kefir, has always been that it's only supported by "anecdotal evidence". Your statement above about research money only going to drugs that can be profitable is exactly what's going on. However in this age of the web and groups forming etc., it seems like now might be the time for a change in this situation. What do you think?

Seth's blog » Blog Archive » Evidence-Based Medicine (2009-10-26 17:16:10)

[...] In the comments, Bruce Carleton writes: The failure to fund trials is combined with a suffocating dominance of the perspective of self-styled "evidence-based medicine" (EBM) - including the groundless notion that only mega-trials should be taken seriously. . . Since the vast majority of randomized trials are industry funded, EBM has meant that industry has a de facto monopoly on "reputable" therapeutic knowledge. seth (2009-10-26 17:17:21)

Dan, I agree that it might be time for a change, for just the reason you say. Indeed, I think we are in the middle of one. Or more precisely in the midst of the beginning. Self-experimentation is highly subversive; the mere fact that you're reading this blog is a step forward. Self-experimentation is fundamentally a way to find new ideas. Another piece of a new ecology are Alexandra Carmichael's CureTogether.com and the similar PatientsLikeMe.com. They are ways of testing new ideas. Both self-experimentation and the websites need no support at all from the health-care establishment.

### Winter Swimming (2009-10-26 07:31)

In [1]Jilin Province, where it gets very cold in the winter, the older residents engage in [2]winter swimming. It's good for their health, they say. Everyone knows this, a friend of mine who grew up there told me. On TV, she once saw an old woman say that she was having heart problems, but once she started winter swimming they got better.

When he was a grad student at Harvard, a friend of mine raised rats to be in learning experiments. He found that if he handled the rats - stressing them, essentially - they grew larger and healthier than unstressed rats.

[3]The cosmic ray effect I mentioned earlier - that trees grow more when there is more cosmic radiation - occurred with older trees but not younger trees.

If you've ever designed an experiment, you know that both the treatment and the measurement need to be neither too high nor too low. With the treatment, that's obvious. I suspect all three of these phenomena are examples of positioning the measurement appropriately. They suggest that everyone needs some sort of stress to be in the best health, but only in certain situations is it easy to see this.

Aaron Blaisdell (2009-10-26 08:14:08)

I was very shy and meek from kindergarten though high school. As a result, I was bullied a lot (but somehow managed to avoid being beaten up). I think that social stress has been like a social hormesis in making me more robust to social stressors as an adult.

Peter McDonnell (2009-10-26 09:39:54)

Art deVany, the evolutionary fitness guru, recommends ending a shower by running cold water over the legs to strengthen the body.

MT (2009-10-26 11:13:28)

An article in the NYTimes today (Oct 26) said that CNN's last-place finish in the prime-time program ratings demonstrates that viewers prefer opinion-oriented coverage. CNN has moved their opinion shows to their subsidiary, Headline News, which is now beating them in the primetime ratings. As someone who finds opinion coverage generally shallow and divisive I was disappointed but not surprised to hear this, but it reminded me of this post. People like stimulation, even if it is the "negative" stress of learning about things that make them angry/upset/shocked, etc, which most news coverage does. Most coverage is informative, but boring, and most people seem to prefer being stimulated to being informed. <http://mediadecoder.blogs.nytimes.com/2009/10/26/cnn-drops-to-last-place-among-cable-news-networks/>

Nathan Myers (2009-10-26 12:49:31)

The ones that don't die from it are the healthier ones. I suppose that could happen at the cellular level too.

Aaron Blaisdell (2009-10-26 15:12:32)

@Nathan. It sort of does at the neural cell population level. It's called synaptic pruning. Synapses are being generated all the time, but only a very few end up surviving after two weeks. Those that survive are selected by the fact that they were stimulated. No stimulation = death for early neurons. Probably happens to stem cells, too, I imagine.

seth (2009-10-26 17:30:34)

very interesting point MT, that maybe our interest in divisive coverage comes from not getting enough shaking up elsewhere. But I think there is a huge sex difference: Men like Fox News, women don't. I'd guess the need for stress doesn't vary much across sexes.

Anonymous (2009-10-26 23:01:08)

"I think that social stress has been like a social hormesis in making me more robust to social stressors as an adult." @Aaron Blaisdell. That is a very interesting point. Perhaps it can be applied to mental health in general, i.e. that there is a kind of mental health immune system that is strengthened through hormesis-exposure to the violence of nature, death of loved ones during childhood, lack of leisure time in childhood, getting beaten up, etc. If it's true that the last half-century has seen a 10-fold increase in depression in the US, depending on who you ask, perhaps one cause lies, counterintuitively, in the REDUCTION of mental health hormesis events.

Aaron Blaisdell (2009-10-27 06:42:58)

@Anonymous. Thanks for the thoughts. And don't forget the campaigns against letting kids watch slap-stick violence on TV. I used to love the Bugs Bunny cartoons, especially the episode where daffy duck kept having his bill blown off by Elmer Fudd's gun. LOL! But then in the 90s they started editing those scenes out. Now I can't even find BB on tv anymore. Or Popeye. or Tom and Jerry (talk about the cartoon violence!). There are likely many reasons why these older (and often more violent) cartoons are no longer airing on TV. Some are surely that a) marketers behind the newer TV shows are making a killing (pun intended) off of the toys, games, etc. that stem from newer shows, b) the huge increase in "edutainment" marketed for younger children (e.g., Dora, Diego, Kai lan) which in my mind is just an extension of point (a), and c) these older cartoons were deemed too violent for young children, who would have trouble distinguishing it from real violence. Well, I watched those cartoons since I was a young child, laughed my ass off, and never once considered it to be real in any sense or had any thoughts of engaging in any of those acts with real people. I think sometimes adults don't give enough credit to the intelligence and resilience of young children.

## Evidence-Based Medicine (2009-10-26 17:16)

In the comments, [1]Bruce Charlton writes:

The failure to fund trials is combined with a suffocating dominance of the perspective of self-styled “evidence-based medicine” (EBM) - including the groundless notion that only mega-trials should be taken seriously. . . Since the vast majority of randomized trials are industry funded, EBM has meant that industry has a de facto monopoly on “reputable” therapeutic knowledge.

Delivering us into the hands of Big Pharma was not - of course - intended by the socialistic founders of EBM, but it has happened nonetheless.

This reminds me of something one of my students said. We were discussing male/female differences – in particular, the observation that women are more religious than men. One student said that in her experience, guys were either not religious at all or very religious.

I agree with her. I think this is why EBM has the form it does. Its male founders – not understanding the tendency that my student pointed out – went from one extreme (medical orthodoxy, unrelated to evidence) to another (evidence-based medicine). Reliance on evidence is a good idea, yes, but the founders of EBM couldn’t help making it resemble a religion. You might think that relying on evidence is the opposite of religion but they made the whole thing as religious as possible. EBM became just another way – just another excuse, really – to sneer at people.

1. <http://www.blog.sethroberts.net/2009/10/25/use-of-probiotics-in-hospitals/#comment-355038>

Armands (2009-10-27 01:25:19)

Seth, why don't you just do a clinical trial of shangri-la and get over with it?

seth (2009-10-27 03:44:07)

Because they're extremely difficult.

david (2009-10-27 06:42:24)

So you just need to find a big corporation that stands to profit from the results of the experiment...oh, wait, never mind.

MT (2009-10-27 07:01:59)

A problem with Evidence-Based Medicine is that the evidence is often corrupted by being based on bad science or bad regulation – making EBM potentially worse than the alternatives. It has the credibility of “evidence” but that evidence can actually be wrong, misguiding the public and policy makers. Apparently the FDA approval process only requires drug companies to submit a certain number and type of studies, and in the case of SSRIs this has meant that if they do a study showing a lack of efficacy of their tested product they don’t have to submit that result for consideration. They can ignore ten negative results, as long as the submitted studies suggest efficacy. Similarly, if they are in the midst of a study whose outcome is likely to suggest the product doesn’t work, they can abort the study. So what quality of “evidence” are we really getting? It isn’t that EBM is a bad principle, it is that the standards for evidence are so distorted by systemic institutional inefficiencies and moral hazards.

Dr Mike (2009-10-28 09:45:18)

It really depends how you define evidence. With EBM if the patient feels better that doesn't count unless you can measure it, but there are no valid objective measures of "better". If your evidence is from a mega trial that shows statistically significant improvement, as it will with a big enough cohort, but is not clinically significant what good is it? But from EBM viewpoint it's a goer. The emperor really has no clothes!

The Newest Put Down | FrumForum (2010-03-12 13:45:18)

[...] The newest way to slam a belief you disagree with — or maybe it's not so new — is to call it "religious." Â For example, "Market Fundamentalism is a quasi-religious faith that unregulated markets will somehow always produce the best possible results," and so is global warming ("The only difference between the religions right and the religious left, is that the religious right worships a man, and the religious left worships . . . Mother Nature"). Â As is evidence-based medicine ("as religious as possible . . . just another excuse, really — to sneer at people"). Â And then there's the religion of Darwinism. [...]

## **The Alternate Universe of Fermented Foods (2009-10-28 05:45)**

In the Afterword to *Lolita*, Vladimir Nabokov wrote that in his books he tried to create an alternate universe "where art (curiosity, tenderness, kindness, ecstasy) is the norm." Fermented foods are now a big part of my food world and I remain amazed how different they are from ordinary foods. They are in another universe:

**Temperature.** To make ordinary food requires high temperatures. You need always be careful that you don't hurt yourself. Fermented food requires no higher temperature than a hot day.

**Deliciousness versus health.** With ordinary food there is the tradeoff we are endlessly familiar with: If it tastes good (ice cream, chocolate, cookies) it's bad for you. If it's good for you – spinach, carrots, cabbage, brown rice, soy products – it doesn't taste so great. Anyone who thinks raw food tastes better than cooked food is ignoring history. Whereas fermented food tastes great and is incredibly healthy. (This point has been missed at any number of otherwise great American restaurants, such as Chez Panisse.)

**Price.** In Berkeley, heirloom tomatoes cost a lot more than ordinary tomatoes. They taste a lot better, too. Perhaps, being organic, they are healthier. The general rule is that better food costs more. An apple costs more than a Coke, etc. Whereas fermented food is often dirt cheap. Kombucha is practically free. For 5 teabags and a cup of sugar, you can make a lot of kombucha. Ordinary milk is cheap but to me at least nutritionally worthless. Whereas yogurt is gold. They cost the same.

**Time.** Ordinary food takes minutes or no more than an hour or two to make. Fermented food takes somewhere between a day (yogurt) to a month (kombucha) to longer (wine, cheese).

**Difficulty.** In my experience, it isn't so easy to prepare a delicious meal if you're not using fermented food. With fermented food it becomes so much easier. And the result is far healthier, I'm sure.

**Need for refrigeration.** Fermented food goes bad very slowly at room temperature. Not so ordinary food. I once visited a New York pickle store/factory. No electricity.

You can read a great novel again and again, yes, but not every day. After I read *Lolita* four or five times, it lost its power over me. But I can happily eat fermented food at every meal, day after day and – judging by other food cultures – year after year.

---

Darrin Thompson (2009-10-28 08:17:05)

My one gripe with fermented foods is can't go to Walmart and try a new one for a buck. Prepared fermented foods in stores cost a premium and are usually weak. That's my other one gripe. If you can find it prepared, it's weak. At least that's been my experience with kefir. My mom in law makes some from unpasteurized milk and lets it ferment for longer than the store stuff. The mom stuff fixes allergies. The store stuff is fun but no allergy relief. I wonder if there's a market for a food product which is just a bite sized sampling of a bunch of available fermented foods?

seth (2009-10-28 13:57:48)

Darrin, that's interesting that your mom's kefir fixes allergies but the store stuff doesn't. In Beijing, you can try maybe 20 or 30 fermented foods, various kimchi and pickles, for a buck. They are sold in whatever quantities you want. In Japanese stores, miso is sold in whatever amount you want.

JLD (2009-10-28 18:45:28)

"Big Research" is [1]catching up on bacteria.

1. <http://communications.med.nyu.edu/news/2009/unusual-bacteria-help-balance-immune-system-mice>

### **Too Big to Fail (2009-10-28 15:15)**

An example of "too big to fail" never mentioned in discussions of the financial crisis are big public-works projects: In spite of staggering cost overruns, which occur in practically every project, they are never stopped. The latest example is [1]London's Crossrail, a new train crossing London. Original estimated cost: 3 billion pounds. Current estimated cost: 16 billion pounds. And construction hasn't started!

I heard a talk about why this happens. I think the speaker said there was no motivation to be honest. The companies that underbid dishonestly pay no penalty; the politicians that approve their dishonest bids risk nothing. Curiously, in notoriously corrupt China, this sort of thing doesn't seem to happen (although my Chinese isn't good enough to be sure). Maybe Dubner and Levitt will write about this in Superduper Freakonomics.

At a talk by Laurie Garrett at the UC Berkeley School of Journalism, I made this point about science journalism: There is no motivation to be honest. The scientists dishonestly inflate the importance of their work, and pay no penalty for doing so; the reporters dutifully write down their lies, and benefit by doing so (because it makes the story seem more important). *No, no, this doesn't happen*, said Garrett. Of course it does. The most visible examples are the press releases that accompany the Nobel Prize in Medicine and Physiology, the most prestigious prize in all biology: the whole field should be embarrassed by the claims about the practical importance of telomere research, which [2]Nicholas Wade dutifully repeated in the New York Times.

There should be some term for these screw-the-public-they're-too-stupid-to-realize-it situations.

1. <http://www.nce.co.uk/section2.aspx?navCode=468>

2. <http://www.nytimes.com/2009/10/06/science/06nobel.html>

---

Peter McDonnell (2009-10-29 06:00:24)

Hi Seth, I enjoy your blog greatly. How about "Boondoggle"? as in a boondoggle project, from Wikipedia: "It also refers to government or corporate projects involving large numbers of people and usually heavy expenditure; at some point, the key operators have realized that the project is never going to work, but are reluctant to bring this to the attention of their superiors. Generally there is an aspect of "going through the motions" â€" for example, continuing research and development â€" as long as funds are available to keep paying the researchers' and executives' salaries. The situation can be allowed to continue for what seems like unreasonably long periods, as senior management are often reluctant to admit that they allowed a failed project to go on for so long. In many cases, the actual device itself may eventually work, but not well enough to ever recoup its development costs."

Darrin Thompson (2009-10-29 06:15:07)

I want to say that term is "bailout" but that's overloaded by the connotation that these things are necessary or inevitable. The story is all wrong. "Freedom Torches" would be another one. Not very direct but you get to tell the story of the original PR man promoting cigarettes for mommies. It's got that cynical overtone such a term needs. Or maybe go the other way with morbidly blank words like, "optional public crisis", "public insurance," or "noncompulsary emergency event."

Nathan Myers (2009-10-29 13:11:33)

Haven't you heard of the Three Rivers Dam?

seth (2009-10-29 13:39:32)

Nathan, trying to figure out what you are talking about I got this:

Your search - "three rivers dam" gigantic cost overruns - did not match any documents.

could you provide a link? "boondoogle" isn't right because these projects do work; they just cost vastly more than estimated.

Peter McDonnell (2009-10-29 16:57:46)

I suspect that Nathan meant "Three Gorges Dam"

JLD (2009-10-29 23:51:18)

Pretty puzzling that being in China you could not identify [1]the matter. Thus the chinese gov't "control" over news is pretty effective.

1. <http://www.google.com/search?hl=en&safe=off&edition=us&num=50&q=%E2%80%9Cthree+gorges+dam%E2%80%9D+cost+overruns&btnG=Search&aq=f&oq=&aqi=>

Tom in TX (2009-10-30 09:52:02)

"There should be some term for these screw-the-public-theyâ€™re-too-stupid-to-realize-it situations." I think they are called "government projects".

Igor Carron (2009-10-31 07:33:35)

There may be good reasons sometimes as to why these projects do change in their price tags over time. I have seen several projects like this and clearly remember a prof at MIT showing us why (I need to dig his name up, I think it was Michael Golay, <http://web.mit.edu/nse/people/faculty/golay.html>). The idea was that in a government projects, the customer (the government) ends up changing the requirements of the project many times over the life of the project. These changes of requirements are extremely bad with regards to the flow of execution of the project. In the space business for instance, there is one example that is pretty interesting: Spacelab, a large cylinder that goes in the shuttle's belly for astronauts to do their

experiments. A company ended up designing the same cylinder and eventually sold the services to this new cylinder to NASA. It was pretty obvious that the company's cylinder had cost much less than the original Spacelab built inside NASA. However, as is often the case in comparing gov and private projects, it is a somewhat an unfair comparison as the second cylinder was built with the knowledge of what the first cylinder final requirements were. The big lessons are that in extremely complex projects, sometimes you should not allow your customer to be able to change your requirements as you go.

JLD (2009-10-31 10:21:23)

*The big lessons are that in extremely complex projects, sometimes you should not allow your customer to be able to change your requirements as you go.* Wait til you enter real professionnall life. Retired consultant.

Igor Carron (2009-10-31 11:15:51)

It is a big lesson for the customer (the government in this case). O agree, consultants can and do strive in this environment.

### **Reduced Diversity of Fecal Bacteria Correlated with Diaper Rash (2009-10-30 06:28)**

In [1]a 2008 study, researchers took fecal samples from 35 babies when they were one week old. They measured the diversity of bacteria in those samples. When the babies were 18 months old, they were divided into two groups: with (n = 15) and without (n = 20) atopic dermatitis, commonly called a rash. Atopic dermatitis is a sign of an oversensitive immune system. Children with this problem are more likely to have allergy problems when they are older. The 2008 study found that the babies with atopic dermatitis had less diverse fecal bacteria.

This is more evidence connecting lack of bacteria with immune problems.

1. <http://download.journals.elsevierhealth.com/pdfs/journals/0091-6749/PIIS0091674907017678.pdf>

---

jean (2009-10-30 17:50:36)

It would be interesting to know if bottle fed vs breast fed would correlate with the rash and fecal bacteria count. I think so.

seth (2009-10-30 18:07:43)

yeah, that's a good question.

### **Who is "Totally Healthy"? (2009-10-30 17:44)**

I watched [1]this 60 Minutes piece on swine flu. Of course nothing was said about boosting immunity as a defense. "The best way to reduce your chances of one of those terrible outcomes [hospitalization, death] is to be vaccinated," said Anne Schuchat, who has a very high position at the Centers for Disease Control and Prevention.

This is just part of a bigger delusion. The story centers on a football player who gets seriously sick after a football game. Schuchat said this:

This is one of the tragic parts of this epidemic. That people who are in the prime of their life, totally healthy, can suddenly become so sick.

Totally healthy. This is the bigger delusion: That the average American who appears healthy is healthy. I believe that practically all Americans have grossly-impaired immunity. Their immune systems work much worse than they could. The poor performance is due to suboptimal sleep and far too little bacteria in their diet. The football player was near death because he had two out-of-control infections. That's how poorly his immune system was working. And a top CDC official called him "totally healthy"! Apparently she has no idea that people's immune systems can vary in how well they work. This is even worse than [2]the UCLA medical school prof specializing in infectious disease who also failed to understand this. Schuchat is one of the top public health officials in America! Public health is about prevention. [3]According to Wikipedia, Schuchat "has emphasized prevention of infectious diseases in children."

---

Nathan Myers (2009-10-30 22:02:17)

Most of the people killed by the Spanish flu were those whose immune systems responded most vigorously. The immune system is, first and foremost, a *system* – that is, a machine based on a model of its environment, and programmed with responses that have worked just well enough in the past to keep enough of a population reproducing that there *is* a next generation, without costing too much, metabolically. No model, and no set of programmed responses is perfect, for all possible environments, and pathogens are continually testing the limits of both. There can be no rational reason to believe that any treatment of the immune system, not even with a brilliantly designed program of bacterial exposure, can change that fundamental fact. No amount of yogurt can protect you from HIV, or from HPV, or from HSV, or from certain flus. The immune system isn't magic, and yogurt isn't magic.

Eugene (2009-10-31 08:04:23)

Here's a good talk about the [1]hygiene hypothesis, the current literature on the subject, and ongoing studies. "Dr. Michael Cabana explores which conditions are benefited by the use of probiotics and what the future holds."

1. <http://www.uctv.tv/search-details.aspx?showID=16721>

Timothy Beneke (2009-10-31 09:11:19)

Seth, Regarding suboptimal sleep and the immune system, I know that sleep deprivation makes one more vulnerable to colds, and in more severe forms has induced diabetic type symptoms in healthy young people. Do we have longitudinal, correlational research showing that people who sleep poorly get more sick and die younger? This research would not be hard to do. Every year, you simply ask people to report on how they have been sleeping for the past year, how many hours, how often they wake up, when they sleep etc... I would assume that longitudinal studies would have already covered this, but I've never seen it reported. I think you are right but I'd want to see basic correlation between poor sleep and sickness before I would begin to be confident about it...

## **"Some of Them Will Have the Wrong Answer" (2009-10-31 08:26)**

In Exploratory Data Analysis, John Tukey tells about visiting a high-school chemistry class. Each student in the class had done an experiment to determine a physical constant. Tukey suggested to the teacher that they gather and plot the results. The teacher didn't like this idea. Some of the students will have gotten the wrong answer, said the teacher. Tukey didn't know what to say.

In [1]a previous post, I said there is great stagnation in health care. Obesity and mental illness are the examples most obvious to me, but there are many other problems on which our health care system has made little progress for a long time. (Sure, we should have universal health care but the idea that this will do much about the obesity epidemic, the autoimmune disease epidemic, the autism epidemic, and so on, is absurd. Doctors don't know how to get people to lose weight. A reasonable health care system would focus on prevention. That is something the current batch of doctors doesn't know how to do.) I added that a reasonable health policy would empower those who benefit from change.

That's a difficult thing for people in power to do. Not only does it mean giving up power, it also means giving it to "the wrong people". The people you like to demonize. People who are . . . not respectable. Not clubbable, John Cheever might say. And, quite apart from that, some of them will have the wrong answer. Tukey's high-school chemistry class was at a fancy private school, where we might expect such elitist attitudes. But I heard the same thing from colleagues at UC Berkeley when I would suggest giving students much more power to determine what they learned in a psychology class. Some of them will want to learn the wrong things, said my colleagues. I think Tukey was trying to say that the chemistry teacher didn't understand variability but I think the psychological point of his story is even more interesting.

## **Effect of Animal Fat on Sleep (more) (2009-10-31 18:01)**

After [1]the striking correlation I described earlier – I ate lot more animal fat than usual and slept longer and had more energy the next day – I started eating much more of what had produced the correlation: pork belly (which is used to make bacon). I couldn't get uncured pork belly, so I ate bacon. I usually ate it raw. I tried several brands; the only one I liked was from [2]Fatted Calf ( \$10/pound).

In Beijing I discovered pork belly for sale in every meat department. It is used to make [3]a dish said to be Chairman Mao's favorite. I bought a soup cooker, an appliance I haven't seen in America, which made it easy to cook the pork belly. I seemed to sleep better when I had it for lunch.

Finally I did an experiment. I ate pork belly for lunch some days but not others. I ate the pork belly in miso soup, with vegetables. I always ate a whole package of pork belly, which was about 0.7 lb and perhaps 80 % fat, 20 % meat. On baseline days I ate my usual diet, which was already high-fat by people's standards. (For example, I ate a lot of whole milk yogurt, a fair amount of nuts, and ordinary amounts of meat.) I tried to alternate baseline and pork-belly days but this wasn't always possible.

Here are the results on ratings of how rested I felt when I awoke (100 % = completely rested = the most rested I have ever felt, 0 % = not rested at all).

[4]

The lines were fit separately to each set of points (red line to the red points, etc.). The difference is very consistent ( $t = 5$ ). Differences in how long I slept were much less clear. I will discuss them in a separate post.

The fascinating thing about this effect isn't just how clear it is; it's also how fast it goes on and off (within a day). With most nutrients you'd never see an effect like this. For example, scurvy takes months to develop and a few weeks to recover from. The omega-3 effects I've studied have a fast onset but take days to go away.

Sleep is controlled by the brain, of course. The brain is more than half fat, but determinations of how much fat the brain has have measured structural fat. This effect is so fast, both on and especially off, that it must involve circulating fat. Apparently my brain works better when there is a certain amount of animal fat in my blood. This supports Chairman Mao's idea that pork belly is "brain food" but is a new idea for American intelligentsia. I think the chance that a nutrient that is good for one part of the body is bad for another part is zero – the same as the chance that the electrical appliances you own work best with widely-different currents. The obvious conclusion suggested by this data is that we need plenty of animal fat to be healthy. The only novel element of these lunches was the animal fat. Miso soup with ordinary meat has no effect on my sleep, as far as I know.

I think the science of nutrition proceeds in four steps, repeated over and over for each necessary nutrient: 1. Figure out that we need it. 2. Determine a way to measure how much of it we need. 3. Figure out the optimal amount. 4. Check your answer. With animal fat, conventional nutrition science hasn't quite reached Step 1. Before this data, I'd say the clearest evidence that we need animal fat is that fat tastes good and long ago we had very little plant fat so it must have been the benefits of animal fat that produced the fat-tastes-good linkage. But conventional nutrition scientists never think this way – never take what we want to eat as meaning anything. And the mere fact that fat tastes good is no help figuring out how much is best.

This data pushes our knowledge toward Step 2. It doesn't just suggest we need plenty of animal fat for best health, it also makes two methodological points: 1. Animal fat improves brain function. There may be better measures of the improvement than sleep quality. 2. The timing of the improvement – which as far as I know is unprecedented in the study of nutrition – makes it easy to measure.

Yesterday at a Carrefour I watched a pig being cut up. The butcher cut off the skin (with a thick layer of fat) and tossed it into a section of the display of pork for sale. I could buy the part of the pig I valued most for an incredibly low price (about 25 cents/pound). All other pork cost more. That's how much Chinese shoppers wanted it. No one rushed to buy the newly-cut piece of skin. It reminded me of New York [5] where I tried to buy food past its expiration date, ordinarily considered worthless.

---

Nathan Myers (2009-11-01 01:18:59)

It probably makes a big difference what the pig ate. We don't call them "soup cookers", we call them "crock pots" in the US.

LF (2009-11-01 02:09:20)

This would explain why drinking a glass of \*whole\* milk helps some to get a better sleep...

seth (2009-11-01 04:39:26)

A soup cooker cooks food at a higher temperature (mine heats its contents to 204 degrees F.) than a crock pot – even a crock pot set on "high". Crockpots cook food at 190 degrees or less, in my experience.

Bob (2009-11-01 08:20:36)

This suggests another important hypothesis to test: low fat diets cause dementia.

Carol (2009-11-01 09:46:21)

So animal fat behaves more like a drug than a nutrient?

Kevin Miller (2009-11-01 10:06:44)

Interesting. I have two concerns. First, I'd be a little leery of eating \*too\* much big fat in China. You've probably seen the bicycle/carts carrying slops from restaurants out to the suburbs (leftover food and oil) to be fed to pigs. Wonderful from an ecological point of view, but I worry that it might tend to concentrate noxious fat-soluble stuff in the pigs after you go through a few rounds of this. I also would be loathe to use Chairman Mao's predilection for Hunan food as a recommendation for this, unless you want to also recommend some of his other habits (never brushing his teeth, sleep with a lot of young girls in his declining years) – probably all things that our Paleolithic ancestors would have done, or wanted to do, but maybe not things we'd endorse (alternatively: New fields for self-experimentation!). Sounds like you need to check out some Hunan restaurants. I can't remember the name of the one we used to go to downtown, just off north Wangfujing (somebody's family restaurant). I did find this pretty strong recommendation, although it's bound to be very upscale, given the location: "2. Karaiya S10-30, The Sanlitun Village, 19 Sanlitun Beilu, Chaoyang District Tel 6415 3535 吃家 Village, S10-30 Karaiya, which means spice house in Japanese, delivers the superb flavors of Hunan by using quality ingredients with a modern twist. Spicy Pepper Diced Rib-eye, a must order dish studded with red peppers, is stimulating while at the same time not dominating the flavor of the meat. Also try deep-fried stinky bean curd. The concise bilingual menu is easy to navigate without having to plow through confusing page after page of dishes. The cheerful and pleasant environment makes Karaiya one of the best dining destinations in the capital." We went hiking in Zhangjiajie once and

had lunch on top of a mountain. There was one dish that had slices of what I thought was some kind of melon, but actually were pieces of fried pig fat. Having hiked uphill all day, it was quite delicious.

CTB (2009-11-01 10:12:56)

Pork fat is also sold as 'lard.' Makes a great pie crust for apple pie. I remember my dad saying that back during the Great Depression, many laborers ate lard sandwiches for lunch...including both my grandfathers who were blacksmiths. Both died from heart attacks in their early 70's. When you can no longer work off your daily intake, it might just start clogging your arteries. Best to monitor cholesterol etc. Lard went out of favor for baking with the advent of Crisco-like shortenings (partially hydrogenated soybean/vegetable oil). But partial hydrogenation creates a lot of transfat, which is now known to be a problem. The new Crisco has had much (but not all) of its transfat removed...but piecrusts made with it just aren't the same (IMHO). Maybe lard will be making a comeback of sorts. I've found that when I'm wired and can't sleep, a big bowl of potato chips works like a charm.

thehova (2009-11-01 13:03:07)

I think fish oil helps me sleep, which I guess would be consistent with animal fat.

David (2009-11-01 13:36:20)

Thehova: A whole pork belly and a couple fish oil caps are on completely different levels. You're talking about adding 2-5 grams of animal fat to your diet; Seth is adding 255 grams (if the 0.7lb/ 80 % fat figure is accurate), and significantly altering his macronutrient ratios. Seth: I've had the exact same experience. The more animal fat in my diet, the better I sleep, without exception.

seth (2009-11-02 00:10:54)

Carol, that's an interesting point. Animal fat behaves more like a drug than a micronutrient, certainly. Macronutrients such as glucose can have fast on and fast off effects. But we don't need glucose every day for anything to work properly.

Peter McDonnell (2009-11-02 05:57:58)

Here is a paper "Alterations in mood after changing to a low-fat diet." [http://www.ncbi.nlm.nih.gov/sites/entrez?Db=pubmed&Cmd=ShowDetailView&TermToSearch=9505799&ordinalpos=15&itool=EntrezSystem2.PEntrez.Pubmed.Pubmed\\_ResultsPanel.Pubmed\\_RVDocSum](http://www.ncbi.nlm.nih.gov/sites/entrez?Db=pubmed&Cmd=ShowDetailView&TermToSearch=9505799&ordinalpos=15&itool=EntrezSystem2.PEntrez.Pubmed.Pubmed_ResultsPanel.Pubmed_RVDocSum) Interesting stuff that appears to confirm Seth's findings. I came across it on the Hyperlipid blog.

Matt Weber (2009-11-02 10:37:17)

Seth or David: I can't imagine the answer to this would be "yes," since you are human beings with lives – but have you tried controlling for overall fat intake? i.e. is it clear that \*animal\* fat is critical? CTB's anecdote suggests that any kind of fat might work.

Darrin Thompson (2009-11-02 11:01:18)

Animal Fat -> Heart Attack. Everyone knows that. It's worth examining why we are so sure about it.

Nile (2009-11-02 11:44:34)

Please don't eat any more raw pork. Trichinosis is a nasty little parasite. Rare in the US because of the sanitary way we raise our pork but common elsewhere. From the Mayo clinic "Mebendazole or albendazole can be used to treat infections in the intestines. There is no specific treatment for trichinosis once the larvae have invaded the muscles. The cysts remain viable for years. Pain killers can help relieve muscle soreness" The larvae can also invade the brain and internal organs. In case you are unconvinced about how nasty the parasite is you might want to find the YouTube video of a trichinosis worm that was removed from a woman's brain. The woman lived in the USA. Note " There is no specific treatment once the larvae have invaded the muscles."

Nathan Myers (2009-11-02 20:00:27)

Nile: Not to worry, "cured" isn't the same thing as "raw".

Nathan Myers (2009-11-03 11:03:39)

Seth: Seriously, hasn't it occurred to you that maybe it's not the pork fat itself that's helping you sleep, but some minor component of it? Maybe you're getting a measured-out dose of melatonin or some other hormone.

David (2009-11-03 14:19:26)

Will be keen to see your follow-up heart scan score with all that dietary animal fat...

seth (2009-11-03 17:02:20)

Nathan, I agree, pork fat has many components, you are right that I don't know which of them makes the difference. That's a long way away – right now I'd like to figure out the best dose. David, yeah, me too. It's great to be actually able to get data about this.

Seth's blog » Blog Archive » Dietary Fat and the Brain (2009-11-04 20:04:56)

[...] Over the last six months I've come to believe that animal fat improves my sleep. Because sleep is controlled by the brain, this suggests animal fat may also improve other measures of brain function, just as omega-3 turned out to improve brain function in a wide range of ways. I didn't know about a recent experiment done with airplane pilots that supports that idea. This was the design: A total of 45 pilots (mean age, 20.8 years; 87 % male) from the [University of North Dakota] commercial-aviation program were enrolled in this 14-week repeated-measures crossover trial. [...]

Alrenou (2009-11-05 17:05:51)

Re: parasites, from wikipedia, "Bacon is a cured meat prepared from a pig. It is first cured in a brine or in a dry packing, both consisting largely of salt; the result is fresh bacon (also green bacon). Fresh bacon may then be further dried for weeks or months (usually in cold air), boiled, or smoked. Fresh and dried bacon must be cooked before eating. Boiled and smoked bacon are ready to eat, but may be cooked further before eating." If the bacon's ingredients include 'smoke' then it's perfectly safe to eat - it's already been cooked.

Seth's blog » Blog Archive » Saturated-Fat Epidemiology (2009-11-07 22:15:33)

[...] The obvious confounding is with wealth — rich people eat more meat than poor people. Were this data submitted for publication, I imagine someone would say how dare you fail account for that! and reject the paper. That would be a mistake. Because it is hard to look at this data and continue to think that saturated fat is the evil it is made out to be. And of course whatever the weaknesses of my sleep/fat experiment (which showed animal fat improved my sleep), confounding with wealth was not one of them. [...]

Seth's blog » Blog Archive » More Animal Fat, Better Sleep (2009-11-10 17:53:34)

[...] My self-experiment about this. [...]

Nile (2009-11-10 19:52:45)

Seth, Nathan Myers and Alrenou- All ready to eat pork products in the US are heated to at least 150 degrees, considered the safe temperature to kill all trichinosis parasites. 137 degrees is the actual temperature at which the parasite dies but because of the possibility of uneven heating pork is heated to 150 degrees to provide a margin of safety. It is doubtful that a butcher in china has the same sort of rigorous QA that, for example, Hormel does. I think we all can envision a homemade smokehouse where the temperature does not get above 150 degrees. Drying or salting does not kill trichinosis. Once trichinosis gets into the muscle THERE IS NO CURE AND IT IS VERY PAINFUL !! Besides, there is no downside to cooking pork. Cooking does not hurt the flavor. Please, all of you, don't eat pork that has not been cooked even if it has been "cured"

Mark (2009-12-26 04:59:21)

I use an electric pressure cooker for soup. I imagine that the soup cooker appliance is motivated by the typical Chinese stove

having fewer burners than a U.S. stove—is that right? Most U.S. stoves have 4, but in Japan we have 2, so an electric pressure cooker in effect adds a burner for me. Trichinosis only affects a dozen people a year in the U.S., which shows it's not that easy to get, considering how many inept cooks there are. If you don't worry about anthrax or black plague, you shouldn't worry about trichinosis. I suspect Nile is a PETA guy, or an unsuspecting stooge of their scare tactics. Canada has higher rates from wild game consumption like bear meat.

Patrik (2010-03-09 13:24:45)

@Seth A recent discussion on PaleoHacks also broaches this subject. One of the PaleoHackers writes: "I'm convinced that many forms of mental illness, particularly things like depression, anxiety and insomnia, are caused in large part by not getting enough animal products in your diet – particularly saturated fat, which is a precursor for a number of hormones that affect mood and energy." <http://paleohacks.com/questions/1460/depression-adhd-anxiety-and-paleo/1461> #1461 I happen to think the same.

American Mini-Meatloaves Italiano « The Everyday Cafe (2010-08-03 14:51:23)

[...] 1 lb. sweet or hot Italian pork sausage (or turkey, if you like, but pork fat may help you sleep better) [...]

billy (2011-12-14 10:21:26)

Cholesterol which comes from fat. Is a precursor to every hormone in your body. You need proteins, carbs and fats in every meal. More people are afraid of fat and are not eating fat and were getting fatter.

How to wake up and feel alert | bodybarn.com (2012-03-08 09:10:12)

[...] Now, I don't think this one will be a hard sell with the PB crowd, but I'm always happy to tell you to eat more animal fat. After Seth started working his way through a pork belly (which is uncured bacon, essentially, and mostly pork fat) that'd been sitting in his freezer, he immediately slept better. As in, the day after his first pork belly meal, he slept better. This effect persisted. [...]

Anonymous (2012-04-18 17:25:26)

It's the miso soup that makes you sleep better, not the pork belly.

## 4.11 November

### Emily Nussbaum Has a Blog (2009-11-02 01:49)

Emily Nussbaum, the brains behind New York's The Approval Matrix, which I read religiously, [1]blogs about television here.

Other magazine journalists I wish would blog: David Owen, Lauren Collins, Mark Singer, Adam Sternbergh.

[2]Interview with Nussbaum.

1. <http://nymag.com/daily/tv/>

2. <http://www.blog.sethroberts.net/2008/05/25/emily-nussbaum-interview-directory/>

## Black-and-White Thinking: An Example (2009-11-02 02:22)

I've complained many times on this blog about scientists who engage in black-and-white thinking. Here is [1]an example of such thinking outside of science:

At the mosque, Haniyeh addressed the campers on the importance of reciting the Koran. "There are two kinds of people," he advised them. "Those who know the Koran is right and who follow it, and those who turn their backs on the Koran."

1. [http://www.newyorker.com/reporting/2009/11/09/091109fa\\_fact\\_wright?currentPage=all](http://www.newyorker.com/reporting/2009/11/09/091109fa_fact_wright?currentPage=all)

---

JLD (2009-11-02 09:45:56)

Not terribly relevant, **which** religious blather isn't black-and-white thinking?

seth (2009-11-02 16:14:02)

New Age "religious blather" isn't black-and-white thinking.

bennetta (2009-11-02 17:18:16)

I like to categorize this as "binary" thinking. There is also linear, numbers based thinking and qualitative thinking. Something like JS Mill's Utilitarianism is the classic idea of "numbers based" thinking, which basically dilutes the entire human experience to a math equation. The problem is that it's never that simple. You can never dilute your life to a yes/no question or even a numerical question. I like to say that rather than thinking in numbers or yes/no, we think in terms of colors. New Age, but also some flavors of Buddhism and Taoism are two examples I can give of "color based" religions that aren't black and white.

seth (2009-11-03 05:32:01)

yes, it could be called "binary thinking". But the fact that the two sides are usually considered good and bad (as in this example) is conveyed better by the term "black-and-white thinking". And while all my Chinese students know what "black" and "white" mean, few of them know what "binary" means.

JLD (2009-11-03 10:39:25)

*New Age "religious blather" isn't black-and-white thinking.* That doesn't count, it's no thinking at all, just kind of fluffy "press release" like. :-D

kevin blumer (2010-11-25 14:51:54)

i like the idear of binary thinking why not just call it not thinking atall just called mushy heads

## Ben Casnocha on China (2009-11-03 05:02)

After a three-week trip to China, Ben Casnocha wrote [1]a long post about it. His main point I very much agree with:

Flush toilets and clean water matter more than abstract rights such as a free press.

Sure, the Chinese government censors all sorts of stuff. I find it hard to read anything on blogspot.com, for example (because the free blogs on that site could be used by Chinese bloggers). But, as Ben emphasizes, freedom in China – the freedom to do all sorts of things, including travel and make a living – has vastly increased over the last 10 years. Simply because of the economic growth. How much has American freedom increased over the last 10 years?

I fail to see any substantial America-specific increase. Due to the Internet, free speech has certainly increased but that has almost nothing to do with how America is governed. Free speech has increased everywhere with Internet access. Due to the increased cost of health care in America (an increased percentage of per capita income), worsening health (e.g., the obesity epidemic), and stagnation in the development of better treatments (e.g., for bipolar disorder) and better prevention, I'd say freedom in America has declined because poor health is imprisoning. Obesity, for example, is profoundly imprisoning. Cross-national comparisons show that America has a uniquely poor health-care system given American wealth. Given the concentration in America of support for health research (money and prestige), America is especially responsible for the lack of progress. And when people as smart as [2]Atul Gawande fail to see the great stagnation in health care, it's hard to imagine those in power doing something about it. So which country is better governed?

1. <http://ben.casnocha.com/2009/08/lessons-and-impressions-from-china.html>

2. <http://www.blog.sethroberts.net/2009/05/29/the-american-health-paradox-what-causes-it/>

---

Darrin Thompson (2009-11-03 06:28:40)

They still (attempt to) censor the Internet. Do they still have that 1 child per family law where you can elect to abort girls? I'll give them the prize for most improved while on the UN security council, but I won't give them better than the usa. usa usa usa... Also apparently their private sector still thinks that they need the right to waste and pollute or else they can't compete, just like us. That's a sure sign they are just riding a wave and are about to get owned by the Japanese, just like us.

Tom in TX (2009-11-03 09:05:15)

If you have freedom, you can probably get flush toilets and clean water. If you don't have freedom, someone else will be deciding if you get flush toilets and clean water.

JLD (2009-11-03 10:13:14)

*If you have freedom, you can probably get flush toilets and clean water.* Zimbabwe has freedom (at least from the evil grip of white men).

Nathan Myers (2009-11-03 11:02:06)

Freedom in the U.S. has plummeted in recent years, as cops are encouraged to torture with electric shocks anybody who doesn't jump to do anything they say, or just because they like to. Freedom in the U.S. has plummeted in recent years, as various police and other agencies are free to eavesdrop secretly on all kinds of communication without a warrant. Freedom in the U.S. has plummeted in recent years, as it's much, much easier to monitor, electronically, what people are doing, and where they are, than ever before. Freedom in the U.S. has plummeted in recent years, as you cannot travel, or even visit the courthouse, without having your personal belongings rifled through. I could go on.

Tom in TX (2009-11-03 11:04:49)

@JLD: Reminds me of the joke from the old Soviet Union: Q: What is the difference between capitalism and communism? A: Under capitalism, man exploits man. Under communism, it's the other way around. ;-)

CCS (2009-11-03 11:35:09)

How can you say that the existence of the internet has nothing to do with how the US is governed? It did not appear by magic, it is based on a vast infrastructure which had to be built according to state, local and federal laws. It was originally created as part of government research. In many countries the legal system would not support such an endeavor. This is regarding both the physical infrastructure/hardware and the software, both of which are constantly being developed and improved by people with a vast array of skills. It is supported by private industry as well as public research. It is not by chance that the internet was created in one country as opposed to another. It could not have been invented in just any country.

CCS (2009-11-03 11:45:36)

How much does the existence of companies like Google and Amazon, and the innovation that they drive, contribute to human freedom? Is having an incredible level of accessibility to media and ideas a contribution to human freedom? Could these companies exist in a country governed like China? Is it simply by chance that things like, the internet, Google and Amazon all originate from the same country? How does technological information and increased information affect freedom? I think you need to define "freedom" very narrowly if you want to think that freedom is decreasing or stagnant in the US. I think you also need to have a very narrow view of how laws and government affect things in order to pursue this argument.

ChristianK (2009-11-03 12:58:12)

With laws like the patriotic act, political freedom didn't rise in the US but decreased. China is governed by engineering and science people while the US is governed by liberal arts folks and one of those groups is able to making better decisions. It's no accident that China is better governed. You shouldn't trust people who go to study political science and believe it with political decisions.

ChristianK (2009-11-03 13:06:10)

@CCS: The internet was invented in multiple country at the same time. It wasn't a pure US thing. US also has a pretty bad broadband penetration, so part of the US haven't even arrived at the real internet. While Google and Amazon both originate in the US, a lot of hardware is made in China (either People's Republic of China or Republic of China).

Hatcher (2009-11-03 14:03:29)

You are confusing freedom with constraints caused by irresponsible use of freedom. If obesity constrains me, to say that my freedom is reduced as a political statement, you would have to blame some government law for my obesity - a law to the effect that I must eat more calories than I need to maintain a given weight. It is not enough to say that they have promoted or recommended things that have been ill-advised with respect to health, so long as they don't force me to abide. Where's the law? Running water and flushing toilets are great, but man also has higher needs and aspirations, and being denied those by government edict can be particularly gauling, even if those aspirations are not held by your everyday peasant. China is not very good on that score.

Socktopi (2009-11-03 15:00:26)

[http://www.theonion.com/content/video/china\\_s\\_andy\\_rooney\\_has\\_some](http://www.theonion.com/content/video/china_s_andy_rooney_has_some)

seth (2010-02-04 22:10:08)

"You would have to blame some government law for my obesity." NIH - government run - has done a terrible job of fighting obesity. I don't expect fat people to lose weight without help. I expect research to help them. That research hasn't happened. And obesity is just one example of terrible American health. We get less for our health care dollars than any other country.

## **Sickness After Starting to Eat Yogurt (2009-11-04 02:33)**

A friend writes:

As of today I'm getting over my fourth cold since I began eating lots of yogurt (maybe 1-2 cups a day, homemade), which was roughly in March of this year. So that would be a rate of about a cold every two months. On the one hand that sounds pretty terrible. On the other hand, a couple of things to think about:

1. I used to always get colds and other sicknesses as well. They just seem to be attracted to me. By my intuition, the current rate doesn't seem particularly unusual, although I never kept track before. If anyone had a cold anywhere around me, invariably I got it. It's been that way as long as I can remember, especially when I was traveling, as I have been during these last few months.

2. Each of the colds I have had in this last eight month period has been remarkably short. Really remarkable, so I will remark, by way of example, that this cold came out of the blue yesterday evening with a fit of sneezing. I hadn't felt bad at all earlier in the day although in retrospect it's possible I was a bit worn down (or maybe not: I took a half-hour swim in the late afternoon and felt pretty good). So I sneezed my way through an evening, nose dripping like a faucet. Before going to sleep I took some sort of medicine for cold symptoms (maybe something made by Bufferin maybe? Night/day something...), and in the morning I took the same thing (day version). During that whole time I was still pretty symptomatic: sneezing, nose dripping etc., but I guess the medicine might have been somewhat useful. Now here it is 2:30 in the afternoon and all of a sudden I realize my nose is dry and I haven't sneezed for hours. I reckon this is about the end of the cold: less than 24 hours. The other three were like that as well: very quick onset, then disappearing almost before I could have time to realize I had a cold. For me this is particularly noteworthy because in years past I always seemed to get the worst of the colds, going on for days and often progressing into a hacking cough that would linger for weeks.

I suspect if my friend improved his sleep he would get see further improvement of these measures of illness. In [1]this study, the frequency of sickness episodes went down for workers given a probiotic but their duration, when they happened, didn't change – perhaps because it was nice to be away from work.

After I copy-and-pasted that, I got sick. It wasn't sickness as most people know it. After an afternoon walk (1 hour) I felt tired; that was the first sign. After dinner, I felt really tired. That was an unmistakable sign. I went to bed early, slept about 8 hours (1-2 hours more than usual) and woke up rested. But an hour later I fell back asleep for 15 minutes. At that point I was sure something was wrong. I had a class that morning starting at 10 am. Should I cancel it? I got much more tired and, about two hours before class, was too tired to get out of bed to turn off the beeping yogurt maker. Okay, I'll cancel class. I phoned the TA to cancel the class but he couldn't – he had a bad cold. I phoned a student and she phoned the other students.

An hour later, however, I felt much better. By class time I felt well enough to go to class, although I walked rather than ride my bike. (The student did her best to uncanceled the class.) In the afternoon I took a long nap (1.5 hours). The next day I was just barely more tired than usual. Today I feel completely well.

I was sick, yes, but without chills, runny nose, sneezing, sore throat – without any discomfort at all unless feeling tired counts as discomfort. And I felt distinctly more tired than usual for only about a day. I think this is what happens when your immune system works properly. You fight stuff off much faster than the five days or so many people take to get better. [2]Before I figured out how to improve my sleep, I got the usual 4-6 colds per year. After I started to sleep much better, I never got sick in the usual runny-nose way so long as my sleep was good. The current episode is striking to me because I was more sick – that is, more tired – than usual. I do only two things to make my immune system work better: (a) improve my sleep in several ways (eat animal fat, get plenty of morning light, stand on one foot); and (b) eat plenty of fermented foods (mostly yogurt, but also miso, kimchi, natto, and kombucha).

2. <http://escholarship.org/uc/item/2xc2h866>

---

JC (2009-11-04 05:33:00)

How much yoghurt/day do you eat and how long do you ferment it?

Matt (2009-11-04 09:43:56)

Hi Seth, I forget how I found your blog, but I am experimenting with eating homemade/active yogurt, hoping to boost my immune system. I've had 3 staph infections this year, and chronic eczema - I tried doing the probiotic pills but ditched that in favor of the real stuff. Have you found evidence of life extension with eating fermented foods? I'd be interested in reading about it. Also, I liked your post about gatekeepers.

Anthony (2009-11-04 13:07:28)

Seth, my experience since starting to eat probiotic yogurt 1-2 times per day is somewhat similar. I can't remember getting actually sick in the last 8 months or so since I started. I can remember various times feeling something coming on, and thinking I was going to get sick, only to be surprised and not. (I have also stopped using an alarm clock during this time, and taking a nap in the afternoon if feeling tired - so, both factors could be at work.)

Aaron Blaisdell (2009-11-04 13:21:34)

My experiences are concordant with all of the above reports.

Timothy Beneke (2009-11-04 17:58:29)

I wonder if what your friend describes as colds are really allergies; in my early 50s I began getting day or half day "colds" where I would have all of the symptoms of a cold and expect to experience the usual 5 or 6 days of suffering and they would suddenly disappear in a day or less; these were allergies. I could generally not differentiate the symptoms from those of a cold.

seth (2009-11-04 18:30:59)

How much yogurt/day do I eat? About 500 ml. Fermented for about 20 hours. Re long life. This is a common observation: Around 1900, a Russian biologist named Ilya Ilyich Mechnikov hypothesized that regular consumption of yogurt was responsible for the unusually long life spans of Bulgarian peasants. I found that here: [http://www.flavormine.com/all\\_about\\_yogurt\\_history\\_culture.php](http://www.flavormine.com/all_about_yogurt_history_culture.php) but it is common knowledge.

Nathan Myers (2009-11-04 20:10:08)

When I eat lots of cow's milk yogurt, I get allergy symptoms. I'm thinking of trying goat's milk yogurt instead. I don't know what they feed the goats, though. Are goats in the US kept in feedlots like cows?

Henri Deschaux (2009-11-17 03:08:15)

Seth, will frozen yogurt work well for this?

## **UCLA: Livers For Sale (2009-11-04 05:00)**

According to [1]60 Minutes, the UCLA Medical Center moved a notorious Japanese mobster to the head of the liver transplant line after he donated \$1 million to the program. Thus imitating Mother Teresa, who became friends with the worst dictators in the world if they gave her enough money.

More UCLA receives a large amount of taxpayer money, both state and federal. None of those taxpayers appreciates losing a life-saving liver to a gangster who paid none of those taxes. It's an extreme abuse of public trust.

1. <http://www.cbsnews.com/video/watch/?id=5486399n>

---

soulfinger (2009-11-04 11:28:03)

Big deal. Livers are scarce and need to be rationed in some fashion. The only alternative to letting prices allocate body parts is to empower some panel to make the decision based upon some set of reasons that are bound to be entirely subjective and transitory. There really is no superior mechanism.

Jim d (2009-11-04 12:31:12)

I'm not sure the point of the parting shot at Mother Teresa. Cite please or retract.

aldoPlepi (2009-11-04 12:45:29)

"...if they gave her enough money. " You know, the money was never for her. You could be decent enough to at least mention that. When faced with the imminent death of thousands under her care, Mother Teresa chose to accept money from anyone that was willing to donate it. If she had not, people would die. It's not as if accepting that money did much to keep those dictators in power. The benefit gained is much larger. What would your choice have been?

seth (2009-11-04 16:37:17)

I learned about Mother Teresa making friends with dictators from Christopher Hitchen's book about her: Assume The Position. To say that giving the money to Mother Teresa saved lives disregards what would have happened to the money had she not accepted it. Perhaps it would have been spent locally, giving the local economy a long-term boost and saving even more lives – lives of those from whom the money was stolen.

Leora (2009-11-04 18:51:48)

giving livers to people based on money is disgusting. It's just another way that this society values the lives of rich people more than the lives of poor people. Why should people with money be entitled to better health care than people without, and this wasn't even a case of people without, this is a case of people without A MILLION dollars to spare and to donate. And this was someone who didn't even get the money legally. The current system of liver dispersal, the MELD score is certainly not great as it takes into account the bilirubin score as well as the INR & creatinine levels, but that only takes into account people with cirrhotic livers– mostly alcoholics. Those who are very sick with end stage liver disease suffering with autoimmune conditions such as primary billiary cirrhosis, won't have INR or creatinine levels that are significant enough to raise the MELD score, yet they're just as acute as others. My mother died at age 54 after being on the transplant list for five years. She was a new york city school teacher for 33 years and She never drank a day in her life. Yet, heroin addicts and alcoholics got one before she did because they had higher MELD scores. I'm not saying that they deserved it less than she did, or that she deserved a liver more... but actually I am.

Patrick Major (2009-11-04 22:26:20)

I am waiting for a liver transplant. I don't wanna die, but I'm not a rich japanese gangster. I was a drug and alcohol counselor for 23 years, which was rewarding in terms of intangible benefits, but not financially. I have been on a transplant list for two years now, as every aspect of my life and health both past and present was examined in microscopic detail. I passed, but what's the point really? This particular criminal godfather isn't the only gangster to jump the line. They got in front by 'donating' a half million dollars each to UC med center. The Docs and Hospital hide accountability for being weasels under the cloak of 'patient confidentiality.' Shouldn't apply to illegal recipients. Gangsters gonna die anyway due to the same thing that ruined his liver in

the first place. Either that or his gangster buds will off him for making a deal with our gullible FBI who are shocked, shocked I tell you, that a gangster lied to them about telling all AFTER the transplant. Morons.

Tom (2009-11-04 23:37:49)

It's also never really been clarified how Steve Jobs was able to get a liver so quickly. Apparently his access to the Apple jet enabled him to "shop" for a region with a shorter waitlist than California (I believe he got his liver in Nashville.)

seth (2009-11-05 03:49:57)

soulfinger, if the doctors involved did this from a private for-profit hospital, I would find it much less offensive. UCLA Medical Center is heavily supported by taxpayers, who didn't fund it so that it could do this sort of thing. The doctors get \$1 million, the gangster gets a liver . . . and taxpayers lose a life-saving liver. It's an extreme abuse of public trust.

grant (2009-11-05 05:18:00)

The last time I checked the United States was a capitalist society. Basically if you can pay for it you can have it. Tax payment and fair play are moot within such a construct. No surprise No big deal

CTB (2009-11-05 07:10:09)

BTW, if you're interested in what Hitchens has said more recently about Mother Teresa, like during the past week or so, just google 'Hitchens Mother Teresa bitch.' The woman has been dead for 10+ years, but he still becomes unglued by the thought of her. Too bad. Seems like he's heading down the same path of shame as other accomplished notables as they mature...James Watson, Mel Gibson come to mind. This morning during a local newscast (WNBC, NYC), there was a story about H1N1 vaccine going to a corporation (Citi). Didn't hear the whole bit, but the newscasters were upset that hospitals and MD offices couldn't get enough vaccine for children and pregnant woman...but this corporation could get it for 'healthy 40-year olds.' If it's true, maybe they paid \$1M for it? Oh wait, didn't we bail them out? If it's not true, then they just ran with a rumor which they knew would push people's buttons. Bottom line: there is nothing new under the sun.

Hatcher (2009-11-05 09:46:49)

"To say that giving the money to Mother Teresa saved lives disregards what would have happened to the money had she not accepted it. Perhaps it would have been spent locally, giving the local economy a long-term boost and saving even more lives - lives of those from whom the money was stolen." Seth, I think that logic may be dubious in the case of Mother Teresa - in lieu of donating to her, these dictators would have been more benevolent to their own people? That objection aside, doesn't that logic apply here in favor of UCLA? Absent selling the liver transplant for \$1 million, they would have \$1 million less to do good works with. And that \$1 million may have been spent by the gangster to propagate more crime. I would agree that a taxpayer should take precedent over a non-taxpayer other things being equal, but as a taxpayer myself I am not so sure the preference should preclude an additional \$1 million in the coffers that could benefit me down the line. The fact that the guy is a criminal is more troubling, and so I agree with the point that on principle we may not want his blood money.

seth (2009-11-05 15:36:47)

True, those arguments cut both ways. I am trying to say there is something morally repugnant about what both the UCLA doctors did and what Mother Teresa did and I think there is something reasonable about that repugnance. Two of the commenters expressed that repugnance much better than I did.

aldoPlepi (2009-11-09 11:09:03)

Seth, I fail to see the "repugnance" of both cases as being equal enough to be mentioned in the same sentence. First, the benefit to the liver program is small at best ( \$1 million does not buy much for a transplant program), while for Mother Teresa's beneficiaries even \$100 can save lives, a very real positive consequence. Second, the same can be said of the benefit to the donor. A Japanese mobster gets a liver and continues to live (a gain of life over death), while a dictator would most likely continue to be a dictator whether Mother Teresa accepts his money or not. The benefit he gains is just a few hours of good PR. Thirdly, if the Med Center refuses the money, the mobster dies (assuming no other choice for liver exists). If it accepts, the

people in the list get pushed down unfairly and their lives are endangered, a very real negative consequence. If Mother Teresa refuses the money more poor and sick around the world will die. If she accepts, the people in the oppressed countries do not see much change in the amount of oppression (if any at all). My point here is this: The Med Center can refuse the money and the world is no worse (in fact could be better), while if Mother Teresa refuses, the world is worse for sure. The Med Center accepts the money and innocent people suffer unfairly, while Mother Teresa accepting brings very real benefits to the suffering of the world. One can question the actions of Mother Teresa as described by Hitchens, but I would not compare them to the Med Center's or call them "repugnant." Finally, I ask again: What would your choice have been? Accept the money or deny it?

seth (2009-11-09 15:23:07)

We disagree whether what Mother Teresa did was repugnant. Fine. But I agree that what the UCLA doctors did is worse. Would I have turned down the money? Yes. It's puzzling that you ask.

### **Dietary Fat and the Brain (2009-11-04 20:04)**

Over the last six months I've come to believe that [1]animal fat improves my sleep. Because sleep is controlled by the brain, this suggests animal fat may also improve other measures of brain function, just as [2]omega-3 turned out to improve brain function in a wide range of ways. I didn't know about [3]a recent experiment done with airplane pilots that supports that idea. This was the design:

A total of 45 pilots (mean age, 20.8 years; 87 % male) from the [University of North Dakota] commercial-aviation program were enrolled in this 14-week repeated-measures crossover trial.

During the first week, participants were randomized to receive 1 of 4 diets (3 full meals and 2 snacks) for 4 days: a diet high in carbohydrates, a diet high in fat, a diet high in protein, or a control diet. After a 2-week "phase-out" period, all pilots then randomly received a different study diet. This process was repeated until all pilots had received all 4 diets.

I haven't been able to find out much about the high-fat diet. Here are some of the results:

The response time on the Sternberg test of short-term memory was significantly faster for participants who ate the high-fat diet ( $P < .05$ ) than for those who ate the protein and control diets, especially at higher memory loads.

With sleep, however, the high-carb diet produced the best sleep.

[4]Here is the abstract.

Thanks to Paul Sas.

Vlemmix (2009-11-05 05:21:14)

I've got 2 pointers: ketones and BDNF. Calorie restriction seems to raise your BDNF. BDNF (important for memory) is lowered by sugar, although some researchers indicate it is also lowered by high fat (tests done with high-sugar+high-fat intake), but in the same articles indicate that enough omega-3 fats ARE important... On a low-carb diet your body switches from the standard glucose-burning, to fat burning (ketosis). Research shows that the heart and brain work 25 % more efficiently in ketosis than on glucose burning. Some indicate that a more efficient brain might need a shorter REM sleep, and thus a shorter total sleep time. I think Micheal Eades wrote an article on sleep and ketosis, and indicated that some people have sleep problems when doing a low-carb diet, and recommends drinking a cup of tea with sugar just before going to sleep. Your body and brain switches back to (the less efficiently?) glucose burning, and makes it easier to fall asleep. I can't find the article anymore... I'm combining SLD with low-carb myself, and it's great. No/low sugar/carbohydrates when possible, coconutoil in the morning, flaxoil in the evening. Some extra vitamins and fishoil, especially during the weightloss period. some links: BDNF: [http://www.proteinpower.com/drmike/intermittent-fasting/fast-way-to-better-health/Ketosis and your brain](http://www.proteinpower.com/drmike/intermittent-fasting/fast-way-to-better-health/Ketosis-and-your-brain): <http://www.proteinpower.com/drmike/ketones-and-ketosis/metabolism-and-ketosis> / BDNF and sugar: <http://stanford.wellsphere.com/healthy-eating-article/what-sugar-does-to-your-brain/490861> BDNF and sleep: <http://www.sleepwarrior.com/use-ketosis-to-train-your-brain-to-sleep-less> Kind regards, Eric

Tom (2009-11-05 10:15:31)

off-topic, Seth, but you'll enjoy this article on evidence-based medicine: <http://www.nytimes.com/2009/11/08/magazine/08Healthcare-t.html?hp=&pagewanted=all>

seth (2009-11-05 15:32:11)

thanks, Tom

## **Nassim Taleb on Incompetent Experts (2009-11-05 18:42)**

Via [1]Proinvests.com, Nassim Taleb said this:

I was in Korea last week with a collection of suit-wearing hotshots. On a panel sat Takatoshi Kato, IMF Deputy Managing Director. Before the discussion he gave us a powerpoint lecture showing the IMF projections for 2010, 2011, 2012, 2013, 2014. I could not control myself and got into a state of rage. I told the audience that the next time someone from the IMF shows you projections for some dates in the future, to show us what they PROJECTED for 2008 and 2009 in 2004, 2005, 2006, 2007, and 2007. They would then verify that Mr. Takatoshi and his colleagues provide a prime illustration to the "expert problem": they serve as experts while offering the scientific reliability of astrologers. Anyone relying on them is a turkey.

This allowed me to show the urgency of my idea of robustness. We cannot get rid of charlatans. My point is that we need to build a society robust to charlatanism and expert-error [emphasis added], one in which Mr. Takatoshi and his staff can be as incompetent as they want without endangering the general

public. We need less reliance on these people and the Obama administration has been making us more dependent on the “expert problem”.

I completely agree. This highlights two hidden strengths of self-experimentation.

First, the more you can rely on data about yourself, the less you need to rely on data from other people, which until recently – internet forums, [2]CureTogether.org, [3]PatientsLikeMe.com – almost always came to you through experts (usually doctors), who filtered it to suit their purposes. When I was a grad student, I had acne. My dermatologist prescribed tetracycline, a powerful and dangerous antibiotic. Studying myself, I quickly figured out tetracycline didn't work. My dermatologist had failed to figure that out – that it didn't work in at least some cases. In his practice, he must have encountered examples of this, but he ignored them. It served his purposes to think it worked. That's one sort of filtering: Ignoring inconvenient data. Self-experimentation made me less reliant on my dermatologist.

Second, self-experimentation allows researchers such as myself to do innovative research in some area without getting permission from experts in that area. Self-experimentation is very cheap; no grant is required. A self-experimenter can be as heretical as he cares to be. [4]My research on weight control has been breezily dismissed by nutrition professors, for example. Obviously they wouldn't fund it. The Animal Care and Use Committee at UC Berkeley turned down my application to do rat research about it – my ideas couldn't possibly be true, they said. [5]My research on mood isn't just utterly different than what clinical psychologists and psychiatrists say to each other in meetings and papers; it also, at first glance, sounds absurd. Self-experimentation allowed me to do it. That's another sort of filtering: control of what research gets done.

I don't think conventional research in nutrition, clinical psychology, or psychiatry is worthless – far from it. I think it is very valuable. (For one thing, it helped me see that my self-experimental conclusions, as unorthodox as they were, had plenty of empirical support.) What is hard for outsiders to grasp is how what they see – what they read in magazines and newspapers and even books – is heavily filtered to conform to a party line. Plenty of research supports the Shangri-La Diet, for example (such as research about the set point theory of weight control), but you are unlikely to read about it in, say, The New Yorker because it doesn't fit conventional ideas. Plenty of conventional research supports my ideas about mood, but you are unlikely to read about that research because it doesn't support the party line of “dopamine imbalance” causing depression or whatever. This is what [6]Leonard Syme taught his public-health students – that the party line was a lot more questionable than an outsider would ever guess. They hadn't heard that before. (And it was unpleasant: Uncertainty is unpleasant.) This is a third sort of filtering: What data reaches outsiders.

I never had a teacher like Leonard Syme – I've never even heard of someone else doing what he did – but self-experimentation taught me the same thing. I came to see the fragility of mainstream claims about all sorts of things related to health. As Taleb says, we are used to thinking the charlatans are on the fringes. But they're not – there's plenty of them at the centers of power.

Thanks to Dave Lull. [7]Frontline's recent show “The Warning” makes the same point as Taleb, that there is great incompetence at the highest levels of power.

ChristianK (2009-11-05 23:22:19)

Tim Conrad who teaches a course on algorithmic bioinformatic repeats at every lecture the mantra: Don't trust your theories or other people's data. You don't know whether they are true or false. I like him :)

seth (2009-11-05 23:30:24)

In my experience, I have been able to trust other people's data most of the time. The Shangri-La Diet derived from trusting my own theory. It's the party line – the consensus – you can't trust. That's quite different than what Conrad is saying. Did Conrad give any examples to support the idea that you shouldn't trust other people's data?

bill (2009-11-06 04:22:01)

I have noticed that some experts totally ignore personal experience. They ignore facts that are sitting in front of them. The world needs more people who can think for themselves, but this is discouraged. It's wise, for example, not to be a genius as geniuses are often persecuted. Experts often become oppressive because they want people to take their advice. My opinion is that the experts are not usually the best and brightest. I accept the council of experts, but I believe that no one will take better care of me than I will. One thing I have always wondered why some people are listened to but even wiser people are ignored.

Aaron Blaisdell (2009-11-06 11:44:19)

How appropriate with Thanksgiving right around the corner. Don't be a turkey! "The Black Swan" was one of the best and most influential books I read this summer. Right up there with the Primal Blueprint by Mark Sisson and Good Calories, Bad Calories by Gary Taubes. And the Shangri-La diet of course. \*wink\*

Jim (2009-11-06 11:52:38)

Seth, I think self-experimentation is valuable. In fact, I'm trying the SLD right now (why not? right?). HOWEVER, I think it's very important to make something very clear to people. If you're going to encourage self-experimentation, I think you need to impress two other things on people 1. Some understanding of statistical validity. 2. Skeptical habits of mind. It's not enough to form a hypothesis, and then test it, noticing only the positive confirmations. If we don't carefully state our hypothesis, the vagueness will allow the confirmation bias to have full sway. And confirmation bias is a huge ugly monster. Take all the other logical fallacies humans commit, and I'd argue that the harm done by confirmation bias outweighs them all. That gives us very good reason to be skeptical of our own theories and our own experiments. Once we test a hypothesis, and get some confirmation, we should also try to think of all the plausible competing explanations we can think of. And, if we're committed to proportioning our confidence to the evidence, we should design tests that will decide among competing explanations. And it takes a lot longer than most people think to do all of that properly. I say this not because I think self-experimentation is dangerous, but because I think encouraging people to have confidence in poorly conducted self-experimentation is dangerous. I guess I would advise people to hold their theories very loosely until they get the kind of evidence that would justify more confidence. Jim P.S. keep up the good work. On balance, I like your approach, and your writings.

ChristianK (2009-11-09 10:20:41)

A lot of data contains assumption that the person who measured the data made. Taleb for example discusses the saying: "What doesn't kill you makes you stronger" in the Black swan and notes that there's a selection biases at work. The voodoo social neuroscience paper would be another example of an analysis that showed that a lot of data is wrong because someone made a mistake when they measured. Therefore it's always important to be aware that the assumptions that underlie some data might be flawed. If you start to believe that the consensus in your own head is necessarily better than the consensus among experts there's probably confirmation bias at work. Truth is always complicated and you should always be aware of the assumptions that you make but can't proof. In your case of self experimenting that's for example that you assume that short term and longterm effects of interventions like eating more omega3 are similar.

## Jiaweishop.com Scam (2009-11-06 19:06)

If you look on this blog you will find several other website names that this site has used to scam people, such as myshopinsun.com. You will pay via PayPal, complain to PayPal, PayPal will "investigate", decide you were right – and not give you your money back. That PayPal keeps helping whoever is behind this is curious and infuriating to anyone scammed.

---

tony (2009-11-07 01:32:43)

Is not it, I've bought here more than 20 thousand dollars in goods, the goods are well received, and their quick, quality is also very good, I also intend to stay long here, the products ordered, I think you are mistaken , which is a very good price, great service businesses.

Ashish (2009-11-07 01:54:25)

I haven't found the PayPay investigation/resolution process to ever help. Has anyone?

seth (2009-11-07 07:32:17)

tony, why the bad English?

Robert Kren (2009-11-09 14:48:25)

Tony, If they are so great, why is the website identical to the myshopinsun.com website where I was ripped off. The item numbers are identical—as are the misspellings. Are you possibly the proprietor?

D (2009-11-09 14:50:19)

Is this a scam or what people I want to order the Wii for my family but don't want to be taken... has anyone order anything from these people

Steph (2009-11-15 20:00:00)

I stupidly ordered from this website the other day before researching it and after reading all the scam alerts I have opened a dispute with paypal and alerted my credit card company. They said I have to wait until the transaction is done pending before they can do anything meaning the scam artist will get his money!!! I cannot believe Paypal allows them to continue using them. How can they claim to be the safer way to pay? I also sent Jiaweishop an email and they have not responded even though they state they have 24/7 customer service? Hmmmm....if that was the case wouldn't they have replied by now? I just feel so horrible about being so stupid!

rahil (2009-11-16 18:04:03)

did anyone order the wii. i want to order the wii for my daughter. i dont want to send my money and be scammed

Jim (2009-11-17 07:53:49)

Steph, I also place an order with Jiaweishop on 11/14. Then I read these blogs. What I did was place a dispute on 11/15 with PayPal. In the dispute we requested the vendor to provide a tracking number within 10 days. Then I sent an Email to the vendor requesting a refund. On 11/16 the vendor refunded my money. So I bet you that the vendor got spooked and decided he better refund my money and not to make any waves at this time. This way he can continue to scam others for a bit longer, then shut down. I did some background checking and saw similarities between Jiaweishop and other sites that have been shut down. That they also had the same complaints pertaining to this scam. Jiaweishop started up on 10/26/2009. A good rule of thumb would be to buy from a vendor that has been in bussiness for at least 2 years.

Daniel (2009-11-17 12:12:12)

do not buy from <http://jiaweishop.com>. check the domain details and you'll see is the same people behing gamesingate, gamesinwelt, myshopingsun and many others

george (2009-11-17 15:42:43)

I would like to thank all of you ,i almost bought from this company(or thought i was going to buy) a wii bundle but since reading all your reports i've change my mind ..i guess buying local does stand for something and again a big Thank You .From N.S.canada

dan (2009-11-17 23:20:02)

thanks for the warning !

TONY (2009-11-18 12:25:17)

Iwas going to buy a wii bundle thanks for warning me about this website

Bob R (2009-11-18 15:24:49)

I too was almost taken, I was looking at site, placed an order for Wii, but did not enter any payment method, I wanted to see how much shipping would cost. I never confirmed the order!! Well, I got a email saying my paypal would be charged for the order. I then went to paypal and canceled.

Mike (2009-11-18 22:39:08)

I bought a wii package from this site on 11-16-09. I started thinking it was just to cheap! I began to research the web site. It was a SCAM! I called my bank and by passed Paypal. They said they would get my money back and it was good I called with in 7 days time! BEWARE!

Keith (2009-11-20 13:47:31)

I too was going to buy from here but after 3 emails with no answer after a wee3k I decided to look elsewhere

john (2009-11-20 20:06:25)

I recently purchased a wii system from this company before researching it. sadly, they scammed me out of most of my christmas money. I should have followed my gut feelings that "if it seems too good to be true, it probably is" at my age (40's), you would think that I would have known better, but like others, I have apparently been scammed by this scammer!!!! THEY NEED TO BE INVESTIGATED AND FOUND AND PROSECUTED TO THE FULLEST EXTENT OF THE LAW!!! People need to be warned and not make the same mistake and need to research EVERYTHING AND EVERY COMPANY before letting someone STEAL your hard earned money. I am reporting them to EVERY PLACE I CAN AND I WILL NOT LET UP. BE WARNED....DO NOT BUY FROM JIAWEISHOP.COM. IT IS ONLY A SCAM. I tried to contact them to get a tracking number but it came back saying that the "merchant can no longer be contacted" that is because it wasn't real to begin with!!! STEER CLEAR OF THIS WEBSITE!!!!

Madrew (2009-11-21 14:24:07)

Why is this site still up I was looking for a wii bundle and it po[ up with some other vendors. After checking with Paypal if they were a valid website. Pay pal told me they were not also I had sent 2 emails that ere never respnded to with 24 or 48 hours. They are truly a scam artist. I plan to send it to the justice department.

Angela (2009-11-23 01:21:21)

I too have been scammed by this website, I have lodged a complaint with Paypal but by the looks of the comments on here I will not get my money back. Might email the guy himself and tell him to refund my money.

lauren (2009-11-23 14:21:20)

Thank you!! I had just put in the order, but hadn't confirmed it. I am so glad I decided to google the company. It is disgusting

to me that people can do this! I am so sorry to those of you who have been scammed.

Tamara (2009-11-23 17:57:27)

Thanks so much. I was about to order from this company as well. I didn't have a good feeling after an email I sent never got a response. I decided to google company and this is what I found.

Justin (2009-11-24 13:35:44)

Forty???? Try sixty-four. No age is immune. Nov 6 purchased two wiii items for \$260. Few days later received a sansdisk from Jiaweshop. That was a red flag since I did not order it. Sent email to Jiaw.....no response. Six days later sent another email. No response. Nov 24 called Pay Pal. Within 40 mins (started off in security) was transferred to disputes and was totally refunded my money right then and there. Pay Pal rep., though he stated he could not talk about clients, told me they had indications that "allowed them to immediately refund my \$ \$ \$ \$. Three cheers for pay pal. I am now a happy camper. Their respons was faster then any bank would be.

Casey (2009-11-24 16:08:37)

So I really want to purchase from this website. Is it really a scam or is it legit?

seth (2009-11-24 17:14:39)

Scam.

John (2009-11-27 10:03:40)

hi This Website Is a scam I purchased a nintendo wii system and got scammed I reported them to paypal and opened a dispute and a claim but it seems I wont be getting my money back, How could these people have the courage to steal from other people. I don't worry they will pay for what they have done. what goes around comes around. Im so sorry for the other people who got scammed, Im out of money and wont be having a good christmass.

matt (2009-11-28 08:03:26)

FUCK JIAWEISHOP!!

Angela (2009-12-04 00:41:34)

Just thought I would let everyone know, that I put in a dispute and claim with Paypal on the 23/11/2009 and got my money back today. So paypal actually do try and get the money back for you.

John (2009-12-05 11:07:14)

Hi Thanks for telling me Angela no I have my hopes up, I have opened a dispute and paypal said thye would refund my money in seven days from today. Happy to hear that you had you refund. Thanks for telling us. I hope i will get mine money back. Many thanks

Jenn (2009-12-07 09:36:55)

Yes, jiaweishop.com is a scam. I wish there would have been all these blogs before I ordered, I never would of been so stupid. But unfortunately I got scammed too. I ordered a Wii and a game. I also sent e mails to them with no response. I have just put in a dispute with pay pal so let's see how my claim turns out. Anyone who is thinking of ordering anything from jiaweishop.com, please don't loose your money too.THEY ARE A SCAM. Wish I was taking a trip to China I would handle this myself instead of waiting to see if I might get my money back from Pay Pal.

Paula (2009-12-08 10:35:00)

I too filed a dispute with paypal...and I filed with my bank so one way or another will get my money back just wish this would have been available when i was looking before I made the purchase.

scott (2009-12-10 04:58:13)

I purchased a wii bundle on the 17th of nov.it has been deducted from my account.my best bet is to go to my bank to get money back???

carolyn (2009-12-10 07:59:31)

I ordered the wii on 11/7. I just found this site and am so upset! I will be calling my credit card company and paypal today to dispute! I only purchased because they used paypal and thought that you had to be reputable to get paid this way. Anyone know where I can get a wii package at a great deal?

Jenn (2009-12-10 09:05:17)

scott, yes go to your bank and if you went through pay pal give them a call and let them know you never received it. if you call pay pal now you might get your money back before christmas. I too purchased the wii on Nov. 15 and I called pay pal on the 6th and they told me i should get my money by the 17th.

Cathy (2009-12-11 17:03:49)

I had looked at one of the other sites that I thought was a scam (lightsinshop) for a WII as well. I finally decided to get it locally. I don't know if it is still available, but this week walmart had them for the same price as everywhere else, but you got back a 50 dollar gift card. If you live near a brandsmart they are also under the 199 amount as well

chris (2009-12-18 12:37:43)

PS3 ordered a month ago, no show and Paypal didn't get my money back. Bought games and accessories still no playstation. After numerous emails to the shop i realised the obvious and so here i am on this page. Don't waste your money people!!!

Jenn (2009-12-22 17:36:23)

Pay Pal gave me my money back. They also told me that they no longer allow jiaweishop.com to use them. I'm glad I got my money back before Christmas.

paul lunn (2010-01-07 15:52:36)

it a scam..... customer service promised failed..... money taken product not recived . To this date 07;01;10 from a order on 11.11.09 no emails recived from the honk kong cheeky gits. will order from amazone or somewhere secure next time as did after found out to be a scam. Wi cheep it was cheep for them. items from amazone arrived 3 days later once bitten twice shy .

paul lunn (2010-01-07 15:53:16)

rip off scam read and take note....

Calvin (2010-01-08 23:13:19)

this site is now going under the name of netxbn.com.Paypal will not accept any orders from this site.Beware make sure you paypal they will get your money back.

## **Why Are Colds and Flu More Common in Winter? (2009-11-07 12:14)**

The effect is so large, so easy to notice, it is enshrined in the word cold. We get far more colds and flu in the winter ("flu season") than in the summer. In [1]this excellent interview, epidemiologist Thomas Jefferson asks:

Why, for example, do we not get influenza in the summertime?

All of the possible explanations listed in [2]this Wikipedia article assume that it is cold weather that makes flu more common in winter. However, [3]an impressive 1981 study found that flu peaked during the light minimum, not the temperature minimum, contradicting all of these explanations.

My proposed explanation is that flu is less common in the summer because people sleep better during the summer. They sleep better in the summer because they get more morning light. More morning light causes your circadian system to have a greater amplitude, which means you sleep more deeply. Better sleep -> better immune function. When I started to sleep much better, I stopped getting noticeable colds and flu.

When I wrote my paper it was essentially impossible to test my idea. You need to measure a lot of sleep - and sleep scientists, intent on making it hard to do what they do, have made this nearly impossible. Perhaps it will soon be easier. To begin with, to test my idea you'd need to improve sleep somehow. To get more light exposure during winter is easy enough with a light box but measuring quality of sleep is much harder. Maybe [4]FitBit (which will start shipping in a few months) will make this possible. I tried using [5]SleepTracker to measure my sleep but after a few months I gave up. There were four big problems: 1. The interface didn't work very well. It was often hard to get the data from the device into my computer. 2. The whole thing wasn't designed to measure sleep, it was designed to wake you at a better time than you would wake up without it. 3. The way it measured sleep was a secret. 4. The output - the measure of sleep - was binary. All you were told was whether movement was above or below some threshold. And I had no idea how that threshold was determined.

Dennis Mangan (2009-11-07 12:32:19)

Seth, John Cannell and several others published a paper recently arguing that variations in vitamin D levels are responsible for the seasonal nature of the flu. Interestingly enough, this follows both the light - not temperature - minimum, and immune system involvement. Here's the abstract from PubMed (no link as it holds up the comment): On the epidemiology of influenza. Cannell JJ, Zasloff M, Garland CF, Scragg R, Giovannucci E. Department of Psychiatry, Atascadero State Hospital, 10333 El Camino Real, Atascadero, CA 93423, USA. [jcannell@ash.dmh.ca.gov](mailto:jcannell@ash.dmh.ca.gov) Comment in: \* Virol J. 2008;5:149. The epidemiology of influenza swarms with incongruities, incongruities exhaustively detailed by the late British epidemiologist, Edgar Hope-Simpson. He was the first to propose a parsimonious theory explaining why influenza is, as Gregg said, "seemingly unmindful of traditional infectious disease behavioral patterns." Recent discoveries indicate vitamin D upregulates the endogenous antibiotics of innate immunity and suggest that the incongruities explored by Hope-Simpson may be secondary to the epidemiology of vitamin D deficiency. We identify - and attempt to explain - nine influenza conundrums: (1) Why is influenza both seasonal and ubiquitous and where is the virus between epidemics? (2) Why are the epidemics so explosive? (3) Why do they end so abruptly? (4) What explains the frequent coincidental timing of epidemics in countries of similar latitude? (5) Why is the serial interval obscure? (6) Why is the secondary attack rate so low? (7) Why did epidemics in previous ages spread so rapidly, despite the lack of modern transport? (8) Why does experimental inoculation of seronegative humans fail to cause illness in all the volunteers? (9) Why has influenza mortality of the aged not declined as their vaccination rates increased? We review recent discoveries about vitamin D's effects on innate immunity, human studies attempting sick-to-well transmission, naturalistic reports of human transmission, studies of serial interval, secondary attack rates, and relevant animal studies. We hypothesize that two factors explain the nine conundrums: vitamin D's seasonal and population effects on innate immunity, and the presence of a subpopulation of "good infectors." If true, our revision of Edgar Hope-Simpson's theory has profound

implications for the prevention of influenza.

David (2009-11-07 13:07:31)

You might be interested in the zeo sleep monitor. It estimates the amount of deep, light and rem sleep. It would be better if the data could be exported into a spreadsheet. It's not perfect but I like it, I've been using it for a while.

LemmusLemmus (2009-11-07 13:12:45)

It's not perfect, but to measure quality of sleep, couldn't you simply ask people how well they slept, how rested they felt in the morning, etc., and related that to whether they get the flu?

Charles (2009-11-07 14:04:38)

Yeah, I gotta say that it's more likely that it's Vitamin D than it is sleeping better. In fact, I know a lot of people who say they sleep better in the winter. (Talk about anecdotal data!) And I think it's actually different for different people. I have moderate Seasonal Affect Disorder (SAD), and I live in the Pacific NW, so winters are dark. I get better sleep if I use my bright "SAD" light in the evening. And that's not uncommon. Bright morning light gives me more energy during the day, but doesn't help me sleep better. Vitamin D, however is a killer immune system booster...okay, bad choice of words. Since I moved to the NW, I've been taking 4-5000 units of D a day. And in three years, I have gotten only 1/2 of a cold that lasted for a couple of days. And I used to get 3-4 colds a year. I just felt another cold coming on in the afternoon, took 50,000 units of D3, and it was gone by the morning. Cannell has posted a couple of suggestive epidemiological stories that seem to demonstrate that D protects against influenza. All of this is not to say that sleep is not critical for immune system functioning. It is. But I think Vitamin D is more critical, and it contributes more to the immune system depression in the winter months.

justin (2009-11-07 14:29:39)

Not to just be a ditto comment, but I think it's the Vitamin D and not the sleep (or more the D than the sleep). Earlier this year my wife came down with the flu and I was initially not catching it from her – on the onset of a scratchy throat I immediately started megadosing Vitamin D3 – 20K IUs every day (I think I did 40K the first day, actually). My sore throat was gone in 24 hours and it never got worse. Prior to trying to megadose Vit D, once the sore throat hit, I'd automatically be in for a weeklong cold, at minimum. That it went away overnight on megadosing and never came back? Unprecedented. I've since repeated that experiment with the same results \*as has my wife.\* There is a big connection, apparently, between Vit D and respiratory infections. I have to point out an error in your post here as it pertains to Vit D. You wrote:

None of the possible explanations in Wikipedia involve the immune system working better in the summer than in the winter. (Yet another example of how the medical establishment overlooks the immune system.)

But on clicking through to the Wiki entry, I found this quote under "Mechanism for seasonal nature of influenza:"

Vitamin D production from Ultraviolet-B in the skin changes with the seasons and affects the immune system.

In conclusion, vitamin D for the win!

seth (2009-11-07 17:01:57)

Justin, thanks for the correction. Dennis, thanks for the link, I didn't know about that paper. I hope it is Vitamin D, so much easier to control than sleep. [1]Here is an 2006 version of Cannell's Vitamin D idea.

1. <http://journals.cambridge.org/action/displayAbstract?fromPage=online&aid=529704>

PS (2009-11-07 19:48:44)

Desperately anecdotal, but another idea for the mix. I live in Taiwan, and I've heard lack of sweating is a cause of colds. My home has no air con, so I sweat a lot in the long summer and mooch around in a sarong, but when the weather turns and I can start to wear real clothes I get my first cold of the season, which i then take to a sauna and sweat out.

David (2009-11-18 13:26:29)

just wanted to update/correct my previous comment on sleep tracking with Zeo and say that it now does support exporting the data to a spreadsheet. I noticed a big dip in REM and Deep sleep when I took an antibiotic a few months ago, pretty cool. here is a link to the zeo data export doc [http://mysleep.myezo.com/export/Export %20Data %20Help %20Sheet.pdf](http://mysleep.myezo.com/export/Export%20Data%20Help%20Sheet.pdf)

### Assorted Links (2009-11-07 12:21)

- [1]reservations about kombucha
- [2]an "alternative" treatment for asthma. Jane Brody, trained to think in black and white, manages not to. But not without apologizing: the article begins: Please forgive me for telling you this . . .
- why is [3]this excellent article about health-care improvement by an economics reporter?

Thanks to Carl Willat, Peter McDonnell, Stephen Marsh, and someone else whose name I cannot find.

justin (2009-11-08 08:09:08)

Aren't many probiotics also somewhat antibiotics to "bad" bacteria, like kombucha? If I recall correctly, probiotics are often like this – they tend to exterminate bad bacteria. That you should only take an "antibiotic" probiotic when you're sick seems to ignore that you have bacteria in you at all times, and that maybe it's better to continually bias that bacteria to favor the good stuff over the bad.

Stephen M (Ethesis) (2009-11-08 11:50:31)

Economics is really several disciplines, one of which is what created the time and motion guys who were really systems analysts. In that sense, it makes sense that an economics reporter wrote that story.

Paul (2009-11-25 12:00:59)

I was thinking about making Kombucha, but the link that you have posted to has convinced me that it isn't the best of ideas. However, I have heard that drinking a small amount of apple cider vinegar(another fermented beverage) is also supposed to have very good effects on your long term health. Any thoughts on to the what the different effects of different fermented, acidic beverages are?

seth (2009-11-25 12:11:07)

Paul, I think the benefits of different fermented acid beverages are the same. They improve immune function. I suspect digestive improvements are small.

### How to Base Medicine on Evidence (2009-11-07 12:59)

The thing to notice about what the New York Times calls "[1]the evidence-based medicine practiced at Intermountain hospital" is how different it is than [2]the movement called evidence-based medicine. The Intermountain stuff, above

all, is not black-and-white thinking. It is a good example of what the opposite looks like. The rules aren't simple, they are complex, and not fixed. It is what engineers in other areas have been doing since Deming.

So many scientists – not to mention everyone else – are completely paralyzed, rendered completely useless, by their black-and-white thinking. It feels good to them – they love the certainty of it, and the power it gives them to look down on others – and they never quite realize what it has done to them. The notion of using evidence to improve health care made perfect sense – until black-and-white thinkers got a hold of it.

Any class in scientific method should be at least half about avoiding black-and-white thinking. They never are.

### **Saturated-Fat Epidemiology (2009-11-07 22:15)**

[1]Here, at Free the Animal, are three scatterplots that show better health (less heart disease, less stroke) correlated with more saturated fat (= animal fat) in the diet. Each point is a different European country (Albania, Bulgaria, etc.). Small and large countries show the same relationship.

The obvious confounding is with wealth – rich people eat more meat than poor people. Were this data submitted for publication, I imagine someone would say how dare you fail account for that! and reject the paper. That would be a mistake. Because it is hard to look at this data and continue to think that saturated fat is the evil it is made out to be. And of course whatever the weaknesses of [2]my sleep/fat experiment (which showed animal fat improved my sleep), confounding with wealth was not one of them.

1. <http://freetheanimal.com/2009/11/drilling-down-saturated-fat-epidemiology.html>

2. <http://www.blog.sethroberts.net/2009/10/31/effect-of-animal-fat-on-sleep-more/>

---

Vince (2009-11-08 04:18:48)

A journal would be right to reject a paper based on this data that did not control for wealth. An analysis that accounted for wealth would be much more informative, and it wouldn't be hard to do. GDP per capita data are even available on Wikipedia - it shouldn't even take an hour to add them to your spreadsheet and run a few regressions (I might have done it myself, if he'd posted a table of his data). And it's important to do - lots of spurious correlations come up in between-countries data, since so many things are correlated with each other. Taking a look at [1]his graph which names the countries and puts them in order of saturated fat consumption, the correlation between sat-fat % and wealth looks to be extremely high, and I wouldn't be surprised if the correlation between saturated fat and health goes away completely if you control for wealth. Some of the outliers on his graph, like Israel and Turkmenistan, jump out as countries where wealth doesn't match saturated fat consumption.

1. <http://freetheanimal.com/images/2009/09/Sat-Fat-CHD.jpeg>

Jeff (2009-11-08 06:14:14)

I slept pretty damn well living in Argentina. Of course there are a lot of variables to account for, but I had a large bife de chorizo (flank steak) almost every day. The cuts of meat there were loaded with fat. Juicy, buttery, mouth-watering fat that. Now I can't get good cuts anywhere. I compromise with daily use of coconut oil.

seth (2009-11-08 06:25:53)

Vince, there is such a thing as overcorrection. X and Y and Z are all correlated, but when you control for Z the correlation between X and Y goes away. Not because the correlation is spurious but because X causes both Y and Z. It is foolish to look at a data set and start by asking how it might be misleading. It is better to start by asking what can be learned from it.

Vince (2009-11-08 07:11:06)

Seth, I'd guess that wealth has a big impact on diet and on health, and that the effect of diet on health is smaller (especially if you're only looking at a single nutrient). That means that it's hard to know what the data set is telling you if you just look at the correlation between diet and health. I favor looking at a data set in the way that's most likely to give meaningful results, adding in more data if that's helpful and practicable, and being careful in considering whether some ways of analyzing a data set are likely to be misleading. I decided to run the numbers myself, seeing if this relationship between saturated fat consumption and health holds up after controlling for wealth. It doesn't. The raw correlation between Saturated Fat Consumption as a Percentage of Total Calories (SatFat %) and Disability Adjusted Lost Years (DALY) is large,  $r = -.69$  ( $p$  less than .0001), but after controlling for GDP Per Capita (GDP/person) it basically becomes zero (it actually reverses direction, with more saturated fat associated with worse health outcomes, but it's nowhere close to statistically significant). All the numbers that I needed except for GDP per capita were in [1]Alex's first post. His first graph has labels with the SatFat % for 45 countries, and his last graph has labels with the DALY figures for those countries\*. I copied those numbers into a spreadsheet, and then added the GDP Per Capita numbers (from the [2]IMF, 2008). If you're interested, I could email you my data set. GDP/person correlated strongly with both SatFat % ( $r = .86$ ) and DALY ( $r = -.84$ ). And in a linear regression predicting DALY from both SatFat % and GDP/person, only GDP/person was a significant predictor ( $F(1,42) = 33.9$ ,  $p$  less than .0001); SatFat % was nowhere near significant ( $F(1,42) = .49$ ,  $p = .49$ ). This model explains 71 % of the variance in DALY ( $R^2 = .710$ ). The regression equation says that every additional \$1000 in GDP/person is associated with 98 fewer DALYs, and each 1 percentage point increase in SatFat % is associated with 54 additional DALYs (but this is not significantly different from zero). I tried a few variations on this analysis, seeing if transforming the variables made for a better model. Using the log of DALY instead of DALY is an improvement: the pairwise correlations are stronger ( $-.75$  and  $-.89$  instead of  $-.69$  and  $-.84$ ),  $R^2$  for the regression model goes up (.787 instead of .710), and Norway is no longer predicted to have a negative number of DALY. The pattern of regression results remains the same: GDP/person is a strong predictor of  $\log(\text{DALY})$  ( $F = 43.7$ ), and SatFat % has a very slight positive association with  $\log(\text{DALY})$  that is not close to being statistically significant ( $F = .05$ ,  $p = .83$ ). These analyses suggest that wealth (or something closely correlated with wealth) has a big impact on saturated fat consumption and on health, and that whatever impact saturated fat consumption has on health is too small to show up in this data set. \*Two countries, Moldova and Macedonia, were missing from the last graph, so I used their approximate DALY from the first graph, which plots DALY on the y-axis but doesn't label the exact number.

1. <http://freetheanimal.com/2009/09/saturated-fat-intake-vs-heart-disease-stroke.html>

2. [http://en.wikipedia.org/wiki/List\\_of\\_countries\\_by\\_GDP\\_\(PPP\)\\_per\\_capita](http://en.wikipedia.org/wiki/List_of_countries_by_GDP_(PPP)_per_capita)

seth (2009-11-08 10:47:17)

"These analyses suggest that wealth (or something closely correlated with wealth) has a big impact on saturated fat consumption and on health, and that whatever impact saturated fat consumption has on health is too small to show up in this data set."

Vince, thanks for the further analyses. Here's an alternative explanation of your results: When people make more money, they eat more saturated fat. The increase in saturated fat intake improves their health. Perhaps this is what the data set is telling us. Perhaps it is saturated fat intake that is the "something closely correlated with wealth" that has a "big impact" on health. One way to look at it is this. Suppose I have a theory: more saturated fat  $\rightarrow$  better health. This data set could have contradicted that theory; the raw correlation could have been zero or negative. By passing a test, my theory gains credence. How much credence it gains depends on what else you believe. But to say it gains zero credence, as you seem to, is to place too much faith in your beliefs. You'd have to know what that "something closely correlated with wealth" is - which obviously no one knows. It's fine to notice the glass is half empty but to fail to notice it's half full is to miss the main point. When you learned correlational data analysis, no one ever discussed overcorrection? Pointing out the alternative interpretation that I just pointed out?

Vince (2009-11-08 23:28:58)

If I have a theory that one feature of rich countries causes another feature of rich countries, and I look at the correlation between those two variables, then it's a pretty safe bet that the correlation is going to be there regardless of whether or not my theory is correct. Wealth, health, education, energy usage, meat consumption, political freedom, gender equality, age at first marriage, and a bunch of other variables should all be correlated with each other (looking just at the raw correlations), and that tells us very little about the causal relationships between them. Once you know that X is a feature of wealthy countries, there really isn't much chance of failing to find a raw correlation between X and another feature of wealthy countries, so that correlation isn't very informative as a test of a theory. You need to do other analyses to start to tease apart the relationships between the variables in order to gain (or lose) credence in the theory. If saturated fat causes substantial improvements in health, then for equally rich countries we would expect the ones that eat more saturated fat to be healthier. That's what the regression looks at - holding wealth constant, are countries that eat more saturated fat healthier? The answer, in this data set, is that they aren't. If two countries are equally rich, and the people of one country eat much more saturated fat than the other, the best guess is that they are equally healthy (if anything, you'd be better off guessing that the one that eats more saturated fat is slightly less healthy). If saturated fat consumption explained the relationship between wealth and health, we'd expect it to remain significant in the regression - we might even expect wealth to become nonsignificant, since if wealth only matters as a way to increase a country's saturated fat intake, once you know how much saturated fat they eat then knowing their wealth won't tell you anything useful. (That's why psychologists commonly use regression to test for mediation.) So I don't think that the data fit your alternative explanation. None of this means that your theory is wrong - there are plenty of reasons why we might find no relationship between saturated fat consumption and health in the regression even if saturated fat does improve (or worsen) health. Maybe the effect of saturated fat on health isn't big enough (relative to the other factors that influence a country's health) to explain a significant amount of the variability between countries, but it still has enough of an effect to be important to individuals. Maybe there are other relevant variables that we aren't accounting for (e.g. countries that eat more saturated fat may also tend to eat more X, and X could be good or bad for people's health). Maybe we aren't using the most relevant measure of health (saturated fats could make people healthier or less healthy in some way that doesn't show up in the DALYs), or we aren't using the most relevant measure of saturated fat consumption (maybe total saturated fat eaten is more important than the percentage of your calories that come from saturated fat). None of these, though, are good reasons to favor the raw correlation over the regression results, or to favor your theory over the standard theory (that saturated fats are harmful). They could be good reasons to pay more attention to your self-experimentation and other individual-level data instead of country-level data.

seth (2009-11-09 00:43:46)

Before I saw this data set I knew that people in rich countries eat more meat. But I didn't know that they had less heart disease and less stroke. That's why this data set is informative. I have no idea how you could have known that to be true, as you seem to be saying. Lots of diseases become more common with wealth. There's a whole category just for them: diseases of civilization. "If saturated fat consumption explained the relationship between wealth and health, we'd expect it to remain significant in the regression." Where in the world did you get this idea? "Significant" is a highly arbitrary criterion, as I'm sure you know. There is error in everything, as I'm sure you know. Have you ever encountered a discussion of overcorrection? And the bigger question is: What do you think can be learned from this data set?

Tom Moertel (2009-11-09 17:48:09)

Vince, Would you mind sharing your data set, perhaps posting it as a Google-Docs spreadsheet? I'd like to take a look at the set, without duplicating effort if possible. Thanks! Cheers, Tom

Vince (2009-11-10 20:53:21)

Tom, [1]here's the data set on Google Docs (hope that worked). Seth, here's my general take on using this data set to test your theory. We know that there are many ways in which richer, more developed countries differ from poorer, less developed countries. So when you're interested in looking at some variable between countries, it's important to check whether it's one of the many variables that are associated with development level. If it is, then it will be correlated with the other variables that go with development level, and those correlations (on their own) won't be very informative about

the causal relationship between a specific pair of variables since they just show that both are part of the same package (development). As a first, simple step to see if two specific variables are causally related, you can run a regression controlling for some measure of development (such as GDP per capita) to see if it still holds up - are they related to each other beyond what you'd expect from them both being features of developed countries? What can be learned from this data set? If saturated fat had been a significant predictor of health then that would have been some (fairly weak) evidence in favor of the theory that saturated fat is beneficial to your health (or harmful, if it came out in the other direction). Instead, it turned out that there was basically no relationship between saturated fat and health in the regression, which I take as (fairly weak) evidence that differences in saturated fat consumption do not play a big role in causing those health outcomes, compared to other factors that differ between countries. Further analyses could challenge that interpretation. You're right that there's nothing magical about the .05 cutoff for significance, and a relationship in the predicted direction that isn't quite statistically significant but is big enough to be practically meaningful could still count as (weak) evidence in favor of the theory. In this case, arbitrary significance cutoffs aren't the issue - the relationship between saturated fats and health in the regression is in the wrong direction for your theory, and in the analysis that seems to fit the data best (predicting log(DALY)) it is very close to zero and very far from statistical significance ( $p = .83$ ). To answer your specific statistical questions, I've learned about various potential problems with regression, including overfitting and multicollinearity, but I haven't studied "overcorrection" under that name (and a quick google search doesn't help). The idea that "if saturated fat consumption explained the relationship between wealth and health, we'd expect it to remain significant in the regression" basically comes straight from the standard Baron & Kenny take on mediation. Some patterns of results might suggest that there's just not enough power for it cross the threshold of statistical significance, but that does not seem to be what's happening in this case.

1. <http://spreadsheets.google.com/ccc?key=0AtvQdFkPNB26dGpSWTRUM3ktUHVMMTAwSDV5cU4tcckE&hl=en>

seth (2009-11-10 22:40:32)

Vince, thanks for answering my questions. Baron & Kenny contains a whopper of a mistake. I'll be curious to see where they got this strange idea. This might be a good example for my statistics column. If we knew that wealth affects health without saturated fat having anything to do with that connection (between wealth and health), then it would be sensible to adjust for wealth and see what remains. But that isn't true. We don't know how wealth affects health. Having more money in your pocket or bank account doesn't automatically make you healthier. Having more money changes behavior - those changes are what make the difference in health. One effect of having more money is that you buy and eat more meat. This change may produce a large part of the wealth-health correlation. I guess most epidemiologists are unfamiliar with the concept of overcorrection. It is related to multicollinearity, of course, but I gather they haven't understood how it can mislead them.

Gian (2009-11-11 01:33:08)

In India, best health indicators are in the state of Kerala where they use a lot of coconut oil. Indicators like maternal death, infant mortality etc are lower in Kerala despite Kerala being less wealthy than other Indian States. Sri Lanka also is high in coconut oil usage and health indicators. Economists usually explain (away) this as owing to greater economic equality in Kerala but I don't buy this.

seth (2009-11-11 06:36:42)

Gian, I've wondered if coconut oil (very high in saturated fat, like animal fat) could substitute for animal fat. So this is very interesting.

Richard Nikoley (2009-11-11 09:14:38)

Seth: Re coconut oil, you might be interested in the Tokelau Island Migrant Study. Dr. Stephan Guyenet at Whole Health Source did a whole series on this study, and, by the way, Tokelauans traditionally got almost 50 % of total energy from saturated fat (coconut fat is about 90 % saturated). Take a guess about their health. Take another guess about the health of those who migrated to NZ and began eating neolithic foods. I blogged about Stephan's series here, with all the links in one place. <http://freetheanimal.com/2009/01/saturated-fat.html> Also, at the top of the blog, I just began a new series on sat fat & heart disease, springing off of some strong claims by a renowned epidemiologist in New Zealand.

Carbs Kill and Eating Animals Saves Lives | Free The Animal (2009-11-11 15:58:25)

[...] As you'll discover, the impetus behind the second post was Shanghi-La Diet author Seth Roberts' complaint about how some of the data was presented. He now appears satisfied, but one of his readers isn't. You can read those comments here. Essentially, Vince ran the numbers but corrected for GDP in each country and the significance went away. Well, at least the correlation didn't reverse the other way. [...]

Richard Nikoley (2009-11-11 16:00:48)

Seth: Alex just ran data on absolute animal fat consumption and I put the post up immediately. <http://freetheanimal.com/2009/11/carbs-kill-and-eating-animals-saves-lives.html> I've asked Alex for the data so those who want can download it. When I get it, I'll upload it. Then, perhaps Vince would be so kind and to run his GDP corrections.

Vince (2009-11-11 18:26:38)

In response to Seth's comment from last night: I have no idea what epidemiologists are familiar with. My statistical training is in psychology. Here's [1]Kenny's website on the Baron & Kenny approach to mediation (with some updates since their oft-cited 1986 paper). I don't think that we need to know that wealth affects health. I've been thinking of GDP per capita as a proxy for level of development, so controlling for it is a way to test whether the correlation between saturated fat consumption & health is just due to the fact that they both go along with higher levels of development or if there's a more direct relationship between them. Do you disagree with any of these 5 points? 1. The health measures that we've been looking at improve at higher levels of development. 2. Saturated fat consumption increases with higher levels of development. 3. 1 & 2 don't provide much support for the theory that saturated fat consumption causes health improvements. 4. The combination of 1 & 2 implies that saturated fat consumption will be correlated with those health measures, so a correlation between them does not provide any additional information. 5. The regression (controlling for GDP/person) does not provide any support for the theory that saturated fat consumption causes health improvements. Put those together, and it looks like we don't have much support for your theory at the country level. Also, I don't think that any of these points depend on the regression methodology issues that we've been debating.

1. <http://davidakenny.net/cm/mediate.htm>

seth (2009-11-11 19:48:53)

Vince, we don't know how level of development affects health. (The effect is surely complex, since there are both diseases of affluence and diseases of poverty.) Forgive the emphasis, but you seem to keep missing this point. Until we do, there is danger of overcorrection. Perhaps greater development reduces heart disease and stroke (in this data set) because it causes more saturated fat consumption. If so, then if we "correct" for level of development we will thereby remove some or all of the effect of saturated fat on health. If we then - as you did - correlate saturated fat and the residuals (health after the "effect" of level of development has been taken out) and find zero correlation, we are fooling ourselves if we take this to mean saturated fat is unimportant. In case that isn't clear, let me tell you an example that might be clearer. Suppose Little League participation improves a child's fitness. We know this, it's been measured. Someone comes along and finds that running laps improves fitness. A strong correlation. It so happens that Little League participation involves running laps because that's one thing coaches do: make their players run laps. And most kids run laps only if they are in Little League. If an epidemiologist came along and factored out Little League participation from the running laps/fitness correlation, and thereby concluded that running laps doesn't affect fitness, we'd all understand the epidemiologist was missing something.

Stephen M (Ethesis) (2009-11-12 11:38:27)

To think I got what is mediation by visiting <http://adrr.com/> ;)

Vince (2009-11-12 18:41:03)

Seth, there are two questions here. First, do these data provide support for your hypothesis (sat fat is good for your health)? Second, what do these data suggest? My answer to the first is that they do not (or, at best, they provide very little support). My last comment tried to focus on that first question (these correlations don't provide much support for the theory), but it looks like you're mainly addressing the second. To put the focus back on the first question, is there a desirable health outcome that is associated with development that you are fairly confident is not caused by saturated fat consumption? Maybe infant

mortality? Because I'd guess that if we ran the same analyses predicting that health outcome then we'd find a similar pattern of results to what we find with heart disease & stroke. Which would suggest that the results don't provide evidence of a causal relationship.

seth (2009-11-13 02:04:12)

Vince, I agree that other data might come along that would change how persuasive I find these data. If someone finds that more X (not saturated fat) reduces heart disease (causality is established), and that greater development is correlated with more X, then yes, this data would become less persuasive that saturated fat is healthy. In reply to your question – is there some health benefit correlated with increasing development that I'm "fairly confident" isn't due to greater saturated fat consumption? – the answer is yes, better vision. (Due to more access to glasses.) I hope you can see that this sort of thing doesn't help. Sure, correlations can be misleading. Sure, if we look hard enough we can find an example. They can also be informative.

Tom Moertel (2009-11-17 22:20:23)

Vince, Seth is right about the potential for "overcorrection," which I would call plain confounding. The idea becomes clear when you think in terms of causality instead of statistics. Let's say we have the following, simple (causal) model, represented as a directed graph:  $\text{SatFat} \rightarrow \text{Health}$  where the arrow  $\rightarrow$  denotes that saturated fat \*causes\* some effect on health. We are not saying what that effect is (positive or negative), or whether it is large enough to matter. All we are saying is that in our model, saturated fat has causal influence over health. We are also claiming, by virtue of our arrow not being bidirected or pointed the other way, that health does not cause saturated-fat consumption. (Here our domain knowledge comes into play to rule out an absurdity.) Now, if we were confident that there were no other factors that could affect the relationship between saturated fat and health \*causally\*, we would consider the relationship to be identified, and we could estimate it directly from our observational data. But in this case we have no such confidence: we can think of many factors that could exert causal influence on both saturated fat and health, wealth for example. Let us therefore update our causal model to reflect that we expect wealth (as a proxy for societal development) to have some causal effect on health, and also upon saturated-fat consumption (meat being expensive). To Seth's point, we don't know what this effect is, but knowing that it probably exists is enough for us to be obliged to update our model:  $\text{SatFat} \rightarrow \text{Health}$   $\text{Wealth} \rightarrow \text{SatFat}$   $\text{Wealth} \rightarrow \text{Health}$  (At this point, you might want to draw the directed graph on paper, arranging the three nodes SatFat, Health, and Wealth as the points of a triangle whose sides are given by the arrows above.) But still, we must recognize our model as incomplete. The effect of wealth on health, for example, is almost certainly not direct. Giving people money doesn't make them healthier. The effect is likely to be mediated by other factors such as health care, which converts money into health. But for now we can omit such factors for simplicity. What we cannot omit is the possibility of other factors that affect both wealth and health (e.g., government policy, social stratification) or both wealth and saturated-fat consumption (e.g., religious beliefs, geography). To represent the potential for these unaccounted-for causal influences, we can introduce mystery edges to our model:  $\text{SatFat} \rightarrow \text{Health}$   $\text{Wealth} \rightarrow \text{SatFat}$   $\text{Wealth} \rightarrow \text{Health}$  where  $X \rightarrow Y$  denotes that an external factor (or factors) influences both X and Y. Now, here's where it gets interesting. One of the recent findings of causality theory [1] is that you can use the information encoded in a directed graph to determine which causal relationships are identified, that is, can be determined from observational (nonexperimental) data. I won't go into all the background, but in a graph like the one above, if you condition on a variable such as wealth, you will confound the relationship between saturated fat and health. For a short explanation of this phenomenon, consider the following 3-node graph:  $X \rightarrow Z$   $\text{Health} \rightarrow \text{SatFat}$   $\text{Wealth} \rightarrow \text{Health}$  Thus conditioning on wealth blocks the first path but opens the second; not conditioning leaves the first open. What this means is that we will need a more sophisticated model (and more corresponding observational data) if we want to ferret out the causal effect of saturated fat on health. (I'm working on some of these models in my spare time. If I come up with anything interesting, I'll be sure to share my findings.) Cheers, Tom [1] [http://ftp.cs.ucla.edu/pub/stat\\_ser/r350.pdf](http://ftp.cs.ucla.edu/pub/stat_ser/r350.pdf) [2] <http://www.andrew.cmu.edu/user/scheines/tutor/d-sep.html>

Tom Moertel (2009-11-18 06:31:33)

Sorry, folks. My previous post, if you tried to read it, gets hopelessly disconnected about halfway through. It seems that WordPress's markup filter has deleted a few of its paragraphs and mangled a few of its diagrams. (Lesson: don't draw diagrams using symbols that WordPress is likely to mistake for HTML.) I have posted the original text here: <http://community.moertel.com/thor/blog/seths-blog-satfat-causality.txt> It should be much, much easier to understand.

;-) Cheers, Tom

Eric (2010-09-01 03:22:39)

Protein is the factor that makes the picture more complete. Poor people eat more of a percentage of animal fat calories than animal protein calories. Eat fat not protein {After 60 about 6 % seems to be right but more testing is needed } Protein is needed for health. Too much or too little can kill or cause illness. <http://www.impactaging.com/papers/v1/n10/full/100098.html> The right percentage for someone 60 or over can add as many healthy years as caloric restriction with better overall health and appearance.

### **Preventing Childhood Asthma (2009-11-08 11:41)**

[1]This website – about how to prevent childhood asthma – placed an ad on the Drudge Report. Those ads aren't cheap. Apparently the Environmental Protection Agency paid for it. It says to prevent asthma you should try to avoid all triggers. Whereas I think it's better to deal with the oversensitivity, which I believe can be cured with dietary bacteria.

1. <http://www.noattacks.org/index.html>

---

Sally O'Boyle (2009-11-09 06:42:20)

You have an ad on your site promoting a "drug free world" which leads to a propaganda site about drugs. Please visit <http://norml.org/>, <http://leap.cc>, <http://stopthedrugwar.org/> for an education on the drug war and what it's costing us, particularly in terms of our young people. Marijuana is a miracle drug, hemp is a miracle fabric. The pharmaceutical industry is behind keeping marijuana illegal. As the mother of two teen boys, I agree that all drugs, including alcohol and tobacco, must be kept out of the hands of our young people. The war on drugs has failed miserably on this front. We need a new tactic. Spreading lies about drugs won't work. Kids are too smart for this, they know the truth.

### **FDA Hid Research Showing that Aspartame is Dangerous (2009-11-10 06:57)**

[1]Here is a lot of information about this. The commercial name for aspartame is Nutrasweet. Because of worries about its neurotoxicity I switched to Splenda long ago. But if the FDA approval process is so deeply flawed they approved Nutrasweet, how safe is Splenda? In China, I've managed to pretty much avoid artificial sweeteners.

1. [http://www.laleva.org/eng/2009/11/fda\\_hid\\_research\\_damning\\_to\\_aspartame.html](http://www.laleva.org/eng/2009/11/fda_hid_research_damning_to_aspartame.html)

---

Conrad Hackett (2009-11-10 10:42:28)

Perhaps artificial sweeteners are harmful but the site you linked to does not inspire confidence. In scanning popular articles on the site, I learned that vaccines cause the flu, swine flu was engineered in a lab, and there is a conspiracy involving AIDS research in Africa and exploitation of natural resources. A few of the many claims on this site may be even correct but good

luck separating the fact from the fiction. Here is a key sentence from the linked article, "The sweetener should no longer be used for human consumption, although perhaps, with appropriate warning, it could be sold as an effective ant poison." There are many challenges involved in evaluating the effect of artificial sweeteners upon humans. However, it should be much easier to evaluate the claim that aspartame is an effective ant poison. If this claim is true, it could lend credibility to the theory that aspartame is bad for humans. If the claim is false, it casts into doubt the credibility of other evidence in the article. Guess what happened when Snopes.com investigated the ant poison claim? <http://www.snopes.com/humor/iftrue/antpoison.asp>

Glen Raphael (2009-11-10 13:18:55)

The FDA's processes are based on the linear dose-response hypothesis, which we know is false. So what makes you think Aspartame is a significant hazard? Given a default assumption of hormesis and a U-shaped or J-shaped rather than linear dose-response curve, for all we know aspartame might cause cancer in the usual lab-rat experiments AND simultaneously be protective or neutral in typical human doses. Running some numbers: they dosed rats with 0, .75, 1.5, and 3.0 grams per kilogram of body weight per day. A can of diet coke has 131 mg of aspartame and I weigh around 81 kilos, so if my math is right I'd have to drink 470,000 cans of diet coke per day to reach .75 g/kg. I do drink quite a lot of diet coke, but I think it's safe to say the amount I drink is enough \*lower\* than 470,000 cans per day that other effects might predominate at the level I consume than did at the level those rats consumed. I agree that the FDA's process is deeply flawed, but the flaws mostly go in the direction of not allowing people to take \*enough\* risks with their health.

Glen Raphael (2009-11-10 13:29:05)

Wait, the math isn't right - it's off by a factor of a thousand. Nonetheless, the underlying point still works. Hormesis. Nonlinear dose response. Oh, and the main reason people think Splenda is probably safer is that it's even sweeter per unit volume than aspartame so you need less of it in your food or in your body to produce the same effect.

seth (2009-11-10 14:43:13)

Glen, it is the suppression of evidence that concerns me. I think the ant poison claim was a joke. True, the website contains a lot of nonsense. As for whether or not Nutrasweet is truly harmless, as you seem to believe, what caused the vast increase in brain cancer over the last decade or so? I don't know. I cannot rule out the possibility that it has been caused by Nutrasweet, but if you can I'd love to hear why. Here is an article about the increase: <http://www.enotalone.com/article/8482.html>

Glen Raphael (2009-11-10 19:17:34)

I think it is really odd to pick NutraSweet - out of all the changes in the world - as the \*one\* likely possibility. We ingest zillions of chemicals every day that haven't been studied as thoroughly as Nutrasweet. Almost everything is cancerous or deadly if you eat enough of it, including many natural food ingredients. I can't positively rule out Nutrasweet as a factor but I see no reason why we'd suspect it more than any other dietary or technological change. I also can't rule out: drinking Starbucks coffee, greater access to dental care (including X-rays), wearing Walkman or iPod headsets, using cellphones, obesity, sunscreen, tanning, watching television, taking megavitamins...the list is endless. One thing we can say for sure is that \*some\* of the change is caused by better scanning technologies, greater affordability of health care, and higher expectations of doctors. Another thing we can say for sure is that overall life expectancy in the US is still climbing and overall cancer-related deaths have been decreasing despite this "vast increase" in one type. (Do you have a chart of that vast increase? I found this one from the UK: <http://info.cancerresearchuk.org/cancerstats/types/brain/incidence/?a=5441> )

seth (2009-11-10 22:19:21)

I haven't been able to find a graph of the increase in brain cancer but if you doubt it is happening, here is more evidence: <http://ces.iisc.ernet.in/hpg/envis/bradoc1117.html> why suspect Nutrasweet more than other environmental changes? because it caused brain damage in animals. That's better evidence of danger to the brain than is available for many other environmental changes.

Conrad Hackett (2009-11-10 23:47:49)

Seth, I think you instinctively give too much credit to those who doubt conventional medical wisdom. Yes, I agree that the

aspartame was mentioned in the article as ant poison in a humorous fashion but what you do not acknowledge is that the humor is predicated on it being true that aspartame does indeed kill ants. The author of the article you cite reveals no awareness of the fact that claims of aspartame's ant poisoning ability have been debunked by Snopes. Instead, the author links to yet another claim that aspartame does function as an ant poison. The author reveals an inability to separate fiction from fact. This does not necessarily mean all other claims in the article are wrong, of course, but it does raise questions about credibility.

Glen Raphael (2009-11-11 10:47:03)

I don't doubt there's been an increase, I just doubt that the pattern of the increase matches Nutrasweet particularly well. It's not enough to search for confirming evidence for a hypothesis; you have to search for disconfirming evidence too; your sources on this issue don't seem to be doing that. So here is some: <http://www.cancer.gov/cancertopics/factsheet/risk/aspartame> "A study of about half a million people, published in 2006, compared people who drank aspartame-containing beverages with those who did not. Results of the study showed that increasing levels of consumption were not associated with any risk of lymphomas, leukemias, or brain cancers in men or women. "

seth (2009-11-11 14:30:16)

Thanks, Glen. I didn't know about that study. I agree, that study does suggest that aspartame isn't to blame for the increase.

John E. Garst, Ph.D. (Medicinal Chemistry, Pharmacology, Toxicology, and Nutrition) (2009-11-12 14:19:34)

This post is garbage. But interested people should know the facts, so here they are. The reader should know that aspartame is perfectly safe; it is perhaps the most studied substance in history. It is approved for use as a sweetener by all the world's relevant regulatory authorities. Its safety has been assessed and affirmed by virtually every relevant regulatory authority in the world and just reaffirmed by the European Food Safety Authority (EFSA, see their website). Aspartame is finding use in many products in the USA, because it is listed as GRAS (generally accepted as safe). That means it can be used in virtually anything, because it poses no known hazard at the dosages involved. Aspartame has been used by millions and millions of people for over twenty years without any viable health issues. There is, however, an internet conspiracy theory claiming things both about its approval and its safety, attributing 90+ problems to aspartame. But FDA approval was over twenty years ago and is irrelevant now anyway. Aspartame's methanol is metabolized by the folate enzyme system. If real at all, any health claims are likely personal sensitivity issues stemming from the still widespread folate deficiency, a folate enzyme (polymorphism) problem, or a homocysteine toxicity issue explained by folate and other biochemical issues. The interested reader can read my new discoveries explaining such sensitivity and confirming aspartame safety in my comments to <http://blog.rv.net/2009/09/green-tea-a-natural-alternative-to-sugary-sodas/comment-page-1/#comment-85221>. The conspiracy theory also has no real scientific merit. For more on specifics, see Snopes comments: <http://search.atomz.com/search/?sp-q=aspartame&sp-a=00062d45-sp00000000&sp-advanced=1&sp-p=all&sp-w-control=1&sp-w=alike&sp-date-range=-1&sp-x=any&sp-c=100&sp-m=1&sp-s=0>. While there are no scientific papers that support any of this website's claims, there is much evidence to deny every one. First, consider the extensive review of aspartame safety (Magnuson, <http://www.fte.ugent.be/vlaz/Magnuson2007.pdf>) that discusses aspartame science and addresses earlier criticisms. Second, consider that the only papers questioning aspartame safety have been or are in the process of being dismissed as valid criticisms. Only two groups report data suggesting any concern with aspartame that cannot be dismissed outright. These are multiple papers from the European Ramazzini Foundation (ERF, Soffritti et al) and a single paper by a Spanish group (Alemany, actually Trocho et al). But both are mistaken scientific papers. The ERF papers are so badly done that they likely will be withdrawn by the journal. In work reported only in abstract form, I found in 2008 that the ERF experiments were fundamentally flawed in at least three ways fatal to their acceptance. Full presentation is in process. But another fatal flaw has just been reported. All the ERF rats in many studies, not just on aspartame but on other compounds as well, were infected likely with *Mycoplasma pulmonis* ([http://www.ncbi.nlm.nih.gov/pubmed/19430000?ordinalpos=2&itool=EntrezSystem2.PEntrez.Pubmed.Pubmed\\_ResultsPanel.Pubmed\\_DefaultReportPanel.Pubmed\\_RVDocSum](http://www.ncbi.nlm.nih.gov/pubmed/19430000?ordinalpos=2&itool=EntrezSystem2.PEntrez.Pubmed.Pubmed_ResultsPanel.Pubmed_DefaultReportPanel.Pubmed_RVDocSum)). The consequence of that infection is that everything the ERF has reported on the carcinogenicity of not only aspartame, but on many other chemicals they claimed to be carcinogenic is but an artifact of their animal's standing infection. In turn their artifacts may well be a consequence of their prior and developing folate deficiencies or homocysteine toxicity issues. The other work by Alemany possessed similar flaws to what I suggest for the ERF work. But, because their flaws enhanced

binding of radiolabeled methanol in aspartame and facilitated their investigation into its binding targets, they are mostly experimentally acceptable, if still unacknowledged. They found that aspartame's methanol-derived radiolabeled binding to protein and to DNA in rats. But from this discovery they jumped to the conclusion that this meant aspartame constituted a hazard. They came to the wrong conclusions about aspartame safety, but their seemingly honest error arose because they simply did not identify the actual proteins and DNA bound. Good scientific evidence uncovered over the past years now suggests structures for those proteins and for the DNA that indicate this radiolabeled binding not only poses no hazard at all, but actually proves aspartame safety (also to be published). Scientific dismissal of both works leaves nothing left to dispute aspartame safety! Third, another of multiple confirmations of aspartame's safety was reported this year: Artificial sweeteners and the risk of gastric, pancreatic, and endometrial cancers in Italy, [http://www.ncbi.nlm.nih.gov/pubmed/19661082?ordinalpos=1&itool=EntrezSystem2.PEntrez.Pubmed.Pubmed\\_ResultsPanel.Pubmed\\_DefaultReportPanel.Pubmed\\_RVDocSum](http://www.ncbi.nlm.nih.gov/pubmed/19661082?ordinalpos=1&itool=EntrezSystem2.PEntrez.Pubmed.Pubmed_ResultsPanel.Pubmed_DefaultReportPanel.Pubmed_RVDocSum). Not only does this paper support aspartame safety, it came from the same country and a far more prestigious group than the ERF work that questioned aspartame (above). Time after time aspartame has been found to be perfectly safe. (Also the cited link's comments about brain cancer are totally garbage too. Besides being old and out of date, brain cancer has been clearly associated with folate deficiency and related issues, but that is another separate post.) John E. Garst, Ph.D. (Medicinal Chemistry, Pharmacology, Toxicology, and Nutrition) (FYI, the author has absolutely no financial or biasing connection with the aspartame, the soft drink or their related industries. The author has a Ph.D. in Medicinal Chemistry (Pharmacy) from the University of Iowa, postdoctoral experience at Yale University (Molecular Biophysics & Biochemistry) and at Vanderbilt University and taught nutritional toxicology at the University of Illinois (Champaign-Urbana) besides having conducted federally funded research at Vanderbilt, UIUC, and at several other universities before recently entering into retirement.)

### More Animal Fat, Better Sleep (2009-11-10 15:44)

After I wrote about [1] eating a lot of pork fat and sleeping better, [2]David Shackelford [3]commented that he had had a similar experience: After he started eating much more animal fat and meat, he too slept better. (He [4]posted about this before he read my post.) I asked him for details. He answered:

About three weeks ago, I started a carnivorous diet. I did this primarily for its supposed benefit to insulin sensitivity, energy levels, and general health, and also because I wanted to see if it was really possible to thrive on nothing but meat.

Immediately after starting, I noticed that I was sleeping easier, longer, and deeper, and having more vivid dreams than usual. I've had a hard time falling asleep for my entire life, usually taking 45 minutes to two hours after going to bed, and occasionally not being able to sleep at all, so this was a very pleasant surprise.

At first I thought that this was due to standing on one foot, which I had started a few days prior, but I stopped one-foot-standing and the effect persisted. The all-meat diet has been pretty great all around- food is delicious, I've got a ton of energy, and I'm rarely hungry-but the sleep has been the best part.

Me

21 years old (senior in college)

130-ish lbs

5'4"

12-15 % body fat

Moderately active, fairly good shape.

My diet

- Breakfast of 3-4 egg omelette, with 1-2 oz cheese and occasionally bacon.
- Lunch: chicken breast, sausage, or eggs.
- Dinner: 1lb+ steak.
- Snacks: nuts and/or cheese.

#### Approximate macronutrient composition

Before: 50 % carbohydrate / 30 % protein / 20 % fat (at least half unsaturated olive oil)

After: 60-70 % fat (all animal fat), 30-40 % protein; 10 % carbohydrates (nuts and the occasional glass of wine, plus trace amounts in sauces and cheeses). Unsure of my caloric intake; I think it varies between 1500 and 2000 a day.

#### Other

- I cook chicken, beef, and eggs in butter.
- I drink coffee 1-2 times a day, and tea about once a day.
- I take a multivitamin (I don't know why), 5,000 IU Vitamin D (I live in Oregon, which gets very little sunlight), and 2.5g fish oil (the grain-fed beef I eat has low 3:6 ratios; if I could afford grass-fed, I probably wouldn't need the fish oil).
- I let the diet go on weekends, for the sake of social life. I probably have 3-5 drinks on Friday and Saturday night, as well as some junk food (pizza/chips/fries). I feel like I don't sleep quite as well on these days, but there are so many confounding variables (alcohol, staying up later than usual, seeing faces later into the night, sex) that isolating a cause of the difference is tough.

#### Exercise

- I lift weights for about 30 minutes, twice a week.
- I go out social dancing for about four hours, once to twice a week.
- Sleep does not seem to vary with whether I exercise or not.

He blogs about this at [5]meatsaur.us. His story is more evidence that the animal fat/sleep connection is cause and effect (animal fat -> better sleep), and suggests that the effect is not limited to me.

[6]My self-experiment about this.

Meatasaur (2009-11-10 16:18:04)

Welcome, Seth Roberts Readers... Seth [found me](<http://www.blog.sethroberts.net/2009/11/10/more-animal-fat-better-sleep/>) after I commented on one of his posts about animal fat and sleep, and I was happy to answer questions about my diet's positive effect on sleep quality. I know I...

Patrik (2009-11-10 18:06:44)

Eating Paleo like this guy ended my insomnia. I think it is likely that both: a) increased intake of saturated fat and b) decrease in intake of anti-nutrients found in grains helped me.

Gerry (2009-11-10 19:16:08)

I agree with your observations. I pity the folks who are still fat-phobic. Do check out Peter's post about lardo (including pictures) on his blog: <http://high-fat-nutrition.blogspot.com/>

Mike Kenny (2009-11-10 21:35:16)

I was reminded of a post way back on this blog that I think referenced Tim Ferriss' idea that milk was what made him sleepy. Milk is pretty fatty, is it not?

seth (2009-11-10 22:22:29)

Mike, a cup of milk has far less fat than the amounts of pork fat I'm eating. Milk is usually thought to cause sleepiness because of tryptophan. Although milk can apparently cause you to fall asleep faster, that's quite different than sleeping more deeply, which is the effect I see of pork fat.

rachna (2009-11-11 11:53:26)

eating Paleo has helped me & many of my friends too! - more energy/strength during workouts, and good sleep!

Jim (2010-01-17 22:02:06)

I've posted a little about Unilever's war on butter at my blog at [1][blogsthatmakemethink.blogspot.com](http://blogsthatmakemethink.blogspot.com)

1. <http://blogsthatmakemethink.blogspot.com/2010/01/manufactured-food-company-launches.html>

### **Three Things Elizabeth Kolbert Doesn't Know (2009-11-11 05:41)**

A staff position at The New Yorker is the best journalistic job in the world. Elizabeth Kolbert, a very good writer and reporter, has one of them. In the current issue, [1]criticizing Superfreakonomics, she writes:

To be skeptical of climate models and credulous about things like carbon-eating trees and cloudmaking machinery and hoses that shoot sulfur into the sky is to replace a faith in science with a belief in science fiction.

I cannot discuss engineering ("carbon-eating trees", etc.) but I can discuss science ("climate models"). Here Kolbert shows the same limitation that practically every science journalist shows (the big exceptions are Gary Taubes and John Crewdson): They take the consensus view too seriously. In case after case – so many that it's hard not to draw sweeping conclusions – the consensus view about difficult topics is more fragile than an outsider would ever guess. It's not necessarily wrong, just less certain.

Kolbert places too much faith in those climate models. Here are three things Kolbert doesn't know:

1. For years, [2]as I've blogged, Leonard Syme, an epidemiology prof at Berkeley, taught his students to distrust one mainstream public-health conclusion after another. Maybe 12 examples in all. He showed them facts they didn't know. All of a sudden the picture wasn't so clear any more. That he could do this in so many cases, one case per week, is what's telling.

2. If you believe mainstream ideas about weight control, the Shangri-La Diet is absurd. It can't possibly work. Since it has actually worked in countless cases – more than half the time, as far as I can judge – the experts, it appears, got it utterly wrong. Long before me, Michel Cabanac, a professor of physiology at Laval University, was saying the same thing – that the consensus view about how to lose weight was wrong. No matter how many millions of times journalists repeated it. The Shangri-La Diet merely makes it vividly clear he was right.

3. Hal Pashler and I wrote [3]a paper about how mental models based on fitting data were delusional. The data that supposedly supported them did not. To take seriously a model because it could fit data was a mistake, we pointed out; what matters is correct predictions. It isn't easy to figure out the predictions of a model with many adjustable parameters; and the modelers in these cases never did. These models were accepted professionally for half a century; perhaps they still are.

It is possible that climate modelers have a different psychology than scientists in other areas – that the evidence for the consensus presented to outsiders is as strong as the scientists involved say it is – but it seems highly unlikely. For example, I doubt the climate models Kolbert places such faith in have been tested (their predictions, not just their fits, compared with reality).

There's no doubt that carbon dioxide concentration and global temperature are correlated, but you may not know that [4]carbon dioxide concentration lagged temperature for a long time. Because of this, I'm sure the temperature change caused the carbon-dioxide change. It isn't mysterious; as water changes temperature, the amount of carbon dioxide it can dissolve changes. As water heats, carbon dioxide is released into the air.

This means that something powerful – not carbon dioxide – has been producing changes in global temperature so large they cause carbon dioxide to rise and fall in amounts as large as those we are now worried about. Until we know what this is there is no way to allow for it. To subtract it from observed carbon dioxide and temperature changes, see what remains, and try to draw conclusions from the residuals. And we don't know what it is, no matter how closely this or that climate model fits data. (How closely they fit data depends on how many parameters they have, not merely how truthful they are. More adjustable parameters → closer fit.) Until we know what it is, it is entirely possible that this force, not man-made emissions, is behind recent increases in global temperature and carbon dioxide. If man-made emissions are not causing the change in temperature, reducing them is unlikely to do much. (Sure, there are a hundred blog posts dismissing the inconvenient backward lag. I've been unable to find even one that addresses the point I'm making here.)

This is like what Richard Herrnstein and Charles Murray failed to understand in *The Bell Curve*. They had a whole chapter on the Flynn Effect (the large increase in IQ over years) but they failed to grasp that until the Flynn Effect was correctly explained – until we knew what caused it – there was a big environmental contribution to IQ that they didn't understand. Perhaps it was this powerful environmental factor that caused the between-race differences in IQ that they attributed to genes. They were unable to equate different races for this factor – to take its effect into account.

Herrnstein and Murray might have been smart enough to see the problem – but, in any case, they ignored it. Kolbert is smart enough to understand that the climate scientists she talks to have a vested interest in overstating their case – but, at least in her writing, she ignores this. If she stopped ignoring the vested-interest problem and tried to think for herself – to sort out for herself conflicting claims, to stop believing everything a mainstream thinker tells her – her job would be much harder. (It took Gary Taubes seven long years to write *Good Calories Bad Calories*.) Given Kolbert's lack of scientific background (at *The New Yorker* she originally covered politics), perhaps her job would be impossible. Kolbert's faith is not in science, as she pompously says, but in scientists.

---

cremes (2009-11-11 07:32:19)

I imagine taking this position and stating it so vociferously in a public forum won't win you many friends. I bet you have been (or will be) called a heretic. I appreciate your candor as well as the scientific rigor you want to apply to problems. Why do so few scientists do this anymore? Is it a case of perverse incentives? e.g. grant money

Aaron Blaisdell (2009-11-11 07:48:47)

Interesting analogy: Carbon in models of Climate Change is like Cholesterol in models of CAD. Trying to reduce your carbon footprint is like trying to lower your cholesterol. Both may be futile as they target the wrong agent. (Nod to Brent Pottenger).

seth (2009-11-11 07:58:42)

Thanks, cremes. I have a funny feeling that most readers of this blog won't be surprised or upset by this.

jay (2009-11-11 08:14:53)

I think the idea that all countries around the world with different objectives and wealth levels are going to get together and cooperate toward a costly solution to the problem we face is more of a science fiction than anything else. Or maybe a fairy tale where someone solves the prisoner's dilemma problem. On the other hand... [http://en.wikipedia.org/wiki/Year\\_Without\\_a\\_Summer](http://en.wikipedia.org/wiki/Year_Without_a_Summer) [http://en.wikipedia.org/wiki/Climate\\_changes\\_of\\_535](http://en.wikipedia.org/wiki/Climate_changes_of_535) %E2 %80 %93 Sorry Earth, you're crazy. That will never work. Nice try, planet.

Jonathan (2009-11-11 14:08:26)

The lag between carbon dioxide and temperature has been discussed at length in a number of places. In a natural historic context, weak orbital forcing of the climate leads to higher temperatures, which leads to increased levels of carbon dioxide and methane, which in turns leads to larger warming. The 'lag' is relatively small and does not in any way invalidate the fact that carbon dioxide and methane trap heat in the atmosphere, or that they have increased dramatically since humans decided to liberate the carbon trapped in millions of years of fossils.

Anthony (2009-11-11 14:50:27)

"He showed them facts they didn't know. All of a sudden the picture wasn't so clear any more." I find this in general. I think a position is absurd, then I actually start to look into it ... and find it's not so clear anymore. I now try to avoid calling anything "absurd", unless I have looked into it a significant amount. Even then, even if I continue to think it's wrong, typically I can see why people might think x and how it is somewhat reasonable. One role public science plays is like religion, in that it gives people (supposed) certainty.

Nathan Myers (2009-11-11 17:33:49)

Except that carbon dioxide concentration in sea water has *increased* right along with atmospheric concentration, causing mass destruction of coral reefs and devastation of ocean ecosystems that depend on them, leading to devastation of fisheries, of the livelihoods of people who depend on the fisheries, and malnutrition in their former customers. Uncertainty about the cause of global warming is no friend to CO2 skeptics. The consequences of global warming and coral bleaching are each, individually, so disastrous that it is enough that CO2 *might* be the cause of the former, and certainly the latter, to motivate extreme measures to contain it. Sorry, Seth, you're way, way out in right field on this one.

Naval (2009-11-11 19:28:37)

Thanks for this - I read it and promptly bought SuperFreakonomics (Ms. Kolbert is selling quite a few copies). Personally, I read this blog for its contrarian and independent-thinking view, not for its ability to regurgitate mainstream soft-science. Keep it coming...

seth (2009-11-11 19:37:18)

Nathan, I think you misunderstand what I believe. I happen to agree we should decrease our dependence on fossil fuels.

Patrik (2009-11-11 20:28:13)

@Seth This is your best post by far. One minor correction: "Kolbert's faith is not in science, as she pompously says, but in scientists. " Should read: "Kolbert's faith is not in science, as she pompously says, but in high priests."

Patrik (2009-11-11 20:32:12)

BTW you can see the sneer on her face when she writes: "Neither Levitt, an economist, nor Dubner, a journalist, has any training in climate science" or, for that matter, in science of any kind. It's their contention that they don't need it." Classic. @Aaron Blaisdell Agreed 150 %!

seth (2009-11-11 22:42:41)

Thanks, Patrik.

Nathan Myers (2009-11-12 02:09:02)

Careful, Seth, you're drawing in the loonies.

Hatcher (2009-11-12 05:00:26)

I tried to make the same point about the potential that a scientific consensus can nevertheless be highly uncertain to some people around the time an Inconvenient Truth came out. I am an economist, and economists are good at constructing mathematical models that do precisely what you say - fit the data. Prediction? Not so much. They weren't scientists, and they simply looked at me like I was insane. Said nothing. Very funny.

Patrik (2009-11-12 12:14:35)

@Nathan Myers If being skeptical of anthropogenic global warming makes me a loonie, then I wear your slur as a badge of honor. - Another way to frame this debate: 1) We don't know if global warming is happening 2) Let's assume the worst, that it is happening, if it is, we still don't know that it is anthropogenic in nature. 3) Again, let's assume the worst, that it is anthropogenic, we still don't know if that is on a net basis, bad or good. 4) Again, let's assume the worst, that it is net bad, we still don't know if we can reverse it. 5) This time, let's assume the best, it is reversible, if it is, we still don't know if reversing is desirable after factoring costs/benefits. My only point: I don't know if AGW is occurring or not - it may be - BUT we do know there is a lotta shit we don't know, but we like to pretend we know on faith.

Patrik (2009-11-12 12:17:56)

Last thing, I sent this to Richard at FreetheAnimal.com who was kind enough to post it. It draws parallels between AGW and Taubes. <http://www.winterspeak.com/2009/10/salute-to-steve-mcintyre.html> **"Salute to Steve McIntyre** In the days of the Royal Society, scientists were hobbyists, pursuing their own whims, pushed to Truth by group norms and the standards of their peers. There was plenty of nonsense then, too (Isaac Newton was an Alchemist) but a small group of individuals, with modest means, got a lot of Science done. Fast forward to 2009, where science is now big non-business. The nexus between Federal Agencies and science is tight, and scientists produce the results they are paid to produce. Both "Good Calories, Bad Calories" and this expose from Steve McIntyre fit exactly with my own experience in the most prestigious laboratories on the planet. Don't believe anything you read in the NYTimes. My favorite quote: In a novel this refusal would have been put down to a deep and deadly conspiracy. What it really concealed was the slipshod data handling, tiny samples, the loss of essential metadata and the careless merging of datasets on which the earlier conclusions were based. Yup, but they forgot

to mention how politically, the wrong answer has become blasphemy. And we think we've moved on from Galileo Galilei's day."

Socktopi (2009-11-12 14:56:55)

Look, I'm an economist and I loved Freakonomics, but writing a chapter about how "Global Warming isn't a big deal, but even if it is, keep driving your Hummer because some day we'll invent a global cooling machine; Everybody stop freaking out." is a reckless misdirection of Dubner and Levitt's talents. Questioning scientific consensus is brave, but what happens when that scientific consensus is correct? We're pretending that Dubner and Levitt are like Galileo challenging the consensus of our planet's place in the universe, when they are more akin to creationists challenging the consensus of evolution. Except unlike evolution, if global warming is real, a lot of people are going to die. 95 % of the dreaded experts believe it is seriously fuckin' real, and therefore we should make broad and difficult changes in our society. People trust D & L and with good reason, but to then use that credibility to write about fantasies of imminent rain dance technology is disappointing. And it blunts the momentum we need to make difficult changes. D & L are superwrong about this one.

Socktopi (2009-11-12 15:12:07)

Let me offer a corollary: Are we 100 % certain that the twin towers weren't brought down by explosives? No. The consensus of experts is that there weren't explosives in the twin towers, but some people disagree; probably some respectable engineer somewhere believes the consensus view is impossible. But most people accept the consensus view even though they aren't scientists or haven't studied the matter closely... Does that mean 9/11 "Truthers" are brave and responsible citizens for questioning people's blind faith in the consensus that there weren't explosives in the towers, and their views shouldn't be ridiculed because scientists don't understand heart disease? No. 9/11 Truthers are lunatic nutcases who are dead wrong. Being a sceptic is admirable - EXPERTS ARE OFTEN WRONG. But pick your allies wisely, before you find yourself at a Lyndon Larouche meeting.

Nathan Myers (2009-11-12 15:39:27)

Let's get more specific: Were we certain that chlorofluorocarbons were causing the ozone hole? Of course not. All we had was a preponderance of circumstantial evidence, just as for anthropogenic climate change. Are we certain now? No. What we do know is that it was growing, and we banned CFCs, and now it's shrinking. Me, I'm very, very glad we were able to ban CFCs. A key to quick action was that CFCs were produced in very few places. CO2 and methane are tougher nuts.

Patrik (2009-11-12 15:53:40)

@Socktopi Your two comments can be boiled down to the following two logical fallacies: argumentum ad verecundiam & argumentum ad populum.

Anthony (2009-11-12 16:13:11)

@Socktopi, Are you familiar with Architects and Engineers for 9/11 Truth? <http://www.ae911truth.org/> If so, do you believe that the 961 architects and engineers (according to the site) who have signed a petition for Congress to authorize an independent investigation into the collapse of the 3 buildings are all "lunatic nutcases who are dead wrong"? Curious about your view on this.

Steve G. (2009-11-12 20:35:56)

Seth, A very interesting and thought-provoking post. Since I don't have the knowledge, not to mention the credentials, to comment on statistical modeling or climate science, I hesitate to comment. However, as a U.S. citizen, I still have small-too small-say in decision-making about policy decisions regarding climate change. Thus, I have to make a decision about what policies to advocate and support, and more importantly, elected officials from the President on down have to make decisions, so how do they sort it out? What I do have some experience about concerns burdens of proof in practical decision-making, as I'm a lawyer, and I try cases. As a lawyer, we never have to prove something absolutely in order to act-or at least the law doesn't make such a requirement (juries, however, often have ideas of their own). On the subject of climate change, given the magnitude of the perceived risk, and the prejudice in favor of inaction (carbon-based industrial society does have its charms), it seems to me that the burden has shifted in favor of action. Inaction, if human activity is a significant driver of climate change (rarely is something THE cause), then we have reason to act. This is different from my changing my diet after reading Gary Taubes or Seth Roberts, as I've done. If both have valid points, I'm ahead; if not, well, no real harm done, and besides,

I like meat and most fermented foods. (Beer counts, too, doesn't it?). The magnitude of the investment and time to receive feedback in the dietary changes that you advocate are small, and I believe that the limited magnitude of time and risk provides the logic behind many of your ingenious personal experiments: small changes, low risk, quick feedback. However, it seems to me that with climate change we don't have the luxury of long term studies to test predicted outcomes. Of course we have to challenge and test—life, unlike a law case, has no final judgments—but we can't continually delay action in this type of situation: not to act is to act. Finally, conventional wisdom may be right, it may be wrong. Social proof is a convenient heuristic for many activities, but for each instance of conventional wisdom we might challenge, we can cite many more that we'd all agree with. Again, it's a matter of regarding the burdens, testing the evidence, and arguing the inferences. Providing a contrarian view and claiming its validity simply because it is contrarian seems to me a very weak argument indeed. Enough. Thanks again for the provocation, and keep up the good work.

Steven (2009-11-13 00:04:01)

Maybe it's just me, but I can't really think of an area in physics where a consensus has been achieved only to be shown to be completely wrong. Sure, models are incomplete but this is different from being wrong. My feeling for this is that climate models have the same chance of being wrong as standard stellar models.

Socktopi (2009-11-13 15:41:14)

Patrick, I think you need to study your Latin. Anthony, yes. People who believe that the government planted bombs in the WTC are lunatic nutcases who are dead wrong. I don't care if they have engineering degrees... Now of course having just said that, I would like to walk back my hyperbole. We all believe the evidence supports various "conspiracies" and I am certain I am someone else's Lunatic Nutcase. I think my point here is that it's good that the New Yorker is rebutting D & L when they go off the tracks. D & L are authorities in their own right who are treated with a certain amount of deference. But in this case they are probably wrong. Global Warming is probably a serious threat and will probably require massive concerted efforts to minimize its damage. Hopefully technology will play a part. But just like that excerpt from the reviewer so eloquently puts it: downplaying the science of global warming while buying whole hog the science of a technological cure for it is a serious lapse in D & L's judgement. The book reviewer not understanding that the study of nutrition is practiced by people who failed out of dental school has nothing to do with it.

Nathan Myers (2009-11-13 17:17:06)

Steven: You must be joking. Physics is the poster child for fundamental reorderings. Right now we have two consensus theories that are fundamentally incompatible. It may be true that in previous temperature swings, CO2 lagged temperature. What is manifestly true is that *this time*, CO2 is leading temperature. It may be, likewise, that in previous events, CO2 was released from the ocean. In *this* event, ocean CO2 is radically elevated, to the point that it is killing whole reef ecosystems. Therefore, this guy is barking up the wrong tree, and has evidently nothing to say about the present crisis – which crisis it certainly is, whatever the cause.

Seth's blog » Blog Archive » Depression and Insomnia Linked at CureTogether (2009-11-20 01:27:15)

[...] CureTogether has found another example of the familiar depression-insomnia correlation. Persons with depression are twice as likely to have insomnia as persons without depression. CureTogether gathered this data much more cheaply than previous studies. Unlike previous researchers, they were under no pressure to publish. (Professional researchers must publish regularly to keep their grants and their job.) Unlike previous researchers, they were under no pressure to follow a party line. On the face of it depression makes you less active. Yet insomnia is a case of being too active. So the depression-insomnia link is far from obvious. Lots of other facts connect depression and circadian rhythms; they all suggest that the intellectual basis of anti-depressants, all that stuff about serotonin and neuro-transmitters and re-uptake, is wrong. If depression is due to messed-up circadian rhythms, taking a drug at random times of day is unlikely to fix the underlying problem. [...]

TGGP (2009-11-22 15:06:13)

A minor quibble: Murray & Herrnstein said they were agnostic on the genetic contribution, although I think they also said it was a good guess to say half genes and half environment.

Ted Simpson (2009-11-23 08:17:08)

As a retired professor in electrical engineering, one thing I am certain about is the overwhelming desire of young scientists to (a) publish, (b) get tenure or a promotion, and (c) go to lots of scientific gatherings and become accepted in the "cutting edge" peer group. And I haven't even mentioned the cocktail parties at these government supported love feasts! And regarding consensus on any subject, it is good to recall what George Carlin said about the "average person." He said, as I recall, "The average guy is not very smart. And if that bothers you, consider the fact that half of the population is dumber than him!" Al Gore is the poster child for the religion of liberalism; he did what Willy Sutton did and went where the big money was! What we should all be concerned about is how we will operate when the Arabs drain thier oil swamps and we get cold and unable to move around cheaply!

Ted (2009-11-30 16:06:23)

CO2 isn't killing the reef ecosystem by "consensus". Why don't you consult a biologist, not a climatologist. Many believe it is nitrogen run off from fertilizers, and furthermore, there is a correlation to reef predators nearest rivers. And we don't know what the correct temperatures are, doctored data from CRU is no longer acceptable as gospel.

## Mistaken Consensus in Physics? (2009-11-13 02:44)

[1]Steven Sheets writes:

I can't really think of an area in physics where a consensus has been achieved only to be shown to be

completely wrong.

Good point. I know little about physics but I tend to agree. Work awarded the Nobel Prize in Physics is more trustworthy than work awarded the Nobel Prize in Medicine, for example. I think a big reason that a consensus presented to the public is wrong is because there is outside pressure to get it right – pressure to find a way to lose weight, pressure to find how to reduce heart disease, and so on. Whereas there is no public pressure to get this or that physics question right. Less is at stake and the physics community can take as long as it wants.

Still, physicists make mistakes and other physicists go along with those mistakes. I can think of three examples:

1. When calculating the charge on an electron, Millikan famously used the wrong value for the viscosity of air. [2] This didn't prevent those using other methods from getting the same answer.

2. It was a rather bold title: [3] *How Nature Works* (1996) by Per Bak. Yet the sand avalanche models on which the whole thing was based turned out to be wrong. Actual sand didn't behave as predicted. There wasn't consensus in the physics community that Bak was right, but many physicists took him seriously. (As far I can tell from a distance.) I've worked on explaining power-law data (the subject of Bak's book) and the ideas in that book weren't helpful.

3. Long ago, [4] lots of physicists – if astronomy is part of physics – believed that the sun revolved around the earth.

There's plenty of pressure and a lot at stake to get climate predictions right. So I think climate models are in the territory where big consensus mistakes are made. As [5] Patrik points out, [6] the story of the Yamal tree-ring data – which I wasn't thinking of when I wrote [7] the Elizabeth Kolbert post, or I would have mentioned it – is a very good reason to think that what Kolbert writes about climate is less certain than Kolbert thinks.

---

Jason (2009-11-13 03:50:23)

There wasn't the same level of consensus, but my understanding is that string theorists were getting most of the grant money and positions and publications and now, well, not so much.

Sonic Charmer (2009-11-13 04:36:36)

We don't have many examples of physics work that has entered the political arena. This is one thing I think is different about climate modeling. It is influenced by political pressure, or at least all the attention. The other thing I would emphasize is that this concept people have of "consensus" among All Physicists or All Scientists is something of an illusion. There are a fraction

of scientists who do real climate science and modeling. The others *do not* and (unless they take an interest in the subject, and roll up their sleeves..) for the most part will only have the vaguest idea what the former are talking about. The latter group's "consensus" with whatever the first group is doing is not meaningful and adds no extra weight to it IMHO. It probably does mean there have been no obvious mistakes that can be easily spotted at a glance by sharp minds, which is something, but as a practical matter it is unlikely that, say, the average high-energy physicist working on superfluids has sat down and thoroughly studied and evaluated a survey of the models, assumptions and data used to simulate the Kuroshio current. At most he maybe skims a paper or (maybe) is at a conference where some of the talks are about climate, and goes "uh huh" or "okay, I guess". If he's politically interested in the issue, or trusts or is friends with the scientist doing the work, he may add his name to a public letter of some sort. The resulting tally seems to be what people call consensus - so we have maybe several dozen people doing actual work at the forefront, thousands of other scientists going "uh huh", and we call it a Scientific Consensus and are very impressed. To me this is the real problem with the concept.

aretae (2009-11-13 04:42:14)

Seth, The third example is unfair. Modern physics properly dates from Newton, the guy who demonstrated that you can explain the world with math. Indeed, it's probably fair to suggest that the dawning of the scientific age was marked by Newton. But regardless, talking physics pre-Newtonian revolution isn't fair. I'm not convinced that phlogiston works well either, even though that's the immediate post-Newton response. But that's at least harder to disqualify.

Sonic Charmer (2009-11-13 04:54:25)

related? [1]Physics and Pixie Dust - PLASTIC FANTASTIC: How the Biggest Fraud in Physics Shook the Scientific World.

1. <http://www.americanscientist.org/bookshelf/pub/physics-and-pixie-dust>

seth (2009-11-13 05:41:18)

aretae, Galileo used math to explain his results. It's true, though, people made more mistakes the further back you go. And I agree there was great improvement starting with Newton.

Jeff (2009-11-13 06:01:49)

Physics has a generally more consistent pattern of getting things mostly right, then either fine-tuning or generalizing. Newton was right, and still is, but it turns out his laws of motion are a special case when Einstein generalized our understanding of nature.. The earth was flat, and still is. It's just locally flat. We generalized our knowledge to say it's a sphere. Then we fine-tuned our knowledge - it's not really a sphere, but an oblong ellipsoid. We fine-tune further: it's not a perfect ellipsoid, the southern hemisphere as a slightly larger bulge than the northern. If our knowledge of the topology of the earth worked the same way it does in medicine, psychology, economics, or other psueodosciences, then one moment we'd think the earth is round, then the next it's a cube, then a donut, then a Klein Bottle, then a dodecahedron.

Darrin Thompson (2009-11-13 06:44:22)

"Whenever there is fear, you will get wrong figures." - W. Edwards Deming

Aaron Blaisdell (2009-11-13 11:03:43)

@ Sonic Charmer Excellent point regarding consensus. One quibble: "The latter group's "consensus" with whatever the first group is doing is not meaningful and adds no extra weight to it IMHO." With one exception. The consensus view on diet (carbohydrates, especially grains = good, fat, especially from animals = bad) has added a lot of extra weight. But only to people's waistlines, not to nutritional science. ;-)

Tom in TX (2009-11-13 11:54:42)

Jason Says: "... string theorists were getting most of the grant money and positions and publications..." That brings up a good point. I don't see why "consensus" should be the standard here. Can we think of examples where scientists got lots of grant money, prestigious positions, and high salaries, and then were shown to be completely wrong? That tells more about how the layman is being scammed by the (bad) scientists.

seth (2009-11-13 13:21:12)

Tom in TX, Ranjit Chandra comes to mind. There are many examples. Ronald Fisher, the famous statistician, argued for years that smoking didn't cause cancer. So did Hans Eysenck, a famous psychologist. Cyril Burt, a famous psychologist, fabricated data. If I had to pick the greatest "scam" (= the public is misled) since 1900, I don't think we have a winner yet but I think it will turn out to be either (a) animal fat is bad for us or (b) humans are causing dangerous global warming. Since I think we should reduce our use of fossil fuels, example (b) has had good effects. Whereas example (a), if I'm right, has done huge harm.

Jason (2009-11-13 13:39:29)

seth, in discussing global warming, I find it hard to get past the "big oil" funds the opposition and such—and it doesn't help the most visible opposition is from the Republicans. Suggestions? Also, on string theory, another point in the physicists' favor is that even though string theory overall is (probably) wrong, the research that went into contributed to our sum total of knowledge (whole new areas of math). Whereas much more of the diet research is simply a waste of time and money I'd say.

Tom in TX (2009-11-13 14:11:08)

Jason wrote: "...even though string theory overall is (probably) wrong, the research that went into contributed to our sum total of knowledge (whole new areas of math). " The guy who gets the money always says something like that. Everything worked out fine for him. 8-) But what could the money have been spent on if it hadn't have been for the bogus idea? Maybe something that would have contributed to the sum total of knowledge, and resulted in something useful as well. And the who-benefits argument cuts more than one way. Democrats will assure themselves of thousands of jobs regulating industry, if the theory of man-made global warming becomes sufficiently popular (whether it is right or not).

seth (2009-11-13 17:05:14)

Jason, yeah, Big Oil put its thumb on the scale. And then Al Gore (with far better motives) put his thumb on the scale. I think blogging has turned out to supply a really powerful counterforce – toward actually establishing the truth of the matter. I think both Big Oil and Al Gore are no match for a bunch of bloggers who get no money, have no job at stake, have no chance of political office (or Nobel Prize), have time on their hands, and may even be anonymous. Darrin Thompson, that's a great quote.

Stephen M (Ethesis) (2009-11-13 22:24:26)

Gee, I still remember studying ether and the nobel prize given for the test that was set to measure how fast the earth was moving through the ether (though the prize was awarded because the test failed, with interesting implications).

Steven (2009-11-13 22:32:51)

I don't dispute fads, frauds, and experimental bias exist in physics. But none of these things seem to have led the field astray for very long. I guess I'm less impressed with blogs for uncovering truth than Seth is. Occasionally they seem to dig up an interesting nugget but to me they mostly to act as noise machines. Nor do I understand their popularity, to understand a subject such as dendrochronology and get to the heart of the matter requires a pretty great investment in time.

Jonathan (2009-11-14 13:05:59)

What about the consensus among evolutionist physicists that the world is more than 7,000 years old? Surely that stands beside the idea of human induced global warming in the foolish scientist hall of fame.

Eugene (2009-11-15 09:41:46)

On 18 December 1953, Nobel Prize winner Irving Langmuir (1932, Chemistry) conducted a colloquium on "[1]Pathological Science" at the GE Knolls Research Laboratory. Those in attendance remember it as "the most seminal exposition on the topic." My father, a recent graduate of Caltech, was in the audience, and says it reminded him of what Richard Feynman stressed in his lectures about common pitfalls in the empirical process.

1. <http://www.cs.princeton.edu/~ken/Langmuir/langmuir.htm>

Nathan Myers (2009-11-15 22:55:34)

Thank you, Eugene, that was the most fascinating thing I've read this month.

Elisa (2009-11-17 14:31:49)

The Copenhagen Interpretation is losing its hold on the consensus. That's straight up physics and I think eventually people will accept that it's wrong.

### **The Parable of the Wii (2009-11-14 13:56)**

For exercise (Dance Dance Revolution) and self-tracking, I decided to buy a Wii. My first attempt, [1]I was scammed. It arrived in August. With difficulty, I took it and accessories unopened to China. That was hard. It was even harder – for no obvious reason – to install it in China. The box sat unopened next to my TV, easily visible, for two months.

Finally I opened the box, took out the parts, put them together, added batteries, plugged it into the TV in my apartment. And nothing happened! Was my TV at fault? Or the Wii? Wii's aren't sold in China. I imagined bringing it back to America to get the problem fixed. After a few days, I tested my TV using video output from a neighbor's Apple computer. My TV worked. After the test, my Wii also worked. When I replaced the Apple input with the Wii input I saw the Wii input for the first time. I don't understand it, but that's what happened.

In my experience, this is how science works. It is much harder than expected, then it pays off in ways that defy understanding. The concept of self-experimentation is simple: I will measure X (sleep, productivity) about myself. I will test different ways to improve X, learn what works, and thereby improve X. The reality is different. For years I measured my sleep and tried to improve it. It was hard to deal with the data. Even worse, every idea I had was wrong. That seemed like a huge obstacle – like my Wii needing repair. But I kept plugging away, because it was better than doing nothing, and . . . got somewhere. Out of nowhere and nothing. Not only did I improve my sleep, I arrived at a broader idea about health that turned out to be very helpful (that our bodies are designed for Stone-Age conditions and self-experimentation can help determine those conditions, which aren't obvious). Just as we overvalue big steps (e.g., well-funded prestigious research), we undervalue small ones (e.g., cheap research with no prestige).

Science is basically a bunch of little steps. Many little experiments that explore cause-effect space. If you find a new example of cause and effect, the payoff is unpredictably large. Scientists don't like thinking of themselves as wandering ants. But that's how they are most effective. This goes against human psychology because wandering (Nassim Taleb calls it "tinkering") is low status and lonely. The payoff is too rare and too unclear. It isn't supported by powerful institutions, such as research universities and medical schools. Imagine an ant who says "I know where food is!" This is a way to get many ants to follow him, to feel important, to have high status, to get support from his employer. That's why he does it. But he doesn't know. The effect on the rest of us, the potential beneficiaries of progress, is that instead of having a thousand ants wandering everywhere, we have a thousand ants following one ant who doesn't know what he's doing.

1. <http://www.blog.sethroberts.net/2009/08/02/gamesinweltcom-scam/>

---

NotInChinanow (2009-11-14 16:18:19)

I was and still am unprepared for how unsuccessful my experiments are. Although I don't have a true tally, the number is certainly less than 20 %, and I think probably a fair and accurate count would probably put that number at around 5 %. It seems

like that number is similar to your success rate with self-experiments. While it's personally hard to deal with that level of failure, I think it's even harder at the institutional level. Most institutions couldn't tolerate employees who get such a low success rate for their experiments even if the resulting success brings much more valuable information. So on a personal level that's why I try to spend time on things that are much more likely to work because it's easier to defend your work that way. That's why I like your self-experiments because they allow for more risk that would probably kill the career of a normal experimenter.

Ashish (2009-11-14 16:20:59)

If you enjoy Dance Dance Revolution, definitely check out Dance Dance Immolation at Burning Man.

Walter (2009-11-15 13:43:31)

When I worked in R/D the upper management wanted predictability in "findings" so we went our way in testing ideas so we ended up with a pipeline of hidden successes and then we metered it out in a "predictable" manner. We ended up predictable but slow in comparison to the rest of the competitor. Upper management patted themselves on the back for being able to manage and to be predictable. There is a lot of randomness in R/D and the quicker one built up a pile of "failures" the quicker one found the nugget(s). The philosophy I found to work the best is TREE-test randomly, evaluate and elect-and the team should consist of a bunch of people with cognitive diversity and experience diversity.

Andrew Gelman (2009-11-15 13:54:51)

Seth: As we've discussed many times (and I've blogged about too), I think I've followed a low-risk, low-return model for science, doing a lot of small projects, each of which is a sure thing (or, at least, something like 50 % chance of success, where "success" means advancing the field in some way and publication in a top journal). In contrast, you've followed a high-risk, high-return model by spending 15 years doing self-experimentation. (Also, rather than writing 6 big books as I did, you wrote one little book-but your one little book was a bestseller.) I guess what I'm saying is that your statement about science, "It is much harder than expected, then it pays off in ways that defy understanding," describes how you do science, but not necessarily how others do science. Perhaps both types are necessary: we need the bold thinkers like yourself and also the more methodical people like me to fill in the gaps.

seth (2009-11-15 16:18:42)

Andrew, by science I meant empirical science, where the main goal is gathering data from which you learn how the world works. This isn't the main goal of statistics professors. They don't gather data nor focus on substantive issues. But I agree, you make a good point. Even within this subset of science I agree that one can pursue a path where progress is more predictable. In terms of the scientist = ant analogy, an ant has a choice of joining a trail of many ants to a food source or wandering around by itself to find a new food source. Likewise a scientist who gathers data has the choice of exploiting a known cause-effect relationship (e.g. doing variations on it, trying to explain it) or trying to find new cause-effect relationships. I don't know what a similar choice would be for statistics profs.

Andrew Gelman (2009-11-16 02:18:34)

Seth: Psychologists are good at gathering data. But you don't need to gather data to be a scientist. You can analyze or build theories based on others' data. For example, Einstein, Feynmann, etc. were scientists even though they were not experimentalists. And they were empirical scientists too-they explained empirical facts and made testable predictions. Also, I completely disagree with your statement that statistics professors don't "focus on substantive issues." Take a look at my research articles! It's possible to be a statistics professor and do applied statistics.

seth (2009-11-16 03:40:10)

Andrew, yes, there are exceptions to the broad statements I made. But most scientists (95 %?) gather data in one way or another. I think physics and astronomy are the only sciences where there are a lot of pure theorists (such as Feynman), and even in those fields I think the data collectors outnumber them. I think you're an exception, too - as far as I can tell, most statistics profs spend little of their time trying to answer substantive questions. Most statistics profs are most interested in developing new methods. Only a few statistics profs are also profs in a substantive area, such as political science. I say all this

partly because I wonder what would be a "high-risk" line of research for a statistics professor. Maybe developing methods to do something unconventional, such as generate ideas?

seth roberts on scientists as wandering ants « the pulchrifex papers (2009-11-16 13:08:26)

[...] seth roberts on scientists as wandering ants 2009 November 16 by Matt I'm competing for postdoc funding from the National Institutes of Health; my career path, if I follow it to its logical culmination, will be regularly punctuated with similar competition. So I'm keenly interested in claims like this: Scientists don't like thinking of themselves as wandering ants. But that's how they are most effective. This goes against human psychology because wandering (Nassim Taleb calls it "tinkering") is low status and lonely. The payoff is too rare and too unclear. It isn't supported by powerful institutions, such as research universities and medical schools. Imagine an ant who says "I know where food is!" This is a way to get many ants to follow him, to feel important, to have high status, to get support from his employer. That's why he does it. But he doesn't know. The effect on the rest of us, the potential beneficiaries of progress, is that instead of having a thousand ants wandering everywhere, we have a thousand ants following one ant who doesn't know what he's doing. (Full post.) [...]

Dennis Whittle: Good Scientists are Like Wandering Ants | News from: The Huffington Post - Breaking News and Opinion (2009-11-17 10:44:01)

[...] That is from the iconoclastic Seth Roberts, formerly a professor of psychology at Berkeley who now teaches at Tsinghua University. His overarching theme is that for science to advance it requires people to come up with and test novel hypotheses rather than tinkering at the margins of the currently accepted wisdom. In short, orthodoxy is often unproductive for scientists, and sometimes dangerous. His blog is full of unexpected hypotheses about how the world works, and he often tests these hypotheses on himself, enlisting his own readers as co-experimenters. [...]

## More Black-and-White Thinking (2009-11-15 22:40)

Here's part of a speech that Geert Wilders, the Dutch politician, gave in New York in February:

There might be moderate Muslims, but there is no moderate Islam. Islam will never change, because it is built on two rocks that are forever, two fundamental beliefs that will never change, and will never alter. First, there is the Quran, Allah's personal word, uncreated, forever, with orders that need to be fulfilled regardless of place or time. And second, there is al-insan al-kamil, the perfect man, Muhammad the role model, whose deeds are to be imitated by all Muslims. And since Muhammad was a warlord and a conqueror we know what to expect. Islam means submission, so there cannot be any mistake about its goal. That's a given. It's a fact.

Whereas here's what a friend of mine living in Amsterdam sees:

Disenfranchised immigrants who were summoned here to do low skilled jobs, aspire to integrate into Dutch society, but are often systematically excluded by Dutch people. A lot of them don't have much formal education. That doesn't help.

Even 2nd and 3rd generation Moroccan immigrants, many of whom are nice people and speak perfect Dutch, get treated like underclass by native Dutch people. It angers and depresses the parents, who feel shut out, and their kids suffer also.

I find it terribly sad to think that the kids I fix bikes with have such a disadvantage due to their origin. Many of them are quite smart. It strikes me as such a waste of human potential.

There are some nice Dutch people who get along fine with the immigrants, but not very many.

They're describing the same thing!

---

Chris (2009-11-16 00:36:21)

Are they? I read it differently that Wilders is describing Islam - the belief system - while the second writer is describing individuals and their experience. They are consistent premises.

seth (2009-11-16 01:24:04)

Chris, yes, on a surface level they are describing different things. But they are both looking at the same thing - Muslim immigrants in Holland. Wilders sees "Islam" and my friend sees people. The only reason Wilders says what he says is that "its [Islam's] goal" is, to Wilders, their goal. Because they are Muslims. "Its goal" wouldn't matter if no one believed it.

JLD (2009-11-16 01:40:35)

*Disenfranchised immigrants who were summoned here to do low skilled jobs*, More than Islam or whatever else **this** is the root of all problems everywhere, supposing that [1]metics are intrinsically "low class" and willing to remain so. Importing cheap labor instead of forcing the always plentiful low skilled aborigenes to participate into society according to their mediocre competencies because they are "of our kin" is an illusory solution which has destroyed many a brilliant society and culture. Stupidity and greed springs eternal.

1. <http://en.wikipedia.org/wiki/Metic>

Dennis Mangan (2009-11-16 07:08:39)

The mayor of Rotterdam, the second largest city in The Netherlands, is a Moroccan immigrant who still holds Moroccan citizenship. Therefore there is much reason to doubt your friend's contention that "2nd and 3rd generation Moroccan immigrants, many of whom are nice people and speak perfect Dutch, get treated like underclass by native Dutch people". Just as in this country, any problems that minorities have get blamed on the majority.

Aaron Blaisdell (2009-11-16 08:15:10)

@Dennis, Your logic doesn't make sense. Barak Obama may be the first black President of the United States, but blacks in many areas of the US are still treated as second class (or underclass) citizens. My black friends in NYC still have difficulty hailing a cab (and not because their thumbs don't work)-even from black taxi drivers. There may be more acceptance at the societal level for an ethnic class of people, but that doesn't necessarily translate to the individual level, at least not for wholehearted embracement.

Hatcher (2009-11-16 08:30:05)

I'm not sure what is meant by juxtaposing these quotes. The first seems to say - Islam beckons problems, whether there are moderate Moslems or not. The second basically says Moslems are discriminated against in Dutch society. Seth, do you put these up there as 2 alternative explanations for Moslem violence in the Netherlands? I suppose both could be characterized as black and white thinking, and perhaps some combination explanation is better. But the target of violence, for example Theo Van Gogh, was chosen clearly for reasons related to the first quote; and secondly, the perpetrators of such violence are very often highly educated successful Moslems (for example, the train bombing in UK orchestrated by doctors). These are hardly the most oppressed.

Robert Reis (2009-11-16 13:25:01)

As a former cabbie in Chicago, let me point out that black cabbie frequently refuse to pick up black customers. Too many cabbies are robbed and killed when they make this mistake.

seth (2009-11-16 15:18:05)

What is meant by juxtaposing these two quotes? One is an example of black-and-white thinking, the other isn't. My friend makes distinctions, doesn't see everyone as the same. That's why her comment isn't black-and-white thinking. Wilders grants that Muslims vary ("There may be moderate Muslims") but goes on to dismiss that variation by ignoring it.

Chris (2009-11-16 15:55:03)

i still think you are unfair to Wilders. There is a distinction between the "-ism" and the individual. He is criticizing the ism. His black and white thinking is with respect to the ism, not the individuals. He accepts that there may be moderate individuals.

seth (2009-11-16 20:02:46)

True, he is criticizing the -ism. And the -ism is an example of black-and-white thinking, yes. So describing it in black-and-white terms could be said to merely be accurate. But I keep coming back to the idea that Wilders wouldn't care about the details of Islam if he didn't see it among Dutch residents. If he wants to criticize Muslim extremists in Holland, fine. But then he should describe their behavior, not abstract ideology. That would be a far more complicated argument. He is badly simplifying here - not simplifying Islam but simplifying the connection between religion and behavior.

Anthony (2009-11-16 23:20:31)

@Seth, Right, but he's a politician, and he's utilizing political rhetoric. He's being alarmist in order to rouse Dutch people to action. It defeats the purpose to be nuanced and subtle.

david (2009-11-17 02:50:03)

"My black friends in NYC still have difficulty hailing a cab (and not because their thumbs don't work)" – "even from black taxi drivers." This is clearly not an example of white establishment racism, since practically no American born whites work as taxi drivers. In fact, in Chicago and Minneapolis, 10-20 % of cab drivers are Somalis.

bgc (2009-11-17 04:58:44)

Well, let's not use such second-order quibbling to avoid discussion of the primary aspect of the situation - which is an historically-unprecedented population displacement currently being implemented by the European elites, probably motivated by their own cultural guilt and self-loathing: [http://www.spsw.ox.ac.uk/fileadmin/documents/pdf/WP33\\_Third\\_Demographic\\_Transition.pdf](http://www.spsw.ox.ac.uk/fileadmin/documents/pdf/WP33_Third_Demographic_Transition.pdf)

Eric (2009-11-17 05:56:21)

I'm also living in The Netherlands, and I do see a problem with Islam, and a certain percentage of the Moroccan people. But these things are not that related as some might think. The largest group in Islam, Sunni, is a quite 'rigid' form, as Wilders describes when he indicates "there is no moderate Islam". This form gives people a set of laws and a book that give them mandate to kill non-believers, start war or commit terrorist acts, as the laws and the book is the word from God. There are moderate muslims, but they are seen as non-true-believers in the eyes of some very strict muslims. There was a intern from Pakistan at the company I worked for last year. He was a muslim, but was more geared towards the Sufism stream of the Islam. It's a more mystical-ascetic form of Islam, and during our conversations, I thought many concepts were almost closer to Buddhism than the Sufism version of Islam. I do not have any problems with most people that are muslim. Most are fairly moderate and just live their lives in society. Strict (Sunni) Islam thought is scary, just as scary as strict Christian thoughts, like the Dutch political SGP, a orthodox protestant political party (no woman could have party membership before the year 2006). 'The Moroccan problem' is something else. Ok, most Moroccans probably are muslim, at least they consider themselves muslim, but might not behave as such. Coming up with "nice people that speak Dutch" does not make a huge impression on me. The percentage of criminal Moroccans is 17 times as high as the percentage of criminal Dutch (year

2006), in some regions this number is even higher. This is not because the Dutch have a problem with foreigners, but it's a problem in some specific ethnic groups. When I worked at Philips, on our campus I worked with people from Netherlands, Belgium, Germany, UK, Spain, France, Romania, Denmark, Finland, Russia, Belarus, Pakistan, India, China, and Singapore that were living or studying in The Netherlands. Dutch companies do not have any problems with people with other cultural background, but you have to put in some effort. Behave well, study, get good grades, work hard to earn your cash, and you will make it just like anyone else. But if you don't study, don't get your grades, dress like a rapper, and behave and communicate like a criminal, people will treat you like one. It's not because of your parents' cultural background, it's because you and your friends thought you did not have a chance, so you did not invest, so in the end you indeed are not going to set that chances. A self fulfilling prophecy. I've seen the same thing happen to Dutch 'natives'. Why study and work 40+ hrs a week for someone else when you can make money yourself going in the illegal drug business? Ok, I do believe it was easier for me to get support from friends when I was going to do a study in electronics and software. But do not blame it on the fact that your (grand)parents being from Morocco, you probably have to blame it on lack of support from friends and family...

Model Train Scale (2009-12-09 14:31:38)

Nice blog dude, but am I the only one having some problems with the interface i don't know if it is because i'm using a old version of Opera!

### **A Chinese Joke (2009-11-16 07:08)**

In a Shanghai apartment, the phone rings. A friend of the occupant answers the phone. "It's someone from a rural area," he shouts to the occupant. (Shanghai and other dialects are quite different.) "I'm from Beijing," says the person on the line. "It's someone from Rural Beijing," the friend shouts.

This joke is told by people who are from neither Shanghai nor Beijing.

---

### **Leonard Mlodinow on Wine Experts (2009-11-16 15:06)**

[1]They're just like us!

In France, a decade ago a wine researcher named Frédéric Brochet served 57 French wine experts two identical midrange Bordeaux wines, one in an expensive Grand Cru bottle, the other accommodated in the bottle of a cheap table wine. The gurus showed a significant preference for the Grand Cru bottle, employing adjectives like "excellent" more often for the Grand Cru, and "unbalanced," and "flat" more often for the table wine.

Whether a wine wins a medal in a competition appears to be pure chance:

Mr. Hodgson restricted his attention to wines entering a certain number of competitions, say five. Then he made a bar graph of the number of wines winning 0, 1, 2, etc. gold medals in those competitions. The

graph was nearly identical to the one you'd get if you simply made five flips of a coin weighted to land on heads with a probability of 9 %. The distribution of medals, he wrote, "mirrors what might be expected should a gold medal be awarded by chance alone."

Thanks to Dave Lull.

---

epistemocrat (2009-11-17 09:11:10)

Hi Seth, I thought this was a good prescription from that article: "If you ignore the web of medals and ratings, how do you decide where to spend your money? One answer would be to do more experimenting, and to be more price-sensitive, refusing to pay for medals and ratings points." We each are "experts" in our own taste preferences: self-experiment away. And maybe use the heuristic that the average price per bottle never exceed \$10 in these experiments. I suspect the health benefits from wine accrue via hormesis. Intake becomes toxic at some point, I imagine, and I suspect that level is lower than we think. Cheers, Brent

seth (2009-11-17 12:49:42)

I wonder if an online site, a cross between Wikipedia and Zagat, where anyone can add a rating, would help.

MT (2009-11-18 12:11:19)

Or similar to Amazon's book ratings. Such ratings could be very valuable, but they're also very hackable currently, as fake ratings can be added by people with vested interests, and often they are quite highly incentivized to do so. What is needed is for "real name" systems to become more common and acceptable, so people have to provide some evidence of who they are – say a credit card – in order to create an account. I think we'll see such verification techniques become more common as digital natives age and constitute a greater proportion of the population, using the net more and more naturally.

Mike Kenny (2009-11-19 11:14:11)

This makes me wonder if I'm enjoying things in nice packages more than I need to. There might be a gold-mine in products in ugly packages. If the framing effects really do make a wine better—I think Tyler Cowen argued for the possibility framing effects might add to real enjoyment—then perhaps you can use this effect to make your life better. You buy some cheap liquor and expensive liquor, pour them into identical, nice-looking bottles, and mix them up so you don't know by look which bottle is expensive and which is cheap.

Seth Roberts blogs framing effects « Mike Kenny (2011-11-24 04:58:05)

[...] Seth Roberts blogs framing effects. I comment there: This makes me wonder if I'm enjoying things in nice packages more than I need to. There might be a gold-mine in products in ugly packages. [...]

## **Dance Dance Revolution (2009-11-16 21:05)**

Just as addictive as everyone said. It reminds me of racquetball, which I could play for hours. But racquetball required going to the gym, getting dressed, finding someone to play with, waiting for an empty court, coming home. It might be possible to use my DDR scores as a measure of something.

---

david (2009-11-17 08:17:31)

I recently got an ipod touch free with another purchase and when I started using it I thought of your posts about using your laptop to measure the effects of omega-3s. It seems like the ipod/iphone/touch screen smartphone would be an ideal format for games that test for the effects of things like omega-3s. The games could be made fun enough to be interesting and the device is portable enough to take with you anywhere.

seth (2009-11-17 12:44:10)

David, yeah, I agree, you could do the test while you're waiting for something.

karky (2009-11-17 14:44:19)

Something similar to the game Brain Age I have for my Nintendo DS perhaps?

### **Gatekeeper Syndrome (2009-11-17 13:48)**

If the original Milgram obedience experiment weren't scary enough, in the 1960s [1]a researcher named Hofling did a variant in which nurses were ordered to give twice the maximum dose of a certain drug. The drug was not on the hospital's approved list, the order was given by phone, and the nurse didn't know the doctor giving the order. Yet 21 out of 22 nurses obeyed. (They were stopped just before giving the drug.) Hofling concluded that of the several intelligences that might have been involved in the situation, one was absent.

I thought of this research when I learned about [2]a remarkable case of anaesthesia dolorosa. Anaesthesia dolorosa is a condition where you lose sensation in part of your face and have great pain in that area. It's rare; it's usually caused by surgery. In 1999, Beth Taylor-Schott's husband had an operation for trigeminal neuralgia that left him with this condition. In the ensuing years, all sorts of pain medications failed to solve the problem. Then he had another operation:

In January of 2008, David underwent a gamma knife procedure to ablate the sphenopalentine nerve bundle. Before the procedure, we were told that 16 other patients had had the procedure, and that all of them had experienced either complete recovery without drugs or an 80 % reduction in pain. So we were optimistic going in. It was only after they had done the surgery that the doctors admitted that they had never done it on someone with AD before and that all those other patients had had atypical facial pain. The surgery had no effect as far as we could tell.

[3]Shades of my surgeon claiming the existence of studies that didn't exist. But that's not the point. The point is this: After reading [4]Atul Gawande's article about mirror therapy for phantom limb pain, she and her husband tried it. "Within 2-3 days, his pain was down to zero." It stayed there so long as they continued the mirror therapy. Soon after this they were able to eliminate his pain medication.

I asked Taylor-Schott what the reaction of her husband's doctor was. She replied:

David's actual pain doctor wrote back a single word, if I remember correctly, which was "fantastic."

Wow. An incurable debilitating pain condition quickly and completely eliminated without drugs or danger or significant cost and . . . a pain doctor isn't interested. Let's call it gatekeeper syndrome: lack of interest in anything, no matter how important to your work, that doesn't involve you being a gatekeeper.

I said that showed remarkably little curiosity. Taylor-Schott said that was typical. I agree. After I lost 30 pounds on the Shangri-La Diet, my doctor expressed no curiosity how I had done so. A friend of mine showed his doctor some data he had collected highly relevant to how to treat his condition; his doctor wasn't interested.

Curiosity is part of intelligence. Not measured on IQ tests – a serious problem with those tests. To lack curiosity is to be just as brain-dead, in a different part of the brain, as those too-obedient nurses. Taylor-Schott speculated that curiosity was beaten out of doctors in medical school. Or perhaps much earlier. Curiosity doesn't help you get good grades in college.

In my experience, college professors have their own problems along these lines. UC Berkeley has a fantastic selection of talks, year after year. I almost never saw a professor at a talk in a department different from his own – no psychology professor (other than me) would attend a talk in nutrition, for example. At statistics talks, I almost never saw a professor from another department. Curiosity had been beaten out of them too, perhaps. Professors who lack curiosity produce students who lack curiosity . . . it makes sense. It sort of explains why Berkeley professors had/have such a narrow view of intelligence; to them being smart means being good at what college professors do. It also explains why the lack of measurement of curiosity on IQ tests is so rarely pointed out.

And it explains why Taylor-Schott and her husband learned about mirror therapy from a magazine article rather than from one of the many pain doctors they consulted.

dilys (2009-11-17 13:53:43)

Just one more iteration – a friend's brother, after about a year on the Paleolithic Diet, had a blood test in which the tech and the doctor agreed they had never seen such high scores of "good cholesterol." Neither one was interested in what he was doing that might have caused this.

Andy McKenzie (2009-11-17 14:30:26)

Seth, instead of assuming that all of these things (med school, college, doing conventional research) reduces or "beats out" creativity, why not just make the simpler assumption that most people just don't have this curiosity in the first place? It didn't help them get there, but it probably wouldn't have hurt either.

Aaron Blaisdell (2009-11-17 15:52:47)

@Andy, There may be some truth to what you say. I try to spark curiosity in the pre-med students taking my seminar in Animal Cognition. Usually a few of the 20-30 students show lasting curiosity week after week. The rest don't show much expression

so I don't know what they're actually thinking. Perhaps just what will be on the next quiz or test so that they can study to get an A in the course. Same with my comparative psychology course which usually enrolls about 80-100 students, most pre-med psychobiology majors. a handful will show genuine interest and ask intelligent (by which I mean creative and interested) questions, but a good majority of the students hardly make a peep in class. Of course absence of evidence isn't necessarily evidence of absence (of creativity or interest), but I know where I'll bet my money.

seth (2009-11-17 16:33:30)

Andy, because young children are curious. All of them. In a world without schools, that's how you learn. That's the first reason. The second reason is that there are examples where a facility that isn't used or encouraged or rewarded goes away. The obvious example is language, where distinction not used in the language are no longer heard. A less obvious example is the urge to decorate. For a long time in Communist Croatia, to decorate your house was forbidden. When Communist control subsided, it took a long time for the urge to come back. Aaron, I found my Berkeley students were intensely curious about stuff related to what they wanted to do after they graduated, like be a nurse. But yeah, I remember when I was a grad student at Brown, a lot of the students in my statistics section (I was a TA) couldn't see the point of anything that wasn't going to be on the test. I think it's normal to be interested in stuff related to what you do for a living and not be interested in other stuff but what these pain doctors seem to be saying to the Taylor-Schotts is what they do for a living isn't alleviate pain but make money. Since mirror therapy doesn't involve them making money, they're not interested in it.

Nathan Myers (2009-11-17 18:48:09)

My wife's grandmother spent a year on doses of Tegretol so strong she couldn't walk safely, prescribed for trigeminal facial neuralgia. (She said it felt like electric shocks to her cheekbone.) I finally persuaded her to talk to a specialist, and it turned out that a simple procedure, essentially inserting a spacer between two nerve fibers, completely cured the problem. Her doctor hadn't been interested enough to find out about the treatment, or to refer to her to someone who knew, and just prescribed stronger doses. My wife's grandfather died of prostate cancer, which it now turns out is caused by a virus, XMRV, the same virus that appears to cause Chronic Fatigue Syndrome. For a long time anyone presenting with CFS was referred to the psychiatrists. Arguably what actually did him in was the radiation treatment, which entirely transformed him in just a few weeks; afterwards he was just waiting to die.

epistemocrat (2009-11-17 22:57:05)

I'll chime in as that (recent) pre-med student. The process does not foster curiosity. It punishes creativity and curiosity in many ways. To make it into and through medical school, residency, etc., students have to 'put their heads down' and just go (don't look left, right, or back)-it's the most effective way to jump through all the hoops set up by academia. Deviating too far from this path is counterproductive in terms of gaining admission, excelling on standardized tests, and receiving accolades. Unfortunately, this approach is flawed philosophically and does not necessarily translate into future physicians who practice medicine effectively, with insatiable curiosity. I had to create my own major to pursue my curiosity-that was not recommended in terms of looking good on medical school applications. I did it anyways; my path was much more valuable that way for me. When I elected to do my Master in Health Administration degree following undergraduate, instead of go straight to Medical School, one of my friends at UCSF Med School asked, "Why would you do that? Do you like studying that stuff?" Every medical decision is an economic/financial/policy decision, I thought, and I pursued my curiosity further. Experienced physicians praised me for foresight, but I still penalized myself in terms of jumping through the mainstream hoops most successfully. Our educational system focuses on the known, not the unknown. Curiosity helps children interact with the unknown. After awhile of schooling that teaches them the grand importance of the known, that curiosity starts to go dormant, unfortunately. The more you standardize education, the more you drown our curiosity. Cheers, Brent

seth (2009-11-18 00:50:24)

"The more you standardize education, the more you drown our curiosity." Yes, I think that's exactly right.

Alex Chernavsky (2009-11-18 04:46:07)

Perhaps lack of curiosity is a factor here, but I think there are other reasons for the type of behavior that Seth described.

There is a book that sheds considerable light on this issue. The book is called, "Mistakes Were Made (But Not by Me): Why We Justify Foolish Beliefs, Bad Decisions, and Hurtful Acts", by Carol Tavis and Elliot Aronson. Here is the Amazon page: <http://www.amazon.com/Mistakes-Were-Made-But-Not/dp/0156033909/>. This is the best book I've read in the last year. You'll recognize relatives, friends, and co-workers on every page (and perhaps yourself, if you are honest).

Darrin Thompson (2009-11-18 05:43:38)

Maybe you'll nuance this a bit in time? (black-and-white, mmmm?) ;-) I'm curious enough about self experimentation to read about others' results, even try out some of their finds, but not enough to invest time measuring every day. I'm curious enough about Deming's methods and Lean to read library books and popular bookstore books about the subject, but not enough to pay \$40 or \$hundreds for more expensive training materials. I was really curious about the technical details of creating a story. I was half tempted to try and scrounge up \$600 and airfare for McKee's seminar. Lucky for me, I found he authored a bookstore priced book. That was one of my best finds last year. Story is a fabulous read. Note, I'm a computer programmer. I've made a habit of trying to study outside my field and it's amazing what I've found. Here's \_why\_ agile works, according to Deming. Here's what Lean manufacturers do. Did you know that "waterfall" never worked anywhere? Anywhere? We didn't "borrow" it from anywhere. No one does it and sees it work. So I'm definitely living out the curious thing, but I have my limits. Your professor friends who don't attend each others' talks are truly missing out on half the excitement of their jobs. You get go to the presenter and breathlessly tell them how what they just said relates to your field, or even the other way around. Did you know ... ?!

## **Pfizer, After Having Its Way with the Good Citizens of New London ... (2009-11-18 00:44)**

Apparently Pfizer Pharmaceuticals, the biggest drug company in the world, needs all the bad publicity it can get. One of the last things Jane Jacobs wrote was a friend-of-the-court letter in the Supreme Court case Kelo v. New London where eminent domain was used to take property from private landowners and give it to a private corporation (Pfizer). It was just as outrageous as that sounds. And Pfizer got away with it. [1]Now Pfizer is abandoning the site. Leaving a large empty lot where houses used to be. The CEO of Pfizer is Jeff Kindler.

1. <http://www.democracynow.org/2009/11/13/eminent>

---

Toni H (2009-11-18 10:54:21)

Dude, who's the worse one here - the capitalist drug company simply seeking profits, the politicians that make the actual decision to ruin people's lives (the company doesn't have a say in this - it's the politicians making the decision!) or the sheepish voters that elected those politicians?

Splint (2009-11-18 12:11:56)

"the company doesn't have a say in this - it's the politicians making the decision!" lol, awww, that's cute.

user@example.com (2009-11-18 12:33:31)

"the company doesn't have a say in this - it's the politicians making the decision!" I was upset when I read this story, but now I see that it's just another example of Big Government and Big Citizen screwing over a poor defenceless company who didn't even want that land to begin with. Damn you, Obama!

Toni H (2009-11-18 16:27:03)

I guess I'm daft but I just can't understand what Pfizer can do besides lobbying and taking the corrupt politicians for expensive

lunches. It's the local politicians that have the final saying and approve the tax breaks and the eminent domain.

Splint (2009-11-18 16:32:21)

Right, and all you have to do is make sure your politicians aren't corrupt and that Pfizer doesn't straddle any ethical loopholes. Why hasn't anyone thought of that?

Sasha (2009-11-18 17:36:15)

user@example.com: Your statement implies the dangerous, indeed fatal, misunderstanding held by a majority of liberals and progressives in the world today. They somehow see government as being some sort of bulwark against corporate power. But if you look at the reality, the government is really an extension of corporate power. Money is, unfortunately, just overwhelmingly more powerful in deciding government policy than popular voice. Government is generally used as the pit bull to justify the use of coercion in achieving the corporate agenda. Sure, the corporations may cry for their mommy, and say all kinds of nonsense about how oppressed they are. But that is an intentional smokescreen. This is a case of corporations and government getting together to screw the citizenry, as it is 90+ % of the time.

seth (2009-11-18 18:28:33)

Sasha, I think you and user@example.com agree.

Tamooj (2009-11-19 00:56:27)

user@example.com - Ummm... How exactly is Pres Obama responsible for this? The court case happened a few years ago under the previous administration, and in any event, it was the courts, not the white house, that made this call. I'm coming to dislike all the hate speech, (left or right) I see in these postings almost as much as I am disappointed by all the grammatical and spelling errors. No wonder the world laughs at us. Sigh.

seth (2009-11-19 01:08:28)

hmm. I guess my previous comment was unclear. user@example is joking.

This Post Will Take Forever to Load (but is of Course Worth it) « Out Of My Mind (2009-11-19 03:37:53)

## Chatting With a Gmail Hacker (2009-11-18 05:59)

Someone broke into my gmail account. (I have regained control.) The hacker sent an email to about twenty people asking for money. To be sent to London. Here is a gchat conversation that ensued (me = the hacker, Richard = one of my students):

18:30Â

Richard : do u need sth professor?

18:32Â

me : nop

Â Â

not good at the moment

Â

Richard : what do u mean? ur feeling not well?

---

16 minutes

18:49Â

me : HEY

18:50Â

Richard : hey

18:51Â

me : heop you get my mail?

Â

Richard : uh.. no

Â Â

when did u send it?

18:52Â

me : I'm stuck in London with family right now

Â

Richard : wow!! u didn't tell us u're going to the uk!

18:53Â

me : I'm sorry for this odd request because it might get to you too urgent but it's because of the situation of things right now

Â

Richard : wait.. are you Kaiping or Seth?

Â

me : Seth

Â Â

i came down here on vacation

18:54Â

Richard : oh..

Â Â

this is really odd

Â Â

i saw kaiping's post saying that he's with his family too..

2168

18:55Â

so u emailed to me? but i didn't get it..

18:56Â

u mentioned request.. what is the request in ur email?

18:57Â

me : i was robbed, worse of it is that bags, cash and cards and my cell phone was stolen at GUN POINT, it's such a crazy experience for me

Â

Richard : what!

where are you now? are you safe?

18:58Â

me : i need help flying back home, the authorities are not being 100 % supportive but the good thing is i still have my passport but don't have enough money to get my flight ticket back home and I need to clear the hotel bills here

Â

Richard : can u resend me the email?

18:59Â

me : please i need you to loan me some money, will refund you as soon as I'm back home, i promise. Get back to me ASAP let me know what to do next

Â

Richard : can u log on gtalk so i can voice chat with u?

Â Â

not enough info for me

19:00Â

i did get ur email so i don know how i can hel u

Â Â

help

19:02Â

me : can i ask you a qus?

Â

Richard : yes

Â

me : tell me who is your best friend?

19:03Â

Richard : .....my girlfriend i guess

Â

me : are you kidding me ?

Â

Richard : if ur serious about my helping u then...

19:04Â

me : are want to who you her

Â Â

tell me who is your best friend?

Â

Richard : why does this matter if.. what?

Â Â

best friend okay, a guy in tsinghua

19:05Â

but u don't know him i guess

Â

me : the title of book I showed you lat time ?

Â

Richard : the shangri-la diet or mindless eating?

Â Â

....professor, please

19:06Â

me : stop kidding me

19:07Â

Richard : professor i thought u r a little strangely

sorry.. i mean talking a little strangely

Â Â

i should be confused

19:09Â

why does these matter if ur trying to fly back?

19:11Â

the thing is i didn't get ur email so i do not know how to help

19:13Â

me : You can wire it to my name from a western union outlet around. Here are the details you need to get it to me;

Â

Richard : can u use voice chat?

19:15Â

2170

it should be easy to install the voice chat plugin for gmail, i mean we are not well connected, so it's kinda slow  
Â Â

i couldn't help thinking this as an experiment...

19:16Â

i think the easiest way would be u resending the email so i can get enough info

19:17Â

besides, i may not have enough money so i would need time to transfer money into my active account if we act fast enough we can get u home more quickly

19:18Â

do u have a phone number of any kind?

19:19Â

me : You can wire it to my name from a western union outlet around. Here are the details you need to get it to me;

Name - Seth Roberts

Location - 27 Leicester Square, London. England.

19:20Â

Richard : and how much? all i have is rmb does it matter?

19:21Â

me : how much can you loan me ?

Â

Richard : i donno. all i have in my account is about 4k yuan

19:24Â

me : I still have my passport so i can use it as identification. You'll be given a 10 digit confirmation number as soon as the transfer goes through, email it to me as soon as you have wired the cash to me.Regards

19:31Â

me : you there

Â

Richard : yes professor do u have a phone number?

Â

me : nop

19:32Â

Richard : but u have access to internet! where r u now?

Â

me : yes

19:35Â

Richard : i gotta go good luck man

Jim (2009-11-18 06:53:30)

Sounds like Not-Your-Self-Experimentation.

david (2009-11-18 07:24:25)

Wow. Any idea how he got your password?

seth (2009-11-18 07:48:45)

No I don't, unfortunately. His English is too good for him to be Chinese. So I have a hard time believing it has anything to do with my being in China. A virus scan of my computer turned up nothing. A lot of gmail accounts have been hacked like this in the last few weeks. It certainly has nothing to do with phishing, as Google first claimed. I didn't give anyone my password. And I use https (rather than http) when using gmail.

DP (2009-11-18 08:12:26)

Did you log in using either a cafe computer or someone else's computer? I find that people, even sysadmins, can't be trusted to maintain security. I try to keep great security on my machines, and rarely use anyone else's when I'll need to enter a password. The one time I know my password was snared was when I was working with a friend on a project & needed to SSH from his terminal, which was logged into the Cal math dept. When it came to light a day or so later, I initially assumed my friend had unwittingly gotten a keylogger. In reality, it was the math department that didn't maintain good security.

Nathan Myers (2009-11-18 11:20:00)

It probably has a lot to do with being in China. A new and practical man-in-the-middle attack on SSL, and thus on HTTPS, allows anyone who controls a router you're going through to get your SSL credentials. No more internet cafes, for a while.

seth (2009-11-18 12:45:59)

Nathan, the attack you're talking about only seems to work with Twitter: <http://news.softpedia.com/news/Practical-Twitter-Attack-Using-SSL-Renegotiation-Bug-Demoed-127087.shtml> I don't have a Twitter account, never use it. You can't get Twitter in China, I'm told.

Kz (2009-11-18 13:35:14)

A few notes: - Are you sure they aren't Chinese? "are want to who you her" - their English is less than perfect. - The vulnerability you linked to is a flaw in SSL, not in Twitter. Any site using SSL is vulnerable. - I wouldn't call this person a hacker, necessarily. Unless you have a much more secure password than average, haven't ever written it down, and don't use the same password for any other websites, they could easily have guessed (brute forced against known info) or otherwise found out your password. If not, it was likely a MITM attack, which anyone can do.

Nathan Myers (2009-11-18 13:55:11)

No, Twitter is just a convenient and familiar way to demonstrate the exploit. It works with any SSL connection and login, under certain conditions. Of course the people using it for ill are not posting articles about how they're using it. Probably most uses involve hacking into thousands or millions of wireless routers and altering how they forward SSL traffic, to harvest authentication details. It's entirely possible, maybe even likely, that your case was not one of them, and that you got taken by a keylogger installed on a cafe machine, or something.

Nathan Myers (2009-11-18 13:58:54)

Also, English skills tell us nothing. Details harvested in China are sold in bulk worldwide. Former Chinese WoW gold farmers are branching out.

seth (2009-11-18 14:14:24)

thanks, Nathan

## **The Return of Charles "Disgraced" Nemeroff (2009-11-18 14:55)**

So soon! Nemeroff, you may remember, took large sums of money from drug companies and failed to disclose them. What is that line about teaching an old dog new tricks? Here is what [1]the New York Times said:

The program, conducted online, had been led by Dr. Charles Nemeroff, an Emory University psychiatrist who last year was removed as department chairman and lost federal grant financing for [2]failing to report income from 16 drug companies.

Dr. Carroll said that the program concealed unfavorable data and side effects of drugs made by AstraZeneca, which sponsored it, and played down alternatives to those drugs. In his complaint, Dr. Carroll wrote that the program "appears to make a mockery of standards against bias."

In an e-mail message Tuesday night, Dr. Nemeroff defended the program. "The program was peer-reviewed and found to have fair balance," he wrote.

Thanks to Michael Bowerman.

## **Pork Scrap (2009-11-18 16:39)**

In [1]a New Yorker podcast, Calvin Trillin says:

I live in Nova Scotia in the summer. And I hear a lot of talk about how Newfoundlanders eat mainly pork scrap.

Hey, that's what I eat: pork scrap. (And fermented food.) Pork scrap (large pieces of pork belly, actually) is absurdly cheap: \$1/pound or less.

1. [http://www.newyorker.com/online/2009/11/23/091123on\\_audio\\_trillin](http://www.newyorker.com/online/2009/11/23/091123on_audio_trillin)

Nathan Myers (2009-11-18 22:43:54)

You couldn't pay me enough to eat American pork. Haven't you read about Smithfield's feedlots?

### **Best TV Season Ever (2009-11-19 04:15)**

Here are my favorites (better to worse):

1. Mad Men.
2. Glee.
3. [1]Lie to Me.
4. The Good Wife.
5. Survivor.
6. Amazing Race.
7. Ugly Betty.

Most seasons I might like three shows as much or more than I like Ugly Betty this season. In most seasons Amazing Race would be in the top three. And 60 Minutes, Frontline, 30 Rock, and Modern Family are watchable. Lie to Me and The Good Wife have both managed to make a case-of-the-week show seem fresh, new, and complex.

1. <http://www.blog.sethroberts.net/2009/03/08/lie-to-me/>

---

Tom in TX (2009-11-19 07:43:24)

This season I like V (though it should have been called O) and White Collar. I also like Amazing Race, Survivor, and Lie to Me.

seth (2009-11-19 11:40:10)

Thanks, Tom. I hadn't heard of White Collar and have never seen an episode of V. I also like Entourage, Leverage, Top Chef Masters, American Idol, and The Bachelor/Bachelorette, which are now in hiatus or between seasons.

Tom in TX (2009-11-19 12:18:07)

V is a sci-fi show on ABC Tuesday nights. It's a remake of a mini-series from a couple of decades ago. Aliens come to our planet with the message, "We're from the government of another planet and we're here to help you". They even offer us universal health care. 8-) White Collar is another one of those "characters welcome" shows on the USA Network. They seem to have a formula for cranking them out - Monk, Psych, Burn Notice, In Plain Sight, Royal Pains. You can watch episodes at abc.com and usanetwork.com.

thehova (2009-11-19 13:04:46)

I'm surprised that NBC's much hyped Thursday night comedies didn't make the list. Mad Men is an incredible show with a ridiculously low budget.

## Obesity and Your Commute (2009-11-19 12:17)

In the 1950s – before the invention of BMI (Body Mass Index) – Jean Mayer and others did a study of obesity at a factory in India. They divided workers by how much exertion their job required. Almost everyone, even desk clerks, was thin, with the exception of the most sedentary. It appeared that walking one hour per day (to and from work) was enough to get almost all the weight loss possible with exercise. Doing more had greatly diminished returns. A study with rats suggested the same thing. Bottom line: If you're sedentary, you can easily lose weight via exercise, which can be as simple as walking to work. If not, it's hard.

This month GOOD has [1]a kind of update of that ancient study – a scatterplot, each point a different country, that shows percentage of obesity and fraction of commutes that are active (bike or walk). It supports what Mayer and others found – that how you get to work makes a difference. If you fitted a line to the data it would have a negative slope (more obesity, less active commutes). America has the most obesity and relatively few active commutes; Switzerland has the most active commutes and relatively little obesity. The graph also suggests that other factors matter a lot. Although Australia has less active commutes than America, it also has less obesity.

1. <http://awesome.good.is/transparency/web/0911/working-out-on-the-way-to-work/flash.html>

---

Charles (2009-11-19 13:26:47)

Correlation is not causation, of course. Are they obese because they're less active, or are they less active because they are obese? (Just as Gary Taubes makes the case that you're not fat because you eat too much; you eat too much because you're fat.) I know that when my diet is good, I'm more active and more interested in being active. When in the past my diet has been bad, I've been much more likely to sit around and watch TV, or get in the car when I could walk or bike. Now if you live in L.A., and work 30 miles from where you live, walking isn't an option of course...

Sam (2009-11-19 13:53:02)

Uuh, this got nothing to do with this post, actually (just delete my comment after reading it, I found no other way to contact you). Look at the video embedded at this site: <http://www.renegadehealth.com/gerson-hbs/> The old lady is talking about her fathers experiments, using foods to cure diseases, and funny thing, the one fat she explicitly mentions at the end of the (interesting part of the) video is flaxseed oil. I thoungh this video about food and health might be of interest to you. Kind regards, Sam

david (2009-11-19 13:53:51)

I saw this a while back and almost sent it to you: <http://science.slashdot.org/story/09/11/09/0556210/Why-Doesnt-Exercise-Lead-To-Weight-Loss> It links to this (the real story): <http://well.blogs.nytimes.com/2009/11/04/phys-ed-why-doesnt-exercise-lead-to-weight-loss/> For me, exercise stimulates appetite and causes weight gain. I use a combination of SLD (nose clipped breakfasts and lunches) and exercise (biking to work) and consider the SLD to be for weight control and the exercise for general fitness (independent of weight).

Darrin Thompson (2009-11-19 14:00:26)

Two things: This moderate amount of exercise probably works best when it's daily and consistent for really long time. TIME recently had a cover story featuring new research indicating that exercising is an ineffective way to lose weight. Although I bet these articles don't really contradict. The kind of exercise that TIME featured is the intense focused fitness club kind, the kind that makes you hungry.

Jennifer (2009-11-19 14:18:19)

I am 43 and used to run, run, run until my poor knees threw up their hands and said, "Enough!" Then I saw that Dean Ornish was asked whether running was better than walking and he said that walking was better because you can do it longer, it's easier on the ol' bag of bones, and the calories spent are equivalent in the long run. So I make sure that I walk for at least 60 minutes each day whether on a treadmill on a good incline or around my neighborhood. I'm not built like a marathoner but I never gained any weight and my knees have forgiven me and we are back on friendly terms. I can see how walking to work or school every day would make a big difference in the amount of obesity an area has. It's impossible to commute on a bike or on foot in most of LA, for example, and people are larger there (or so it seems to me) than New Yorkers, who can do more walking.

seth (2009-11-19 17:37:24)

"Are they obese because they are less active or less active because they are obese." An important feature of the Indian study was that the amount of activity you got depended on your job. Not on what you did in your free time. So exercise (actually, activity level) was a more potent and less-confounded force than most correlational studies of exercise these days. And people were unlikely to sort themselves into different occupations based on how much they weighed.

bennetta (2009-11-20 11:18:13)

Getting a desk job has been my downfall. All my previous jobs (natural foods store database manager/teacher) have been relatively aerobic in comparison. Since I started sitting in this cubicle more than three years ago, I've put on about 25 lbs. I blame my job. For me, weight loss is a lifestyle thing. It's extremely difficult, if not downright impossible, to make up the burnt calories you'd get from eight hours of constant movement vs. eight hours of sitting in a chair. I'm also not really the gym type, as it seems really unnatural to me, like I'm cramming what I should be doing into a small time period, but can't, because I'm forced to sit here at my desk like veal. Moreover, the type of exercise is not the same (long endurance vs. short burst), but most importantly, intense workouts cause my appetite to rage. I suppose that's the crux of it for weight loss purposes, and why gym plans tend to fail. Intense workouts cause intense hunger. Remaining active throughout the day doesn't. My solution, which I took up about two months ago, has been to walk to work. While walking 5 miles twice a day (often in the rain) isn't for everyone, I've found it to be the best alternative to having an active job that I can find. So far, I've lost about 8 lbs. That was a mouthful!

jasonfiorini (2009-11-24 18:50:23)

well said

Bob Sherman (2009-12-28 06:41:43)

In the 1950s you could not find fast food in India. Hardly even in the U.S. And, the vegetarian diet of most in India had to be a factor in keeping most people slim. Walking a mile works off about 100 calories. Not hard to keep slim eating rice and veggies. But, today... There are 540 calories in a Big Mac. And, don't forget the 790 calories in an Angus Bacon & Cheese. You'll want a large fries with that, right? Of course, for another 500 calories. And, let's ease up on the drink with only a medium Coca-Cola® Classic for another 220 calories. (see [http://nutrition.mcdonalds.com/nutritionexchange/nutrition\\_facts.html](http://nutrition.mcdonalds.com/nutritionexchange/nutrition_facts.html)) OK. That's one Big Mac, large fries, medium Coke for 1260 calories. Gotta walk more than 12 miles to work that baby off. Our lifestyles have brought most Americans to the point of over indulging in high caloric foods and reducing our need to exert ourselves. No wonder we're fat.

Tyler (2010-02-22 12:24:00)

Bob you hit the nail on the head, times have changed, portions have changed and simple solutions are failing to address complex problems. Simply walking a mile or two to and from work isn't enough anymore, especially given the calorie rich foods we're all eating and the increasingly sedentary lifestyles. Technology is making it too easy to do so much that requires so little physical effort. Until people realize they have to push themselves the extra proverbial miles, it's not going to change.

## Depression and Insomnia Linked at CureTogether (2009-11-20 01:26)

Fourteen years ago I woke up one morning and felt really really good: cheerful, eager, and yet somehow serene. I was stunned: There was no obvious cause. I hadn't slept particularly well. Nothing wonderful had happened the day before. But there was one thing . . . the previous day I'd watched a tape of Jay Leno right after waking up. I'd thought it might improve my sleep. Now – a day later – my mood was better. Could there be a connection? Two very rare events: A (TV early in the morning) and B (very good mood upon awakening). Did A cause B? Such causality would be far different than anything we're familiar with. Yet it made some sense: From teaching introductory psychology, I knew that depression and insomnia are related. If you have one you are more likely to have the other. I had done something to improve my sleep; had it improved my mood? The already-known depression-insomnia linkage made the new idea, the cause-effect relation, far more plausible. [1]Subsequent experiments led me to a whole new theory of mood and depression.

[2]CureTogether has found another example of the familiar depression-insomnia correlation. Persons with depression are twice as likely to have insomnia as persons without depression. CureTogether gathered this data much more cheaply than previous studies. Unlike previous researchers, they were under no pressure to publish. (Professional researchers must publish regularly to keep their grants and their job.) Unlike previous researchers, they were under no pressure [3]to follow a party line.

On the face of it depression makes you less active. Yet insomnia is a case of being too active. So the depression-insomnia link is far from obvious. Lots of other facts connect depression and circadian rhythms; they all suggest that the intellectual basis of anti-depressants, all that stuff about serotonin and neuro-transmitters and re-uptake, is wrong. If depression is due to messed-up circadian rhythms, taking a drug at random times of day is unlikely to fix the underlying problem.

1. <http://escholarship.org/uc/item/2xc2h866>

2. <http://curetogether.com/blog/2009/10/30/depression-insomnia-link-reported-at-curetogether/>

3. <http://www.blog.sethroberts.net/2009/11/11/three-things-elizabeth-kolbert-doesnt-know/>

---

JLD (2009-11-20 03:40:45)

There are other hypothesis about depression, [1]The bright side of being blue: Depression as an adaptation for analyzing complex problems. If such is the case there is no contradiction between insomnia and low activity, on the contrary it matches quite well.

1. <http://sites.google.com/site/paulwandrewsphd/>

intellectual yokel (2009-11-20 09:21:35)

Seth, do you still watch faces every morning?

thehova (2009-11-20 13:14:30)

I used to be a filer for a primary care physician (it turned out to be a really interesting job). I was shocked by how many patients he prescribed anti-depressants (such patients were typically in bad health and returned to the doctor often for all sorts of reasons). Would a sleep prescription improved their depression and health? It seems like it would be much less invasive than

anti-depressants.

seth (2009-11-20 16:37:31)

intellectual yokel, yes, I still watch faces most mornings.

Alexandra Carmichael (2009-11-20 21:39:03)

Fascinating, Seth! Is insomnia always a case of being more active? I hadn't heard the depression-circadian cycle connection before either, definitely food for thought in my own family - do you know of any good resources/studies that talk about this?

seth (2009-11-21 07:11:03)

"Is insomnia always a case of being more active?" Well, mentally active, yes. Waking up is a step toward being more physically active, too. Curiously I cannot find any recent surveys of the depression/circadian rhythm link. There is a 1983 book called "Circadian Rhythms in Psychiatry". Yet the depression/insomnia link isn't just very clear in research studies, it's also clear that many persons with depression feel better later in the day. The depression begins to lift. My 2004 self-experimentation paper <http://escholarship.org/uc/item/2xc2h866> gives many references about the various ways circadian rhythms and depression are linked.

Nansen (2009-11-21 13:51:08)

@ thehova re: "Would a sleep prescription improved their depression and health?" To the extent one believes Wikipedia: "...the duration of [Slow-Wave Sleep] periods can be increased by ingestion of alcohol, THC, SSRIs, and other drugs....This increase of [Slow-Wave Sleep] can lead to increased REM latency and a decrease in REM period durations...An increase in REM is believed to produce symptoms of depression and bipolar disorder in many patients...Certain substances, such as benzodiazepines (e.g. Ativan, Valium, Klonopin) seem to have the reverse effect on the time spent in [Slow-Wave Sleep]....While these sedatives can increase sleep duration or shorten the time it takes before sleep-onset occurs, they tend to deprive patients of deep sleep." in other words, sedatives can increase REM, which can increase depression.

MT (2009-11-23 16:58:34)

I don't think this is a revelation - insomnia is well-linked to depression, and is even considered a diagnostic indicator in the DSM-IV, the medical standard. @theHova, would sleep prescriptions be more productive - "sleep meds" (such as benzodiazapenes and other relaxants) are commonly prescribed for mood disorders including depression and anxiety. In my opinion they are generally ill-advised as people acquire tolerance to them, leaving them worse off when they have to taper off of the medications. Sleep is better regulated through behaviour modification including regular sleep and wake times, and cutting back on or eliminating alcohol and caffeine. Seth's suggestions about sunlight and other interventions are also worthwhile.

ceva (2009-12-20 15:35:22)

Hi have noticed a very strong connection between my mood and these factors, in order of importance: 1) Time at which I fall asleep - if this is later than midnight, there is a very good chance that I will be in a very bad mood the next day. 2) How long I sleep for - 8 hours is required, or I will be at least 'somewhat grouchy' 3) How much 'stimulation' I have had - this encompasses pretty much anything more demanding than sitting in a darkened room and thinking airy thoughts. To have a chance of being in a very good mood the following day, it is \*vital\* that I manage to relax fully through an hour or so of \_awake rest away from anything even mildly demanding \_. I have only recently been taking the third step, in the process discovering precisely why I have been in an unaccountably bad mood for the last 15 years or so. Wrt to the third point, it has recently occurred to me that what is generally taken to be restorative or relaxing: watching the tv, reading, listening to music are actually quite the opposite - however 'mild' each dose may be, they are still enervating. Relatedly, I have found that tv in the evening has a noticeable effect on my inclination to be sociable during the following day (my job is the most social of all). The mental exertion involved in seemingly innocuous, routine activities was confirmed by some experiments I carried out on myself on 'concentrated concentration' ie. attempting to 'think hard' for very long periods (all waking moments in days on end). After three or four days, my brain would rebel and react to any attempts at further thinking with nausea, headaches - the offending acts of cerebration would include many activities that I had hitherto considered eminently undemanding - watching bad tv,

reading magazines, chatting (!) with nausea, headaches etc.

seth (2009-12-20 16:03:38)

Ceva, your point #3 is very interesting. You're saying that if you watch TV in the evening you are LESS inclined to be social the next day? That awake rest you need to be in a very good mood the next day – when during the day must it occur? your experiments on concentrated concentration sound really good.

ceva (2009-12-20 16:59:02)

Yes, absolutely. I noticed this because I had a limited set-up at home for a while, alternating between weeks of spending evenings doing little or nothing (reading or sleeping) or doing little or nothing whilst watching tv (when my housemate would be around - he hated not having it on). I was working as an elementary school teacher, a reasonably intense job that involves a huge range and great number of social interactions, so changes in social inclination on my part tended to be clear to me. One theory I had was that tv might 'use up' the psychological space that one has for social interactions - for my housemate, he may have felt compelled to watch it to supplement the small number of social encounters that his job involved (he would typically watch Friends). The more straightforward theory I had was that tv was actually enervating rather than relaxing. The concentrated concentration experiments involved two days (8am to 11pm) of non-stop German grammar drills, followed by a day of writing maths puzzles. The work was highly intensive (I was aiming to be 'processing' info as deeply as possible at all times), far more intensive than any of the academic work that I have been led to do in the past. The consequent feelings of nausea were very closely related to having to process mentally even the most rudimentary input. I also suffered from a mild but insistent, and oddly located, headache and had difficulty walking (I would list to one side). I repeated the experiment recently, seeing how much I could stuff into my head using spaced repetition software. After reviewing 2000 words in the first session, I again got oddly located headaches (front-top of head?), nausea and slight dizziness. That lasted for two hours or so. As if that wasn't enough for me to learn my lesson, I recently decided to append heavy language work (aural comprehension) to intensive daytime work learning new maths, after which I had about 5 days of odd headaches (which would be provoked by mental work and whose intensity would be proportional to the difficulty of the work (this was a good way of ascertaining the difficulty of tasks!)) and general malaise. It was after this that I decided to start tweaking the levels of stimulation more closely, to maximise working time without permanently disabling myself. Regarding awake rest, I haven't started playing with timings during the day, but it would appear that, for me, full mental 'cooling', before decent sleeping rest is vital to be in a good mood the day after. In a different experiment, I seemed to find that high-speed, repetitive, high-concentration analytical work (for example, Sudokuing or anagramming) had noticeable effects on my social skills/awareness of the social world around me/self-relation, lasting for around three hours, after a twenty minute 'dose'. It would feel like induced aspergers (as if I were operating myself at one remove, as one would a puppet - very bad for teaching well). I repeated this experiment many, many times (over a space of three years) and had the same outcome on every occasion. I haven't been able to find someone with similar experiences.

### **In Your Wheelhouse (2009-11-20 02:16)**

I'd never heard the phrase in your wheelhouse (= in your area of expertise) until a few days ago. Now I've heard it twice: once on Ugly Betty, once on Glee. Maybe someone used in the LA Times six months ago, when those scripts were being written.

Bartacus (2009-11-20 07:17:13)

It's actually a fairly common phrase, Seth. Baseball fans will encounter it a dozen times a season. In that context it means a pitch is located where the batter is most likely to connect for a base hit. And I hear it occasionally in the business world, usually when project assignments are being made in accordance with experience, skills and temperament. Perhaps the phrase has not penetrated the realm of academia.

James (2009-11-20 07:42:24)

I believe you've just encountered the Baader-Meinhof phenomenon. (<http://thankswiki.blogspot.com/2009/03/entry-baader-meinhof-phenomenon.htm> I)

Andrew Gelman (2009-11-20 08:24:09)

Seth: Maybe it was used on some TV show six months ago. But my guess is that you've heard the expression before but did not register it. Once it stuck in your mind, you were primed to notice it when it came up again. That said, yes, I knew what the expression was and I've seen it in print, on occasion, but I don't think I've ever heard it spoken.

Hatcher (2009-11-20 08:30:29)

i've heard the term used a lot in sports, especially baseball. some hitters have certain pitches and zones that are right "in their wheel house." Like maybe an inside fastball.

Rose (2009-11-20 08:49:18)

I noticed it in Glee (I even re-wound to catch it). I hadn't heard it either, but some people I know edit a very good experimental writing webmag called Wheelhouse (which is the first time I'd ever heard the word)

seth (2009-11-20 13:07:07)

The baseball usage explains what happened – I pay no attention to baseball these days (except on Wii Sports). And it was baseball season when those scripts were written.

## **BoingBoing on Natto (2009-11-20 12:56)**

[1]This post by Lisa Katayama told me a few things I didn't know – especially that there is "good soy" and "bad soy". Good soy is mainly fermented (soy sauce, miso, and natto). The book she mentions (The Jungle Effect by Daphne Miller), which I didn't know about, sounds interesting.

Katayama's series about food has the global title "Taste Test" so I was disappointed she didn't compare different brands. I have done natto taste tests. The big difference between brands is the sauce packets! This is not how taste tests are supposed to turn out. Natto has a mild flavor that doesn't matter if you add sauces. The texture is very similar across brands.

Thanks to Bryan Casteneda.

1. <http://www.boingboing.net/2009/11/20/taste-test-natto.html>

bennetta (2009-11-20 17:59:06)

Soy has a lot of estrogen in it, so much that I know women who will actively avoid it while on their period because it makes them... "weird," as they put it. Excessive estrogen can cause a number of health problems over time. For example, it can cause thyroid dysfunction, increase your appetite, and encourage the development of breast cancer. The information is readily available and I can provide links if you'd like. After reading the article, perhaps the fermentation process somehow neutralizes the estrogen? This could probably be easily researched. What do you think, Seth?

Caleb (2009-11-21 07:57:58)

From what I recall, fermentation doesn't effect the estrogen effect of soy. I tell all my female patients who are anywhere near borderline low thyroid to avoid all soy.

JLD (2009-11-21 08:55:45)

*From what I recall, fermentation doesn't effect the estrogen effect of soy.* Awwwww... shit! Since for other reasons I have to avoid dairy products and replaced yoghurt with lactofermented soy what kind of **other** substitute could there be?

Marc Feel Good Eating (2009-11-23 08:40:51)

Love natto.....but I don't use the included the "packets". They are of the Franken foods variety. If you are preparing natto at home add some scallion for extra yum. FYI, JDL is correct, estrogen not effected by fermentation. Marc

### **Acid Reflux is Immune Problem, Says Rat Study (2009-11-21 06:55)**

[1]A study using a rat model of acid reflux found that the problem is inflammation caused by the immune system, not stomach acid damaging tissue, as had previously been thought.

[The] study in rats showed that gastroesophageal reflux causes tissue in the esophagus to release immune chemicals called cytokines, which attract inflammatory cells. These cause the heartburn and chest pain that make GERD [gastroesophageal reflux disease] so distressing.

"Currently, we treat GERD by giving medications to prevent the stomach from making acid," said Dr. Rhonda Souza, who led the study published in the November issue of Gastroenterology.

"But if GERD is really an immune-mediated injury, maybe we should create medications that would prevent these cytokines from attracting inflammatory cells to the esophagus and starting the injury in the first place.

Months ago [2]I posted about a friend of mine whose acid reflux was cured by drinking kombucha. The implication of that case and the rat study is that acid reflux is caused by an over-active immune system. Perhaps stomach acid often gets into the esophagus. Only if your immune system is under-stimulated does this cause trouble.

Acid reflux is very common. According to the article, 20 % of Americans "have it regularly". All this supports my view that we need plenty of bacteria in our diet to be healthy, that few Americans get enough bacteria in their diet, and that the deficiency causes all sorts of digestive and immune problems.

1. <http://www.reutershealth.com/archive/2009/11/20/eline/links/20091120elin012.html>

2. <http://www.blog.sethroberts.net/2009/08/10/acid-reflux-cured-by-kombucha-yes/>

---

peter (2009-11-21 09:02:56)

there may be many causes for acid reflux; in my case it is a defect in the sphincter between the stomach and the esophagus; that key sphincter does not close and as a result stomach acid splashes on my esophagus. what you describe as an immune system problem appears to be another cause of acid reflux, at least in rats and perhaps in humans.

Jeff (2009-11-21 12:36:49)

This isn't surprising. You see immune system inflammation with lots of types of tissue damage. A similar thing happens when lungs are exposed to air pollutants. Immune cells come to the area and release compounds that cause damage. "The implication of that case and the rat study is that acid reflux is caused by an over-active immune system. Perhaps stomach acid often gets into the esophagus." Maybe stomach acid often gets into the esophagus and maybe it doesn't. Without having any idea, it's hard to see how that can be taken as evidence that you are right. This may be the reaction every time acid is in the esophagus, regardless of immune system function. The example you link to of your friend's experience is very strange. "Every once in a while I might be a little uncomfortable. Then I drink a little kombucha, it gets better within an hour." Do you think the kombucha is affecting the immune system and the immune system is then changing, that fast? That seems incredibly fast for an immune mediated change. Jeff

seth (2009-11-21 15:26:14)

Jeff, that's a good point - except that I have no reason to think the immune system can't change that fast. If you do I'd like to know what it is. The immune system has to be built for speed, certainly, because the faster it responds to an infection the better. Do you have another explanation of why my friend's acid reflux - which had lasted a long time - disappeared soon after he started drinking kombucha?

Matt (2009-11-21 17:44:13)

Hi Seth, Your posts got me researching probiotics and the immune system. Have you seen the Duke study on Sucralose (Splenda) that reduced the amount of good bacteria in rats? Pretty eye-opening for me, as I have been drinking a lot of soft drinks sweetened with Splenda. This year I had 3 staph infections. Coincidence or not? Something was suppressing my immune system. I am now eating yogurt daily and have stopped my consumption on Splenda. I have also been on the SLD for a little over a week and it is so liberating to be free of the cravings. Thanks!

seth (2009-11-21 22:21:00)

I have not seen that study. Very interesting, since sometimes I consume a lot of Splenda.

Matt (2009-11-22 11:11:54)

<http://www.informaworld.com/smpp/content?db=all&content=a902553409>

David (2009-11-22 17:23:28)

This guy experimented with ground flaxseed: <http://blog.szynalski.com/2009/05/14/heartburn-remedy-ground-flaxseed/>

Carol (2011-11-26 23:22:05)

Hi there!! I suffer from acid reflux and what triggered it was a mononucleosis virus. Since then its very bad!! Probiotics help!! Do i need a supplement for the immune system?? Pls let me know what is Kombucha!!!

## Interview with Tyler Cowen (2009-11-21 18:03)

Tyler Cowen's new book *Create Your Own Economy: The Path to Prosperity in a Disordered World* has a lot to say about two topics in which I am especially interested: autism and human diversity. What can the rest of us learn from people with autism? What does the wide range of outcomes among autistic adults tell us about our world? I interviewed Tyler by email about his book.

ROBERTS If I remember correctly, you think a book should be new, true, and something else. What's the something else?

COWEN The "something else" should cover at least two qualities.

First, if everyone read the book and was persuaded by it, would anything change for the better? An author should aim to write a book which matters.

Second, the book should reflect something the author really cares about. If the author doesn't care, why should the reader?

ROBERTS What was the tipping point for this book – the event that made you say: I'm going to write a book about THIS?

COWEN To me it's very important what an author is thinking about in his or her spare time, if the phrase "spare time" even applies to my life, which has an extreme blending of work and leisure time. Ideally that is what an author should be writing about. At some point you realize: "Hey, I am constantly thinking about xxxxx in my spare time!" And then you want to write it up.

I also hit up the idea of this book through pondering the lives of some particular individuals I know – and how much they \*live\* the thesis of my book – although I am not sure they would wish to be identified publicly.

ROBERTS Have you been to Autreat, the annual conference of Autism Network International, that you mention? If so, did it affect your thinking?

COWEN I haven't been to Autreat, which for me is located somewhat inconveniently away from major cities (that is on purpose, I believe). I'm also not clear on exactly who is welcome, who needs an invitation, etc. Most conferences have a very high variance in quality across presentations and mostly one goes to meet one or two key people; often you don't know in advance who they will be. I suspect the same logic applies to Autreat as well.

ROBERTS Do you think there are jobs that persons with autism do better than persons without autism?

COWEN Autistics often exhibit superior skills in attention to detail, pattern recognition, what I call "mental ordering," and they have areas of strong preferred interests, in which they are very often superb self-educators. So yes, that will make many autistics very good at some jobs but also poorly suited for others. But I don't want to generalize and say "autistics are better at job X," that would be misleading. Across autistics there is a wide variety of cognitive skills and also problems. Engineering and computer science are the stereotypical areas where you expect to find higher than average rates of autism. While I suspect this is true in terms of the average, it can be misleading to focus on the stereotype precisely because of the high variance of skills and outcomes among autistics. One of the central issues in understanding autism is grasping the connection between the underlying unity of the phenomenon and the extreme variability of the results. In the short run, positive stereotypes can perform a useful educating function.

But the more we present stereotypes, the more we are getting people away from coming to terms with that more fundamental issue, namely an understanding of the variance.

ROBERTS There is a basic biological phenomenon in which animals and plants under stress become more variable. Some say variability in the genotype has been released into the phenotype. Do you think the variance seen in autism has been "released" in some way?

COWEN I am not sure I understand the question...for one thing I am not sure what is the postulated increase in genetic stress...

ROBERTS Yes, it's a confusing question. Let's try this: What do you think the high variance of outcome seen in autism is telling us?

COWEN I'll try to make that more concrete. One view of autism is that autistics have greater access to lower-level perception and such that access is essential for understanding autism. On one hand it gives autistics some special abilities, such as pattern recognition, certain kinds of information processing, and noticing small changes with great skill. (In some cases this also leads to savant-like abilities.) This also may be connected to some of the problems which autistics experience, such as hyper-sensitivities to some kinds of public environments.

It could be that non-autistics have a faculty, or faculties, which "cut off" or automatically organize a lot of this lower level perception. The implication would be that for autistics this faculty is somehow weaker, missing, or "broken." The underlying unity in autism would be that this faculty is somehow different, relative to non-autistics. The resulting variance is that the difference in this faculty gives rise to abilities and disabilities which very much differ across autistics.

That's one attempt to come to terms with both the unity of autism and the variance within it. It's a tough question and we don't know the right answer yet, in my view. What I outlined is just one hypothesis.

ROBERTS A clear parallel in the increased variance of autistic persons is the increased variance of left-handers. Left-handers have brain organizations that vary much more than the brain organization of right-handers. Right-handers are all one way; left-handers are all over the place. Do you see any similarities between left-handers and persons with autism?

COWEN I recall some claims that autistics are more likely to be left-handed but I've never looked into their veracity. There are so many false claims about autism that one must be very careful.

ADHD is another example of something which produces high variance outcomes. I don't think it is correct to call it a disorder \*per se\*.

We're just starting to wrap our heads around the "high variance" idea. Most people have the natural instinct to attach gross labels of good or bad even when a subtler approach is called for.

ROBERTS The term left-hander is confusing because left-handers aren't the opposite of right-handers. The dichotomy is okay but the two sides are better labeled right-handers and non-right-handers. In other words, one group (right-handers) has something (a certain brain organization); the other group doesn't have that brain organization. Then the vast difference in variance makes sense. How accurate would it be to say that non-autistics have something that autistics don't have? (I'm left-handed, by the way.)

COWEN I would say we still don't have a fully coherent definition of autism. And "have" is a tricky word. I think of autistic brains as different, rather than "normal" brains with "missing parts." Some researchers postulate

differences in the kind of connections autistic brains make. In thirty years I expect we will know much, much more than we do right now.

ROBERTS I hope this isn't too self-indulgent: What do you make of the correlation between autism and digestive problems?

COWEN I don't think there are convincing theories about either digestive problems causing autism or autism causing digestive problems. There is \*maybe\* a correlation through a common genetic cause, but even if that is true it is not very useful as a means of understanding autism. This is another area where there are many strong opinions, often stronger than are justified by the facts.

ROBERTS Another "assorted" question: I loved the study you mentioned where people with perfect pitch were more likely to be eccentric than those without perfect pitch. That's quite a result. How did you learn about it?

COWEN There is a somewhat scattered literature on music, cognition, and society. It still awaits synthesis, it seems. Someone could write a very good popular book on the topic. (Maybe Gabriel Rossman is the guy to do it.) The more I browsed that literature, the more interesting results I found.

ROBERTS I don't think I've done justice to your extremely original book but here is a last question. You talk about Thomas Schelling's use of stories. Presumably in contrast to other econ professors. I think of story-telling being something that once upon a time everyone did – it was the usual way to teach. Why do you think Schelling told stories much more than those around him?

COWEN Thanks for the kind words. Schelling has a unique mind, as anyone who has known him will attest. I don't know any other economist or social scientist who thinks like he does, but we've yet to figure out what exactly his unique element consists of. I would say that Schelling views story-telling as a path to social science wisdom. They're not even anecdotes, they're stories. Maybe that doesn't sound convincing to an outsider, but it got him a Nobel Prize.

I am very interested in the topic of "styles of thought in economics."

---

### **Splenda Reduces Gut Bacteria in Rats (2009-11-22 14:39)**

[1]This 2008 study done at Duke University found that small amounts of Splenda – similar to what a person might consume – reduced "beneficial bacteria" in the guts of rats. The effect was very large (reduction by about 50 % in 12 weeks) and occurred even at the lowest dose, which was lower than what the FDA allows. Most ominous of all, the effect had not levelled off after 12 weeks. The number of bacteria was still going down.

Within a day two different people told me (in the comments to this blog) about this study, which was published a year ago. [2]A press release about the study. The research was funded by [3]the Sugar Association. Someone recently told me that the only way doctors learn about bad side effects of this or that drug is when drug reps selling competing drugs tell them. While reading about this I came across [4]this chilling comment:

Excitotoxins are implicated in Parkinson's as well... makes you wonder about Michael J. Fox - his time as Diet Pepsi's spokesperson and his admitted addiction to the stuff for decades. I remember seeing an interview with him. His head was shaking from the Parkinson's and his Diet Pepsi was right next to him.

One of the authors of the Duke study is a professor of psychiatry, Susan Schiffman. [5]An earlier study of hers had pro-Splenda results.

More The makers of Splenda issued [6]a press release that could not be less convincing. The study, it says, has "major deficiencies" that include "a lack of appropriate control groups necessary for understanding results." No statement of what those control groups are. The press release also claims that because the investigators did not measure food and water intake, the results are meaningless! The idiotic press release is made even more curious by [7]the statement quoted in the comments below, that "Drs. Abou-Donia and Schiffman admitted that some of the results recorded in their report submitted to the court were not actually observed or were based on experiments that had not been conducted." But these, too, are not described. Which means to me that the details are not on Splenda's side, or they would have been presented. It sounds like really bad news for Splenda.

---

Nathan Henderson (2009-11-22 17:35:41)

From a press release from McNeil Nutritionals, creators of Splenda: "Drs. Mohamed Abou-Donia and Susan Schiffman are the principal authors of the study dismissed by the judge. During depositions in ongoing litigation between the Sugar Association and McNeil Nutritionals, LLC, Drs. Abou-Donia and Schiffman admitted that some of the results recorded in their report submitted to the court were not actually observed or were based on experiments that had not been conducted." Fabricated results? That doesn't exactly instill confidence.

seth (2009-11-22 18:34:10)

Thanks for uncovering this Nathan. I will try to find out what they are talking about.

Mike Kenny (2009-11-22 20:32:08)

I use a lot of Splenda in my coffee. Is there anything one might notice if one's stomach's good bacteria were diminished 50 %?

Nathan Myers (2009-11-22 21:02:39)

Bad news for people suckered into eating Splenda. For Splenda itself, what it is is *old* news; they knew about this at least a year ago.

JLD (2009-11-23 05:24:20)

Why not trying [1]Stevia if you are hooked on sweet tastes?

1. <http://en.wikipedia.org/wiki/Stevia>

Darrin Thompson (2009-11-23 09:15:00)

The anti-splenda press release is from "national consumer education group Citizens for Health" which doesn't exactly inspire confidence either. I mean, come on, Citizens for Health? Could you make the name sound any more like a PR shell? Anyone able to see the actual study?

Sheila (2009-11-23 13:08:28)

Benefits of Stevia: \* Sugarless with no calories \* Will not effect blood sugar levels like sugar does. \* 100 % Natural \* 250 to 300 times sweeter than sugar \* Heat stable to 200 degrees Celsius (392 degrees Fahrenheit) \* Non-fermentable \* Flavor enhancer \* Plaque retardant Anti-caries (prevents cavities) \* Recommended for diabetics \* Non-toxic Extensively tested in animals and Extensively used by humans with no adverse effects. Stevia has been used in Japan since 1970 and there have been no reports of toxicity or other side effects. The Japanese Food and Drug Safety Center has found stevia not to be mutagenic. Only one study has shown stevia to be potentially a mutagenic and this study has been criticized for errors in procedure. Scientist in Great Britain said that according to the study's formula, distilled water is mutagenic. Two studies showed stevia to have a contraceptive effect. The first study was done in Uruguay over 30 years ago and since then no one has been able to reproduce the results. The second study was done by a graduate student in Rio de Janeiro and the results and methods have been questionable. Multiple other studies have shown that stevia has no contraceptive effect. \* Is Stevia Safe? Absolutely. Stevia has been used around the world with NO reports of stevia overdose or toxicity to humans in the past forty years. What are the benefits of Using Stevia? Studies have shown the following benefits from using Stevia in one's diet. These benefits have not been approved or confirmed by the FDA. Splenda on the other hand is made from binding chlorine with sugar....to me, the choice is obvious.

Keane (2009-11-23 23:20:40)

I think diet Pepsi would have been using a different sweetener than Splenda, maybe aspartame. Certainly a different chemical, from Splenda. Are all man made sweeteners harmful? Does natural source necessarily mean more beneficial?

seth (2009-11-24 07:49:05)

"Are all man-made sweeteners harmful?" It is beginning to look that way. One reason there are so many is that problems keep being identified long after FDA approval. Certainly they are more dangerous than we are led to believe. Yes, Diet Pepsi is sweetened with aspartame (NutraSweet), not Splenda (sucralose).

Study: Splenda kills beneficial bacteria in GI tract | Les Jones (2009-11-24 10:21:09)

[...] Seth Roberts - Splenda Reduces Gut Bacteria in Rats: This 2008 study done at Duke University found that small amounts of Splenda "similar to what a person might consume" reduced "beneficial bacteria" in the guts of rats. The effect was very large (reduction by about 50 % in 12 weeks) and occurred even at the lowest dose, which was lower than what the FDA allows. Most ominous of all, the effect had not levelled off after 12 weeks. The number of bacteria was still going down. [...]

smeach (2009-12-01 14:29:50)

I have a copy of the article. Unfortunately, copyright law prohibits me from sharing my personal copy. However, if you type "Abou-Donia and splenda," on Google Scholar, you may find a link to the article.

Ted (2009-12-01 15:12:15)

Since aspartame is actually used as an ingredient in 'lite' yogurts, is it safe to assume that aspartame is unlikely to chase off gut bacteria in the same way?

John H (2009-12-04 00:06:33)

To me, Stevia tastes more bitter than sweet. So until this controversy about Splenda is cleared up, I think I may have to go back to aspartame (Equal). Better to run a small increased risk of brain cancer (if even that--see Seth's previous posts on aspartame and readers' comments) than this?

KS (2009-12-06 21:35:49)

I retrieved the paper using Google Scholar, and discovered this acknowledgment: "This research was supported in part by a grant from the Sugar Association, Inc., Washington, DC" In other words, the study cannot be assumed to be entirely unbiased. This is not to say that the findings are not valid – they might be. (I hope not, since I've been using Splenda, having switched from aspartame due to concerns about its safety.) But when a competing interest is funding a study, the results need to be viewed with some skepticism.

Alexandra Carmichael (2010-02-20 05:43:13)

Hi Seth, This is fascinating. What about xylitol? Due to its antibacterial/cavity-preventing properties, we are considering giving it to our daughter who is prone to cavities. Any idea if it would affect the bacteria in her gut? Thanks for your thoughts, and for always posting such thought-provoking pieces. Alex :)

seth (2010-02-20 07:08:39)

Thanks, Alex. I don't know about xylitol, sorry. In Nutrition and Physical Degeneration (available online), Weston Price has a lot to say, based on data, about what foods do and don't cause cavities. I don't know if his ideas will be helpful, because they sort of boil down to modern food is bad, but you might learn something useful from it.

Joseph (2010-10-04 07:30:44)

For the past six to nine months, after using Splenda for a year or more in my coffee at WORK, I've been having horrible acid mouth, throat, heartburn, even my eyes burning. Nothing my doctor tried worked. Lots of probiotics and enzymes helped somewhat. It always seems to be less on the weekends (I use mostly Palm Sugar on the weekends)–I just found out about this study a few days ago. I stopped using Splenda right away. Things seemed improved a little. I guess time will tell. Thanks for posting this.

## **Breakthrough in Treating MS (2009-11-23 04:15)**

When Paulo Zamboni's wife came down with MS (multiple sclerosis), he was in an unusual position: He was a professor of medicine. Not only did he have technical expertise, he was going to care far more than most MS researchers about finding a cure. (Likewise, when I suffered from early awakening, I had both technical expertise and cared more about finding a solution than any sleep researcher.)

Using ultrasound to examine the vessels leading in and out of the brain, Dr. Zamboni made a startling find: In more than 90 per cent of people with multiple sclerosis, including his spouse, the veins draining blood from the brain were malformed or blocked. In people without MS, they were not. [emphasis added] . . . More striking still was that, when Dr. Zamboni performed a simple operation to unclog veins and get blood flowing normally again, many of the symptoms of MS disappeared. . . . His wife, who had the surgery three years ago, has not had an attack since. . .

The initial studies done in Italy were small but the outcomes were dramatic. In a group of 65 patients with relapsing-remitting MS (the most common form) who underwent surgery, the number of active lesions in the brain fell sharply, to 12 per cent from 50 per cent; in the two years after surgery, 73 per cent of patients had no symptoms.

Clearly Dr. Zamboni has discovered something very important. Perhaps no true health breakthrough would be complete without appalling responses from powerful people within the biomedical establishment. The American MS society issued [1]a comment on these findings that the rest of us can marvel at. According to them, people with MS should not get tested for malformed or blocked veins!

Q: I have MS. Should I be tested for signs of CCSVI?

A: No, unless you are involved in a research study exploring this phenomenon, since at this time there is no proven therapy to resolve any abnormalities that might be observed, and it is still not clear whether relieving venous obstructions would be beneficial.

Persons with MS cannot be trusted with the dangerous knowledge of whether or not their veins are malformed or blocked! The Chairman of the Board of the National MS society is Thomas R. Kuhn. The President is Joyce M. Nelson. I would love to know how they justify this position. I wrote to the National MS society asking how Kuhn justifies this. [2]The Canadian MS society is far less negative, perhaps due to public pressure.

Over at This Is MS, [3]the National MS position is derided. Someone has made the shrewd observation that if there is something to Zamboni's idea, persons with MS should get a red head after exercise more often than persons without MS and [4]is collecting data to see if this is true. There seems to be something to it.

Not only is this a wonderful discovery but it is wonderful how the National MS Society can simply be ignored. There are now much better sources of information.

Thanks to Anne Weiss, Charles Richardson, and James Andwartha.

---

James (2009-11-23 05:10:44)

More things: MS is correlated with higher latitudes, and low Vitamin D has been correlated with vascular disease. Finally, here's a [1]1986 abstract titled "Multiple sclerosis, latitude and dietary fat: is pork the missing link?".

1. <http://www.ncbi.nlm.nih.gov/pubmed/3638477>

James (2009-11-23 06:12:03)

Also, a recent [1]genetic study linked MS and Vitamin D.

1. <http://www.msaustralia.org.au/msra/research/anzgene.php>

Andrew Gelman (2009-11-23 07:40:06)

Are you sure you "cared far more about finding a solution than any sleep researcher"? I imagine that many sleep researchers have sleep problems or have close friends or relatives who do. That might motivate some people to go into sleep research in the first place.

Alex Chernavsky (2009-11-23 08:18:50)

I don't know about the National MS Society, but NAMI (National Alliance for Mental Illness) is a lapdog of the pharmaceutical industry: <http://www.nytimes.com/2009/10/22/health/22nami.html> <http://psychcentral.com/blog/archives/2009/10/22/nami-nearly-75-percent-of-funding-from-pharma/>

seth (2009-11-23 14:27:05)

Andrew, yeah, that's a good question. Judging by everything I've read, I cared more than any sleep researcher. No expressions of concern about this. As you say at least a few of them had/have the same problem. Why no expressions of concern? Why no research program? Well, early awakening isn't life-threatening. Other sleep disorders are much worse. Maybe because to study early awakening would get in the way of more conventional research that would be more palatable to funding agencies and their colleagues – but I don't know. Aside from trying to read people's minds, I did experiments about the problem for 20 years. Nobody else has done experiments about it for one year. But you also have a good point and I've removed the "far" from "far more". The difference in motivation (between the person with the problem and the average researcher) is really important but I hope I can find a better way to put it.

John (2009-11-23 18:22:18)

The actions of the American MS society remind me of the American Heart Associations belief in the lipid hypothesis (and statin drugs), and the American Diabetes Association's support for low-fat high carb diets. I'm not sure these big organizations have justified their existences.

Hal (2009-11-24 17:53:03)

I'd suggest it's reasonable to wait for replication of these results before getting MS patients all worried and clamoring for vein surgery. I have ALS and last year there were encouraging reports (also out of Italy) that lithium had been very effective against that disease. Should the ALS Association have told everybody to rush to their doctors and get lithium? A larger trial was started to replicate the results and was recently stopped midway due to ineffectiveness. Lithium did nothing for ALS in that study. There are reasons why science does not turn on a dime and change all its recommendations based on the latest result by one scientist. Too many of these reports turn out to be inaccurate or at least incomplete. I hope very, very strongly that this treatment turns out to be as valuable as claimed and brings great relief to patients with MS. But we need to double check the results before performing this surgery on a large body of people.

seth (2009-11-24 20:18:14)

Hal, it's the fact that the National MS Society discourages testing that I find appalling. Treatment (such as lithium) and testing are really different. And the evidence here is far stronger than the ALS case. No one found that lithium levels in ALS patients were always lower than lithium levels in non-ALS patients, which is essentially what has been found here.

Tom in TX (2009-12-08 15:58:44)

@Seth or someone who knows: What was blocking the veins?

Willis Morse (2009-12-10 14:57:09)

I wonder if this ties in with the reputed gluten/schizophrenia connections. Peter (Hyperlipid) posted about gluten-induced hypoperfusion in the brain causing schizophrenia: <http://high-fat-nutrition.blogspot.com/2009/06/gluten-and-schizophrenia-spect-scan.html> The gluten connection has been around for a while, but this is the first I'd heard that it causes (or is associated with) blood flow problems in the brain.

Tamela Gockerell (2010-04-12 10:52:46)

Fantastic to see the views being spread on here! Try to smile, laugh and enjoy each and every day! CCSVI needs to be explored further

## **A Fourth Thing Elizabeth Kolbert Didn't Know (2009-11-24 07:21)**

Elizabeth Kolbert, the New Yorker staff writer, did not know that [1]Phil Jones, a climate-change scientist, maneuvered to keep hidden information that disagreed with his conclusions. Here is what one of [2]the damning emails gathered from the University of East Anglia's Climate Research Unit said:

From Phil Jones [head of the Climate Research Unit]. To: Michael Mann. Date: May 29, 2008  
"Can you delete any emails you may have had with Keith re AR4? Keith will do likewise."

To keep them from being exposed via a Freedom of Information law. [3]Robin Hanson and [4]Tyler Cowen think this is no big deal. I disagree. Yes, I said before this happened that [5]the consensus was likely to appear stronger than it is and that [6]bloggers were a powerful force toward truth – both of which this episode merely supports rather than reveals. And, yeah, it's just email; the really damning info is [7]the tree-ring data reanalyzed by Stephen McIntyre.

The reason I think this is important is two-fold. First, this is not a smoking gun. Global warming does not equal the honesty of Phil Jones. But it is a powerful piece of evidence that climate skeptics can use to convince anyone that the consensus isn't as consensus-y as it appears. Second, it exposes what Kevin Trenberth (a proponent of man-made global warming) really thinks. This is something that few knew until now. Here is what he really thinks:

The fact is that we can't account for the lack of warming at the moment and it is a travesty that we can't. The CERES data published in the August BAMS 09 supplement on 2008 shows there should be even more warming: but the data are surely wrong. Our observing system is inadequate.

The data are surely wrong. Trenberth, being human, is going to put the best possible spin on things, the spin most consistent with what he has said many times . . . and this is what he comes up with. Support for the idea of global warming is entirely based on climate models. No one has created a mini-Earth and done experiments. If the data and models don't agree, there is no reason to believe the models. And if you don't believe the models you have no reason to believe in global warming. Is Trenberth an ignoramus whose honest assessment of the situation (the models and the data profoundly disagree) should be ignored? Of course not. He doesn't draw the obvious conclusion (the models are wrong) but nothing prevents the rest of us from doing so.

Just to be clear: I completely agree with Robin's larger point that this sort of thing supports prediction markets. And I think reduced reliance on fossil fuel would be a very good thing.

[8]Three Things Elizabeth Kolbert Doesn't Know.

8. <http://www.blog.sethroberts.net/2009/11/11/three-things-elizabeth-kolbert-doesnt-know/>

Jonathan (2009-11-24 09:54:24)

You are absolutely right - Elizabeth Kolbert did not know that Phil Jones displayed a bias that is at variance with the ideal of open investigation and pursuit of truth. But that research is only one of many threads that support the idea of anthropogenic global warming. Are you suggesting that all scientists behaved that way? What about the mass of research not conducted at that small center in the UK?

seth (2009-11-24 12:13:45)

Jonathan, Phil Jones gets around. He knows about lots of data, not just his own. Based on everything he knows, the climate models and the data do not agree. The disagreement is so great that "the data must be wrong". The idea of global warming - the prediction that the earth will be a lot warmer in the near future - is entirely based on climate models. There is nothing else. No one has done experiments with other Earths. There is no animal model. Given a profound disagreement between those models and the data, any sensible person would believe the models are wrong. We don't know how much wrong, or why, we just know they are wrong. Support for the prediction of global warming completely collapses. That was my second point - until now, few people (certainly including Kolbert) knew what Jones really thought. In all accounts of this I have read, the writer has focused on the misconduct (hiding data that disagrees). Just as Tyler and Robin said, this is no surprise. But neither Tyler nor Robin nor me nor almost anyone else knew that Phil Jones believes the data and the climate models profoundly disagree. Of course the commentators enjoy finger-wagging and saying how awful someone or some group of people is. They are overlooking what really matters here. [I have revised the post to put more stress on the second point about what Phil Jones really thinks.]

Jonathan (2009-11-24 14:31:04)

» "No one has done experiments with other Earths." Hmm ... a bit tautological there, as there is only one Earth. But the early work on the macro-modeling of planetary temperatures was done by Lovelock, et al, and that did use information from other planets. Lovelock's work with NASA was to determine if there was life on other planets based on their atmospheres. Today's models are complex (and do not include all factors) - and there is uncertainty as to the rate of change. But it was long ago that relatively simple models were created to determine planetary temperature equilibrium based on the solar income, planet size, and composition of the atmosphere. We do know that certain gases will increase the retention of heat - these gasses are transparent to visible light, but reflect some of the wavelengths that are re-radiated. And we know that a huge amount of carbon that was sequestered over millions of years has been released in the past century ...

Hal (2009-11-24 17:41:20)

I have dipped a toe into the flood of challenges and explanations at [realclimate.org](http://realclimate.org). They explain Phil Jones' comment as referring to a narrow technical issue. CERES is the Clouds and the Earth Radiant Energy System satellite experiment. They are trying to accurately measure the energy radiated and absorbed by the earth, at the boundary of the upper atmosphere. Apparently it is not going too well, and that is what Jones is supposedly complaining about. He wants us to be at a point where our satellite observations are sufficiently complete and accurate that the amount of energy we see entering and leaving the earth matches up with temperature changes. He finds it a travesty that his scientific goals are not being met. The satellite measurements are wrong, they would seemingly indicate a temperature rise in the past few years but that is not happening. This is the data that must be wrong. He is not referring to the general program of climate modeling, or suggesting that the recent lack of global warming somehow invalidates the broad conclusions and predictions of climate models. He is not discussing that issue at all. His comments are specific to one satellite experiment, and relate to common problems in cutting edge science, of data accuracy. At least this is what the [realclimate](http://realclimate.org) folks claim.

Vince (2009-11-24 22:41:34)

Are you sure that's a Phil Jones quote? Other places have it attributed to Kevin Trenberth. And reading that paragraph doesn't tell me what he thinks - it needs a translation so that I can understand it. Your view, Seth, is that he's talking about Global Warming and the data and models that are the basis for our predictions of long-term temperature trends. Gavin Schmidt [1] says that "Trenberth is talking about our inability to be able to measure the net radiation balance at the top of the atmosphere to the requisite precision to be able to say on short time scales what the energy budget is doing. The observations are inadequate for that." He also provides a link ([2]pdf) to a recent paper by Trenberth that seems to express that same view (in milder terms). There have been several other examples like this in the reactions to the emails, which raise serious doubts

about the practice of reading snippets of scientists' emails and assuming that your interpretation of what they're talking about is correct.

1. <http://www.realclimate.org/index.php/archives/2009/11/the-cru-hack/comment-page-3/#comment-142191>

2. <http://www.cgd.ucar.edu/cas/Trenberth/trenberth.papers/EnergyDiagnostics09final.pdf>

David (2009-11-24 23:35:46)

Hal, thanks for the insightful comments. Seth, love your blog, but you are sometimes quick to jump to conclusions when there are things you don't know - for instance, that data in these types of experiments is often wrong due to measurement error arising from a variety of causes, such as faulty instrumentation.

seth (2009-11-25 00:56:26)

Thanks for the correction, Vince. You're right, it's Trenberth, not Jones. Hal, thanks for the further details. People rarely use the word "travesty" to describe minor stuff. It isn't a travesty that I got the wrong change when I went shopping. It's a travesty when something important goes wrong (e.g., "travesty of justice"). Of course the people at realclimate.org would love to minimize the meaning of this and say that Trenberth is just really excitable and that the data disagree with prediction because they are "inadequate" - whatever that means. But you are right that further information might change what I make of this. If the scientists at realclimate.org would like me to believe that the climate models they rely on so heavily are very plausible, there's an easy way to do it: just show me cases where their predictions have been tested. This is a case where the models failed to predict correctly. Fine. Show me all the cases where the models have been tested and I will give less weight to this case.

ChristianKI (2009-11-25 04:38:11)

Why should it support prediction markets? If whether we had a consensus on global warming would be decided by prediction markets, it would be easy target for lobbying money. It's easy to corrupt a prediction market. Let's say the oil industry puts down 5 million in the prediction market and internally bills it as marketing expense. Having money invested in the prediction market has to have a higher return than putting the money into other investments for investors who are looking to make money. If we talk about predictions for global warming there should probably a time window of 10 years or more between the making of the prediction and the payout of the money. Therefore there no reason to assume that investors will bet enough money to outway any influence of lobbying money. Than there the question about how much money the oil lobby has to pay per point of consensus. To reach a 20/80 split the oil lobby would only have to put up a fifth of the money that the people who believe in global warming put up. The industry has lobbying budgets that are big enough to remove consensus from any prediction bet. Again the "the data is wrong" statement is something that I brought up before in the comments of this blog. In areas where you need a complex procedure to measure your results some of your data is nearly always wrong. Hal describes above a perfectly reasonable explanation of why the CERES data might be wrong. Just because the CERES data doesn't match the models doesn't mean that there aren't other datasets that match the models.

Vince (2009-11-26 21:42:52)

Seth, are you saying that Trenberth's email and his article which I linked ("An imperative for climate change planning: tracking Earth's global energy") are not talking about the same thing? There are plenty of reasons to think that they are, including the fact that his email cites that article (have you seen the full email?). Why think that the email represents his true, secret view and that everything else is just for show? It sure looks like the email is talking about what he said in the paper. If you can't tell what he means in the email (e.g. "Our observing system is inadequate"), take a look at the paper - the introduction gives a sketch of what an "adequate system" would allow us to track. It also turns out that the one email was part of a string of emails and replies, as you can see [1]here. Someone disagrees with his "travesty" sentence, and Trenberth responds "How come you do not agree with a statement that says we are no where close to knowing where energy is going or whether clouds are changing to make the planet brighter. We are not close to balancing the energy budget. ..." Then someone else notes that our observations are within the range of what could be expected based on natural variability, and Trenberth replies "Saying it is natural variability is not an explanation. What are the physical processes? Where did the heat go?" and then continues in a way that sounds a lot like the introduction to his paper. It reads like scientists arguing over their research, not like they're sharing secrets.

1. <http://www.eastangliaemails.com/emails.php?eid=1052&filename=1255523796.txt>

seth (2009-11-27 00:09:16)

Vince, you have a good point. Trenberth's view isn't as hidden as I thought. And the model under discussion isn't exactly about climate prediction. But I still think there is a problem. To quote from Trenberth's paper: "An assessment is given of our ability to track changes in reservoirs and flows of energy within the climate system. Arguments are given that developing the ability to do this is important." That equals "the lack of agreement between model and data is a travesty"? I disagree. Vince, do you disagree with my big point? That Kolbert was fed a false sense of security? If not, where in her climate-change book does she point out that Jones was fond of suppressing dissent? Nowhere. Did she hide this unpleasant tendency? Or did Jones? My guess is Jones hid it. I keep thinking there was something important she didn't know. My big question remains: why should I believe climate models? I would love to read something that compares their predictions (not their fits) to what actually happened. In psychology, modelers have failed to grasp this point – the need to test their models by predictions, not fits – for more than 50 years.

### **A Disease of Wealth in Squirrels (2009-11-24 14:18)**

Most people look at my research and see self-experimentation. I see a new way to understand diseases of wealth (often called diseases of civilization). We get sick because we live differently than our long-ago ancestors. Self-experimentation is powerful enough to sort through the thousands of differences between modern life and long-ago life to find those that matter.

In [1]an experiment about the value of circadian rhythms to chipmunks, Patricia DeCoursey, a professor of biology at the University of South Carolina, found that their value was revealed by stress created by wealth:

In one experiment she discovered that chipmunks without an internal circadian clock appear quite normal at first. They can survive in optimal conditions; during the first year after their internal clocks were disabled, "predation by weasels was minimal," she says. But then the chipmunk population increased strikingly due to two successive years of abundant acorn crops in the forest. The weasel population also increased, following the growth of the chipmunk population. Under these more crowded conditions, the restless nighttime movements of the arrhythmic chipmunks in their burrows clued the weasels in to their locations, and predation increased dramatically. The weasels killed all but four of the 100 chipmunks in this population.

1. <http://www.scientificamerican.com/article.cfm?id=patricia-decoursey-biology-westinghouse>

---

Aaron Blaisdell (2009-11-25 10:48:40)

Just goes to show that science won't always provide immediate conclusions for a simple manipulation. Sometimes what's important is the interaction between the manipulation and the diversity of environments in which the manipulation can be expressed (checked). Our causal models usually start out simple (Cause→Effect), but reality is often much more complex and therefore more subtle (Cause1+Cause2→Effect, or Cause1→Effect iff Cause2 is equal to or greater than some threshold value, etc.). Thanks for finding this!

Nansen (2009-11-25 17:14:48)

Even cancer may be linked to abnormal circadian rhythms: "A nationwide study in Denmark, for example, found that women who work mainly at night for at least six months are 1.5 times more likely to develop breast cancer than those who work regular hours (8). Researchers suggest that the raised cancer risk could be because these people's cells start to divide at the wrong time and run amok, an idea supported by some cell-culture studies." (for the reference, see

chronotherapeutics.org/docs/press/circ/Nature\_2009.pdf )

Aaron Blaisdell (2009-11-25 19:53:10)

Interesting. Or those working the graveyard shift get significantly less sunlight and therefore vitamin D which is also correlated (maybe causally related) to cancer. Though I don't know how much vitamin D sun exposure in Denmark will produce. If it is a good source, it will only be during the summer.

### **Benefits of Kefir: N=1 (2009-11-25 04:13)**

A year and a half ago, Charles Richardson was given antibiotics for an ulcer. He writes:

When they put me on the course of antibiotics for the ulcer, my digestion absolutely went south. Stools became runny and smelly and irregularly timed. Even though I took a lot of supposedly high-end probiotic capsules, that went on for months after the antibiotics.

Six months ago – a year after the antibiotics – he started drinking kefir because of this blog. "After about a month [of kefir], I was back to normal," he writes. He got the starter culture from [1]kefirlady.com (where they cost \$20 cash).

More recently he has seen further improvements:

I had a number of food allergies, particularly wheat. If I ate any wheat, I'd get hemorrhoids immediately, and sometimes what looked like a herpes outbreak.

I've had that for 30 years or so, but it appears to have gone away in the last month. I had to eat some pasta at a formal dinner, and was expecting a reaction, but had none. I was shocked. I also have a similar reaction to chicken, and had the some non-experience with some of that recently.

I don't know to what I can attribute that change. The kefir could have helped, and possibly the Vitamin D [about 4000 units/day]. I also started take an amino acid dipeptide of L-glutamine/L-alanine. [2]<http://www.kyowa-usa.com/brands/sustamine.html> [about 10 g/day]

This is informative for several reasons.

First, the bad effects of the antibiotics lasted a really long time (a year). This indicates how bacteria-poor a normal American diet is. Richardson probably ate healthier than normal given that he once owned a health-food store.

Second, expensive probiotics didn't help. This is why I make kombucha and yogurt, to have more quality control. And yogurt is surely closer to what our ancient ancestors ate to get bacteria than probiotic capsules.

Third, the kefir took about a month to solve the problem. This gives an idea of the time it takes to repopulate your intestine with bacteria. And thus how long you should try this or that solution before giving up.

1. <http://kefirlady.com/>

2. <http://www.kyowa-usa.com/brands/sustamine.html>

---

Kevin Miller (2009-11-25 05:04:08)

I started making Kefir, bought from the same source, and have been surprised at how easy it is to make (easier than yogurt, which is saying something). I just mix a cup of powdered milk with two cups of water in a mason jar, add some of the kefir "grains" from the previous night, shake it up, and let it sit for 24 hours on a counter. Every week or so I have to harvest some of the kefir grains and eat them separately or else the milk turns to whey, but it's been remarkably easy to do. I think perhaps Kefir is actually "yogurt for dummies"

Darrin Thompson (2009-11-25 08:00:18)

I can't get my autism kids to drink kefir. I tried even. I'm actually getting to like it myself and I've seen that allergy reduction effect on myself. But for autism kids, the mouth is a temple for popcorn, green beans, and hot dogs, at least that's the case for mine. I can get them to take a slurry of pretty much any foul thing if I can fit it into a pharmacy oral syringe. Kefir isn't quite "dense" enough. A serving of Kefir that works for me is several ounces. The syringes we have only hold 2 tsp. However, with a 'scrip, you can get "vsl #3." And you can get your medical benefits to cover the cost. \$80- \$100 ish dollars for what might last the better part of a month. Most store probiotics contain 5 to 20 billion "units" of bacteria. I've seen one that was 50 billion. The pharmacist told me that VSL #3 has 450 (not a typo or marketing trick, really 450) billion units of bacteria per packet. Furthermore, that is the measurement for expiration time. It's higher when it's new. Suffice it to say, that stuff actually does work. We cleared up an annoying bowel problem in the kids, then ran out for a few days, and the problem came right back. The store stuff wouldn't work. So don't bash the off the shelf stuff too much. It can work, but you need a lot, and good stuff does exist. Also, props for Kefir. I have persistent annoying (not debilitating) pollen allergies. For a week or so I drank several ounces of the homemade stuff from made raw milk twice a day. I experienced a weird feeling of, I'm going to call it Not Congested(tm), that I could not recall ever feeling before. Also, it has a reputation of being really hard to ferment wrong. I'd guess milk is a less competitive environment, (good bacteria win over unwelcome easily) compared to the sugar water that kombucha starts in. You can poke around on internet boards for people making Kombucha and see that it's probably not your best first choice. One conversation went something like this: "I tried making a batch and it tasted a little strange. I drank it all anyway. [ok, problem there, but it was drinkable] After that I had this weird feeling of being outside my body for a while. I felt weird for awhile after it ended." "Dude, that's called getting high." "Oh." Which leads me to believe that Kefir is a better starting point. I screwed up a kefir batch once, and there was no way on earth I'd ever drink what was in that jar.

Walter (2009-11-25 09:56:49)

Seth, What happens when we get "flushed" for a colonoscopy? Any idea how long it takes to recover the bacteria? Walter

seth (2009-11-25 11:56:30)

Walter, in my experience the flushing doesn't involve antibiotics. So I imagine that bacteria in the appendix help repopulate the gut. Closer to a week than to a day or a month is my guess. It would surely depend on how much fermented food you eat. Darrin, that's all very interesting. If stuff with >450 billion units actually works, it becomes clearer why stuff with 10 billion units doesn't work. And in other cultures I'm pretty sure kids drink kefir so how do they do it?

Darrin Thompson (2009-11-30 11:00:39)

Beats me how they do it. I'd be curious too. I'd guess that early exposure to refined sugar etc. warps kids' taste buds away from stuff that's actually good for you. Just a guess though.

Gary (2009-12-05 18:57:22)

Hi, I made my first batch of kefir tonight with some grains given to me by a friend. Unfortunately, I misunderstood her instructions about how to do it. I poured the kefir into a bowl through a strainer and mashed all of the grains and now I have nothing left. My question is this, did I ruin the kefir by mashing all of the grains up? Is the kefir any good now and is it safe to drink? I'm kinda of slow at learning stuff like this but I saw a video demonstration \*after\* I made the kefir and re-

alized how I messed up. Too bad I didn't see it prior to making it. Anyway, is the kefir ruined now or is it still edible? Thanks, Gary

seth (2009-12-05 22:30:24)

The grains are safe to eat, if that is your question. So, yes, the kefir is still edible.

Slee (2010-01-20 01:05:07)

I've been doing kefir for about a month - I was given the grains from a woman who had been diagnosed with breast cancer that had metastasized to the bones in 1999 (most women with that diagnosis in '99 aren't around 10 years later) and this is the same diagnosis I got Oct 2008, when I when I went into the hospital severely dehydrated & with an inflamed stomach. I've had quite a struggle in the months since then. Two days after starting the kefir I noticed that I wasn't as cold as I've been most of the time since the hospital (last winter I kept my thermostat between 81 and 84 degrees, now it's between 72 & 75 degrees). It's also helping my stomach to reach another level of healing, and I'm weaning myself off the omeprazole. I generally let my kefir ferment for 24 hours, sometimes more depending on my schedule. So it's pretty tangy - adding some agave nectar balances the sourness enough without becoming too sweet. Try blending it up with honey & fruit for kids as a way to get them to try it. I've also started experimenting with making kefir cheese. Plus I strain it and use it instead of sour cream on potatoes. Given what I've read online, many of the commercial kefirs sold are not made by fermentation with the grains, but have developed shortcuts that result in not having all the same nutrients and health benefits as traditionally made kefir. However, it's so easy to make at home, that I've now decided to never buy yogurt or sour cream again.

### **More About What Causes MS (2009-11-25 18:02)**

In[1] an earlier post I linked to [2]a poll at This Is MS that asked if there is a correlation between getting red in the face after exercise and having multiple sclerosis. Such a correlation would support Paulo Zamboni's idea that MS is due to poor blood circulation in the brain.

A poll at This Is MS is likely to be answered by people who have MS. Nancy Lebovitz realized she could help get answers from people who don't have MS - crucial to learning if there is a correlation - by posting [3]the poll on her LiveJournal page.

The two polls taken together show a strong correlation. Out of 40 people with MS, 72 % get red-faced. Out of 27 people without MS, 22 % get red-faced. Thanks, Nancy.

1. <http://www.blog.sethroberts.net/2009/11/23/breakthrough-in-treating-ms/>

Alexa is far more of a customer reporting type of software, not SEO sort device...many thanks for studying!

### **Senator Grassley Asks Med Schools Their Policies On Ghostwriting (2009-11-26 19:02)**

Medical ghostwriting is plagiarism with a bullet: not only do med-school profs get the benefits of a published article they didn't write, that published article – written by a drug-company hack – is inevitably misleading, causing doctors to prescribe a drug that is worse than they think. (Which is the whole point.) Patients who take the drug are the big losers.

This sort of thing is so patently awful – especially the harm done to millions of sick innocent people – that you'd think everyone finds it repulsive. Quite the opposite. Living breathing med school professors, such as [1]New York University professor Lila Nachtigall, have trouble seeing what's so bad about it. The practice appears so common that [2]Senator Grassley asked the ten top medical schools, such as Harvard, Johns Hopkins, and UCSF, to say their policies about it. He's asking them: Do you consider plagiarism wrong? Except it's much worse than plagiarism. Although several say on their websites that it's wrong, Duke University says that "Severe and/or repeated offenses will result in formal disciplinary action" – in other words, non-severe examples are okay! At least the first time. "Formal disciplinary action" can be as mild as a letter. At Duke, at least, they have trouble grasping how awful it is.

This might seem to have nothing in common with self-experimentation. Self-experimentation can be done by anyone, costs nothing, and is a way to figure out helpful truths; whereas almost no one can get a drug company to write a

paper for them (you need to be at a top medical school), drugs are a hundred-billion-dollar/year business, and this sort of ghost-writing is done to hide helpful truths. In a better world, they really would be worlds apart. But you are reading this not because I did self-experimentation but because I did self-experimentation that found out something useful and surprising – the Shangri-La Diet and [3]new ideas about sleep and mood. A big reason it did so was that the experts in those fields – such as the relevant med school professors – were utterly and completely asleep, so to speak. They were incapable of making significant progress. Extreme careerism – putting one’s career ahead of everything else – is no doubt one reason. They could have done what I did. Fat weight-control pros could have tested different diets on themselves, for example. But doing good research would be harmful to their career (e.g., not enough publications), so they don’t do it. Medical ghostwriting helps their career, so they take advantage of it. So what if millions of sick people are harmed by these decisions.

My surprisingly-productive self-experimentation and the staggeringly careerist decisions of med school pros are two sides of one coin: the profound stagnation in health care. The complete inability of those in charge to innovate effectively. Drug companies are businesses that make drugs. They are not going to explore non-drug low-cost solutions, such as those I explored. Nothing, however, prevents med school pros from doing so – at least, nothing except their extreme careerism. My self-experimentation shows what could have been done. It shows that the health questions we face (e.g., how to lose weight) have solutions much better than a new drug. The widespread practice of medical ghostwriting is one indication why those solutions haven’t been found. Failure to find new solutions means problems have stacked up unsolved, getting worse and worse (the obesity epidemic, the allergy epidemic, etc.). It’s usually called a healthcare crisis – but it’s really a health crisis.

---

Jake (2009-11-26 19:47:09)

Most preventative medical innovations today are done by successful doctors with practices. Lucky for us, the internet is available to them to disseminate their discoveries. Universities researchers are 10 years behind the successful doctors. The mainstream media is 5 years behind the researchers. And the government is 10 years behind the media. So our health care crisis is actually a health information crisis for those who don’t use the internet for their preventative health information.

seth (2009-11-27 00:23:57)

Jake, that’s very interesting. What are some examples of “preventative medical innovations by successful doctors with practices”? I can think of one: a dermatologist who figured out something about how acne is caused by diet.

Jake (2009-11-27 10:44:15)

These are the doctors I am talking about: Dr Michael Eades-low carb diets lower weight and prevent many diseases. Dr Mary Vernon and Dr Richard Bernstein treats diabetes 2 patients with low carb diet and exercise and makes most of them drug free Dr William Davis and Dr B.G. - treats heart patients with wheat and fuctose elimination, fish oil, niacin, exercise and Vitamin D and achieves plaque regression in most cases. Dr Larry McCleary treats dementia cases with low carb diets, fish oil and some supplements and achieves success much of the time. Dr. T treats kidney diseases with low carb diets, elimination of omega 6 fats, and Vitamin D and achieves success much of the time. Dr Barry Sears controls omega-6 to omega 3 ratio to eliminate heart disease, dementia, arthritis and cancer Dr Stephan Guyenet whose studies show that eliminating grains, fructose, omega-6 fats

from your diet will prevent heart disease, cancer, diabetes, arthritis, and dementia. Dr. Art Ayers studies showed that eliminating most carbs, trans fats, omega 6 fats from your diet. Plus exercise, Vitamin D and fish oil will cure most autoimmune diseases.

seth (2009-11-27 17:33:42)  
Thanks, Jake. Very helpful list.

#### **F.lux (2009-11-27 05:10)**

seth (2009-11-29 02:06:17)  
No. great idea! thanks1

#### **Congratulations, Andrew Rivkin (2009-11-28 07:25)**

Andrew Rivkin writes about climate change for the New York Times. One of the stolen emails says:

At 17:07 27/10/2009, Michael Mann wrote:

Hi Phil,

...

p.s. be a bit careful about what information you send to Andy and what emails you copy him in on. He's not as predictable as we'd like

In other words: Most reporters are predictable. Meaning they repeat what they are told instead of thinking for themselves. Otherwise there would be no need to say this.

Think about it. Michael Mann, a respected climate scientist, thinks that whatever line he and Phil Jones, another respected climate scientist, are pushing is so poorly supported by the evidence that they worry about a New York Times reporter finding holes in it! Independent thinking, even by someone without technical training, worries them! Really, it's hard to avoid concluding that these guys are clowns, propped up by all sorts of people (journalists, Al Gore, 2200

many others) who benefit from a false certainty about this stuff.

Please, someone tell me: Why should I believe climate models? Have their predictions (not their fits) been compared to what actually happened?

---

Mike Bowerman (2009-11-28 10:32:25)

I am agnostic about the proportion of human influence on climate change, and think it is plausible that much of what comes out of the IPCC is political and of dubious quality. It is true however, that we are having a significant influence on the composition of the atmosphere – CO<sub>2</sub> is at its highest level in over 600,000 years, and given China is adding one coal-fired power plant a week to their electricity generation as combustion engines are adopted by developing countries, we are going to massively overshoot changes in composition that would occur through other means. I share your concern about climate scientists' credibility, but do you think it is reasonable to apply the precautionary principle here, and act to limit actions whose outcomes are unknown, but potentially catastrophic, for future generations? How do you think we should we treat such unknowns? The decision-making tools we apply for prediction are horribly unreliable, as our financial markets, foreign policy and weather-predicting abilities show. Humans tend to systematically underestimate risk by excessively discounting the future relative to the present, and I think multiple speculative financial market collapses attest to that tendency. Climate change seems a similar example, but the environment may not rebound as quickly as a market. If it should prove to be the case that we cannot rely on climate models, do you have any thoughts on how we should proceed with policy? The consequences are almost all for future generations I think, so how we assess these issues depends on how we value their interests relative to our own and I would be interested to hear your take on that as well.

Vince (2009-11-28 10:35:49)

A lot of science reporting gets the science wrong, quotes scientists out of context & misrepresents their views, etc. What makes you think that they're worried about Rivkin finding holes in the science, rather than this kind of stuff? I tried to post this link in response to your previous climate post to a brief list of some ways in which climate models have been tested, but it didn't go through. If you google "climate models are unproven" then the first link (to grist) will give you the page.

seth (2009-11-28 12:38:12)

Why do I think they are worried about Rivkin finding holes rather than making mistakes? Because the term "error-prone" or "inaccurate" is used to describe people who make a lot of mistakes. "Not as predictable as we'd like" is used to describe people who think for themselves. Note the word "we". Thanks for the link about testing. Apparently [1]James Hansen had not tested any predictions of his model before he presented it to the world in 1988. If he had, he doesn't mention it in an essay about why we should believe his model.

1. [http://www.columbia.edu/~jeh1/2005/Crichton\\_20050927.pdf](http://www.columbia.edu/~jeh1/2005/Crichton_20050927.pdf)

seth (2009-11-28 18:13:44)

Mike, I think a desire to reduce air and water pollution, and a need to not run out of fuel, and a need to avoid economic stagnation are plenty of reasons to reduce our dependence on fossil fuels. By a lot. Scaring us inappropriately is just one more way that other people take power away from us. Stagnation in American transportation is much older than worries about catastrophic climate change. The first hybrid cars are from Japan! That says it all. Policy: I think government decision makers should grasp the concept of economic stagnation – lack of development of new ways of doing things. And fight it in all areas. All stagnation is a problem, in the sense that problems build up unsolved. The stagnation in health care is far more damaging to all of us than the stagnation in development of other sources of energy. As many have noted, the stagnation in health care is

so bad it was a big reason GM went broke. It is starting to cripple the rest of the American economy. Not to mention the huge burden of depression, obesity, diabetes, etc. They are big problems right now. It's always very hard to deal with economic stagnation because any solution involves taking power away from the powerful (those who benefit from the status quo) and giving it to the less powerful (those who benefit from innovation).

CCS (2009-11-28 22:49:08)

"Please, someone tell me: Why should I believe climate models? Have their predictions (not their fits) been compared to what actually happened?" James Hansen of Goddard Institute for Space Studies. I won't link to the Wikipedia article since it will throw my post into moderation. But if you go there, scroll down to "Climate model development and projections". I have a better article from Technology Review that I can send you if you are interested. Weather models are constantly compared to what has actually happened. Models are run with old observation data to see if their outputs correspond to what actually happened with the weather. You can attempt to validate climate models in the manner described in the Hansen article. I know you're skeptical and I value your fresh ideas, but really did it not occur to you that people are constantly looking for ways to validate and improve computer models (not just climate models). Weather and climate models are among the most advanced because modeling has been used in that field much longer than it has been in other fields, and because there is such a huge body of observational data to draw on in order to perform these experiments.

CCS (2009-11-28 22:54:32)

Sorry I skimmed over the previous response. I'll send you a copy of the TR article I mentioned.

seth (2009-11-29 02:02:45)

I'd like to see that article from Technology Review, thanks. "People are constantly looking for ways to validate and improve computer models." That's awfully vague. In psychology, modelers have spent the last 50 years pretending that fitting their model to data constituted testing it. All their work: worthless. I wonder if the same thing is happening in climate science. Sure, people like to improve stuff but they also like professional advancement, status, and attention. Sometimes the two types of goals (improvement and advancement) are in conflict.

Dennis Mangan (2009-11-29 06:36:15)

Seth asks why we should believe climate models, and that's a good question. In many areas, especially in science, a certain deference to authority is warranted unless we ourselves can take the time to truly understand something about the field. Climatology is one of those complex areas. But what Climategate shows, IMO, is that quite a few of the main climatologists were not doing disinterested science, but were political advocates, and thus they can't be trusted. They are no longer authorities that we can defer to.

seth (2009-11-29 06:58:13)

I found this email more revealing than the rest. Sure, the consensus is overstated. Sure, they try to stifle dissent. But who would have guessed that these guys are afraid of a newspaper reporter? Perhaps we will learn that when they give talks at high schools, they refuse to answer questions.

Mike Bowerman (2009-11-29 11:22:29)

I agree with your comments about economic stagnation and think you can add institutional structures with perverse incentives on top of that. Many of the problems in automobiles and health care for instance are because the corporations and other institutions driving these industries lack incentives to pursue the best solutions for health or transportation problems, and are instead pursuing personal rewards, often based on share price or career progression. Until the institutions are reformed we will predictably see these significantly sub-optimal outcomes. With health as an example, the patent system provides incentive to pursue pharmaceutical treatments for health problems, and to ignore preventive solutions or non-patentable treatments like nutrition. They then have an incentive to market these solutions, paying media companies who then have a disincentive to criticize them as it affects their own profitability, and the result is antidepressants and statins. ADs don't show clinically significant results for any but the most severely depressed yet are widely prescribed, and statins don't reduce all-cause

mortality yet are the biggest selling drugs in the world. I think this is a predictable outcome of the institutional structures. I share your doubts about climate science, but don't find the email you cited a convincing example of insecurity in the quality of research on behalf of a climate scientist. There are other plausible explanations for Michael Mann's caution to Phil Jones, such as concern that Rivkin was already partisan on the issue, or simply not a great science reporter who might misrepresent their findings due to incompetence. That doesn't mean they feel their work is of low quality, just that they want it to be represented accurately, as they see it. Similarly, I can imagine if a journalist didn't understand the Shangri-La diet and misrepresented it in their writing, you might be cautious dealing with them in the future. We don't know what Mann meant by "predictable" or what history he had with Rivkin that drove this comment.

Walter (2009-11-29 12:15:59)

Seth, Two quotes for climate change part of the topic: 1. "Do not disturb a complex system since we do not know the consequences of our actions owing to complicated causal webs. ... "leave the planet the way we got it"" Nassim Taleb 2. "Don't pee in the pool too much because soon we are going to notice" Old mentor of mine Walter

bgc (2009-11-30 04:36:39)

The most ridiculous aspect of the global warming, I mean climate change, scam has been the prescriptive one. That alone should have been enough to alert sceptics to what was going-on. I mean the idea that we humans know how to control the earth's climate. The idea, endorsed at the highest levels of international conferences, that we can choose a global temperature, and decide to hold the planet at that temperature by means of economic policy (think of those serious debates about whether 'we' should 'allow' the average temperature to rise by two degrees, maybe three? ). Add to it this that we have a narrow window of time in which strong action can - luckily! - 'save the planet'. Well, wasn't that fortunate! - that we discovered a climate process just in the nick of time, and that although the process has been supposedly going for some hundred plus years, our discovery allows that intervention can be effective in a political time frame of about five or ten years; just right for electing the next government, but not so long as to allow for any testing of computer simulations against observations... If - in the space of just a few years - governments can be so persuaded of their omnipotence that they openly claim to have precise control of the global temperature, then I fear that anything is possible. This puts King Canute into perspective. Stopping the tides by sitting in a throne with your hand raised is nothing compared with fixing the global climate at whatever temperature you desire by fiddling with economic policies.

Ted (2009-11-30 15:52:39)

Check out the actual programming comments in the code leak. This is bigger than watergate. I mean it. It's more than bullying, it's down right fraud and data manipulation. Pull up that old blog post you did on "Cargo Cult Science" and Biology you did a long time ago - YOU WERE RIGHT!

seth (2009-12-01 05:02:08)

Thanks, Ted. This is my post on Cargo Cult Science and Biology: <http://www.blog.sethroberts.net/2009/10/08/modern-biology-cargo-cult-science/> You mean I was right that the extent to which the public is deceived by scientists about scientific stuff is really large?

CCS (2009-12-01 12:10:12)

Seth, I e-mailed the article to your address on the website "contact" page. I had to straighten out something with my TR subscription before I could send it.

Steve G. (2009-12-03 06:11:26)

Mr. Bowerman's two comments seem most directly on point to my concerns. I, too, agree that we have other reasons for moving from carbon-based energy, as Seth suggests. But in the end, we can have no doubt, can we, that we're putting an incredible amount of carbon into our atmosphere. We (humanity) are like a kid with a chemistry set and no idea of what combination of chemicals may blow us to kingdom come. Climate is a complex system, and to think that we completely understand it or can control it amounts to folly. However, even in the face of ignorance, not to choose is to choose: and the safest choice remains significant reduction of carbon and other warming gases.

PhysicstDave (2009-12-06 18:40:35)

CCS wrote: >Weather models are constantly compared to what has actually happened. Models are run with old observation data to see if their outputs correspond to what actually happened with the weather. You can attempt to validate climate models in the manner described in the Hansen article. That is not science: that is curve fitting. There is a general theorem that *any* finite set of data can always be fit with *enough* free parameters. Indeed, this can be done in multiple ways (I like Lagrange interpolation myself – the future extrapolations are just so wildly insane!). To engage in real science, they need to make firm, unambiguous, statistically significant predictions of *future* data that they are willing to stand by. I.e., if the data does not meet their predictions, they have to admit their science was wrong, not just say that they will fiddle the free parameters a bit to get a better fit. Anyone – i.e., the dominant in-group in climate modeling – who does not understand this is simply ignorant of science. Dave Miller in Sacramento

PhysicstDave (2009-12-06 18:54:07)

Mike Bowerman wrote: > I share your concern about climate scientists’ credibility, but do you think it is reasonable to apply the precautionary principle here, and act to limit actions whose outcomes are unknown, but potentially catastrophic, for future generations? How do you think we should we treat such unknowns? We need to be careful with the word “catastrophic.” The extinction of the human race or the destruction of the biosphere would indeed be catastrophic, to be avoided at almost any cost. But, a slow rise in sea level, over a hundred years or more (and this is the sort of scenario even many of the warming alarmists foresee) is not necessarily a “catastrophe.” After all, this has in fact actually happened over the last ten thousand years due to the end of the Ice Age. The Little Ice Age from the 1600s to the 1800s also had a very real impact on human life, but it has not usually been viewed as a “catastrophe.” Nor has the quite substantial global warming from 1800 to the present (due largely to natural causes – i.e., the end of the Little Ice Age) been generally thought a “catastrophe.” I’m not suggesting that future global warming, if it occurs (based on current evidence, I think that the big global warming was in the last 200 years, not the next 200 years), will not be a major inconvenience. But the prospect needs to be evaluated rationally, based on standard probability techniques, standard cost-benefit analysis, etc. There is not and cannot be a rigid, iron-clad “precautionary principle” or we would all have to live fifty feet underground to avoid being hit by meteorites! Dave Miller in Sacramento

seth (2009-12-06 20:50:11)

Dave, yes, I agree the only way to test a model is to make predictions with it, not fit it to data. The climate modelers don’t seem to understand this.

PhysicstDave (2009-12-07 04:35:13)

After posting an earlier comment, I realized that my statement >There is a general theorem that *any* finite set of data can always be fit with *enough* free parameters. would probably be misinterpreted. A more accurate way of making the point would be to say that there are theorems that prove that it is possible to fit any amount of finite data by introducing enough free parameters of a very simple sort – for example, polynomial coefficients. In practice, the distinction between my more careful statement and my more careless initial statement does not actually matter: anyone with much experience in simulations knows that if you introduce enough free parameters, you can indeed fit pretty much any data, even data generated to be simply random noise. There are statistical techniques to guard against falling into this hole. There are also simple simulation techniques to avoid this: Feed randomly generated data into your parameter-fitting program. If the program can adjust the parameters to fit what is in fact random data, then it is not really modeling anything real at all: you just have a curve-fitting program of no scientific interest. Alas, the dominant group in the global-climate-modeling community, based on both their published results and the leaked CRU e-mails, seem rather unaware of all this. Indeed, whenever their predictions turn out wrong, they seem rather pleased with the ease with which they adjust their models to the “new” data. That is a profound problem. A model that can model anything really models nothing at all: no matter how wildly wrong its predictions turn out to be, the model can be adjusted to fit the new data that disagrees with the older predictions. Since it can be adjusted to any new data, no matter how wildly that data differs from earlier predictions, the predictive value of the model is nil. This is the fundamental problem with the global-warming work – CRU, the GCMs, etc. Unfortunately, it is very hard to get this point across to non-scientists: if a model can model *anything*, this actually seems to many non-scientists a positive feature! It isn’t. But how can

that be explained to scientific illiterates? Seth, you study how humans think, right? Any suggestions? Dave Miller in Sacramento

seth (2009-12-07 07:26:37)

Dave, no I don't study how humans think. My mainstream psychology work is with rats. Skeptics have reasonably focused on the data rather than on the models. If the data are scary enough you don't need a model; and if the data are unscary enough, you don't need a model then, either. I would like to first figure out what the data are before I worry a lot about models.

### **Kombucha Reduces Free Radicals (2009-11-29 15:26)**

Trichloroethylene (TCE) is a common industrial solvent for many years used as an anesthetic. It appears to cause liver damage. [1]A recent experiment with rats asked if kombucha could protect against TCE damage. For at least two measures, it did. TCE raised free radicals in the blood by a factor of 6; kombucha reduced the increase to a factor of 2. TCE also increased [2]gamma-glutamyl transferase (GGT) activity, a mark of liver damage; kombucha reduced GGT activity to normal levels.

The paper's bibliography includes a reference to a survey of kombucha's health effects:

Dufresne C, Farnworth E: Tea, kombucha health: a review. Food Res Int 2000, 336:409-421.

The researcher brewed the kombucha that was used (for about ten days). Weirdly the source of the kombucha is given under "Competing Interests" at the end of the paper.

This article will appear in the journal Chinese Medicine – but I have not found kombucha for sale in Beijing.

### **A Clue About How To Sleep Better (2009-11-30 03:10)**

A few nights ago I slept surprisingly well: I woke up feeling more rested than usual. Each morning I judge how rested I feel on a scale from 0 to 100 where 0 = as if I hadn't slept and 100 = completely drained of tiredness. I got scores of 100 after standing 9 or 10 hours during the day. That showed what was possible but that much standing was unsustainable. Without extreme standing, 99 has seemed to be the maximum.

A few nights ago, I did better. The ratings for that night and the preceding four nights were: 98.9, 98.8, 99, 98.8, 99.2. Doesn't look like much, but actually the improvement was so clearly unusual I didn't need records to notice it. If I gave the scores for the preceding 100 nights you'd see it was rare to score above 99. Moreover, I was keeping the amount of animal fat I ate constant, unlike previous nights with scores above 99. The difference between 98.8 and 99.2 is easy to notice. Think of the difference between 12 and 8.

What had improved my sleep? I could think of four unusual things about the preceding day:

1. Several cloves of garlic in the pork-belly soup I ate for lunch. I'd never before added any garlic.
2. [1]I began using f.lux, which reduced the color temperature of my computer screen after sunset.
3. I'd played Dance Dance Revolution (on the Wii) for 10 minutes at 8 pm. Usually I do it in the morning (much longer, 30-50 minutes).
4. More bike riding than usual (including two long stretches that added up to 66 minutes).

All four seemed unlikely. 1. Who'd heard of garlic improving sleep? Not me. 2. Laptop screens are quite dim compared to sunlight. 3. The amount of exercise was small. I'd played Wii Tennis for longer periods in the evening without noticing any change. DDR in the morning hadn't made an obvious difference. 4. I'd ridden my bike for 50-odd minutes at a stretch without noticing better sleep. This was only slightly more.

Now I am testing these possibilities. If you have any idea which it is – perhaps it is none of them – please comment.

1. <http://www.blog.sethroberts.net/2009/11/27/flux/>

---

jrf (2009-11-30 06:28:35)

My sleep gets much, much worse when using any kind of computer at night. Seems unlikely it's just the difference in color temperature, but who knows? Some speculations. \* Monitors can certainly blow your night vision, which is something that haven't been possible for human ancestors prior to being able to make fires. So having night vision activated, and not interrupted, for a time might be a pre-requisite for sound sleep. \* Monitors usually show vivid colors that are impossible to perceive at night time. Maybe colors are enough to trigger wakefulness. Vivid colors are also semi-universal signals of danger, so there might even be an evolutionary reason for staying alert in the presence of strong colors. There's seems to be a bunch of studies on the effect of different lighting by the US Navy, so there's probably data available to suggest one way or the other.

Bart (2009-11-30 06:59:55)

Surely it's the extra bike riding, right?

Caleb (2009-11-30 09:12:34)

Sleep researchers have found that it's specifically blue light, from wavelengths 465-480 nm, which activates wakefulness and interferes with sleep. It's probably because we evolved to respond to the blue sky as a sign it was time to be alert. Both fluorescent lights and computer screens give off a fair amount of blue light. Sleep centers have started making specific blue blocker clip-ons to block out light in the 465-480 wavelength range. About two hours before bed I clip on some cheap amber lenses to my glasses to help block out the offending light. It makes a noticeable difference, and I imagine I'd get even better results if I tracked down a prescription pair of blue blockers. Seth, does your 1-100 scale feel more logarithmic or incremental to you at the high end? I personally tend to think in a bell curve that is incremental in the middle and logarithmic at the tails when I rate stuff for myself, but most people don't think like this. To most scientists, trying to draw inferences from incremental differences of a few thousandths on highly subjective measurement is going to be considered skeptically. Not saying there's nothing to your data, just trying to get a clearer idea what your numbers mean to you.

Helen (2009-11-30 11:09:18)

I agree with the above commentators. It's probably the (reduction in) blue light from the computer screen. If I use a computer after 8pm, I get insomnia. It has a much stronger effect than the fluorescent light bulbs around my house. Garlic and onions

contain compounds that cause drowsiness in some people, but I haven't found that either improves my sleep.

Scott (2009-11-30 12:03:34)

I had a similar reaction as Caleb to your scale. To say that you can have an accurate subjective judgement on a 1-10 scale is one thing, staying accurate with 1-100 precision seems to already be pushing the boundaries of a reliable measurement and going to an effective 1-1000 scale as you are with your tenths of a unit scale seems like a lot of noise. How would you describe the difference between sleep quality of 98.9, 98.8, 99, 98.8, 99.2?

Vikram (2009-11-30 12:57:44)

Mr. Pla Cebo might have something to do with it? My problem is waking up in the middle of the night due to little kids sneaking into our beds late at night. I can be up for hours and some days I'm up at 3 or 4am for good. Getting by on 3-4hrs of sleep for several days is awful and terrible for our immune systems. I thought it was related to caffeine and cut back my coffee intake to zero. Problem went away and then came back. I eat a high fat diet, low in carbs (especially refined ones) and high in protein. I also supplement with vitamin E, D etc. I drink some bacteria rich yogurt but probably nothing as good as the stuff you're growing :-). Rather than tweaking my diet I tried breathing slowly in and out and just focusing on my breath and nothing else. Somewhat like meditation and I go back to sleep very easily ever since. And this is regardless of how I'm eating that night. So in my case - it was simply finding a better technique to go to sleep with. I think one of the gotchas with self-experimentation is the placebo effect. Making a change (switching from tea to coffee) can certainly plant the belief that something has changed - and that could be all that's really needed.

Timothy Beneke (2009-11-30 13:30:23)

I would not rule out the garlic, whatever else may be going on. I seem to have had a very relaxed feeling of bodily "earthy bliss" that is hard to describe as a result of eating several cloves of garlic. People in Berkeley in the 70s ate a lot of garlic because it seemed to mellow them out... I doubt that this was mere placebo or wishful thinking...

David (2009-11-30 13:47:12)

You might want to look at a longer period than a single day- is there a chance that diet, exercise, or sleep in the days preceding had an effect?

bennetta (2009-11-30 18:00:45)

“Sleep researchers have found that it’s specifically blue light, from wavelengths 465-480 nm, which activates wakefulness and interferes with sleep. It’s probably because we evolved to respond to the blue sky as a sign it was time to be alert. Both fluorescent lights and computer screens give off a fair amount of blue light. Sleep centers have started making specific blue blocker clip-ons to block out light in the 465-480 wavelength range.” Last year, my psychiatrist, who is one of the best in the state, suggested I keep an open window in my room and replace my alarm with a natural-spectrum light that would go off at the appropriate time. His reasoning? Folks with ADD (which I have) have circadian clocks that are out-of-whack and need to be reset more often than the average person. We’re generally pretty horrible at waking up. Natural light, taken in the morning, essentially resets your circadian clock. When your eyes take it in, it sends a signal to your brain to wake up, probably for the reasons you stated. My morning wakefulness improved substantially. According to him, however, this can only happen between the hours of 6 and 9am. Past that time and you’re out of luck. Perhaps it’s anecdotal, but his reasoning suggests the blue light spectrum doesn’t have much to do with Seth staying up at night. I don’t sleep well when I use the computer late at night, either, but I think it has more to do with what I’m doing, which is generally pretty active. I’m also staring at a light source 3 feet from my face as opposed to one across the room. I can sleep well after reading or even watching TV (which also has a lot of blue light), but it’s more difficult when the computer is involved.

Anthony (2009-12-01 00:19:20)

Vikram said "one of the gotchas with self-experimentation is the placebo effect" Right, and if it works, then it isn't 'just' a placebo effect, as some researchers are wont to say. Rather, the placebo effect is effective. No need to discount it or control for it, except in so far as to identify it.

Janet (2009-12-04 10:21:23)

1. Evening exercise may increase sleep length if the problem is waking up earlier. 2. I don't think you can rate accurately on a scale from 1 to 1000, as your scale effectively is with 3 sig figs, but I will trust your subjective impression.

q (2009-12-22 20:33:21)

too much garlic wrecks my sleep – i think the reason is that i think it increases circulation to limbs and peripheral stuff. but ymmv. perhaps you were fighting something off?

insomniac (2011-02-17 23:54:36)

Its obvious you have no problem sleeping or any sort of sleep disorder. Stop whining and get on with your life. The ability to be able to rate sleep between 98 and 99 with 0.1 "accuracy" is a dream (no pun) for many of us. For those of you who do, keep a dream journal and rate the pleasure of the dream. Then also compare that to the quality (enjoyment) of sleep you had. You may get a surprise. Even if you wake up to go take a pee, quickly jot your dream down. As for the few of us who dont sleep regularly, and i mean 2 or 3hours at a time if im lucky, and who dont dream, (ever cat-napped during the day, think only 10mins have passed but its really been 3 or 4 hours ? I do that every time, i dont dream anymore), do whatever you can to experiment. Try random beds, places, catch up on the books you want to (re)read, etc. ALso watch the movie "cash-back". An extra 8 hours per day can be some what liberating.

Seth Roberts (2011-02-18 18:47:09)

insomniac, you wrote: "It's obvious you have no problem sleeping or any sort of sleep disorder. " Not exactly. I've been studying my sleep for 30 years. I started studying it because I woke up too early in the morning (which is a sleep disorder – early awakening, a form of insomnia). Eventually I found four ways to improve my sleep so now I sleep fine. But it all started because I had trouble sleeping.

Greg (2011-03-10 19:10:02)

The idea behind your experiment is exactly what we hope to automate and uniformly quantify at WakeMate. If you use our app, we automatically upload a sleep quality score for that night based on how restful you sleep was. We use a clinically proven science called Actigraphy. You can tag anything you want and then compare your sleep score across the different metrics you are tracking! Check out [www.WakeMate.com](http://www.WakeMate.com) for more!

## **The Hygiene Hypothesis, Pro and Con (2009-11-30 04:56)**

According to BBC News, [1]recent research supports the hygiene hypothesis:

Normal bacteria living on the skin trigger a pathway that helps prevent inflammation when we get hurt, the US team discovered. The bugs dampen down overactive immune responses that can cause cuts and grazes to swell, they say.

And [2]other recent research says it's wrong:

The decades-old "hygiene hypothesis" holds that early exposure to microbes somehow challenges the immune system and strengthens it against allergies. Studies have shown children exposed to bugs by older siblings or attending nursery cut their future allergy risk.

But new work published by the American Thoracic Society casts doubt on this.

The study by Dutch investigators at the Erasmus University found although children in day care got more colds and other infections, they were just as likely as other children to go on to develop asthma or another allergy by the age of eight. The children who went to nursery and who had older siblings had more than quadruple the risk of frequent chest infections and double the risk of wheezing in early life, with no obvious pay off in terms of later protection from allergy.

The original hygiene hypothesis said that exposure to harmful germs (e.g., that cause colds) cuts down on allergy risk. But it's now clear it's the exposure to harmless germs (e.g., in dirt) that's helpful.

Allergies in the UK have tripled in the last 10 years. I believe this is due to greater consumption of food that is germ-free, such as factory food and restaurant food. Shelf-life considerations and food-safety laws, in other words.

Advice given by Allergy UK:

The best advice we can currently give to parents is not to smoke around their children and make sure they have a balanced diet and get plenty of exercise.

Not even close to what I think. My advice is: Feed your kids plenty of fermented food, such as yogurt. I'd bet a lot of money that my advice is better.

Thanks to Mark Griffith.

1. <http://news.bbc.co.uk/2/hi/health/8373690.stm>

2. <http://news.bbc.co.uk/2/hi/health/8241774.stm>

---

Jaroslav (2009-11-30 07:47:35)

"My advice is: Feed your kids plenty of fermented food, such as yogurt." I think it's more than that. If you feed kids fermented foods that will probably help, but if you also continue to feed them with such a healthy junk like tons of grains and grain fibre, which will continue to damage their guts, it's like taking cure together with poison. In this case the poison may be stronger than the cure. In my case I was eating quite a lot of fermented foods, but it did nothing to my asthma and allergies. Only after I started to eat grain free (paleo style) they went away (after about 9 month since this change) and my digestion improved. My point: I believe your theory about bacterias is correct (because they protect guts by helping with digestion and by enriching the food), but too simplistic. In case of autoimmune diseases other factors may be stronger than the ingested bacteria - as was my case. Also, the increase of incidence of allergies may correlate more with current dietary recommendations (grains, fibre) than with bacteria consumption, but here the issue is little fuzzy, because less fermented foods also means more junk carbs and fibre.

Tom Moertel (2009-11-30 08:15:46)

It's an interesting hypothesis, that exposure to harmless bacteria helps the immune system. If it were true, what might explain it? The best I've come up with: (1) Exposure to harmless bacteria is how the immune system calibrates its sensitivity. When almost none are available, the immune system becomes overly sensitive. (2) Harmless bacteria aren't merely harmless but a functioning part of the body's immune system. When there aren't enough, the immune system breaks down. (3) Harmless bacteria are a proxy for the absence of pathogens. When harmless bacteria are lacking, the immune system thinks pathogens are abundant and prepares for battle. Any others? Cheers, Tom

Helen (2009-11-30 11:11:50)

Tom, those are great hypotheses. I find that full-fat yogurt really brings down my allergies, which have been severe all my life. I think it may be the combination of the cultures in the yogurt and anti-inflammatory properties of the butterfat in the yogurt.

Andrew Gelman (2009-11-30 11:42:15)

Seth: Why does your advice compete with the advice "not to smoke around their children and make sure they have a balanced diet and get plenty of exercise." Suppose people do follow your advice. Don't you think it's still a good idea for the parents not to smoke and to give the kids plenty of exercise?? (Also I assume a balanced diet is a good idea too, although maybe your definition of "balance" differs from theirs.)

Gian (2009-11-30 21:57:28)

Grains alone can hardly be the problem. People 100 years ago used to eat more more grains-often exceeding 1 kg of wheat per day. But the grains used to be properly prepared, with low-temperature grinding, fresh flour and sufficient soaking . I think that's the key

Jaroslav (2009-12-01 02:51:26)

Gian, I don't think it's that simple. I can tolerate soaked or fermented legumes, I do fine on moderate amount of rice, but all other grains are out of question (including some non-grains like buckwheat). Like Seth I like self-experimentation and I did quite a lot of it on myself with grains. Sourdough fermented (3 days) wheat or rye bread made from freshly ground flour will still give me rapid heartbeat for several hours, brainfog and headaches. After a week long experiment I ended with strong diarrhea and a fever. Before switching to paleo, I had the same symptoms all the time, but I was so used to them that it was not so insufferable. But as a one time experience they are intolerable. So I don't agree with simplistic theories like let's just soak them and everything will be fine. Does not work for me and many others.

## 4.12 December

### ClimateGate: An Inside Job? (2009-12-01 17:26)

As a commenter[1] pointed out, the real scandal is [2]the state of the data. University of East Anglia Climate Research Unit researchers were very reluctant to give anyone their raw data and now it is clear why: It would have been like opening a door and showing a giant mess. I wonder if the frustrated programmer who had to work with the data finally decided enough was enough. He was tired of his bosses (research scientists, such as Phil Jones) using his work to deceive the rest of world on a very important issue. Maybe he felt guilty. And decided to put an end to it. He could have easily told someone outside how to gain access. In the Ranjit Chandra case, one of his employees was the first whistleblower.

Professor Michael Mann of Penn State University, whose veracity has been called into question by the scandal, says [3]he's glad that he's being investigated.

"I would be disappointed if the university wasn't doing all [it] can to get as much information as possible" about the controversy, Mann tells the Daily Collegian.

---

Ted (2009-12-03 15:56:08)

It doesn't matter. It's the very definition of 'consensus' and 'science' that is at stake. They are already guilty of playing fast and loose with that without the email leak. The rest of us forgot to pay attention when they quietly changed the definitions on us, using a wink-wink-nod code to fool the public. The email is just the tipping point, when we all noticed. We want our words back, and things will never be the same.

### **Climategate: Its Educational Value (2009-12-02 05:32)**

Before the printing press, there were very few books. It was extremely hard to learn math; you had to pay a tutor. Of course literacy was very low – but all knowledge that could be transmitted through books (such as math) was very low.

Science cannot be taught through books. You can learn a lot about calculus by reading books. You can learn almost nothing important about science. Science is not a collection of facts, it is a method, a way of gathering knowledge. Almost always it is taught by doing – by working in a lab, for example. Just as, before printed books, almost no one could do any math, it is true today that almost no one can do any science. (Most doctors think the bigger the sample size, the better.)

If you look at a biology textbook, it is full of conclusions. It says practically nothing about the process by which those conclusions were reached. For some reason biologists have decided not to teach that – perhaps because it is difficult and messy to teach. And someone might be offended. Whatever the reason, the process goes undescribed. And it's all sciences, not just biology. (Until recently, economists avoided teaching data. At least in introductory economics, data was too messy for them.)

As long as you have to learn science by doing it practically no one will understand it – just as almost no one did math when you had to hire a tutor to learn it. But now we have the Internet. And blogs. Two new things have entered the picture: a great deal of emotion (blogs are full of emotion, unlike textbooks); and unlimited space. Now science can begin to be taught without actually doing an apprenticeship. [1]If you add enough emotion, anything becomes riveting. And there is now plenty of room for all the false starts and messy details. I suppose most scientists who blog are too worried about being dignified to say anything emotional or messy, but that doesn't matter because there are so many bloggers.

According to [2]Stephen Dubner, "if you are fan of science, this [Climategate] is a pretty grim day." I think it's a great day. As great as the day the first math text was printed. It's the first time a large number of people are getting a real lesson in science. [3]Mainstream media coverage is pathetic but there are so many bloggers it doesn't matter. [4]You can read about it endlessly. As you do, you will painlessly and unforgettably learn what [5]Leonard Syme taught his students for years, and [6]what I blogged about a few weeks ago: The apparent consensus on any difficult issue is more fragile than it looks. You are learning how conclusions are actually arrived at. It isn't pretty – which textbook writers and professors, seeking dignity above all else, fail to mention.

---

Andrew Gelman (2009-12-02 06:45:22)

Seth: You write, "You can learn almost nothing important about science [by reading books]." I disagree. I think you can learn a lot about science from reading my books, also from reading the Feynman lectures. I've never read Origin of Species, but I've heard that you can learn a lot about science from reading that also. I'm sure there are many other examples.

Eugene (2009-12-02 09:26:45)

Speaking of the scientific process, I thought you'd appreciate [1]this: "Brotto did a bit of experimenting on herself. Not that she suffered from any disorder, but she talks of herself sometimes in a researcher's terms as 'an n of one,' a single subject on whom she likes to test her ideas."

1. <http://www.nytimes.com/2009/11/29/magazine/29sex-t.html>

Tom in TX (2009-12-02 11:24:41)

Seth wrote: "If you look at a biology textbook, it is full of conclusions. It says practically nothing about the process by which those conclusions were reached. For some reason biologists have decided not to teach that â€" perhaps because it is difficult and messy to teach." Or perhaps because they did not follow the right method to get to those conclusions. According to Dennis Prager, the purpose of graduate school in the social sciences is to destroy the student's ability to think for himself. Ouch.

milieu (2009-12-02 11:26:50)

Hi Seth, As a doctoral student expecting to learn science (albeit in an engineering department), I was dissappointed. My advisor (though I think he knows how to do science, wasnt interested in making things explicit, perhaps he doesnt care about me?). I think I learnt a lot about Science by reading blogs (especially radical and controversial blogs) which I never learnt by reading books. Maybe because most books (with rare exceptions) are interested in just the final result, while blogging is an interacting medium where a blogger might be questioned and he has to respond to comments. BTW you are also amongst those who helped me in 'learning' Science. So just a thank you!

Patrik (2009-12-02 11:41:11)

@Seth Fantastic post. The hidden and unappreciated gem in your post is as follows: "Science is not a collection of facts, it is a method, a way of gathering knowledge." 99.9999 % of people (high priests, er, I mean, "scientists", included) do not understand this differentiation. Science is a method, not a body of knowledge. When I hear people say "the science tells us X, Y and Z" — I ask myself, how does the method "tell" us anything? You could have one universe of data and facts interpreted an infinite number of ways, all potentially valid. The reason most people conflate science as a method with science as a body of knowledge is that the former is harder to control (being that the principle tenet of science as a methodology is skepticism), while the latter becomes a religion and a political tool of the elites.

JLD (2009-12-02 11:52:55)

*The reason most people conflate science as a method with science as a body of knowledge is that the former is harder to control* I would rather say the reason is that it is harder to **define**! May be you should read a little philosophy of science, *no consensus* here either.

Bruce G Charlton (2009-12-02 12:29:40)

Very interesting ideas. But as well as input, you need a feedback loop. The apprenticeship system provides for constant monitoring of the apprentice to check that the information really is being understood. Otherwise you could be endlessly misunderstanding.

seth (2009-12-02 12:37:05)

Andrew, I'm not sure what you are referring to when you say important stuff about science can be learned from reading the Feynman Lectures. I read Volume 1. I like it, but it taught me nothing about how to do experiments or analyze data, which is 99 % of the science I do. I can't imagine it affects your work. So what are you talking about? milieu, any blogs you would recommend to learn about science from? yeah, the fact that blogs deal in radical and controversial stuff makes them much easier to learn from. Patrik, thanks. I think people who do interesting research know perfectly well what I say is true, I just think it would make their lives more difficult to acknowledge it – how crappy the usual textbooks are, for example. So they don't. I wouldn't say the primary attitude of science is skepticism. I think it is to think for yourself, which is quite different. To think for yourself can mean being more skeptical than everyone else; it can also mean being less skeptical than everyone else. To think for yourself means reaching conclusions based on whatever evidence is available, as opposed to reaching conclusions based on what other people think. Perhaps that is the core reason science (the method) is rarely taught – because it would give whoever is teaching you less power over you.

Bruce G Charlton (2009-12-02 13:21:46)

"To think for yourself can mean being more skeptical than everyone else; it can also mean being less skeptical than everyone else." Excellent!

seth (2009-12-02 13:33:57)

thanks, Bruce. Medical Hypotheses embodies that idea much better than most other journals.

milieu (2009-12-02 14:26:37)

Well, I think my 'eyes opened' when I read blogs like gnxp [1]gnxp , [2]Eric Raymond's Blog , [3]Overcoming Bias . I do not agree with many of their ideas but I learnt that the established truths are not sacrosanct and have to be questioned. But I would admit that the starting point of all these might be the book "The Black Swan" by Nassim Taleb and his writings on the web including his [4]website .

1. <http://www.gnxp.com/>

2. <http://esr.ibiblio.org/>

3. <http://www.overcomingbias.com/>

4. <http://www.fooledbyrandomness.com/>

milieu (2009-12-02 14:28:46)

These are not per se Scientific but another one might be [1]Eric Drexler's blog , again with a heavy technology bias.

Andrew Gelman (2009-12-02 15:04:31)

Seth: "Doing experiments and analyzing data" is what you do, but it's not what Feynman did. He was a theoretical physicist. That's the sort of science that he teaches in the Feynman lectures. What did I learn from those books? The idea that you can study anything–anything–from first principles. I remember his ratchet-and-pawl discussion where he shows what happens if you try to build a Maxwell's Demon machine and why it still follows the second law of thermodynamics. In my methodological research, I follow similar principles, for example in my work on model checking. I go back to first principles and am as direct as possible. I learned some of that from Feynman. As to my other examples: I haven't read Origin of Species, but I imagine it's taught people a lot about observation and theory building, both of which are important aspects of science. And, of course, I think my own books have taught many people about data analysis. Reading is not as good as doing, but if you read carefully, you learn a lot, I think.

The Educational Value of Climategate « Daniel Joseph Smith (2009-12-02 16:32:03)

[...] The Educational Value of Climategate By Daniel J. Smith <http://www.blog.sethroberts.net/2009/12/02/climategate-its-educational-value/> [...]

seth (2009-12-02 17:55:54)

Andrew, thanks for explaining that. I've learned a little bit about data analysis from reading – from reading Exploratory Data Analysis by Tukey, in particular. But since that book didn't include examples of real-life data analysis, what could be learned only went so far. Sort of like what you could learn about cooking from a cookbook that used only two ingredients. To say that you learn science when you learn how to do a t-test (or any statistical method) is true, but I think it confuses many people. They confuse the detail with the big picture. The big picture is that doing science consists of deciding what data to collect (what experiment or survey to do), dealing with difficulties along the way, extracting the most info out of the data you've collected, and seeing how what you've learned fits with what people already knew. For some people it also consists of raising money and effectively working with students and/or employees. From Tukey I learned a little bit about value of transformations and graphics. Deciding what data to collect is by far the most important step and, in my experience, is never taught by books.

seth (2009-12-02 18:24:44)

milieu, yeah, I think Taleb does the best job among living writers of teaching that you shouldn't take established truths as so established. And he describes himself as a philosopher, not a scientist!

Mark (2009-12-03 18:25:18)

Is "On the Origin of Species" worth reading? Which edition? The 6th, as the final, most finished version? Or the 1st, as the edition that had the most historical impact?

Matt Goff (2009-12-03 20:09:03)

It has been a long time since I read it, but my recollection is "Chaos: Making a New Science" by James Gleick might qualify as a book that one can read to learn a bit about how science is done. One story I remember in particular was about Edward Lorenz studying atmospheric models and unexpectedly finding widely divergent results from simulations that started with nearly the same conditions (as I recall, it had to do with roundoff while re-starting simulations). His investigations into this led to the idea of the "butterfly effect" or a bit more formally, "sensitive dependence on initial conditions."

seth (2009-12-03 20:51:25)

Matt, a friend of mine said Chaos by Gleick is a good example of journalistic misunderstanding. Gleick thought the science was much more important than my friend thought it was. As far as I can tell my friend was right – that stuff has gone nowhere. The big decision for most scientists is what data to collect. What you describe is remote from data collection.

Matt Goff (2009-12-03 22:10:26)

I don't feel like I have enough of a comprehensive understanding of the field to know about the big-picture importance of what Gleick specifically wrote about in Chaos, but I certainly would not argue with the idea that "Chaos Theory" and fractals had their 15 minutes of fame in popular culture where they were "the next big thing" that was going to "revolutionize our understanding" and then they faded from public view. That said, it is also my understanding that the study of 'chaos theory' (by which I mean non-linear dynamics and complexity, going back to the late 1800s) has resulted in some important breakthroughs (though perhaps you would not consider them to be scientific). As I understand it, one significant idea to come out of these studies has been that for many even relatively simple systems it is not possible, even in theory, to directly calculate the system state at an arbitrary point in time. Even worse, it is often not even possible to accurately simulate future states of a given system. Another idea that I think came out of this field is the understanding that a given system (even one that is completely deterministic) may have some parts of its parameter space where it is 'well behaved' and others where it is 'chaotic'. This idea suggests investigations to understand where/how the transition between "nice" behavior and chaotic behavior occurs. My background is mostly mathematics with a healthy dose of statistics. I do not consider myself a scientist, so perhaps my understanding of what is included in science is faulty. However, I tend to think of Lorenz' work as being scientific in nature. I am curious about how you would define/describe science. For example,

what role, if any, does mathematical modeling play in science? Finally, for what it's worth, BBC did a program called [1]"High Anxieties - The Mathematics of Chaos" (available on youtube) which appears (I've not watched the whole thing yet) to get into some of the impacts of this field of study. Of course this doesn't necessarily mean that studies are scientific in nature.

1. <http://www.youtube.com/watch?v=gTDC2yWBSkY>

seth (2009-12-04 01:14:31)

Matt, my guess is that 99 % of published scientific articles involve data collection or summarizing (review articles). That is their emphasis. They may fit lines or other functions to the data, sure, but that has nothing to do with the stuff in Chaos. Mathematical modeling of other people's data (no original data collection) is among the 1 %. Articles about mathematical modeling of hypothetical data are very rare.

lance (2009-12-04 23:04:59)

"Mathematical modeling of other people's data (no original data collection) is among the 1 %." Isn't that what all the climate science is about, creating models based on data? Sure, most of the articles may be data collection, but the heart of the argument for AGW is based on models. Maybe the stuff in chaos has been a dead end because the lesson is "most systems are too complex to be modeled so as to generate useful predictions."

seth (2009-12-04 23:34:46)

Lance, data, not models, are at the center of Climategate. For example, failure to provide data after it's been asked for. The models can't be taken seriously because they haven't predicted anything correctly, as Bruce Charlton says. I think the heart of the argument for AGW was stuff like the hockey-stick graph. With that gone, I suppose people will shift to saying it is the models that matter.

lance (2009-12-05 06:28:13)

So you're saying the billions spent on climate science are primarily devoted to [1]collecting data and not to run models on expensive computers?

1. [http://gallery.surfacestations.org/main.php?g2\\_itemId=3396](http://gallery.surfacestations.org/main.php?g2_itemId=3396)

seth (2009-12-05 06:57:49)

Lance, no I am not saying that. What's your point?

lance (2009-12-05 07:50:47)

I'll answer with a story (you love stories, right?) In ninth grade, I did a science project on chaos models, the simple equation  $f(x)=x(1-x)$ , which can model the swings in rabbit populations, for instance. I spoke with one of the judges who told me something I haven't forgotten: non-linear systems are very hard to disturb – after some internal shock they will almost always revert to the original equilibrium. You slighted mathematical modeling, but the models are crucial for the case. Data is one thing, but the models tell a great story. And of the 21 models followed by the IPCC, all 21 assume that increasing CO2 will lead to changes that amplify warming. <http://www.drroyspencer.com/2009/07/how-do-climate-models-work/> But if one paid attention to non-linear systems and models, then you would be very sceptical of a) the ability to predict temperature based on models and b) models that assume a system as the earth's climate is unstable. That may be a negative conclusion, but negative conclusions are still conclusions.

seth (2009-12-05 15:35:04)

"Non-linear systems are hard to perturb." For non-linear systems with negative feedback that's true; for non-linear systems with positive feedback that's false. The climate modelers say the system has positive feedback ("amplify the warming").

Sammy Finkelman (2009-12-08 12:09:12)

» is true today that almost no one can do any science. (Most doctors think the bigger the sample size, the better. There are a number of things that are very hard to learn without personal teaching (usually involving building things) but this example isn't

onw of them./ Every book or article about polling will tell you this. I've read this many many times, and it is very logical. Once you get beyond about 1,000 increasing the size of the sample doesn't add much to the accuracy - the key thing is the quality of the sampling. If doctors don't know taht that;'s only because they never read anything about it. perhaps they had to take calculus, but not statistics - actually a statistics course might obscure this tye of thing - just read any old book about political polling. » If you look at a biology textbook, it is full of conclusions. It says practically nothing about the process by which those conclusions Textbooks are probably about the worst place from which to learn anything. Now to know something about how conclusions were reached you need to read Asimov and other wroters. \This is usually found at around Dewey Decimal number 500 or 504 or 508 in the library. You need collections f essays or any popularization. One problem: Books like "Microbe Hunters" can be misleading because since 1948 or so we've had the problem of "peer review" and "double blind studies" and grants. This is misleading as to how science works nowadays. A good science fiction story dealing with how science could be controlled is "The Dead Past" by Isaac Asimov. This aspect of the story might not be captured in the summary: [http://en.wikipedia.org/wiki/The\\_Dead\\_Past](http://en.wikipedia.org/wiki/The_Dead_Past) Asimov's belief wa sthat in the long run (which could mean decades) science couldn't be suppressed because one field impacts on another » The apparent consensus on any difficult issue is more fragile than it looks. You are learning how conclusions are actually arrived at. This is stuff everybody should know. And nobody will do good work without knowing it. And neitehr should policy be made by people who don't question the work. It's harder for people to realize because so much is developed now so it looks better than it is. Talking about chaos, if anybody thouyght a little bit about they would realize that IF it were true that there is a tipping point where a slught increase in CO2 could start a runaway greenhouse effect (which is actually what the alarmists are touting) it would most likely be a chaotic system so that whether it happened or not would depend n just where exactly the value was - it would be something wiotha starnger attarctor, so that ti would make very little sense to lower the level of CO2 slightly - you ciould actually start the runaway greenhouse effect that way - you;d be dealing with the probability of it happening, and it wouldnt be worth it to go to a lot of effor to reduce the probability slightly.

### **Climategate: Its Educational Value (continued) (2009-12-02 13:26)**

In a response to the comments on my previous post, I say that the primary attitude of science isn't to be skeptical, it is to think for yourself. (Which, in practice, means ignoring what fancy hot-shot scientists at prestigious universities tell you to think.) Funny that fancy hot-shot scientists at prestigious universities never teach that.

Or almost never. In another comment on that post, Andrew Gelman mentions the Feynman Lectures as books from which you can learn about science. Having read Volume 1, I have no idea what he means. I was a freshman at Caltech. Feynman was a professor there at the time. The Feynman Lectures had been published but they were judged too difficult for most of the freshmen! I am not kidding. The faculty had learned that they were too hard to understand. They didn't teach what the faculty called "problem-solving" - that is, deriving predictions from theories. So there were two tracks of Intro Physics at Caltech: the Feynman track (fewer students) and the non-Feynman track (more students). I was in the Feynman track. He wasn't the professor, but we used his book. That's how I came to read Volume 1. I liked it, but it didn't teach me anything important about science.

Yet - during the exact same time, freshman year - Feynman himself did teach me something important about how to be a scientist. He taught me (= encouraged me) to think for myself. Not in any obvious way. On Wednesdays at 11:00 am, Feynman would answer questions for an hour. Anything except textbook problem-solving questions. There were more than a thousand students at Tech but maybe 20-30 attended these little sessions. One day I asked: "I've read some philosophy. It doesn't make sense. Yet lots of people say it's important. Am I missing something, or does it have as little value as I think it has?" Feynman's answer: He agreed with me. There was one book of philosophy he liked, a survey by Bertrand Russell, but for the rest of it, it was people talking and talking and saying nothing.

Wow, he agrees with me, I thought. I had reached what I thought was a very minority opinion - an opinion I'd read nowhere else, had heard nowhere else - and this famous person who I respected agreed with me! It certainly taught me to think for myself.

---

JLD (2009-12-02 14:26:10)

**HOW SILLY** An argument from authority (*Feynman agrees with me*) to support "think for yourself" !!! ... ([1]rotflmao)

1. <http://www.netlingo.com/word/rotflmao.php>

JLD (2009-12-02 14:27:35)

Let's see what happens to my previous comment...

Andrew Gelman (2009-12-02 15:08:07)

You write that "fancy hot-shot scientists at prestigious universities never [teach people to think for themselves]." I wouldn't say I have a perfect record on this, but this is one of my goals, and I think I succeed some of the time. Admittedly, my evidence for said success is pretty weak—I don't, for example, have pre-test and post-test data—but I think "never" is a pretty strong claim on your part. I think you're getting carried away with your rhetoric about fancy hot-shots etc. I'm a hot-shot scientist for about the same reason that Tyler Cowen is a hot-shot blogger: people want to read what we write.

Anthony (2009-12-02 17:11:42)

"One day I asked: 'I've read some philosophy. It doesn't make sense. Yet lots of people say it's important. Am I missing something, or does it have as little value as I think it has?' Feynman's answer: He agreed with me." That's interesting, Seth, because what you're doing in this and the previous post is what's known as Philosophy of Science.

seth (2009-12-02 17:28:46)

Andrew, by "fancy hot-shot scientists" I was thinking of people who have written famous textbooks (David Freedman, James Watson, Paul Samuelson, other authors of biology, chemistry, geology, economics, and physics textbooks) that are assigned in large numbers to undergraduates. Those books have their strengths, but teaching students to think for themselves isn't one of them. By a long shot. I was also thinking of undergraduate science lectures I've attended. What do you do to try to teach students to think for themselves? You actually teach students to ignore your opinion about stuff? That's impressive. Anthony, you will look in vain among books and articles labelled "philosophy of science" for anything that resembles this post and the previous post.

Bruce G Charlton (2009-12-03 02:51:39)

Actually, I don't believe that you can teach people to think for themselves: that comes naturally, or not. Another somewhat different thing that comes naturally, or not, is creativity. But you can train people to conform, and you can exclude (often coercively) people that do think for themselves and creative people - and these are both characteristic of mainstream modern 'science' - which is why I put-in the scare-quotes around science. Or, you could say that modern science has replaced a multitude of individual biases with massive blocs of group-think bias (a.k.a. peer review).

Alex C. (2009-12-04 07:47:11)

It's interesting, though, that when you talk to people who hold patently ridiculous ideas (that Uri Geller can bend metal with his mind, that TV psychics can communicate with one's dead relatives, etc.) what these people tell you, in essence, is that they are thinking for themselves and not allowing hot-shot scientists to tell them about the nature of reality.

PhysicstDave (2009-12-06 00:19:51)

Seth, You know, Feynman himself (I think he said this in the preface) admitted that the lectures were a pedagogical failure. In my frosh year (1972-1973) everyone used the Red Bible. My wife's frosh year (1973-1974), the other track used

the Berkeley physics series “much better textbooks, though not as poetic as Feynman. By the way, I had an oral final at the end of my senior year with Feynman in a graduate-level course. I was lost by the end of the year in that course, and seriously contemplating an “F.” It actually ended up being a good experience. He gave me an A-: I probably deserved a B-, but I think he bumped me up one grade for having the guts to hang in there even though I was clearly in over my head. I’m still glad I went to “Tech, though it is not for the faint of heart. And, yeah, what I learned from Feynman was not so much physics but more how to maintain integrity as a scientist and as a human being. Dave Miller Class of ~76

### Philip Greenspun on Universities (2009-12-03 04:38)

[1]This essay by Philip Greenspun, about the trouble with American college education, is most notable for its description of a class lecture by Robert Shiller at Yale:

- 0-4:30: name of course, name of professor, names of TAs, pictures of TAs [all stuff that could easily have been on a handout or Web site]
- 4:30-5:15: bragging about how many important people on Wall Street took his course, bragging about how great the course is even for people who aren’t going on to Wall Street
- 5:15-6:20: talking about how every human endeavor involves finance, e.g., if you’re a poet it will help you get published to know how finance works [my haiku: AIG bankrupt; your taxes gone to Greenwich; no one hears your screams]
- 6:20-7: talking about an unrelated course, Econ 251, and who taught it in previous years [big excitement at a university: some guy other than the usual lecturer taught it because Kahuna #1 was on leave]
- 7-10: history of why two intro finance courses exist, glorious biography of teacher of the other course, [after several minutes, we learn that the other course has a bit more math]
- 10-11:30: show of hands for who is interested in organic chemistry, discussion of how Robert Shiller is reading about this because he has such broad intellectual interests [implicit comparison to finance wizards, though Shiller is not able to cite an example of how organic chemists managed to bankrupt their shareholders and wreck the world economy]
- 11:30-15:00: writes authors of textbook on blackboard, says it is “very detailed”, discusses reactions of previous classes of students to this book, talks about his vacation in the Bahamas with some other important guy, reading textbook by the pool unlike the other stupid tourists who were reading novels. Discussion of what number the current edition is. “I met a really prominent person on Wall Street” who told him that his son had dropped out of the course because the textbook was too hard. Apparently Yale students are too stupid/lazy to read this book intended for undergrads at schools with more motivated students.
- 15-16: discussion of how library is obsolete in the Internet age, how Franco Modigliani is 2nd author of primary textbook, a Nobel Prize winner, and “my teacher at MIT”

Funny! Spy had a similar article about 24 hours of an all-sports-talk radio show. Okay, Robert Shiller is full of himself. The most telling criticism of the modern university is in a comment by Mike Lin:

The first day of Statistics 100 at the University of Michigan, the professor said our final grade was either the average score of our midterm and final, or the score of the final – whichever was greater. Our labs

and homework assignments did not impact our course grade. My roommate, also enrolled in the same course, didn't make the first class. I told him about the grading system. Neither of us attended another class, nor took the midterm.

Before the final, we spent two days straight, reading the material and doing problem sets. I got a B+. He got an A-. [Shades of [2]Tucker Max.]

I am ashamed to admit that I wasted all those lectures and labs that my family paid for. But what does it say about inadequacy and inefficiency of the lecture system when we arguably learned the practical application of our course material with 24 hours of self-study spread over two days and a \$100 textbook?

It says a lot.

Via [3]Aaron Swartz.

---

Bruce G Charlton (2009-12-03 05:16:02)

I was asked to review Robert Shiller's recent 'Animal Spirits' for an Israel based magazine called Azure. I spent a fair bit of time on the job, but Azure declined to print the piece - presumably because I thought it was a bad book: <http://charltonteaching.blogspot.com/2009/06/animal-spirits-akerlof-shiller-review.html> That aside, I think that psychometrics has shown that most educational claims are bogus since heritable intelligence and personality account for so much of the variation in educational outcomes. <http://medicalhypotheses.blogspot.com/2009/07/replacing-education-with-psychometrics.html> Therefore, coverage of specific valuable content by formal lectures plus training in specific skills via personal apprenticeship are probably what most education ought to be about (education for its own sake being a real but small minority activity).

CCS (2009-12-03 06:58:08)

Heh. Well I could have gone my entire life without knowing that Shiller is a d\*che. I have never been anywhere near Yale but his book has literally saved me hundreds of thousands of dollars. If enough people read "Irrational Exuberance" in high school (it's easy enough for a high schooler) the tremendous suffering of the housing crisis could have been averted. The act of simply identifying the cliches that people start to believe in a bubble could go a long way to helping people avoid losing their money. While I agree with the author that grades given by non-objective professors (human beings) are a complete joke, IT certifications are not the model you want to look at. They are just as un-objective because they are tests written by humans. The MCSE is the biggest joke in all of IT (I have one - years ago.) The purpose of the MCSE is for MS to be able to create a lot of admins by giving them a test that everyone cheats on so that they can say the TCO of their systems is low. Self-taught linux/unix admins make much more than an MCSE, but Linux is free and Unix is way better than Windows, so MS needs a reason for corporations to buy their products. Cheap admins are the answer. The MCSE asks arbitrary questions that reveal zero problem-solving skills, they are just canned, meaningless phrases from MS. If you want to know how IT certifications work, google "brain dump." IT certifications are worthless because you can't measure the skills of a good sysadmin in a test where a person answers multiple-choice questions. Redhat has slightly better tests but they still need a LOT of work. It may be the case that there aren't easy, efficient ways to sort out who has the right skills for various careers. Universities aren't the answer and superficial tests, even if graded by a computer, aren't the answer. BTW I'm in grad school at a supposedly good university

and I have found that cheating and plagiarism are tacitly tolerated. If I didn't like interacting with some of the other students and teachers I would quit. There are a few decent reasons for me being there but it certainly isn't what it's cracked up to be.

CCS (2009-12-03 07:42:49)

PS are you really criticizing Shiller for being a name-dropper \*cough\*Feynman\*cough\* Logic, as taught by your friendly neighborhood Philosophy department, in my opinion/experience, has a lot to do with problem-solving. But I am not sure who else agrees with me on that!

Kevin Miller (2009-12-03 07:57:26)

Great article. The current economic crisis is a real opportunity for big state universities to rethink what they do. I suspect that there are some "stages of grief" involved, but I'll be curious to see what Berkeley does to reshape how it educates its students. I came to Michigan when it was already well along in dealing with a similar crisis, but I have to say that I've never been anywhere that has been more thoughtful and experimental in dealing with these issues, although there's a lot of inertia. Yale has always been in a league of its own, and the Schiller lecture reminds me of a history lecture I sat in on when I was looking at schools that convinced me not to go there. I went instead to a small and intense college, although I ended up having one experience very similar to the stats story cited above. I took a cognitive psychology course and because my girlfriend lived at a different school some distance away ended up missing a very large proportion of the classes. So that meant that I really had to learn the material on my own and make my own judgments about what was important and how the instructor would assess it. I ended up doing very well in the course (the instructor, who was a terrific teacher, didn't hold a grudge), and it was a very useful experience. I've found that it's really hard to predict who will get what from an educational experience, and even hard to know what will resonate many years hence. The message I take from this is that our responsibility as faculty is to provide students with challenges and opportunities to think and learn about a broad range of important questions. In fields like psychology, that's pretty easy to do, but it's also pretty easy to forget that that's the point of the enterprise.

Timely Snow » Blog Archive » The university and economic growth (2009-12-03 08:03:02)

[...] Courtesy of Seth Roberts, this interesting article by Philip Greenspun on the future of universities. [...]

Tim Newsome (2009-12-03 09:47:01)

One interpretation of Mike Lin's anecdote is that the lectures are worthless. Another one is that the final just doesn't do a good job testing what students know. I think it's common knowledge that tests are an imperfect measurement of knowledge, so that's the explanation I would pick. Of course that doesn't change the fact that there are bad teachers out there, but at least my experience has been that most of them are good. Taking a university course is a great way to learn about a subject, especially if you take the time to ask questions. Tim

Peter (2009-12-03 10:12:22)

Criticizing the first lecture of the semester for being mostly administrivia and posturing seems a bit weak.

seth (2009-12-03 15:05:18)

CCS and Peter, I thought the report of Shiller's lecture was funny. That's why I quoted it. Peter, I agree it isn't exactly incisive criticism. CCS, it would be name-dropping if I said something like: "the other day, I was talking to Feynman . . . ". I don't think anything's wrong with telling a story about how he helped me learn to think for myself.

Alex Chernavsky (2009-12-03 18:48:45)

Shiller's entire course is available for download here: <http://oyc.yale.edu/economics/financial-markets/> My daily commute is about an hour long, and I recently finished listening to all of Shiller's lectures. I can say that Greenspun's criticism is unfair. Shiller may not be the most dynamic speaker, and it's true that the introductory lecture was particularly weak. However, I learned a lot from the course, and I also found Shiller himself to be an intelligent and prescient economist. Rumor has it that he's on the short-list for the Nobel prize in economics (for good reason, I think). Meanwhile, Greenspun is best known for heading up a dot-com company that crashed and burned in a most spectacular way. Last time I checked his blog, he seemed to

have some sort of obsession with helicopters.

Andrew Gelman (2009-12-03 23:36:39)

I've never flown in a helicopter myself, but, ya gotta admit, they're pretty impressive machines.

peter (2009-12-04 11:50:19)

I agree with Alex Chernavsky; the online course is first rate and provides long-lasting useful insights into investing. The guest speakers were especially useful, since with hindsight they sounded a little silly. Overall, the lectures provided a framework to structure a portfolio. There was so much useful information it's difficult to single out just one. But, for me, Shiller's bemusement relative to "magical thinking" that is pervasive in the retail investing public was especially insightful.

### **Nature Editorializes on Climategate (2009-12-03 06:57)**

[1]It reads like something from Shouts and Murmurs in The New Yorker:

If there are benefits to the e-mail theft, one is to highlight yet again the harassment that denialists inflict on some climate-change researchers, often in the form of endless, time-consuming demands for information under the US and UK Freedom of Information Acts.

If only all Nature editorials were this amusing. It ends with the same pompous reference to "science" as [2]Elizabeth Kolbert's review of Superfreakonomics:

The pressures the UEA e-mailers experienced may be nothing compared with what will emerge as the United States debates a climate bill next year, and denialists use every means at their disposal to undermine trust in scientists and science.

Thanks to Bruce Charlton.

More [3]Here's what James McCarthy, Alexander Agassiz Professor of Biological Oceanography at Harvard and President-elect of AAAS, has to say: "The content of a few personal emails has no impact whatsoever on our overall understanding that human activity is driving dangerous levels of global warming.â€ He is ignoring the fact that the data has been revealed to be a huge mess.

---

Jim (2009-12-03 08:38:38)

There is a VERY easy way to avoid the "endless, time-consuming demands for information under the US and UK Freedom of Information Acts," don't take government money that triggers the laws. As a government employee of a large organization that looks a lot like the Army Corps of Engineers, who is used to being sued under the National Environmental Policy Act, and has

had to produce emails for litigation, I have zero sympathy for this argument. It's a fact, the People, through their Congressional representatives have spoken, deal with it.

Ted (2009-12-03 14:09:27)

Try your hand at suggesting economists have a pet project in all this too: Carbon Credit trading. I can't seem to get any prominent economist blog to let my comments through. They get "moderated".

JLD (2009-12-04 01:03:09)

This isn't an "either or" question. I strongly suspect that there is both climate trouble **AND** juicy embezzlement prospects (Carbon taxes and trade) from govts and traders. We get the "best of both worlds", isn't that wonderful?

### **Foot Fungus Cured With Socks (2009-12-03 14:36)**

A friend writes:

I remember reading on your blog about [1]more socks as a cure for Athlete's Foot and I had a fungal infection on my foot from climbing around barefoot outside, I think. I tried using two different antifungal creams. They didn't work. To be honest I didn't use them for the recommended time cuz it's a huge fucking hassle. You have to put it on your feet, let it dry, rub it in blah blah blah. And it's kinda gross to use. So I went to [2]Uniqlo [a Japanese clothing store] and bought like 20 pairs of extra socks and forgot about it. But when I wash socks the washed ones get put in the back of the drawer so the effect is the socks I wear spend like 3-4 days away from my feet every time. Anyway, the infection COMPLETELY disappeared. There is a weird sense of satisfaction from this kind of cure. It feels like just by doing some small things 'right' all these health issues can be fixed.

I had foot fungus for years, I too tried antifungal creams without success, and the problem cleared up within days when I bought a lot more socks. It has remained cleared-up. You could call it the staging-area problem: Our things act as staging areas for harmful bugs. Another example is [3]getting an eye infection from pillowcases.

1. <http://www.blog.sethroberts.net/2009/10/11/how-to-eliminateprevent-a-skin-infection-and-what-it-means/>

2. <http://www.uniqlo.cn/>

3. <http://www.blog.sethroberts.net/2009/08/17/how-to-avoid-infection-something-i-didnt-know/>

---

Ted (2009-12-03 15:27:53)

The cure for ringworm is too wash your clothes and bedding every night.

Jeff (2009-12-03 15:52:49)

"An extreme example is that Eskimos started dying of poison from fermented fish after they began using plastic containers. Which is why I use glass jars to make kombucha. " Can you explain this? I assume you are talking about the problem of creating botulism while fermenting the fish. This does not have anything to do with the material of the container, but whether the container is airtight (plastic) or not airtight (the ground). Plastic versus glass would not make a difference. Unless you are talking about something else.

seth (2009-12-03 16:55:56)

Jeff, yes, that's I was talking about. Thanks for the correction. I have removed those two sentences.

George (2009-12-04 11:44:59)

This reminds me of a story I read about a young man who had chronic acne problems; after trying a lot of different things, what finally worked for him was putting a fresh towel over his pillow every night before bed: [http://www.reddit.com/r/reddit.com/comments/9p2f8/i\\_am\\_a\\_seventeenyearold\\_who\\_had\\_terrible\\_and/](http://www.reddit.com/r/reddit.com/comments/9p2f8/i_am_a_seventeenyearold_who_had_terrible_and/)

voiceofreason (2009-12-04 12:04:38)

Even as important as lots of socks, is lots of shoes. If you own 5-6 pairs of shoes, and give them at least 3-4 days airing out before you wear a particular pair again, always with fresh socks, you will never get athlete's foot.

Dave (2009-12-04 12:27:18)

I had the same problem. When I switched to socks that were cotton instead of polyester/nylon the problem went away. After that I changed my underwear to cotton and had some nice results there too. Natural cellulosic fibre materials are better to put up against your skin than cheap synthetics.

Bruce G Charlton (2009-12-04 13:41:40)

My father has taken this a step further - he has 14 pairs of (leather) shoes which he wears in rotation...

G-Man (2009-12-04 13:53:19)

@Jeff, I can't really speak to the fermenting of fish and how various types of containers affect their poison content. However, I am a brewer, so I can speak to your statement about plastic being airtight, which is incorrect. Many types of plastic containers are actually porous and will let the things inside them breathe. This is why homebrew beer is only fermented in glass carboys, or very specialized plastic containers (PET3, I think, but I only use glass so I'm not really sure). So, with that out of the way, back to my foot fungus... More socks? Really? I have a pretty good amount of socks now, and I never wear an unwashed pair. Any idea how this actually is affecting the fungus? What is the 'cure'? Is it the fact that it takes longer to recycle a pair back onto the feet? Perhaps some fungus stays in the sock after washing but dies if it doesn't come into contact with the host for a certain period of time?

Mike (2009-12-04 18:40:57)

Seth, a very sure fire way to ride yourself of tenia pedis (latin for foot funk) is something almost no-one knows about, but I repeat, it's a sure fire way to remove it. Garlic!!! Take a two cloves of garlic through a garlic press, and massage the 'mush' into the effected area for at least 5 minutes. It sometimes requires 2 applications (the next day), but it works. I had the worst kind the funk for a long time, and I am no completely free of it for over 2 years now. Before it would stir itself back up every other month. NO MORE!!!

Mitch (2009-12-04 19:23:41)

I've been pretty lucky never to have had athlete's food. If I had it I think I would try raw garlic, olive oil infused with raw garlic, yogurt, or a solution of boric acid. I already have a lot of socks so I can last longer between doing laundry.

Dan (2009-12-04 22:07:24)

Okay, first off, your symptoms may have vanished, but the fungus is still there. I hate to break the bad news, but, like herpes, tinea pedis is forever. Once you have it, you will always have it. There is no cure, no matter what anyone says. But, with proper care, your outbreaks will become less frequent and milder. I contacted tinea pedis in my late teens. After the first few years, it's basically disappeared, because I learned the right way to take care of my condition. (I'm over fifty, now.) What you need to do is wear breathable, cotton un-dyed socks. White over-the-calf tube socks work great for me. Wear shoes as little as possible, and try to have at least two pair of shoes, to trade off each day. Let those smelly suckers dry out and breathe. When you get an outbreak, the best treatment is called a Burrow's solution. You can get Burrow's powder from your pharmacy. Mix

it according to the instructions, and apply cold (I mean ice-cold) compresses, soaked in the solution and worn for as long as you can stand it, several times per day. The cold will cut the inflammation, and the Burrow's solution will dry the pustules. Fungus thrive on warm, damp and dark places, like your feet in shoes. UV light from sunlight will help to kill many of them, and keeping your feet cool and dry will do more for your unpleasant condition than will any "home remedy." It goes without saying that a good diet and lessening stress will also help out your problem. Best of luck, and may your fungus bother you no longer.

Anonymous (2009-12-04 22:22:22)

Sounds similar to something I did. For years I had bad acne on my face, that just wouldn't disappear no matter what prescription medication I tried. Suddenly, it went away. What did I do? I just washed my face in the middle of the day when it felt oily, with nothing but plain water, and maybe a drop of soap.

Keane (2009-12-05 18:51:53)

When I had this problem and medicated creams didn't help enough, I applied vinegar and my problem disappeared.

eric (2009-12-06 06:01:23)

to dan: uhhh, before you use such bombastic language ("no matter what anyone says!") you might want to get your facts straight 1. herpes is a virus. it's DNA actually enters the nucleus and is kept latent there by an extremely complicated and delicate RNA repression scheme. 2. foot fungi are.. fungi. they live on the surface of your feet. if you bring their population down to a certain level, you can get rid of em forever. do you have some theory on how the fungus would magically persist in an asymptomatic fashion forever?

## **The Parable of the Children's Book (2009-12-03 17:27)**

In 2007, Laurie David, producer of An Inconvenient Truth, ex-wife of Larry David, and self-described "global warming activist," published The Down To Earth Guide to Global Warming, a book for children. It contained a graph showing the very strong correlation over time between carbon dioxide levels and global temperature. The point was that carbon dioxide controlled global temperature. But there was a problem: The graph was mislabeled. The function labeled "carbon dioxide" was actually the temperature function. Correctly labeled, the graph showed that carbon dioxide changes followed temperature changes. Which meant that the temperature changes had caused the carbon-dioxide changes, rather than the other way around – which was one of the book's main points.

[1]David's reaction to the mistake?

Thanks guys! We will correct the illustration in the next edition. We're happy to learn that that was the only question SPPI had about the entire fact-filled book!

As if it's trivial.

Moral: A sign of things to come.

More The fact that a producer of An Inconvenient Truth, the movie that arguably won Al Gore a Nobel Prize, could (a) make such a basic mistake and (b) dismiss it as trivial is the ladies-who-lunch equivalent of the fact that [2]Jones and other CRU scientists were scared of a New York Times reporter.

---

Nathan Myers (2009-12-03 22:57:34)

Seth, it's sad to see you descending into full-on crankhood. How is it that CO2 followed prehistorical temperature fluctuations by centuries, yet tracks the rise directly today? It's fortunate you and your new compatriots weren't able to involve yourselves in forestalling efforts to protect the ozone layer. That said, efforts to reduce CO2 emission sufficiently by regulation are doomed. We should be sluicing money into research and development of technologies that will come to produce energy more cheaply than burning fossil fuels. Taxing fossil fuel use would be a practical source of money to pay for it, and of (local, temporary) artificial competitiveness for the new products of such development. After fossil fuels have been rendered relatively more expensive, the nations that developed the practical alternatives will benefit from first-mover advantage. The furnaces will crumble of their own accord, unlamented.

seth (2009-12-03 23:39:11)

Why does CO2 now go up at the same time as global temperature? Because now a lot of carbon dioxide is man-made. Nathan, why are you sure that people who question man-made global warming are cranks?

Gian (2009-12-04 00:15:46)

The phenomena is well-known to climate scientists and they explain it (away?) as some currently unknown forcing that heats the planet for 800 years, and also causing increase in Co2. The increasing Co2 positively reinforces the previous small heating from the unknown cause. The Co2-caused heating is 80 % of the total heating and 20 % is the heating in first 800 years. This is from [realclimate.org](http://realclimate.org)

Bruce G Charlton (2009-12-04 02:22:42)

Scientists shouldn't be needing to add auxiliary hypotheses until their primary hypotheses is established as having some plausibility. First you state your hypothesis in explicit detail and state its predicted consequences (e.g. a specific mathematical model might be the 'hypothesis' - although in fact a mathematical model isn't really an hypothesis when it is derived post hoc from the data it is aiming to explain - an hypotheses really ought to be causal rather than merely statistical) - then you test the predicted observations against a new set of observations; naturally this must be done without changing the hypotheses to fit the new observations. Until a post hoc statistical model has been tested against new observations it has zero credibility. And until the post hoc model has been tested, it has zero predictive value, and we have zero idea about what will happen in the future. But all this is absolutely basic. The fact that so many people don't understand it simply means that they are not scientists at all, not even a little bit. They are merely technicians - whether good or bad technicians, whether honest or dishonest.

Bruce G Charlton (2009-12-04 02:59:55)

I should maybe spell out my point even more clearly. The debate is not about whether global warming has happened, the debate is about whether we \_understand \_ the causes of global climate to the extent that we can predict the future climate. My point is that - because the predictions of 'the' computer model was not tested against new observations (but instead was repeatedly adjusted to more closely describe already-existing past observations) - there is zero evidence that we understand the causes of global climate. Therefore we cannot make scientific predictions. Since we cannot even predict climate, it should not really be necessary to add that there is also (to put it as mildly as possible) zero evidence that humans can control the global climate. Anyone rational who \_really \_ believed the guesses (not scientific predictions) of significant future global warming would want to use our limited resources to \_prepare \_ for global warming; rather than engaging in the utterly ignorant, wasteful, distracting, dishonest nonsense of trying to prevent something we do not understand.

Sonic Charmer (2009-12-04 04:53:56)

Nathan, if CO2 used to follow temperature but now tracks it (which I'm not sure we know, or you know), then what is the point of looking at historical graphs? What hypothesis about CO2 and warming does it support? This is an especially puzzling question given that apparently to AGW believers you can interchange CO2 and temperature willy-nilly, show the interchanged graph, and still be (supposedly) proving the same point. It's as Bruce says, if you don't have or know a mechanism for what you think you're predicting, such graphs are useless.

Vince (2009-12-04 11:05:46)

[1]Here is a realclimate post on the topic. Briefly: - ice core data show that temperatures increased for a few thousands years at the end of glacial periods, and CO2 levels started increasing a few hundred years after temperatures started increasing (so both rose together after the first few hundred years) - climate scientists have recognized this at least since 1990 - climate scientists have concluded that CO2 acted as a positive feedback mechanism that kicked in after warming started for other reasons - their best guesses seem to be that orbital forcing caused the initial warming and that the feedback carbon mainly came from the oceans - when analyzing the data, it's not possible to account for the amount of warming unless you give a causal role to CO2 and other greenhouse gases - the data imply that greenhouse gases were responsible for about a third of the warming - climate models and predictions are based on other information, not on these historical records from ice ages, but these data do suggest fairly similar predictions of future warming due to rising greenhouse gases

1. <http://www.realclimate.org/index.php/archives/2007/04/the-lag-between-temp-and-co2/>

Vince (2009-12-04 11:17:14)

Looking through realclimate a bit more, it looks like ice cores provide another example of [1]accurate predictions by climate scientists. Climate scientists had data on atmospheric concentrations of greenhouse gases going back only a few hundred thousand years, and they were going to gather data on atmospheric GHGs going back farther (up to 650,000 years ago), so they made predictions of what they would find based on their knowledge of temperatures from that time period, their knowledge about other causes of temperature variation, and their model of how GHGs influence the temperature. The idea was that temperature variation that wasn't accounted for by the other factors was probably due to the unmeasured GHGs influencing temperature in accordance with their models. And apparently their predictions were pretty good.

1. <http://www.realclimate.org/index.php/archives/2005/11/650000-years-of-greenhouse-gas-concentrations/>

Nathan Myers (2009-12-05 14:22:07)

Seth: It would take just as much work to demonstrate that CO2 is not the main cause of global warming as has gone into proving that it is, but you're trying to do it with parlor tricks instead. Bruce: This use of "technician" as an insult is nothing better than bigotry. Your family doctor is a technician. Scientists who pay close attention to technicians become better scientists, because technicians have the most contact with the data and their sources.

seth (2009-12-06 12:45:01)

Nathan, I asked you: Why are you so sure that people who question AGW are cranks? Your answer is: "It would take just as much work to demonstrate that CO2 is not the main cause of global warming as has gone into proving that it is, but you're trying to do it with parlor tricks instead"? Huh? I suppose you're ignoring my question, but I'm not sure.

TCT (2009-12-06 16:22:28)

I think he thinks you are a crank because you didn't bother to do a basic Google search and figure out for your self why this isn't a big deal, and instead decided to make mountains out of moll hills.

TCT (2009-12-06 16:31:51)

Allso are you going to address Vince?

Nathan Myers (2009-12-06 21:09:55)

Seth, I'm not saying "people who question AGW" are cranks, although many are. I'm talking about your own behavior. It's

completely legitimate to question mainstream science and industry, but not to seize on trivialities. The Ares rocket is a positively idiotic design, obviously driven by the politics of patronage, to the exclusion of the most basic sense. Minor mistakes would be invisible or incomprehensible to me, but its are so gross even I can't miss them.

seth (2009-12-06 22:47:27)

Nathan, thanks for explaining that. It is my mission in life to hold Laurie David accountable.

Josh (2009-12-07 13:45:11)

I've looked at the graph in question, and at the annotation given by the authors, and at no point do they mention anything about leading or lagging of the two data sets, only that they are correlated – which of course is true independent of which is which. Furthermore there is only really a lag in temperature at two points, otherwise they're mostly in sync. So whereas this (corrected) graph admittedly shows only correlation and not causation, it certainly in no way disproves either. Therefore there is every reason to believe this was just a simple mistake, easily overlooked by even the most experienced climate scientist. And to flap your hands around and scream "Look here! They're lying!" because of it is intellectually dishonest at best.

Ted (2009-12-07 13:45:20)

Yeah, Seth don't seize on trivialities like the perihelion shift of Mercury. Ignore it. Newton was right.

## **What I've Learned From Climategate (So Far) (2009-12-04 21:47)**

Google "Climategate" you get 31 million hits. "Obama" returns 40 million. Yet mainstream media, such as the New York Times, have said little about it. The New Yorker has said nothing about it. Given so much interest, that will change.

Some of my prior beliefs – that empirical support for the view that man has caused global warming is weaker than we're told, that bloggers are a powerful force for truth – are stronger. But here are a few things I didn't think of until now:

1. The truth leaks out before it gushes out. [1]Laurie David's children's book – its egregious mistake, her blithe dismissal of that mistake – is an example of the truth leaking out. In the Ranjit Chandra case, little facts implied he was a fraud long before this became utterly clear. An example is the claim in one of his papers (published in The Lancet!) that everyone asked agreed to be in his experiment.
2. Teaching is even better done via scandals than via stories. The number of hits for Climategate is an indication of how much people are learning from it. As I blogged earlier,[2] they're learning a lot about science. A mere story about science would never attract so much attention. I should think more about how to use scandals to teach stuff. When Nassim Taleb is scathing about this or that, he has the right idea. Spy was the perfect example. It taught me a lot about New York City.
3. Jane Jacobs was wrong. Or at least missed something very important. In *Dark Age Ahead*, her last book, she pointed to a number of disturbing signs. One was the rise of crappy science. She was quite right about that – as scientists have become more professional they have become more status-oriented and less truth-oriented. She didn't foresee that the Internet would be an enormously powerful corrective force, as is happening now. Climategate is a (relatively) small example of even bigger force: the rise of the power of sophisticated amateurs/hobbyists. Who, unlike professionals, with jobs and status to protect, have complete freedom. The first big example was printed non-fiction books, [3]as I blogged earlier (which are written with great freedom, usually); but now the Internet provides another great outlet, much faster, cheaper, and more accessible than books, for independent thought.

1. <http://www.blog.sethroberts.net/2009/12/03/the-parable-of-the-childrens-book/>
2. <http://www.blog.sethroberts.net/2009/12/02/climategate-its-educational-value/>

---

Bruce G Charlton (2009-12-04 23:35:53)

Another corrupt science scam which has already been discredited is the supposed epidemic of 'new variant' Creutzfeldt-Jakob disease (CJD) in the UK. This prion was supposed to be transferred to human from 'mad cow's with BSE (Bovine Spongiform Encephalopathy). This table described the supposed-epidemic - which dominated UK public consciousness for months, with predictions of hundreds of thousands of casualties, triggered regulations which cost a fortune, caused massive changes in food consumption, killed off UK beef farming etc. <http://www.cjd.ed.ac.uk/figures.htm> In retrospect the most parsimonious explanation is that 'new' variant CJD was not new, but had previously been undetected; and what the grant-beneficiaries were describing as the start of an epidemic, was merely due to ascertaining previously undetected cases. On the small piece of false evidence of a 'new' disease which obtained from cattle, a vast superstructure of heavily funded and government-promoted nonsense and irrelevance was then erected. But here is the sacry bit. Even though the epidemic never happened, the bogus science has not been discredited. Sources like Wikipdia still accept the bogus claims. Among the public BSE-nvCJD is either forgotten, or - in a peculiar way - remembered as if it was true, and as if (somehow) the epidemic really had happened. My take home message from this is much more pessimistic than Seth's. My interpretation is that zombie science can thrive almost indefinitely, and when bogus science is exposed, most people are not really interested, and apparently learn nothing from it. I hope that Climategate prevents Western societies from destroying the world economy and imposing authoritarian laws - but even if this happens I doubt whether anything will be learned, and the elites will simply find another bogus excuse to impose their brand of centralized state-socialism.

epistemocrat (2009-12-05 10:30:38)

Hi Seth, Here is what I have learned from TigerGate: It's like Climategate in that the truth leaked out and then started gushing out. This is a fracture in fractal math: there are a few small signs of snow drift, then all of the sudden, an avalanche ensues. Jime Rome, the sports commentator, likes to say this about these scandals in athletics: "Where there's smoke, there's fire." In the case of Tiger Woods, it turned out to be a roaring Forest Fire. The fire department has yet to contain it. Cheers, Brent

Mike Kenny (2009-12-05 12:25:24)

Climategate has made me consider that perhaps I really shouldn't think of anyone as especially worth listening to (I can listen to them, but not give them special privilege) unless they make public predictions that happen to be true at a useful rate. Does anyone happen to know how well climatologists do in making predictions?

Neil Baxter (2009-12-05 15:26:48)

What I found most interesting in regard to climategate, is that in my local paper, The Vancouver Province, the only reports on Climategate were Opinions on the editorial pages, whereas reports of imminent environmental collapse were news items spread liberally through all of the news sections of the paper, therefore presumably, factual. Now surely such speculative fiction as imminent environmental collapse is at best opinion, and reports on the contents of emails admitted by the sender to be genuine are 'news', ie factual - an odd perversion, indeed. As an aside. I think there is not a scientist alive who would not do well to read Socrates (the father of induction, according to Aristotle), then Aristotle (not for his particular assertions, but for his method), then Francis Bacon for his works on induction and the scientific method, which should be followed up by a good course on ethics on the virtues of honesty and integrity. What surely has failed here, is all of the above. What is being vindicated is capitalism - as is it applies to the market for ideas - through its proxy, the Internet.

Mark (2009-12-05 15:41:41)

There have been studies on the bias that occurs when corporations fund studies: [http://www.allacademic.com/meta/p\\_mla-apa-research-citation/1/8/4/9/7/p184976\\_index.html](http://www.allacademic.com/meta/p_mla-apa-research-citation/1/8/4/9/7/p184976_index.html) I wonder if anyone has looked into bias in research where there are no such backers, but where the result that the study reaches could affect one's status in one's group, one's chances for tenure, the number of parties one is invited to, the chance of group ostracization, and so on. It seems to me that if I were in a field connected to global warming, and I was doing research that seemed to be coming to results that were counter to the mainstream, I'd just try to find some other area to do research in that my skills qualified me for.

Alex Chernavsky (2009-12-05 19:15:55)

When I Google "climategate", I get 30.7 million hits. When I Google "climate", I get only 20.9 million. That doesn't quite make sense.

HPTNS (2009-12-05 19:22:48)

Look at the writings of Aynsley Kellow, a professor of politics, with a science background, at the University of Tasmania in Australia, for a discussion of how international scientific communities trade status amongst participants and how the rise of the internet has made peer review a reduced force for self correction. In particular his 2007 book discusses all of this in the context of AGW. This book was quite prescient.

seth (2009-12-05 23:17:16)

Thanks, HPTNS.

PhysicstDave (2009-12-07 15:30:29)

Bruce G. Charlton wrote: > I hope that Climategate prevents Western societies from destroying the world economy and imposing authoritarian laws - but even if this happens I doubt whether anything will be learned, and the elites will simply find another bogus excuse to impose their brand of centralized state-socialism. Thirty years ago, we would never have heard about Climategate at all. Times have changed â€" the "power elite" is losing its grip. Look â€" Seth is over in China (if his personal bio is up-to-date), and yet he is hosting this discussion! Revealing on multiple levels: he's in "Communist" (AKA "New Capitalist" China, and he's communicating with us from half-way around the world. (Even if he is currently back in the States, my general point stands about a radically-changed world.) Oh, the power elite will fight like a rabid dog, but I think its days are numbered. Dave

PhysicstDave (2009-12-07 15:36:03)

Mike Kenny wrote: >Climategate has made me consider that perhaps I really shouldn't think of anyone as especially worth listening to (I can listen to them, but not give them special privilege) unless they make public predictions that happen to be true at a useful rate. What you've described is the scientific method. And scientists, even climate "scientists" are supposed to follow it. The real scandal here isn't the snarky, infantile behavior of the CRU Team. The real scandal is "scientists," not just at CRU, who seem utterly ignorant of the scientific method. Dave Miller in Sacramento

Jim N. (2009-12-17 16:04:00)

Regarding Jane Jacobs, it seems a bit dramatic to lead your paragraph with "Jane Jacobs was wrong" when all you're really saying is that she failed to predict the trajectory of a technology that was still pretty new when she turned 80. Not trying to be overly-critical, but the woman was quite a force for good in the world.

## **Associative Memory Studied by Self-Experimentation (2009-12-05 02:51)**

Joel Voss, a postdoc at the University of Illinois, Champaign-Urbana, [1]studied himself to measure the capacity of associative memory:

No previous experiments on humans have investigated the capacity of associative memory. I describe the first relevant data, which I obtained by systematically probing my own capacity during 58,560 memory trials for picture–response associations (approximately 1 year of testing). Estimated capacity was on the order of several thousand associations.

A few thousand is the number of characters a well-educated Chinese person knows.

---

Mike Kenny (2009-12-05 12:05:23)

That's quite fascinating. I'm reminded of the authors I like who tend to make use of ambiguity, like Nabokov or Pynchon. Having just one interpretation of their work is no fun. I also wonder if associative thinking is stronger in people who score high on the big five personality trait of openness, who Daniel Nettle thinks are better at divergent thinking than people lower on that scale. Assuming the student who did this study is an intellectual and so probably higher than average in openness, perhaps one might hypothesize lower numbers of associations made in people lower on openness.

## **Three Chinese Jokes (2009-12-05 08:08)**

QUESTION: When the green bean jumped off a tall building, what did it become?

ANSWER: Red bean.

QUESTION: When the banana jumped off a tall building, what did it become?

ANSWER: Eggplant.

QUESTIONER: For Spring Festival, a farmer wanted to kill a donkey or a pig. Which did he choose?

LISTENER: I don't know. The pig?

QUESTIONER: Congratulations, the donkey agrees with you.

Tom in TX (2009-12-05 11:21:05)  
Maybe some explanation is in order. 8-)

seth (2009-12-05 15:26:13)

1. Blood is red. 2. When a banana is bruised its skin becomes the color of eggplant. 3. Surely no explanation is needed.

### **Aynsley Kellow on Climategate (2009-12-06 03:30)**

Aynsley Kellow is a professor of political science at the University of Tasmania. In [1]an interview five years ago, he said, about global warming, "weâ€™ve got a much broader range of choice to respond to a problem that is much more uncertain than certain people who are pushing the issue would have us believe."

As in a protection racket, the people trying to scare you benefit from you being scared:

I did a study of electricity planning, including here in Tasmania, the good old Hydro Electric Commission in the old daysâ€”and the logic was much the same; they would produce forecasts of [hard-to-meet] future demand which were then taken as immutable, and then they would try and justify particular policy responses to those. In the case here it was with hydro dam construction.

I learned about Professor Kellow's work from [2]a comment about status-trading among scientists. I wrote to him to ask what work of his was being referred to. He replied:

I think the reference is just to my 2007 book (Science and Public Policy: The Virtuous Corruption of Virtual Environmental Science), where I write about the shrinking size of groups which possess expertise, the effect of the communications revolution in establishing close networks of cooperation, and the effect of this on quality-assurance processes like peer review. The prevailing paradigm then becomes a "club good" from the defense of which all members benefit (in status, grant success and career advancement).

The problem is exacerbated by some of the circumstances revealed by Climategate: not just pressure on editors, and influence in being IPCC lead authors, but peer review in climate journals where submitting authors nominate reviewers, the identity of authors is known to those approached to referee papers, and so on. I am so accustomed to double-blind peer review that I found it hard to believe that this was a common practice.

When we add this to the lack of disclosure of raw data and code, we have serious reliability problems underlying science upon which we are basing very costly policy. We know in social science research the potential for subjective factors to obtrude into data manipulation even when researchers do not consciously mean for this to happen, so we often see data preparation and analysis performed by independent teams, and emphasise transparency, disclosure of methods, double-blind peer review, and so on.

That's a good point about single-blind peer review. I agree, it should all be double-blind, no exceptions. In psychology authors don't know the name of reviewers but reviewers know the names of authors. You can request double-blind review but then your paper enters the review process with a "paranoid" label attached.

[3]Kellow interviewed about Climategate.

---

Kevin Miller (2009-12-06 06:20:17)

"In psychology authors don't know the name of reviewers but reviewers know the names of authors." I don't think this is true WRT developmental journals and, I thought, APA journals in general. Of course, patterns of self-citations and/or citations of unpublished work often make it reasonably clear who the authors might be, but that's a different problem and harder to solve.

Bruce G Charlton (2009-12-06 07:29:55)

Seth - what do you personally think peer review actually does? Not what it ought to do in a perfect world, but what it actually does. This would refer to (something like) what the average peer review in the average journal does; or maybe to the minimal peer review in a low ranked but Thomson/ ISS listed journal. David L Hull (Science as a process, Chicago UP, 1988) - who probably knows more than anyone else about how science functioned up until a couple of decades ago (because he is so smart, knowledgeable, and well-connected - and also had done more empirical study and analysis than anyone else) - believed that peer review mostly functioned so that research groupings could prevent the publication of low quality/ dissident work from among their own research group; and this was why peer review needed to be anonymous: i.e. because by PR scientists were actually excluding their friends and colleagues from publications which might embarrass or discredit the research program - not because by PR they were excluding their enemies. What we call science nowadays isn't really science at all - so modern peer review doubtless has a different function from the golden age. The reaction to Climategate shows us this - there are two views: the cynical view that Climategate revelations are just normal behaviour for scientists - so that half of scientists are worse than the Climategate mob; and the other view (which is supposedly the moralizing view) that Climategate behaviour is about one standard deviation worse than average - which means that about 16 percent of scientists behave worse than that. Well, Climategate behaviour is at least two SDs worse than science was when I began working in it 30 years ago (ie only about 2 percent of scientists behaved as badly as the Climategate mob) - which is such a large change as to be qualitative. And the response to Climategate shows why. Since prestige in modern 'science' comes from funding, the mainstream view is that whatever highly funded scientists do is, by definition, OK. (The idea that science is tested by checking its predictions against the real world is left out.) For me, Climategate is a confirmation that science - mainstream science - is broken; it isn't really science at all; and if we want real science again, we will need to rebuild it almost from the ground up.

seth (2009-12-06 13:00:56)

Effects of peer review: 1. Helps editors decide what papers to reject. 2. Increases quality of what's published (relative to random choice). 3. Provides many suggestions for improvement. 4. Reduces unorthodoxy. 5. Used by reviewers to protect their own reputations. 6. Burdens authors with stupid comments they must answer. I believe it's a lot better than random selection in most cases but its effect on stuff that is extremely good may be negative. "Whatever heavily-funded scientists do is okay." There is truth to that but it isn't the whole truth. Heavily-funded scientists must get jobs for their grad students. If they fail to do this it isn't okay. If over a long time - say, 10-20 years - the heavy funding produces no good results then there is also a problem. That's what happened to cognitive science. The bloom that was once on cognitive science has shifted to cognitive neuroscience. In the short run, you need merely convince people with money. In the medium run, you must convince colleagues with hiring power. In the long run, you have to convince your whole profession.

Bruce G Charlton (2009-12-06 23:16:09)

That peer review is better than random selection is obvious, but the historically the alternative to peer review has been editorial review; in which the editor decides the content of the journal (using whatever advice from others he thinks appropriate). Until recently (I'm not sure about now) the top medical journals of which I had some inside knowledge were strongly influenced by the decisions of their editors, who did not use referees for all submissions - i.e. it was a mixed system of peer review (for the dull solid stuff) and editorial review - which was how the heterodox stuff got published (most of which, naturally, turned out

to be wrong; but some of which made the journal's reputation over the long term). My experience is that editorial review is superior to peer review (all else being equal); not just because it does a better job (more efficient etc.), but because peer review degrades science by destroying personal responsibility all round until we get... exactly what we now have - science by committees (i.e. not science at all). "In the short run, you need merely convince people with money. In the medium run, you must convince colleagues with hiring power. In the long run, you have to convince your whole profession." Yes, that is how it used to be. Is that what you have observed in science? It is not what I have observed. If the long term is a 'generation' i.e. about 25 years, then it is clear that things have not worked like that. You mention cognitive neuroscience. This has been dominated by the techniques of 'functional' brain imaging since the early/ mid 1980s - i.e. for a generation. Much of FBI was justified by the supposed medical benefits - these have been essentially zero. The \_scientific \_ yield of ?billions of dollars invested in FBI has also been approximately zero (ie. at best FBI has been confirmatory of established knowledge). But the neuroscience professoriate are now pretty much dominated by people involved in brain imaging - it seems. It does not take much to convince them that the way forward is ever-more functional brain imaging. So, from observation over the past 25 years - I would re-write your para: "In the short run, you need merely convince people with money to give you large capital grants. In the medium run, the extra productivity and higher prestige research outputs deriving from large capital grants will get your graduate students hired at the best institutions. In the long run, you will re-populate and thereby re-shape the whole profession."

seth (2009-12-06 23:45:55)

Bruce, I don't think it is working out as well as you think for the cognitive neuroscientists. I am told their graduate students have difficulty getting jobs. They have difficulty getting jobs because scanners are so expensive and research money so hard to get. As undergraduates learn this, the field will become less popular. It's a familiar story line. It happened in animal learning - after 20 or 30 years of overpromising (from the 1940s to the 1960s), the rest of the field (psychology) lost interest and became enthusiastic about something else. From the 1960s to the 1980s, it was cognitive psychology that overpromised. Jobs in that area dried up. Now it is cognitive neuroscience. It may not look like a bubble - but it's a bubble.

Ted (2009-12-07 13:37:43)

Seth, you ought to check this out. Climategate means nothing to the coterie! They're still at it - trying to bully and suppress dissent even publicly! <http://rogerpielkejr.blogspot.com/2009/12/climate-scientist-threatens-boycott-of.html>

Stephen M (Ethesis) (2009-12-08 20:45:56)

<http://volokh.com/2009/12/08/the-homogenized-data-is-false/> - an analysis of the data. The graph displays are amazing. **Figures 7 and 8 are indeed stunners: "homogenizing" in effect changes slight temperature declines into huge temperature increases.** Some good links too.

Ben Hyde (2009-12-09 08:11:44)

It is true that status is a benefit that many clubs use as a binding force to holding the club together. But it is lousy glue in most cases. It is the rare club that exists merely to create status for its members. Rather, their primary purpose is always (?) to generate public or club goods of some kind and member labor is directed principally to that end. Working on status will displace the primary work only if two things are true. First you need the members, most of them, to be isolated. E.g. they must lack a diversified portfolio of other clubs they draw status from. Secondly you need the exceptional situation that inside of the club there is no class structure, i.e. the members have high equality of status. Absent either of these the members can always call the membership back to the primary purpose of the club. The idea that the global warming science community is merely defending the status of the community is perverse and self congratulatory on the part of the deniers. The community feels they have won the argument; their concern is now the planet's survival not the status of their community. And it is projection, it is the deniers who at this point are on the verge of losing face.

Ted (2009-12-09 23:16:49)

Ben, no offense, but you're full of hot air.

## My Theory of Japanese Aesthetics (2009-12-07 03:07)

Japanese packages are beautiful. One after another. Old-fashioned Japanese buildings, Japanese posters, and so on, are also gorgeous. Even the Japanese flag is better-looking than other flags. The look of the IBM Thinkpad came from bento boxes. Why is Japanese visual design so great?

The usual answer is that Japan is an island, with scarce resources, therefore the Japanese learned to do much with little. This might explain a certain minimalism but there are plenty of island countries with undistinguished visual aesthetics.

My answer is different. It starts with the fact that Japan has a very large coastline/area ratio. It isn't just an island, it's a skinny island. That's why the Japanese eat so much seafood. Seafood has a mild flavor. To preserve variety, you cannot spice it much otherwise everything ends up tasting like the spice. The differences between different fish are lost. This is why Japanese cuisine is weakly-flavored.

This created a problem for cooks. If the main food is weakly-flavored, everything else must also be. You want to show you care but you cannot do it with time-consuming complex sauces (such as harisa or mole, which takes a whole afternoon to make) or complex spice mixtures (such as curries) or complex cooking methods (French, Chinese). You are basically serving raw or lightly-cooked food with almost no spices. The solution – the way to show you cared – was presentation. The emotional energy of Japanese cooks went into making their food beautiful. Japanese food isn't just the least-flavored of all major cuisines, it is also by quite a bit the best-looking. That's how it started. Japanese cooks figured out how to make food beautiful. The lessons they learned and taught (at every meal!) spread to other design. When you grow up surrounded by beautiful things, as Japanese designers do, it helps you make beautiful things.

A friend of mine is a Chinese design student. She has met Japanese design students. How do they explain it? I asked her. They didn't talk about it, she said. "We communicated in English. Their English is even worse than mine."

---

david (2009-12-07 07:27:06)

You might enjoy the movie Tampopo (which is described as a "Japanese noodle western"): <http://www.imdb.com/title/tt0092048/> The main character's quest is to make the perfect noodle soup. It's actually a very funny movie.

KenF (2009-12-07 09:46:07)

The simplicity thing extends even to religion. Traditional Shinto shrines are extremely simple (see Ise Jingu, the Torii entrance-ways to shrines, the paper and rope adornment, etc.) Are you suggesting that the Japanese native religion (which is a form of nature worship) took this form because they eat fish?

Timothy Beneke (2009-12-07 11:19:41)

Fascinating! I'd want to see crude correlational data about coastlines and other variables along with possible confounds before I would necessarily "believe" it but it's a really imaginative smart hypothesis. I hope some creative geographer or anthropologist reads it... I used to know someone who was a Berkeley anthropology grad student living in Japan writing his dissertation on

Japanese culture... I'll try to track him down and run this past him...

Aaron Blaisdell (2009-12-07 14:52:51)

Does the Danish aesthetic as applied to furniture fit here?

seth (2009-12-07 18:03:36)

Aaron, no I cannot explain why Danish furniture is the way it is. Although there may be a Scandinavian tradition of wood carving – my Swedish cousin carved butter knives for his family. That might have given them an advantage in furniture making.

seth (2009-12-07 18:06:21)

KenF, did the minimalism come entirely from lessons learned about how to present raw fish? I don't know. I'm only trying to explain visual design.

Bruce G Charlton (2009-12-07 22:55:03)

I suspect the higher average visuo-spatial IQ of East Asians goes a long way towards explaining high visual appreciation and creativity in EA cultures. This would not fully explain a distinctively Japanese ability, if that exists. But the explanation of IQ subscale differences then pushes the question back to why EAs have a higher VS IQ - which is presumably some selection factor. Unless it is, as I tend to suspect, an accidental and contingent by-product of selection for higher general intelligence leading to different IQ profiles in different populations due to the contingencies of gene mutations. At any rate, Amerindians demonstrate the same East Asian differentially-higher VS IQ than Europeans (although with different general intelligence levels than modern East Asians), suggesting that this IQ subscale differential was probably established in Asia before 15000 years ago. Ashkenazi Jewish higher IQ, for example, is differentially in the verbal IQ subscale (not visuospatial) (which also fits the profile of Ashkenazim achievement - which is very high indeed for many intellectual activities but \_not\_ for those requiring exceptional visuospatial intelligence). However, at around population average IQs, smallish differences in subscale IQ probably make little difference to the performances under selection - and these differentials only become apparent as performance moves further away from the mean - performance levels which are (by definition) rarer, and also prone to regression to the mean.

David (2009-12-08 01:22:31)

For most of its history, Japan has been a rich country, but the one resource it can't import is space. Japanese design, at least as far as architecture and interior design go, seems heavily driven by the need to make cramped spaces functional and livable. Your theory about the aesthetic of food is interesting, though.

## **How the National Multiple Sclerosis Society Harms MS Patients (2009-12-08 05:57)**

[1]I blogged earlier about how Paulo Zamboni, an Italian surgeon, discovered that almost all MS patients have impaired blood flow from the brain. Surgery to improve the blood flow usually reduced MS symptoms. A very important discovery.

At the [2]National Multiple Sclerosis Society, in Denver, they are unconvinced. They want more studies. Yes, Zamboni's single study shouldn't be the final word but here is the astonishing part: They say patients shouldn't get tested to see if they have impaired blood flow. Impaired blood flow is very rare. When an MS patient gets tested, this tests Zamboni's theory. His theory predicts they are likely to have impaired blood flow. At the National MS Society, they are against gathering data that would help decide if Zamboni is right. And against individuals finding out if something is wrong with their blood flow. This isn't conservative, it's stupid. And harmful – if anyone listens to them.

I wrote them to ask about their astonishing recommendation. Here's the answer (from Kris Graham):

Our greatest concern at this point is the risk involved with the possible treatment, and we would like to see more clinical testing done before making a recommendation to the general public.

I wrote again to say it was the recommendation against testing (not treatment) that I was asking about. I got this reply:

We are not recommending that people get tested because there is not yet a treatment that has undergone comprehensive clinical testing.Â In other words, we do not encourage people to go through testing that can not “yet” lead to treatment.Â If clinical trials show that treatments, such as Dr. Zamboni’s, are clinically safe and effective, we will of course change our recommendations.Â Until we know from controlled trials that there is a treatment to offer, spending the money to get tested doesn’t seem very reasonable.

What nonsense. Dr. Zamboni did a clinical trial. Spending money to get tested is money spent in a way that helps every MS patient – not to mention yourself. It’s [3]gatekeeper syndrome – they can’t fathom why a MS patient would want to gather useful health-care info without waiting for “controlled trials,” whatever those are. I wrote back to ask what “controlled trials” meant. No reply. Thank god for self-experimentation, [4]PatientsLikeMe, and [5]CureTogether.

3. <http://www.blog.sethroberts.net/2009/11/17/gatekeeper-syndrome/>
4. <http://www.patientslikeme.com/>
5. <http://www.curetogether.com/>

---

Bruce G Charlton (2009-12-08 10:12:14)

Well said! Medical Science nowadays is about careers not cures. Patients need to seek cures for their own diseases, otherwise it won’t happen.

Aaron Blaisdell (2009-12-08 11:57:14)

The folk at the National MS Society sound like a bunch of ostriches to me. It makes no sense to not test for a possible cause merely because there’s no safe, effective treatment yet developed. If testing revealed support for the hypothesis, then the MS researchers (I’d hesitate to call them scholars) would be able to submit grants to fund work to develop treatments. But we need knowledge about the cause in order to know what to treat. They’re putting themselves in a Catch 22. Dummies!

Alexandra Carmichael (2009-12-08 12:05:18)

Interesting position - are they trying to not get patients’ hopes up, or save them the time and money of another test until they by whatever standard they have decide to promote it? Or protect themselves from potential liability? Science is still incredibly slow at integrating new information, worried about harming people with a new idea and reluctant to ask the question ‘how many people are harmed, or not helped, by doing nothing?’

richard (2009-12-08 12:43:50)

I was also interested to see that the National MS society outright "discourages" banking a cord blood stem cells. MS patients typically go into remission during pregnancy so it would be interesting if there is any medical value to the mother or conceivably the child derived from cord blood stem cells. Obviously this is all speculative, but I thought that was sort of the point of science, hypothesize, test, etc. Even so, it is one thing to stay silent on the issue, another entirely to discourage. I would certainly understand their silence on banking cord blood as there isn't any research as of yet showing therapeutic value of cord blood stem cells for MS patients. But unless it is harmful, discouraging banking seems like overkill at best, and if in fact beneficial applications for MS are thusly derived, disastrous to those whose interests they claim to represent. <http://www.nationalmssociety.org/research/researchers-need-you/donate-to-tissue-banks/umbilical-cord-blood-donation/index.aspx>

Cliff Styles (2009-12-08 15:28:00)

To refuse to gather evidence about a plausible cause because an acceptable (to the gatekeepers) treatment is not yet available seems to me to invert cause and effect. Surely the incentive to develop the acceptable treatment must follow from evidence that such a treatment is potentially valuable? It is utterly remarkable to me, a non-scientist, that supposed scientists can think like this. Of course, that's not the first instance of twisted thinking from supposed scientists that your blog has worked over, nor will it be the last. Thanks for your efforts, Seth.

Mike Kenny (2009-12-08 15:30:50)

Very interesting. I wonder if a less regulative FDA and less government involvement in health insurance would lead patients and doctors to be more experimental and engaged in their treatment. The FDA won't let you use drugs until they've been tested, which means you can't try some things out until they've gone through a certain process. I wonder if this process becomes a kind of ritual that blinds people to obvious reasonable experiments, particularly ones with low cost and low risk and give you a bit of information about whether there's something good or not about the approach. I believe I've heard of people being prevented from making use of treatments banned by the FDA while the treatments are being tested. If a patient is going to die anyway, he may feel comfortable with a great risk, and so preventing him from trying something seems blind to reasonable calculations about risk. More private healthcare might mean people would be more aware of costs, possibly would shop around for cheaper treatments, doctors might be incentivized to experiment with cheap effective treatments to beat their competition, and also insurance companies might have a variety of different plans, so some would pay for a certain treatment and others not, and which might help to avoid monoculture and reliance on one officially sanctioned approach. Perhaps even insurance companies would be more inclined to pay for cheaper treatments than more expensive ones, and this might incentivize self experiment, because self experimentation seems to be cheaper and smaller over big expensive ones. This is all very speculative, of course. I'm open to counterarguments.

rps (2009-12-08 22:20:40)

What's the point of testing if you're not going to do anything about it? What difference would it make, other than wasting money? Of course they shouldn't recommend a test if they don't recommend acting on the results of the test. Science would only be advanced if scientists are collecting the data, and even if they are the insurance companies and the patients aren't going to want to pay for it. What's wrong with doing it in the context of a trial? And if Zamboni's trial was enough, why are you arguing with their recommendation against getting tested instead of their recommendation not to have the procedure done? Having said that, if I had MS I provisionally think I would want the procedure (with the caveat that I'd read up on it more if I had to actually make this decision). I think medical guidelines should say "we're not sure, make your own decision," not "don't do this" when they're not sure.

Alexandra Carmichael (2009-12-08 23:24:14)

here's what the myelin repair foundation's position is: <http://ow.ly/K1Rx>

seth (2009-12-08 23:30:08)

"What's the point of testing if you're not going to do anything about it?" Who says you're not going to do anything about it? It

is useful info. People can make up their own minds about what to do – and with more info, they will make better decisions. This is what the National MS Society fails to grasp. Mike, I think the solution is simple: Do things that empower patients. That is, the public. Give them access to diagnostic tests without requiring a doctor's approval. Give them information about hospital efficacy. Give them more access to medical journals. Give them tools and info to help them make decisions without doctors. Help them ask their doctors tough questions, such as asking a surgeon: "how often have you done this operation?" "What were the outcomes?" "How often have there been adverse events due to anesthesia during your operations?" I am sure that the pending health care reform bill contains exactly zero things that do this.

Hal (2009-12-09 12:19:25)

Suppose you had a friend with MS, who asked you if you thought he should get himself tested. I assume you would advise him to do so. Suppose the test comes back positive. He comes to you and asks if he should have surgery done. What would you tell him?

AA (2009-12-09 14:18:42)

Seth - if every patient had access to diagnostic tests without doctor approval, every Tom, Dick and Harry would decide they need an MRI for every ache and pain. Insurance companies would never go for that - that's not the MS Society's problem. But the MS Society actually does promote clients advocating for themselves and asking their doctors the right and relevant questions: see below. <http://nationalmssociety.org/living-with-multiple-sclerosis/you-can/get-more-out-of-a-doctor-visit/index.aspx> There is no doubt why people with MS want timely answers and to be in control of their own treatment regimen. But even if a person knew that they had impaired blood flow, I don't know that most doctors would recommend surgery at this point in time without more testing. There is no way to confidently recommend a type of testing after one study conducted with 65 people. The NMSS has also stated that if it received a "proposal related to CCSVI that is found to be outstanding and relevant to MS, we would likely commit to fund such a study." So we all wait...

seth (2009-12-09 14:29:38)

AA, you write "f every patient had access to diagnostic tests without doctor approval, every Tom, Dick and Harry would decide they need an MRI for every ache and pain." I'm not saying they should be free. Perhaps they should cost market price. Whatever the market will bear. "Even if a person knew that they had impaired blood flow, I don't know that most doctors would recommend surgery at this point in time without more testing." Sure, that's reasonable. But patients can decide for themselves. The testing info – which would tell them whether they have impaired blood flow – would surely improve their decision making. Hal, I don't know what I would tell him. I would certainly want more info than you give in your hypothetical situation. The price of the surgery, the dangers of the surgery, the impairment caused by MS, the side-effects of the current treatment, the efficacy of the current treatment, etc. But I am sure that the probability I would recommend the surgery would go way up compared to before testing (when neither of us knew if he or she had impaired blood flow).

AA (2009-12-10 14:48:52)

As of today.... "The National MS Society is undertaking the funding of follow-up research in CCSVI in MS and has invited investigators to apply for grant funding that would explore this lead. These applications will undergo an accelerated review process. If this hypothesis is confirmed, it may open up new research avenues into the underlying pathology of MS and new treatment approaches to therapy."

Andrew K Fletcher (2010-01-01 06:16:19)

Have you been following the inclined therapy threads on thisisms forum? <http://www.thisisms.com/ftopic-6755-days0-orderasc-0.html> <http://www.thisisms.com/ftopic-8535-225.html> A growing number of people are using a simple modified sleeping posture to recover from multiple sclerosis.

Ali (2010-01-25 05:51:00)

More information about Multiple Sclerosis you can find in: [http://www.geneticsofpregnancy.com/Encyclopedia/Multiple\\_sclerosis.aspx?pid=62](http://www.geneticsofpregnancy.com/Encyclopedia/Multiple_sclerosis.aspx?pid=62) This site contains information On Pregnancy Diseases And Genetic Testing.

## Lightsinshop.Com Scam (2009-12-08 23:36)

This website is a scam. Search "scam" in this blog for lots and lots of evidence about why it is a scam. It used to have other names, such as gamesingate.com. Notice how new the website is – how recently it was registered.

---

matt massaro (2009-12-09 08:30:22)

Dear friend, I placed a order with this very company on Dec 8th. for over \$500.89. I thouhgt that it was kinda strange that the email they sent me was in some sort of asian text. What did they do to you and how did you get ripped off? Please reply, Matt

seth (2009-12-09 14:34:49)

They take your money and don't send you the stuff.

Mark (2009-12-09 19:24:07)

They may very well be a scam, but have you tried complaining to them? We have a Web site that sells stuff, and (1) after you get more than about 10 orders per day, things get really confusing, even with decent e-commerce software, and you miss some orders and customer complaints, and (2) you would not believe how flaky the USPS is, losing stuff, delivering it to the wrong address, omitting tracking scans from the tracking record, and so on. Another possibility: a backorder where they neglected to inform you they didn't have it in stock, or they deliberately keep a thin stock and put up with a certain percentage of orders being sent late. Just as most conspiracy theories in fact usually are just incompetence, it's more likely that this is just a badly run business than some sort of deliberate master scam.

D. W. (2009-12-09 20:17:18)

I made the mistake of thinking I had everything researched on this site. Yet I see this 8 hours after I have made my purchase. I replied to the contact section and my funds have been returned. I now wonder if they may have sent me something or if they just don't want the trouble before the item is supposed to go through shipping. If they were legit I will just pass them by until I can verify someone actually used them, otherwise I'll have to pay full price for the Wii.

willie (2009-12-09 20:20:16)

made purchase 11 30 09. \$528. told items would arrive 5-7 days. i have recieved 2 emails stating items have shipped. they do not respond to my request for shipping method or tracking number. Praying all goes well this will be a hit for xmas. will update if recieve items.

seth (2009-12-09 20:39:25)

Mark, if you read the rest of my posts about the previous versions of this website and the many comments you will see beyond any doubt it is a scam.

MaryAnn (2009-12-10 07:39:40)

I have been trying to order something and I keep getting that paypal is not being honored anymore. I did not choose Paypal, I wanted to use my VISA account. I have sent them 2 emails regarding that I wanted to place an order. Nothing has come out of my bank account as of yet. But when you see prices like that, "if it's to good to be true, then it is to good to be true." I just hope they don't take my money out of my account.

willie (2009-12-10 19:19:07)

Stop! it's a scam! the sight shut down today 12/10/2009. I have paypal and visa working on getting my \$528 back. please list the other website related to these scammers. I pray my xmas is not ruined.

Shanika (2009-12-10 20:17:55)

I had a feeling this website was just unreal! I had been looking EVERYWHERE and all the prices were the same. Not on this website! Atleast \$90 to \$200 cheaper, I just knew it was too good to be true! Luckily, I was waiting to buy the items when I got paid. Went to check things out tonight and Paypal had shut them down, Wow! Then I read all these comments....Did ANYONE receive what they ordered??? I'm really sorry for the people who lost their money but thank you for the info, everybody!!! Merry Christmas!

D. W. (2009-12-11 00:31:14)

I thought this was lightsinthebox.com.....Whew Allah works in mysterious ways.

Cathy (2009-12-11 17:05:34)

I thought this was a scam, I had gotten to the point of putting in an order, but never confirmed it or hit the payment button. I called paypal right away trying to find out any information, and mentioned they might need to watch them. I am so glad that I didnt end up ordering anything.

Nacho (2009-12-11 21:31:55)

Well, the scammer had succeed in many times and this time he failed! Sooner or later, the bad guy would coming back, let's keep an eye on them.

Nacho (2009-12-11 21:41:47)

Do anyone still remember the PayPal email address these scammers using? I thought they got similar pattern, too. I only know the newest one. Would someone else could share? Gamesinwelt.com Gamesingate.com jiaweishop.com lightsinshop.com: myluye@126.com

## **Physicists Disagree about Climate Change (2009-12-09 00:02)**

Here is [1]a statement from Hal Lewis, a physics professor at UC Santa Barbara, in answer to a question from CBS News:

I know of nobody who denies that the Earth has been warming for thousands of years without our help (and specifically since the Little Ice Age a few hundred years ago), and is most likely to continue to do so in its own sweet time. The important question is how much warming does the future hold, is it good or bad, and if bad is it too much for normal adaptation to handle. The real answer to the first is that no one knows, the real answer to the second is more likely good than bad (people and plants die from cold, not warmth), and the answer to the third is almost certainly not. And nobody doubts that CO<sub>2</sub> in the atmosphere has been increasing for the better part of a century, but the disobedient temperature seems not to care very much. And nobody denies that CO<sub>2</sub> is a greenhouse gas, along with other gases like water vapor, but despite the claims of those who are profiting by this craze, no one knows whether the temperature affects the CO<sub>2</sub> or vice versa. The weight of the evidence [suggests] the former.

That's reasonable. Here is [2]a statement from another physicist, a friend of mine and Andrew Gelman's:

Like a lot of scientists – I'm a physicist – I assumed the "Climategate" flap would cause a minor stir but would not prompt any doubt about the threat of global warming, at least among educated, intelligent people. The evidence for anthropogenic (that is, human-caused) global warming is strong, comes from many sources, and has been subject to much scientific scrutiny. Plenty of data are freely available. The

basic principles can be understood by just about anyone, and first- and second-order calculations can be performed by any physics grad student. Given these facts, questioning the occurrence of anthropogenic global warming seems crazy. (Predicting the details is much, much more complicated). [He seems to miss the point here. The usual claim is that man-made warming is large relative to other global temperature changes. That's not predictable "by any physics grad student" and to call it a "detail" is misleading. – Seth] And yet, I have seen discussions, articles, and blog posts from smart, educated people who seem to think that anthropogenic climate change is somehow called into question by the facts that (1) some scientists really, deeply believe that global warming skeptics are wrong in their analyses and should be shut out of the scientific discussion of global warming, and (2) one scientist may have fiddled with some of the numbers in making one of his plots. This is enough to make you skeptical of the whole scientific basis of global warming? Really?

At risk of sounding v smug, my views have changed only a little. [3]I already thought the consensus was more fragile than it appeared. That's just a general truth about modern science. I was already skeptical of climate models because [4]I knew how easily modelers fool themselves. I began to believe the consensus was not just fragile but wrong when I heard [5]the story of the Yamal tree ring data – the long refusal to supply the raw data and, when the researcher's hand was forced and the data finally supplied, the way it contradicted the claims that had been made. Climategate didn't vastly change what I thought; it provided more evidence for ideas I already had.

Another friend of mine used to be a math professor. He has views similar to the views of my physicist friend. "Look," I said to him, "if you want to argue that humans are causing major global warming you should at least show it's warmer now than in the past. Even that isn't true. The Medieval Warm Period." "That was only in Europe," he replied. Actually, there is [6]evidence of the same thing in the Gulf of Mexico.

---

Jonlongstrider (2009-12-09 04:16:52)

Seth: Nobody fiddled with the data. Part of the data, the tree ring data, has been funky since the early 60s. For unknown reasons, since 1961 the tree ring data has been diverging from temperature data at the same location. Rather than throw the baby out with the bathwater, they used the "trick" of decreasing the weight of the tree ring data over time since then. So tree ring data should trump direct temp measures, pollen distributions, stalagmite and stalagmite measures, annual ice deposition thickness, and isotope concentrations? We live in an age of Shibboleths. There is no such thing as artery clogging saturated fat, cholesterol tells us next to nothing about heart disease, and even with your work there isn't a fully sound theory about metabolism. But skepticism without measure leads to gullibility. AGW and Climate Breaking are the simplest hypothesis, are consistent with paleontological evidence of past warmings, and do not have the burden of proof you demand.

seth (2009-12-09 05:28:15)

You are sure the "temperature" (which means what?) data are right and the tree-ring data wrong because . . . ? As for the idea that "nobody fiddled with the data" – have you read [1]this?

1. <http://wattsupwiththat.com/2009/12/08/the-smoking-gun-at-darwin-zero/>

Ben Hyde (2009-12-09 07:50:23)

"my views have changed only a little" And it's wonderfully convenient that these views are consistent with your both your politics and attitudes about large institutions generally. It is fun, being a cynical contrarian sceptic.

Peter Smith (2009-12-09 08:06:40)

i agree. we did nothing. it's not our fault. let the poor people of the developing world suffer. they deserve it.

James (2009-12-09 09:01:01)

Peter: Wouldn't it be a better idea to use the billions (or trillions) to directly improve the lives of poor people?

Glen Raphael (2009-12-09 09:01:22)

Jonlongstrider: The point of the chart that got fiddled with was to show the long-term trend based on proxy data. If the proxy data "diverges" almost immediately after leaving the period it was calibrated against, what makes us think it didn't "diverge" in the past? Two perfectly plausible hypotheses about this include: (1) tree rings just aren't a good long-term proxy, and the apparent fit with temperature in the past was just a result of data-snooping (2) tree rings are a decent proxy but stop being so when the temperature exceeds X. If either of those are the case, tree rings *couldn't have shown us* if the MWP was warmer than today because the temps they show in the past are probably "diverging" just as recent ones are. No

Glen Raphael (2009-12-09 09:03:05)

(hit submit by accident there..) No argument has been made to exclude those hypotheses. Instead choices were made with respect to plotting the data that deliberately hide the otherwise obvious potential problem from those who read the resulting chart.

Hal (2009-12-09 11:46:34)

It's always a bad sign when new data only confirms what you already believe, especially on a controversial issue. A priori the chance that you are one of the small fraction of people in the world who are right on the issue, given incomplete and contradictory data, is very low. Yet of course you will think you are right, because if you didn't, you would change your opinion. So the great majority of people think they are right, but are at least slightly wrong. Hence new data should cause almost everyone to change their opinion. But it does not, because most people are biased and will interpret and adapt the new data to reinforce their pre-existing beliefs. If you, too, find the new data only confirming what you already believe, it is overwhelmingly more likely that you are committing this logical error than that you were in the lucky minority that happened to be right before. OTOH if you find your opinion changing in response to new data, that doesn't prove you are right or logical, but it is evidence in that direction.

Phil (2009-12-09 12:30:29)

That Hal Lewis quote is a really good one for the purpose of contrasting the two viewpoints. I just don't see any part of Lewis's quote as "reasonable". For instance, the statement that continued warming is more likely good than bad because "people die of cold, not warmth"...I've just typed and deleted four different responses because I am having trouble coming up with anything other than an insult. There may (or may not) be an abstract sense in which a warmer climate would be better. But the fact is that the manmade world (and the terrestrial ecosystem) is highly optimized to the current climate. Reservoirs are built where the rain falls. Coastal cities, towns, and houses are built at an appropriate location for the current ocean level. To suggest that the major effect of warming is that fewer people will die of cold isn't just wrong, it is obviously wrong. It's ridiculously wrong. And as for the claim that change is "almost certainly not" too big for "normal adaptation" to handle...well, that obviously depends on what "normal adaptation" means, and also on how much change we are talking about. Considering Levin doesn't think the temperature is changing much at all — he says so a few sentences later — well, if you believe that then I guess you can believe that "normal adaptation" is going to do OK. But that's arguing from a false premise: temperatures are going up, and going up fast. (And global warming isn't just about temperatures, it also affects rainfall patterns and storms and so on). It's not clear if Levin (or you, Seth) would agree that if climate change is very large and rapid, "normal adaptation" would suffice? I hope you would agree that there is some magnitude of climate change for which "normal adaptation" would not be enough. Lewis says increasing temperature causes an increase in CO2 rather than the other way around, and that "the

disobedient temperature seems not to care very much" about increasing levels of CO2. Confusingly, he also says that CO2 is a greenhouse gas. But it's hard to interpret these statements as anything other than a denial that increasing levels of CO2 lead to an increase in temperature. So, I think this entire Lewis quote is something very close to nonsense. The fact that you, Seth, say it is "reasonable"...I just hardly know what to say. Moving on through your post: you insert a comment in my quote, that I "seem to miss the point here. The usual claim is that man-made warming is large relative to other global temperature changes. That's not predictable — by any physics grad student" and to call it a "detail" is misleading." First, that is not the usual claim. The usual claim is that man-made warming is large enough that it may be catastrophic. I've never understood the importance of comparing it to historical variability, unless you are one of the people who believes anything natural is good. (Malaria? Smallpox?). Even if we had some philosophical agreement that anything natural is good, it wouldn't necessarily follow that something unnatural, but of the same magnitude as a natural effect, is good. If we agree that it's a good thing that people die of the flu — culls the herd, and all that — it doesn't necessarily mean that if I go out and kill 10,000 people, I've done a good thing. Second, it is not "missing the point," nor "misleading" to say that any grad student can do the first- and second-order calculations of the magnitude of a change. This is important because there are people out there who claim that the whole concept of any human-caused influence on the climate is a scam. Ironically, and seemingly contradicting my claim about any physics grad student, you just quoted a physicist who apparently believes the amount of CO2 in the atmosphere does not affect global temperatures! In your post, you have simultaneously proven the relevance of my point, while also apparently disproving my assertion. Actually, I'm sure Lewis is capable of performing the calculations; he presumably is sure (why?) that effects beyond the first orders are big enough to cancel out the leading terms. I'm just at a loss. You people are nuts!

Jonlongstrider (2009-12-09 12:55:10)

Seth, how about [1]Deltoid's take. Glen Raphael, I'll have to look at the memo again, I thought it was about current temps. Hal, I would wager everyone here thinks you're talking about the other guy.

1. [http://scienceblogs.com/deltoid/2009/12/willis\\_eschenbach\\_caught\\_lying.php](http://scienceblogs.com/deltoid/2009/12/willis_eschenbach_caught_lying.php)

seth (2009-12-09 14:16:27)

Phil, can you explain why Lewis — who surely understands physics at a better-than-grad-student level — has the views he has? Not the view that warmth is good for people but the other views. You don't see a problem when you argue based on what any physics grad student can do and I give an example of a physics professor who disagrees? Ben, my "politics"? what are you talking about? I'm a member of the Green Party. I fail to see the consistency.

Phil (2009-12-09 14:54:20)

Seth asks: Phil, can you explain why Lewis — who surely understands physics at a better-than-grad-student level — has the views he has? Not the view that warmth is good for people but the other views. I reply: No. To ask me to explain why someone else has the views that they have, based on a single paragraph of nonsense...you're asking too much of me. Seth asks: You don't see a problem when you argue based on what any physics grad student can do and I give an example of a physics professor who disagrees? I reply: First, I have to correct you on a minor point. What I'm claiming that any physics grad student can do is to calculate things like: what would the earth's temperature be if it had the same albedo that it actually has, but no atmosphere? What would the earth's temperature be if the amount of CO2 were doubled but nothing else changed? This latter question is what I meant by the "first-order" problem. I see no evidence that Lewis would have any problem solving those problems. I do not think Lewis would disagree with these calculations. Perhaps he would — maybe he lost his physics chops when he retired — but I doubt it. But I think you're intended point isn't to ask about those specific calculations, it's to say "do you think there's a problem when a presumably intelligent physicist who claims familiarity with the issue disputes anthropogenic global warming?" If that's your question, then yes, I do see a problem. Two problems. But I think the problems I see are different from the one that you see. The first problem I see is that this guy is just not thinking clearly about this subject. He says that even if global warming happens as expected it will be good because fewer people will die of cold, as if that's the main expected effect. He says global temperatures are not in fact increasing, which is simply false. He says CO2 is a greenhouse gas (meaning it absorbs and re-radiates infrared radiation) but that as for trebling or quadrupling its atmospheric concentration "no one knows" if that affects temperature. These are just not reasonable statements, whether they come from a physicist or someone else. The second problem I see is that some intelligent people think these unreasonable statements are

in fact reasonable!

seth (2009-12-09 16:04:00)

Thanks, Phil. I agree, he should have avoided the question of whether more people die of cold than of heat.

seth (2009-12-09 16:17:17)

posted for Bruce Charlton: The whole Climate Change business hinges upon computer modelling: This is John Wixted of UCSD : "To think about the relationship between CO2 emissions and global warming, the most important step to take is to imagine that scientists had never invented climate models that presume to predict the future. In the absence of those models, what would you think about CO2 emissions? That's the question. The reason to drop the climate models from consideration is that models of complex systems cannot predict the future in any area of science, so climate models should not be trusted until they are uniquely shown to be able to do that. So far, the models have not passed any serious test, and the excuse given is that, in the short term, unpredictable weather variations can mask predictable long-term climate trends. In the long-term, the argument goes, the models may be shown to be right after all. But get back to me in the long term because, for now, I have no reason at all to believe that the models are accurate (and neither do you). Scientists who are infatuated with their own climate models seem to have a different view, namely, that the models should be trusted until those models are proven wrong. By definition, this cannot happen in the short term (because of unpredictable weather), so the models are protected from disconfirmation until decades go by. That's not a reasonable view because, in light of the general predictive utility of complex-system modeling, the odds are very high that the climate models are incorrect." [http://engram-backtalk.blogspot.com/search/label/Global %20Warming](http://engram-backtalk.blogspot.com/search/label/Global%20Warming) But I must admit that probably the biggest influence on me was Freeman Dyson, whom I respect hugely. Just search his name and 'climate' to get a flavour of his views.

Phil (2009-12-09 19:14:32)

Seth, you could remove the statement about deaths from cold from Lewis's statement, and it would still be nonsense for reasons I have outlined. Bruce and John: The whole "Climate Change business" does not hinge on computer modeling. Bruce or John (I can't tell who said it): Freeman Dyson was an excellent mathematician and physicist, but has always been absolutely terrible as a futurist. His main stance on climate change is that the problems won't be nearly as bad as people think because technology will allow cheap and easy adaptation — we'll genetically engineer plants to take up the CO2, or else we'll adopt special planting methods over virtually the entire surface of the earth to recapture in biomass what we are putting out through burning fossil fuels...and this will be cheap and easy and won't have negative side effects (yep, seriously. He proposes that we increase the rate of plant growth by an average of 1/10 of an inch per year over the entire surface of the earth). Dyson is, and has always been, a technological optimist to an almost incredible degree. For instance, he thought in the 1950s that we would land people on Mars by the mid-60s (using nuclear-powered spacecraft), and that we would send people to the outer solar system by the 1970s. Please allow me to revel in the irony of someone who says not to trust predictions of complex systems, especially if they don't have a track record of success...but then cites the authority of a man with a 60-year track record of failure who predicts the progress of technology far into the future and, on that basis, claims that adapting to climate change is going to be a piece of cake.

Stephen M (Ethesis) (2009-12-09 20:05:23)

Ah, but the issue is that it turns out that the tree ring data and the raw (unmodified) temperature data are the same.

seth (2009-12-09 20:46:35)

Phil, you are misstating Dyson's position. A big reason for his skepticism is his distrust of climate models. (Which I share.) That has nothing to do with technological optimism. See this interview, for example: <http://www.e360.yale.edu/content/feature-.msp?id=2151>

Ted (2009-12-09 23:17:41)

Ben, put up or shut up. How about some facts, not vague attacks on the messenger.

Scot (2009-12-10 13:56:27)

First, the dialogue is tremendously useful. Second, I looked at the "fiddling with data reference" <http://wattsupwiththat.com/2009/12/08/the-smoking-gun-at-darwin-zero/> Seth referred to above and think wonder three things: 1) How much more time do I need to figure out what the author is doing? 2) What are the confidence intervals around the 1-2 degree anomalies? 3) If he had to work that hard to find an anomaly, what is the likelihood this represents the work of a conspiracy to fool the planet into believing the planet is heating when it isn't? Cui bono?

Phil (2009-12-10 16:06:45)

Seth, that Freeman Dyson article at <http://www.e360.yale.edu/content/feature .msp?id=2151> is a really good one, when it comes to seeing why people shouldn't put a whole lot of weight on Dyson's beliefs on this! He says himself, "it is definitely a tactical mistake to use somebody like me for that job, because I am so easily shot down. I'd much rather the job would be done by somebody who is young and a real expert. But unfortunately, those people don't come forward." I also don't think I've mischaracterized Dyson's views. That particular article doesn't emphasize his technological optimism. He doesn't say global warming isn't happening — indeed, he specifically says that it is: "No doubt that warming is happening. I don't think it is correct to say "œglobal," but certainly warming is happening. I have been to Greenland a year ago and saw it for myself. And that's where the warming is most extreme. And it's spectacular, no doubt about it. And glaciers are shrinking and so on." Dyson does say in that interview that he doesn't think most of this is due to anthropogenic effects, a claim I hadn't previously seen. It's an odd claim, not exactly contradicting other things he has said, but close: he has said "Everyone agrees that the increasing abundance of carbon dioxide in the atmosphere has two important consequences, first a change in the physics of radiation transport in the atmosphere, and second a change in the biology of plants on the ground and in the ocean." Check out the long article by Dyson at <http://www.nybooks.com/articles/21494> Among other things, he says "I consider it likely that we shall have "genetically engineered carbon-eating trees" within twenty years, and almost certainly within fifty years. Carbon-eating trees could convert most of the carbon that they absorb from the atmosphere into some chemically stable form and bury it underground. Or they could convert the carbon into liquid fuels and other useful chemicals. Biotechnology is enormously powerful, capable of burying or transforming any molecule of carbon dioxide that comes into its grasp." Or, check out the article he wrote at [http://www.edge.org/3rd \\_culture/dysonf07/dysonf07 \\_index.html](http://www.edge.org/3rd _culture/dysonf07/dysonf07 _index.html) in which he says "If we use genetic engineering to put more biomass into roots, we can probably achieve much more rapid growth of topsoil. I conclude from this calculation that the problem of carbon dioxide in the atmosphere is a problem of land management, not a problem of meteorology." In all of Dyson's publications, he emphasizes that (1) he is not an expert on climate change and does not intend to become one, (2) the climate is changing, and particularly the colder parts of the earth are warming, and (3) even major climate change will not be harmful. In the two that I cited, he also mentions using biotechnology to remove carbon dioxide from the air. I definitely agree with Dyson about item (1), above!

Sean Estey (2009-12-10 22:27:45)

Quick response to Scot on question (3): I would say the likelihood of conspiracy is close to 0 %. Cui bono? No one, because no one need benefit. Conspiracies are unnecessary to explain massive consensus based on questionable evidence. Exhibit A, I give you world religion.

Ben Hyde (2009-12-14 08:36:30)

Ted - I think you can find more productive ways to cheer on those in your tribe than trying to bait me. Seth - My impression from reading your work and postings is that you are an enthusiastic believer in the power of individuals to do good and you are deeply suspicious, concerned, and dismissive of the power of institutions to do good. I think that's a deep and fundamental part of your world view. Would you dispute that?

seth (2009-12-16 07:19:07)

Ben, yes, I dispute that. Some institutions work well, some don't. I have often praised Spy magazine, for example. That was an institution. I'm a member of Slow Food – another institution. I've praised printed books for their power to teach cheaply – although written by individuals, they are published by publishing companies, which are institutions. I've praised CureTogether.com – yet another institution.

Ben Hyde (2009-12-20 08:33:36)

Seth, embrace who you are. You have spent your entire life being a gadfly, a contrarian, and doubter. You've been marvelously successful at that. But to claim that you are not pro-institutional, be real! Your examples prove my point. Spy magazine, green party snort. But we are getting pulled away from the topic at hand. My point was and is that for you to join the consensus that we have sufficient confidence about the source and the likely consequences of global warming at this point to spin up a vast and coordinated response would demand not once by twice that you create some allegiance to really vast institutions. One the side of the consensus about sources you'd have to join assent to agree with institutional science in a way that you've spent most of your life being a contrarian about. And to support the vast response we need to spin up you'd have to work, or at least allow that it's possible, to make the institutions that coordinate those responses functional. Both these are deeply hard given where your political center of mass is. I am not, by choice, arguing about the merits of the contrarian arguments around the global warming consensus. Though I consider them broadly wrong. I am highlighting that like the majority of those who take them seriously your engagement with them runs true to your politics in ways that create what I consider an unfortunate synergy. You all have recently gotten all into trying to play the group think card, a move that suffers a tad from projection.

Ben Hyde (2009-12-20 08:34:43)

opps, "not pro institutional" -> "pro-institutional"

## **The Most Promising Solutions to the Allergy Epidemic (2009-12-09 07:44)**

At a charity dinner in New York City to benefit the Food Allergy Institute, [1]the president of the Institute told the guests that

Several promising treatments [were] in the works, including a Chinese herbal therapy being developed by the prominent allergist Dr. Hugh Sampson of Mt. Sinai (ready as soon as 2011) and a parasite "similar to those found in the stomachs of most citizens in developing countries," which could someday be introduced into imperiled Upper East Side intestines, the theory being that "in the developed world, we live in too clean of an environment, so our immune system has nothing familiar to attack."

[2]Gatekeeper syndrome. How dare they not read this blog!

2. <http://www.blog.sethroberts.net/2009/11/17/gatekeeper-syndrome/>

---

Matt (2009-12-09 09:17:29)

Hey Seth, can you do a post on eczema? If you haven't done experiments on it, maybe your readers have? I've done some self experimentation, but the only thing that really clears it for a few days is swimming in the ocean. Supplementing with Omega 3 flaxseed oil helps a little, bit but not much. All the doctors tell me the same thing - apply steroid cream. Googling for info on this topic pulls up a lot of spam/snake oils. I'm hoping maybe there is an easy solution, like your foot fungus cure. Thanks!

Aaron Blaisdell (2009-12-09 10:59:14)

@Matt, Have you tried really upping your saturated fat intake? Coconut oil is an excellent source. Try increasing the fats in your diet to 50 %, most of that coming from saturated and omega-3 PUFA. Also try eliminating all grains for a month, in particular the ones with gluten, such as wheat. Check out <http://www.paleonu.com/get-started/>.

Jaroslav (2009-12-09 14:21:22)

Eliminating all grains (or at least all gluten grains) may require far more then just a month to get results. I went grain free 13 months ago and it took about 9 months (August this year) for my allergies and asthma to disappear. For people with damaged guts it may take even longer.

Anthony (2009-12-09 16:27:34)

OT, interested in any thoughts on this presentation on sugar: <http://www.youtube.com/watch?v=dBnniua6-oM>

seth (2009-12-09 20:54:42)

Matt, I've done about four posts on eczema. Search this blog (search box is in right side column) for "eczema". Anthony, sorry in China I can barely get YouTube.

Hatcher (2009-12-10 05:18:40)

I read in a book recently that they planted a harmless parasitic worm (I think they said that pig farmers often have it from working with pigs, so they knew it was harmless) in 30 or so patients with Crohn's disease, and about 20 of them saw their symptoms go away.

Paola Bressan (2009-12-10 10:55:31)

Just published online (free full text): "Early origins of inflammation: microbial exposures in infancy predict lower levels of C-reactive protein in adulthood" <http://rspb.royalsocietypublishing.org/content/early/2009/12/08/rspb.2009.1795.abstract>

Cyan (2009-12-15 14:20:49)

@Hatcher Parasites are harmful by definition. If the worm was truly harmless, then it should be termed "commensal".

## **Acidophilus Pearls versus Fermented Food (2009-12-09 20:56)**

I hear a voice: "Okay, you've convinced me, I need to eat more bacteria. How should I do it?" Well, Tim Beneke writes:

I want to revise [1]my comments of a few months ago on probiotics and breathing through my nose. The probiotic pills by themselves do not enable me to breath better though my nose, even if I take 2x the dose they recommend. However, if I eat a lot of miso, yogurt, tempeh etc., I can breathe better through my nose within a day or 2. Previously, when I ate a lot of yogurt etc. for a couple of weeks, and then just went on the probiotic pills, it seemed as if the pills were enough, but after a week or so of just doing the probiotic pills, the stuffed nose came back. Then just doing yogurt and miso, my stuffed nose went away.

The probiotic pills are called [2]Acidophilus Pearls, said to have one billion CFU [colony-forming units] of lactobacillus acidophilus and bifidobacterium longum per capsule; I got zero noticeable effect taking 2 of them a day while eating virtually no probiotic food.

Doing 16 oz of yogurt/day plus one 480 ml bottle/day of kombucha, while consuming none of the Pearls enabled me to breathe much better through my nose within a day or 2.

1. <http://www.blog.sethroberts.net/2009/09/04/this-blog-reduces-sinus-congestion-continued/>
2. <http://www.enzymatictherapy.com/pearlslife/>

---

Mike Kenny (2009-12-09 22:26:07)

I haven't tried regularly eating fermented foods, but I did quit putting Splenda in my coffee after reading about how it seems to have been killing off bacteria in the guts of rats, so I can see if anything new happens to me off Splenda.

Nathan Myers (2009-12-09 23:03:31)

Just as another data point, when I eat more than 10 oz. of yogurt in a day, my nose gets substantially blocked, in typical allergic response. Cow yogurt, goat yogurt, makes no difference. (I've been using Trader Joe's's "European Style" and "Goat", plain, served with fruit.) The response is different from orange, which clogs my throat too, and from cranberry, which does neither but raises tiny blisters on the backs of my hands and neck, and also from onion, which raises large blisters in my nose and sinuses. I haven't found any medical doctor who knew a name for the latter symptoms.

Aaron Blaisdell (2009-12-10 11:16:48)

@Nathan, Too bad to hear about your extensive food allergies. Are you able to tolerate sauerkraut and other pickled vegetables like kimchi? If so, you should give those probiotics a try.

Pantagruel (2009-12-10 13:33:23)

I was wondering about the relative effects of pills vs the real stuff. I recently started having yogurt, kombucha, and kefir daily and have felt much better (due to this blog, thanks seth). I do have a question about pasteurized vs non- kombucha. If it's pasteurized does it lose the benefits? I'm also trying to figure out if Carpe Diem brand is pasteurized, as it is the easiest for me to get. I can't find the info definitively anywhere and they do not address the issue on the company's website (as well as not answering my query I submitted to them.)

Nathan Myers (2009-12-10 13:58:33)

So far I just eat less yogurt, and more cheese. Cheese doesn't cause me any difficulty. I mentioned it here because it's clearly not the dairy causing the allergic reaction, but the *Acidophilus*. Bacterial exposure is manifestly not anything approaching a panacea.

Socktopi (2009-12-13 15:22:39)

After starting a new prescription med about 2 years ago, one of the side effects was that my appetite was drastically reduced, and when I did eat, I would have a mild upset stomach and a general ill feeling like mild car sickness. I already often ate soy yogurt and kombucha, but not on a daily basis. Just reading your blog gave me an appetite for more and I started to consciously include lots of fermented foods in my diet. I tried milk kefir even though I'm vegan (didn't like the taste). I likewise bought a cup of icelandic cow yogurt and goat yogurt at Whole Foods (these tasted good). I bought a case of Kombucha on sale for \$1.50 per bottle, and I started loading up on soy yogurt at the grocery outlet. Heavy consumption of soy yogurt and kombucha showed some minor improvements in my digestion. But I like the way they tasted, anyway, so I wasn't too worried that they didn't cure me. A couple months ago I started using a fermented oat/juice drink called "Good Belly" - I think this improved my indigestion and appetite more than the yogurt/kombucha. After reading about Tim's perceived success with pills, (which I had considered purchasing before, but had always chickened out over the price) I decided to spend the money and bought the cheapest kind. These really worked the best, as far as I can tell. Since my condition was digestional, instead of nasal, it makes some sense that a delayed release pill to get past my stomach might succeed in repopulating my tract with good bacteria. I took the pills daily for 2 weeks and this seems to have finished my indigestion permanently. Now i take one of the remaining pills when I remember, but it seems that after 2 years on stomach ailments, the pills permanently cured it (with the help of all the other fermented foods) So while the pills may not contribute the allergy-symptom-fighting benefits of other probiotics, in my case I think they were an effective tool against my indigestion.

Socktopi (2009-12-13 15:35:01)

I should clarify: The intermittent use of Good Belly and the regimen of pills both started this summer, and that's when I noticed the most improvement, even after I stopped taking both.

Tom (2010-05-22 23:33:05)

Socktopi - thanks for your input. I'm coming from a background of digestion problems, and it is so inspiring to hear success stories like yours! Thank you so much, Best wishes!

## **Will Sea Levels Rise? (2009-12-11 07:27)**

This is from [1]The London Telegraph several months ago:

If one thing more than any other is used to justify proposals that the world must spend tens of trillions of dollars on combating global warming, it is the belief that we face a disastrous rise in sea levels. The Antarctic and Greenland ice caps will melt, we are told, warming oceans will expand, and the result will be catastrophe.

Although the UN's Intergovernmental Panel on Climate Change (IPCC) only predicts a sea level rise of 59cm (17 inches) by 2100, Al Gore in his Oscar-winning film *An Inconvenient Truth* went much further, talking of 20 feet, and showing computer graphics of cities such as Shanghai and San Francisco half under water.

But someone who actually measures sea levels thinks otherwise:

The reason why Dr Mårner, formerly a Stockholm professor, is so certain that these claims about sea level rise are 100 per cent wrong is that they are all based on computer model predictions, whereas his findings are based on "going into the field to observe what is actually happening in the real world".

When running the International Commission on Sea Level Change, he launched a special project on the Maldives, whose leaders have for 20 years been calling for vast sums of international aid to stave off disaster. Six times he and his expert team visited the islands, to confirm that the sea has not risen for half a century. Before announcing his findings, he offered to show the inhabitants a film explaining why they had nothing to worry about. The government refused to let it be shown.

Haha!

1. <http://www.telegraph.co.uk/comment/columnists/christopherbooker/5067351/Rise-of-sea-levels-is-the-greatest-lie-ever-told.html>

Vince (2009-12-11 11:17:05)

Do you think that Morner is the only person who measures sea levels, or that the IPCC didn't bother including anyone who measures sea levels? The commission that Morner served on was a commission of the International Union for Quaternary Research (INQUA), and according to the [1]President of INQUA most of its members disagree with Morner on climate change. [2]Here is a NASA map of recent sea level changes, which suggests that Morner is correct about the lack of recent sea level rise *in Maldives* (which is in the bluish-green area below India), but not about the broader pattern. You can click through to the NASA page or the Wikipedia article for more information about it.

1. [http://www.peoplesvoice.ca/articleprint36/10%29\\_SCIENCE\\_UNDER\\_FIRE\\_ON\\_EARTH\\_DAY\\_2009.html](http://www.peoplesvoice.ca/articleprint36/10%29_SCIENCE_UNDER_FIRE_ON_EARTH_DAY_2009.html)

2. [http://en.wikipedia.org/wiki/File:NASA\\_sea\\_level\\_change\\_trend.jpg](http://en.wikipedia.org/wiki/File:NASA_sea_level_change_trend.jpg)

Vince (2009-12-11 11:41:06)

My mistake - it looks like he's [1]wrong about Maldives too.

1. [http://scienceblogs.com/deltoid/2008/11/the\\_australians\\_war\\_on\\_science\\_24.php](http://scienceblogs.com/deltoid/2008/11/the_australians_war_on_science_24.php)

pat (2009-12-11 14:46:08)

this whole supposed "scandal" thing sounds like just so much swiftboating or the so-called Dan Rather ratfuck to me.

Jonathan (2009-12-11 18:35:14)

Gore was not speaking of the same time frame as the IPCC - he said that sea levels would rise 20 feet if a big portion of Greenland melted. The quote of him by the newspaper (and its republication here) are shoddy and irresponsible.

Alex Chernavsky (2009-12-11 20:36:32)

Psychologist Stanton Peele (an expert on addiction) has an interesting take on climategate and related issues: <http://www.psychologytoday.com/blog/addiction-in-society/200912/climate-gate-e-mails-science-and-psychology-usual>

Nathan Myers (2009-12-11 20:43:39)

*Alarmists* insist the sun will "go down", bringing "the dark", but the glare from my window has been overwhelming all afternoon. Everyone acknowledges that the IPCC report does not take into account increased lubrication under glaciers caused by melting, which has been observed to speed up their slide into the sea. It is therefore a strict lower bound on expected increased sea level. Here's a graph of reliable satellite data on sea levels: [http://scienceblogs.com/deltoid/2009/11/copenhagen\\_diagnosis.php](http://scienceblogs.com/deltoid/2009/11/copenhagen_diagnosis.php) Seth, you are really disappointing me.

Dennis Mangan (2009-12-11 21:26:41)

Al Gore as a whole is pretty shoddy and irresponsible.

Patrik (2009-12-13 22:59:09)

@Seth I am enjoying your take on ClimateGate. Have you seen this blog post? Very reasonable and provides some great perspective. I think the "zooming" out of the temp data make for a strong narrative. <http://www.foresight.org/nanodot/?p=3553>

Ted (2009-12-16 08:55:53)

Mass Psychosis of the empowered "elites". Why is Seth "disappointing" - he's never, ever follows the consensus (especially ones unbacked by data), he knows that academia is full of self-important defenders of a self-serving status quo.

## **Not Being Your Own Doctor Can Be Dangerous (2009-12-12 05:21)**

A friend of mine had a kidney stone. He got rid of it via Chinese herbs and yoga. After the kidney stone passed, a prostate infection went away. Here's what he saved himself from by solving the problem himself:

1) A CAT scan. This particular scan would have been the equivalent of 18 years worth of (background) radiation (according to the FDA web site), all in 45 min or an hour. Also, I would have had to take an iodine contrast material. This latter is (a) at least mildly nephrotoxic in healthy people (and I was already having kidney problems) and (b) accumulates in the thyroid and, being radio-opaque, causes deposition of larger amounts of x-radiation energy into the thyroid. This latter is being blamed in the medical literature for the explosion in thyroid cancer rates over the last few years. (Apparently they have had this problem before, prior to the advent of CT's, when iodine was used as contrast, and then multiple x-rays were taken.) I also learned that in Europe, there are controls with regard to how much x-ray a person can be exposed to. This means that they do not do these extensive CT's, but employ MRI's instead. The latter are not just less dangerous, but also much better diagnostic tools; but they are more expensive. As a result the US health insurance companies refuse to pay for them.

(2) Taking Cipro, which is what I had been given after the first round of antibiotics failed to work (leaving me a second positive urine test). Cipro was the antibiotic given to the postal workers as a prophylaxis, when the scare about anthrax in the mail was going on. Were it not for the fact that they were all given the same thing, all started having the same symptoms, and then all started talking to each other, we would probably have never had the massive class-action law suits that forced the FDA to put a "black box" warning on this drug. How bad could an antibiotic be? Well, it seems that some people are having their tendons release from the bone, often the Achilles tendon, sometimes within 24 hours of starting the drug. And that is only what the FDA is now admitting to. On the web, you find that the really serious problems are neurological. Lots of what were very high functioning people are reporting on the web very similar effects.

---

Ralph (2009-12-12 08:00:54)

Not understanding the Post hoc ergo propter hoc fallacy is even more dangerous. I'll stick with the science for now.

Tom in TX (2009-12-12 10:13:51)

Do you know what herbs he used?

Alex C. (2009-12-12 13:15:00)

Yes, but being your own doctor can be dangerous, too. Here's an interesting article from the *Los Angeles Times* about people who erroneously think they've found a cure (or at least a treatment) for autism: <http://www.latimes.com/features/health/I-a-he-autism-parents7-2009dec07,0,7076900.story> Allergies, fungal infections, kidney stones – these things come and go, or fluctuate in severity. Given the noise in the signal, and an "N" of 1, how is one to know that changing socks, or eating kim chee, or what-have-you is the reason for any improvement that one sees? I'd like to hear Seth's thoughts about this.

seth (2009-12-12 13:24:49)

Ralph, my point isn't what he did to get rid of a kidney stone. As you say it's hard to tell. My point is that, at least in this case, the conventional medical treatments he was offered had big costs that many people don't know about. Tom, no I don't know what herbs he used. He believes it's more likely that the yoga was what did it.

Greg Conen (2009-12-13 07:45:29)

I agree that doing your own research and taking responsibility for your healthcare is important, but this is a particularly bad example. Kidney stones have significantly different courses depending on type and size, so comparing two cases is difficult. Avoiding unnecessary CT scans is good, but make the diagnostic alternatives clear. Using, e.g. an simple x-ray (about 1/50 the radiation) and/or ultrasound. Simply leaving it undiagnosed is bad, since it shares symptoms with other conditions (like

bladder cancer) which do need treatment. And the Chinese herbs need to be vetted, just like any other treatment medicine.

seth (2009-12-13 20:40:50)

Greg, yeah, avoiding unnecessary CT scans is pretty obvious. It's far less obvious how dangerous Cipro is. And the increase in thyroid cancer and the possibility it is caused by the iodine used in those scans is likewise an important new piece of info.

Stephen M (Ethesis) (2009-12-14 05:41:39)

Wow, I had no idea Cipro was so dangerous.

Greg Conen (2009-12-14 11:01:35)

My point is that owning your health care often means different conventional treatments, rather than none. X-ray, ultrasound, or MRI instead of CT. Using antibiotics other than (fluoro)quinolones where possible. (Actually, I'm confused why a kidney stone was treated with antibiotics at all. Even if it's associated with infection, usually getting it out is the key treatment) A healthy lifestyle is the first step, of course, but Chinese herbs and yoga is a poor summary of "being your own doctor".

seth (2009-12-14 14:39:12)

Why were antibiotics involved? Because of a prostate infection that wouldn't go away. It went away soon after he got rid of the kidney stone.

Cynthia (2009-12-16 07:06:09)

An FDA advisory panel just recommended that the warning for Covidien's Optimark and GE's Omniscan drugs in the family of medications known as gadolinium-based contrast agents (DBCAs) be updated to restrict their use in patients with severe kidney disease because of the potential for an increased risk of nephrogenic systemic fibrosis (NSF). NSF causes thickening of the skin and organs. DBCAs carry a strong "black box" warning. This site has good information on this issue: <http://www.gadolinium-mri.com/index.html>

naman (2009-12-21 05:42:41)

Agree with Greg - being your own advocate is not bad advice. But your claims on what was saved are exaggerated or false: 1) many stones will pass w/o treatment, some may not 2) you would do an ultrasound, not a CT first, for suspected kidney stones 3) tetracyclines or trimethoprim-sulfamethoxazole are also commonly prescribed in addition to cipro (which by and large has a good safety record).

## Two Types of Yogurt (2009-12-13 07:18)

After making yogurt a hundred times, and reading a lot about it, I finally realized there are two types. The mild sort (incubated maybe 12 hours) is good by itself, with fruit or nuts for texture and flavor. The strong sort (incubated maybe 24 hours) is a good condiment. Mild yogurt is a poor condiment, strong yogurt is poor by itself.

---

Ben Hyde (2009-12-13 18:09:17)

My containers of yogurt spend about 3 hours in the water bath; which is close to 130F to begin. So: 14 cups of milk in double boiler to 190F, water bath to drop to 130F, add about a cup of cold yogurt to the hot milk, mix, pour into containers, into the 130F bath. 3 hrs later into the fridge. I guess you could say it's mild; my family says they like that. The bath often is as low as 110

when I start. I use a picnic cooler for the hot water bath.

### **Interview with Seth Roberts (2009-12-13 23:14)**

[1]Justin Wehr asked me some interview questions and decided not to publish my answers. I thought they were good questions. Here they are, reworded slightly, and my answers.

QUESTION Of the experimental treatments you have studied, which ones have the most positive effect on your life?

ANSWER From more to less effect:

- Effect of morning faces on mood
- Effect of fermented food on health
- (tie) Effect of animal fat on health
- (tie) Effect of omega-3 on health
- Weight-control experiments.

QUESTION What about everyone else?

ANSWERÂ It depends on how far in the future you look. The morning faces stuff is the most important, I'm sure, but it's also the hardest to implement. The fermented food stuff is easy to implement. It's easy to eat more yogurt. So I believe that in the short term, the fermented foods stuff will have the most effect on others, in the long term, the faces stuff.

QUESTION Much of your research is related to the idea that we get sick because we live differently now than long ago. Can you explain this? Are there exceptions?

ANSWER Our genes were shaped to work well in one environment. Now our environment is quite different. All sorts of things go wrong – we don't eat an optimal diet, for example – and our bodies malfunction in all sorts of ways. The exception is that once we know what an optimal diet (or environment) is we can assure it. For example, we can make sure we get the optimal amount of Vitamin C. The health problems caused by progress can be fixed, in other words, and we can emerge in better shape than ever before.

QUESTION How much time a day do you spend on self-experimentation?

ANSWER About ten minutes. Measuring various things, such as blood pressure and brain function.

QUESTION Why do few people self-experiment?

ANSWER Millions of people self-experiment. For example, millions of fat people try many different ways to lose weight. Professional scientists (e.g., med-school professors) do not self-experiment, at least publicly, because it is low-status,

because it is frowned upon (by their colleagues), because it might be hard to publish the results, and because it won't help them get grants.

QUESTION How do you determine an appropriate dosage for treatments that might have a good effect on what you measure but a bad effect on other things? For example, maybe animal fat is good for sleep but bad for other things.

ANSWER I don't worry about it. Just as all electric appliances are designed to use the same house current, I'm sure all parts of our body are designed to work best with the same diet.

QUESTION Could advances in medical technologies (such as regenerative medicine) replace the need to live healthily? For example, if we could easily replace livers, maybe people could drink more.

ANSWER Not likely. Except that the more we know about nutrition the more we can replace our ancestors' diet with a diet made up of the necessary nutrients. For example, I drink flaxseed oil to get omega-3. I'm sure our long-ago ancestors got omega-3 in other ways. So I no longer need to be like them. Basic nutrition isn't medical technology, but it is a way in which it is easier to be healthy.

QUESTION What don't you know, but wish you did?

ANSWER How to make book-writing as addictive as Wii Tennis.

1. <http://wehrintheworld.blogspot.com/>

---

epistemocrat (2009-12-14 01:06:44)

Good questions and answers, indeed. The last answer made me laugh.

Andrew Gelman (2009-12-14 02:20:48)

Seth: I'm glad you posted this. I find it so irritating when people interview me and then don't use the interview or don't even thank me for my time. It makes perfect sense—I run lots of regressions but don't use most of them, so, similarly, an interview can gather lots of information and publish only some of it. Still, it's annoying.

Justin Wehr (2009-12-14 08:12:01)

Thanks, Seth. I like the re-phrasings, and glad you added some bulk to your answers. I will link to this later, but probably better on your blog anyway – your readers will appreciate this more than mine. I would still really like to see you develop the first two questions. \*How much\* do they improve your life and potentially other people's lives? Thanks again.

Caleb (2009-12-20 08:48:11)

We really need a website who's *raison d'être* is to organize and provide links to online videos appropriate for morning face viewing. I have a "Face Videos" folder on my desktop in which I try and keep a queue of such downloaded videos, but it's often in danger of running out. Seriously, someone with web skills should start this up; once the layout was up most of the linked content could be user submitted. Have you experimented using video with two faces? I've started using such videos, and have

noticed a much stronger effect than using a mirror or a video with a single speaker. Bloggingheads.tv contains a ton of these type of videos, with two bloggers recording an hour long dialogue they have with their webcams. On my 24 inch monitor, the heads seem to come out just about the right size when I put the video on full screen. My theory on why it works so much better is that it simulates rich social interaction much better, with a back and forth conversation to follow, and the monitoring of how facial expressions are changing in reaction to what's being said, engaging a lot more of the brain than when I view just one face.

seth (2009-12-20 09:01:22)

No I haven't tried videos with 2 faces. That's fascinating that you get a stronger effect. I think two faces is more likely to resemble the ancestral situation. I doubt people just talked to one person at a time. I imagine a few people got together and talked – about their dreams, for example.

q (2009-12-21 19:23:19)

have you tried laughter yoga?

### **How I Write Letters of Recommendation (2009-12-15 01:49)**

As all professors know, it is letter-of-recommendation-writing season. I write them differently than anyone else I know. I meet with the student and write the letter during our meeting. I ask questions, type, ask questions, type, etc. The student inevitably remembers details of the class and how well they did better than I do. I ask questions that try to elicit the strengths of their case – about relevant experience, for example. Anything I find convincing I put in the letter. Sure, maybe they described the same stuff in their statement of purpose but I'm sure I can do a better job – professor to professor – than they can. (Statements of purpose are usually badly written.) I speak professorese, they don't.

I like to think it's win-win-win. It's good for me because the letter is written quickly, easily, on time, and with good content. It's the strongest possible truthful letter I could write – so I feel I'm doing my job. It's good for the student because I make their case in the best possible way. It's good for whoever reads the letter because it's factual and well-argued. I don't just say the student is this or that; I give examples. Most letters of recommendation do not give examples. Without examples, I ignore them.

---

Ethan Fosse (2009-12-15 06:52:17)

Wow, great idea. Much better than playing email tag or trying to read the tea leaves from a student's CV.

david (2009-12-15 12:43:15)

Yeah, your approach is much better in every way. I had well-meaning professors who misremembered details of my situation. I have to assume that if your letter of recommendation contains details that obviously don't apply to you, it does more harm than good.

Aaron Blaisdell (2009-12-15 16:14:01)

That's great, Seth. Have you encountered a situation where you thought the letter should showcase the student's weaknesses? That is, have you had a student in your office while writing a letter and realize that he or she did not do so well, was lacking in important skills or attributes, etc.? Or do you screen out those you wouldn't write a good letter for prior to the office visit?

And what if you don't know the student very well (e.g., in a class of 100 or 300) and all you have is what you see in your office, not anything about their prior performance in the course?

seth (2009-12-15 17:36:40)

Aaron, no, I haven't encountered a case where I thought the letter should showcase the student's weaknesses. If I don't think a positive letter would be appropriate, I decline to write one. There's always some prior performance in my class.

Sarosh Motivala (2009-12-17 00:53:13)

You described a great approach; what I like the most is how upfront it is. I will start doing this for my students as well! Thanks!

### **The Wisdom of Tsinghua Freshmen (2009-12-17 06:01)**

This semester at Tsinghua University – the most selective college in China – I taught a freshman seminar about recent psychology research. Three weeks ago I gave my students a choice of five articles from *Psychological Science*, all published in 2008. They were to read one of them and comment.

Mostly I try [1]to teach appreciation but three weeks ago we focused on how articles could be improved. I have never tried to teach this, yet the students made some very good points. Here are some of their comments:

1. [2]This article said that we believe women make better leaders when there is within-group conflict and that men make better leaders when there is between-group conflict. One student pointed out that Rwanda was a good example. After the genocide (within-group conflict), [3]far more women were elected to office.

2. [4]This article studied the effect of cleanliness on moral judgments. One experiment compared two groups: subjects in one group had recently washed their hands, subjects in the other group had not. Before the time when the handwashing happened, both groups saw unpleasant scenes from a movie. Students pointed out an important confounding not mentioned in the article: The two groups differed not only in handwashing but also in the time from movie to test (because handwashing took time). Perhaps subjects who washed their hands remembered the movie less well.

3. The name-letter effect is a tendency to favor outcomes (broadly defined) that involve the first letter of your name. [5]This study involved Belgium workers. The authors found that workers were more likely to be employed by a company whose first letter matched the first letter of their name. The correlation was small but reliable. Two students pointed out that this might reflect the company's choice of whom to hire rather than the employee's choice of where to work. One student pointed out that the correlation might be due to name-place correlations across Belgium. Perhaps certain regions favor certain names for both people and companies. As you move closer to the French border, perhaps French names become more common among both people and companies.

In all of these cases, had I been the editor, I would have required the authors to change their article appropriately.

James Surowiecki's *The Wisdom of Crowds* described cases where averages of estimates made by non-experts did very well, sometimes out-performing experts. These three examples don't involve numerical judgments nor averaging, but they do show non-experts (freshmen) doing better than experts (journal editors and reviewers) in certain ways. Each paper was read by about eight students.

More It isn't easy to convey how impressed I was. The comments about Rwanda and about name localization certainly deserve a letter to the editor (if *Psychological Science* published them).Â Both of them are sophisticated methodological comments. The Rwandan one says that after you write an experimental article, try to find out ifÂ real-world

events support your findings. That may be a helpful lesson in many cases. The name localization one suggests that psychologists who use survey data should be learning more about how to analyze survey data. Several other times my students surprised me with how good their comments were. One was during a discussion of possible reasons for the Holocaust, another was about why women in ancient China bound their feet, a third involved proposals for Mindless-Eating-type experiments.

Aaron Blaisdell (2009-12-17 07:53:56)

Seth, while your post is interesting, it seems to be based on the assumption that the "experts", that is journal editor and reviewers, would catch all of the major criticisms or flaws of the manuscript during the review phase. This is not a safe assumption. I've recognized from early in my career that if you give a draft of a manuscript to 12 people, you will get back 12 sets of partially overlapping sets of comments and criticisms. Sure there are a lot of common things picked up by the majority of reviewers, but each reviewer will invariably catch one or two flaws or see a potential confounding factor or account that all the others hadn't. It's like writing computer code. No matter how many programmers work on a piece of software, it will never be completely bug-free.

Andrew Gelman (2009-12-17 09:16:36)

Seth: Setting aside questions about expert reviewers, etc., I just want to say that you must be doing something right if you're getting these sorts of comments. I wonder if it helped that you had them do "appreciation" before you had them do "criticism." Perhaps it also helped that they are psychology students, so they're motivated to understand psychology literature. When I've assigned articles for undergraduates to read and comment on in statistics classes, I don't generally get such good comments.

Robin Barooah (2009-12-17 13:35:48)

Have you considered the possibility that the students were much more motivated to pay close attention than journal reviewers generally are? The students were doing this as a one time exercise, with the very immediate rewards of engagement with their peers, and with you, an encouraging professor whom they presumably respect. Furthermore, you were listening to and respecting them for their criticism of published papers, something I suspect is not a consistent experience. For journal reviewers, on the other hand, the task has presumably become 'work', and it seems likely that many individual papers simply won't be of engaging interest to them. There is little immediate social reward for playing 'the game' of catching faults, and indeed doing so may carry some costs in terms of increased administration. I don't mean to suggest that journal reviewers are not taking their role seriously or professionally. I am just pointing out that it may sometimes be the scientific equivalent of 'guard duty', and that to maintain a consistent level of attention to each paper could be very challenging compared to someone who is doing it for the first time.

seth (2009-12-17 14:01:11)

Aaron, I wouldn't say that I expect reviewers and editors to notice all ways an article could be improved – just that they didn't notice these particular ways. But you have a point: Perhaps the editors and reviewers picked up various problems that the students would have missed. Still, I was surprised how good their critiques were. That's what I was trying to say here. Andrew, thanks. You might be right about the subject-matter match (psychology students reading psychology articles). I never gave this assignment in Berkeley so I can't directly compare – but I would have been surprised if more than maybe 10 % of my Berkeley

students made comments like this. Robin, you're probably right. Although the articles were not in their native language, the students were quite motivated to understand them and make comments that would interest me. I am a tough grader. They couldn't get the highest possible grade unless they told me something I didn't know.

### **Review of Other Diets (2009-12-17 15:37)**

[1]This comment by goblyn on the Shangri-La Diet forums made me laugh:

When you're on Atkins it gets harder when you start wanting to sell your first born for a piece of bread.Â On Weight Watchers you'd kill for a pizza.Â On South Beach you'd sleep with Donald Trump for an order of buffalo wings.Â On the cabbage soup diet, you'd willingly chop off your hands if you could eat something...anything...other than cabbage soup.Â On SLD it gets harder when you are suddenly only losing 1 lb a week rather than 4.

So well written! The comment continues, in very gratifying way:

It's harder when you effortlessly eat 1400 calories a day and don't feel deprived.Â It's harder when you have to buy a whole new wardrobe.Â It's harder when you're out with friends and they all think you're anorexic because you get stuffed from the bread they served before the meal...Â But there's rarely a moment when it's actually HARD.Â SLD is easy.Â Yes the weight loss slows down, yes the AS [appetite suppression] gets less noticeable, but at no point does it stop working.Â You won't suddenly find your weight skyrocketing from eating a piece of celery.

### **The New Yorker Reading List (2009-12-17 17:51)**

For the first time, the New Yorker website contains comments by all of their contributors [1]about the best books they read last year. It's a great idea. I'll be studying it for a long time. I was most immediately persuaded to read *The Evolution of Calpurnia Tate* by Jacqueline Kelly (recommended by Margaret Talbot) and *The Gardner Heist* by Ulrich Boser (recommended by Jeffrey Toobin). I'm interested in anything Lauren Collins has to say because [2]she is a very talented writer. Her list was unusually long. Tad Friend misspelled the title of his own book.

Some of the writers didn't write very well. Paul Muldoon, the poetry editor, used the royal we:

Weâ€™re very pleased to report that the title-poem first appeared here in *The New Yorker*.

It should be called "the pompous we". He also wrote:

Among the poetry books that particularly recommended themselves this past year

Richard Brody wrote this:

The laser-like clarity and probity with which Lanzmann brings

I think he means "the laser-pointer-like clarity . . .".

1. <http://www.newyorker.com/online/blogs/books/2009/12/what-we-read-this-year.html>

2. <http://www.blog.sethroberts.net/2008/05/08/magazine-article-of-the-year/>

---

Mike Gibson (2009-12-17 20:20:46)

I highly recommend The Gardner Heist. Not sure what the New Yorker says, but half the fun is that it's an open ended case. By the time you're done reading, you're convinced you can come up with a plausible theory for the whodunit. The answer seems so tantalizingly close.

Pat (2009-12-18 01:10:57)

The Guardian book section in the UK has done this kind of thing every year for years (I've seen it for at least 5). They ask famous writers (and other famous Brits) what they've read that they liked best in the past year. I suspect that the New Yorker borrowed this idea from them. It's a good one, I agree with you. Here's the URL from the Guardian for this year: [www.guardian.co.uk/books/2009/nov/22/books-of-the-year-2009](http://www.guardian.co.uk/books/2009/nov/22/books-of-the-year-2009) There's mostly poets on the interview list this year, but I seem to remember more of an assortment of professions in past years. Re the "royal we" - this is typical New Yorker style (which I have read for years) - a bit "twee" as the Brits like to say - i.e., the New Yorker's "voice" has always been a bit self-amused going back to the days of Robert Benchley and Dorothy Parker when they were staff writers. I Seth, I'm not sure why you think "laser-like clarity" is wrong - it's kind of a cliché in literary/film critical writing. But now I gotta go look at the list on their website - thanks for the heads up. Interesting about Tad Friend's typo - might not be his fault - they have underlings at magazines, y'know, who do the actually drudgery. What is interesting is that the New Yorker (of old, when edited by William Shawn - for 30 or 40 years or so) was notorious for its fact checking and attention to meticulous detail. This is of course before the internet and blogs when the magazine was actually typeset. There's a good book about the history of the New Yorker by the way, by Brendan Gill (can't remember the title - My Days at the New Yorker or something like that). To think I came to your blog to see if there was anything new about fermented food! This is the first time I've ever posted, but thanks for the Shangri-La Diet while I'm at. I have very high LDL numbers. Has your high dose of flax oil ever disturbed your LDLs? Cause flax oil sure does help me sleep the few times I've tried - almost too deeply in fact...

seth (2009-12-18 05:40:28)

"Laser-like clarity" is not only a cliché, it's nonsense. Lasers are not especially clear. I don't know what the flax oil I drink has done to my LDLs, sorry.

Javad (2010-05-20 10:21:59)

Brendan Gill, Here at the New Yorker. That is the book on the history of the magazine that is recommended by Pat. And "laser-like" refers to the fineness of a laser; nothing else can be as pointed (so far as we know currently). Well, that is how I read the cliché.

Javad (2010-05-20 10:24:04)

I would like to read your recommendations for a reading list of authors who best represent what I call the New Yorker style.

## MSG and Nightmares (2009-12-18 18:38)

At a dinner for foreign teachers at Tsinghua, I met a Canadian woman who teaches English literature. Soon after she moved to China, she started having nightmares every night. For dreams, they were unusually linear and realistic. They were nightmares in the sense that they felt "sinister". This hadn't happened to her before. It was especially puzzling because she was having a good time.

On a forum for foreigners in Beijing, she asked what might be causing the problem. MSG, she was told. All Chinese restaurants use MSG. She started cooking her own food. The problem went away. Whenever she ate a restaurant meal, the problem returned. The time between meal and sleep made a difference. The dreams would be more vivid if she slept soon after the meal.

[1]Here is a discussion of the MSG/nightmare link with many stories about it. I believe we like the taste of MSG because glutamate is created when proteins are digested by bacteria. We like glutamate because we need to eat bacteria to be healthy. Bacteria are too big and varied to detect directly; it's much easier to evolve a glutamate detector.Â The problem is that now you can have glutamate in your food without bacteria. Apparently cooked tomatoes and garlic are other sources.

With PubMed I found two relevant articles. [2]One reported an experiment where hyperactive boys got better when additives, including MSG, were removed from their food. [3]The other is a review article about the effects of MSG that mentions sleep.

I'm sure from the personal stories that MSG causes nightmares – and therefore probably also causes other problems. (That glutamate is a neurotransmitter makes the MSG-nightmare link even more likely.) Here are [4]researchers from

the Scripps Clinic in San Diego saying MSG is safe:

Since the first description of the 'Monosodium glutamate symptom complex', originally described in 1968 as the 'Chinese restaurant syndrome', a number of anecdotal reports and small clinical studies of variable quality have attributed a variety of symptoms to the dietary ingestion of MSG. . . . Despite concerns raised by early reports, decades of research [this review was published in 2009] have failed to demonstrate a clear and consistent relationship between MSG ingestion and the development of these conditions..

What the woman I met did in a week or so (establish that MSG has bad effects), medical researchers – at least, judging by this review – have failed to do in 41 years ("decades of research"). Just as dermatologists have been unable to figure out that [5]acne is caused by diet.

[6]More about the dangers of MSG.

Hap (2009-12-19 06:21:56)

Joseph Campbell, author of "The Hero With A Thousand Faces," as well as of the PBS television series on cross-cultural mythologies, gave us two now popular concepts, i.e. "The hero's journey" (which inspired George Lucas), and "Follow your bliss" (which could have inspired everyone). But what he said which has always stuck in my mind is this: "Dreams are the warring of the internal organs." Unfortunately, that's about all I recall him saying on this, and there's little online to amplify it. This appeals to me because it connects body and mind. One "concrete," the other "abstract." Personal experience suggests some examples: Dreams of fire as nothing more complicated than thirst. Dreams of searching for a functioning bathroom as an expression of that need. Spicy food seems to intensify dreaming. And I've watched enough police chases and gang documentaries on TV to have a greater appreciation for the effect of drugs on brain functioning, thus behavior. I wonder if traditional Chinese medicine, with its intimate, more global understanding of the relationship of organs, meridians, energy, etc. can make more sense of what Campbell was saying. In any case, I'd enjoy reflections from others here on the same subject. Maybe we can simplify the whole business of dream interpretation. Might it be nothing more complicated than the narrative, time-binding "left brain" transforming present bodily chemistry into a story?

Nancy Lebovitz (2009-12-19 07:50:47)

Patricia Garfield's [1]Pathways to Ecstasy is an account of long observation and thought about dreams, with the conclusion that dreams are reactions to bodily changes. Not related to your post, but more self-experimentation: Olivier Arneisen's [2]The

End of My Addiction by a cardiologist who became an alcoholic and eventually discovered that baclofen (a muscle relaxant) completely eliminated his craving for alcohol. Unfortunately, so far, no one has been willing to do the tests necessary to make sure that the relatively high dosages he needed have a reliable effect for other people.

1. [http://www.amazon.com/Pathway-Ecstasy-Way-Dream-Mandala/dp/0136531555/ref=sr\\_1\\_2?ie=UTF8&s=books&qid=1261233904&sr=8-2](http://www.amazon.com/Pathway-Ecstasy-Way-Dream-Mandala/dp/0136531555/ref=sr_1_2?ie=UTF8&s=books&qid=1261233904&sr=8-2)

2. [http://www.amazon.com/End-Addiction-Olivier-Ameisen-M-D/dp/0374140979/ref=sr\\_1\\_1?ie=UTF8&s=books&qid=1261234045&sr=8-1-spell](http://www.amazon.com/End-Addiction-Olivier-Ameisen-M-D/dp/0374140979/ref=sr_1_1?ie=UTF8&s=books&qid=1261234045&sr=8-1-spell)

Nancy Lebovitz (2009-12-19 21:49:53)

More self-experimentation: Bob Cooley's [1]The Genius of Flexibility. He discovered when trying to rehab after serious injuries that resisting while stretching (a sort of moving isometric) improves flexibility rapidly (I've had a little experience with this working) and strength, and has good effects on the personality. The comments at amazon show that this system works for a lot of people.

1. [http://www.amazon.com/Genius-Flexibility-Smart-Stretch-Strengthen/dp/0743270878/ref=cm\\_cr\\_pr\\_product\\_top](http://www.amazon.com/Genius-Flexibility-Smart-Stretch-Strengthen/dp/0743270878/ref=cm_cr_pr_product_top)  
eric (2009-12-20 22:41:28)

What the woman I met did in a week or so (establish that MSG has bad effects), medical researchers "at least, judging by this review" have failed to do in 41 years ("decades of research"). Just as dermatologists have been unable to figure out that acne is caused by diet. this is really bizarre phrasing. the medical researchers haven't 'failed' any more than your woman has succeeded, they have two different results, and there is seemingly no reason to prefer the woman's result over the researchers results--the other way around perhaps. in the future i guess i'll just tell anyone who disagrees with me that they are 'failing to be correct' lol

seth (2009-12-21 02:29:39)

Eric, the woman determined that MSG is dangerous, the researchers failed to figure this out. That was the broad goal of their research, to determine if MSG was safe or not.

eric (2009-12-22 07:39:35)

err no she didn't determine it was dangerous any more than they determined it was safe, i.e. she could be wrong about what's causing her nightmares, just like the researchers could be wrong that MSG is safe?

Phil (2009-12-22 12:24:18)

I avoid MSG, figuring better safe than sorry, though I've never noticed a problem on the occasions when I think I've eaten it. (At some restaurants I'm not sure). But, Seth, the abstract of that paper that you cite doesn't say anything about nightmares or about health impacts in general, it looks only at "asthmatic bronchospasm, urticaria, angio-oedema, and rhinitis." Maybe you read the whole article, but at least the abstract doesn't contradict the nightmare connection. If the woman said her nose ran if (and only if) she ate at a Chinese restaurant, then you'd have found a disagreement!

seth (2009-12-22 12:49:51)

Phil, yes, the abstract doesn't mention nightmares. But the whole point of the article is to say "as far as we know, MSG is safe." Suppose I wrote an article claiming that arsenic doesn't cause "asthmatic bronchospasm, urticaria, angio-oedema, and rhinitis." ("In spite of decades of research . . . ") It would be literally true but also a joke - because we know arsenic is dangerous. The articles in which dermatologists claim that diet doesn't cause acne (using phrases like "there is no strong evidence that...") are literally true but a joke since a lot of the rest of us have managed to figure out that diet does cause acne. Eric, she totally got rid of her nightmares. And she can predict when they will return (when she is forced to eat food with MSG). This is a lot better than those researchers can do. Based on their review, they haven't gotten rid of any real problem nor made any accurate predictions.

Laura (2010-05-03 05:37:09)

I just had the worst nightmare of my life. I was very scared when I woke up this morning. I remember I had Chinese food yesterday at a restaurant. I am never going to eat food that has msg. Good thing the link between nightmares and msg is in this blog. I also noticed that msg gives me anxiety, too. Yesterday I was anxious. I hardly ever am anymore, with all my coping skills, but yesterday I was scared.

Catherine (2010-05-06 11:08:24)

I have always found that I have headaches, flushing and severely vivid nightmares after consuming large amounts of MSG. In fact, even without the headache or flushing, I can always tell a food had too much MSG after a long night of nightmares. I think it has something to do with sensitivity to certain amino acids such as MSG. I once took an amino acid supplement and the after-effects were horrendous. I can't eat most chips, certain Chinese food nor the McD's sausage patties due to my reaction. Although I think there has to be a high level for me to have a reaction.

william storm (2011-09-22 04:03:00)

I have been suffering for years with benzodiazepene tolerance withdrawal including severe irrational phobias, terror and nightmares. Once I found out that the anxiety meds were CAUSING anxiety I switched over to Valium (longer half-life and active metabolites as opposed to ativan). I also quit drinking coffee. After a month off of coffee my problems were reduced almost to the point of being gone. Benzo withdrawal symptoms have something to do with inversion of the GABA receptors in the brain, but they also stimulate GLUTAMATE receptors. Apparently coffee stimulates glutamate production somehow. It was explained to me that the GABA receptors are like brakes on the brain and anxiety, while glutamate is like the gas pedal for staying awake and anxiety symptoms like nightmares. After two months away from coffee I was feeling pretty happy (although still using a small amount of valium daily) and starting to take lithium over the counter (which suppresses glutamates) I had one 25 cent cup of coffee after church with my pastry and suffered with horrible anxiety and nightmares for nearly a week. Being a coffee addict, I tried the post-church coffee and suffered again. Finally, this week on a fishing trip to the mountains and a nice bacon and eggs breakfast at my sister's cabin, I drank a large cup of coffee. Within 24 hours, SEVERE anxiety and two nights worth of nightmares so far. Which is why I am online researching glutamates and anxiety and found this discussion. There is a definite link between coffee, glutamates and nightmares/anxiety. I am typing this at 3:49 am after a terrible nightmare and I am afraid to go back to sleep. I do have schizoaffective bipolar disorder but the lithium was making the "vivid dreams" tolerable. I also take Ritalin for excessive daytime sleepiness due to severe sleep apnea. So the nightmares are more complicated than just coffee and ARE related to activity in the body. But after 3 strikes of glutamate-stimulating coffee, it's OUT. No more for me until I get fully tapered off the valium. Oh yeah, and for some reason eating chicken parmesan made me anxious until I read that cooked tomatoes are full of natural glutamates. Glutamates are a stimulating neurotransmitter. There is scientific evidence of that. Proof enough for me. I'm not sure I would try coffee even after I'm off the valium, the anxiety is that bad and the nightmares are intolerable. I will just be getting over this bout of anxiety on Sunday when I am going back to church after the fishing trip. I just have to avoid that lovely pot with the 25 cent sign on it and drink bottled water or Coke (Coke and hot tea don't seem to bother me as much, but diet soda definitely gives me anxiety attacks)

## **Appreciative Thinking and Buddhism (2009-12-19 15:20)**

After I mentioned [1]appreciative thinking in [2]a recent post, my friend [3]Carl Willat wrote me:

Part of Buddhism I think is that gratitude is the secret to happiness. Â It's always possible to want more, so you won't be happy by trying to get all the things you want. Instead, being grateful for what you have is where happiness lies.

That's a good way to put it. Not matter what article you read, no matter what study you do, there are always ways it could be better (what others call flaws). Be grateful for what the article or study tells you. That's how to learn

something from it.

Bryan (2009-12-19 21:26:20)

Dennis Prager, a Jewish commentator, has also been preaching "gratitude is the secret to happiness" for years:  
<http://www.amazon.com/o/ASIN/0060987359>

epistemocrat (2009-12-19 22:21:26)

This reminds me of a rule for book reviews: Don't criticize the author for not accomplishing something that he/she did not set out to accomplish.

Alex Chernavsky (2009-12-20 07:02:56)

The new field of positive psychology emphasizes the beneficial effects of gratitude:  
[http://www.usatoday.com/news/health/2002-12-08-happy-main\\_x.htm](http://www.usatoday.com/news/health/2002-12-08-happy-main_x.htm)

JLD (2009-12-20 09:10:45)

*Not matter what article you read, no matter what study you do, there are always ways it could be better* That's not the problem I most often see, the problem I most often see is *fluff*, **one 5 lines worthwhile paragraph** in the middle of an 8 pages paper.

### **Tsinghua Student Life (2009-12-20 12:16)**

The Chinese government sets limits to the number of acceptable student suicides per year at every college. If the number is exceeded, the college is punished – perhaps by a reduction in administrator salaries. Although colleges conceal suicides from their own students, they dare not conceal them from the government. At Tsinghua (with about 12,000 students) the annual limit is six. (So far this year, there have apparently been none.) In the electrical engineering department recently, more than six students were thought to be considering suicide. Because of this, a psychology professor gave the EE majors a talk about looking at the bright side of things.

A newly-formed Tsinghua student club has a Chinese name that means Sing Your Heart. It is for students who want to volunteer to teach in poor rural areas. The club has a special song that they sing at every meeting. They are remarkably ambitious: They want to set up a training program to train students to teach in these areas.

The School of Humanities and Social Sciences has a debate competition every year. This year's topic is: Should [1]the Fuwa (the Beijing Olympic mascots) have genders?

1. <http://en.wikipedia.org/wiki/Fuwa>

Denshil (2009-12-22 01:53:05)

As I know, in our school (THU), there would be student suicides every year. In the beginning of 2009, one of my friend suicide, he is Tsinghua's student, and I cried every time when I thought about him...

Shi (2009-12-22 02:53:26)

I am amazed by how the absurdity of things in everyday life becomes so salient after being pointed out.

Willy (2009-12-22 16:51:24)

Are the suicides related to academic problems?. Thanks

Denshil (2009-12-22 20:47:07)

I believe that these suicides relate to a lot of things, such as, relationship which I think is the important reason, hunting jobs, academic problems...

### **Michael Perelman on the Purpose of College (2009-12-21 14:36)**

In [1]a talk, Michael Perelman, a professor of economics at CSU Chico, said this:

Each semester, I tell my class that each of them has the potential to be the best in the world at something.  
The most important thing they can do in school [= college] is find out what that something is.

That is a sane view of college. At Berkeley, I told undergrads: "Take as few classes as possible and do as many internships as possible."

Perelman's talk, an intellectual autobiography, has all sorts of interesting details, such as "As the economy faltered, economists would express doubts about how the economy functioned but once the economy recovered, challenges to market fundamentalism would become rare."

1. <http://michaelperelman.files.wordpress.com/2009/11/lecture.pdf>

---

Jeff (2009-12-21 18:45:09)

Why wouldn't classes help people learn what they want to do?

Caleb (2009-12-21 22:11:59)

Four or more of the best years of your life and tens of thousands of dollars seems pretty steep to find out what you're suited for compared to good ol introspection and real world experience (at least it worked well in my case), especially if you're also getting such saccharine pie-in-the-sky nonsense as 'everyone has the potential to be the best in the world at something' dumped into your head. Education certainly has some value, and I expect it could have a lot more, but until it allows for a free market in hiring that value is very hard to determine, allowing the institution to become largely parasitic. Perhaps I'm biased, but it seems to me the way the system currently works, college has little true value added, and the main purpose of college is to make money for the colleges and the staff by fleecing the students and public. Typical rent seeking elite behavior. I'm being

a little unfair because I feel strongly about how messed up education is. I still want back all the time and \$70,000 dollars of public money wasted before I wised up that I was being played and promptly quit school in the tenth grade.

seth (2009-12-22 03:54:24)

Jeff, why don't classes help? Because at almost all colleges, including CSU Chico and UC Berkeley, only a tiny fraction of students want to be professors. A class tells you what it's like to be a professor and how good you will be at it. If you don't want to be a professor, it doesn't help. Perhaps the first few college classes you take help you decide if you want to be a professor. The rest do not. Caleb, I have written many posts agreeing with you – that colleges are run for the benefit of professors, not students. That they are exactly what you say – rent-seeking elite behavior. It's not so much "making money for the colleges and the staff" as providing jobs for the professors. I believe it is becoming easier to skip college and more students, including the most talented, will do so. You don't have to go to college to be an intern.

Alex Chernavsky (2009-12-22 05:51:02)

Regarding Caleb's comment: Here is an excellent article from *Forbes* magazine (Feb. 2, 2009), called "The Great College Hoax": <http://www.forbes.com/forbes/2009/0202/060.html>

Jeff (2009-12-22 14:53:25)

I don't think that's great advice to get students. You can take classes in three or four different areas in a semester but only have one internship. I didn't think of college classes being about whether the students would be a good professor or not, but we can agree to disagree. A class about econ is still going to teach the subject of econ, etc. Taking a variety of classes should allow a student to figure out which subjects are interesting to them.

Stephen M (ethesis) (2009-12-25 16:50:49)

Practice and a lot of time will make you very good. What you need to do is find something you can tolerate enough that you will find yourself willing to practice and do ...

## **Modern Biology = Cargo-Cult Science (continued) (2009-12-22 13:19)**

In [1]an earlier post I pointed out that modern molecular biology has one big feature in common with cargo-cult science (activities with the trappings but not the substance of science): relentless over-promising. David Horrobin, in [2]a 2003 essay, agreed with me:

Those familiar with medical research funding know the disgraceful campaigns waged in the 70s and 80s by scientists hunting the genes for such diseases as cystic fibrosis. Give us the money, we'll find the gene and then your problems will be solved was the message. The money was found, the genes were found - and then came nothing but a stunned contemplation of the complexity of the problem, which many clinicians had understood all along.

During the question period of a talk by [3]Laurie Garrett about science writing at the UC Berkeley School of Journalism, I said there was a kind of conspiracy between scientists and journalists to make research results (in biology/health) appear more important than they really were. Oh, no, said Garrett. If she's right, then journalists are completely credulous. They have no idea they're being scammed. If I wrote a book called *The Real Scientific Method*, there would be a whole chapter on better ways ([4]cool data) and worse ways (over-promising) to promote your work.

The discovery of [5]leptin, the hormone that tells the brain how much fat you have, was front-page news in 1994. Supposedly this discovery would help people lose weight. It is now abundantly clear that it hasn't and won't. The discoverer of leptin, Jeffrey Friedman, gave a talk at UC Berkeley several years ago and resembled a deer caught in the

headlights. All he knew – following the party line – was that genetics was important. That genetics was so obviously not the reason for the obesity epidemic . . . he didn't mention. [6]This interview gives a sampling of his views. He really does believe in the primacy of genes:

Over the years, Dr. Friedman says, he has watched the scientific data accumulate to show that body weight, in animals and humans, is not under conscious control. Body weight, he says, is genetically determined, as tightly regulated as height.

Never mind animal and human experiments that show adult body weight is controlled by recent diet. Adult height is not controlled by recent diet. What about the obesity epidemic? Well,

"Before calling it an epidemic, people really need to understand what the numbers do and don't say," he said.

This is what one molecular biologist – a professor at Rockefeller University – is reduced to: telling us what data collected by other people "do and don't say". Not to mention qualifying the obvious (Americans are much fatter now than 50 years ago). I'm sure his lab has all the trappings of modern science. But the planes don't land.

[7]A journalist named David Freedman has figured this out.

intellectual\_yokel (2009-12-22 13:32:02)

<http://www.smbc-comics.com/index.php?db=comics &id=1623>

Tom in TX (2009-12-22 13:35:00)

I get the impression that an incorrect theory can be better than a correct one. You can keep getting research money to chase the ad hoc explanation of why the previous study didn't work as planned. Ptolemy could have gotten a government grant to study each of his epicycles. Copernicus would have been done right away and then he would have needed to find a new project. 8-(

Bryan (2009-12-22 13:54:44)

»If I wrote a book called The Real Scientific Method... What do I have to do to convince you to write that book?

Patrik (2009-12-22 14:46:55)

@Seth You are on a roll. Your posts on epistemology/science are excellent. Keep it up.

Alex Chernavsky (2009-12-22 14:47:46)

Man, if you think molecular biology is bad, you should see psychiatry. See, for example, Robert Whitaker's excellent book, *Mad in America: Bad Science, Bad Medicine, and the Enduring Mistreatment of the Mentally Ill*: <http://www.madinamerica.com/Mad%20In%20America/Home.html>

Jeff (2009-12-22 15:37:10)

Biology is pulling in a lot of strong minds from – \*ahem\* – more rigorous disciplines. Ex-physicists, ex-engineers, and ex-mathematicians are pouring into fields like computational biology, computational neuroscience, systems biology etc. Things will change.

Nathan Myers (2009-12-22 15:42:04)

Seth, your postings on the condition of Science are usually interesting, but your credibility is deeply compromised by your jeremiads on global warming and Nobel prizes. Yes, science in the U.S. is deeply compromised by the grants system, particularly in medical research. Yes, the PR for new results is frequently abjectly stupid. No, fundamental research into cellular processes is not money wasted, even if no therapies immediately result. No, credible reasons to doubt anthropocentric global climate change have not surfaced, despite trillions of dollars backing anybody who could come up with some. Also, no, language did not originate after large towns arose where people didn't all know one another. It would be hard to list how many ways that doesn't make sense.

Darrin Thompson (2009-12-22 20:09:04)

If there's a poster boy for calling out cargo cult research it's Gary Taubes. I'm surprised you don't have a link to his book from here.

seth (2009-12-23 05:58:30)

Nathan, two questions: 1. Tell me a single fact that's good support for the idea that humans have caused global warming. 2. If you have a problem with my theory that language evolved because it facilitated trading, I'd like to know why.

Nathan Myers (2009-12-23 16:36:19)

Seth, the mechanisms that link human activity to global warming are well known to everyone by now. The people denying their role these days are using transparently dishonest tactics. When somebody has to lie to make their case, you don't need to look at everything else they've said, and figure out what else is or isn't a lie, and see how what's not obviously untrue adds up. The lies tell you all you need to know. You will say that's what the global warming people are doing. I've looked carefully at the places where they are said to be lying, and the closer I look, the clearer it becomes that it is their accusers who are misrepresenting the facts. Everything you've posted has turned out, on further examination, to be at best trivially irrelevant. I don't know why you are so eager to credit deceptions, but your eagerness to pass them on is your least appealing quality. As for language evolution... We've had language for tens, maybe hundreds of thousands of years. During the overwhelming majority of that time, it was a major event to encounter another person one hadn't grown up near. Everyone knew exactly what everyone else nearby had. If someone wandered in, as still happens in tribal areas to today, he would be surrounded with spears and delivered to the headman to decide whether to kill him, escort him away, or take him in as a guest. You and he would have no useful vocabulary in common. If he had anything to trade it would suffice to show what he had, and look over what he was offered; it didn't need language. Traded items did move over hundreds of miles, but there's no need for it ever to have happened between strangers; valuable items could spread far by changing hands over and over, each time between neighboring groups, whether traded or robbed. Anonymity is an extremely recent phenomenon. The best current theory is that language developed first between mother and child.

seth (2009-12-23 18:00:53)

Nathan, the first language functioned as advertisements (both wanted and for sale) do today: It helped bring the two sides of a trade together. Try buying something unusual in a place where you don't speak the language and you'll see what I mean. In human prehistory, as the range of specialized skills increased, and trading networks grew, there came a time when everyone did not know what everyone in their trading network had to trade. It was much easier to spread that knowledge via words than

by physical contact. The same as today. As for global warming, I notice a complete absence of facts in your answer. Please, tell me a single fact that clearly supports man-made global warming. Just one! When you accuse all critics of being "transparently dishonest", I say get real. Stephen McIntyre and Freeman Dyson aren't using such tactics.

Nathan Myers (2009-12-23 20:42:51)

Seth: Please. Language use necessarily developed for tens of thousands of years within family groups before "specialized skills increased, and trading networks grew" – or, indeed, could exist at all. You might as well suggest that airplanes were invented to give us a place to spend all the air-miles we've accumulated. It should worry you to find yourself promoting such a trivially silly idea. Stephen McIntyre certainly is using dishonest tactics. Freeman Dyson isn't saying anything meaningful at all. (Magic trees? Spare me.) I'm not trying to engage you at that level because you've demonstrated again and again that you are really *not interested* in facts in this area. "*It is my mission in life to hold Laurie David accountable.*" That's what I'm taking you to task over. Your behavior has been egregious, and is starting to border on the risible. There is one area where you do well, and that's where you measure things personally. In climate science there's nothing for you to measure, and you're left floundering in a sea of others' statements you're not equipped to evaluate. On language origin, no direct measurements are possible even in principle, and you're off in cloud-cuckooland. Why not spend your time on things you're uniquely good at, instead of chasing around with Sancho Panza?

Mark (2009-12-23 22:40:22)

Are you saying that people's body weight to the pound (or to a reasonable range of pounds) is predetermined, or that where a person's body weight falls relative to others in the same environment is predetermined? In other words, how do you deal with the fact or claimed fact that average body weight or BMI or however you want to measure it is increasing? Is environment completely irrelevant? I certainly don't believe that.

seth (2009-12-23 23:56:46)

Mark, you are confusing me with Jeffrey Friedman. He believes that stuff, I don't.

david (2009-12-24 01:14:37)

Nathan, you should start a blog - I'd read it.

Tedderick (2009-12-24 01:43:59)

Seth, something was pointing out to me about Global Warming Idiots. It's remarkable I never noticed. They have a religious devotion to labeled and awarded authority. When they say 10 billion "scientist" signed a petition. It means the world to them. When a Nobel Laureate says something – that is the word of god. They don't understand science as a body of facts interpreted (though they claim too). They believe science is a priesthood with priest who words must be heeded, and us wee-folk need to get in line.

seth (2009-12-24 04:42:30)

Nathan, please, one fact, just one? Can you tell me one fact that supports man-made global warming? What's an example of Stephen McIntyre using dishonest tactics? What's an example of Freeman Dyson using dishonest tactics? My comment about holding Laurie David accountable was a joke.

Patri Friedman (2009-12-24 09:20:20)

Ditto what Bryan said. Some combination of "consistent failings of science as currently practiced" and "ideas for how science can be done better" would be a kick-ass book. Illustrated with examples of scientific consensus gone horribly wrong (like fat = bad).

Tom in TX (2009-12-24 09:45:37)

Seth, here are the facts that prove man-made global warming: 1. The hockey stick graph. 2. If you don't agree with man-made global warming, you can't publish your scientific papers.

Alex Chernavsky (2009-12-24 10:15:41)

Another example of scientific consensus gone horribly wrong is the idea that antidepressants are effective drugs. See, "Antidepressants Versus Placebos: Meaningful Advantages Are Lacking", by Irving Kirsch and David Antonuccio, *Psychiatric Times*, Sept. 1, 2002: <http://www.psychiatrictimes.com/display/article/10168/47701?verify=0>

seth (2009-12-24 14:37:40)

Thanks for the encouragement, Patri and Bryan. It seems sort of pompous to write such a book. On the other hand the subject really interests me, all the ways scientists actually learn things and all the problems they face. Such as premature consensus. I've also thought of writing a book called *How To Lie With Experimental Design*. I googled the title to see if anyone else had had the same idea – and found that I had, a year ago.

Tedderick (2009-12-24 15:19:33)

Seth, who cares if it's pompous, the fact that you're worried about it – seems to prove you are qualified to write it! It's not like pompousness disqualifies writing. If that were the case, there would only be a dozen books for sale at amazon. We're all waiting to buy another book from you.

Tedderick (2009-12-24 19:16:10)

I also like how Nathan talks down to Seth like he's a disobedient child.

Glen Raphael (2009-12-24 23:33:15)

Tom in TX: Imagine that you somehow became convinced the Hockey Stick graph was invalid and that a more accurate best-guess view of past temperatures is that reflected by the *prior* consensus - one that included a substantial MWP, one that seems to have been close enough to modern temperatures that we can't reasonably be sure that current temperatures are "the warmest in 2000 years". If that happened, would it change your mind about anything \*else\* related to Global Warming? Because the sad truth is this isn't a hypothetical. Given enough time and persistence on your part to evaluate the arguments on their merit (rather than on the basis of who holds them), that is the conclusion you would likely reach.

Glen Raphael (2009-12-24 23:36:22)

On a second read, I think I missed a [sarcasm] tag Tom meant to include...

seth (2009-12-24 23:36:54)

Tom, the more I examine this and try to find out the evidence, the more I tend to agree with you. Those are exactly the two facts that support man-made global warming. Tedderick, that's true, it's hard to avoid being pompous when you write a non-fiction book. Thanks for the encouragement.

Tom in TX (2009-12-25 07:31:29)

Glen, your second reading is the correct one. 8-)

Hal (2009-12-28 13:17:07)

The hypothesis of man-made global warming is a chain of evidence and reasoning, so I don't know how one could list a single fact. But I suppose a key fact is that atmospheric CO2 levels are substantially higher now than they were a couple of centuries ago. If you grant that higher CO2 levels increase temperatures (the greenhouse effect) and you grant that man is the cause of higher CO2 levels (due to burning of carbon containing fuels, and other industrial activities), then there you go.

seth (2009-12-28 13:31:34)

Thanks, Hal. Global temperature has been going up and down for quite a while. Viewed in the light of far more than a few hundred years, the last few hundred years don't stand out. For example, the Ice Age shows how much temperature can vary without human intervention.

Tom in TX (2009-12-30 09:46:03)

Not everyone grants Hal's claim that higher CO2 means higher temperatures: <http://www.climategate.com/german-physicists-trash-global-warming-theory>

Stephen M (Ethesis) (2010-06-18 12:16:35)

There has been some claim that the ice age was brought on by lowered methane levels associated with the extinction of megafauna.

## **William Penn Accidentally Signs Away Pennsylvania (2009-12-23 14:47)**

From [1]Wikipedia:

A more serious problem arose when fellow Quaker Philip Ford, his business manager, embezzled from Penn. He capitalized on Penn's habit of signing papers without reading them by including a deed transferring Pennsylvania to himself, and then demanded more rent than Penn could pay.

Why am I reading about William Penn? Because Penn was [2]an insider/outsider. Born to wealthy parents and educated at Oxford, he became a marginal religious leader, at one point imprisoned for eight months for writing a "blasphemous" pamphlet. Just as self-experimentation empowered me, cheap travel across the Atlantic empowered Penn. He took his followers to what became Pennsylvania.

I believe that cheap new ways of doing things empower insider/outsiders. A modern example is [3]Stephen McIntyre, empowered by blogs. (His blog is [4]Climate Audit.) The classic example is Martin Luther, empowered by the printing press. In contrast, expensive new ways of doing things empower insiders (the already powerful) because only they can afford them. I suppose the classic example is agriculture. Agriculture is expensive because it requires land. Lots of things start off expensive and become cheap, but many do not. The classic example is agriculture (land never becomes cheap); the big modern example is health care. It is very expensive to develop a new drug or new medical technology. This is at the heart of why the health care industry is extracting more and more money from the rest of us, just as government officials in rural China regularly ripoff farmers. I am unsurprised that [5]doctors resist cheap new improvements, the only way out of a terrible situation. In China, people in rural areas migrate to cities; that's how they escape. In Croatia, some friends of mine lived downhill from neighbors who were in the Communist Party. My friends were not Communists. One day they woke up to find that the property line between them and their uphill neighbors had shifted downhill about 10 feet. Unlike William Penn and rural Chinese, my friends could not move – and thus the powerful became more powerful.

1. [http://en.wikipedia.org/wiki/William\\_Penn](http://en.wikipedia.org/wiki/William_Penn)

2. <http://www.blog.sethroberts.net/2009/01/24/not-the-same-study-section-how-the-truth-comes-out/>

3. [http://en.wikipedia.org/wiki/Stephen\\_McIntyre](http://en.wikipedia.org/wiki/Stephen_McIntyre)

4. <http://climateaudit.org/>

5. [http://www.newyorker.com/reporting/2007/12/10/071210fa\\_fact\\_gawande](http://www.newyorker.com/reporting/2007/12/10/071210fa_fact_gawande)

Ben Hyde (2009-12-23 15:16:48)

You might enjoy Puritan Boston and Quaker Philadelphia by E. Digby Baltzell; (I just love the author's name).

seth (2009-12-23 15:56:56)

yeah, Penn wasn't the only religious leader to move to America. I've seen that book.

intellectual\_yokel (2009-12-23 16:01:38)

Whenever you write about climate science I get a little nervous for you, because eco-consciousness is the new piety and blasphemers get excommunicated from the church. You mentioned Feynman before, have you seen this? [http://www.youtube.com/watch?v=\\_EZcpTTjjXY](http://www.youtube.com/watch?v=_EZcpTTjjXY) &feature=related

david (2009-12-24 00:58:57)

that explains the popularity of fMRI research in psychology and economics

seth (2009-12-24 05:01:07)

David, that's a good point. I would put it a bit differently. It explains why rich psych and econ departments are hiring people who do fMRI research. Less well-off departments are not hiring such people because their research is too expensive. intellectual yokel, thanks for the Feynman link. I can't always get YouTube here in China but next time I can I'll look at it. As for climate science, Alexander Cockburn put it well: "the Copenhagen dogmata are a farce. In terms of distraction from cleaning up the pollutants that are actually killing people, they are a terrible tragedy." That's right. Trying to reduce CO2 emissions is a huge distraction from reducing industrial byproducts that kill people, heavy metals, carcinogens, and so on. <http://www.counterpunch.com/cockburn12182009.html>

Stephen M (ethesis) (2009-12-25 17:09:11)

**reducing industrial byproducts that kill people, heavy metals, carcinogens** That is the real tragedy. I was listening to people talk about climategate today. What has always bothered me is that the predictions indicate that it is already too late to avoid disaster (which is obviously not going to happen, given that the data was cooked). I couldn't understand the approaches, given that it was too late under the model promulgated. They should have been advocating how to cope with the disaster that was already unstoppable. One guy said that what they were doing was telling lies in order to get people to do something now before it was too late. Another said they were just looking for a way to corner the grant money and the attention. A third said they were malevolently trying to cause us to all starve to death in the dark after collapsing the international economy. Finally, someone said they were just in the pay of those causing the real problems and being paid off to distract everyone. I've been thinking ever since about that.

Hal (2009-12-28 13:10:34)

IMO the climate situation is pretty clear. Models show that it is too late to avoid disaster, as Stephen M says. However, the future is uncertain, and reality may be better or worse than this. If it is worse, too bad, but if it is better, then maybe it is not quite too late to avoid disaster. By acting now we decrease the probability of future disaster. This message is probably too complex and subtle to be easily communicated, but it seems to be a straightforward summary of the current scientific understanding. Some people say we shouldn't trust our models, but after all they represent our best efforts to apply the collective intelligence and reasoning power of humanity towards understand the likely course of future events. We shouldn't ignore our best forecasts just because we don't like them.

seth (2009-12-28 13:39:13)

Hal, those models haven't been tested, much less verified. By which I mean their predictions haven't been tested. In the absence of verified models, we have to rely on simpler reasoning, such as whether recent climate is unusual.

## Sometimes Black Really Is White (2009-12-24 14:26)

Jenny Holzer, the artist, says, "[1]I get up about four times a night and go back to sleep, or not." I suspect she's not [2]eating enough animal fat. At my local Beijing supermarket yesterday, I asked a butcher to cut the meat off a piece of pork fat. Reverse trimming. At the moment, I think about 180 g of animal fat/day is a good dose. I'm much less concerned about amount of meat. Another instance, I thought to myself, [3]where I want the opposite of everyone else. But that's far more true in America than here. In China but not America, I can buy pork belly at any supermarket; in China but not America, there is vast selection of pickles and yogurt at any supermarket.

1. [http://www.nytimes.com/2009/12/20/magazine/20fob-domains-t.html?\\_r=1&scp=1&sq=jenny%20holzer&st=cse](http://www.nytimes.com/2009/12/20/magazine/20fob-domains-t.html?_r=1&scp=1&sq=jenny%20holzer&st=cse)

2. <http://www.blog.sethroberts.net/2009/10/31/effect-of-animal-fat-on-sleep-more/>

3. <http://www.blog.sethroberts.net/2009/04/22/trying-to-buy-expired-food/>

---

david (2009-12-25 00:39:01)

well, much of the world seems to sleep just fine eating mostly carbs... so does dean ornish

CD (2009-12-25 06:34:05)

Seth, do you mean 180 grams in weight (6.3 ounces) or 180 grams of fat (1620 calories)? Thanks.

Nile (2009-12-25 19:30:09)

Sleep apnea could cause someone to wake several times a night. That was my experience and I believe it is common. I now use a cpap and sleep soundly all night long.

seth (2009-12-26 15:47:23)

David, if by "just fine" you mean "as well as possible" I am much less sure than you that that's the case. Sleep disorders are common in America. And I didn't have a sleep disorder. I slept through the night without waking up. Animal fat made me feel more rested when I awoke. CD, I don't grasp the difference between 180 grams in weight and 180 grams of fat. The fat weighs 180 grams. I weigh it.

Hal (2009-12-28 12:55:53)

Ever since I was diagnosed with ALS this past summer, I have lived in Oppositeland too. Turns out ALS survival is maximized with a high fat, high cholesterol, high calorie diet - exactly the opposite of what is (said to be) good for everyone else. So I'm putting butter on everything and having ice cream every day. I'm not a meat lover but I've been trying to eat bacon and sausage regularly, for my health. Unfortunately lately my appetite has been diminished, probably a side effect of the nerve damage, so the gluttony has not been quite as enjoyable as it was a few months ago.

Dexter (2010-01-08 17:23:46)

Hal, You have simply become ketone adapted because of your high calorie, high fat, high cholesterol diet...thus your desire to eat has diminished. You must try a burger that is 50 % saturated fat. Get the 75/25 at your supermarket/butcher and get some pure ground fat and mix the burger and the fat together. It has a most wonderful, delicious flavor when cooked by itself or cooked in coconut oil. And eating meat and fat and eggs fried in butter or coconut oil is not gluttonous. It is the most healthy diet you can eat. Eating carbs...especially wheat products...is like eating poison....as is eating anything with sugar in it. Sugar: The Bitter Truth. Dr Lustig, Obese pediatrician, UCSF <http://www.youtube.com/watch?v=dBnniua6-oM> Exception: salads with Olive oil & vinegar and green veggies with lots of melted butter.

## **Stupid Noodle Restaurant (2009-12-25 13:57)**

On Christmas, I had lunch in a factory town near Shanghai at a restaurant whose Chinese name means Stupid Noodle Restaurant. It's not a joke. Nor a mystery, if you're Chinese. The reason a restaurant would call itself stupid is because a stupid owner won't cheat you. Next to the restaurant are a small store that sells cables and a small store that sells car batteries. At the restaurant, the knife-cut noodles were very good.

---

Kate (2009-12-29 09:02:01)

When I saw the subject of your post, I didn't think you had good noodles, but the noodles were good, not like the name as I imagined. The name of the restaurant did the same as your post name, but I was cheated by your post name:-)

Kate (2009-12-29 09:05:32)

Well, I am Chinese, if I first saw the restaurant, I might not come in it because of the name more or less, but would like to try if recommended.

Restaurant Lover (2010-03-08 18:55:12)

After having visited China the name makes sense to me. I found that you really have to negotiate with most family restaurants to get a fair price.

## **MSG and Nightmares (continued) (2009-12-26 16:12)**

I am staying in a nice hotel near Shanghai. Last night I dreamed that my stuff (suitcase, etc.) had been put in the hallway outside my room. As – in the dream – I was walking to the front desk to complain, I realized I must be dreaming. This couldn't possibly have happened, I thought. It was that realistic. Later that night I had another mild realistic nightmare – about missing the bus.

I rarely have dreams like that. During the day I'd had a lot more Chinese food than usual. Two big meals. (Lunch, at a restaurant, had included yogurt, incidentally.) Without [1]my friend's experience I would have never connected the Chinese food and the nightmares.

1. <http://www.blog.sethroberts.net/2009/12/18/msg-and-nightmares/>

---

Jim (2009-12-27 05:06:15)

In your previous post, you mentioned "cooked tomatoes and garlic" as also being possible problems. I eat a very large quantity of fresh tomatoes in salads. Should that be safe?

Jason (2009-12-27 05:09:53)

Do they use vegetable oils in China in Chinese restaurants? Cuz I think it may be the overheated veggie oils, not MSG...

seth (2009-12-27 05:25:20)

Jason, yes, I will see if I get the same thing by adding MSG to food I have cooked myself. Jim, I'm not sure but I think the glutamate in tomatoes isn't much available unless they are cooked.

Andrew Gelman (2009-12-27 14:15:35)

Seth: It's cool how you and your commenters are living on such a different part of the ROC curve from most scientists. Most of us are so worried about making a mistake that we wouldn't want to make confident claims based on so little data. But, from your perspective, there's much more to be lost by not acting on these uncertain inferences. It's sort of like, while the rest of us are going around making 95 % intervals, you're making 5 % intervals. Seems like a good idea: you're putting these ideas out there and others can investigate further. Nothing would be gained by you keeping your speculations to yourself (out of fear for embarrassment or whatever reason). I think I'll still go with the expert consensus when it comes to sea level measurements etc., but it's great when you can filter your own experiences through your ideas about psychology and nutrition.

seth (2009-12-27 15:38:56)

Thanks, Andrew. I agree with your overall point, but I don't see any 5 % intervals in this post. I don't say, "wow, the food caused the dreams"; I say essentially that my observations support my friend's earlier claim. While her claim may sound speculative to you, 1. It was based on plenty of observations. 2. Other people found the same thing. 3. Glutamate is a neurotransmitter. 4. Actions based on her theory produced a benefit (her nightmares ceased). When experts (at Scripps) write a paper saying that, as far as they know, MSG is safe (discounting evidence they don't like that says otherwise), and I blog about evidence that MSG causes nightmares and given that evidence is dangerous, I wouldn't say they are the cautious ones. The "experts" have careers to protect. That biases what they say, I'm sure. And not in a good way. It makes them less likely to say or do something that would be perceived as unusual or that could damage their career. You say they "are afraid of making a mistake." It's not that simple. Their (understandable) careerism makes them less likely to make an "active" mistake (such as saying something wrong) but more likely to make a "passive" mistake (failing to point out that something is wrong). But maybe you are talking about my posts in general. My claims about animal fat and fermented food, for example. My comment is: Let's wait and see. You think I'm at a different point on the same ROC curve whereas I think I'm on a different ROC curve.

Tom (2009-12-27 22:43:23)

I think this depends on the field. In nutrition, Michael Eades and Stephan Guyenet have blogged extensively on how researchers actively twist their abstracts to give the impression that the standard low-fat/dietary cholesterol dogma has been reinforced by a study (while the underlying data shows it to have been refuted.)

Tom (2009-12-27 22:44:41)

Whoops, not sure why that post turned out so weird. It was referring to the idea that careerist researchers are likely to make passive – rather than active – errors.

Andrew Gelman (2009-12-28 13:53:03)

Seth: I think you're making a good point (in your reply to my comment) that what counts as "cautious" or "conservative" depends on what is your default. That's one problem I have with the whole Type 1 / Type 2 error thing; it privileges one sort of hypothesis above another.

seth (2009-12-28 19:20:27)

Andrew, thanks for the thought-provoking comment.

Kate (2009-12-29 09:15:39)

There must be too much MSG in your meals so that u made nightmares, according to the experiment in your previous post.

Anti Shoes (2010-01-09 01:00:16)

those problems turn largely on how much money is at stake. Telescopes and colliders don't Energy. Physics is second-oldest, and they're off chasing Strings. Probably

### **James Michener Anticipates Me (2009-12-27 15:12)**

In James Michener's *Poland* (1983), a Polish peasant in a concentration camp tries to survive by thinking about food (p. 532 of the paperback):

He then transferred his imagination to a supper served at the wedding of a well-to-do farmer, where huge platters of sauerkraut, sausage, boiled pork and pickles had been provided, one to each of six tables, and he had helped himself piggishly, moving from one to the other so as not to reveal his gluttony. He recalled this particular feast for two reasons: as a peasant, he knew that the acid bite of the pickled kraut was good for him, all peasants knew that and it was one reason why they survived so long; and he could see in the rich fat of the meats the strength that came from them.

Later he thinks about animal fat:

He imagined himself luxuriating with platters of butter, or grease, or pork drippings, or oil that rich people bought from Spain, or the golden globules at the edge of a roast, or plain lard.

[1]According to Wikipedia, *Poland* was based on "extensive study of Poland's history and culture." Thanks to Nadav Manham.

1. [http://en.wikipedia.org/wiki/Poland\\_%28novel%29](http://en.wikipedia.org/wiki/Poland_%28novel%29)

---

Jim (2009-12-27 18:32:16)

Imaginary gluttony? Interesting. If I imagine that I'm eating lots of fattening foods, would I get fat(ter)? And would the reverse be true: If I imagine I'm on a very low calorie diet, would I lose weight? Seriously. If placebos work maybe 30 percent of the time, that would mean that a placebo diet just might be the world's most successful diet.

cremes (2009-12-27 22:17:10)

Jim, I think you are missing the point. The key element here is that "Poland" mentions the "acid bite" of pickled kraut is healthy and that animal fat will give them strength. I doubt the imaginings will change your biochemistry too much. It's just interesting to hear that pickled/kimchi flavors were known to be healthy to the Polish. What else do these folks know about health from food that we don't?

Jason (2009-12-27 23:35:43)

Great find with those quotes! I keep re-reading them. I'm about to eat fatty ham with home-made pickles and mustard. They remind me of a quote I like that was referenced as an old Dutch proverb: "Eat butter first, and eat it last, and live till a hundred years be past." Also, L Keith's *The Vegetarian Myth* (I think it was that book) has a reference to concentration camp survivors eating the fats first from the foods offered to them when they were freed. So that backs up the novel there too.

Patrik (2009-12-28 01:11:42)

*He imagined himself luxuriating with platters of butter, or grease, or pork drippings, or oil that rich people bought from Spain, or the golden globules at the edge of a roast, or plain lard.* This could also be taken from some turn-of-the-century Hungarian short stories. I think it was Zsigmond Moricz (or Mikszath?) who wrote of a Hungarian peasant invited to a wedding feast for the local noble's daughter's wedding. The peasant doesn't eat for a few days in preparation for the feast and dreams of fat/lard/butter. Ironically and tragically, the peasant dies of over-eating as his body is not used to such rich food. (BTW Moricz's point was the exploitation of the peasants by the nobility.)

Patrik (2009-12-28 01:19:40)

BTW this is off-topic for this post - but completely keeping with one of the themes of this blog. Seth, I think we'd all like your thoughts on this: <http://medicalhypotheses.blogspot.com/2009/02/why-are-modern-scientists-so-dull.html> "Why are modern scientists so dull? **Why are modern scientists so dull? How science selects for perseverance and sociability at the expense of intelligence and creativity** Medical Hypotheses. Volume 72, Issue 3, Pages 237-243 Bruce G. Charlton \*\*\* Summary Question: why are so many leading modern scientists so dull and lacking in scientific ambition? Answer: because the science selection process ruthlessly weeds-out interesting and imaginative people. At each level in education, training and career progression there is a tendency to exclude smart and creative people by preferring Conscientious and Agreeable people. The progressive lengthening of scientific training and the reduced independence of career scientists have tended to deter vocational "revolutionary" scientists in favour of industrious and socially adept individuals better suited to incremental "normal" science. High general intelligence (IQ) is required for revolutionary science. But educational attainment depends on a combination of intelligence and the personality trait of Conscientiousness; and these attributes do not correlate closely. Therefore elite scientific institutions seeking potential revolutionary scientists need to use IQ tests as well as examination results to pick-out high IQ "under-achievers". As well as high IQ, revolutionary science requires high creativity. Creativity is probably associated with moderately high levels of Eysenck's personality trait of "Psychoticism". Psychoticism combines qualities such as selfishness, independence from group norms, impulsivity and sensation-seeking; with a style of cognition that involves fluent, associative and rapid production of many ideas. But modern science selects for high Conscientiousness and high Agreeableness; therefore it enforces low Psychoticism and low creativity. Yet my counter-proposal to select elite revolutionary scientists on the basis of high IQ and moderately high Psychoticism may sound like a recipe for disaster, since resembles a formula for choosing gifted charlatans and confidence tricksters. A further vital ingredient is therefore necessary: devotion to the transcendental value of Truth. Elite revolutionary science should therefore be a place that welcomes brilliant, impulsive, inspired, antisocial oddballs "so long as they are also dedicated truth-seekers."

Aaron Blaisdell (2009-12-28 08:36:13)

Patrick, Thanks for your comment. The description of the ideal science student at the end of the abstract reminds me of the Dungeons and Dragons role-playing game crowd I used to hang out with, except that they were a bit too drawn towards anachronistic fantasy rather than the what-could-possibly-be-in-the-future science fiction type (like Asimov). Methinks we should raid some dungeons to scout talent.

seth (2009-12-28 13:52:02)

Thanks, Patrik. I can't get that link, being in China. I tend to blame our educational system, not the career selection process, for turning out boring people. But I agree there is selection for Agreeableness. As for crummy modern science, I tend to blame status seeking and careerism by scientists. As there was more status to be had (e.g., more money), the field attracted more people who cared a lot about status and more of their time was spent trying to increase their status. How status seeking fits with personality dimensions I don't know, but it certainly correlates with being boring. As for biology/health in particular, the

field has been taken over by a delusion (control of health by genes) which has brought progress to a halt. Perhaps lack of progress has also increased status-seeking and careerism. Lack of something interesting to say would make anyone boring.

Patrik (2009-12-29 14:19:02)

@Seth and Aaron I hold a master's degree in economics from a University of California. I found that the ideal graduate econ student is one who is: -Way over-qualified mathematically, so much that it is a handicap IMHO (Levitt of Freakonomics fame has also talked about this.) -Willing to spend inordinate amount of time running regressions without actually asking themselves about the underlying logic (or lack of) the relationships -Doesn't rock the boat and ask questions that have no answers -Lacks creativity — I am painting with a very broad brush, but in my mind, that these people are akin to human computing machines, not actual "thinkers". Give them input, they will process, and spit out. But having the ability to think/decide what the input should be, how and if it should be processed, and what the output might look like was not a desired trait.

Stephen (2009-12-30 19:52:07)

Hey Seth, I'm curious - do you get regular blood tests (e.g. renal, liver, lipid, urate) or blood pressure tests? I think it would be interesting to see if there's any relationship between your diet and those sort of results because "cholesterol lowering diets" for example, often advise cutting out animal fat completely and only eating specific types of lean white meat such as chicken and fish.

### **Chimamanda Adichie on Academia (2009-12-28 15:54)**

After a few years of being a writer, [1]Chimamanda Adichie – author of my [2]Short Story of the Year – wondered if she should be a professor. (Her father is a statistics professor.) And she wanted to learn more about Africa. So she enrolled in an African Studies program at Yale. In [3]an interview, she said:

I met very lovely people at Yale, so it wasn't an entire waste of time. . . . After two years of the program . . . academia I discovered – particularly political science as it is done in the US – is not about the real world. It's about academia. I would joke and say that what they do is they create straw men, and they beat them down.Â While all this is going on, the real world is going on in a parallel universe. It is completely disconnected from what happens in academia. I didn't understand most of what I read. It wasn't written in English, it was written in political-science jargonese.

This is the usual critique, but it is well-put. If you spend enough time in academia, as I have, you can see it becoming that way, disciplines turning inward, [4]becoming less and less interested in reality. Becoming more and more ivory-towerish. Statistics, for example, became less and less concerned with real-world problems; but I could say the same about every other area (engineering, English, etc.).

This is glaringly obvious, roughly as clear as the sun rising in the morning, but some Berkeley professors denied it. "English departments have really lost their way," I would say. No they haven't would be the reply.

---

Jeff (2009-12-28 20:24:58)

I'm in the natural sciences and this hasn't been my experience, though I can see how it would be the case with – particularly – economics and political science.

seth (2009-12-28 23:06:27)

Jeff, I think the older the science the less clear is the trend – because it has been going on longer. Psychology and statistics are much younger than physics and chemistry.

Nathan Myers (2009-12-28 23:45:02)

Astronomy is the oldest of all, and astronomers are off in cloud cuckoo land chasing "Dark Energy". Physics is second-oldest, and they're off chasing Strings. Probably those problems turn largely on how much money is at stake. Telescopes and colliders don't come cheap these days. Surprises are hazardous. In economics, it costs nothing to study practically anything, so it's probably the political consequences that mire them. According to Alan Greenspan, ironically, economists in the U.S.S.R. were free to study anything they liked, because no one paid them any attention, and they had no reliable domestic data, so they studied western finance. Paleontologists still seem admirably well connected to the data, although their poverty can make them touchy and moody. Engineering is about as stable as any department can be, because if their stuff doesn't work, *everybody* notices.

seth (2009-12-29 01:08:54)

Yes, paleontologists seem immune from this. Engineering however is a prime example. Engineering profs work on stuff that will – 95 % of it, one grad student said – never be used. One engineering asst prof complained to me how little her department cared about actual stuff. They liked theory.

ChristianKI (2009-12-29 03:23:05)

It's not a problem if 95 % of the stuff doesn't get used if they follow big ideas that have a chance of success of 5 % but a potential massive payoff. It only becomes a problem when you can say with near 100 % certainty of 95 % of the projects when those projects are started that they won't be successful. As a lot of fields grow with Moore's law and a good chunk of the patents come out of academia engineering works.

Jeff (2009-12-29 10:21:29)

Nathan, you clearly have only a layman's grasp of astronomy and physics. It's typical for laymen to get caught up in semantics – "dark matter", "the god particle", "superstrings", etc – without having the faintest grasp of what those words represent or their relevance and importance in human intellectual achievement.

Nathan Myers (2009-12-29 16:45:08)

Jeff: If you can point to a single prediction subsequently observed from either of the Dark Energy or String notions, I will concede utterly. I didn't mention dark matter, but that has also not produced testable predictions, except insofar as they have frequently been able to account for anomalous observations by assuming appropriate amounts of it sprinkled about. This might count for *something*, because it's easy to imagine cases that couldn't be accounted for by any such distribution, but I don't suppose we'd hear much about those cases. Talk of a "god particle" is unadulterated PR; the less said about it the better. Seth: To ask for "facts supporting" a notion isn't meaningful, but successful predictions can count for a lot if nothing else predicts the same. Engineering departments rise and fall, but people notice where actual advances come out of.

seth (2009-12-29 17:04:29)

Nathan, you called Stephen McIntyre and Freeman Dyson "dishonest", I asked for examples, you have failed to provide them. Duly noted.

Nathan Myers (2009-12-29 17:31:02)

Seth: I didn't say Dyson was dishonest, I said his comments were meaningless. He has been promoting magic tree-breeding for many decades. He has inspired nobody to work on it at all, but magic trees are all he offers. Detailed McIntyre takedowns are easy to google up. If you don't care what they say, they're even easier to ignore. Are you aware of the concept of selection bias?

Nansen (2009-12-30 16:53:43)

@ Nathan Myers Could you please clarify somewhat your comment, "Surprises are hazardous." ? From the context, you seem to be saying that experimental surprises would be hazardous to continued funding of gigantic equipment – which leads astronomers and physicists to avoid testable predictions. Have I got that right?

Nathan Myers (2009-12-30 20:46:09)

Nansen: That's the theory. Of course the reality is more interesting. Researchers know not being tested leaves them in limbo, but have little choice about what to work on.

Alex Chernavsky (2009-12-31 12:01:30)

See also this excellent article called, "Letter from Yale", by Helena Echlin: [http://web.archive.org/web/20040427073259/http://www.zmag.org/letter\\_from\\_yale.htm](http://web.archive.org/web/20040427073259/http://www.zmag.org/letter_from_yale.htm) (Give it a moment to load – the original seems to be unavailable, so I've posted a link to the Internet Archive.)

### **Science of Everyday Life: Why "Boys and Girls"? Why Not "Girls and Boys"? (2009-12-29 14:14)**

I try to connect my self-experimentation to other intellectual activity. One broader category is [1]the stunning single case – the single example that makes you think new thoughts. Another is [2]superhobbies (activities done with the freedom of hobbyists but the skills of professionals). Superhobbies lie between hobbies and skilled jobs. A third is my position as [3]an insider/outsider. I was close enough to sleep research to understand it but far enough away to ignore all their rules about what you can and cannot do. I had the knowledge of an insider but the freedom of an outsider.

A fourth broader category is the science of everyday life – meaning science that involves everyday life and can be done by most of us. My experiments cost almost nothing, required no special equipment or circumstances. They involved common concerns (e.g., how to sleep better) and tested treatments available to everyone (e.g., standing more, eating more animal fat). [4]A post by Mark Liberman at Language Log has a nice non-experimental example of this category. The question is about word order in gender pairs. Why do we say "boys and girls" more often than "girls and boys"? Or "husbands and wives" more often than "wives and husbands"? There are plenty of such pairs, not all with male first (e.g., "ladies and gentlemen"). The several possible explanations can be tested in lots of ways that require no fancy equipment or data. As Liberman says,

A smart high-school student could do a neat science-fair project along these general lines.

A great feature of what Liberman is proposing is that the answer isn't obvious. There isn't a "correct" answer as there is in so much of the way that science is taught (e.g., physics labs, demonstrations). If I searched for examples of "science of everyday life" i would merely find canned demos, which have little in common with the practice of science. Whereas Liberman's idea gets to the heart of it, at least the hypothesis-testing part.

Thanks to Stephen Marsh.

---

John (2009-12-29 20:42:33)

Actually, there is a simple and coherent (and testable...in this way) theory that explains this. Long ago, Roman Jakobson, the Slavic linguist who worked for years at MIT, discussed the notion of markedness in both phonological but also semantic/lexical relations. Briefly, the first term in such a pair is generally the "unmarked" term, whereas the second is the marked one. If one of them can be used as the generic, it will be the unmarked one. In Romance languages, for example, if you ask "do you have brothers?" the word for "brother" can be either "brother (m) or sibling(m/f)". The word for sister is restricted only to female siblings. The ways that noun-phrase marking languages do this (and transform over time) is at the boundary of culture and cognition—see the signal (and early) MA thesis by Deborah Spitulnik, a senior linguistic anthropologist at Emory, on the nominal class struggle in ChiBemba (nominal here relates to nouns, not to other senses of the word), and the now classic article by linguistic anthropologist Michael Silverstein (emeritus at Chicago) called "Language and the Culture of Gender..." as well as more recent work on language and gender in ling anth and sociolinguistics by scholars such as Penelope Eckert, Kira Hall, Mary Bucholtz and the like. For specific cites see Google Scholar but these are all worth reading.

ceva (2009-12-30 14:19:36)

'In Romance languages, for example, if you ask "do you have brothers?" the word for "brother" can be either "brother (m) or sibling(m/f)". I don't think that this is the case - certainly not in Romanian, almost certainly not in French or Italian.

John (2009-12-31 00:13:21)

I should have said "Western Romance," i.e. Spanish and Portuguese where this holds true as far as I was certain. Note that the generic term for "sibling" in French, "la fratrie" is derived from the Latin for brother (and it is used in academic writing, if not as often in conversation), but here the derivation still reveals the unmarked class subsuming (or -erasing-) the marked class, which is more specific in reference (cf. the illustration at [fr.wikipedia.org/wiki/freres \\_et \\_soeurs](http://fr.wikipedia.org/wiki/freres_et_soeurs) "Deux soeurs forment une fratrie.") I wonder if the fashion of using "freres et soeurs" (sorry no accentuation on this keyboard) is a later development in French, such as the recent innovation of using "he/she" and "his or her" in English. In Italian (according to the Italian wikipedia article on "fratello," it can be used for either males or males and females (fratelli) but "sorelle" must be used if referring to a group of only females (<http://it.wikipedia.org/wiki/Fratello>), as in Spanish. Not sure about the other Romance languages. Of course none of this impedes people from saying "brothers and sisters" (hermanos y hermanas) if they want to—but currently, that would be marked in discourse because you would be doing extra linguistic work to specify the females. In any case, the main point is still there. We more commonly say "men and women" in English (at least the Englishes I grew up with," but reverse this for the vocative "Ladies and Gentlemen," and in other such phrases "Meine Damen und Herren" perhaps a marked form to mark special occasions through reversal of order? Anyone who wishes might look up the work of Linda Waugh 1982 "Marked and Unmarked: A choice between unequals" and the interesting review and critique of the uses of markedness in Martin Haspelmath "Against Markedness." In social anthropology, Bourdieu's article on the Kabyle house brings in the notion of the inequality between marked and unmarked to understand the inequalities of norms of lived space.

ceva (2009-12-31 12:15:23)

I presume that one term of a m/f polar pair is used as a generic because the advantage gained from appealing to one gender more than makes up for the disadvantage of potentially alienating the other. This then allows for terms that are unmarked in one context to be marked in another - for instance, I would expect the relevant pairs of terms to switch their markedness

in a predominantly female setting ('girls and boys'). I think that this also applies to marked/unmarked cultural signifiers and their reception. In a formal social occasion, there is more power to be gained for a man by overt appeal to the women in company than to his fellow men (he is more likely to be courting the former). Perhaps women are less prone to say 'ladies and gentlemen', or do so with less enthusiasm.

John (2009-12-31 20:11:54)

It's not that anyone designated these linguistic patterns (i.e. "appeal to one gender") in order to bring in or alienate anyone. It's difficult not to read this in terms of discursive power but it's not a simple relationship (grammatical marking != social power)–for example, some languages such as Turkish, have no grammatical gender. Does that imply that there is less sexism in Turkey? Some languages (such as English) have very little overt morphological gender marking on nouns (ex: "doctor" and "nurse" are -not- gendered in their form as nouns (actor/actress are). But many people understand "doctor" as male and "nurse" as female despite real-world evidence to the contrary. And generally, the markedness relation is generally part of the understanding of the noun, not the momentary social situation in which it is used. Grammar is -not- about appealing or courting or other social functions, although of course it is the matrix through which we perform these actions. AnBut intentional praxis can change language, albeit often in unexpected directions. The general loss of "thou/thee" in English was hastened by the Quakers, who continued to use thou as singular and you as plural, refusing the shift where thou was understood as familiar and you as a term of distance. They seemed rude to the majority of English at the time, who then started moving en masse to use only you, reserving thou/thee for religious purposes.

ceva (2010-01-01 03:17:30)

Well, people generally understand 'doctor' as male as doctors are more likely to be male. I dare say that the opposite would be true in a society in which the majority of doctors are female. In a society in which there are equal numbers of male and female doctors, then I would expect the understanding of the term to be sexed following the sex of he who is doing the understanding. 'Mom and dad' is so ordered as women generally have more of a say in their children's upbringing, 'men and women' as men tend to be the power brokers outside of the home. Merely looking at 'who' is talking and 'to whom' they are talking provides satisfactory explanations for orderings of polar pairs. This also allows for reversals of markedness according to the context of the 'momentary social situation' (re what I mentioned about predominantly female workplaces). I suppose that the general grammatical make-up of a language provides certain hard-to-change parameters within which patterns of use develop, so Turkish sex generalisations would still exist, but be expressed within such parameters implicitly cf. "Gender in a genderless language: The case of Turkish", by Friederike Braun What might disconfirm my thesis would be to find a language which presents three possibilities: m/f or neuter, with its users choosing neuter forms (or the form that normally signifies the minority part of the group) to address unevenly mixed dual sex groups (ie. with one sex constituting a clear minority). I propose that this would only be the case if either a) there is something especially intractable about the language's grammar that prevents a direct-appeal-to-one-sex being expressed or b) the general social context has little or no sex differentiation, so appeal to one sex or another would go against habit or could backfire (change in social context might explain the rise in use of 'they' for he/she and would be the test of invented pronouns, such as ze/zir).

John (2010-01-01 23:17:08)

The only problem I have with your argument is the intentionalist fallacy–grammatical categories and noun class systems in themselves were not "designed" to appeal or not to anyone. It is really a historical accident that Romance noun classes are called "genders," as the way nouns are assigned to them is arbitrary–there is no real gender in the sun or moon although speakers may feel that the noun class assignment is not arbitrary, it is. Case in point–while sun is marked as masculine and moon marked as feminine in Romance langs. generally and many people feel this is natural and obvious, in German it is the other way around, and those speakers also feel it is natural and obvious. These are truly arbitrary assignments in the linguistic system (in German "girl" (das Maedchen) is neuter!), and go well beyond gender (do "leaf" or "root" or "ceiling" have any innate gender?). Where I think we really agree is that there are potentially reciprocal conditioning effects between cultural notions and "feelings" about the naturalness of the assignment of gender to noun classes and the subsuming of the mixed gender case into the masculine plural. But as these are explicitly marked surface level forms, they are easier to rise into consciousness and oppose through practice (unlike, say, count and non-count classes in English, which are not clearly morphologically

distinct). However, this doesn't appear to happen outside of an ideological program (change in the social context, as you point out)-which may have unintended effects. For example, it is surprisingly common for female US English speakers whether feminist or not to use "Hey guys" to address an all-female group instead of the all-female "Hey gals" (as reported by my female and feminist roommate). Again, "guys" while originally a term of address for men, becomes the preferred generic informal term of address, even in an all-female group. Why? While I also agree with you that the generic should not be masculine (vs. instead of *la fratrie* (combo of feminine noun class with masculine (*frater*) root, German uses "*das Geschwister*teil," neuter all the way through), the pattern of such noun class use is resistant, but not immutable-I think you would really like reading Spitulnik on ChiBemba and Bantu langs. more generally, as they have what is sometimes called "supergender" with many, many noun classes that do get reinterpreted and reassigned through practice-what she calls "nominal class struggle."

### **Why I Love the Internet (2009-12-30 13:31)**

Because it allows me to read stuff like the following, an anonymous comment on [1]a post by Washington Post reporter Andrew Freedman. Freedman complained that 2009 saw "erosion of clarity about climate":

Mr. Freedman, the expression you're struggling to avoid with regard to your propaganda in support of "mainstream climate scientists" is one devised by Nobel laureate Richard Feynman in 1974.

The words are "Cargo Cult Science," the advancement of scientific seeming without scientific integrity. Not just error but flagrant dishonesty. Fraud. Criminal conspiracy, too.

That's your "mainstream climate scientists" in a neat little bundle of filth.

The Climategate revelations - the obvious work of an insider, a whistle-blower, not an outside hacker - show how the CRU correspondents cooked their data, manipulated their crooked computer models, and generally schemed to defy the UK and US laws covering Freedom of Information, including indications that Prof. Jones of the University of East Anglia suborned not only the compliance officers of his University but also one or more officers of Her Majesty's government in the ICO.

Thirty wonderful years of duplicity, mendacity, "cork-screwing, back-stabbing, and dirty dealing."

And you, Mr. Freedman, are defending this. Tsk. But what the hell have we any right to expect - other than this act of accessory after the fact in a multiple-count felony investigation - from anyone associated with The Washington Post?

Courtesy of Climategate, we now have stunning "clarity on climate."

This isn't exactly brilliant but it is better (better-written, better-argued, more heartfelt) than 99 % of mainstream journalism, such as the Washington Post or New York Times. One big function of journalism is "to afflict the comfortable." That includes science journalism. When a journalist, [2]such as Elizabeth Kolbert, cannot form her own opinion but must accept what powerful people tell her, she cannot "afflict" them.

I think there is a psychological principle at work. It has different names. One is [3]belief in a just world. The rich and powerful think they deserve their good fortune. Another is [4]cognitive dissonance. If I did this crummy job for low pay, I must enjoy it. Yet another is [5]Stockholm Syndrome. The science journalist thinks: If I trust this scientist, he must be trustworthy. But he isn't. Outsiders, such as the anonymous commenter, are not subject to this effect and see things more clearly.

---

Andrew Gelman (2009-12-30 13:43:01)

I'll avoid the temptation to be sarcastic here and just say that, no, I don't trust the opinions of an anonymous letter-writer to the Washington Post over an actual expert such as [1]this guy. I'm not saying that an anonymous letter writer can't be correct; I just think I'll go with the experts on this one. Nor do I believe that that letter is better-argued than 99 % of what's in the newspaper. I do believe it's heartfelt ("bundle of filth," etc.) but I don't see that as such a virtue in this case!

1. <http://geosci.uchicago.edu/~rtp1/>

Pedro J. (2009-12-30 14:38:00)

Not getting your point. Freedman's main point is quite clear (apart from true) in this paragraph "Increasingly, individuals with backgrounds in a wide variety of fields, ranging from statistics to electrical engineering, are taking to the Internet to conduct their own climate science research (or to poke holes in someone else's work, which, in theory, can be a valuable service in science) and share it with the world. Their efforts are making an impact. For example, popular climate skeptic blogs such as Climate Audit and wattsupwiththat were instrumental in pushing climategate into the mainstream press, while mainstream researchers' sites, such as RealClimate, were put on the defensive." The best example of Cargo Cult Science is people doing parallel research outside the peer-review process.

seth (2009-12-30 14:49:13)

Andrew, I wasn't comparing the commenter to an expert, I was comparing him or her to a journalist. Pedro, my point is that the commenter's response to Climategate is better than Freedman's. Better in the sense that I'd rather read the comment than what Freedman wrote.

q (2009-12-30 14:53:06)

i've been having trouble making heads and tails out of climategate from a neutral fact point of view. clearly there is the appearance of poor decisions on the part of a few scientists. clearly a lot of people are making use of it to support their ideologically driven agendas. those two datapoints are not helpful in terms of creating my opinion on global warming; or rather only the latter is only helpful, and only insofar as it provide easy markers on which i can recognize an opinion that is ideologically driven from one side. without a lot of additional context i can't say whether what the scientists did rises to the level of fraud, and even if so, i can't judge how important these people were in the overall debate. i know you enjoy the internet, seth, but it's also clear that it – just as any communication media – is full of uninformed people pushing angry views in an attempt to stir up waves of angry people. it's a soapbox. it's very cheap to shout angrily on the internet, but as far as i am concerned i'd rather have a rational discussion. so here's my request: if the climategate emails are important, a couple things should exist, and maybe you can point me to them: – a resource that explains these emails rationally in context and which keeps the temperature low – some people who have materially changed their minds about global warming as a result of this new data

Pedro J. (2009-12-30 15:20:50)

"a resource that explains these emails rationally in context and which keeps the temperature low" Wikipedia is doing a good job. There are lost of references there [http://en.wikipedia.org/wiki/Climatic\\_Research\\_Unit\\_e-mail\\_hacking\\_incident](http://en.wikipedia.org/wiki/Climatic_Research_Unit_e-mail_hacking_incident)

Nathan Myers (2009-12-30 18:05:58)

The Washington Post is a remarkably low standard of comparison, these days. The letter really says nothing more than "Climategate makes me think of cargo-cult science", which the writer certainly thought before the e-mails came to light. I have had doubts about climate science, but the more I look at details, the more confidence I have in the results presented. (That's not to say I expect high water levels a century on; a global freeze seems an equally likely ultimate outcome, but not a more appealing one.) Looking into the supposed "smoking guns" in the e-mails, I find simply nothing there. I also find lie after lie about what they are supposed to mean, and the lies are all on one side. When you find that somebody feels they have to deceive you to make their case, you don't need to know much else about their case.

Ben Hyde (2009-12-31 14:54:45)

I believe this is well covered in <http://xkcd.com/239/> , but did Martian Luther wear a cape?

Hal (2009-12-31 16:30:45)

I suspect that the practice of science exposed in climategate is not an anomaly but is common. Tribalism, attempts to suppress the voice of opponents, vicious insider battles, hiding inconvenient facts, all are part of the scientific world. Science is not at all practiced as per the idealistic descriptions. And yet, science works. No one can deny the reality of scientific progress over the last several centuries. Even with all its flaws, even with every human error and bias as part and parcel of the process, science works. In fact I suspect that flawed, vicious, spiteful science is probably MORE effective than would be science by the book. Nothing motivates scientists like the chance to show their enemies are fools, and a virtuous, objective science would never have such devoted practitioners. Climategate gives us no reason to distrust the conclusions of climate science, because science works despite (or perhaps even because of) the kind of practices exposed in those emails.

## **The Unwisdom of John Mackey (2009-12-31 15:56)**

John Mackey is the founder of Whole Foods, a business I greatly respect. But he's not always right.

“You only love animal fat because you’re used to it,” he said. “You’re addicted.”

(From [1] a profile of Mackey in The New Yorker.) I discovered that [2] animal fat improved my sleep when I overcame my (learned) repulsion and ate a lot more than usual. I think it's obvious that fat tastes good for unlearned reasons. For reasons not based on experience. (Babies like fat. Animals similar to us, who have never eaten fast food, like fat.) Mackey's comment is an example of a larger disregard of this. Professional nutritionists, including nutrition professors, have ignored the general point that our food preferences must somehow be good for us. I'm not saying all fat must be good for us – just the fat we ate when our liking of fat evolved. The idea that evolution would shape us to like and eat a food component that's bad for us makes no sense.

1. [http://www.newyorker.com/reporting/2010/01/04/100104fa\\_fact\\_paumgarten?currentPage=all](http://www.newyorker.com/reporting/2010/01/04/100104fa_fact_paumgarten?currentPage=all)

2. <http://www.blog.sethroberts.net/2009/10/31/effect-of-animal-fat-on-sleep-more/>

---

Helen (2009-12-31 16:31:26)

I haven't read the whole article yet, but, to my satisfaction, he looks terrible. I do appreciate Whole Foods, though, for having some grass-fed animal products and other unadulterated food.

Bryan (2009-12-31 16:51:05)

That quote jumped out at me too. Gary Taubes would replace "animal fat" with "simple carbs" like rice, potatoes, bread, and pasta.

Anthony (2009-12-31 17:15:37)

Seth, how would you respond to the claim that certain food likings (as in fat) are good for us short term but not long term (say, they might take several years off our life) - and that the immediate benefits were large enough to outweigh the longer term detriments evolutionarily speaking?

AntiAntiCamper (2009-12-31 17:54:38)

Sorry mate but I think I gotta take this blog off my list. I respect your ability to go your own way. But recently you've been saying things that are counter-logical. Consider: quote: ...the general point that our food preferences must somehow be good for us. I'm not saying all fat must be good for us - just the fat we ate when our liking of fat evolved. The idea that evolution would shape us to like and eat a food component that's bad for us makes no sense. Our food preferences were the result of natural selection at a very different point in human evolutionary time. Food preferences that once served a useful purpose may very well be harmful at this time, in the present context. Perhaps animal fats help you sleep better. OK. Good. But the general argument simply does not hold. Also, you recently claimed to measure sleep quality, subjectively, to an accuracy of one part in one thousand. I don't believe this accuracy at all.

Joe (2009-12-31 19:24:39)

I think it's obvious that SUGAR tastes good for unlearned reasons. For reasons not based on experience. (Babies like SUGAR. Animals similar to us, who have never eaten fast food, like SUGAR.)

seth (2009-12-31 20:28:50)

Joe, there was no sugar 100,000 years ago. I'm sure that whatever tasted sweet back then was good for us, at least in the amounts that were available. Israel Ramirez thinks sweet things taste good so that we would eat more plants. Fruit, for example. AntiAntiCamper, food preferences that worked 100,000 years ago may now be harmful because we can fulfill them in ways that weren't available back then. My point is that our basic nutritional needs are unlikely to have changed. If we needed a certain kind of fat back then we probably need it today. Anthony, nothing I know about in nutrition supports the idea of short-term benefits but long-term costs. Vitamin C: short-term benefit, long-term benefit. Etc.

lance (2010-01-01 02:59:17)

I've noticed a surprising amount of resistance to the the caveman/paleo theories of nutrition, at least when I've proposed it to acquaintances and family members. I think people resist the implication that the most expensive diet is the healthiest . . . it goes against democratic sensibilities.

Rashad (2010-01-03 02:15:16)

I think the problem behind the assumption is that evolution didn't necessarily select for foods that contribute to longevity. The strongest effects of natural selection occur up to parenting age. While having older humans around could certainly help the survival of a community, anything that improved odds of surviving and reproducing in the first 20-40 years would have the highest favorability. Hence, it seems entirely conceivable that something like fat, which is the densest source of calories and very useful to those with inconsistent access to food, might have long-term consequences that evolution didn't care about. Now, I'm not saying that this is necessarily right, but it is certainly plausible. So I don't think you can say that anything that has a demonstrated positive effect and we evolved to like, is necessarily something that is good for overall health and long-life.

seth (2010-01-03 06:58:17)

Rashad, I'm pretty sure that grandparents help their grandkids more when they are alive than when they are dead. As for "necessarily" - we can't "necessarily" say anything about nutrition. If you know of data that cast doubt on my conclusions or assumptions that would be more convincing.

michael vassar (2010-01-04 09:16:34)

The conventional wisdom is that sugar other than honey and fat other than blubber weren't available in modern quantities and purities until agriculture.

Patrik (2010-01-05 01:01:55)

The anti-saturated fat misinformation cascade has done irreparable damage.

Vesna (2010-02-03 05:40:57)

Sugar \*including\* honey was not available in modern quantities and purities until recently. Agriculture was invented some 10,000 years ago. Sugar became cheap and plentiful with the advent of the European powers developing warm-weather colonies around the globe suitable for sugar plantations. Honey became cheap and plentiful much later. The 19th century saw the invention of human-made beehives with removable, replaceable square frames that bees spontaneously fill with honey. Until then, humans had to smash a beehive (and usually kill the bees) to get at the honey. Honey in any controllable, scalable quantity dates only from that time. Modern, large-scale, commercial beekeeping involves keeping a cheap syrup solution near the beehives for the bees to visit. Cheap honey comes from bees that never lit upon a flower. I suppose you could call the resulting product "pure" in that it is simpler, lacking the complexity of wild or artisanal honey, in content and in taste. As far as the "purity" of modern fat, I don't understand what is meant by this. True, olive oil has been available in large quantities since the dawn of the agriculture. (Only in its "extra-virgin" form, though.) But modern plant oils, like canola and cottonseed, are the result of complex, high-tech processes like bleaching and hydrogenation that result in substances that may appear "pure" to the naked eye, but they are so altered from any naturally occurring fats that our animal bodies cannot safely metabolize them. The problem with them does not inhere in their quantity, but in their quality: they are not fit to eat. Why marginalize blubber? The fat of many types of marine fauna supported the human race throughout our history. Arguably, it was eating all those high fat creatures so easily captured along shorelines that enabled our brains to grow big enough for us to figure out how to hunt down faster, stronger land creatures. Humans have long thrived on a lot more fat than many well-meaning people allow themselves today.

Jim (2009-12-31 19:43:28)

Seth, your persistent questions about global warming are thought-provoking, but I think you may be overlooking many other issues related to manmade pollution. These include well-documented damage to our air, land, and water, and the resultant

extinction of many animal and plant species which are vital links in our food chain and bio-system. By all means, insist that global warming groups show their evidence, but don't trivialize the overwhelming evidence of related environmental destruction.

seth (2010-01-01 03:43:13)

Jim, as others have said, to focus on reducing carbon dioxide emissions when what really needs to be reduced are dangerous pollutants would be a terrible mistake. A terrible mistake that is currently being made by many people. As you say, it's obvious that pollution is a problem. I live in Beijing part of the year! My questions about global warming will help us put our resources, our power of innovation, where they will do the most good for the environment.

Hal (2010-01-01 12:23:14)

Seth do you intentionally pick and choose articles which support your current view of climate change? If so, are you worried that this could bias your opinion and prevent you from taking an objective view of the situation? In other words, do you see yourself as a partisan who has a side that he wants to see win, or as an impartial observer who wishes to know the truth and is open-minded about evidence from all directions?

seth (2010-01-01 15:39:38)

Hal, I pick articles that I think are revealing. It'd always possible that they reveal I'm wrong. (See the next post.) I'm not sure what it means to be "impartial" but yes I want to know the truth. I've been searching for evidence I'm wrong about this.

Dave (2010-01-04 20:42:07)

Re: the global warming article - It's a common fallacy to want to use "extreme" statistics (high/low records for example) to demonstrate trends, but the way you measure the standard error in the tail of a normal distribution is different than the way you measure standard error in changes in the mean. The error bars are much, much bigger when you look at extreme statistics, so what might appear to be a real statistically significant change will in reality not be statistically significant (and therefore, not real). Bottom line - don't even bother looking at studies that use extreme measurements. Dave

### 5.1 January

#### The Door-in-the-Face Effect (2010-01-01 05:08)

One of my Tsinghua students, a freshman, has been getting up early Saturday mornings to go to nearby Beijing University to attend a 4-hour intro psych class for graduate students. "What does the teacher talk about?" I asked. He showed me his notes. "The Door-in-the-Face Effect" was the heading of a little graph he'd drawn. "What's that?" I asked. "If you get someone to help you in a little way, they're more likely to help you in a big way later," he said. I knew that result. It's called the [1]foot-in-the-door effect. "Your teacher made a mistake," I said.

I was wrong. There is a [2]door-in-the-face effect very similar to the foot-in-the-door effect. The door-in-the-face effect is after you make a big request that is turned down, you are more likely to get agreement to a small request.

1. <http://psycnet.apa.org/index.cfm?fa=buy.optionToBuy&id=1989-27177-001&CFID=27027292&CFTOKEN=43085010>
2. [http://pdfserve.informaworld.com/986334\\_770849120\\_713690244.pdf](http://pdfserve.informaworld.com/986334_770849120_713690244.pdf)

---

Mike Kenny (2010-01-01 08:29:51)

hm, that reminds me of the movie 'choke' i just saw, in which the main character induces choking in a restaurant in order to get someone to do the heimlich maneuver on him, and then these people tend to send him money, the idea being once someone saved your life, they'd want to help you further. to me the idea sounded implausible—it's slightly different than the above ideas in that it's about someone helping you in a big way wanting later to help you in smaller ways later.

Ä...se Innes-Ker (2010-01-02 05:39:44)

It is a fairly well established effect within the psychology of persuasion (nicely described in Cialdini's book Influence - or, rather one of the many variants of it). I teach it in a course on marketing psychology. On top of working (asking for a big thing and then backing down and asking for something smaller - which is then accepted), it makes the person that this is used against feel good about accepting the second request (after all, one has met the requestor half way). My 6 year old son intuitively understands this: Beginning by asking for something he will not get (chocolate), then backing down to ask for a cookie (and getting it)...

david (2010-01-03 19:30:30)

Mike, you should the book version of Choke. It's much much much better than the movie. That's often the case and especially so with Choke, however with Fight Club (book by the same author) I'd say the movie was slightly better than the book.

#### Academic Horror Story (Harvard University) (2010-01-01 15:21)

Are the heads of large companies worse than the rest of us? Aaron Swartz said as much when, in a discussion of Ken Auletta's Googled, he [1]called them "sociopaths". Nicholson Baker seemed to have had similar thoughts when

he [2]said about the same book that "what Auletta mainly does is talk shop with C.E.O.'s, and that is the great strength of the book."

Lawrence Summers, now in the Obama administration, was head of Harvard University, one of the world's most powerful companies, from 2001 to 2006. Everyone knows about Summers'[3] repeated tendency to do the incredibly inappropriate thing. A generous interpretation of those incidents is that Summers had lived a sheltered life. I believe they were signs of something much worse – signs of pathology – based on what he did to one of Harvard's best employees:

Back in 2002, a new employee of Harvard University's endowment manager named Iris Mack wrote a letter to the school's president, Lawrence Summers, that would ultimately get her fired.

In the letter, dated May 12 of that year, Mack told Summers that she was "deeply troubled and surprised" by things she had seen in her new job as a quantitative analyst at Harvard Management Co.

She would go on to say, in later e-mails and conversations, that she felt the endowment was taking on too much risk in derivatives investments, and that she suspected some of her colleagues were engaging in insider trading, according to a separate letter written by her lawyer that summarized the correspondence.

On July 2 Mack was fired. But six years later, the kinds of investments she allegedly warned about did blow up on Harvard. The endowment plunged 22 percent last summer, in part due to the collapse of the credit markets. . . .

Mack, who holds a doctorate in mathematics from Harvard, had been with Harvard Management for just four months when she approached Summers. She asked him to keep her communications confidential, or risk making her life "a living hell."

But on July 1, Mack was called into a meeting by her boss, Jack Meyer, then the head of Harvard Management.

The next day Meyer fired her, according to the letter from her attorney, Jonathan Margolis, a copy of which was obtained by the Globe. Meyer told Mack that she was fired for making "baseless allegations against HMC to individuals outside of HMC," according to the Margolis letter.

Mack writes to Summers, alerting him to behavior by her co-workers that she believed could (and eventually did) have a very bad effect on Harvard. Fearing loss of her job, she asks him to keep her warning confidential. Summers fails to honor her request. What distinguishes this particular horrible behavior from more conventional examples of horrible behavior by incredibly powerful people is that Summers' action did him no good. He didn't backstab Mack to get to the top. He was at the top. He didn't exploit Mack. He didn't cheat Mack. This is coming across a courageous decent far-seeing person, much less powerful than you, who is trying to help you and all the people in your care . . . and giving that person a good hard kick. For no reason. There is something very wrong with Lawrence Summers.

[5]Frontline's recent show The Warning tells how [6]Brooksley Born, when she was head of the Commodity Futures Trading Commission (1996-1999), did her best to protect the rest of us from exactly what Mack warned about. Summers told her, according to a third party, "you're going to cause the worst financial crisis since the end of World War II. I have 13 bankers in my office that have informed me of this. Stop. Right away."

Harold Jarcho (2010-01-01 19:33:17)

Sounds like The Gervais Principle. The "Sociopaths" at the top are protecting the system from "Losers" like Meck, who don't realize that it's all rigged. A "Clueless" manager would never have raised the alarm and provoked the ire of the few at the top. <http://www.ribbonfarm.com/2009/10/07/the-gervais-principle-or-the-office-according-to-the-office/>

Siah (2010-01-01 20:00:02)

This story really freaked me out.

Michael Bishop (2010-01-01 20:51:34)

Seth, boston.com link is broken Are you so sure you understand what happened that you want to accuse Summers of being evil?

seth (2010-01-01 23:17:33)

Michael, "evil" is your word, not mine. Mine is "pathology". No one at Harvard nor Summers himself has denied what Mack has said. It has been more than half a year since she said it. They know a lot more about it than I do – and, as far as I can tell, they agree with her description of what happened. If you know something I don't know, or have a different interpretation, you are welcome to put it forward. I've fixed the boston.com link, thanks for letting me know about it.

Andrew Gelman (2010-01-02 00:58:08)

Seth: My impression is that it's pretty much universal in organizations that if you go over your immediate superior's head to talk to a higher-level figure in the organization, he or she will go right back and talk with your immediate superior. I agree this is a problem—it can be a huge problem—but it happens all over the place. Whether or not it's "pathological," it's hardly unusual for Summers to behave like just about every other higher-up. I think this attitude is horrible, horrible, horrible, but it happens all the time, and there's often a huge amount of secrecy about who's talked with whom in an organization. Higher-ups always like to follow the line of the hierarchy. More specifically, I disagree with your implied claim that there was no reason for Summers to talk to Mack's boss. (The basis of your claim of "pathology" is, I believe, that you're saying that Summers did something bad "for no reason." An obvious reason for Summers to talk with Mack's boss is for Summers to get to the bottom of things as quickly as possible. The president of an organization is a busy guy. Trying to handle this while protecting the confidentiality of someone he doesn't know . . . well, maybe that would be the moral thing (and, in this case, it would've been the smart thing too, retrospectively), but, short-term, it takes a lot less of Summers's time to call Mack's boss, or Mack's boss's boss, or whatever, and delegate the problem to them. It's amusing that Mack shares a name with the lowly turtle who quit his job and, as a result, toppled the mighty Yertle. I wonder what's happened in the 8 months since the story came out in the newspaper. It doesn't seem to have been enough (yet) to topple Summers. I'm of mixed feeling on this; on one hand, behavior such as Summers's is pretty horrible (here, I'm assuming the claims in the news report are accurate); on the other hand, maybe it doesn't make so much sense to slam Summers for the sort of behavior you see in just about every organization; on the third hand, setting an example with Summers might motivate upper-level managers elsewhere to think more carefully; etc.

seth (2010-01-02 06:05:18)

Andrew, thanks for your reaction. The "bad thing" that Summers did wasn't talking to Mack's boss – it was telling Mack's boss who complained. He could have easily talked to Mack's boss about the complaint and kept her identity confidential. A Harvard Crimson article about this says (based on email documentation) that Mack was promised confidentiality. I don't think you see

this sort of betrayal "in just about every organization". I can't think of a single example anywhere close to this. I am unfamiliar with many sorts of organizations but in the ones I know about I have not encountered anything like this. Until now. My guess, based on the Born story, is that Summers decided that Mack should be fired and accomplished that by telling her boss what she'd done. "May I fire her?" Mack's boss asked Summers. "She's your employee," he replied. I am quite familiar with the dangers of whistle-blowing. It's plenty dangerous, but not – in any other case I know of – because the person you are writing to might decide you should be fired.

Andrew Gelman (2010-01-02 09:48:31)

All the organizations I've ever seen, if person A complains about boss B to higher-up C, the most likely next step is C calling up B and saying, "Hey, A says you're doing something wrong. What's up?" I don't know about the Summers case, but in general I doubt that C gives a damn about A, one way or another; C's goal is to not have to think too hard in these situations and to rely on B to deal with it.

peter (2010-01-02 10:19:59)

[illegible]

```
seth (2010-01-02 15:24:47)
```

Andrew, Mack asked for confidentiality and was promised it. Peter, the two cases you mention (Born and Shinseki) are both very different. from the Mack case. Born wasn't fired. A promise of confidentiality wasn't broken. She was much much more powerful than Mack. She wasn't a whistle-blower in the usual sense; she was simply trying to do her job as best she could. Whereas Mack's job description didn't include "protect Harvard from your foolish superiors". As for Shinseki, of course if you publicly disagree with your boss, especially in the military, you risk being fired. Mack didn't publicly disagree with anyone. Moreover, the power difference was much greater in the Summers/Mack case than in either of those two cases.

Andrew Gelman (2010-01-03 07:55:32)

Seth: I don't know what "a whistleblower in the usual sense is," but someone going around saying that the people she's working for are thieves . . . that sounds like a whistleblower (in a very good way)! On the other point, I think it's standard operating procedure in almost any organization that when person A complains about immediate supervisor B to higher-up C, that C will immediately go and talk with B, whether or not confidentiality has been requested or promised.

peter (2010-01-03 13:38:00)

Seth, in the article i don't see that Summers made a promise; and even if he did promises are broken all the time. Mack does not have a cause of action (a legal claim) even if summers broke his promise (which i don't see from you excerpt). Also, Shinseki's comments that resulted in his dismissal were made to a Congressional Committee; whatever duty of loyalty one has to one's boss, it cannot supersede the duty to speak truthfully under oath. But why quibble; the larger point of the summers/mack episode and the examples i gave are same; there is an entrenched institutional mantra that is defended at all cost; the people at the top have an interest in the status quo and see themselves as indistinguishable from the institution, so that an attack of any sort on the institution is an attack on them and vice-versa. That's the problem. Summers is not any worse or better than anyone else. They are all the same, that's how they get to the top. They stay at the top (or in power) by letting everyone around them know that dissent(which might reflect badly on them) will not be tolerated. Anytime any of them speak you'll

notice that 80-90 % of the comments are self-aggrandizing or defending their department. This is especially true of Geitner and Bernanke.(just today Bernanke said Fed policy of easy credit played a small role in the housing bubble and that mostly it was caused by relaxed lending standards and exotic mortgages; of course, those 2 phenomena would not have been present without the easy credit provided by Fed policy; so his comments were just double speak designed to exonerate the Fed from its obvious responsibility; It is not a coincidence that there are legislative proposals to audit or otherwise supervise the Fed and his comments were an attempt to thwart that effort.) Finally whatever the result of the Mack/Harvard lawsuit, her career is likely irrevocably damaged in the way that an Army General's career would be damaged by being dismissed by the Sec. of Defense. Even if Mack is vindicated by the lawsuit, the message to every employee is that same, i.e., keep your mouth shut or we'll ruin you.

seth (2010-01-03 14:29:18)

Peter, the promise of confidentiality is described here: <http://www.thecrimson.com/article/2009/3/31/hmc-analyst-questions-dismissal-a-fter-a/> As far as I know there is no "lawsuit". There was a settlement between Mack and Harvard several years ago. I suppose Mack released the documents she did because she thought the rest of the world should know what happened to her. I agree, obviously. Promises of confidentiality to whistleblowers "are broken all the time"? I thought I knew a lot about what happens to whistleblowers; I haven't encountered this. Can you give an example? Andrew, yes, Mack was a whistleblower in the usual sense. My point was that Brooksley Born was not. Born thought OTC derivatives should be regulated. That was why she got in trouble. Born wasn't criticizing her co-workers or boss. I have the same question for you as for Peter. You seem to think that promises of confidentiality to whistleblowers are routinely violated ("standard operating procedure"). Could you tell me an example?

peter (2010-01-03 17:21:35)

i think we're speaking at cross purposes. your distinctions are correct, but in a big picture sense, in my opinion, not terribly relevant. if you google "fate of whistleblowers" several items are raised; i'm not going to review all of them to see if promised confidentiality was violated, but it hardly matters if one's career is derailed; it seems to me that this is the important issue. e.g., "The fate of whistleblowers is characteristically bleak in that if they have not already decided to resign they can expect to be dismissed from their employment."[http://findarticles.com/p/articles/mi\\_m4339/is\\_n2\\_v19/ai\\_20823856/](http://findarticles.com/p/articles/mi_m4339/is_n2_v19/ai_20823856/) "The conventional story-high-minded individual fights soulless organization, is persecuted, yet triumphs in the end-is seductive and pervasive. In speaking with whistleblowers and their families, lawyers, and therapists, Alford discovers that the reality of whistleblowing is grim. Few whistleblowers succeed in effecting change; even fewer are regarded as heroes or martyrs."[http://www.cornellpress.cornell.edu/cup\\_detail.taf?ti\\_id=3501](http://www.cornellpress.cornell.edu/cup_detail.taf?ti_id=3501) WHISTLEBLOWERS Broken Lives and Organizational Power C. Fred Alford

seth (2010-01-03 18:35:49)

Peter, yes, I knew about the average fate of whistleblowers. Harvard isn't your average company. It claims to be much better. (The average company hasn't received billions in charitable donations.) Nor Larry Summers the average CEO. He claims to be much better. (The average CEO isn't high in the Obama administration.) It wasn't naive of Iris Mack to expect that a promise of confidentiality from Summers, the CEO of Harvard, would be respected.

bc (2011-07-23 09:06:26)

I'm late to the discussion, sent here by today's Seth links. Andrew Gelman has it correct, although I might go further. It's the boss' job to make their organizations run smoothly without constantly digging in and micromanaging. They will always get requests that skip levels and they will nearly always send them back down to the sender's manager to go and deal with it without bugging them. To do anything else undermines the intermediary managers and swamps the CEO. Senior managers get a lot of 'my manager is screwing things up' email, usually from people who aren't very good at their job. You can't tell how good Mack was, but she was a newbie in the org. Did Iris Mack know Summers? Did she know that he'd want to listen to her comments? If not she's taking a huge risk and it didn't pay off. That was a painful way to learn a lesson. Ms Mack starts a new job and straight away goes behind her manager's back to mail really bad news to the CEO. No wonder she's no longer on the team. Now we don't and can't know the circumstances. Did she raise the problems with her team members and her

manager? Did she go up the chain with her manager's assistance? How well did she communicate with her coworkers? Did her manager already know the problem? How big was the org chain? But based on what little is in that quote she sounds like someone I wouldn't want on my team. Maybe that's what Summers thought, too. Seth, it looks like there was no promise of confidentiality from Summers. The article mentions a request from Mack, but no promise from Summers. He's got a new employee whining to him so he sends it to the line manager. Yeah it's kinda rough since she asked for privacy but he's got a big organization to run, and yeah it bit him in the arse a few years later but there's nothing out of the ordinary with his actions.

Seth Roberts (2011-07-23 09:51:50)

Was Mack naive? Yes. Of course new employees are naive. It is inevitable. Naivete should not produce such results. As for Summers, I don't find the "everyone does it" excuse ("there's nothing out of the ordinary with his [Summer's] actions") persuasive or exculpatory. Summers bears considerable responsibility for the financial crisis because he was one of the strongest opponents of bank regulation. Sure, his position was popular. That doesn't excuse it.

bc (2011-07-23 16:46:06)

There are two areas of concern here - investment and management. On the investment front I can't comment - I don't know that area - and my previous comment could be misread otherwise. My bad. My comments were only on Summers' management actions. Sending employee complaints about how the business runs back down the chain is good management. The boston.com article but it is behind a paywall and there are so many details missing that it is impossible to say anything more. Depending on those details the actions of Summers and his management staff could be anything from exemplary to illegal.

Paul Sherrard (2011-07-27 07:53:10)

"[N]ew employee whining to him"?? bc, this employee had good reason to suspect her peers of insider trading. Hello? Lawbreaking? Corruption? Playing havok with an esteemed institution's endowment and reputation? Her motives were plainly good and not at all self-serving. Yet you try to spin it like she went whining to the boss for a better stapler. Why?

Seth Roberts (2011-07-27 16:39:38)

"Sending employee complaints about how the business runs back down the chain is good management." Not when the complaint is that your immediate boss is doing criminal or near-criminal stuff. Obviously that will get the complaining employee fired. As happened here. As Paul Sherrard says, her motives were plainly good - noble, even. Why get her fired? That's a horrible way to treat employees who try to do the right thing.

## **The Accidental Influential (2010-01-03 15:32)**

Duncan Watts, a Yahoo! researcher who studies networks, has [1]some interesting things to say:

"If society is ready to embrace a trend, almost anyone can start one—and if it isn't, then almost no one can," Watts concludes. To succeed with a new product, it's less a matter of finding the perfect hipster to infect and more a matter of gauging the public's mood. Sure, there'll always be a first mover in a trend. But since she generally stumbles into that role by chance, she is, in Watts's terminology, an "accidental Influential."

Epidemics and many other contagion phenomena have a power-law distribution (large frequency of small number infected, small frequency of large number infected). [2]When my colleagues and I studied the distribution of rat bar-press durations, we found a power-law-like function where the "size" wasn't number but duration. Most bar-presses were quite short; a few were quite long. We also found that expectation of reward had a big effect on the slope of the power-law function. I think Watts is saying that more attention should be paid to what determines the slopes of these power-law functions.

[3]A recent article by Watts. Thanks to Hal Pashler.

---

Jim N. (2010-01-04 11:01:12)

When talking about trends, it seems like it's not the first person who is influential, so much as the first group. That is, first a group within a culture adopts a certain practice, then the larger culture adopts it or not. The first person within the group is not so important, maybe. I wonder if the same can be said of contagion.

Tedderick (2010-01-06 01:55:33)

Thanks so much for the link to this article. You didn't even mention, the root of the study is new mass experiments that don't confirm the folklore science of influence that spews from the mouths of experts without data or confirmation. So much of our science is data-free posturing. Are we on the cusp of a new scientific revolution? One that finally jettisons the pretenses of academic theory and demands only data?

## Psychophysics of Flavor Complexity (2010-01-04 14:44)

If I need evidence that we like complex flavors, I will quote [1]this passage from The New Yorker:

“This sauce is really good,” she said. “It’s so Jean-Georges. He does this French-and-Asian thing.” She warned me that she would need a few seconds to figure out its precise ingredients. (She refused to divulge them, on the ground that Vongerichten would consider the recipe “a trade secret.” I later learned from one of the waiters that the ingredients include powdered English mustard and soy sauce.) “It’s so complex,” she said. “It makes me smile.”

The soy sauce is fermented. As any regular reader of this blog knows, I believe we evolved to like complex flavors so that we would eat more bacteria-rich food. So we have something in our brain that measures complexity of smell/flavor and translates that into pleasure: the more complexity, the more pleasure.

My experience of cooking is that it isn't easy to produce a lot of complexity using spices and stuff like garlic and ginger. It's possible but not easy. Ordinary recipes, such as in *Saveur*, aim for a low level, with 5-8 spices. Chinese Five Spice has 5 spices; spice mixtures might have 8; curry powders might have 10. At Whole Foods, the ready-to-eat soups have twenty-odd ingredients. Apparently their soup designers don't find it easy, either.

Then [2]I discovered that miso by itself produced sufficient complexity. Miso soup doesn't feel "under-complex". Finally I understood why wine is such a powerful flavoring agent; wine, like miso, is fermented. It makes sense that foods that our complexity detector evolved to make us eat do a better job of setting off that detector than other foods.

Now consider how that detector works. Suppose you have two sources of sodium – two different salts, for example. You get the same saltiness from 2 g of Salt A as you do from 1 g of Salt A and 1 g of Salt B. I think complexity is quite different. I suspect that 2 g of Source A (e.g., miso) will produce a lot less complexity than 1 g of Source A and 1 g of Source B (e.g., wine).

I tried adding two fermented flavoring agents (miso and [3]tsukudani) to soup. It worked! The result tasted clearly better than miso alone. Now I do this routinely. It's very easy. The results have a level of deliciousness I can't remember encountering before. Everything else I can eat (such as restaurant food) now seems less delicious. I think that three sources works better than two; whether four is noticeably better than three I don't know.

The basic idea is there are strong sources of complexity (fermented foods) and weak ones (all other flavoring agents). One strong source = 10-20 weak sources. You get the best results by using several strong sources of complexity, perhaps three or more. Once you know this you no longer: 1. Obsess over recipe details (as in the New Yorker quote) because all complexity is alike and easily produced, just as no one worries about the source of saltiness. 2. Think traditional, time-honored recipes are better than what you can make yourself (e.g., Saveur). As far as I can tell food professionals ([4]with one big exception) don't understand this. I really enjoyed Top Chef Masters (a competition between 12 of the best chefs in America) but there was an almost total absence of fermented foods. Perhaps one chef used soy sauce. The winner, Rick Bayless, made a mole sauce. Mole sauces, which combine 20-odd weak sources of complexity, take hours. I think they produce less complexity than three fermented sources put together, which takes about a minute.

Luddite Solutions Inc. « Anthny (2010-01-04 20:10:00)

[...] I find that low-tech, typically low-cost, easy to implement solutions can often be the most elegant solutions, compared to ones where people typically like to throw tech and money at it. (This is one of the reasons I like Seth Roberts' blog, such as here.) [...]

eric (2010-01-05 03:36:32)

very interesting. tsukudani is delicious also. i'll have to try the combination. one question though, why when you write about this untested (untestable currently?) stuff do you write about it declaratively "So we have something in our brain... and not 'so we might have..' ?

Aaron Blaisdell (2010-01-05 10:27:54)

Seth, you should enter cooking contests as a way to test your hypothesis which would be supported by high marks in such contests. Why do you think fermented foods produce such complex flavors and why do you think people enjoy them? For the first question, I'm wondering what the fermentation process does that produces complex flavors. Is it the production of rare compounds (rare in the sense that they're not found in non-fermented foods)? If so, what is the nature of these compounds? And the second question then asks why do we enjoy these compounds (a question that should be addressed at both the functional level -why we are adapted to enjoy these flavors- as well as at the mechanistic level – what taste/odor receptors are being activated by the products of fermentation.).

Todd Fletcher (2010-01-05 11:03:42)

Another way to add complexity is with small amounts of smoked meats. For example, a couple of tablespoons of a strong sausage like spanish chorizo added to rice before cooking goes a long way towards making it a satisfying dish on it's own. And it's not because of the fat. Adding butter or olive oil only makes the flavor richer, not more complex. I don't know anything about the process of smoking meats. Maybe there's a bacterial component to it?

seth (2010-01-05 14:03:13)

Eric, if you find a way to get tsukudani in Beijing, let me know. The reason for such firm statements as "so we have something in our brain . . ." is because I can't think of a plausible alternative explanation. Todd, that's a good poing. Burning stuff generally produces a large number of chemicals (more than 20?) so when you add smoke to something you are adding a lot of different chemicals. Maybe that is the reason it adds complexity. But smoking takes place at bacteria-friendly temperatures so maybe some of the complexity comes from bacteria that grow and then die (killed by chemicals in the smoke). Aaron, bacteria produce many byproducts, in addition to the bacteria themselves, which probably fall apart when they die. And usually fermentation involves several different bacteria. So the chemical complexity of a food goes way up when it is fermented. As for why we enjoy these added compounds, see my posts on the umami hypothesis.

Tom Moertel (2010-01-05 18:21:30)

Most chorizo is [1]fermented, so it might not make the best evidence for smoke having sensory effects similar to those of fermentation. Cheers, Tom

1. <http://cat.inist.fr/?aModele=afficheN&cpsidt=2188112>

Kirk (2010-01-06 12:57:57)

I find this subject fascinating. In the past year, whenever I knew I'd be eating a boring supper, I would quickly stir together a sauce consisting of fermented foods, such as yogurt or sour cream, tamari, fermented pickle, and then flavor it with some combination of spices, herbs, garlic, tomato paste, or anchovy paste. (Besides making the food tastier, that kind of flavoring also satisfied some of the SLD tactics I use to lose weight.) When cooking a meat-based soup or stew, until now I have generally used a guideline of Three Meats (such as the one I made two days ago, which had bacon, beef, and chicken), with one of the meats having bone, and then add in some other glutamates, such as anchovy and tomato paste. I have also used red wine but I've been trending away from cooked wine because of the heartburn it gives me. Thinking about making a complex soup/stew using fermented foods gives me a new playground. As for miso, I have tried miso in various dishes, but the rest of the family objects to the taste. I probably need to pay more attention to the overall flavor and tweak before serving. As for your observation that professional cooks seem unaware of this subject, 'The Flavor Bible' has just a few entries for fermented foods, and for those fermented foods it does list, it rarely shows them combined with others (except for miso, which it says can combine with mirin, sake, and rice vinegar). I'd like to see a good list of tasty fermented food combinations. For example, I'm not a big fan of sauerkraut; I'd like to know if there is a way to combine it with other fermented foods to make it more palatable.

seth (2010-01-06 15:34:11)

Kirk, thanks for your comments. You might try putting sauerkraut in miso soup. In case you've been trying "dark" miso, you might also try "light" miso. A milder flavor. The way I use miso now (combined with substantial amounts of other fermented foods) it doesn't taste like miso soup.

Richard (2010-01-07 09:51:41)

Don't mislead by overusing the term "bacteria", I would suggest micro-organism is a better way to convey your meaning. Much fermentation is caused by yeasts and funghi. I made a vegetable soup today spiced by small amounts of vegetable stock, hoi sin sauce, angostura bitters, lea & perrins worcesteshire sauce, kikkomann soy sauce, maggi wÅ¼rze, marmite, maille mustard. I can honestly say it was the best tasting soup I, or any of my guests, can remember having been served.

seth (2010-01-07 15:29:28)

Thanks for the terminology correction. Yeah, maybe I should say "microbe". And thanks for trying out my flavoring idea. I hadn't heard of maggi wurze. And I now wonder why I keep worcestshire sauce in the refrigerator.

Cliff Styles (2010-01-07 15:46:37)

Todd: Spanish chorizo is actually fermented: [http://www.sciencedirect.com/science?\\_ob=ArticleURL&\\_udi=B6T7K-3VM6SX6-8&\\_user=10&\\_rdoc=1&\\_fmt=&\\_orig=search&\\_sort=d&\\_docanchor=&view=c&\\_searchStrId=1158132677&\\_rerunOrigin=google&\\_acct=C000050221&\\_version=1&\\_urlVersion=0&\\_userid=10&md5=7e63219f3862396dc763b3f565be7e23oy...what an url...](http://www.sciencedirect.com/science?_ob=ArticleURL&_udi=B6T7K-3VM6SX6-8&_user=10&_rdoc=1&_fmt=&_orig=search&_sort=d&_docanchor=&view=c&_searchStrId=1158132677&_rerunOrigin=google&_acct=C000050221&_version=1&_urlVersion=0&_userid=10&md5=7e63219f3862396dc763b3f565be7e23oy...what an url...)

Barb Stuckey (2010-01-12 10:55:48)

Hi Seth, Very interesting observations. The "deliciousness" that you're experiencing is called "umami." It is the Japanese word for the flavor of glutamate. The complex flavors you note that are the result of fermentation also occur during aging (think parmesan and steaks) and cooking (think tomatoes and mushrooms). What's happening is the breakdown of large protein molecules into smaller amino acid molecules. These amino acids have more flavor to us, and hence add to complexity. Keep tasting! Barb <http://www.umamiinfo.com/>

mike (2010-01-15 23:01:43)

Wow, you might have just solved a mystery for me. Recently, I had mentioned to my wife that I found the food at most of the restaurants – some we've been going to many years – suddenly to have a lot less flavor and to have a "cheaper" taste to them. I just didn't enjoy them anymore, but I didn't know why. And it wasn't just one or two restaurants, it was most of them, pretty much almost across the board. My only theory was that food quality was going down. But it was about 6 months ago I started eating yogurt daily. I wrote to you in an earlier comment that it cured my seasonal allergies. So now this seems like the most logical explanation. (I hadn't read your blog in several weeks before tonight, so my conclusion that restaurant food was less tasty could not have been subliminal.)

Dan (2010-01-17 21:05:48)

Hi Seth, I am trying to think of a logical / evolutionary reason for why we would like "complex foods." As Barb said, the complexity you refer to is Umami, and it's basically just free amino acids (glutamate is the main one, aka MSG). Upon digesting food, our body breaks down the complex proteins into to their individual amino acids anyway, so ingesting them in an already free state would not be advantageous to us. And most of the complex foods that are created via microbes (predigesting proteins and lipids for our sensory enjoyment) contain very few if any living microbes (and whether or not the microbes or their enzymes would even survive a trip through our stomachs is totally up for debate). The only reason I can think of is what I would call a boredom theory. It's the same reason we love music or paintings or philosophy or even food blogs for that matter. As humans, we are both blessed and cursed with a great deal of intelligence and a lot of time on our hands. We need a way to entertain ourselves and take our minds off the burden of being alive. So much of what we love is simply here to entertain us, push our sensory envelopes further than what we would need to simply survive. If not for that, the 80+ years some people live would become an eternity of monotony. Dan

seth (2010-01-17 22:06:44)

Dan and Barb, lots of complexity has nothing to do with umami. The complexity of wine, for example. In this case I have never heard anyone say miso or tsukudani tastes good because of umami (that is, glutamate). What makes you think that is what's going on here? Let's say miso has 1 unit of umami per tablespoon. Let's say tsukudani has 1 unit of umami per tablespoon. Then 2 tablespoons of miso should taste as delicious as 1 tablespoon of miso plus 1 tablespoon of tsukudani. That isn't true. This is why I doubt your explanation.

Tana (2010-02-28 11:38:34)

Hi Seth, Just wanted to say that your blog has inspired me to start making my own yogurt, which is so much tastier than store bought yogurt. I make it by letting it incubate on a heating pad set to medium for 10-12 hours. I have also been making miso soup with mirin, soy sauce, sauerkraut and bacon, and it's the most delicious soup ever. I agree with Mike that restaurant food

is less tasty than before I started eating lots of fermented food.

## Reflections on a Few Years of Blogging (2010-01-05 15:39)

[1]Andrew Gelman's blog has lasted longer than this blog (and [2]was responsible for this blog.) Recently [3]Andrew looked back. It seemed like a good idea so I will follow his lead.

The two big surprises have been how easy it is and how helpful it is. In the beginning it wasn't easy to find interesting things to say. Somehow it got easier and easier. Partly because I had more ideas – about omega-3, the umami hypothesis and fermented foods, the effect of animal fat on sleep. Partly because readers sent me interesting stuff. Partly because I started teaching at Tsinghua and moved to Beijing part of the year. Partly because the Shangri-La Diet produced results that I wanted to brag about. And – a very big part of it – because there are enough comments here and elsewhere to make me think people are reading it. I think everyone has an innate desire to be listened to. As our concerns and knowledge become more and more specialized, it becomes harder and harder to find an audience. When Spy magazine was around I read every issue three times. I was dying to talk about it with other fans. I couldn't. I couldn't find them.

Some of the stuff people have sent me has been incredibly helpful. Most of the examples involve trying my ideas. Taking omega-3 (via flaxseed oil or fish oil). [4]Tyler Cowen's experience, for example. [5]Tim Lundeen's results. [6]The effect on sports injuries. Or eating more fermented food. [7]Tucker Max's experience. Not only does it make the whole subject much easier to talk about, it convinces me I'm on the right track. Some of the examples involve telling me about other more conventional data related to my ideas. For example, I'm very glad to know about [8]hormesis, which supports my ideas about fermented food. Knowing about radiation hormesis makes me [9]stop worrying about the small dose of radiation I get from my cell phone. The [10]recent comment about two morning faces being better than one might turn out to be really helpful and important.

I haven't read [11]She Stoops to Conquer, an 18th century play, but the title is brilliant. My self-experimentation, I now think, had a dose of that because I was willing to do something as humble as study myself whereas most scientists wouldn't stoop to that. Too low-status. Blogging has a lot of that. How many Berkeley professors blog? Uh, [12]Brad DeLong? And someone else, rarely. Blogging is beneath them. Whereas half of Tsinghua students have blogs. They aren't worried about appearing undignified. The phrase [13]keeping up with the Joneses means your car has to be at least as expensive as your neighbor's car, and so on. A kind of arms race. Such an arms race goes on in science: What you must do to appear high status takes up more and more of your resources, leaving less and less to actually make progress. So less and less progress is made. Self-experimentation breaks out of that vicious cycle. Blogging is the same thing more generally. Supposedly professors, especially at a place like Berkeley, have interesting things to say. But the demands of status, as Veblen described in the last chapter of [14]The Theory of the Leisure Class, make it harder and harder for them to say them. Blogging breaks out of that vicious cycle.

When I taught introductory psychology I found I could often weave whatever I'd been thinking about into my next lecture. It's good to start a lecture by saying "Something interesting happened to me a few days ago . . ." Now I can just blog about it.

Cliff Styles (2010-01-05 17:18:01)

This is a perfect place to send a note of appreciation, Seth. I came here initially from Tyler Cowen's blog, and since coming here my life is better. How? From fermented food added to my diet (especially kombucha!) , from the additional encouragement I found here to read Taubes' book last year, and from the inspiration of your example of self-experimentation. If changing others' lives for the better is an additional motivation for you to blog, I'm writing to offer your effect on mine as one datapoint. Thanks!

seth (2010-01-05 17:41:58)

Thanks, Cliff, that's nice to know. A year ago I wasn't even thinking about fermented food...

Alex Chernavsky (2010-01-05 18:31:50)

Seth, thanks for posting all the interesting info. I've lost about ten pounds on your Shangri La diet (and still losing weight). Not entirely convinced by your stance on climate change, but the information you post is always thought-provoking.

Nathan Myers (2010-01-05 19:34:23)

I really appreciate the self-experimentation articles. I eat flaxseed oil pretty regularly now, and my daughter takes fish-oil capsules. I have lost some girth – albeit probably more from avoiding bread than from The Diet – and now know a ready treatment for inflamed gums.

Dennis Mangan (2010-01-06 07:27:51)

Ditto on that note of appreciation. I started coming here also through Marginal Revolution, and since I was already interested in the sorts of things Seth writes about, I stuck around. Around that time, Seth was discussing Taubes and the lipid-heart hypothesis; I thought I knew something about that and argued for it, but Seth was responsible, at least indirectly, for completely changing my mind. So thanks, Seth. Also, that's an interesting observation about blogging and Berkeley professors. You'd think they'd want to have wide influence through blogging...

seth (2010-01-06 18:44:14)

Thanks, Alex, Nathan, and Dennis. What's the phrase? Something about "keeping [one] honest"?

Nathan Myers (2010-01-07 00:44:03)

Frankly, I cannot even imagine how Brad can find the time to do it, so it doesn't surprise me at all that the rest of the professors don't. I don't know how he is able even to read all the things he's posting excerpts of and links to, never mind also post and comment on them, and read the ten times more other stuff that he doesn't end up posting. No normal person could do all that and professorate besides.

Richard (2010-01-07 10:19:29)

Hello Seth, thanks for blogging. I have been following your blog for quite a while through the google reader. I think it is great to have such access to the thoughts and musings of a professor - someone who is at the forefront of expanding the body of knowledge in their field. Can you point to any other blogging professors? I'd like to start a category in my feed reader ;)

seth (2010-01-07 15:22:10)

To find blogging professors, look thru the blogroll of Marginal Revolution.

## **Influential Statisticians (2010-01-06 16:28)**

[1]This article ("Ten statisticians and their impacts for psychologists") impressed me. It's a lot more accessible and basic than the usual academic article. However, my list - of the statisticians who've had the biggest effect on how I analyze data - is much different than his. From more to less influential:

1. John Tukey. From Exploratory Data Analysis I learned to [2]plot my data and to [3]transform it. A Berkeley statistics professor once told me this book wasn't important!
2. John Chambers. Main person behind S. I use R (open-source S) all the time.
3. Ross Ihaka and Robert Gentleman. Originators of R. R is much better than S: Fewer bugs, more commands, better price.
4. William Cleveland. Inventor of [4]loess (local regression). I use loess all the time to summarize scatterplots.
5. Ronald Fisher. I do ANOVAs.
6. William Gosset. I do t tests.

My data analysis is 90 % graphs, 10 % numerical summaries (e.g., means) and statistical tests (e.g., ANOVA). Whereas most statistics texts are about 1 % graphs, 99 % numerical summaries and statistical tests.

1. <http://www.psy.jhu.edu/~yantispdf/Wright-PPS-2009-TEN-STATISTICIANS.pdf>
2. <http://sethroberts.net/articles/2009%20Plot%20your%20data.pdf>
3. <http://sethroberts.net/articles/2008%20Transform%20your%20data.pdf>
4. [http://en.wikipedia.org/wiki/Local\\_regression](http://en.wikipedia.org/wiki/Local_regression)

---

Aaron Blaisdell (2010-01-06 18:30:56)

I agree with your list, Seth. Actually, because of you I bought a copy of Tukey's EDA and am working through it one chapter at a time. I finished chapter 4 last night. On to Chapter 5 tonight. It's great stuff! I've always been a fan of plotting data to understand it through visuals before even doing other summary stats and definitely before applying any inferential stats. You're right that psychology (maybe other science disciplines as well?) have really lost touch with this and overemphasize inferential stats. I'd add a purely graphing book to your list: Edward Tufte's The Visual Display of Quantitative Information.

seth (2010-01-06 18:41:21)

Thanks, Aaron, glad to hear it. I was told by an editor that Exploratory Data Analysis was published only so that the same company could publish another book (with Mosteller) that came out at the same time.

Alex Chernavsky (2010-01-07 06:08:25)

I have two of Edward Tufte's books. They're both excellent. He's also quite a good speaker.

Kevin Wright (2010-01-07 08:23:09)

I've used S-Plus and R for many years, but now work almost exclusively with R. I've filed many more bug reports for R than for S-Plus, so I find your suggestion that R has fewer bugs to be surprising. Also, from my own experience, almost every semi-annual release of R has major changes that break my existing code. S-Plus was much more stable. YMMV. Kevin

David (2010-01-08 04:28:27)

You might find this interesting if you haven't already read it: <http://www.amazon.com/Probability-Theory-Logic-Science-Vol/dp/0521592712>

Mike Cooke (2010-01-08 09:21:18)

BC Canada had a high school Probability & Statistics grade 12 course in the 80s. I used Tukey's EDA and Tufte's books with considerable success. At its peak the course attracted as many students (especially girls) as the standard pre-university Algebra 12 course. 20 years later we hired a former student as my vice-principal who says that course was the best in his high school career. Then came the qualitative literacy movement (good) and the BC Ministry of Education mysteriously dropped the course (bad) to minimal protest (sad). Now there's piddling disconnected tidbits of P & S in the K-12 curriculum. Bring back the good old days!

Siah (2010-01-08 13:29:59)

A friend on twitter recommended your post. and enjoyed it a lot. I'm going to get John Tukey's book. Thanks a lot and go bears :)

seth (2010-01-08 14:15:37)

David, thanks for the recommendation, the book sounds really interesting. Since a couple people have mentioned Tufte, I will say that I have learned nothing from his books. I find them annoying, starting with such titles as "Envisioning Information". Tufte is, however, a genius entrepreneur.

Sarosh Motivala (2010-01-13 12:06:32)

Great post Seth. To add to the mix, in my own work, I would add Peter Bentler for his contributions to structural equation modeling and Reuben Baron's and David Kenny's papers on mediation vs moderation very insightful. As far as statisticians-educators go, although thick and intimidating at first glance, Tabachnick and Fidell's Using Multivariate Statistics is superbly written. I wonder if there is a stats/methodology book on self-experimentation?

Influential Statisticians « Permutations (2010-01-17 15:39:32)

[...] I recommend Seth Roberts' comments here and Andrew Gelman's comments here. [...]

## **"Two or Three Sentences That Go Together" (2010-01-07 15:45)**

In [1]the latest episode of This American Life, devoted to 2010 predictions, a sixth-grade teacher says she would like one of her students to become a better writer. His essays are disorganized. "I would like Lewis to write two or three sentences that go together and make sense," she said.

In the latest issue of The New Yorker, [2]a profile of Supreme Court Justice Sonia Sotomayor by Lauren Collins contains

this paragraph:

Perhaps in an effort to absorb quickly the mores of the Court, Sotomayor has hired experienced clerks, including one who spent the past year clerking for Justice Stevens and another who clerked for Justice Ginsburg. Near her desk is a framed cartoon by the Mexican-American illustrator Lalo Alcaraz. Against a lavender background, a girl with a pink bow in her dark hair sits at a desk, banging a gavel. A nameplate in front of her reads “Judge Lopez.” To her right is a makeshift witness box, inhabited by a Teddy bear. The jury box is full of stuffed animals. Taped to the wall behind her is a photograph of Justice Sonia Sotomayor.

The first sentence (“Perhaps in an effort . . .”) and the rest of the paragraph (“Near her desk . . .”) don’t go together. I suppose Collins or her editor liked the cartoon detail but didn’t have a good place to put it. So they put it here, at the end of a section.

The whole profile is [3]more great work from Lauren Collins. The impressive thing about Sotomayor, someone tells Collins, isn’t that she’s the first Latina Justice, it’s that she’s the first Justice to grow up in a housing project. To good writing based on lots of work, Collins adds interesting observations:

In a profession that values the illusion of infallibility, Sotomayor has been unusually willing to acknowledge murky areas.

We want stories with heroes and villains. We want moralizing, in other words. In this sentence, Collins calls the legal profession bad and Sotomayor good.

## The Limits of Expert Trial and Error (2010-01-08 15:04)

Of course I loved [1]this comment on [2]a recent post of mine about how to flavor stuff:

I made a vegetable soup today spiced by small amounts of vegetable stock, hoi sin sauce, angostura bitters, lea & perrins worcestershire sauce, Kikkomann soy sauce, maggi wrze, marmite, maille mustard. I can honestly say it was the best tasting soup I, or any of my guests, can remember having been served.

I routinely make soups that taste clearly better than any of the thousands of soups I had before I figured out the secret. There is no failure (I’ve done it 20-odd times), no worry about over- or under-cooking. Something else odd: There seems to be a ceiling effect. The texture could be better, the appearance could be much better, the creaminess could be better, sometimes the temperature could be better, the sourness could be better, but I can’t imagine it could be more delicious.

Why wasn't this figured out earlier? I've looked at hundreds of cookbooks and thousands of recipes. I haven't seen one that combines three or more sources of great complexity, as I do and the commenter did. There may be more trial and error surrounding cooking than anything else in human life. Billions of meals, day after day.

I think it goes back to my old comment (derived from Jane Jacobs) that [3]farmers didn't invent tractors. Some people claimed they did but I think we can all agree farmers didn't invent the engine on which tractors are based. You can't get to tractors from trial and error around pre-tractor farming methods. Even though farmers are expert at farming. I think that's what happened here. I am not a food professional or even a skilled cook. My expertise is in psychology (especially psychology and food). Wondering why we like umami, sour, and complex flavors led me to a theory ([4]the umami hypothesis) that led me to a new idea about how to cook.

And this goes back to what many people, including Atul Gawande, [5]fail to understand about how to improve our healthcare system. The supposed experts, with their vast credentials, can't fix it – just as farmers couldn't invent tractors. Impossible. The experts (doctors, medical school professors, drug companies, alternative healers) have a serious case of [6]gatekeeper syndrome. The really big improvements will come from outsiders. Outsiders who benefit from change. To fix our healthcare system, empower them.

Cliff Styles (2010-01-08 16:59:01)

Just getting out of their way would help: end government-sanctioned occupational licensing in medicine.

q (2010-01-08 18:56:29)

re fermented food, you might want to do some kind of survey of what various cultures do. i had some very good hot sauce from ghana once which i think had fermented fish. i don't remember the name but it had a name with a long sssssss sound in it. also you might want to look at david chang's momofuku cookbook.

Alex Chernavsky (2010-01-08 19:16:15)

Seth, can you post recipes – or at least ingredient lists – for the soups you make?

Tom Moertel (2010-01-08 21:01:32)

Tonight, I made cabbage braised in chicken stock with Mangalitsa bacon, onion, and a little raw apple-cider vinegar. I made this dish a few nights ago – my control – and it was good. Tonight, however, I also added a little miso, fish sauce, and caraway seed as seasonings. Tonight's version was much better.. I don't think the caraway seed explains the difference. I've used it before without noticing much effect. Nor do I think the salt in the miso explains it. I adjust my salt to taste while cooking and simply used less salt this time. Something else seems to be going on. On this evidence, Seth, my belief in your hypothesis has increased. Oh, yeah. I'm also going to be adding miso and fish sauce to everything from now on. This is an experiment that rewards repetition. ;-) I wonder how fish sauce would taste in butterscotch sauce... Cheers, Tom

Part of how to get improvements and how science progresses « Anthny (2010-01-09 00:39:00)  
[...] Seth Roberts has two important paragraphs here: [...]

Nansen (2010-01-09 13:44:38)

Many of the condiments in the quoted recipe have a high salt content. Does that fact ever concern you?

seth (2010-01-09 14:00:17)

Nansen, I once varied whether or not I ate cheese (high in salt). My blood pressure didn't noticeably change. So I don't worry much about salt intake, so long as my blood pressure is reasonable. But it's a good point and I would rather get my complexity from low-salt stuff. Alex, my soups contain fat (pork fat), protein (pork or beef, sometimes fish), vegetables (e.g., chinese greens, carrot, onion, mushrooms, tomato, cabbage, kimchi), and flavorings (ginger, sometimes garlic, mustard oil, Chinese-type aged vinegar, miso, Chinese fermented soy beans, Japanese BBQ sauce). The last three are the crucial ingredients, added at the very end, and vary according to what's available. Right now I've run out of Japanese pickles. I add yogurt just before eating.

Glen Raphael (2010-01-09 14:47:13)

I took my standard omelet recipe and added some miso, soy sauce, and vinegar. The result: the resulting omelet tasted (1) very strange, (2) too salty, (3) not particularly good. I took a cooking class series once and one of the big things I learned was the importance of salt. Adding salt at each cooking stage - and adding *enough* of it - brings out all the other flavors. The goal isn't for a dish to taste "salty" but for all the component flavors to be distinctly perceived. When balancing a soup recipe if you can't taste one ingredient, add more of that ingredient. If you can't taste many ingredients, add more salt. People are unreasonably afraid of salt and many homecooked meals are bland due to the lack of it; the idea that \*everybody\* should try to avoid salt is folk wisdom, not medical science. Seth: a good null hypothesis here is that it's the added saltiness rather than the added complexity that is making your soup taste good compared to how it tasted before. The good news is that unlike many of your experiments, this idea is something it would be trivial to test "scientifically". You say the crucial ingredients are added at the end. So you could make soup right up to the point where you'd add them, then ladle the soup into a few saucepans (if it needs more cooking) or bowls (if it doesn't). Modify each in different ways- more salt, more miso, nothing at all, etcetera - pour small amounts into numbered paper cups and do a blind taste test. You could even make it double blind!

seth (2010-01-09 17:34:57)

Glen, I've never gotten results like this by varying amount of salt, which I've done countless times. Variations in amount of miso - which varies the amount of salt at the same time, because miso is high in salt - never produce results like this. Only when I add a second source of complexity (and reduce the amount of miso) do I get big improvements.

Mike Kenny (2010-01-09 20:47:18)

Does the complexity need to come from a non-commercially produced source,(because of uniformity or weakness of fermentation)? I think of a cheeseburger-it has cheese, pickles and ketchup, which all fermented or made with an ingredient that are fermented. Cheeseburgers are great, but I think most pickles I have taste the same, and ditto for ketchup and American cheese. Maybe they are so uniformly produced that they don't really introduce my pallet to the novelty homemade fermented products would.

seth (2010-01-09 20:53:23)

Mike, the answer to your question is no. I use commercially-produced miso and Japanese pickles, for example. In the recipe I quote, all the ingredients are commercially-produced.

Mark (2010-01-10 10:58:56)

I'm skeptical of recipes that have a lot of (flavoring) ingredients. It's like a painter saying he mixed a great color by using 12 different base colors. Given, say, six equally spaced primary colors and black and white you can mix any color there is with four of the paints. If there are only four or five or six basic tastes, then after a while they just start to cancel themselves out and product the culinary equivalent of the muddy color you get when you mix too many paints together.

Nathan Myers (2010-01-11 01:28:17)

This is off-theme, but my favorite new soup ingredient is sweet potato. It improves both texture and flavor.

Glen Raphael (2010-01-11 17:27:24)

Like Mark, I'm suspicious of the lots-of-tastes hypothesis. I still haven't tried it in soup but I did try another omelet. After last time I noticed that I'm using a new brand of miso (a red-and-white type) which has salt as an ingredient so maybe the miso I was using before was just too salty. So I made a new omelet with \*no\* salt as a separate ingredient and added to the eggs a teaspoon rather than a heaping tablespoon of miso. Also added: a teaspoon of yogurt, a small amount of vinegar and a small amount of natto. I left off the soy sauce since that's almost pure saltiness - I didn't want to risk it with the miso. The mushroom-and-cheese omelet that resulted was strange and kind of interesting. It didn't taste bad but also didn't taste unusually delicious. So if this phenomenon is real perhaps it needs a longer cooking cycle, or perhaps it doesn't work in an egg omelet or wonderflavor doesn't mix well with cheese or only works in soup. Or, lots of experimentation is required to find a collection of relative amounts that results in "pure deliciousness"; Seth is getting consistent results due to things he's doing or amounts he's using automatically from long force of habit. Or it only produces ultimate deliciousness in the context of some other set of ingredients Seth is using. Or it's an acquired taste that I haven't yet acquired. In summary: applying the "multiple complex taste" theory to egg omelets I have thus far: two attempts, two failures.

Melissa (2010-01-12 07:38:38)

I have definitely made atrocious soups with this principle. I remember one that had fish sauce, miso, and soy sauce....I had to throw the whole thing away. You have to be careful, particularly with fish sauce.

seth (2010-01-13 12:51:30)

Melissa, I'd imagine it tasted atrocious because it was too salty. I don't use soy sauce to complexify anything because it seems to me more salty than anything else. Miso has a better balance. I don't know much about fish sauce.

Chris Burd (2010-01-14 13:12:23)

Seth, can you provide us a recipe? Amounts, cooking times, etc.?

Glen Raphael (2010-01-17 09:35:55)

I, too, would like to see an exact recipe. Two failures were enough; I've given up on this principle as applied to omelets. I might try it on soups but I suspect the result would be the same as it was for omelets. Note that if the hypothesis is correct as stated, one ought to be able to pre-mix a few "sources of great complexity" to get a big tub of "super-complexity" you just keep in the fridge and add a dollop to whatever you cook. If that works, somebody could then sell "complexity" in premixed tubs at the store. miso+yogurt+wine or whatever. Then you could dehydrate the super-complexity to sell it in powder form and use like MSG. Is there a reason to think this wouldn't work? Contrary theory: perhaps "crazy-spicing" for a while puts people in a different frame with regard to what they consider tasty. As might Shangri-La. Perhaps the need for "complex" flavor is enhanced after eating flavor-free calories for a while. Anyway, taste is subjective, but recipes don't need to be. If this theory is correct, you should probably be writing a cookbook.

seth (2010-01-17 09:55:24)

Glen, I've never compared dehydrated miso to regular miso but I imagine there's a good reason miso is usually not sold dehydrated. "The need for complex flavor is enhanced after eating flavor-free calories for a while." Techniques that produce complexity are found in a wide range of cuisines. As far as I can tell, almost everyone enjoys complexity. You're right, I should be seeing how this idea can be used elsewhere than soups.

Glen Raphael (2010-01-17 13:10:18)

"You're right, I should be seeing how this idea can be used elsewhere than soups." Sure, but at this point I'd settle for a precise soup recipe. Without a recipe, if I try it and it doesn't work I don't know whether to count my attempt as a fair test of your hypothesis. You could always say I didn't use \*enough\* complexity source or I used too much of some specific complexity

source or other. I assume miso is sold in tubs because it improves the texture. But your soup theory specifically is that the \*taste\* is optimized to best-soup-ever status. You make no claims for texture, appearance, creaminess. The taste effect ought to be substantially the same from complexity-bouillon cubes as it is from the tub; the other aspects would be whatever they already were. So if your theory is correct and you convince people of it, the logical outcome is that henceforth all restaurants will add complexity cubes to their soups. And the guy who sells those cubes will make a fortune. And then everyone will get fat due to the flavor-calorie association being stronger than ever before. (Unless complexity cubes deliberately vary the blend from one cube to the next.) Incidentally, the way you get better "creaminess" is by blending and then pushing soup through a fine strainer.

### **The Post-It Restaurant (2010-01-09 14:15)**

Two of my students took me [1]here, which one list said is the best fish restaurant in Beijing. (Based on our meal, that's plausible.) Its specialty is grilled fish "Wushan style". Wushan is a mountain, not a province (like Sichuan or Hunan), so the restaurant may have invented the term. The menu is short. There are a bunch of cold dishes and the grilled fish, which comes in seven different flavors (hot & spicy, chinese sauerkraut, etc.). Unlike any other Beijing restaurant I've been to, you need a reservation. (Call a week ahead.) The restaurant, which wasn't large, was packed. The walls were covered with Post-It notes. One said: "I wish I find my dream girl and me and my friend Bob have a safe life." Another said: "Very spicy, very tasty, makes me feel very good." A third said: "We had to wait a long time, so we ate a lot." I wrote one saying what one of my students suggested: "We didn't have to wait a long time but we ate a lot anyway."

1. <http://www.wskqy.com/>

---

Mike Kenny (2010-01-09 21:26:00)

Good conversation piece while you're at the restaurant with someone. I wonder if people get favorite tables, and over time they create a story that unfolds through their post its from various times they sat in that area. I recall an ice cream parlor where I used to live that took photos of customers and put them on the wall. A conversation piece, and also social proof I guess!

### **"The 11 Best Foods You Aren't Eating" (2010-01-10 06:01)**

There isn't one fermented food on [1]a list of "the 11 best foods you aren't eating" compiled by Tara Parker-Pope, author of the world's most visible health blog. Nor do any of the listed foods contain animal fat. One of them (sardines) is high in omega-3, so the list gets a D instead of an F. Fermented foods and animal fat (in sufficient quantity) have easily-noticed benefits, in contrast to every food on the list. Parker-Pope and the nutritionist she consulted (Jenny Bowden) have large gaps in their understanding of nutrition.

1. <http://well.blogs.nytimes.com/2008/06/30/the-11-best-foods-you-arent-eating/?em>

Alex Chernavsky (2010-01-10 06:38:41)

Are there any plant-derived fats whose health benefits are comparable to those produced by animal fats? Perhaps tropical oils, cottonseed oil, or hydrogenated fats like Crisco-type vegetable shortening?

david (2010-01-10 06:50:14)

Alex, The benefit Seth speaks of is that he's observed that eating animal fat seems to make him sleep more soundly/longer. It seems quite a leap to go from that to 1) Eating fat has the same effect on people other than Seth, 2) The effect really is a substantial benefit, and 3) The benefit outweighs any other negative effects. So Tara Paker-Pope can be forgiven for not including it on her list. Fermented foods are more widely accepted as beneficial. I suppose she might argue that people already know about that and eat yogurt. David

seth (2010-01-10 06:50:15)

Alex, omega-3 is a plant-derived fat (e.g., in flaxseed oil), so the answer to your question is yes.

seth (2010-01-10 07:45:41)

David, there is plenty of evidence to support what you call "quite a leap". I have linked to someone else who had the same experience with animal fat as me: when he ate a lot more animal fat he slept much better. I know of no cases where a deficiency disease (e.g., scurvy) cured in two people by Substance X was not cured in everyone by Substance X. The nutrients we need to cure obvious deficiency diseases – vitamin C, all the other vitamins – have no negative effects at those doses. This is one reason I'm not worried about negative effects of enough animal fat to improve sleep.

Caleb (2010-01-10 09:12:03)

Alex, many people believe the medium chain fats in coconut oil have health benefits.

NE1 (2010-01-10 11:20:33)

It really depends on what they mean by healthy. Maybe Seth has really found something Re: sleep quality, but poor sleep isn't the number one killer of women (heart disease), and recommending things (pork fat) with a more dubious role in that cause probably isn't a great idea here. The original Men's Health list describes these things as "superfoods" which is an idea still rooted in vitamins, minerals and antioxidants. Maybe the appropriate criticism here is that this is not the problem with most Americans' diets.

John (2010-01-10 11:21:55)

Seth, let us know when you start drinking fermented cod liver oil. I'm afraid to try it.

Erika (2010-01-10 13:56:17)

The dogma of the dangers of fat have penetrated our society so deeply that it will take a lot for it to be changed. I bet it'll take years of small studies to pave the way for a large scale study. Even then, most people will probably refuse to believe any evidence that animal fat can be good.

seth (2010-01-10 14:54:00)

John, yeah, I should try fermented cod liver oil. Aaron Blaisdell drinks it. Erika, I wonder how people explain to themselves that fat tastes good. Why would evolution cause us to want to eat something that's bad for us? Obviously some forms of fat are bad but cavemen would have been eating animal fat, not olive oil or soybean oil.

q (2010-01-10 18:07:12)

why do you think that what this addresses is a deficiency disease? also, why do you think that what you term as 'good sleep' is a natural condition and not merely something that is convenient to you?

Spoter.com (2010-01-10 18:50:55)

Seth's blog » Blog Archive » The 11 Best Foods You Aren't Eating... Seth's blog » Blog Archive » The 11 Best Foods You Aren't Eating...

Nathan Myers (2010-01-11 01:36:29)

Really, a "D" grade for not promoting your hobby-horse? Each item in the list looks like a reasonable addition to anyone's diet, however much kim chee they also eat, or don't. Would you advise people eating any particular item on this list to give it up?

seth (2010-01-11 03:26:52)

why such a low grade? because, given the world's bulliest pulpit, she uses it to tell people what they already know. Her readers have heard a hundred times that fatty fish is good for you. And she tells them to eat sardines.

Andrew Gelman (2010-01-11 05:45:22)

Seth: You write, "I wonder how people explain to themselves that fat tastes good. Why would evolution cause us to want to eat something that's bad for us?" Do you really wonder that? I've always hear the commonplace explanation that some fat is good, but that it's not so great if you eat too much, triple bacon cheeseburgers and all the rest. For you, "animal fat" might be relatively small servings compared to what many Americans scarf down. Also, I think it's a bit of simplification to say "fat tastes good." I like some fatty food, but I don't actually enjoy the taste of a slab of fat by itself. I remember as a kid that our mom was always trying to get us to eat the fat that we would trim off our meat. If it had tasted good to us, we would've eaten it, that's for sure!

Darrin Thompson (2010-01-11 10:54:10)

Seth, On that fat bit... Have you taken any time to read Taubes' Good Calories Bad Calories? He's writing as an outsider like you but comes to some different conclusions based on some simple self experimentation and what appears to be a \_very \_ thorough analysis of the bulk of obesity research. He, like you, disagrees vehemently with the conventional wisdom, especially regarding animal fat but for different reasons. Where you see researchers ignoring cheaper routes to insight, he shows researchers systematically downplaying huge swaths of data to show their research conforms to a party line. He covers animal fat \_extensively\_. The only problem was I nearly died of boredom trying to read it all. I had to skip to the end where he covered obesity research that was actually good and have been using his index for the rest. For instance, I looked up salt in his index. He had a nice five page summary of salt vs. hypertension research where, again, researchers have deliberately downplayed data contradicting conventional wisdom. Salt was fine. I think you enjoy some time with it if you haven't yet. You'd have a lot of WTF moments and possibly a more testable hypothesis for why and how SLD works. In my opinion, appetite suppression has no real bearing on the weight loss brought on by SLD. Taubes makes powerful arguments based on existing conventional research which show that calorie cutting/eating less is an ineffective way to lose weight, practically a non factor in isolation. Controlling insulin is the only way the body will reduce it's fat store. Based on that model, SLD is working by either stabilizing blood glucose through more fat consumption, the oil way, or unscrewing a carbohydrate addicted reward mechanism in the brain, the sugar way. Appetite suppression is just another fancy way of saying satiety. Sane cycles of insulin == satiety. Not eating when you are satiated (something probably hard for some of your experimenters at first, due to refined carbohydrate addiction and insulin out of homeostasis) probably further results in people eating \_more \_ fat, since they think that they can get away with it now that they are eating less, furthering the benefits of the saturated fat. I did not see coverage of fermentation and I did not see coverage of omega 3 in his book. Perhaps I oversell. Perhaps you read it already and rejected it? If you haven't yet read it, you \_really \_ want to. It will save you some research time and fuel some really fun righteous indignation.

seth (2010-01-11 12:12:20)

Andrew, yes, I really wonder about that. I haven't heard the "little bit of animal fat is good" part. I agree, just knowing fat tastes good doesn't tell you how much is optimal. (Which is why I was surprised when a lot of animal fat made me sleep better-I thought the optimal was much less.) And your story about not wanting to eat fat as a kid is telling. I have a similar story, which is that I bought a lot of pork from a farmer and put off eating the fattiest part till last. Ugh, fat, I thought. I think the resolution of the paradox is that some parts of our diet have too little animal fat. Unnaturally low levels. For example, bread without

butter. So to get the optimal amount we need to eat more than we would choose in other parts of our diet. Darrin, yes, I like Taubes's book and I interviewed him at length on this blog. I don't agree with him, however, about how body fat is regulated. He ignores (or doesn't know about) a lot of research, such as the research of Michel Cabanac. q, why a deficiency disease? All disease interferes with functioning. So does poor sleep. So does poor immune function. Deficiency diseases are caused by too little of a food that our ancestors ate more of. There is plenty of reason to think our ancestors ate more animal fat than most of us do now. And plenty of reason to think that their food had more bacteria & fungi growing on it.

Darrin Thompson (2010-01-11 12:52:20)

Silly me! Google knew even. I'll read that. I don't see a layman's summary of Michel Cabanac's research available. If you have a link to that I'd most appreciate it. Or I'll just hunt around more.

Tom in TX (2010-01-11 16:26:14)

Darrin, here is a book that talks about it: [http://www.amazon.com/Shangri-Diet-Hunger-Anything-Weight-Loss/dp/B0014E92NC/ref=sr\\_1\\_1?ie=UTF8&s=books&qid=1263252321&sr=8-1;-](http://www.amazon.com/Shangri-Diet-Hunger-Anything-Weight-Loss/dp/B0014E92NC/ref=sr_1_1?ie=UTF8&s=books&qid=1263252321&sr=8-1;-))

Darrin Thompson (2010-01-11 18:39:03)

I meant \_besides\_ that. :-) @Tom in TX, I added a comment in part 12 or 13 of the Taubes interview that answers your question about measuring blood glucose response to sucrose vs. other sugars.

Helen (2010-01-13 06:16:14)

NE1 - Sleep deprivation is linked to inflammation, metabolic disorder, and increased risk of heart disease, especially in women. I'll take my chances with bacon fat.

Hal (2010-01-14 14:44:10)

Sugar tastes great but most people (even/especially Taubes) don't think it's good for you. Sugar and fat tastes the best but I've never found anyone who will tell me that chocolate cheesecake is health food. I'm still looking though.

seth (2010-01-14 21:42:00)

Hal, there was no sugar available back when our preference for sweetness evolved. Israel Ramirez has speculated that our liking of sweetness evolved so that we would eat more plants, which use sugars to transport energy. That makes sense. If you think plants are bad for you . . . then there would be a puzzle.

Jason (2010-01-19 12:43:45)

I take fermented cod liver oil from Green Pastures I think it is (you only need a tiny bit so I wouldn't say drink). I notice a difference and recommend it to all.

Lemmy Caution (2010-02-18 13:01:28)

*Hal, there was no sugar available back when our preference for sweetness evolved. Israel Ramirez has speculated that our liking of sweetness evolved so that we would eat more plants, which use sugars to transport energy. That makes sense. If you think plants are bad for you . . . then there would be a puzzle.* I eat a lot of meat, and don't eat much sugar. However, lots of hunter gatherers eat honey and I see no reason why paleolithic people wouldn't eat honey when it was available.

Mr F (2011-04-16 01:23:31)

Late comment (new to you site), what is it that makes you think that sleeping longer is a sign of better health? This is new to me and goes against my personal experience of people sleeping longer only when they are ill. Was quite enjoying your site until I read this post, which goes a bit too far against the mountains of data. :(

Seth Roberts (2011-04-16 02:09:00)

This post doesn't say that sleeping longer is healthier so I am puzzled by this comment. I believe that sleeping more deeply is healthier because after I found several ways of doing so, my health improved: I stopped getting colds. Sleep is closely connected with fighting off infection.

### Even More Room For Improvement at the NY Times (2010-01-10 06:21)

In [1] a widely-emailed article about depression, Judith Warner, a former columnist at the New York Times, writes:

This is the big picture of mental health care in America: not perfectly healthy people popping pills for no reason, but people with real illnesses lacking access to care; facing barriers like ignorance, stigma and high prices; or finding care that is ineffective.

When [2] Atul Gawande fails to mention prevention in a discussion of how to improve American health care . . . well, he's a surgeon. Of course he has [3] gatekeeper syndrome. What's Judith Warner's excuse? Judging from this article, the notion that depression might be prevented has not occurred to her.

1. <http://www.nytimes.com/2010/01/09/opinion/09warner.html?em>

2. <http://cspan.org/Watch/Media/2010/01/07/HP/A/28096/Dr+Atul+Gawande+Surgeon+Writer.aspx>

3. <http://www.blog.sethroberts.net/2009/11/17/gatekeeper-syndrome/>

---

Alex Chernavsky (2010-01-10 21:43:09)

Judith Warner refers to a study which purportedly demonstrates that antidepressants work for severely depressed patients. I haven't seen the study, but I have my doubts about that conclusion. Based on the evidence I've seen, I don't think the drugs work for anyone (that is, they don't work any better than a placebo). See, for example: <http://www.spring.org.uk/2008/02/new-study-ssri-antidepressants-dont.php> For anyone who has an interest in psychopharmacology, I recommend a book called, *Blaming the Brain: The Truth About Drugs and Mental Health* by Elliot Valenstein: <http://www.amazon.com/Blaming-Brain-Truth-Mental-Health/dp/0743237870/> Valenstein is respected neuroscientist based at the University of Michigan (actually, he may be retired now). In this book, he debunks the fashionable but simplistic "chemical imbalance" theories that are so popular these days, especially among psychiatrists and pharmaceutical companies. (And, no, neither I nor Valenstein are Scientologists.)

Mike Bowerman (2010-01-11 13:36:54)

I was glad that she noted the lack of quality psychotherapy, rather than arguing for more prescriptions: "In 2008, a team of psychologists brought this point home in blunt terms in the journal *Psychological Science in the Public Interest*. "Despite the availability of highly effective interventions," they wrote, "relatively few psychologists learn or practice these interventions." I think it is worth reporting both the lack of efficacy of psychopharmaceuticals for much of what they are prescribed for, as well as the need for higher quality psychotherapeutic interventions.

### Value of Blood Glucose Self-Monitoring (2010-01-11 13:16)

In the 1960s, Richard Bernstein, an engineer and a Type 1 diabetic, pioneered the use of blood glucose self-monitoring. Using it, he was able to greatly improve his glucose control and thereby his health. No one doubts it helps Type 1 diabetics. With Type 2 diabetics, whose blood glucose is better controlled, the benefit is obviously less clear – but to

many Type 2 diabetics, unmistakable.

[1]A recent literature review, however, begged to differ:

Contrary to the widely-held belief, there is no proof that non-insulin-dependent patients with type 2 diabetes benefit from glucose self-monitoring. Moreover, it remains unclear whether an additional benefit is displayed by the blood test compared to the urine test or vice versa, in other words, whether one or other of the tests might offer an advantage to patients. The current data are quantitatively and qualitatively inadequate: the few trials that are suitable for investigating these questions have not included or have insufficiently reported many outcomes important to patients. Owing to their short duration, it is also not possible to draw any conclusions on the long-term benefit of glucose self-monitoring. This is the conclusion of the final report of the Institute for Quality and Efficiency in Health Care (IQWiG), [which is in Germany,] published on 14 December 2009.

Which is even more ridiculous than dermatologists concluding that acne isn't due to diet. At [2]a forum for diabetics, the report was roundly criticized:

Telling a Type 2 Diabetic not to measure his/her BG is like telling an overweight person not to weigh themselves....Ignorance is NOT bliss.

Totally agree! I was told by a nurse the other week not to measure my blood pressure at home as 'home testing can cause patients to get worried'!!!

I have recently been diagnosed with type 2, and without the regular testing i did whilst i was going though my diet change, I would have no idea which foods caused high or low readings. I definitely think regular testing gives you the ability to control your diabetes 100 % more than with no testing and using the 3 month HBA1c tests.

[impressive self-experimentation:] For my own edification, I discovered that chromium, zinc, and vitamin B1 added to my diet were beneficial. I discovered that cinnamon, selenium, Omega 3, and some other quack remedies being touted on the web did nothing for me except empty my pocket. I was about to start investigating CQ10 enzymes, but the doctor [who said "don't self-test"] stopped that trial in its tracks.

The most noticeable thing about this thread is how many people have either just joined or made a relatively "early" post after belonging for ages. Amazing! There is a depth of feeling aroused [by this report] that wasn't apparent before!

Why have dermatologists claimed we can't say acne is caused by diet ("there is insufficient evidence")? Why did these diabetes researchers claim we can't say home testing helps Type 2 diabetics? A big reason, I believe, is that these claims (if true, which they aren't) would preserve their gatekeeper function. You don't need to see a dermatologist to stop eating chocolate. Home testing will reveal all sorts of simple ways that you can control your blood sugar without medicine. The doctors who reach these ridiculous conclusions have a big conflict of interest that goes unstated. They are fine with the conclusion that home testing helps Type 1 diabetics because Type 1s will still need them. Because Type 1 diabetics inject insulin, they need doctors to prescribe it.

1. <http://www.iqwig.de/index.991.en.html?random=4b6198>

2. <http://www.diabetes.co.uk/diabetes-forum/viewtopic.php?f=1&t=12432&start=0>

---

Hypatia (2010-01-11 14:27:51)

Seth, While I usually agree with you, I am finding myself less convinced by your gatekeeper theory. Type II diabetics, even if their blood sugar is well controlled, have to see their doctors on a regular basis to monitor their liver and kidney function. But I look forward to hearing your thoughts. Hypatia

Jim (2010-01-11 15:03:18)

Blood glucose testing, or urine testing? For me, either could work, and it just becomes a matter of convenience and personal preference. Of those two choices, I prefer blood glucose testing. However, I very much prefer an entirely different measurement: my pulse rate. A fingertip pulse oximeter shows how my body is responding to food, with results much quicker than either blood or urine tests. And as someone who has both Type 2 diabetes and frequent chest pains, I like to monitor both conditions. The pulse oximeter results vary from the blood or urine tests, because I get very rapid heartbeat (tachycardia) from bread and cereals (gluten?). Also, my pulse is affected is very strongly coffee and tea. Generally speaking, my blood glucose and my pulse rate move in the same directions, with some differences But those differences are important, and my pulse oximeter has helped me identify and avoid foods that cause me to have very unpleasant tachycardia and chest pains. A fingertip pulse oximeter is expensive, but no testing supplies are needed. A cheaper alternative for measuring pulse would be an ordinary blood pressure monitor.

seth (2010-01-11 17:11:57)

Hypatia, long before they resisted home testing for Type 2 diabetics, doctors resisted home testing for anyone. And it isn't just these two examples – acne and diabetes. Prevention is generally ignored. What's your explanation for why prevention is so ignored by American health care?

Alex Chernavsky (2010-01-11 20:56:17)

This essay argues that preventive medicine isn't cost-effective: <http://www.nytimes.com/2008/10/07/health-views/07essa.html>

Jim (2010-01-11 21:56:53)

Seth, you asked Hypatia why prevention is ignored, but I'll give my answer also. I think doctors neglect prevention for two reasons: 1. Doctors think that patients will be more likely to do something simple like taking pills, instead of making major lifestyle changes, even though lifestyle is much safer and effective than pills. 2. Doctors get reimbursed for doing something. And while prescriptions are a tangible action, just counseling patients about lifestyle may not be considered important or effective in the eyes of the insurers. Health care reform will be meaningless if the only changes are in who pays for drugs and surgeries. The real change will only occur when doctors are rewarded financially for teaching patients how to modify their lifestyles.

Cord (2010-01-12 16:23:54)

I don't think it's necessarily a Gatekeeper attitude that causes this. I do think that people who have finished several years of expensive specialized education often become a little cynical about the intelligence of the public, and are unable to view patients as individuals: all recommendations must be suitable for "the public" and "the public" is stupid, and if you make a recommendation for someone intelligent and curious, you are in danger of having your recommendation followed badly by this great theoretical dumb mass of "the public". So if it can't be used by a cow, it's not valid.

Nancy (2010-01-23 23:54:59)

Found this commentary rather interesting as a (probably) LADA diabetic, who was first diagnosed as Type 2 before the right docs looked at the tests and saw Type 1. I think home blood glucose testing (by the time the sugar's in your urine, you've been high for TOO long) can be equally as beneficial to Type 2s IF they are taught how to respond to the numbers on the

little gadget and how to log and look for patterns. The idea is to prevent as much long-term damage as possible and improve daily quality of life, right? Really, I think well-trained diabetes educators (or similar educators for other conditions) can be just as beneficial to ANY person with diabetes as doctors. And, in response to Jim above - tachycardia is not really going to tell you which direction your blood glucose is heading. Your pulse can accelerate if your sugar is crashing, too. Believe me - I have mistaken that sensation of increased heart rate for increasing BG levels as well, until I get out the meter and do a fingerstick.

Regarding Data Logging, I have been using Google Docs to accomplish something similar. I created a Google Docs Form and emailed it to my iPhone, then save the link as a home screen button. This should work for any phone with a browser... Currently I am tracking weight, BP, exercise, coffee and nicotine consumption... all with different forms. I can enter on my phone or my laptop... Now if I could only find a use for the data, that would be something... -Ed

### Two Chinese Idioms (2010-01-12 10:02)

dao ye. dao means to buy in one place and sell in another (an example of how Chinese has far more verbs than English). The literal meaning of ye is grandpa but it is humorously used to praise someone. The dao ye are people who buy little stuff, such as clothes, in Southern China, where it's made, and sell it in Beijing. Probably on the sidewalk.

chao fang tuan. Chao means stir-fry (fast cooking), fang means houses or apartments, and tuan means group (of people). The chao fang tuan are those who speculate in real estate. They buy a house or apartment and sell it quickly.

"Everyone in China hates the chao fang tuan," said my friend.

---

Socktopi (2010-01-12 21:38:24)

Although mainly applied to the buying and reselling of financial instruments, the verb you are looking for is 'arbitrage'.

Hal (2010-01-14 13:55:00)

The house people are called "flippers" in the U.S. Not super popular these days although most of them got badly burned in the end.

## **False Alarm (2010-01-13 19:59)**

Today I flew from Tokyo to San Francisco. Just before boarding there was a level of security I hadn't encountered before: Every passenger's carry-on luggage was searched and every passenger was wand-scanned. Then my name was called. "Please come to the check-in desk." I went to the check-in desk. "Are you Mr. Roberts?" Yes. The woman who had asked me that started typing. "Why did you call my name?" I asked. No answer. I asked again. No answer. Eventually I figured out I'd been summoned to the check-in desk to be offered a better seat, for which I hadn't asked and for which I was very grateful. The airline was ANA.

---

Adam (2010-01-13 21:36:05)

Nice one! \*Flew ANA from Honolulu to Tokyo. They took great care of us...drove us from the front desk to the terminal, b/c time was short, escorted us through security, and made sure we got on the plane OK. \*Their service was much appreciated, given we were traveling with children and were being re-booked from a canceled United flight.

## Back to the (Recent) Past (2010-01-14 01:53)

My work is all about how the past was better for us. People stood more; so they slept better. They ate more animal fat; so they slept better. They saw more faces in the morning and fewer faces late at night, so their mood was better. Their food had more bacteria growing on it, so their immune and digestive systems worked better. And so on.

Past meaning 100,000 years ago. In Beijing, I am moving from one apartment (A) to another apartment (B). Apartment A is in a modern building, Apartment B is in a building maybe 40 years older. To my surprise, Apartment B is clearly better than Apartment A. The biggest improvement is that Apartment B has all-incandescent lighting. Apartment A was all-fluorescent. Exposure to fluorescent light in the evening can interfere with the faces-mood effect because it can resemble sunlight. Incandescent lamps are so much cooler than the sun that the light they emit is very different. Another improvement is that Apartment B, unlike Apartment A, has a sun deck. So it's easy to get lots of sunlight in the morning – important for sleep and for the faces-mood effect. The third improvement is that Apartment B, like Apartment A, is on the sixth floor – but Apartment B is a walk-up. Walking up six flights of stairs will tire out my legs so that when I do one-legged standing (to sleep better) I won't have to stand as long before getting exhausted. When I lived in Apartment A I could have taken the stairs, but I never did.

---

Andrew Gelman (2010-01-14 08:37:27)

I much prefer fluorescent lights; I looove the bright light. But my situation is different from yours; I see my family every morning when I wake up, so the faces-mood thing isn't such an issue with me.

Chris Burd (2010-01-14 12:19:20)

I'm surprised to hear that the Chinese were building good apartment buildings in the 1960s. I thought everything had gone to hell back then.

seth (2010-01-14 13:13:25)

Chris, maybe the apartment building dates from the 1950s. Andrew, to get the full benefit of seeing your family in the morning, it might be necessary to avoid fluorescent light in the evening.

Andrew Gelman (2010-01-14 13:15:29)

For me, I don't think so. But maybe the effect is more dramatic for you because you live alone.

Nansen (2010-01-16 16:11:42)

It's unclear whether Andrew Gelman's comment, "For me, I don't think so", means that he tried a self-experiment, or, is giving his best guess.

seth (2010-01-16 22:59:56)

I think he is guessing.

## Insurance Group VP Questions Climate Science (2010-01-15 01:33)

Science journalists, like other journalists, have a built-in problem: What they write affects the careers of the scientists they talk to. So those scientists are unlikely to be honest. No doubt most science journalists realize this but cannot

say it, for fear of damaging their own careers. Dirty little secret is the phrase.

This is why, when Climategate happened, the many claims of climate scientists that the emails meant nothing themselves meant nothing. "The reason for the denial was the need for it," Thorstein Veblen was fond of saying. What the climate scientists really thought they were unlikely to make public. The faux-horrified reactions of the few who made a living on the other side of the debate also meant nothing.

And this is why [1]this reaction to Climategate, from Robert Detlefsen, an insurance industry group vice president, is meaningful: what he says will have no effect on his career. He is disinterested.Â And he makes some good points:

- "The CRU e-mails show that a close-knit group of the world's most influential climate scientists actively colluded to subvert the peer-review process [to prevent publication of disagreement]; manufactured pre-determined conclusions through the use of contrived analytic techniques; and discussed destroying data to avoid [FOIA] requests."
- He quotes from the Wegman report, which I hadn't heard of. The Wegman report is by a group of statisticians.Â It says: "' independent studies' may not be as independent as they might appear on the surface". It also says that when climate scientists were asked to explain their work, "the sharing of research material, data and results was haphazardly and grudgingly done."

He concludes that the science is less certain than has been claimed.

1. [http://www.eenews.net/public/25/13791/features/documents/2010/01/13/document\\_cw\\_02.pdf](http://www.eenews.net/public/25/13791/features/documents/2010/01/13/document_cw_02.pdf)

---

Jeremy (2010-01-15 03:06:29)

What a shame Mr Detlefsen doesn't work for an actual insurance company. If he did, and if I had the money and temperament, I'd be shorting his company like mad.

Nile (2010-01-18 09:52:22)

One can download the Wegman report - just google it. The report is brutal to the climate scientists - they don't understand statistics and they are a self referential group. The report charts the relationships among the climate scientists. I don't know why the report hasn't gotten more publicity.

## **My Theory of Human Evolution (Beijing furniture shopping) (2010-01-16 00:16)**

I am moving to an unfurnished apartment in Beijing so I went furniture shopping at a huge "furnishings plaza" with hundreds of furniture showrooms. (Not to mention showrooms for mattresses, doors, stairs, security systems, curtains, light fixtures, and interior decorators.) It was more like a trade show than anything I've seen in America or Europe. I think it had more furniture choices than the whole Bay Area. I loved wandering around it, partly because it kept reminding me of [1]my theory of human evolution:

1. The huge choice included a big range of styles, including European, Chinese Traditional, modern, and "flat-plate" (meaning flat pieces of wood). At least 90 % of the stuff struck me as ugly. Garish, too ornate, too simple, clunky, chunky, bad colors, bad patterns, and so on. Of course there were buyers for all of it. That there is such diversity of taste ("no accounting for taste") supports a diversity of technological development. Exactly what a healthy economy needs.

2. Almost all the furniture was decorated. (If you don't want decoration, you shop at Ikea.) Decoration is unnecessary from a functional point of view – you can sleep on a bed whether it is decorated or not – but is obviously pleasant. (Which is why I wasn't at Ikea.) Decoration is difficult, so the demand for it supports technological innovation.

3. I write a lot sitting up in bed. After I saw a bed with a cushioned headboard, I realized I wanted a bed with a built-in cushion for sitting up. I found something better than I knew existed – the headboard cushion is detachable and cleanable. Having chosen the bed, there was pressure to buy matching furniture – the side table, the wardrobe, and so on. The furniture that matched my chosen bed was not especially attractive by itself but would become more attractive when near my bed. Because we like seeing things match. Our preference for matching stuff at first glance is paradoxical since it seems to push for less diversity rather than more. Why do we like seeing things match? The evolutionary reason, I believe, is so we will put similar things side by side to get that effect. Notice how clothing stores and many other stores are decorated. Why is that good? Because when we put things side by side it is much easier to see little differences and thus little ways one of them can be improved. When you start to notice these little differences, you become a connoisseur. Connoisseurs pay more for hard-to-make stuff than the rest of us and thus support technology that produces hard-to-see improvements.

4. Few Chinese bedrooms have closets. Clothes are hung in wardrobes. The wardrobe that matched my chosen bed wasn't the loveliest wardrobe I saw. But the loveliest wardrobe I saw didn't match the bed I wanted. The loveliest wardrobe I saw had something unusual: decoration of several sizes. We like a combination of large-, medium-, and small-scale decorative detail more than one size alone. This creates further challenges for artisans: There is pressure to be skilled at a wide range of sizes. So you don't just develop technology for making small decorative details, you also develop technology for making larger details. Again, human nature promoting diversity of technological development.

5. The more expensive stuff looked better than the cheaper stuff, yes. But a lot of the expensive stuff wasn't so much beautiful as expensive-looking. You might or might not like it – but no one would disagree it was expensive. Presumably people buy such stuff to show off, the way we do so many things to show our status. That we use difficult-to-make possessions to display status (thus creating demand for such things) is yet another way that human nature promotes technological innovation.

Jim (2010-01-16 23:50:36)

Diversity vs. conformity ... Several years ago, when I needed new eyeglasses, I found it almost impossible to buy the large-lens style that I had worn for decades. It wasn't that the frames were not available. The problem was that the sales ladies insisted that I should conform to the style of the season, with small lenses from French and British fashion designers with famous (and expensive) brands. After about 15 minutes of arguing with them, I finally walked out when one of the ladies asked if I wanted my sons to be ashamed of me because my glasses were unfashionable. It sounds like diversity may be more acceptable in

Beijing furniture shopping than in my local optical shops. Diversity vs. conformity.

seth (2010-01-17 09:46:24)

Jim, it's true that no one tried to argue with me when I went furniture shopping. They had a hard enough time telling me the most basic things. Your example is interesting since the force of "conformity" was the force of fashion – which keeps designers from endlessly repeating themselves. Fashion promotes diversity, but over time rather than space.

Darrin Thompson (2010-01-18 12:05:01)

Can you post pictures?

Graven Image (2010-01-24 20:57:48)

Diversity vs. conformity = balance,..

haaa\* I told ya!

### **Lindemans Lambic Framboise (2010-01-17 01:49)**

At a Beijing "food and wine exhibition" (which was 95 % wine) my favorite drinks were the Lindemans fruity beers – a type of beer called lambic. The label of the raspberry (framboise) one says:

Lindemans Framboise is a lambic made from local barley, unmalted wheat, and wild [= air-borne] yeast.Â After spontaneous fermentation, raspberries are added, creating a secondary fermentation and yielding a beer of exceptional flavor and complexity.

Maybe the presence of two quite different fermentations (grain and fruit) [1]is why it tastes so good, just as this says. To me, the more important point is the linkage of fermentation and complexity – the idea that fermentation creates complexity.

1. <http://www.blog.sethroberts.net/2010/01/04/psychophysics-of-complexity/>

---

Byron P (2010-01-17 20:50:41)

Seth, You are correct about Lambics and complexity. You may already know this, but "spontaneous fermentation" refers to the fact that the brewer does not use specially cultured yeasts to ferment the beer, as is the normal practice. Instead the large vat of malts (later infused with fruits) is literally left open to the air. Whatever free floating bacteria and yeasts happen to find their way in to the wort (i.e. unfermented malts) drive the fermentation. Often the brewers will stomp on the roof of the brewery above the vats to dislodge yeasts etc. from the rafters. P.S. In my experience, Belgian beers are full of complexity (Lambics are a type of Belgian Beer), I had always assumed due to unique strains of yeast.

megan (2010-01-20 14:28:42)

Seth, I love the Raspberry Lambic and am happily surprised to see that you wrote about it! I'd like to try the other flavors so I should get around to that =)

Patri Friedman (2010-02-01 10:48:39)

I love lambics! For me part of it is that they don't seem to use hops. I hate the bitter taste of hops.

### **How Bad is Animal Fat? (2010-01-17 22:14)**

After learning that [1]animal fat improved my sleep, I happily ate much more of it. [2]I wasn't worried that it made something else worse (e.g., heart disease). I believe that all parts of our bodies have been shaped by evolution to work well on the same diet, just as all electric appliances are designed to work well on the same house current.

[3]A to-be-published meta-analysis in the American Journal of Clinical Nutrition supports my view that animal fat is nowhere as bad as we've been told a thousand times. It says:

During 5â€“23 y of follow-up of 347,747 subjects, . . . intake of [more] saturated fat was not associated with an increased risk of CHD [coronary heart disease], stroke, or CVD [cardiovascular disease]. The pooled relative risk estimates that compared extreme quantiles of saturated fat intake were 1.07 (95 % CI: 0.96, 1.19; P = 0.22) for CHD, 0.81 (95 % CI: 0.62, 1.05; P = 0.11) for stroke, and 1.00 (95 % CI: 0.89, 1.11; P = 0.95) for CVD.

Emphasis added. One aspect of the results suggested that studies that found an positive association (more fat, more disease) were more likely to be published than those that didn't find an association or found a negative association. Which means these numbers may underestimate the good effects.

Thanks to Steve Hansen and Michael Pope.

1. <http://www.blog.sethroberts.net/2009/10/31/effect-of-animal-fat-on-sleep-more/>
2. <http://www.blog.sethroberts.net/2009/12/13/interview-with-seth-roberts/>
3. <http://www.ajcn.org/cgi/content/abstract/ajcn.2009.27725v1>

Jim (2010-01-17 22:33:57)

I love my saturated fats, especially eggs fried in real butter. Which made me very unhappy with fake-food giant Unilever and their new global campaign to "Ban butter to save thousands of lives." Of course, a ban on butter would give a big boost to Unilever's chemical fake butters like Country Crock and I Can't Believe It's Not Butter! [1]Ban Butter? Ban Fake Foods instead!

1. <http://blogsthatmakemethink.blogspot.com/2010/01/manufactured-food-company-launches.html>

Carol (2010-01-17 23:29:53)

I think you underestimate the number of times we've been told it was bad. It's been way more than a thousand times. It's too bad that real lard is almost impossible to get unless you render it yourself from natural pork (not the "always tender" salt & phosphate treated stuff - it ends up tasting salty) , or buy it direct from a farmer or 'gourmet' butcher. That lard that is in the stores has been hydrogenated and treated to be 'shelf stable' with the usual fat preservatives.

q (2010-01-18 09:19:57)

Carol, you can often get lard from Mexican groceries.

Timothy Beneke (2010-01-18 12:03:35)

Gary Taubes is useful here; the summaries he gives of the Women's Health Initiative studies support the idea that animal fat is not so bad. The attempts at controlled long term studies where one group is coached to eat the "right" foods and the other is not finds that eating the "right" foods (assuming we can trust the data) had no better health outcomes over a 9 year period than eating supposedly less nutritious food. People who were coached were encouraged not to eat a lot of animal fat... When nutritionists attempt to actually demonstrate their knowledge claims about the best overall diet, they tend to fall flat on their faces... So far at least...

peter (2010-01-18 13:26:33)

<http://www.telegraph.co.uk/health/healthnews/7010677/Ban-butter-to-save-our-hearts-says-doctor.html> Ban butter to save our hearts, says doctor Butter should be banned in a bid to save thousands from heart disease, a leading heart surgeon claims. Dr Shyam Kolvekar said that he is "increasingly concerned" about the nation's eating habits as he is seeing patients as young as 30 in need of heart bypass surgery due to a diet "overloaded" with saturated fat. According to a national diet survey, nine out of 10 of children, 88 per cent of men and 83 per cent of women in Britain eat too much saturated fat, consuming a fifth too much each day.

John (2010-01-18 22:18:26)

Love this post, but is there a typo? p equals .22 for CHD, .11 for stroke, but a whopping .95 (not .095?) for CVD. At least CHD and stroke are highly reassuring.

seth (2010-01-19 00:10:14)

John, .95 is not a typo. Notice how well-centered on 1 the confidence interval is. Peter, someone should ask Dr. Kolvekar why the French, who eat so much animal fat, have such low rates of heart disease.

peter (2010-01-19 14:24:56)

Seth, FWIW, my understanding is that the French paradox is attributable to the red wine the French drink.

Nigel (2010-01-19 16:39:24)

There are three studies showing that there is no significant association between saturated fat consumption & CHD. See [1]**Ban Butter, Part 4,400?**

1. <http://nigeepoo.blogspot.com/2010/01/ban-butter-part-4400.html>

How bad is animal fat? | dv8-designs (2010-01-19 16:42:41)  
[...] How bad is animal fat? [...]

Afrop (2010-01-19 17:02:51)

I would just like to point out to Jim (the first commenter) that Qi Sun, a co-first author of the study, is supported by a fellowship from Unilever Corporate Research. I thought that was interesting in the context of your comment. I would also like to point out that the study makes no claims regarding fat origin, simply saturation. The study applies to coconut or palm oil as much or more than, say, lard.

How bad is animal fat? | The World Matters (2010-01-19 19:03:05)

Salsa AI (2010-01-19 21:02:24)

You all know Julia Child don't you? She lived to 92, loved butter and animal fats. We humans evolved eating "food." Don't confuse chemicals for food.

Dr.N (2010-01-19 22:38:27)

Simple, good fat; raised with proper husbandry, provides ample amounts of co-Q 10. The only substance known to reduce arterial oxidadative stress and it's free; not like a pharma created monster that can't be put down because of fear. So - EAT YOUR GOOD FAT in moderation. Live. Dr.B

Pietro (2010-01-20 08:44:28)

When will someone acknowledge that heart disease is primarily due to genetic factors ? This does not mean that the "risk factors" are not important. They are but their relevance ( eventual heart attack) differs. Julia Child would have lived to 92 regardless of her diet.

Ashish (2010-01-21 00:51:21)

I've always loved bacon. Over the past couple of months, this blog has been my excuse to eat fatty bacon - with fried eggs, as an addition to miso soup, and elsewhere - and to cook with bacon drippings. Unfortunately, my personal correlation between eating bacon fat and getting heartburn is turning out to be close to 1. (I very rarely otherwise get heartburn.) So I have to discontinue my animal fat experiment.

Eva (2010-01-21 02:26:28)

Somewhere in the Bible it is mentioned that among good things is "oil to make one's face to shine" and I don't think it means to slather your face with the stuff. Butter is a gift of treasure from the goddess to the kitchen. Like all animal fats, it should be revered and honored and given thanks for. The kitchen is the true temple of humanity. You don't overeat in that place—that would be sacrilege—but you do give thanks for being a part of the Earth's natural cycle. All real food is holy. "Ban Fake Foods"

is a great, simple slogan and the key to our survival—thank you!

### **An Alphabet (2010-01-18 09:45)**

Apparently I'm [1]a mad scientist. "Peasants (with pitchforks)" refers to rebellion – peasants storming the capital, armed with pitchforks. The alphabet, with lovely illustrations, is on [2]a set of blocks available for purchase.

Stephen M (Ethesis) (2010-06-12 15:34:47)

Martha Coakley should have been disbarred and sentence to a maximum sentence.

## Morning Light Self-Experimentation (2010-01-19 06:27)

A 25-year-old Toronto accountant [1]blogs:

A few weeks ago my parents came downtown to take me out for dinner. Apart from leftovers, my dinosaur garbage can and a few pieces of mail, they also brought my Ikea lamp.Â Now my apartment is very small.Â Itâ€™s a bachelor with about 600 square feet.Â It faces south and gets a fair amount of light during the day, which is fine during the weekends.Â But during the week when Iâ€™m at home â€œ in the morning and at night â€œ it can get pretty dark.

Now enter my Ikea lamp.Â The first morning after receiving it I turned it on along with all my other lights, while getting ready for work.Â I noticed a few things that day.Â One, I wasnâ€™t angry during my commute via the subway.Â If youâ€™re not from Toronto you wonâ€™t get this.Â But if you are and you ride the rocket each morning, then youâ€™ll understand the general expression of, â€œangry defeatismâ€ on most commutersâ€™ faces.Â My lack of hate was personally noticeable.Â I also noticed that I didnâ€™t need my usual green tea when I got into work.Â Even crazier I was alert when I got in,Â the type of mental alertness that often doesnâ€™t show up until roughly 11 am.

I really thought about this for a while.Â I couldnâ€™t figure it out until I remembered [2]this post by Seth Roberts.Â Itâ€™s very short.Â I thought about it for a few days and made a little experiment.Â I went from turning on all my lights every morning to a few, to none.Â My â€œawakenessâ€ varied positively with the quantity and duration of morning light.Â Along with morning light, Iâ€™ve also found that having the TV on and taking Vitamin D amplifies this effect.

Itâ€™s not a small impact.Â Itâ€™s had a huge effect on my day-to-day.

I left a comment asking what the Ikea lamp was. One interesting thing about this was the exposure time. Judging from a comment (see below), it was about an hour. That's the minimum I try to get early every morning (from sitting outside).

After I bought the absolute necessities for my Beijing apartment (bed, water heater, washing machine, etc.), my first optional purchase was a chair for the balcony. So I can sit on the enclosed balcony in the morning.

---

Brennan (2010-01-19 07:39:27)

I usually keep it on for closer to an hour - hour and 15min. I like to have a relaxed breakfast.

Jeff (2010-01-19 09:01:17)

One thing to consider is the positive effect of light exposure on dopamine and serotonin, both neurotransmitter stimulants associated with wakefulness and positive mood.

Radek Pilich (2010-01-19 09:22:22)

I have IKEA lamp as well ;) This one <http://www.ikea.com/us/en/catalog/products/20370383> Solid performance for the price. I have full spectrum lightbulb in there - some 5000K. I keep it on as much as I can during the day (it's energy saving bulb) and switch it off soon after transitioning to ceiling lighting that has some 2000K full-spectrum bulbs for the later part of the day. Before sleeping time, I switch even those off and use just 2 small halogen lamps to keep a bit ambient light in the room - just enough to prepare for next day or do a bit of reading. But that's not why I am writing this comment. I am writing it because I got an idea after reading this article. Next time I am in a DIY store, I will buy an electric socket timer, so I can program it to switch on my lamp automatically some time before my morning alarm. I hope this could make waking up more comfortable, especially in the winter.

ceva (2010-01-19 12:55:52)

I've begun to start each morning with lights fully on. Seth, you should investigate whether practising the dual-n-back task improves your mood the next day. I think that it does mine. This might be because it does some of the things that meditation might (I don't meditate).

bennetta (2010-01-19 13:46:45)

The light exposure trick is something that has been relatively well known and practiced by Psychiatrists treating ADHD for years. A specialist I saw recommended it 4-5 years ago and it's wonderfully effective at getting me going in the morning, as well as keeping my internal clock regular (which is a classic problem for people with AD(H)D) I do not remember the details, but according to him, certain wavelengths in the light trigger responses in your brain that resets your internal clock and helps wake you up. Unfortunately, this can only happen between around 6-9am due to what's going on in your brain at the time. This is why you can actually be more tired and less pleasant after you sleep in, but also why people nowadays can have problems waking up. It's especially important for folks with ADD to do it because our internal clocks are much more out of whack than average, but I'm sure it helps everyone. The best way to do it is to get a wake up light that gradually turns on with a timer. Couple it with a full spectrum bulb and you can have a miniature sunrise right in your own room! This, meditation, and Omega 3 are, by far, three of the most effective "home remedies" I've ever used.

lance (2010-01-19 14:24:05)

I use a light in the afternoon . . . There's conflicting info about whether it's the light or when you use the light that matters.

Patrik (2010-01-20 01:48:41)

*One, I wasn't angry during my commute via the subway. If you're not from Toronto you won't get this. But if you are and you ride the rocket each morning, then you'll understand the general expression of, "angry defeatism" on most commuters' faces. You have just described the Budapest metro/subway during winter. My guess, this is a function of latitude.*

npr (2010-01-20 11:00:44)

it would be interesting to do an activism campaign to get subways to install lighting that tries to match sunlight- I wonder if you could change the mood of a whole city.

donny (2010-02-27 19:35:51)

Last time I went on the subway in Toronto, I noticed how dim the lighting was. The stations were much more brightly lit when I was a kid. I found it strikingly oppressive.

## IvanView Contains Malware (2010-01-20 11:45)

A few days ago I needed to convert image files from one format to another. Searching for the software, I found Ivan-View, an apparently reputable company whose program once got 4 stars from CNET. I download and installed the converter. Right after that I started having trouble with my Firefox browser. After I did a Google Search, and tried to go to one of the results, I'd be directed elsewhere. Trying to use Avis.com in America put me on Avis's Australian website – and many relocations were much worse. Internet Explorer still worked okay.

I searched "Firefox virus." I found a post about a problem that was the same as mine, with the reassuring words that it will just mess with your web surfing. The outlined solution steps, however, were either very complicated or didn't solve the problem.

Later I started to have trouble with Internet Explorer. I used Norton Antivirus to scan my hard drive. It found nothing of importance. But it did tell me I had some sort of incoming malware. Then it told me to restart my computer. I did so – and was unable to log on! No one had reported this problem in what I'd read.

At this point I did a full system recovery (from a few weeks earlier). It took a few hours but then everything was fine. It's unfortunate, though, that Mozilla and Norton, not to mention Microsoft, haven't managed to protect against a virus that has been around for almost a year, as far as I could tell. You should be able to fix this by downloading a free antivirus program.

---

Sean (2010-01-20 13:34:37)  
Try IrfanView. Very good program.

Cord (2010-01-20 13:54:53)  
The malwarebytes free software is excellent for most things of this nature. I also recommend the bleepingcomputer.com site. Twice, now, I have used my laptop, a thumb drive, and those tools to perform miraculous resuscitations on computers plagued by malware. My family now regards me as a computer whiz, even though I know absolutely nothing about programming. I do, however, know how to boot up in safe mode and follow a set of directions– and bleepingcomputer has got that covered.

ivan (2010-01-20 14:22:11)  
The reputed company and famous program is IrfanView, Ivan View sounds like a Russian's hacker version of the program!

Kevin Miller (2010-01-20 14:55:32)  
Sounds like you wanted "Irfanview," which is free and effective. "Ivanview" sounds suspicious on its face. Odd that CNet rated it highly, but the user reviewers were appropriately scathing.

JC (2010-01-20 17:05:42)  
Yep, it's Irfanview you need.

seth (2010-01-20 20:00:46)  
Thanks, I didn't know about Irfanview. Kevin, good point about the user reviews.

amber (2010-01-21 06:48:51)

Once again, system restore proves itself as the poor man's virus protection. I could make a long list of the folks who've downloaded doozies and I've walked through that process on the phone. I keep brand name antivirus software on the boxes at my office because it seems like a best-practices thing to do, but I've never had a virus/adware/whatever problem that system restore couldn't fix. BTW, system restore doesn't usually take me that long—you need some more ram?

seth (2010-01-21 07:28:21)

Amber, maybe it took two hours because I have many files? How long does it take you? I used Lenovo's recovery system.

Nathan Myers (2010-01-21 13:11:36)

I can't imagine why anyone would subject themselves to Microsoft Windows. Virus checker? System restore? Stars on CNET? What a strange way to run a computer.

amber (2010-01-21 18:33:24)

Hey Seth, I read back over your post and realized you never got it to boot back—yeah, full system restore from a backup is two hours. Next time – before you shut'r down – do start/programs/accessories/tools/system restore. It'll wipe whatever you just downloaded, just pick your most recent restore date (or one the week earlier if you're not sure when the rogue download occurred). Takes five minutes. If you can't boot normal, I'm pretty sure you can run it from a boot in safe mode. Normally if mine won't boot I'll let it sit a few hours and try later. Who knows why windows works when it does. Sometimes I hit F8 and play with the boot order to get a cleaner boot. Nathan is right though—for a brief second I wondered whether as an educator you might have a Mac and I didn't know if system restore existed on Macs, then it occurred to me, of course it's not a Mac, it's got a virus. But hey, PC is the world standard, what can you do. I told a college prof once long ago I needed to buy a PC because 'everyone' uses them and he said I was crazy. He was wrong.

Mark (2010-01-21 21:28:38)

Life is so much easier with a Macintosh. I end up having to support my wife's Vista machine. Windows is actually is pretty safe from viruses since Vista, but my wife bought Kaspersky's virus program, and it has so many false positives that it's driving me crazy. My wife just doesn't understand why everything's O.K. if the program has caught something. It takes me 30 minutes of wasted time to find the Kaspersky forum postings confirming that it's a false positive. I don't know why Macs don't have problems. In theory they're just Unix boxes susceptible to viruses and trojans. But in practice they have been completely safe.

seth (2010-01-21 23:34:37)

Thanks, Amber, I didn't know about that accessory.

Nathan Myers (2010-01-22 00:24:50)

Macs are a nuisance too, for the expense if nothing else. It's easy to try Ubuntu Linux these days, just run it in a VMWare session. (VMWare is a free download.) If you only ever connect to the internet – for e-mail, browsing, what-have-you – in the Ubuntu VM, you never have to worry about viruses at all, because they can't get through. All the apps on Ubuntu are free downloads from the Ubuntu servers, so there is no Ivan. Once you get used to it, maybe you just make it your main system, and then if you have to run a Windows program, run that in a VM. (I don't because everything I need is on Linux, but ymmv.) One advantage of switching around is that then you never have to download or install drivers again. Also, everything on the machine runs faster, because the Linux kernel operates the hardware much more efficiently than Windows or Mac does.

Alex Chernavsky (2010-01-22 05:31:07)

Amber wrote, "Next time – before you shut'r down – do start/programs/accessories/tools/system restore" That procedure may not work. Lots of viruses disable the system restore feature in Windows. I do tech support at work, and I've run into that problem a number of times. In extreme cases, you have to reinstall Windows (I've only had to do that once, though.)

amber (2010-01-22 06:29:02)

I think the default for system restore is for it to be "on" but Seth it might be worth checking your system just to make sure. The only time it didn't work for me, the laptop didn't have it "on" for some reason. I've never run against anything system restore wouldn't fix, but most of my virusy things are internet activex type exploiters. (My employees are pretty good about not opening weird emails and they're too overworked to surf the web much.) And it's worked for everyone in my family. My dad had a problem that sounded like Seth's with his box last month, took it to some store and paid money for it not to be fixed, and we had it fixed within five minutes of him finally calling me. The other thing I do, if I realize I've wandered onto a site that seems to be downloading something, I disconnect the internet cable or wifi card immediately, control-alt-delete out of explorer, and run the system restore right then. I've got some work applications that require me to use explorer so I'm stuck with the exploitability. I view the whole system restore thing like changing your carb intake to lower your cholesterol. It works, really well 90 % of the time or more, but ain't nobody gonna make a dime on antivirus if they publicize system restore.

Nathan Myers (2010-01-23 14:19:35)

It's appealing to imagine that "system restore" is the Holy Grail of virus recovery, but it's trivially easy for a virus writer to hide their virus in your personal files and re-infect the system after the restore. Having done so, it's equally easy to lay low for a while - maybe even until the next "system snapshot", corrupting it too - and then pick up again. The better ones won't affect your browsing much, they just deliver spam and attack extortion victims 24x7, or sit quietly watching for you to type the password to your bank account. You're much better off keeping the virus out in the first place. The first line of defense is not to use Internet Explorer, ever.

## **Does Prenatal Ultrasound Cause Autism? (2010-01-23 05:41)**

Caroline Rodgers, a science writer, has [1]noticed some very interesting correlations:

The new autism figures published in the CDC's 12-18-09 Morbidity and Mortality Weekly Report (MMWR) [2]<http://bit.ly/57XRca> reveal an apparent anomaly: While there was an overall average autism increase of 57 percent in children born between 2002 and 2006, Hispanics in Alabama showed a 67 percent decrease in autism.

The mothers of the first batch of children who were eight years old in 2002 would have been pregnant in 1993. Therefore, I looked at what changes might have occurred in Alabama's public health policy in 1993 that would explain a 67 percent drop in the autism rate of Hispanic children born between 2002 and 2006.

According to the 2002 PRAMS Surveillance Report: Multistate Exhibits Medicaid Coverage for Prenatal Care [3]<http://bit.ly/8godkv> .

During 1993-2002, the prevalence of Medicaid coverage for prenatal care . . . decreased in 3 states (Alabama, Florida and West Virginia).

This particular correlation is in addition to a broad correlation between wealth and autism (more wealth, more autism):

Also significant in last week's MMWR report were the ethnic differences in autism prevalence found among non-Hispanic whites, blacks and Hispanics. The autism rate in the monitored areas throughout

the United States of children of non-Hispanic white women was 102 per 10,000; among black children, 76 per 10,000; and among Hispanic children, 61 per 10,000 – roughly half of the non-Hispanic white rate. These results seem counter-intuitive, since the non-Hispanic white population could be expected to have more access to prenatal care than the black or Hispanic populations. Yet if autism risk is increased by exposure to prenatal ultrasound, these figures make perfect sense.

This isn't cherry-picking. Rodgers believed that we should take seriously the idea of a prenatal-ultrasound/autism link based on [4]entirely different data.

q (2010-01-23 07:06:46)

> While there was an overall average autism increase of 57 percent in children born between 2002 and 2006 i have trouble believing that ultrasound was used much more in 2006 compared to 2001. it's not a new technology.

Jeff (2010-01-23 07:32:52)

It's not about having trouble believing something. That's the type of cynicism that's blunted almost all intelligent discussion regarding autism, particularly its increased diagnosis, likely relating to its increased incidence.

Caroline Rodgers (2010-01-23 07:56:55)

Ultrasound use has changed rapidly in every possible respect over the last 20-plus years, whether in terms of scans per pregnancy, the gestational window of exposure or the type of scan. A study from Canada showed a 55 percent increase in scans per pregnancy for the 10-year period ending in 2006, with the highest percentage of increase among low-risk pregnancies, which the study authors pointed out were not medically indicated. A fairly new type of scan that should be of particular concern is the nuchal translucency scan, which must be performed between gestational weeks 10 and 14. The test measures the amount of nuchal fluid at the base of the neck. According to an expert on fetal ultrasound safety, this test has been standard in Europe for the last three or four years and has been recommended for all pregnancies since early 2009. At an ultrasound convention last year, I was told that this test was popular among U.S. doctors because it had a high reimbursement rate from the insurance companies. Every ultrasound scan has many variables, such as the amount of acoustic output, the dwell-time, type of equipment, etc. When the FDA approved an eightfold increase in power in the early 1990s, it required that thermal indicators be on every machine. Unfortunately, surveys within the industry reveal that most operators cannot even find the thermal indicators on their own machines; among those who can, very few know how to read them. Doctors and ultrasound technicians told me they were not concerned about the thermal indicators, pointing out that the machines and settings are both FDA approved for obstetrical use; unfortunately, these specs and settings are not based on safety – a fact that was confirmed for me by an FDA network leader.

Jim (2010-01-23 09:09:36)

Like all medical interventions, the possible benefits must be weighed against the possible risks. There appear to be many benefits from ultrasound, as I experienced when my terrible abdominal pains were diagnosed as gallstones. Her information is intriguing and certainly deserves more research. [1]the50besthealthblogs.blogspot.com

1. <http://the50besthealthblogs.blogspot.com/>

Nancy Lebovitz (2010-01-23 09:22:34)

*The Brain that Changes Itself* (a very interesting book about neuroplasticity) suggests that autism might be caused in vulnerable babies/toddlers by too much exposure to white noise. The idea is that developing the ability to perceive information is a crucial part of early development, and the brain is disrupted if there's too much input that doesn't have information. I don't know if ultrasound is white noise (probably not), but the connection to sound is interesting.

Cord (2010-01-23 11:16:11)

I've seen this hypothesis before, and I'm not sure what to make of it. Plausible, but unproven? The main thing I took away from reading this and other articles on the subject is that statistically, there's no improvement in pregnancy outcomes when ultrasound is used. So it's an unnecessary procedure, where you're spending money for no real benefit (and, possibly, harmful). That's all I need to know about it. I can wait till my babies are born to see what they look like.

wcw (2010-01-23 17:18:00)

Cf <http://www.ncbi.nlm.nih.gov/pubmed/19728066>

David (2010-01-23 22:10:59)

It does not seem like it would be difficult to do a survey of parents of five year old children, looking for a correlation of autism related symptoms to recollections of ultrasounds. It wouldn't be the last word, but it would be something a statistics class could do as a class project. It would be cool if someone put together a web site of useful studies suitable for class projects.

Helen (2010-01-24 17:13:52)

I had many ultrasounds (I lose count) because I was expecting twins and had gestational diabetes. I wonder if the increase in ultrasounds correlates with increased multiple pregnancies (which receive more ultrasounds) due to increased use of fertility drugs and reproductive technologies (IVF), as well as more pregnancies in older women, which also have a higher rate of twins. During my pregnancy, I read about the risk of autism from ultrasounds, and it sounds very plausible. I couldn't do much about it, though - in my case the benefits of regular screenings seemed to outweigh the risks of the ultrasounds. I was concerned, though, when the technicians would try to "give me a picture" by holding the wand over the fetus extra long - it was hard to say no because they seemed to perceive no risk in using more ultrasound than was necessary. One gave me a 3-D image without asking me, which pissed me off. (Is 3-D ultrasound good for anything but an early "baby picture"? Why does it exist?) Fortunately, my daughters, now age 2, seem far from autistic. I was glad I was carrying girls (lower risk of autism in general), considering all the ultrasounds they got. One does seem to be left-handed, which isn't in itself worrisome, but I wonder if it could have been caused by the ultrasound. I remember reading one study that, while finding no increase in autism in children who'd had multiple ultrasounds, found a higher rate of left-handedness among male children, indicating that the ultrasound did \*something\* to the brain.

Helen (2010-01-24 17:18:53)

BTW, @ Caroline Rogers - We had the nuchal fold ultrasound test at 11 weeks because it was safer than amniocentesis or chorionic villus sampling and was available earlier in pregnancy. Although we would have continued the pregnancy whatever the finding, the results gave us peace of mind and we felt no need for further tests. I didn't know at the time that there were particular concerns with this type of ultrasound, but I probably would have done it anyway.

3wheelerbuggy (2010-02-23 04:37:51)

You would not believe how long ive been searching for something like this. Scrolled through 7 pages of Google results without finding anything. One search on Bing. There was this... Gotta start using this more often

Heather (2010-02-26 01:12:14)

I have an ASD diagnosed seven year old daughter. I have been wondering since her regression at fifteen months and diagnosis shortly there after, if there was a link to her diagnosis and the many ultrasounds I had. I don't understand why this possible link

has not been researched more. I had a high risk pregnancy and got an ultrasound everytime I walked through the door, whether I liked it or not. I also had a chorionic villus sampling done at eleven weeks where the Doctor just seemed to rest the ultrasound device on my belly as my husband asked questions for the next thirty minutes, after the test. I hope that someone will finally run the numbers...so often ultrasounds are unnecessary. Wouldn't it be tragic, if such a simple unnecessary procedure, ends up being a major contributing factor? Isn't about time that someone reserched this seriously?

Gary Saffer (2010-11-07 19:44:28)

I have been looking into this for a number of years. I contacted several Medical research groups & none were interested in looking into this. I also Contacted Dr. Woo, "the athority" on prenatal ultrasound. He has yet to respond. Autism is increasing in the more affluent areas where prenatal ultrasound are more likly to be used . As we know ultresound is microwaves, as in ovens. Microwaves were expermented with to put out forest fires, which they did very well but also cooked anything alive in the area. I think there is a diffenite connection between Autism & Ultrasound.

Margaret Bailey CT(ASCP) (2010-11-13 12:51:02)

A few years ago I saw a brief item in a medical newsletter about a study done with pregnant rats. Offspring of rats who had ultrasound showed alteration in development of the brain. I wish I could cite the reference, but it could have been "Mood, Mind and Memory" or something like that, or one of the newsletters from a medical school, or even a pathology newsletter. I know it was since 2005. I thought of autism at the time and hoped someone in an appropriate field would follow up on it.

## **Animal Fat, Sleep, and the Ketogenic Diet (2010-01-24 08:00)**

Kathy Tucker draws my attention to [1]a recent article about the ketogenic diet, which is essentially a very-high-animal-fat diet, used to treat childhood epilepsy. I've blogged about the ketogenic diet ([2]here, [3]here, and [4]here) but that was before I was on a similar diet. Kids on the diet didn't develop high cholesterol ("very few children actually end up with cholesterol or lipid problems on the diet"). I slept better [5]when I ate more animal fat, which suggests that animal fat makes the brain work better overall. The success of the ketogenic diet supports that idea. My results suggest that it is the animal fat, not the other fat, that makes the diet effective.

That many kids with epilepsy get better when put on the ketogenic diet can be seen as a canary-in-the-coal-mine phenomenon. Canaries are more sensitive to bad air than miners; children with ketogenic-responsive epilepsy are more sensitive to lack of animal fat than the rest of us. That lesson was lost on me when I first learned about the diet and its success. The broader lesson is that almost any disease has something to teach us about what the best environment is.

---

Jim (2010-01-24 09:35:43)

Seth, I eat a lot of avocados, which are mostly fat. I wonder if their fat would offer the same benefits as animal fat? (And they also have fiber, unlike animal products.) [1]The50BestHealthBlogs.blogspot.com

1. <http://the50besthealthblogs.blogspot.com/>

CD (2010-01-24 11:34:35)

Did you happen to catch the last sentence of the article? "Max's brain is thought to have recovered enough that he is being gradually transitioned to normal meals." Time to load poor Max up with sugar, corn, and wheat again! Maybe Max's doctor should instead rethink his definition of a "normal" meal.

Richard A. (2010-01-24 11:56:22)

The most ketogenic fats are the medium chain fatty acids. These fatty acids produce ketones even in the presence of carbohydrates. You can buy MCT oil over the internet. Coconut oil contains some medium chain fatty acids and to a lesser extent butter. This is anecdotal – I tend to begin getting sleepy in the evening. Lately for about the last several months, I have been consuming about 100 calories of coconut milk in the evening and that night time drowsiness has gone away.

Jeff (2010-01-24 11:56:59)

I've had this notion as well. The first evidence of epilepsy being treatable through a ketogenic diet is old (1920s?), and through the years the idea has only been verified. Yet it's still regarded as some anomaly, something that "probably benefits only a bizarre minority of epileptic patients." There's also evidence for ketosis being beneficial for people with Alzheimer's. Furthermore, no one wants to make the connection that, maybe – just maybe – the clear and obvious benefits of a ketogenic diet towards epilepsy and Alzheimer's has some – just SOME – relevance to normal brains. The brain is a peculiar organ in terms of metabolism, in that brain cells need glucose more so than other cells of the body (the heart famously prefers ketones to glucose). I imagine there is probably some relation between the brain's unique metabolism, and the benefits of ketogenic diets.

Alex Chernavsky (2010-01-24 19:41:15)

Seth, what do you think is the crucial difference between animal fats and plant oils/fats that accounts for the benefit of animal fats? Is it the degree of saturation? Or is it not the fat at all but rather some other (non-fat) substance that's present in animal fats?

Nathan Myers (2010-01-25 02:38:09)

I slept better when I ate more animal fat, which suggests that animal fat makes the brain work better overall. A more parsimonious conclusion would be that some component of the fat – and there are hundreds of chemicals dissolved in it – had a mild sedative effect.

James (2010-01-25 11:53:32)

Does this animal fat theory mean that vegetarians should sleep poorly compared to everyone else?

What is the new ketogenic diet? - QuestionBin::Answer (2010-01-31 08:38:02)

[...] First, the ketogenic diet isn't a diet to lose weight. The ketogenic diet is a high-fat, adequate-protein, low-carbohydrate diet primarily used to treat difficult-to-control (refractory) epilepsy in children (source). Other Articles: <http://www.blog.sethroberts.net/2010/01/24/animal-fat-sleep-and-the-ketogenic-diet/> <http://www.fitnessstipsforlife.com/is-the-ketogenic-diet-just-another-fad.html> Null's Sig: To err is human... To really foul up requires the root password. [...]

## Impressive Versus Effective (2010-01-25 06:47)

[1]A profile of James Patterson, the hyperprolific novelist, says this:

“I don’t believe in showing off,” Patterson says of his writing. “Showing off can get in the way of a good story.”

A few days ago, just before this profile appeared, I gave a talk about self-experimentation at [2]EG (= Entertainment Gathering), a TED-like conference in Monterey. One reason my self-experimentation was effective, I said, was that I wasn't trying to impress anyone. Whereas professional scientists doing professional science care a lot about impressing other people. I planned to say it like this but didn't have enough time:

Years ago, I went to a dance concert put on by students at Berkeley High School. I really enjoyed it. I thought to myself: I like dance concerts. So I went to a dance concert by UC Berkeley students " college students. I enjoyed it, but not as much as the high school concert. Then I went to a dance concert by a famous dance company that all of you have heard of. I didn't enjoy it at all. Why were the professionals much less enjoyable than the high school students? Because the professionals cared a whole lot about being impressive. That got in the way of being enjoyable. Scientists want to be impressive. They want to impress lots of people " granting agencies, journal editors, reviewers, their colleagues, and prospective graduate students. All this desire to be impressive gets in the way of finding things out.

In particular, it makes self-experimentation impossible:

They can't do self-experimentation because it isn't impressive. Self-experimentation is free. Anyone can do it. It's easy; it doesn't require any rare or difficult skills. If you want to impress someone with your fancy car, self-experimentation is like riding a bike.

Because my self-experimentation was private, I was free to do whatever worked.

My broader point was that my self-experimentation was effective partly because [3]I was an insider/outsider. I had the subject-matter knowledge of an insider, but the freedom of an outsider.

2. <http://www.the-eg.com/>
3. <http://www.blog.sethroberts.net/2009/01/24/not-the-same-study-section-how-the-truth-comes-out/>

---

Jeff (2010-01-25 08:40:28)

Will the video of the talk be posted online?

seth (2010-01-25 12:20:12)

yes, the video of the talk will be posted online. I don't know when.

Andrew Gelman (2010-01-25 21:56:50)

Seth: I read the article about Patterson and it's fascinating. But I don't think he's a good example for your discussion. He's much more like the professional dancers you can't stand, than like the high school dancers you love. He has a factory and churns out 9 books a year, doesn't seem to be doing a lot of self-experimentation in your sense, rather is working entirely within conventional forms. And he definitely isn't doing it for himself, he's trying to impress someone-the mass audience, in this case. I don't completely disagree with your main point (although I suspect that expectations are involved too; one reason

the high school students are fun to watch is that you're expecting less from them in terms of raw talent), but I don't think that a mass-media figure such as Patterson who writes by formula, really works as an example for you here.

Adam (2010-01-25 21:57:42)

Some similarities to the point made in this piece by Mark Twight at Gym Jones. <http://fwd4.me/CmJ> Dressing to impress, training for a certain look, doing the right workout routine, etc. does nothing for making actual gains in performance..that is why there is a distinct difference between gyms. There is always an underground feel to the gyms that will train you for performance and embrace experimenting. Otherwise, you have to do it yourself in your garage, old barn, on the playground, or wherever...

seth (2010-01-26 05:41:29)

Andrew, that's very interesting because you are correct that I cannot stand Patterson's writing. In that sense, just as you say, he is more like the professional dancers I didn't enjoy than the high school dancers I enjoyed. This puzzles me (why does his formula work with others but not me?) but there it is. Adam, that's a good point – that there are probably lots of other examples besides novelists, dancers, and scientists.

Michael Kelly (2010-01-26 15:16:39)

Seth - I loved your talk at E.G 10! You were impressive! hmmm... Is there some kind of app on the web or iphone or whatever for assisting and informing self experimentation? Should we make one?

seth (2010-01-26 16:56:00)

Thanks, Michael. Someone told me about an iphone app for collecting data but he hasn't yet given me an example of actual usage. At a Quantified Self meeting I heard a presentation by a woman who was developing a website to help people self-monitor. I signed up for the website – but never heard anything. I guess she's still working on it. And I could tell you several other stories of potential applications for self-experimentation that went nowhere. I think the crucial thing is that the developer must have a problem that they themselves want to solve. So if you have a problem you'd like to solve via self-experimentation, I'd be happy to help you develop an appropriate iphone app or website.

Robin Hanson (2010-02-01 12:10:38)

Probably most folks in the dance audiences disagreed with you - they enjoyed the more professional dances more, because they wanted more to be impressed. Face it Seth, you and I are \*weird\*. :)

Science, Black Swans, and Insider-Outsiders | Anthony Burgoyne (2010-07-16 12:59:51)

[...] This reminds me of Seth Roberts' insider-outsider idea in science – the idea that insiders (people with expert knowledge in an area) who are also outsiders (have markedly different personal resources than most experts in the area\*) have an advantage. If a more-than-marginal breakthrough tends to come from “an idea that is not easily conceived of by the current population of” experts in a field, then it makes sense why an insider-outsider might have an advantage. [...]

## **Bacteria and Mood (2010-01-26 06:10)**

[1]Carl Willat pointed me to [2]this press release about some remarkable research:

Treatment of mice with a “friendly” bacteria, normally found in the soil, altered their behavior in a way similar to that produced by antidepressant drugs, reports research published in the latest issue of Neuroscience. . . .

Interest in the project arose after human cancer patients being treated with the bacteria *Mycobacterium vaccae* unexpectedly reported increases in their quality of life.

I believe [3]we need a substantial daily intake of microbes (in our food) to be healthy. The obvious microbe-produced improvements are in immune function and digestion. But this study and the research on which it's based suggest we also need microbes to make our nervous systems work properly.

When I started eating lots of fermented food I did notice an improvement in mood. Not dramatic, but clear. On a trip to Boston last year, I thought: I'll go without fermented foods to see what it's like. But after a day or so without them, I felt so bad I stopped the experiment. A friend of mine says something similar, that kombucha improves his mood in a way that doesn't seem to be due to caffeine.

I asked Carl how he learned about a three-year-old press release. (The research article - [4]gated version here - appeared in 2007.) "Neil Gaiman tweeted about it," he said.

---

solidmastery (2010-01-26 22:05:20)

Do you have a comprehensive list of fermented foods and drinks as well as complex flavourings that you have used in n=1 experimentation and observed to produced excellent effects in mood, satiation, and disease immunity? I looked all over you site to no avail.

seth (2010-01-27 03:24:07)

No I don't have such a list. The main fermented foods I eat are miso, kimchi, yogurt, natto, and kombucha. Smaller amounts of beer, wine, sauerkraut, pickles, strong cheeses. Wikipedia has a list of fermented foods: [http://en.wikipedia.org/wiki/Category:Fermented\\_foods](http://en.wikipedia.org/wiki/Category:Fermented_foods)

Claire (2010-01-27 21:37:51)

A NHMRC Australia Fellowship has just been awarded to Professor Charles Mackay from Monash University who is keenly interested in an intriguing link between diet, gut bacteria and immune responses. His Australia Fellowship will be used to gain new knowledge on immune responses, by exploring new ideas on inflammation and the role of diet and gastro-intestinal microflora.

## Self-Experimentation and Journalism (2010-01-27 03:47)

Journalism and science are both ways of finding out about the world, so maybe changes in journalism presage changes in science. In [1]a lecture about the future of journalism, Alan Rusbridge, editor of the Guardian, concluded:

There is an irreversible trend in society today . . . It's a trend about how people are expressing themselves, about how societies will choose to organize themselves, about a new democracy of ideas and information, about changing notions of authority, about the releasing of individual creativity, about an ability to hear previously unheard voices; about respecting, including and harnessing the views of others.

My self-experimentation had/has some of these elements. The fact that I reached useful conclusions about sleep, mood, and weight without being an expert in any of these fields changed my ideas about authorities (that is, experts). Self-experimentation is very much – perhaps above all – a "releasing of individual creativity" in the sense that I could try to understand sleep, mood, and weight. If I had an idea, I could test it. The problem was mine to solve. Self-experimentation releases scientific creativity just as any artistic tool releases artistic creativity. In the areas of sleep, mood, and weight, I was a "previously unheard voice". This blog connects my ideas with "the views of others".

If the parallels between science and journalism hold up, we should eventually see a big restructuring of science – especially health science – that resembles the changes in journalism now happening. Dennis Mangan, who works at a blood bank, has shown that [2]Restless Leg Syndrome can be due to niacin deficiency. No one ever found two causes of scurvy so it is likely that all cases of RLS are due to not enough niacin. So long, expensive drugs for RLS! The poor health of Americans pays for a lot of not-very-useful health science. When that health improves, that pool of money will shrink. Just as when people became better informed (by the Web), the pool of money available to pay journalists began to shrink.

1. <http://www.guardian.co.uk/media/2010/jan/25/cudlipp-lecture-alan-rusbridger>

2. <http://mangans.blogspot.com/2009/05/niacin-for-restless-legs.html>

---

amber (2010-01-27 05:39:14)

Seth, I've forwarded this info on niacin to my stepfather who has RLS, perhaps it will help. Did some quick double-checking for others' experiences with niacin for RLS and came across this video that I don't know if you've seen but I suspect you would enjoy on several levels, off-topic as it is for the RLS issue: <http://psychdrugs.wordpress.com/2009/01/27/1098/> BTW, I take niacin & a smattering of other supps every day and have gone from HDL around 40 in August last year to last week (got a meter, check it myself) HDL of 85. Also modified diet etc., so probably not just the niacin.

epistemocrat (2010-01-27 08:07:27)

One primary goal of a science/journalism infusion restructuring movement in healthcare should be to empower individuals with ways to set their own physiologies free from disease, on their own terms. Self-experimentation does that. We are all Patients of One, so self-experimenting is fundamental to the human condition, whether we realize it or not. I suspect it's better to realize it.

donny (2010-01-27 08:20:15)

I started taking niacin after reading the HeartScan Blog. I took it for its effects on the silent inflammation that is supposed to help reduce, low hdl, high triglycerides etc. I wasn't aware at the time that it had any sort of an effect on louder inflammation like arthritis or this restless leg thing. I have a shoulder that acts up once in a while, it starts with slight discomfort and over the course of days becomes actual pain, eventually spreading to my neck, getting to the point where I can barely turn my head. Just going on a low carb diet seemed to decrease the spread; the pain would stay in my shoulder, then slowly go away again, more or less sparing my neck. I started taking niacin and fish oil, and the whole thing pretty much went away. After a while, I would start to think it was resolved, and stop taking the supplements. Big mistake. I thought it was the fish oil. Several times I ran out of niacin, but not fish oil. Turns out it was the niacin. My Dad takes niacin, and when he goes off of it, if he goes back on he has to slowly increase the dose from very small amounts or the flush he gets is very uncomfortable.

When I go off it and then back on, I don't have this problem. My mom is schizophrenic, and schizophrenics as a group are supposed to flush less than non-schizophrenic. I'm not schizophrenic, but do suffer from extreme social anxiety and did have a psychotic episode over a period of months when my maternal grandmother was dying in the hospital. I have one sister who is celiac, another gluten intolerant, whose two daughters are celiac. Celiac is supposed to be higher in schizophrenics, which would at least give a possible theory as to why more niacin might be needed to prevent deficiency in some people than in others.

david (2010-01-27 08:39:47)

Seth, I have an idea for your next book: write a book on HOW to do self-experimentation effectively. I don't have the scientific/research background to know how to collect data, how to control for various biases, how to analyze the data. The book could be aimed at a broad audience, from those that just want to do simple experiments to see if a change has an effect, to those that want to learn how to do more sophisticated statistical analyses on data they collect. For some stuff, you could defer to existing books, but your audience could benefit just from knowing what those books would be.

seth (2010-01-27 12:30:48)

David, my next paper will be about that – why my self-experimentation was effective. My EG talk, the powerpoint of which I will post in a few days, covers the same ground more briefly.

Melissa @Cellulite Investigation (2010-01-27 12:41:34)

Dear Seth, I just discovered your blog from Nina Planck on Twitter and this post is particularly timely for me. I suffered with cystic acne for years, consulting family physicians, ob-gyns, dermatologists, and many aestheticians in an attempt to get the problem under control. I knew the outbreaks were directly related to where I lived because my face would react to a new environment within days of a move. I never had a problem living overseas but certain US cities on the east coast were especially problematic. After several years, I finally figured out it was from the fluoride added to the public water supply. It took me another year to figure out how to limit my fluoride exposure enough to get rid of the acne problem (fluoride is in a lot of foods and other places you wouldn't expect – I learned this mostly through trial and error). I can't believe how many other people I've heard from who have this condition, fluoroderma, since I started blogging about it a few months ago. The reason your post is so timely is because my mom just went to the dentist and asked them about fluoroderma, and they had never heard of it. They asked her who my doctor was that made the diagnosis. As soon as she told them I figured it out on my own, they lost interest in the conversation. I was feeling a bit belittled when I clicked on Nina's link which led me to your blog. Now I am reminded of why I started blogging in the first place. Thank you! Off to buy your book...

david (2010-02-01 15:40:50)

Melissa, I have my own story about fluoride in the water. When my permanent teeth came out, the front two teeth were already badly stained and others somewhat stained. Apparently, some portion of the population is affected by the added fluoride in this way. I really have to wonder whether adding chemicals like this to the water supply is worth it. When you are older (assuming you have enough money) you can cover up your teeth with dental work, but the emotional scars from growing up with brown teeth take a long time to heal. David

Melissa @Cellulite Investigation (2010-02-01 15:58:21)

David, I have dental fluorosis, too, but it's mild. I've read that over 30 percent of American children now have some degree of dental fluorosis – a sign that they are ingesting too much fluoride during the formative years. My fluorosis isn't severe enough to try to cover with veneers, but I'm curious if remineralizing the teeth through a Weston Price inspired diet would help, a la Rami Nigel's advice in his book, *Cure Tooth Decay*. He was interviewed recently on Cheeseslave's blog: <http://www.cheeseslave.com/2010/01/27/how-to-cure-tooth-decay-with-rami-nagel/>

## The Billion-Dollar Hoax (2010-01-27 12:36)

[1]This reasonable article gives ten reasons why the Prime Minister of Australia has suddenly stopped talking about global warming.

1. <http://www.heraldsun.com.au/opinion/the-billion-dollar-hoax/story-e6frfhqf-1225823736564>

---

Steve G. (2010-01-27 14:20:32)

Wow, this is a very thin argument. Does UC Berkley or Tsinghua adjudicate arguments in this way? Of course, yes, in some measure, because they're all humans, and human love arguments based on ethos and pathos more than we do logos (takes too much time & effort). That some climate scientists may have used foolish and even unethical means to forward their cause does not make the cause illegitimate nor does it negate the factual basis. In addition, to say that those who recognize climate change and push for changes in our behavior are perpetuating a "fraud" is a farce of an argument. Incorrect conclusions, perhaps; fraud? Come on! Next, we'll hear about a "conspiracy". I love that thought: a worldwide conspiracy among persons from all over the world. And as to the failure of Copenhagen: again, we see myopia among politicians, not evidence that a problem doesn't exist. This is a demonstration of the collective action problem, not any measure of proof that human activity has not affected global climate change. Finally, why has the Aussie PM stopped talking about global warming? IF he has, it probably has more to do with politics than with science. Given the complexity of the climate system, some predictions will prove dicey, and many wrong, but we have to go with the weight of the evidence, and I don't see that it has shifted.

bennetta (2010-01-27 15:21:07)

Seth, Isn't the bulk of this article an ad hominem? Let's say there was a particularly powerful group of frothing (and credentialed) advocates who hated smoking and wanted it banned. And let's say this group was willing to stretch the truth about smoking to advance their agenda. And maybe these folks like to cite a particular study that was done in the early days of smoking research that was later discovered to be tainted. Can we conclude, then, that smoking doesn't cause cancer? It seems to me that the article says more about the IPCC than it does about global warming. Perhaps the difference lies in that the anti-smoking organization was created with a cause in mind, while the IPCC is supposed to just look at the science. From my experience, however, climate change scientists (at least the ones I've met) are passionate about the issue with the same zeal as any advocate. Similarly, I'm also unsure how you can refute climate change by simply pointing at the fact that the Earth has not warmed for the past 10 or so odd years. So one chronic smoker doesn't develop cancer. Does that mean, then, that smoking doesn't cause cancer? What about if ten smokers don't get cancer? 100? Of course not. What matters is the overall body of evidence. Due to the nature of it, said body in regard to climate change is small and young, but the potential costs, if it turns out to be true, could be huge. Tremendous. Catastrophic, even. Large enough to outweigh the cost if we don't act. So we're stuck. If it's a hoax, it's a very elaborate one, probably the greatest ever made, perfectly tailored to prey on our poorly developed ability to identify causal relationships. Why are we so bad at that, anyway? So many of our problems seem to hinge on that. Please, correct me if I'm wrong, off the mark, or just plain missing the point, here, but this is how it seems.

Nathan Myers (2010-01-27 15:28:17)

It's very sad to see you going down this road. When you find yourself pointing to such a shoddy, thrown-together scandal-sheet article for support, it's time to do some soul-searching. It's obvious where all the money is, in climate change: it's not in climate research. It's in mineral extraction. It's also a matter of public record where the money is being spent: it's spent on muddying the water about the causes of climate change. Are you aware of the term "placement"? PR companies pay reporters a bonus for getting a story published that advances their clients' interests. Each place a story appears is a placement, and merits another bonus. Remember all those articles glorifying fructose? Those were placements. Similarly, pomegranate juice. There is nothing to be proud of about being taken in by placements. Nobody is paying for placements of articles warning about global

warming, but there is endless money for anyone playing up the manifestly phony "climategate".

seth (2010-01-27 15:36:52)

Steve G., the article to which I linked does several things that "negate the factual basis". For example, lack of warming in the last ten years, in contradiction of the models on which the predictions of catastrophe are based, is a considerable "negation" of the basis of the argument that if we don't do something big and soon we're doomed. bennetta, "scam" is a better description than "hoax". It is one of many scams where someone scares you in order to make you buy protection – from them. It's one-time, not on-going, so "protection racket" doesn't really cover it. In contrast to criminal scams, I'm sure many (most? all?) of the scientists involved really believe what they say – but one reason they believe what they say is that it doesn't help them to be skeptical about it. Lack of warming in the last 10 years is just one of many facts that cast doubt on the predictions of catastrophe.

pat (2010-01-28 14:01:15)

AAAACH. In the upper lefthand corner is a link to "FOXsports." Which presumably means that the article you published is part of Rupert Murdoch's Fox News Empire. It's one thing to say that there are reasonable things in that article, but don't ask me to waste my time to bother reading article from a company that employs Hannity, Bill Kristol, and Bill O'Reilly. My experiment with relying on them as a fair and balanced news source ended a long time ago.

bennetta (2010-01-28 15:56:49)

Pat, FYI, from Wikipedia: "The Herald Sun is a morning tabloid newspaper based in Melbourne, Australia. It is published by The Herald and Weekly Times Ltd, a subsidiary of News Limited, itself a subsidiary of News Corporation...."

Catherine (2010-01-28 23:28:17)

Who in there right mind would believe the Herald Sun on any intelligent issue?

Hal (2010-01-29 19:05:56)

Seth, with regard to your point that the lack of warming in the past 10 years contradicts the models: How literally do you mean this? Are you engaging in some playful iconoclasm, tweaking the establishment for fun, or does this represent your objective, rational understanding of the data? If the latter, can we infer that you believe that the models predict warming over the past 10 years with a high degree of probability, such that a ten year period with little or no warming would have been essentially ruled out? That would seem to be a straightforward translation of your claim into the language of model predictions and probability. If you agree, then could you say what your understanding is of the actual (approximate) probability that the models would have assigned to a lack of warming as extreme as what has been observed, such that it is fair to describe the observations as contradicting the models?

seth (2010-01-29 19:49:30)

"How literally do I mean this?" I am repeating the remark of a well-respected climate scientist in a Climategate email. The tone of the remark suggested it was a well-known fact (among climate scientists). The lack of agreement was distressing, so in that sense you could say, yes, the observation contradicted the model.

Stephen M (Ethesis) (2010-01-30 07:46:43)

What appears to be going on is that the solar system is cooling again, after warming a bit. There are cycles. Do greenhouse gas emissions have an impact on the cycles? Good chance, but do they create results independent of them? Ah, that is the rub.

## **Beijing Hot Pot (2010-01-28 08:34)**

Beijing has far more hot pot restaurants than you'd ever guess from Chinese restaurants in America. There are about ten restaurants on the Tsinghua campus; one of them is a hot pot restaurant. Judging from this passage in [1]an article about Beijing hot pot restaurants, some aspects of restaurant reviews ("don't forget", semi-humorous derogatory

comparisons) are universal:

And don't forget the wan or spheres of hashed protein, often how fish and seafood find their way to the table. Wise up in cheaper establishments and be warned that some meatballs [i.e., fishballs] can have a texture as if they bounced off the courts of Wimbledon, so avoid them unless you're in a reputable safe house.

1. <http://www.timeout.com/cn/en/beijing/restaurants/feature/9496/beijings-best-hot-pot.html>

---

### **Green Metropolis by David Owen (2010-01-29 00:10)**

I liked David Owen's new book, *Green Metropolis* (free copy from publisher), [1]as much as I thought I would. Owen criticizes a large fraction of the environmental movement for missing the point that big cities like New York are the greenest communities in America. To make a community green you need two things: high density and great public transportation. They go together: high density makes great public transportation possible. In large chunks of New York, unlike most big American cities, it's easy to not have a car.

The book has plenty of villains. Bill McKibben has written many books: one about global warming, one about cutting back on consumerism, one about having only one child (to save the earth from overpopulation), one called *Hope, Human and Wild* about environmentalism – yet he lives in a small town in upstate New York, which requires him to use a lot of energy for heating and travel that he wouldn't have to use if he lived in New York City. (McKibben is my example, not Owen's.) A great many environmentalists, Owen says, have causes or goals that have little to do with reducing energy use. They tend to see themselves as preserving the past rather than shaping the future – an excellent point. That's something Jane Jacobs might have said and if the book has a hero, it's her. "Jacobs's focus was on the vibrancy of city life but the same urban qualities she identified as enhancing human interaction also greatly reduce energy consumption and waste," Owen writes.

Owen sees himself almost as deluded as the average environmentalist. He and his family moved from Manhattan to rural New England when their daughter was one year old. How she will love the country, thought Owen. She didn't. Walking through the country bored her far more than walking through the city. "And it [a country walk] usually has the same effect on me, although I hate to admit it," he writes.

Why did my self-experimentation discover a lot? Because a lot remained to be discovered. The discoveries I made weren't made by the experts who should have made them (e.g., sleep experts) because [2]they were too busy doing research whose main goal was to impress other people. Rather than do science that worked, they did science that looked good. It's the same with environmentalists. Rather than do projects that work (save energy), they do projects that feel good. "Sitting indoors playing video games is easier on the environment than any number of (formerly) popular outdoor recreational activities, including most of the ones that the most committed environmentalists tend to favor for themselves," says Owen, neatly summing up the problem.

Andrew Gelman (2010-01-29 06:25:52)

Seth: You write, "In large chunks of New York, unlike anywhere else in America, it's easy to not have a car." When we both lived in Berkeley, California, it was easy to not have a car. I didn't have one, and I don't think you did either! I get your general point, but I think you're a bit too quick to make judgments on what is easy. There are tradeoffs: a car gives you some conveniences, and it creates other costs and inconveniences. Regarding your last point, I think you're generalizing about "environmentalists," just as you'd similarly be making mistakes if you generalized about "conservatives" or "liberals" or "religious people" or whatever. I also don't understand how that Owen quote is "summing up the problem." I agree that it's an interesting thought, but what's the point: we all should be sitting inside playing video games (or blogging)? Or is the point that it's ok to do outdoor activities such as hiking, skiing, hunting, fishing, but only if you don't call yourself an "environmentalist"? Would Bill McKibbin be a better person if he'd written a book in favor of consumerism? I haven't actually read anything by Bill McKibbin, so maybe I'm missing something here, but I don't see your point here.

seth (2010-01-29 07:41:53)

"When we both lived in Berkeley it was easy to not have a car." Then why do most Berkeley non-student households have cars? If you have children in Berkeley, you must have a car. Re "environmentalists". Sure, statements that this or that correlation is perfect are wrong. No actual correlations are 1.0. Not all environmentalists fit my description. But Owen gave many examples of misguided environmentalism, so many that it painted the picture I describe: A large fraction of environmentalists work on projects that miss the point. Of course not all. Of course it is good to encourage bike riding and better public transit, for example. The video-game quote sums up the book in the sense that a lot of environmentalists have a pro-nature anti-city bias that gets in the way of them doing things that help. Bill McKibbin would be a more effective environmentalist if he lived in a big city. Then he would be exposed to the problems that need to be solved. And he could write about how to solve them. McKibbin is like an American academic who knows almost nothing about Africa but is quite sure he knows what should happen there for Africa to improve.

Andrew Gelman (2010-01-29 09:24:11)

If I lived in Berkeley with my family, I can assure you, I would not have a car. "Must have" is what you make of it.

Kaylee (2010-01-30 09:34:40)

I live in Chicago and, while I had a car for the first year that I lived here, it died two years ago and I never replaced it. Chicago covers a greater expanse of land than NYC, to be sure, and the further away from the lake, the less likely you'll have easy access to the quick transportation of trains, but there are always bus routes to get you where you need to be. While I haven't needed to sign up for the partnership between the CTA and ZipCar because I don't mind walking a few blocks to the grocery store, the option is easily accessible for those rare times I might need a car. Besides, knowing I can only walk out of any store with what I can carry really cuts down on the over- and unnecessary buying. Granted, I don't have children, nor do I plan to have children, but I have friends with children who don't have cars, either. NYC may have more train lines and a larger number of people who strive to be green, but Chicago isn't exactly lagging in this department.

seth (2010-01-30 11:04:17)

Thanks, Kaylee. I have fixed the post.

## Why We Travel (2010-01-29 10:20)

Jonah Lehrer [1]writes:

We travel . . . because distance and difference are the secret tonic of creativity. When we get home,

home is still the same. But something in our mind has been changed.

He's wrong about animal fat ("the taste for saturated fat, one of those instincts we should have left behind in the Pleistocene epoch") but he's right about that. A trip to Amsterdam is why I have a scooter. It's so much better than a bike or a car. Only after visiting Amsterdam did I figure this out. The Shangri-La Diet came out of a trip to Paris. Living in Beijing half the year is somewhere between emigration and travel but whatever you call it it has opened up a whole new world. (Whether this will make me more scientifically creative remains to be seen. It certainly makes blogging easier.) My study of the faces/mood effect showed that travel changes something in the brain in a bad way: The light-sensitive oscillator involved takes about three weeks to fully recover from a big change in time zones. The effect takes three weeks to regain full strength, which is longer than it takes sleep to appear normal.

1. [http://scienceblogs.com/cortex/2009/12/why\\_we\\_travel.php](http://scienceblogs.com/cortex/2009/12/why_we_travel.php)

---

aaron blaisdell (2010-01-29 11:12:12)

Reading literature is like poor-man's travel. It changes you in interesting and unpredictable ways. RIP JD Salinger.

Andrew (2010-01-29 12:48:00)

I liked this passage on traveling I read in Catherynne M. Valente's *Orphan's Tale*: It is not the sea that calls us back. What calls is stronger and more inexorable than any current. I long for the sea, yes, my skin is always dry, and I am always thirsty, and I miss the crash and swell of the black waves, but more, I long for the leaving. I am restless, I am ready, and the leaving whispers to me at night. It says that I will breathe easier when the air is full of fog and seagulls, that I will breathe easier when I am at the start of a story, rather than at the end. Many of us just love the idea of a new adventure.

seth (2010-01-29 13:49:06)

Aaron, I would say that travel is the poor man's self-experimentation.

John (2010-01-30 11:28:52)

You don't have to go too far for some of the effects of travel--when I even just take local day trips to those places you never visit when you live here, I find my mood expands, I take in more sensory information--it's not the same as going to another culture for a period of time but nevertheless something is there--that's how I do it now that I'm a poor man.

Adam (2010-01-30 15:55:46)

Seth: \*Anecdotally, have to agree with a major time shift sapping strength and motivation. \*I can hang for the first two to three days in a new time zone with my workouts. Then, just when my sleep feels calibrated, I bonk on my workouts. \*Coming back to the original time zone starts the drain all over again. A recent trip from Seoul to SF had me not performing or performing badly in the gym, etc. for at least two weeks. Q: What do you think the recovery time is before you feel back to your normal strength/ability?

Nathan Myers (2010-01-30 20:04:35)

I suppose you long ago gave up on melatonin to help your sleep cycle, but have you tried it for adapting to time zone changes?

seth (2010-01-30 21:00:39)

Nathan, no. Adam, about 2-3 weeks. Although I haven't measured this.

## Homemade Kombucha Tips (2010-01-30 16:19)

1. You don't need a starter culture (often called a scoby). You can make one from store-bought kombucha. I let a cup of Rejuvenation kombucha sit in a wide-mouth jar at room temperature, covered with a paper towel. After two weeks, a thin film had formed on the surface, easily transferred to a tea-sugar mixture. More This didn't work! The culture grew poorly. It might have worked to just pour the Rejuvenation kombucha into the tea-sugar mixture.

2. My friend [1]Carl Willat has used empty Synergy kombucha bottles to bottle kombucha he makes himself. By bottling your kombucha, and leaving it at room temperature for a few days, you get carbonation.

1. <http://www.carlsfinefilms.com/>

---

david (2010-02-01 15:33:39)

Adding a little lemon (e.g. 1/2 tsp/bottle) seems to help add fizz. I'm currently experimenting with boiling ginger slices in the water when I make the tea (i.e. before fermentation) to get the ginger flavor in the finished tea. I've added ginger slices when bottling and some ginger flavor does come out if you do a 10 day second fermentation in the bottle, but I'm hoping to get the ginger flavor without the long second fermentation.

david (2010-02-02 08:13:26)

Ok, here's my ginger kombucha recipe: When you boil the water to brew the tea, add some peeled, sliced pieces of ginger to the water. After brewing the tea (while letting the tea cool), spoon out these pieces of ginger and add them to the bottles in which you are bottling the previous batch of finished kombucha. I also add 1/2 tsp of lemon juice to each 12 oz bottle. The combination of the ginger that was released while boiling the water and the ginger that comes from the slices in the bottle gives it a nice gingery flavor even after just a day or two in the bottle (i.e. no need for a longer fermentation in the bottle). The longer the in bottle fermentation the more fizz. Personally, I like a little fizz, but not too much.

April (2010-02-27 14:55:31)

Have you tried any other flavors like blueberry or raspberry and when and what part of the process have you added the flavor?

Moon Maiden (2010-05-14 18:30:52)

Dear David, What is it about leaving the bottles at room temperature that helps add fizz? After the fermentation process I had some good fizz going on. But then I placed the bottled juice right into the fridge and since then I have had no fizz. I was wondering if it was because I did not have equipment to make the seal airtight? But after reading your post about leaving the bottles at room temperature I am beginning to wonder. Thanks for posting.

seth (2010-05-14 19:58:31)

April, I haven't tried other flavors. I don't like them. You add them at the end. Moon Maiden, the fizz (dissolved carbon dioxide) is produced by a second fermentation. The first fermentation is aerobic (needs oxygen); the second is not, which is why it continues when the bottle is sealed. But it only happens at room temperature.

Meg (2010-05-22 17:59:13)

When doing a second fermentation with a sealed bottle, don't let it sit too long! It can explode. I had a bottle with kombucha and apricot blow up on me in the middle of the night. I invested \$20 in a food-grade bucket with lid and an airlock (gizmo that

lets gasses out but no air in for the second, anaerobic, fermentation). Any home-brew store will be able to set you up. And they have glass options if you don't want to deal with plastic. Now I don't worry about cleaning up glass chards from the floor or cleaning kombucha splatter off the cabinets, counters and floor! Thanks for the recipe tips above!

Courtney (2010-06-25 07:37:53)

Hi! I have just bottled my first ever batch of kombucha. I'm really excited about it, but wary of drinking it. I left the bottles on the counter for the second round of fermentation, and when I opened them, there was a film on top. I'm assuming it's more culture growth from the mother scoby, and I've seen hunks of it in store-bought kombucha, though never a complete new film on the top. Is this ok? If my jars were not completely air-tight, would this be dangerous to drink? Thanks for any help you may have! Courtney

seth (2010-06-25 09:38:48)

yes, it's more culture growth. I don't worry about it.

Courtney (2010-06-27 11:08:08)

Oh thank you! I'm pumped about this first batch!

moreless (2010-08-07 09:04:34)

I spontaneously generated my Kombucha mushroom! I was keeping a sourdough starter in the pantry... just in case. I keep it in an old pint jar. When the old sourdough had crusted up. I added in enough water to make a batter, then added some fresh flour. After a week, I had a layer of alcohol on top. After another week, I had a rubbery mother on top! I transplanted the mother to a cool jar of : 1/2C sugar, 1/2gal steeped wtr, via 2 teabags, 1/2C vinegar. After 9-12 days later, i had an additional daughter membrane! Maybe after a few more cycles the taste will mature and stabalize, There is a variance in shades of cream, and hanging snots of darker yeast. Compared to others who have posted pictures... it appears to be normal. (Except for those who cleaned their scoby up for picture taking..... Geez, the vanity)

## **The Checklist Manifesto by Atul Gawande (2010-01-30 20:02)**

A few years ago, Gawande wrote two articles in The New Yorker about medical innovation: [1]The Score (about [2]Ap-gar scores) and [3]The Checklist. Since then, he has done actual research promoting the use of checklists and this book (which I got free from the publisher) is mostly the story of his contribution, with sidebars about the origin of checklists in aviation and their use in building construction. The word checklist suggests that it is all about making sure certain things get done but Gawande takes pains to say that is only half of it. The other half is helping people who don't know each other work together – by having them introduce themselves and by making sure everyone is heard.

Use of checklists, judging by the results, is a big advance and for that reason alone this would be a solid book – the story of one person's part in an important innovation. I am sorry he didn't tell parts of the story that reflect badly on others – such as [4]the Office of Human Research Protections decision that Johns Hopkins research must be stopped immediately because introducing checklists and tracking their effectiveness was dangerous. (Doctors might be embarrassed by the results!) I wouldn't expect a Harvard Med School prof to get nauseous with rage, the way Richard Harris, an earlier New Yorker writer, appropriately did in A Sacred Trust (how the AMA tried to block Medicare), but every story needs a villain. And there are plenty of villains in American medicine.

[5]The book's website, including Steve Levitt's review.

---

Patrik (2010-01-31 00:04:56)

@Seth You gotta get this book: Bad Medicine: Doctors Doing Harm Since Hippocrates [http://www.amazon.com/Bad-Medicine-Doctors-Doing-Hippocrates/dp/0199212791/ref=sr\\_1\\_1?ie=UTF8&s=books&qid=1264921360&sr=1-1](http://www.amazon.com/Bad-Medicine-Doctors-Doing-Hippocrates/dp/0199212791/ref=sr_1_1?ie=UTF8&s=books&qid=1264921360&sr=1-1) Taleb recommended it, and I have just started it and am totally blown away. Tremendous overlap with the mega-themes of this blog.

seth (2010-01-31 09:13:31)

Thanks, Patrik. Yeah, it looks really interesting. I'll get it.

Clyde Adams III (2010-02-02 08:25:25)

Seth, you say "...this book (free from publisher)..." As far as I can tell, it is not available for free from the publisher. Am I missing something? <http://us.macmillan.com/TheChecklistManifesto>

seth (2010-02-02 09:18:59)

by "free from publisher" I meant I got it free from the publisher. I have fixed the post to make it clearer.

rani (2010-02-18 16:50:13)

Hi Seth - I just recently read the Checklist Manifesto as well. I just wanted to add that in addition to checklists and introductions, the other key thing is the distribution of power on a team (key when nurses are reading the checklists to Doctors). Also the support from the higher ups to enforce said checklists is key. Great post. cheers.

vik (2010-09-24 13:52:53)

[www.expertchecklists.com/](http://www.expertchecklists.com/) Expert Checklists is a new web app for professionals working in difficult and complex environments. Users can work together to create and discuss very effective checklists for their fields. They can also customize checklists for their own needs and download in a convenient PDF format . Applications include medicine (for example WHO safe surgical checklist), aviation, adventure sports, and project management. The site was inspired by the book 'Checklist Manifesto' by Atul Gawande.

## 5.2 February

### Four Quantified-Self Talks (2010-02-01 13:25)

At the recent [1]Quantified Self Meetup in San Francisco, four talks especially interested me.

The first was by a woman who has been making scrapbooks about her life for a long time. She now has nineteen volumes. They contain the usual scrapbook stuff (photos, ticket stubs, drawings – she's a designer – newspaper clippings, receipts, and so on) plus her design work and her medical records. They help her remember her life. "I look at them so I won't make the same mistakes in relationships," she said. "How's that working?" someone asked. It's a lot of work and she's now three months behind. Her talk was about what sort of computer tool would make the

whole thing easier. It made me wonder why woman scrapbook so much more than men. [2]My earlier post about scrapbooking didn't answer that question. The whole thing reminded me of [3]Jill Price:

At the age of 10, Price began to keep almost daily diaries, which she then saved "thousands of pages filled with her impossibly tiny handwriting.

The curious thing about Price's diaries is that her memory is so astonishingly good that she can remember her past in great detail without them. Apparently she kept such detailed diaries because of her great memory or both have some common cause.

The second was by a man who had recorded his daily activities in detail for five years. A graph showed that he had a free-running sleep cycle: He went to sleep slightly later each day. At certain times he'd be awake at night and asleep during the day. He started keeping these records because he was washing his roommates' dishes a lot and wanted to see how much time it was taking. (Much less than he thought, it turned out.) I asked what he'd learned from his records. The sleep pattern, he said. Someone told me he must have meant the regularity of the pattern. His records had no obvious value so again I wondered: What's the evolutionary reason? He enjoys keeping these records. Why? In some ways it's a male version of scrapbooking: You can't easily show it to someone (in line with male lack of communicativeness), but, like a scrapbook, it's a long-term record of random stuff that helps you remember what happened.

The third was about a startup called [4]Skimble. Maria Ly and her partner have created a web app to keep track of your outdoor activities, such as climbing and kayaking. She does a lot of climbing and the app started as a way for her to keep track of it. She used to be an engineer at Google. This seems promising because she was trying to solve her own problem, not someone else's. Apps to help other people self-experiment don't get very far, in my experience.

The fourth was a kind of combination of the first three. [5]Robin Barooah wanted to meditate more. His bouts of meditation last a half-hour or more, so it wasn't easy. After a retreat, he started meditating more but the effect wore off within a month or so. His talk was about [6]an iphone app for tracking his meditation. After he started using it, about a month ago, he's been achieving his goal of regular daily meditation better than ever before. It reminds me of a University of Colorado engineering professor who stopped binging on ice cream as soon as he forced himself to keep track of what he ate.

david (2010-02-01 15:27:27)

Hi seth, Do you remember the name of the iphone app? I googled, but there are so many meditation timers out there that it's hard to find. Speaking of meditation, and specifically Buddhist meditation, one of its goals is to free you from the illusion that there is a separate, permanent self. I wonder if the impulse to collect data that isn't used for anything comes from the need to prop up the illusion. The scrapbook (or unused data) is an attempt to preserve and make permanent the self that vanishes

with each passing day/hour/minute. Thanks, David

Robin Barooah (2010-02-01 16:16:33)

Hi Seth and David, The iPhone App is called "Equanimity" - there's a link to it here: <http://www.meditate.mx/iphone> Disclosure: I'm the author of the app. The idea that led to the app was the desire to create a 'mirror' in which I could see the reality of my practice. I had noticed that I tended to have thoughts like "It's too late today, I'll meditate tomorrow", or "I meditated yesterday, and I feel great today - which led to me not actually practicing, and so I wanted a record that would provide an antidote to such thoughts. I'd found the same approach (of having data to counteract false beliefs) to be effective in breaking my coffee habit (<http://www.kk.org/quantifiedself/2009/10/the-false-god-of-coffee.php>) earlier in the year, so I was fairly convinced that the same things would work for creating a positive habit.

MikeY (2010-02-01 22:25:10)

"pparently she kept such detailed diaries because of her great memory or both have some common cause." Seth, writing things down improves memory. Must've been some basic cog-psych stuff from the old days, maybe Tulving, or Craik, or somebody. I'm not being a nitpick about this, though. Maybe there's some other benefits of self-data collection besides analysis that help people. Do you have any thoughts on this? Perhaps people maintain more continuous self-images - the only studies I've seen with this concept examine the effects on intertemporal preferences, but I'm sure there's plenty of other interesting things. Or perhaps those who have such self-images are more likely to test data.

MikeY (2010-02-01 22:31:38)

Haha, actually I just had another thought - you know how there's been a trend in the last ten years of doing psych studies where people self-report on blackberries or whatever a few times a day? Kahneman's done them, my old advisor who does mind-wandering stuff did a few, among many others. Point is, I'd love to see a study correlating compliance with these blackberry quizzes and various personality measures. I can think of a few that might be pretty intuitive, and ran it with a big group (maybe not in the furloughed UC system, though) you could make a neat story out of it. I'm not an individual differences kind of guy, but still.

seth (2010-02-02 06:44:43)

Robin, thanks for the info. I have added it to the post. I didn't know you were the person behind the false-god-of-coffee experiment. That was great! MikeY, yes, writing stuff down improves memory. Price's diaries are unlikely to be the reason for her fantastic memory because she also had a great memory for stuff that wasn't likely to be in them - all sorts of world events. If you are saying that maybe the reason we have a desire to keep diaries, scrapbooks, and other records is so that we will remember, that's an interesting idea. Price found her great memory a huge burden but of course no memory at all is even worse. In evolutionary terms, widespread literacy is recent - so recent that I doubt evolution shaped us to write things down so that we will remember them. My guess is that scrapbooking and the computerized record-keeping project I described derive from the combination of a desire to tell stories and a desire to make art. The evolutionary reasons for those I think I understand. Scrapbooking is obviously an artistic kind of story-telling. The computerized record-keeping I mention (a log of daily activities) was in fact artistically done. Different activities were given different colors and the whole record was nicely displayed.

## **A Call From Dr. Eileen Consorti's Office (2010-02-02 06:28)**

Yesterday I was contacted by Dr. Eileen Consorti's office. (Dr. Consorti is a surgeon to whom I was referred a few years ago, after my primary-care doctor noticed I had a tiny hernia - so small I hadn't noticed it.)

"Can I ask a favor of you?" her assistant began. The favor was to remove her name from my blog. Why? I asked. Because when someone googles her, he said, what you have written comes up, and it isn't favorable. (When I googled her name yesterday [1]this was the first result. When I googled the same thing today, it was the seventh result.) He

said nothing about any inaccuracy. I said if she has anything to add, I would be happy to amend what I wrote. He asked if I had any "further" questions for Dr. Consorti. No, I said. The conversation ended.

Then I realized I did have a question. During my discussion with her of whether or not I should have surgery, I had said that surgery is dangerous. Dr. Consorti had replied that no one had died during any of her surgeries. She had said nothing about the likelihood of other bad outcomes. That struck me as incomplete. My question was: Why no mention of other bad outcomes? I phoned Dr. Consorti's office, reached the person I'd spoken to earlier, and told him my question. He tried to answer it. I said I wanted to know Dr. Consorti's answer. Wait a moment, he said. He came back to the phone. He had spoken to "the doctor", he said. She wasn't interested in "further dialog". She would contact a lawyer, he told me.

Dr. Consorti, if you are reading this, I am happy to publish verbatim anything you have to say about this.

Thanks to Tucker Max.

More On November 18, 2011, soon after I posted [2]this, Dr. Consorti asked me to post the following:

Dr. Fitzgibbons from Creighton published a prospective study comparing repair of inguinal hernias versus watchful waiting in men with asymptomatic inguinal hernias. At five years twenty percent of the patients in the observation group crossed over to have surgical repair. By the way, I only get reimbursed \$300.00 dollars to repair a hernia not thousands of dollars. I hope you asymptomatic always, thanks.

Even after [3]all this, Dr. Consorti has described [4]the Fitzgibbons study in a way that makes her recommendation seem more reasonable than it was. As I said, the results of that study do not support her recommendation. Its abstract says: "Watchful waiting is an acceptable option for men with minimally symptomatic inguinal hernias. Delaying surgical repair until symptoms increase is safe."

---

Alex Chernavsky (2010-02-02 07:40:51)

If there's one thing I've learned from dealing with the healthcare industry, it's this: you have to do your own research and take charge of your own situation. About ten years ago, I was diagnosed with a parathyroid adenoma (a non-cancerous growth of glandular origin). My endocrinologist referred me to a surgeon whose office was in the same building. The two doctors were buddies, as I found out later. When I went to my initial appointment with the surgeon, the first thing I noticed was that his waiting room was filled with posters, flyers, pamphlets, etc. all about breast cancer. I saw no information about any other type of cancer. This fact immediately made me suspicious. When I met the surgeon, he told me that his plan was to do an operation to take a biopsy sample, and then go back at a later date to excise the growth. This strategy made absolutely no sense to me. Surgery in the neck is complicated and risky, and there didn't seem to be any reason to do it twice, when you could remove the growth the first time. I went to my local medical school and looked up a bunch of articles and textbooks. I couldn't find anything that corroborated the surgeon's recommendation. I asked my endocrinologist to refer me to a surgeon who specializes in endocrine surgery. The second surgeon basically confirmed my suspicion that the first surgeon was nuts. I

had my surgery with no significant complications. *You need to do your own research.*

david (2010-02-02 07:50:38)

So the medical profession wants tort reform so they won't be sued (if the potential payout is low enough, it won't justify the expense of bringing the case to court), but if you put factual information about your experience with them and it happens to make them look bad, then they're happy to call a lawyer.

seth (2010-02-02 07:50:40)

Very interesting and important story, Alex. David, yes, I completely agree. As [1]Robin Hanson put it, what does "first do no harm" actually mean?

1. <http://www.blog.sethroberts.net/2008/03/21/robin-hanson-on-doctors/>

Patrik (2010-02-02 12:01:50)

The synchronicity of this blog post/comments with the book I am reading right now is spooky. I already mentioned it to Seth. [http://www.amazon.com/Bad-Medicine-Doctors-Doing-Hippocrates/dp/0199212791/ref=sr\\_1\\_1?ie=UTF8&s=books&qid=1264921360&sr=1-1](http://www.amazon.com/Bad-Medicine-Doctors-Doing-Hippocrates/dp/0199212791/ref=sr_1_1?ie=UTF8&s=books&qid=1264921360&sr=1-1) @Alex You're 100 % right about doing your own research.

Andrew Gelman (2010-02-02 12:02:23)

Seth: What do you mean by "Thanks to Tucker Max"? It looks like this is all something that happened directly to you.

Rachael (2010-02-02 13:47:07)

My son had repeated strep throat infections over the course of a year. We were referred to an ENT doctor who suggested tonsillectomy. I researched tonsillectomy for strep with no tonsillitis and found that on average in the year following a tonsillectomy patients like my son get one fewer strep infection. Surgery with it's risks, and ten day recovery, seems like a steep price to pay for one fewer infection. I brought my son to a naturopath who made some supplement and herb suggestions that we followed and my son has not had strep since.

seth (2010-02-02 15:38:57)

Andrew, by "thanks to" I meant "thank you to" rather than "due to". I asked Tucker for advice. He was in a similar situation: Someone threatened him with legal action if he didn't take down something he had posted.

Lotus (2010-02-02 16:32:45)

If you ask a surgeon if you should have surgery most of the time the answer is going to be "yes" because that is the solution they are trained to provide. Surgeons cut and sew and, if they spend time thinking about their profession, it is more likely to be about how to cut and sew better, not how not to cut and sew. So, in a case where you have doubts that surgery is necessary, it may be better to consult with a non-surgeon. This doctor apparently accepted the conventional thinking of her profession (i.e. cut out everything that could grow to be a problem) as fact, even though research may not exist to back up that thinking in this case. In reality, much of medicine is practiced this way. (As an example, check out this recent article: <http://www.nytimes.com/2010/01/26/health/26child.html?ref=health>) If medicine purely relied on scientific fact and not on cultural norms, one would expect to see less variance in the way things are done from city-city in the U.S. and between countries. Too bad the system isn't more objective and transparent when it comes to treatment outcomes and we are left to scour the internet to find some clues.

Nathan Myers (2010-02-03 02:11:54)

Alex: I suspect you would have been better off with the biopsy, and then maybe no excision. Why excise what doesn't need to be excised?

Alex Chernavsky (2010-02-03 05:35:30)

Nathan, the parathyroid adenoma was causing me to have high levels of calcium in the blood (this is how I was first diagnosed),

so it needed to be removed regardless. All the references I found recommended removal of the adenoma. The neck has many delicate structures, particularly nerves. A fairly common complication of neck surgery is damage to the laryngeal nerve, which can cause hoarseness (sometimes permanent). Doing neck surgery twice, when once is enough, doesn't make any sense. My first surgeon seemed to specialize in breast cancer, where taking a biopsy sample is more routine.

Nathan Myers (2010-02-03 02:04:04)

About titles, I have a rule: Never buy a book with a whole sentence for a title. I've thought about why the rule works well, and I think it comes down to that the author doesn't think we'll read the book, and is trying to get the story into the part we can't avoid reading. But if so, then (1) the author didn't have much to say, and (2) I already read the important part. That rule wouldn't make a good title. About "The IPCC under Siege": The IPCC isn't the evidence. The IPCC doesn't do science; they just write summaries. What made an impression on me was the enormous number of contentless and actually false or deliberately misleading comments following the posting. All of the worst liars were arguing against acting on AGW. When so many, many people offer *nothing* but lies to persuade you to their side, it is much easier to pick which side is right. The IPCC reports are big and contain errors, but the errors are necessarily rare exceptions. It's hard to pick out a single reliable fact from the opposition.

frank petrillo (2010-02-03 10:04:06)

I bought a car this way in the fall. Check out fightingchance.com for a more eloquent way.

## Scholarly Research Exchange (2010-02-03 07:32)

Today I got an email inviting me to contribute to a journal called SRX Neuroscience. The journal is "peer-reviewed open-access". The email continued: "There are many reasons to submit your work to SRX Neuroscience, including an efficient online submission process, no page limits or restrictions on large data sets, immediate publication upon acceptance, and free accessibility of articles without any barriers to access, which increases their visibility."

I'd never heard of it. Its [1]web page didn't open. [2]The website for SRX (short for Scholarly Research Exchange) was extremely vague: [3]no names, no location. And no sign of how it was funded.

Finally I learned that SRX is run by Hindawi Publishing, in Egypt. From [4]this excellent overview I learned its money comes from author fees, \$500 or more per article. They are trying a new kind of editorship: 30 editors or more per journal. Each editor handles only two articles a year and receives a 50 % discount when they themselves submit an article. (I wonder what referees get.) Meanwhile, [5]BioMed Central, a better-known open-access publisher, is having trouble: They have been forced to raise their charges to libraries so high that Yale decided to cancel.

It seems very low-rent. But, as Clayton Christensen told in *The Innovator's Dilemma*, this is often how important new things begin. In the beginning hydraulic shovels were only good for digging a ditch in your backyard. The makers of cable-powered shovels, whose products made the giant holes for skyscrapers, turned up their noses at such a low-prestige task. But the hydraulic shovels got better and better. Companies that made cable-powered shovels eventually went bankrupt.

---

Darrin Thompson (2010-02-03 08:39:59)

My hypothesis: People aged 33 and above have a rationally negative view of self published info on the internet. At 50 and above it's complete taboo. Below those ages people are more likely to filter self published material less stringently. Their mental filters will be equivalent to what I (age 35) would use to filter a radio commercial. There will be no more internet stigma. The result would be that in three decades it will be acceptable to self publish many results and cheaper for lay people to read primary sources. The scientific community's "immune system" will have been reinvented into something still very flawed but better than the journals used today. That's a falsifiable hypothesis and I'm sticking with it. Put another way, Journals have been dead for over a decade, except for the fact that other forms of self publishing have been unnaturally stigmatized. I think the stigma will clear and science will find a cheaper way of "blessing" important results.

david (2010-02-03 09:31:21)

Darin, I suspect you're right. Here's a more general formulation of your hypothesis: "1) everything that's already in the world when you're born is just normal; 2) anything that gets invented between then and before you turn thirty is incredibly

exciting and creative and with any luck you can make a career out of it; 3) anything that gets invented after you're thirty is against the natural order of things and the beginning of the end of civilisation as we know it until it's been around for about ten years when it gradually turns out to be alright really." – Douglas Adams David

rps (2010-02-03 09:40:11)

What does this publishing company really do to justify their income? I'm not a scientist, but my dad used to edit a journal and he told me how it worked. He worked for free since it was supposedly prestigious, the authors didn't get paid anything, and the publisher charged \$50 a copy to university libraries. This may have made sense in those pre-internet days when you had to publish it on dead trees and coordinate with university libraries, but now you could just put it on a website for essentially nothing.

Andrew Gelman (2010-02-03 10:14:24)

Seth: If authors are paying \$500 per article, I doubt this is the wave of the future or anything like it. It sounds more like a scam where people can buy publications in pseudojournals and put them as lines on their C.V.

seth (2010-02-03 10:41:25)

Andrew, there are "pseudo-journals," such as the SRX journals, and there are "real" journals with very low impact factors – such as many journals. I'm not sure drawing a sharp line between them makes sense. At least the SRX journals are trying something new. If I recall correctly, they reject about half of the submissions. rps, the company aggregates content (e.g., many neuroscience articles in one place) and organizes the review process. It has about 200 employees.

## **Schizophrenia Prevented By Fish Oil (2010-02-03 21:41)**

A new study in the Archives of General Psychiatry, [1]summarized in the Wall Street Journal:

Researchers in the new study identified 81 people, ages 13 to 25, with warning signs of psychosis, including sleeping much more or less than usual, growing suspicious of others, believing someone is putting thoughts in their head or believing they have magical powers. Forty-one were randomly assigned to take four fish oil pills a day for three months. The other patients took dummy pills.

After a year of monitoring, 2 of the 41 patients in the fish oil group, or about 5 %, had become psychotic, or completely out of touch with reality. In the placebo group, 11 of 40 became psychotic, about 28 %.

The study is impressive not only because it uses ordinary food (fish oil) rather than a dangerous drugs (such as Prozac) but also because it studies prevention. Just as [2]the ketogenic diet suggests a widespread animal-fat deficiency, so this study suggests a widespread omega-3 deficiency, which won't surprise any reader of this blog. Completing the picture – I believe most Americans eat far too little animal fat, omega-3, and fermented food – [3]baker's yeast is being studied as a cure for cancer.

Thanks to Oskar Pearson and Chris.

Adam (2010-02-03 23:07:23)

And here I thought that Vitamin D was the superhero of the week... <http://fwd4.me/ELD> \*Perhaps they are the new dynamic duo...NIH wants to find out. <http://www.vitalstudy.org/>

Andrew Morrison (2010-02-04 00:08:16)

A few minutes ago I was sent to a yeast-cancer article by another blog. My mind immediately jumped to kombucha and then to Seth Roberts. Overcome by curiosity, I clicked over here just to see if you had beaten me to the scoop and to seeing the connection. I laughed to see that you had. I'm proud to sport you on my favorites list.

Fran (2010-02-04 08:46:32)

Hello, I have been following your blog for some months now...and have experienced a marked improvement with gum inflammation while using Flaxseed Oil. When I saw the article on Brewers Yeast, I did some googling that brought me to the Sloan Kettering/Integrative Medicine/Herb site and while I couldn't find Brewer's Yeast info, I did take a look at Flaxseed Oil. <http://www.mskcc.org/mskcc/html/69220.cfm> I was diagnosed with ER+ breast cancer in 2006 and darn- according to SKCC, flaxseed has phytoestrogenic effects and should be used with caution by ER+ individuals. Do you think Fish Oil is as effective for inflammation? I have tried searching your blog for a comparison of the two. I wonder if there is a comparable dose of Fish Oil to the very effective 2 TBS of Flaxseed Oil? Thanks for your help.

seth (2010-02-04 09:33:07)

yes, I suspect that fish oil reduces gum inflammation just as flaxseed oil does. But I haven't tested this.

1 (2010-02-04 11:31:43)

seth, how come you think psychiatric drugs are dangerous?

Alex Chernavsky (2010-02-04 12:54:27)

Newsweek magazine has a cover story this week about how antidepressants are nothing but glorified placebos: <http://www.newsweek.com/id/232781> Although they work no better than placebo at alleviating depression, they do have adverse physiological effects on the brain. Here is an excellent article about the dangerous effects of psychotropic drugs: <http://psychrights.org/articles/EHPPPsychDrugEpidemic%28Whitaker%29.pdf> (For the record, I am not a Scientologist.)

seth (2010-02-04 15:00:53)

I believe psychiatric drugs are dangerous because there are many examples of them causing harm. An early example is tardive dyskinesia. Prozac causes suicidal thinking. Lithium causes weight gain.

Kudzu Bob (2010-02-04 18:24:43)

I am surprised that the notion of using baker's yeast to fight cancer is being treated as new idea. My layman's understanding is that for more decades than most of the readers of this blog have been alive, beta glucan, derived from the cell wall of baker's yeast, has been studied for its apparent ability to boost immunity. I do not claim to know how effective beta glucan is for such a purpose, but I do gather that this substance is also present in a number of medicinal mushrooms, maitake among them. Also, health food stores have sold beta glucan pills and mushroom extracts for many years, although some brands are reportedly of much higher quality than others.

J (2010-05-29 10:14:45)

Hello seth. I was wondering if you can provide some suggestions regarding Omega 3 Fish oil pills? I have been delusional for years now but no hallucinations. I have not been diagnosed yet. Should I start consuming this natural supplement? I really don't want to get on anti-psychotic drugs as you too have claimed of them to have severe side-effects. Thank you.

seth (2010-05-31 00:50:49)

Sorry, I can't, I haven't used fish oil pills. I get my omega-3 from flaxseed oil. I recommend Spectrum and Barlean's.

### **Camp No (2010-02-04 08:12)**

It's nauseating that [1]John Yoo (a Berkeley law professor) is getting off with a slap on the wrist. The superficial and childish response to 9/11 was they killed us, let's kill them. The supposedly adult response was we need to make sure this never happens again – by getting rid of terrorists. The real lesson I've never heard or read: here's something inside all of us that is stronger than we realized. We must try even harder to suppress it. 9/11 meant that laws against torture should be strengthened.

The opposite happened – thanks in part to John Yoo. Now it's clear there was a lot of torture at Guantanamo. It happened at a place called Camp No (as in "I have no idea what you're talking about"). As I read [2]this excellent article about the torture, I wondered how such journalism will survive [3]as newspapers disappear. I was glad to see that [4]the author, Scott Horton, is a lawyer, not a professional journalist. Just as my self-experimentation was essentially a hobby that I did in addition to my regular job (a Berkeley professor).

4. <http://www.harpers.org/subjects/ScottHorton>

---

Christine (2010-02-04 17:09:33)

I completely agree with you on this Seth. What a disgrace that John Yoo is not in jail for crimes against humanity. And yes– an excellent article.

Cole (2010-02-04 18:50:52)

I also enjoyed the article that you posted, Seth. For yet another look at torture/PMCs/abuse, I found this law journal article to be very insightful: [http://74.125.155.132/search?q=cache:C5essvsFAnAJ:law.slu.edu/conf/slwa08/papers/Harvey\\_SYMP\\_08.doc+wrapping,+american+flag,+thomas+harvey&cd=1&hl=en&ct=clnk&gl=us&client=firefox-a](http://74.125.155.132/search?q=cache:C5essvsFAnAJ:law.slu.edu/conf/slwa08/papers/Harvey_SYMP_08.doc+wrapping,+american+flag,+thomas+harvey&cd=1&hl=en&ct=clnk&gl=us&client=firefox-a) - Cole

Vic (2010-02-04 23:06:06)

To torture or not to torture is a false dichotomy. I would argue that confinement (i.e., jail) and being separated from one's loved one's is torture, certainly solitary confinement can be viewed as torture. I don't favor pulling out finger nails, but count me in support of coercive interrogation for high level terrorists with "hot" intelligence. As for John Yoo, I find it a sad sign of the weakness of our civilization that we need legal cover at all to engage in coercive interrogation against terrorists captured in afghanistan. It should be done covertly with a wink and a nudge.

Nathan Myers (2010-02-05 01:59:37)

Solitary confinement has always been considered torture. Vic, I hope you'll look forward to your turn as torture becomes routine. Too many parking tickets? Electric shocks for you, my good man.

Stephen M (Ethesis) (2010-02-05 07:34:28)

Ghh. Torture is useless for obtaining intelligence. On the other hand, prosecuting Yoo because of his advocacy or beliefs is just one more slip into the abyss of McCarthy.

tom (2010-02-13 11:48:50)

Seth, your post seems ignorant and visceral. Why didn't you analyze these issues more critically before (or instead of) posting?

1. Harper's article: Jack Shafer of Slate has shown huge problems with Horton's claims about 'Camp No'. And Horton's claims require a conspiracy so large that it strains common sense. I'm guessing you don't believe Obama was born outside the US or that the US government blew up one of the WTC buildings or that LBJ killed JFK. Why would you believe Harpers on this? Original Shafer article: <http://www.slate.com/id/2242942/pagenum/all/#p2> Harpers answer and Shafer reply: <http://www.slate.com/id/2243294/pagenum/all/#p2>

2. Yoo: I'm a lawyer and I still don't know much, if anything, about the subject of Yoo's memos. I'm guessing that you have no US Constitutional law expertise and that you don't know much about legal interpretation. Do you know that Yoo's advice to his client was incorrect about the law? And even if you do somehow know that, do you know that it was sufficiently incorrect that he should be sanctioned under normal standards for lawyers? I think you have no idea. So are you consciously suspending your normal critical process on Yoo and Horton's article because you want to send a very clear signal that you are a good torture-hater? Or are you always leaping without looking? I was just about to put my aquatic ape on an all-fat diet, but maybe I should rethink my faith in your posts.

seth (2010-02-13 12:40:29)

Tom, perhaps you should be more critical of Shafer. In his response – thanks for the links – he says: I dispute that it was called Camp No. !!! As if that mattered. As if he could possibly know that no one called it that. As for your points, I'll just say that I don't consider these two assertions: 1. US government tortured Guantanamo prisoners 2. US government bombed World Trade Center to have the same level of plausibility.

## **Medical Ghostwriting: Every Cloud Has a Funny Lining (2010-02-04 22:51)**

Never let it be said that med-school professors are [1]afraid of appearing foolish:

The articles come in with doctors' names on them and we often find some of them have little or no idea about what they have written, [the BMJ editor] said.

---

## **The Need for Animal Fat (2010-02-05 06:53)**

If you read Good Calories Bad Calories you may remember that the Arctic anthropologist Vilhjamur Steffanson spent a year on an all-meat diet, with no ill effects. (In [1]an earlier post about Steffanson, I stressed the fermented food that the Eskimos ate.) You may not know that animal fat was crucial for his health during that year, which began with [2]a brief attempt to eat lean meat (meaning meat without fat):

On February 26, 1968, [Stefansson] was admitted to the ward and on February 28, started on the meat diet. At our request he began eating lean meat only, although he had previously noted, in the North,

that very lean meat sometimes produced digestive disturbances. On the 3rd day nausea and diarrhea developed. When fat meat was added to the diet, a full recovery was made in 2 days.

During the year, he got about 80 % of his calories from fat.

Via [3]Inhuman Experiment.

1. <http://www.blog.sethroberts.net/2009/03/26/what-did-eskimos-eat/>
2. <http://www.jbc.org/content/87/3/651.full.pdf+html>
3. <http://inhumanexperiment.blogspot.com/2009/09/two-brave-men-who-ate-nothing-but-meat.html>

---

david (2010-02-05 08:39:07)

What I take away from that is that if you eat meat, you should also eat a certain amount of fat with it. I don't know about a vegan diet, but switching to vegetarian has helped my digestion. When your SLD stuff first appeared on the freakonomics blog (was it 4 years ago already?) I did the SLD based on your original paper and was suddenly eating a lot fewer calories each day. I decided if I was eating fewer calories, I should make sure I get the most value from those that I did eat, so I started eating a lot more veggies and quickly stumbled into being a vegetarian. When stopped eating meat, my digestion improved greatly. Around the same time I added yogurt (which I suddenly craved), and then (after you blogged about it) Kombucha. They have improved things even more (in particular, reducing sensitivity to dairy I used to have). The only animal fat I get is from eggs (which I do eat frequently) and dairy (which I only get from yogurt and some cheese). David

Heather McD (Heather Eats Almond Butter) (2010-02-05 10:57:51)

Big fan of fat over here. I've tried low carb eating, but I kept gaining weight. Could not figure it out. Suddenly realized I was focusing on protein, and lean protein at that. Once I switched my focus to fats, I lost the weight I had gained, and I can't tell you how much better I feel after adding more animal fats into my diet. My dry skin totally disappeared. Bring on the butter, cream, and whole eggs!

Tristan (2010-02-06 04:03:15)

Two factors changed coincident to the digestive problem clearing up: 1) meat fat was introduced to the diet 2) more time had passed How can we find out which factor cured the digestive problem?

seth (2010-02-06 06:13:17)

Tristan, Steffanson's earlier experience – a very low fat diet caused digestive problems – suggests that the first factor (meat fat) is what caused digestion to improve.

Tristan (2010-02-06 08:19:05)

Perhaps I misunderstood the post "On the 3rd day nausea and diarrhea developed. When fat meat was added to the diet, a full recovery was made in 2 days" It sounds like this was just 3 days into a new diet that he got a common upset which then cleared up 5 days into the diet. Quite normal even without a new diet. Is this another case of far too little original data being published?

seth (2010-02-06 09:52:39)

Tristan, nausea and diarrhea are not common effects of a new diet that doesn't involve unfamiliar foods. I agree, if the nausea and diarrhea had been numerically measured, we might have been able to see if they were starting to clear up before fat was added.

Haha "Greg Mankiw distances himself from reality" - Great links I love it!

## Is Your \_\_\_\_ Telling You the Truth? (2010-02-06 20:05)

You may have heard that Madonna's attempt to adopt a Malawi child was rebuffed by the legal system. A judge [1]ruled against the adoption:

Madonna was devastated by the ruling, said witnesses, and shouted at her attorney, "What went wrong? How could this have happened?" when the judge announced her decision.

Yet the ruling doesn't appear mysterious. There are clear residency requirements, which Madonna didn't come close to meeting.

Did her lawyer tell her the truth? The outburst suggests no, but in any case the perverse incentives are obvious: The lawyer benefits from being hired. Painting a rosy scenario – saying "I can definitely get you what you want" – increases the chances of that.

What about doctors? Dermatologists seem to claim, [2]as a group at least, that acne is unrelated to diet. The fact that [3]certain groups of people with unusual diets don't have acne suggests that this is wrong. Again, the mistake is highly self-interested. If acne is due to diet, you need to try different diets to figure out the problem foods. You don't need to see a dermatologist to do that.

1. <http://www.newser.com/story/55345/let-madge-adopt-my-my-niece-uncle.html>

2. <http://www.blog.sethroberts.net/2007/12/20/diet-and-acne/>

3. <http://www.blog.sethroberts.net/2009/06/24/acne-self-experimentation-why-its-promising/>

---

Jim (2010-02-06 20:30:27)

That's very interesting. In a couple weeks, I will be going to my first-ever dermatologist appointment to discuss my dry, flaky, itchy, red skin, which I think may be caused by harsh anti-bacterial soaps. I was fascinated recently by a blog post called "Paleo I Don't Care: I Like No Soap; No Shampoo." on Richard Nikoley's "Free The Animal" blog. I plan to tell the dermatologist that I want fewer chemicals on/in my body, not a bunch of prescription stuff. It'll be an interesting appointment.

LemmusLemmus (2010-02-07 00:04:45)

But what about reputational effects? Once you find out our doctor/lawyer is clueless or a liar, are you going to bring more business their way? The narrow self-interested strategy makes most sense if the expert expects a one-shot transaction or thinks the customer won't find out about his (the expert's) deception. Empirically, there are anecdotes to counter yours.

lance (2010-02-07 04:07:44)

When I was serving in Korea, I found a book in the base library (no new books since about the Vietnam War, as far as I could tell) by a dermatologist who had experimented with his patients and discovered that trans fats and polyunsaturated fats cause acne. It was only much later when I figured out the differences between the different kinds of fats that I realized he was right, that it's the prevalence of vegetable fats that causes certain kinds of acne. Now that I eat sardines in olive oil every day, and avoid all the vegetable fats, my acne has gone away after about twenty years. Couldn't have done it without the internet.

seth (2010-02-07 04:19:54)

LemmusLemmus, sure, there are forces pushing professionals to tell the truth, too. I am saying there are forces (well, one force, self-interest) pushing them to lie. The relative strength of the various forces, who knows? As for shopping around, if everyone in the profession agrees on the untruth – as dermatologists appear to have done – you can't easily find a better specialist. As far as I know, you can't easily find a dermatologist who will say that acne is due to diet. lance, do you have any idea what that "book in the base library" was called? I'd like to look at it. Jim, why haven't you tested your idea about harsh anti-bacterial soaps causing dry itchy skin by simply not using them?

Vic (2010-02-08 21:14:28)

Jim, why do you even bother going to a dermatologist if you don't want prescriptions and just want to stop using anti-bacterial soaps? The only thing a derm can do is give you prescriptions. Lance, are you sure olive oil isn't a vegetable oil?

Steve G. (2010-02-09 08:21:26)

Seth, Methinks you give Madonna too much credit. As an attorney (a lawyer representing clients), I find that clients want to be told "we'll win" and other comforting thoughts, and it's hard to find a path between Pollyannaism and defeatism (which one will be accused of quickly). In this case, I'm suspect that Madonna thought that all her money could buy her the outcome she wanted. It sure does help, but I have to tell my clients: "No guaranties!", no "slam dunks" (I don't want to be the local George Tenant). An honest appraisal of prospects? Yes. Certainties? No. I'm as quick to suspect the client in this case as the attorney as the source of faulty expectations. As to perverse incentives, the client, who must pay a significant sum, has the incentive to maintain a skeptical attitude and press for honest assessments. However, if you're rich enough (alas, not my class of clients), the money doesn't caution you since you have so much of it. Most people would prove more careful with their money.

## Experiments in Gift-Giving (2010-02-06 23:05)

Kathleen Hillers [1] posted this on a website called The Intention Experiment:

I just read a book called 29 Gifts: How a Month of Giving Can Change Your Life by Cami Walker. The author of the book has MS and was seeking natural healing. She was told by a "wise woman" from South Africa that if she gave a gift everyday for the next 29 days that it would have a healing effect in more ways than one. It's a great book, but if you don't want to read it, start giving a gift everyday and make a journal of every gift you give and the circumstances involved. If you miss a day, you have to start over because you have to keep the flow of giving constant. The gifts do not have to be materialistic. You can give someone a phone call, a ride, encouragement, whatever. I just started doing this on Feb 1st and my life is already getting better. The day before I started, I was in a panic. I couldn't sleep, and I was completely broke. The day I started, I actually started feeling much better, and things are already looking up.

Regression to the mean, maybe. But maybe not. The idea has some plausibility: The Chinese character that means "happy" is a combination of a character that means "owe" and a character that means "again".

1. <http://theintentionexperiment.ning.com/xn/detail/848178:Comment:194245>

---

Bob (2010-02-07 02:05:05)

Are you sure about the character? Could you please write it here?

Hack (2010-02-07 05:14:15)

I think it was Marcus Aurelius in Meditations who talked about how the Stoics considered gifts to be curses because they believed Fate/Fortuna would eventually take it away, leaving the giftee unhappier than before having received the gift.

david (2010-02-07 07:13:40)

The word "generosity" comes from the Latin word meaning "of noble birth". I suppose the idea is that "well born" people are more giving than "low born" people, but then it's easier to give resources away if you have a monopoly on them to begin with. Then there's a Veblen aspect...people may give stuff away to prove that they have so much extra money that can afford to give the gifts.

Alexandra Carmichael (2010-02-07 08:38:04)

Even better if the gifts are free or otherwise un-purchased! :) I practice random acts of kindness, with a goal of helping at least 10 people a day (and at least 1 person I don't know). I find this helps my mood toward the end of the day, when it is most likely to fall - no matter what else has happened that day, at least I've helped 10 people.

Alex Chernavsky (2010-02-07 08:52:19)

The new field of positive psychology concerns itself with topics such as this. I don't have references handy, but there seems to be a fair amount of research which shows that doing charity work, or simply being nice to others, can boost your mood.

Kevin Miller (2010-02-07 08:59:17)

Not so much on the character. I assume you're referring to the simplified version of huan: 欢 if it comes through. The original character was: 鴈, which (according to Wenlin) comes from 鴈 as a phonetic (from a picture of a heron, but not a character any more), and 鴈 "breath", as in 哈 鴈 - 哈 "yawn" from a picture of a person with their mouth open (in the ancient version of it). So the idea that being short of breath might relate to owing makes a bit of sense. If anything, you might want to say that breathing again -> happiness (works for me), but in etymology and ornithology the "again" probably just has something to do with the sound of the name of a bird. But the experiment seems like a great idea.

seth (2010-02-07 11:03:42)

Kevin, yes, that's the character. Yeah, it's a little ridiculous to think that the phonetic part of a character has something to do with concepts of happiness. Thanks for the correction.

## **Visible Big vs. Invisible Small (2010-02-08 06:40)**

In the current New Yorker, [1]James Surowiecki writes:

The bailout of the auto industry, after all, was as unpopular as the bailout of the banks, even though it was much tougher on the companies (G.M. and Chrysler went bankrupt; shareholders were wiped out, and C.E.O.s pushed out), and even though the biggest beneficiaries of the deal were ordinary autoworkers. You might have expected a deal that helped workers keep their jobs to play well in a country spooked by ballooning unemployment. Yet most voters hated it.

Yes, rewarding failure doesn't play well. The voters were right. The same money that was used to give a few giant companies a second (or third) chance could have been used to give many thousands of very small companies a first chance. It could have been used to help many thousands of people start new small businesses (often one-person businesses) or keep their new small business afloat. All those small businesses would have provided plenty of jobs. and they would have had a far more promising future, far more room for growth, than the Big Three, being both far more diverse and having not already failed. The many thousands of people who wanted to start small businesses were unable to get together and make themselves visible, so the failure of government to help them went unnoticed. Their diversity was economic strength but political weakness.

It isn't surprising things happened as they did - the Big Three (not to mention Wall Street) were bailed out, small businesses were ignored - but it is an indication of how poorly our economy is managed in the most basic ways. I'm not even an economist and I understand this simple point. Bernanke and Summers do not.

It's easy for me to understand because the same thing happens in science. Government support of research is a good idea, but the money is misspent, in the same way. Grant support goes to a few large projects - generally to people who have already failed (to do anything useful) - rather than to a large number of small projects that haven't

yet failed. The way to support innovation is to place many small bets not a few big ones. That's one thing I learned from self-experimentation, which allowed me to place many small bets.

1. [http://www.newyorker.com/talk/financial/2010/02/15/100215ta\\_talk\\_surowiecki](http://www.newyorker.com/talk/financial/2010/02/15/100215ta_talk_surowiecki)

---

Vic (2010-02-08 21:09:17)

There are a billion small businesses in india, and 100 million in Nigeria. What products are small businesses going to create that could compensate for the destruction of our industrial base?

seth (2010-02-08 21:56:34)

Vic, I don't think that propping up the Big Three for a few years or even ten years going to save American manufacturing. All manufacturing is much larger than those three companies. The book In Praise of Hard Industries lamented the loss of American manufacturing expertise long before GM went bankrupt. As for small businesses, all sorts of businesses that are now big (such as Google) were both small and hard to imagine 10 years ago. There's a reason that people move to Silicon Valley to start businesses rather than to India or Nigeria: the prospects for those new businesses are better here. If you mean that large businesses are the sign of a rich country, you're obviously right - but I'm sure that those large businesses were once small. The rich country is rich because it provided an environment that allowed small companies to flourish.

### **Alexandra Carmichael on Random Acts of Kindness (2010-02-09 06:06)**

Alexandra Carmichael is one of the founders of [1]CureTogether.com, whom I met at a Quantified Self meeting last year. A few days ago, she left [2]an interesting comment on one of my posts:

I practice random acts of kindness, with a goal of helping at least 10 people a day (and at least 1 person I don't know). I find this helps my mood toward the end of the day, when it is most likely to fall - no matter what else has happened that day, at least I've helped 10 people.

I asked her about it:

SETH Where did the idea come from?

ALEXANDRA It goes all the way back to my grandparents being Scout leaders - I was never in the Scouts myself but I observed how helpful and supportive they always were. Then during my university years when I was forming my life philosophy, I got to attend an incredible lecture by Jane Goodall. Her organization Roots & Shoots inspires people around the world to give back to the earth, animals, and people around them, with her amazing presence and the quote "Every individual can make a difference." Service learning is also one of the things we thread into homeschooling our two daughters, along with design, simple living, and non-violent communication.

The specific goal of helping 10 people a day started last summer during a goal-setting weekend. I was curious to see if formalizing and quantifying something I had been doing in a fuzzier way would make a difference in my life, if measuring acts of kindness would result in an increased number of acts, or more friends, or help me with my chronic depression - plus I love quantifying things! :) I don't find it necessary to actually record how many people I help in a day, but I keep a rough running tally in my head as I go through the day to make sure it's at least 10 - my kids

like to help with this count too.

SETH What are some examples of these acts?

ALEXANDRA I do a lot of different things. If I get extra free tickets to events or conferences, I will pass them along to people who I think would love to go; I will offer to take a picture of a tourist family where one person inevitably gets left out behind the camera; I will connect people who I think would benefit from knowing each other; I will take two hours to listen and hug and support a child who is having a hard time learning a new skill; I will answer a newbie entrepreneur's questions about how to get started in business or help them spread their message; I will help coordinate gatherings that I believe in (such as Quantified Self); I will hold the door for someone. It can be anything really, no matter how small.

SETH How have people reacted when you tell them about this?

ALEXANDRA The most frequent reaction is "That sounds too challenging to do every day - 10 people? Why not 1 or 2?" The second most frequent reaction is "You are inspiring me to make positive changes in my own life." My answer to both is "I love helping people!"

SETH What have you learned?

ALEXANDRA if you help people, without wanting anything in return, you get help when you need it - often surprising help, and often more than you gave. I learned that helping people seems to make them like you more, so my number of online friends has skyrocketed (1500 on Twitter, 800 on Facebook, 500 on LinkedIn) - but close "in person" friends I choose to limit to a handful because of my tendency to get overwhelmed by frequent or shallow social situations. I learned that helping people does help with depression, because (a) you have something else to focus on outside of yourself and (b) you go through the day with an expectant air of wonder at who will be the next person you can help. I also learned that helping 10 people a day is really not a lot, and I often wind up helping 20 or more people in a day. Of course, this is only from my perspective - I can't guarantee that all of these people actually feel helped, I just know that I tried to help.

SETH When you say "if you help people, without wanting anything in return, you get help when you need it - often surprising help, and often more than you gave" I'm not sure I understand. Can you give some examples?

ALEXANDRA It's not so much that the people I help help me in return, but more that by spreading goodwill and being tuned in to what others need, I also became more aware of my own needs and started to feel a greater sense of self-worth, like I deserved to have my needs met. This is not something I was taught growing up, and I went through two bouts of major postpartum depression without asking for or getting the support I needed. I feel much more open about my needs now, which perhaps makes it easier for others to help me. So the change was more in me than in others.

In terms of specific examples, when I learned that I have a Tourette's spectrum disorder, and tweeted that, I made an incredible new friend who has been through similar neurological issues, and who in our conversations of support and empathy has helped me more than I can ever thank him for. Also, when I decided to find some consulting work to support my family while we build CureTogether, a very welcoming door opened (soon to be made public), and offered me basically a dream position. I guess I needed to learn to ask for and accept help as well as to give it.

SETH Thanks, Alexandra. It's especially interesting that helping others raised your feeling of self-worth. I wouldn't have guessed it would have that effect.

1. <http://www.curetogether.com/>

2. <http://www.blog.sethroberts.net/2010/02/06/experiments-in-gift-giving/#comment-390054>

---

NN4 (2010-02-09 10:58:41)

"SETH Thanks, Alexandra. It's especially interesting that helping others raised your feeling of self-worth. I wouldn't have guessed it would have that effect." Seth, you've written that much of your self-experimentation has pointed to the wisdom of returning to our more ancient lifestyles: morning sunlight, fewer ditto foods, stand more, etc. I speculate this may be another example of that: before the invention of money or the bartering of goods, the main currency of human societies was probably reciprocity. You simply couldn't get along in a tribe without contributing to the welfare of others, which in turn ensured they would contribute to your welfare. By that logic it wouldn't be surprising that helping others raises your own self-worth, as in a sense you are accumulating "assets."

seth (2010-02-09 12:26:29)

Nadav, yes, humans are cooperative – so something must push us to cooperate. Somehow it must feel good or produce pleasant results. But predicting what pleasant results it produces is hard. Does it improve happiness, reduce irritability, increase serenity, reduce sensitivity to stress, reduce anxiety, increase feelings of well-being, or what?

flyboy (2010-02-09 12:52:00)

Is it really being kind when we are, even subconsciously, hoping for something in return? Real kindness is not fancy. Just responding to someone's need with simplicity, without awe at your own charity, without expecting anything in return. In fact, without any sense of self at all. Kindness says, "I want you to be happy." "Life's most persistent and urgent question is, What are you doing for others?" – Martin Luther King, Jr.

NN4 (2010-02-09 12:54:39)

Thanks Seth. I suppose it's also possible for people to give different names to the same mood effect, based on the kind of frame through which they view the world. Someone who has a "loneliness" frame may interpret the good feelings that result from helping others as "I feel less lonely when I help others," while someone else who has a "low self-worth frame" might interpret those same good feelings as "I feel greater self-worth when I help others." That would make it even more difficult to predict the pleasant results that result from something like cooperation.

1 (2010-02-09 22:38:34)

Seth, you've helped thousands of people around the world with your discoveries!!!

seth (2010-02-10 12:46:30)

thanks, 1

## **A GAPS Testimonial (2010-02-10 12:45)**

Gut And Psychology Syndrome (GAPS) is a book by Natasha Campbell-McBride about how to treat allergies, autism, and similar conditions. In [1] this entry, Cheeseslave talks about her own son and then quotes another mother about the effects of the GAPS diet (plus other changes) on her autistic son.

Kevin lacked oxygen at birth, so in the first year of life, I already saw that he was not developing like my

other kids (he is our 5th). His motor skills lagged and he cried a lot, didn't sleep so well, etc. At two, his behavior was just not right. He never responded right to correction, would throw things in anger or frustration, cried all the time, especially when waking up, basically never happy. He didn't walk until two and then he would fall down constantly.

He also began to always be starving. When he was really hungry, his face would get distorted and frozen in a strange way. I now think he was having seizures of sorts.

We did not vaccinate at all and we figured out that if we fed him lots of protein type foods like meats, he would relax his body and face and be able to go play for a bit until it happened all over again in a short time.

I do think that because we didn't vaccinate and figured out to keep feeding him this way, we were able to "coast along" like this for years. He had learning disabilities, lacked social skills and continued to have autistic traits like sensory issues, hiding under blankets, reacting to sounds, not liking people around, rigid in routines, and spinning and going on his head along with head banging.

Long story shorter, we did get a diagnosis of Aspergers at one point. We took him to doctor after doctor, specialist after specialist to no avail. He also strangely was NEVER once sick (we later learned that his immune system was not working a bit).

At 9 years old, he got pneumonia, followed by asthma and allergies. His eating [problems] had escalated to the point of feeding him every 20-30 minutes or he would have gigantic meltdowns. We eventually could not even have people over.

He was given an inhaler for the asthma and suddenly, without us making the connection, he began to not respond when called, became extremely hyperactive and began to run away at all hours of the day and night requiring police to find him and being very dangerous. (we once lost him in the middle of downtown Chicago). He would also try to jump out of moving vehicles, out of windows and required constant restraining.

The seizures got bad, he would fall down the stairs and lose consciousness several times per day. They tried psych drugs and he almost died twice from his reaction to them (I am now grateful that we couldn't go that route).

We became so desperate that we brought him home from hospital and got deadbolts to keep him from running, did all our own restraining and called alternative docs to help us.

We began kefir and diet from nutritionist (basically a BED [Body Ecology Diet]/GAPS version), took him off inhaler. His allergies were totally out of control, he could barely open his eyes from swelling, and his chin was deformed and swollen, his belly too, his whole body. He would only eat junk food and fast foods and it was incredibly difficult to transition him to the diet.

The DAN (Defeat Autism Now) protocols we followed, made him worse in lots of ways b/c the chelation made him extremely violent, the B12 shots kept him awake for nights on end without any sleep, the antifungals and all those other interventions were nightmarish for him.

Eventually, I resolved to use only foods and do this without any kind of doctors. So for this past year, I researched and researched and was determined to bring him back from this state. We have done a combo of GAPS (and BED) very successfully along with lots of fermented foods and drinks.

The allergies and asthma are 100 % gone, the seizures we have had only one in 65 days and very mild (compared to 5-10 per day). He sings every morning and has cried once in the last 2.5 months (he used to cry for 1-3 hours at a time each day) and he can go outside again without running away. He is in martial arts, acting appropriately at church, having eye contact, no autistic traits of late and learning academics after two years of not being able to open a book. He reads before bed at an 8th grade level.

This story has many interesting elements. 1. Huge improvement. Very plausible that it's due to the dietary change. 2. Autism and allergies go away at the same time, suggesting same cause. 3. Treatment with fermented foods. 4. A different "radical" solution failed, meaning there is no reason to think this is a placebo effect. 5. The mystery of why an inhaler made things worse. 6. Autism not due to vaccination.

1. <http://www.cheeseslave.com/2008/08/22/gaps-diet-testimonial-aspergers-allergies-and-asthma/>

---

Aaron Blaisdell (2010-02-10 13:57:34)

That is a VERY compelling account. Yet another example of how dietary intervention can have profound and positive health consequences. Add this to the list of dietary interventions that have 'cured' migraines and EPP (erythropoietic protoporphyria)-see here (<http://epistemocrat.blogspot.com/2010/02/ancestral-fitness-bricoleurs-two-e.html>), and here ([http://pigeonrat.psych.ucla.edu/systems/file\\_download.aspx?pg=277&ver=1](http://pigeonrat.psych.ucla.edu/systems/file_download.aspx?pg=277&ver=1)) for the poster.

(original) Jeff (2010-02-10 17:59:49)

Seth, How much do you worry about self-reporting accuracy in a story like this? With just one example do you worry about something being a coincidence and that correlation is not actually identifying causation? A lot of aspects of this account (by Millie) struck me as strange. Jeff

seth (2010-02-10 19:50:46)

Jeff, I worry less about the accuracy of this report than I worry about the accuracy of a scientific article reporting something similar. I don't worry at all about "something being a coincidence". I accept that the behavior changes were due to the dietary changes. There are many similar reports to this; nothing rests on the accuracy of just this one.

Timothy (2010-03-02 15:52:25)

If you haven't already found it, this article suggests a link between autism and gastrointestinal abnormalities. Essentially, the cause of the unusual development in the brain may also cause unusual development in the enteric nervous system in the gut. There is also a brief mention of the interaction between the immune system, the enteric nervous system, and bacteria in the gut. It's short on detail but full of hints to things you like to write about. <http://www.scientificamerican.com/article.cfm?id=gut-second-brain>

Sally O'Boyle (2010-03-27 10:05:46)

My 16yo son's asthma has also been almost 100 % cured by dietary changes and, oddly, gymnastics. We have cut out almost all sugar (that has been the most difficult part of the diet), eliminated dairy (except for kefir from goat's milk), only eat whole wheat flour, no white flour products at all, no processed foods, take a boatload of vitamins and have started chelation using the Cutler protocol. One of the biggest changes came when he started doing handstands at home. He watched a Damien Walters video on free running and yearned to do it. After a week of practicing handstands, he had a weekend of something like a cold: stuffed up, coughing (a productive cough which is what you want but rarely get with an asthmatic), tired, but no fever or any other symptoms. I'm a yoga person and happened to be reading the world's greatest

yoga book (<http://tinyurl.com/bestyogabook>) and noticed that upside down poses are great for the lungs. I concluded, not very scientifically, that he had dislodged some crap in his lungs... But after this sick weekend and his intense gymnastics workouts (see one here: <http://www.abroadincostarica.com/2009/11/ffa.html>), his asthma is 99 % gone. When I hug him, there is no wheeze. I hear nothing which is a miracle. I've been studying, reading, exploring alternative paths to health since we moved to Costa Rica 4 years ago. I started out looking for ways to help (healing wasn't even part of my vocabulary back then) Ryan's asthma. I knew there must be a better way. I also started out convinced that mercury poisoning from the few vaccinations my kids did was responsible for the asthma and some learning disabilities for my oldest boy. I do still feel there is a connection but maybe just in the gut. Mercury does stay in your body, getting it out is critical for good health, but maybe it does not cause the autism/allergies, etc. Maybe it just creates other problems that then create the a/a... then there is the aluminum, viruses, and other toxins injected with the vaccines. Today, after treating colds, asthma, cuts, even my dog's infections, preventing flu, a myriad of evidence piling up around here, I wouldn't go to a doctor unless I had a broken arm. My husband manages his high blood pressure with magnesium... well, the list is endless. We have not followed the GAPS diet strictly but basically adhere to it in spite of that! We are all happier and healthier because of our new eating habits. I found you because I'm starting your diet. I am a firm believer in self-experimentation. Thank you for being out there!

### **Written With A Straight Face? Dept. (2010-02-11 00:47)**

Jonathan Cole used to be provost of Colombia University. He has written a book called *The Great American University*, in which, according to [1]this review,

He lists their dazzling achievements, which in biology and medicine include findings on gene-splicing, recombinant DNA, retroviruses, cancer therapies, cochlear implants, the fetal ultrasound scanner, the hepatitis B vaccine, prions, [2]stem cells, organ transplantation and even a treatment for head lice. . . . In a chapter on the social sciences, he cites, among many others, such useful innovations as theories of human capital and social mobility, research in linguistics and even the use of prices to reduce traffic jams.

"Research in linguistics"? Yes, that sounds dazzling. I'm sure those "theories of human capital" have been v v "useful". And who would have thought that if you raise the price of something ("use of prices to reduce traffic jams") . . . people use less of it? Which was traffic engineering, not social science. Did the reviewer, an economics professor at Harvard named Claudia Goldin, write this with a straight face?

The "dazzling achievements" in biology and medicine are only slightly less unconvincing. "Gene splicing" and "recombinant DNA" research are [3]different names for the same thing. [4]Fetal ultrasound scanners may cause autism. Vaccines were not invented by an American university professor. The discovery of prions has had no obvious non-laboratory use – besides being questionable. Stem-cell research has yet to produce anything of use outside of labs. To be fair, gene splicing has been used to produce human insulin, which is better than the insulin previously available, but conspicuously absent from the list of accomplishments is prevention of diabetes – not to mention allergies, obesity, depression, arthritis, stroke, or any of the other lifestyle problems that a large fraction of Americans suffer from. Such achievements would be truly useful. Great American universities haven't given us any of those . . . but they have given us a treatment for head lice.

There's a reason for the term ivory tower. Apparently Cole, conscious of the term, is trying to argue against it – but merely shows why it exists. (I'm assuming the review is accurate.) It reminds me of the time that top Chinese students, visiting top American colleges such as Harvard and Yale, found the American students [5]ignorant and arrogant. The theme of Cole's book is that American universities are in trouble and need more support. What useful stuff they've accomplished is central to his argument. When I was an undergrad, I read Thorstein Veblen's bitter *The Higher Learning in America*, which said American universities were dysfunctional. He mentioned "committees for the

sifting of sawdust."

Alex Chernavsky (2010-02-11 05:02:20)

"Gene-splicing, recombinant DNA, and stem-cell research have yet to produce anything of use outside research labs." Humulin (human insulin produced by bacteria) is the product of recombinant DNA technology, isn't it?

seth (2010-02-11 05:58:42)

Alex, you're right. Thanks for the correction.

ChristianKI (2010-02-11 09:27:52)

Prions give us a way to understand mad-cow disease and test whether a given cow is affected by the disease. As a result we can kill those cows that are effected and therefore prevent the spread of the disease. Mad cow disease could become a bigger crisis without the understanding of prions.

Nate (2010-02-11 10:16:20)

"By œcancer therapiesœ does the reviewer mean oncogenes œ" the discovery of which won a Nobel Prize but hasnœt saved a single life? " Umm, testing tumors for mutations in oncogenes is extremely important for a bunch of cancers (colon cancer tumors with KRAS mutations don't respond to anti-EGFR drugs, for the most basic example). It's now standard in many cancers to take a look at oncogenes in the tumor in order to see what treatments will work...

seth (2010-02-11 11:50:50)

Nate, thanks for the correction. ChristianKI, you don't need to look for prions to figure out if a cow has mad-cow disease. Such a test has never been used, as far as I know.

thehova (2010-02-11 12:41:15)

As a humanities major I enjoyed the, "Graduate school in the Humanities is a trap" article. I'm thankful for my history professor for explaining to me the grim journey a history professor must take to get a tenured position at any institution.

Tom in TX (2010-02-11 12:53:56)

Seth wrote: "Stem-cell research has yet to produce anything of use outside of labs." Adult stem cells have been used to treat patients for various conditions, such as leukemia.

Nathan Myers (2010-02-11 13:28:57)

I seem to recall stem cells being used to regrow the dead parts of people's hearts (not speaking figuratively). Anybody who doubts the liveliness of linguistics research should hie on over to Language Log, <http://languageblog.idc.upenn.edu/nll/> for an awakening. A very great deal of very important work is going on in universities. A much greater amount of pointless wankage is also going on in universities. These are not contradictions, and it would be hard to get the former without the latter. Even in physics departments, while the string theorists demand public attention, most physicists aren't string theorists, and many are doing important work in, e.g., materials science, which finds its way quickly into new products.

Sylvia (2010-02-11 13:48:29)

I feel obliged to put in a word for academia, which I am normally not inclined to do—I am an academic (a current PhD student) who is well aware of the dysfunctional nature of the American system. I am also a self-experimenter and know very well how much can be begun via non-peer-reviewed, non-double-blind type research. The medical "system" in this country is a business, with all business' concomitant issues, and that goes for academia too. All that said, I'm not sure we should be so quick to dismiss the benefits of seemingly "obvious" or un-dazzling research or achievements in the academic system. Your own research shows that something which might be patently obvious or unobvious to one person might be seen very differently by another. As a theoretical linguist, I can be fairly certain that none of my research is going to directly affect the health of my fellow man any time soon (though I certainly don't speak for other theoretical linguists). However, there is a great deal of linguistic research that focuses on far more practical matters (how best to help patients with aphasia regain their ability to talk, for instance). I would not have a hard time keeping a straight face while calling any of that research dazzling. The American academic machine is undoubtedly broken. People outside of academia have made some of the greatest advancements in our knowledge base, yes. But I would caution even those of us who agree on these points to avoid the trap of eschewing research that cannot be immediately shown to be useful in a socioeconomic sense—after all, it is from such research (whether by a university professor or a patent examiner) that so much of our real advances come. Academia in America needs major adjustments—but I don't believe that it's a completely lost cause.

seth (2010-02-11 21:20:53)

Sylvia, that was Veblen's critique. The subtitle of *The Higher Learning in America* was "A Memorandum On the Conduct of Universities By Business Men". For all I know some linguistics research is dazzling, but you don't convince me of that with the bland description "linguistics research". Tom, by "stem-cell research" I meant stem cells used as a research tool, not as a therapeutic tool. Having spent his entire professional career in academia, Cole should have noticed that professors, especially at elite schools, dislike doing research with obvious value. It strikes them as menial. "Practical" and "applied" are terms of disparagement, whereas "pure" research (research without obvious value) is good. Cole ignores this just as humanities professors ignore the horrible job prospects of their graduate students.

(original) Jeff (2010-02-12 09:32:39)

Seth, Normally you criticize biology and medicine for not having applications. When someone mentioned the application for stem cells, you said "Tom, by "stem-cell research" I meant stem cells used as a research tool, not as a therapeutic tool." What does this mean? Biologists haven't learned a single thing from using stem cells as a research tool? That doesn't seem true at all and it sounds like you made no effort to verify it. Thanks, Jeff

seth (2010-02-12 21:36:13)

Jeff, stem cells are a research tool. They are used in labs. In petri dishes. This is quite different than their use in hospitals. I don't mean nothing has been learned from stem-cell research, I mean nothing of practical value has been learned. Nothing that warrants being called a "dazzling achievement". Cole is trying to say that university research has benefited the public. So the public – the rest of us – should help the university in its hour of need. This is why I am focusing on the absence of practical value. Not scientific value. If you know of something of practical value that has come from stem-cell research, I'd love to know about it.

Jim (2010-02-12 21:37:53)

Sort of on topic Seth, have you seen Henk Tennekes resignation letter to the Royal Netherlands Academy of Arts and Sciences?

[1]Scientist Resigns I don't think "dysfunctional" is limited to the USA.

1. <http://pielkeclimatesci.wordpress.com/2010/02/12/henk-tennekes-resigns-from-dutch-academy/>

seth (2010-02-13 00:03:08)

No I hadn't seen it, thanks.

Noumenon (2010-02-15 23:51:39)

"If you know of something of practical value that has come from stem-cell research, I'd love to know about it. " I do not understand how Tom's post is not an example of this. He said they're using it to treat disease! They wouldn't be doing that without the research.

seth (2010-02-16 03:57:49)

By "stem cell research" I meant the research you learn about when you google "stem cell research". For example, NIH Announces First hESC Lines Eligible for Funding Dec. 2, 2009 The ISSCR is encouraged by the announcement by the National Institutes of Health (NIH) of 13 human embryonic stem cell lines now eligible for use in NIH-funded research under the guidelines adopted in July, 2009. More lines are expected to be named in the future. This represents a significant step forward in allowing researchers access to an increased range of lines which will accelerate efforts to understand and treat major public health problems. As far as I know, it was to such research that Jonathan Cole was referring. The term "stem cell research" doesn't include all research with stem cells, just as the term "experimental psychology" doesn't include all psychology research that uses experiments.

Ragout (2010-02-17 16:20:31)

Congestion pricing is economics, not traffic engineering. And there's more to it than "if you raise the price, people use less." From Bill Vickrey's Economics Nobel Prize citation (about subway fares, a closely related issue to congestion pricing): "Efficient pricing of public services permeates Vickrey's scientific production. He has not only made significant theoretical contributions, but - unlike most excellent theorists - he has also followed up on his proposals all the way to their practical application. An example is Vickrey's famous study of the New York subway fare system in the 1950s. His proposal was an early attempt at efficient pricing of public services, under the restriction that the authorities should receive full cost coverage. His study represents more than an improvement on the basic pricing principle (so-called Ramsey pricing); it is also fascinating in its wealth of detail."

seth (2010-05-23 02:51:36)

Ragout, after Bill Vickrey received the 1996 Nobel Prize in Economics, he told a journalist his prize-winning work was "at best . . . of minor significance in terms of human welfare" (quoted by John Cassidy in his recent book about economics). So I think this example supports my point.

Alrenous (2010-02-12 09:50:28)

Regarding randomizing the trials, I don't think the placebo affect could work on only half your body at a time. Although, maybe it could. That would make a great trial of the placebo affect, actually, to see what makes it tick.

Ragout (2010-02-17 16:28:24)

The Vioxx link is fairly accurate, but pretty unfair to the FDA. Merck didn't just fool the FDA, they also published the study (the "VIGOR" trial) about "how incredibly effective Aleve was at reducing heart attacks" in the NEJM, probably the most prestigious medical journal.

### **Elizabeth Kolbert Confronts Climategate (2010-02-12 21:27)**

The New Yorker website has a weekly podcast called The Political Scene. I've listened to almost all of them. [1]This week's was unlike any other.

The brief description is "Elizabeth Kolbert and Peter J. Boyer discuss recent attacks on climate science." Never before have the discussants been so far apart. They should have replaced discuss with debate. Boyer hasn't written a word about climate science – or even science. He moved from the New York Times to The New Yorker after he wrote an (excellent) book about television. Recently he's covered politics. Kolbert has written dozens of articles and a book about climate science. In spite of this, the moderator (Dorothy Wickenden, executive editor of the magazine), asked Boyer to describe the Climategate emails and their significance. They showed, he said, "an intolerance [by the scientists] of skepticism of their narrative . . . this was a real shock to the system and a real shock to the global warming consensus." I think any unbiased observer would agree.

Then Wickenden asked Kolbert what she thought:

KOLBERT I don't agree with him [Boyer] . . . One of the things that comes out in these emails is the climate scientists' frustration with having to deal with people who use the data in all sorts of irresponsible ways. . . I'm not aware of any instances where people have had to go back and had to say "you're right and the conclusion we drew was wrong."

BOYER Perhaps we could say that language was used in these communications that would allow for an interpretation that perhaps there was fudging or something going on that needed to be obscured. There was a whole tone of intolerance of questioning of their data or – and this was what was so disturbing to hear from scientists – any questioning of what sounded an awful lot like their mission.

Boyer went on and on – as if he were the expert. (And he clearly knew what he was talking about.) Then Wickenden turned to the United Nations IPCC report and asked Kolbert what she thought of recent criticism (which Wickenden learned about from the NY Times).

KOLBERT . . . [The error was in Part 2.] In [Part 2 of] this report, which was literally 986 pages long, there were a couple of things inserted that weren't from the peer-reviewed literature. . . .

BOYER Well, Betsy, I'm sorry, these aren't just 986 pages of Scripture, and then a couple of little awkward errant notations on the side. The IPCC isn't an inconsequential body. Al Gore and Mr. Pachauri shared the Nobel Prize. They are granted a level of authority when they speak. These reports were certainly granted authority. . .

KOLBERT [interrupting] I guess I should ask you: What is your point? . . .

BOYER . . . The consensus about the consensus has begun to crack. That's just the political reality . . . There is a crack in the consensus.

Kolbert has published hundreds of thousands of words about global warming in the most prestigious magazine in the world. That she is unable to see or at least say this basic truth but must have someone else say it is another sign of [2]problems with her reporting.

Until now, all speakers on The Political Scene have sounded calm and confident. On rare occasions they disagree, but never like this. And the conversation always has a relaxed tone. Not this time. Boyer sounded calm and confident but I thought Kolbert sounded nervous and upset. With good reason: It struck me as a huge and public rebuke from her employer. She's been the expert. Now someone with no credentials has been allowed to say she's wrong – has been brought on the program, apparently, in order to disagree with her. As if it's no longer clear she's right. And her dismissal of the Climategate emails, as if they taught her nothing, didn't help her. The debate with Boyer was preceded and followed by softball questions by Wickenden to Kolbert. They struck me as attempts to soften the blow, as did a comment at the end by Boyer about a Super Bowl commercial.

---

Andrew Gelman (2010-02-13 08:02:42)

Seth: It makes sense to me that a political writer will focus on the politics (for example, Boyer's statement, "That's just the political reality . . . There is a crack in the consensus."), while a science writer will focus on the science.

seth (2010-02-13 10:36:03)

Andrew, that's an interesting point. Kolbert is not a science writer in the usual sense. The only science she writes about is climate science. Before writing about climate science, she wrote about politics. I suppose she got permission to write about global warming by telling her bosses that the science was settled, the news in the coming years will be about the translation of science into action, which is basically politics. Now that the science turns out not to be settled, she is in a difficult position.

Andrew Gelman (2010-02-13 13:09:25)

Seth: I think the science is [1]much more settled than you think it is. The politics is very relevant in any case.

1. [http://www.stat.columbia.edu/~cook/movabletype/archives/2009/12/say\\_a\\_little\\_pr.html](http://www.stat.columbia.edu/~cook/movabletype/archives/2009/12/say_a_little_pr.html)

Mike Bowerman (2010-02-14 14:22:55)

Andrew, that's a great post you link to, but doesn't suggest anything is settled. The comments provide a number of interesting critiques of the post which aren't convincingly refuted. I'm an agnostic on the extent and significance of anthropogenic influence on the climate. Most interesting to me is how difficult it seems for people to remove their emotions from the debate. Informed, intelligent people take positions on either side and seem frustrated by, angry at, irritated with or hostile toward people who don't share their opinions.

seth (2010-02-14 14:42:25)

Andrew, yes, you and I differ greatly on how much we (the scientific community) actually know about this. Phil thinks the science is settled, so do you, but I think the science (e.g., Hansen) is far less certain than claimed. I also believe its overstatedness will eventually become clear. (This post is about one small example of that.) Phil says, "how could 90 % of the experts be wrong?" I say: Lots of people move into the "wrong" column when there is money, attention, and status to be made by such a move. Especially when the fact that you're wrong is hard for the general public to realize. (E.g., dermatologists claiming that acne isn't caused by diet. An example where >90 % of the experts are wrong.) I wish there was a prediction market where I could put money on my belief.

Will Hunting (2010-02-14 19:16:13)

Apropos the statement that "any unbiased observer would agree" that the Climategate emails ".. was a real shock to the system and a real shock to the global warming consensus." <http://www.rifters.com/crawl/?p=886>

seth (2010-02-14 19:47:36)

Thanks, Will. I suppose he was saying that he wasn't in the least shocked by the Climategate emails. If he didn't learn something from the emails, he's not too bright. If he thinks others didn't learn from them, he's wrong.

### **Climate Science Slowly Becomes Less Settled (2010-02-14 15:51)**

Andrew Gelman, in<sup>[1]</sup> a comment on the previous post, said that he believes the science of climate change is "much more settled" than I do. He's right – in the sense that I believe the state of the world is different (less certain) than claimed. Andrew sees correct certainty; I see false certainty. Because science slowly becomes more accurate, I think the science will slowly shift toward "less settled" – a prediction I don't think Andrew would make. Here's an example of such a shift. According to the <sup>[2]</sup>Mail on Sunday, Phil Jones

admit[s] that there is little difference between global warming rates in the Nineties and in two previous periods since 1860 and accept[s] that from 1995 to now there has been no statistically significant warming. He also leaves open the possibility, long resisted by climate change activists, that the "Medieval Warm Period" from 800 to 1300 AD, and thought by many experts to be warmer than the present period, could have encompassed the entire globe.

<sup>[3]</sup>Phil Jones slowly shifts.

2. <http://www.dailymail.co.uk/debate/article-1250813/MAIL-ON-SUNDAY-COMMENT-The-professors-amazing-climate-change-retreat.html>

3. <http://bishophill.squarespace.com/blog/2010/2/14/jones-on-the-medieval-warm-period.html>

---

G. Pelkabo (2010-02-14 23:25:17)

Yes this was a stunning admission by Jones. Watch 90 % of experts start backpedaling now. I'm going to make some popcorn, this should be fun to watch.

Mike Bowerman (2010-02-15 01:07:49)

Other scientists questioning the data in the Times Online: <http://www.timesonline.co.uk/tol/news/environment/article7026317.ece>

Steve G. (2010-02-15 10:28:08)

1. Are CO2 levels not rising to levels not seen in millions of years? 2. Is the polar icecap not receding? 3. Can we afford to "wait and see", which will help decide whether we are now experiencing a period of global warming, and if so, how much of it (0-100) is caused by human activity? Sorry, I'm a pragmatist, I have to go with something, and the path we're now on still gives the overwhelming impression that we're slowing stewing ourselves. Are we acting on perfect knowledge? No. If science turns around and says "drill, baby, drill" and "burn, baby, burn", then so be it. But it ain't there now.

seth (2010-02-15 11:16:05)

Steve, the recent rate of warming is matched by the rate of warming during two previous periods before we started putting so much CO2 in the air. This suggests that CO2 doesn't make a big difference. (If it did, the current rate of temp increase should be greater than ever before.) If the current global temp was unprecedentedly high OR the rate of warming was unprecedentedly high, then I would get really worried. But neither are true, as far as I can tell. "Is the polar icecap not receding?" The South Pole is not shrinking, as far as I know. During most of the Earth's history and all of recent history, the polar ice cap has been shrinking half of the time. (It has been growing the other half.) That fact alone doesn't mean a lot. "Can we afford to wait and see"? I think so. Overreaction is costly too. There are plenty of good reasons to reduce carbon emissions and I believe they will go down.

Vince (2010-02-15 13:59:46)

Are Phil Jones's actual words available anywhere, or do we have to rely on this paraphrase from The Daily Mail? Both of the claims about recent temperatures sound like they could be meaningless. The claim that two previous periods had similar warming rates is hopelessly vague and it's not at all clear that it represents a shift in anything - temperature records have long shown a substantial increase from the 1910s to the mid 1940s, for instance. The claim about no statistically significant warming since 1995 could just be relying heavily on "statistical significance" and a small sample size. Googling around a bit... [1]yep, that's exactly what happened: Question: "Do you agree that from 1995 to the present there has been no statistically-significant global warming?" Jones: "Yes, but only just. I also calculated the trend for the period 1995 to 2009. This trend (0.12C per decade) is positive, but not significant at the 95 % significance level. The positive trend is quite close to the significance level. Achieving statistical significance in scientific terms is much more likely for longer periods, and much less likely for shorter periods."

1. <http://voices.kansascity.com/node/7593>

Dave Lull (2010-02-15 14:22:01)

"'Climategate' scientist speaks out "Climatologist Phil Jones answers his critics in an exclusive interview with Nature." <http://www.nature.com/news/2010/012345/full/news.2010.71.html>

seth (2010-02-15 16:27:16)

Vince, Jones's exact words are in the link called "Phil Jones slowly shifts" but they only apply to one issue. Sure, 15 years is a relatively short period and statistical significance is arbitrary. The two earlier periods with similar rates of warming are spelled out in various places. They are pre 1900, if I remember correctly. Take my prediction as a prediction about what will happen over the next five-ten years. Obviously any shift so far is tiny.

Vince (2010-02-15 18:16:30)

Those are his words for one of the three claims. I quoted his words for a second claim, and it's clear that the article is being misleading: he wasn't retreating at all. He was fed a leading question, and responded by noting that it was technically accurate and explaining why it's misleading: it's hard to make precise estimates of trends with data from a short period of time, so it's no surprise that the increase in temperatures since 1995 isn't quite statistically significant. I haven't seen his words on the third claim, but I'd guess that it's a lot like the second - he was fed a misleading question and agreed that it was technically accurate. He was probably relying on an updated version of [1]these data, and it looks like you could pick out a couple 10-15 year periods before 1900 with upward trends similar to the trend over the past 40 years (one starting in the mid 1850s and one starting around 1890), but it's not clear why anyone should care (it's just as easy to pick out a decade with a downward trend, like by starting in the late 1870s).

1. <http://www.cru.uea.ac.uk/cru/info/warming/>

Nathan Myers (2010-02-16 19:50:09)

Seth, please do look up "confirmation bias". You write very much as if you have never heard of it. You're convinced that AGW is a load of hooey; so, to be scrupulous, you should be seeking out evidence that it's real. If you could bring yourself to bother, you'd find plenty. Instead, you find yourself quoting from editorials and misquotes in the least scrupulous newspapers. That should worry you. Other warming periods not involving CO2 say nothing about the present trend. There are plenty of possible causes for warming, and if all of them were combined, then the rate would obviously be higher than it is; but they haven't been. All we know much about is the trend we're experiencing now where the temperature rise really is tracking CO2.

Steve G. (2010-02-17 11:01:04)

A more articulate writer than me and a widely recognized layman's voice on these issues from 2.17.10 NYT: <http://www.nytimes.com/2010/02/17/opinion/17friedman.html?ref=opinion>.

Hal (2010-02-18 14:14:01)

If Seth is guilty of confirmation bias then he is certainly not the only one. It is one of the most common of logical errors. Very few people can approach a controversial topic with a fully unbiased and open mind. Particularly with global warming, many people have ideological preferences which will interact strongly with their beliefs about the topic. Those who distrust big business and favor government regulation will be inclined to welcome evidence for global warming. Those who hold the opposite views will tend to be skeptical. I find that there is a very strong correlation on this issue between people's beliefs and their preferences.

Vince (2010-02-18 21:09:38)

The [1]full interview is now online. On the similar trends question, the interviewer picked out the time periods (1860-1880, 1910-1940 and 1975-1998) and he just ran some numbers that confirmed that they had similar temperature trends (around .16 degrees C per decade). This was a prelude to a few questions about how he can be so sure that the recent warming is human caused, then. He agreed with the IPCC report that it's very likely to be human caused, gestured towards all the research that directly addresses that question of what factors are influencing the temperature, and seemed to get annoyed when he kept getting asked versions of the same question.

1. <http://news.bbc.co.uk/2/hi/science/nature/8511670.stm>

## **Confirmation of Stunning MS Claim (2010-02-14 20:15)**

I [1]blogged earlier about an Italian med school professor named Paulo Zamboni who, studying his wife, came up with an entirely new theory about multiple sclerosis (MS): It's caused by restricted blood outflow from the brain. Almost all MS patients had this condition, Zamboni found. The great value of this theory is that blood outflow can often be improved with surgery. In at least some cases, this surgery has reduced MS symptoms.

Now, a study done in Buffalo has found [2]results that support Zamboni's idea. MS patients were twice as likely

as healthy people to have restricted blood flow. This is a weaker correlation than Zamboni found but I make nothing of it – there are lots of ways to mess things up, so that you get noisier results. (And there are lots of ways to push results in a preferred direction.)

Zamboni wasn't an MS expert. He made this breakthrough because his wife had MS and he had technical skills (including surgical skills – his specialty is surgery).

Thanks to Anne Weiss.

More [3]A more detailed description.

---

peter (2010-02-15 00:29:42)

ms patients have a high level of inflammation, so this would be expected, i.e., inflammation causes vein constriction or at least exacerbates it.

q (2010-02-15 10:44:41)

only double the incidence? if it were the cause, wouldn't you expect 100 % incidence?

seth (2010-02-15 11:49:35)

q, no you wouldn't because the dividing line used by researchers to classify is unlikely to be the same as the dividing line used by nature and life and diagnosticians to divide people into affected and non-affected. peter, it isn't the diameter of the blood vessels that's weird, it's their configuration.

Hal (2010-02-16 12:36:57)

Imagine if ten years from now MS is routinely cured by simple vein surgery. And people could be screened for being at risk of the disease and have it prevented as well. This would be a true medical miracle. Somehow I think it is too much to hope for, but there is a chance it could happen.

Hal (2010-02-17 10:53:34)

Just reading a little bit about MS. This is a disease of the myelin sheaths that surround and insulate nerve fibers. It is thought to be a form of autoimmune disease, and in particular results when a particular type of lymphocytes (white blood cells) called T cells escape into the brain and cause harm. Normally T cells are not supposed to be able to get into the brain due to the blood brain barrier. The endothelial cells that line blood vessels in the brain are supposed to be glued very tightly together, preventing anything escaping. In the rest of the body these connections are intentionally rather loose, but the brain environment is very controlled and nothing is supposed to get through. The brain has its own immune cells, separate from the lymphocytes. So having T cells in the brain is a prescription for havoc and this is thought to be one of the primary causes of MS. Somehow the BBB breaks down in MS and lets the T cells through. Given all this, maybe it is not so surprising that blood flow problems might contribute to at least some cases of MS. You could imagine that failure to drain blood freely could cause some backups and increase pressure on the BBB, potentially causing failures and leading to the whole chain of damage in MS. Freeing blood flow as a curative factor is not then as outlandish as it may seem. I was diagnosed last year with ALS, a different neurological disease but also pretty bad. Interestingly there are some hints that ALS could also be related to blood brain barrier problems. Traces of

hemoglobin have been found in ALS spinal cord tissue, another substance which should not be allowed to escape. Hemoglobin is iron rich and iron can be harmful in tissues where it is not designed to be present. A few therapies have been tried which are supposed to improve BBB integrity but so far nothing dramatic has resulted.

## Exploratory Versus Confirmatory Data Analysis? (2010-02-15 06:02)

In 1977, John Tukey published a book called *Exploratory Data Analysis*. It introduced many new ways of analyzing data, all relatively simple. Most of the new ways involved plotting your data. A few involved transforming your data. Tukey's broad point was that statisticians (taught by statistics professors) were missing a lot: Conventional statistics focussed too much on confirmatory data analysis (testing hypotheses) to the omission of exploratory data analysis – data analysis that might show you something new. Here are some tools to help you explore your data, Tukey was saying.

No question the new tools are useful. I have found great benefits from [1]plotting and [2]transforming my data. No question that conventional statistics textbooks place far too little emphasis on graphs and transformations. But I no longer agree with Tukey's exploratory versus confirmatory distinction. The distinction that matters – at least to historians, if not to data analysts – is between low-status and high-status. A more accurate title of Tukey's book would have been *Low-Status Data Analysis*. Exploratory data analysis already had a derogatory name: *Descriptive data analysis*. As in mere description. Graphs and transformations are low-status. They are low-status because graphs are common and transformations are easy. Anyone can make a graph or transform their data. I believe they were neglected for that reason. To show their high status, statistics professors focused their research and teaching on more difficult and esoteric stuff – like complicated regression. That the new stuff wasn't terribly useful (compared to graphs and transformations) mattered little. Like all academics – like everyone – they cared enormously about showing high status. It was far more important to be impressive than to be useful. As Veblen showed, it might have helped that the new stuff wasn't very useful. "Applied" science is lower status than "pure" science.

That most of what statistics professors have developed (and taught) is less useful than graphs and transformations strikes me as utterly clear. My explanation is that in statistics, just as in every other academic area I know about, desire to display status led to a lot of useless highly-visible work. (What Veblen called conspicuous waste.) Less visibly, it led to the best tools being neglected. Tukey saw the neglect – underdevelopment and underteaching of graphs, for example – but perhaps misdiagnosed the cause. Here's why Tukey's exploratory versus confirmatory distinction was misleading: Because the tools that Tukey promoted for exploration also improve confirmation. They are neglected everywhere. For example:

1. Graphs improve confirmatory data analysis. If you do a t test (or compute a p value in any way) but don't make an associated graph, there is room for improvement. A graph will show whether the assumptions of the computation are reasonable. Often they aren't.
2. Transformations improve confirmatory data analysis. That a good transformation will make the assumptions of the test more reasonable many people know. What few people seem to know is that [3]a good transformation will make the statistical test more sensitive. If a difference exists, the test will be more likely to detect it. This is like increasing your sample size at no extra cost.
3. Exploratory data analysis is sometimes thought of as going beyond the question you started with to find other structure in the data – to explore your data. (Tukey saw it this way.) But to answer the question you started with as well as possible you should find all the structure in the data. Suppose my question is whether X has an effect. I should care whether Y and Z have an effect in order to (a) make my test of X more sensitive (by removing the effects of Y and Z) and (b) assess the generality of the effect of X (does it interact with Y or Z?).

Most statistics professors and their textbooks have neglected all uses of graphs and transformations, not just their exploratory uses. I used to think exploratory data analysis (and exploratory science more generally) needed different tools than confirmatory data analysis and confirmatory science. Now I don't. A big simplification.

Exploration (generating new ideas) and confirmation (testing old ideas) are outputs of data analysis, not inputs. To explore your data and to test ideas you already have you should do exactly the same analysis. What's good for one is good for the other.

Likewise, Freakonomics could have been titled Low-status Economics. That's essentially what it was, the common theme. Levitt studied all sorts of things other economists thought were beneath them to study. That was Levitt's real innovation – showing that these questions were neglected. Unsurprisingly, the general public, uninterested in the status of economists, found the work more interesting than high-status economics. I'm sensitive to this because my self-experimentation was extremely low-status. It was useful (low-status), cheap (low-status), small (low-status), and anyone could do it (extremely low status).

1 (2010-02-15 08:29:02)

I spoke with a statistics professor at Berkeley about this book. On her website, it says she studies "multilevel and latent variable modeling." She said Tukey's book is "not important" and she mentioned something funny about Tukey's life. She did say, "Are you interested in statistics?" Thanks, Seth, for making me seem smart to these Berkeley profs!! I always talk to them about something I learned from you and your blog!!

seth (2010-02-15 10:04:16)

what was the funny thing about Tukey's life? Tukey's book was really important to me because it stressed two things (graphs & transformations) that my other statistics textbooks did not. They turned out to be incredibly useful.

jay (2010-02-15 10:26:30)

Hey Seth, have you seen this? [http://thelastpsychiatrist.com/2009/02/the\\_bubble\\_in\\_academic\\_research.html](http://thelastpsychiatrist.com/2009/02/the_bubble_in_academic_research.html) Sounds similar to a lot of what you've been saying lately (which is good, because people independently arriving at similar conclusions... is good).

q (2010-02-15 10:43:43)

how do you draw a graph with more than two or three variables?

seth (2010-02-15 11:27:58)

[1]lattice plots allow more than three variables to be visualized. For example, one scatterplot shows X vs Y. And a 2 x 2 matrix of X-Y scatterplots shows how that relationship varies with W (rows) and Z (columns). So you get up to 4 dimensions easily enough. More than 4 dimensions is hard. Gotta use ANOVA to figure out what graphs to make.

1. <http://geography.uoregon.edu/geogr/topics/lattice.htm>

seth (2010-02-15 11:46:26)

jay, thanks for the link. Nice post. Although psychiatric research has done little for the general public, it has done wonders for the status of the psychiatrists who publish it (within their profession). That's why it's not a bubble. It really pays off – just not for the rest of us. Basically the same situation as most statistics research, I agree.

1 (2010-02-15 11:53:06)

Seth, she said Tukey had a strange life.

LemmusLemmus (2010-02-15 12:50:58)

I can't agree on the last paragraph. Much of the research that was popularized in *Freakonomics* was published in the most renowned journals economics has: Definitely high status.

1 (2010-02-15 12:54:38)

I believe for bipolar disorder, there hasn't been a lot of new medications out in the last ten years. Or at least, to my knowledge. Probably true for schizophrenia medication (antipsychotics), as well. In addition, some of them can be hard to tolerate, all have side effects, etc. It is too bad, but some people have no other choice and have to take these psychiatric medications. I think that's why there's therapists and psychologists who devote their careers to helping the mentally ill cope with these things. They've developed different ideas such as CBT and ACT. Together with the psych meds, these can be more powerful than psych meds alone.

seth (2010-02-15 12:57:03)

LemmusLemmus, my self-experimentation was published in a high-status journal. That didn't change the basic picture. I believe that most econ profs in high-rated depts believed that determining the income of drug dealers was low-status. The abortion stuff, not so low-status. Sumo wrestlers = low status.

Mike Bowerman (2010-02-15 17:31:07)

What is interesting to me about the low-status/high-status distinction when you extend it to academic work is that much of the low-status academic work could also offer more value to society than the high-status work that is instead undertaken – like more lessons from self-experimentation would be of value than expensive clinical trials, or research on prevention of disease might be of greater social value than high-status pharmaceutical or surgical interventions. Is much of the research in *Freakonomics* also of value to society, or simply popular in the way that other novelties are popular – e.g., information on Britney Spears' personal life is popular, but not valuable to society. I didn't read *Freakonomics* because in the multiple excerpts I read the only valuable insights I found were the relationship between abortion and later crime rates and the low-incomes of drug dealers on the street – both of which were fascinating and potentially valuable, but covered thoroughly in other sources. Was the 'sumo wrestlers' for instance useful? I don't recall reading about it.

Mike Bowerman (2010-02-15 17:36:18)

Veblen was also said to have a "strange life" – likely a good sign for Tukey.

seth (2010-02-15 17:37:03)

Michael, the broad point of *Freakonomics* – that data is useful, that it can change your mind – is quite useful. Whether this is a low-status point to make I'm not entirely sure but many famous economists have been far less interested in data collection than Levitt.

Socktopi (2010-02-16 03:50:33)

Steven Levitt is a Clark Medalist from the University of Chicago, easily the most influential Economics department in the world. The idea that he is some outsider doing low status work that the rest of the field disdains is nonsense. His prominence in the field is what allows him to study cheating in sumo wrestling and ghetto baby names, instead of unemployment and inflation. That is to say, exactly the kind of esoteric and impractical status signaling work you deplore in every other academic.

M (2010-02-16 04:59:03)

I think this post is great and agree in general. But I'll chime in and agree that Steven Levitt is about as "high status" as you can get within the academic economics community. The Clark Medal is only given out once every two years (as opposed to one Nobel a year). I think one of the reasons that he is high status is because he has used fairly conventional econometric techniques to "colonize" areas not traditionally the realm of economists. (Eg, what would have been considered the realm of sociology.)

seth (2010-02-16 05:25:22)

Socktopi & M, you make a good point that perhaps I should have made. (In an earlier draft, I did.) It's like Nixon and China. That his anti-communist credentials were secure made it easier for him to go to China. Long before Exploratory Data Analysis, John Tukey's very high status was assured. He was a co-inventor of the Fast Fourier Transform, for example. I'm sure he was utterly unconcerned how EDA would affect his perceived status. (As L says, it didn't help. It really did get a scornful reception from some high-status statistics professors.) Likewise with Levitt. Just as you say, Socktopi, Levitt's very high status made it easier for him to do low-status research. I wouldn't call the stuff Levitt studied "esoteric". For the field of economics, they are esoteric topics but for the general public they are common concerns: What to name our baby? for example. You could say that by doing such research, Levitt signaled his extremely high status – just as Tukey did, just as Nixon signalled his extreme anti-communism by going to China. In practice I don't think it works that way. I don't think the motive for the work is signaling. I don't think Nixon went to China to show how incredibly anti-communist he was. Nor did Tukey write EDA to show how incredibly high status he was.

LemmusLemmus (2010-02-16 11:02:28)

Seth, I'm not buying the revised version of the Levitt's-work-as-low-status view either. According to his CV, he got the John Bates Clark Medal in 2003. The papers that went into Freakonomics are (based on Wikipedia's chapter overview, plus memory - i.e., I may have overlooked stuff): Cheating teachers - 2002, QJE, Brookings-Wharton Papers on Urban Affairs Cheating sumo wrestlers - 2002, AER Drug-selling gang's finances - 2000, QJE Abortion and crime - 2001, QJE SES and names - 2004, QJE The established economists that vote for the Bates Clark Medal clearly liked the "low-status" stuff that went into Freakonomics.

seth (2010-02-16 11:16:34)

LemmusLemmus, I'm not saying all economists think alike. Lots of people were glad Nixon went to China. Enough prominent statisticians liked Tukey's emphasis on graphics that the whole area has become more popular. Nor am I saying that Levitt's work was simply low-status. It was also well-done – just as Tukey's work wasn't merely low-status. He also introduced important new ways of making graphs. Disdain for what Levitt has studied has been publically expressed by Heckman, one of his colleagues. But I agree with you to this extent: Levitt had technical skills that made his work on low-status questions more acceptable to his profession. People are far more concerned about their own status than other people's. Professor X, who would never study something low-status, might be quite happy that Levitt did so.

Alex Chernavsky (2010-02-16 12:09:56)

Seth, I'm glad you mentioned psychiatry. I may have posted this link in the past, but here is an excellent book about the psychiatric establishment and how it does more to harm patients than help them: [1]*Mad in America: : Bad Science, Bad Medicine, and the Enduring Mistreatment of the Mentally Ill*, by Robert Whitaker. Whitaker (the author) is also coming out with a new book soon: [2]*Anatomy of an Epidemic: Magic Bullets, Psychiatric Drugs, and the Astonishing Rise of Mental Illness in America*. It should be out in April. I've pre-ordered it. If it's anything like the previous book, it should be excellent.

1. <http://www.amazon.com/Mad-America-Medicine-Enduring-Mistreatment/dp/0738203858>

2. <http://www.amazon.com/Anatomy-Epidemic-Bullets-Psychiatric-Astonishing/dp/0307452417/>

seth (2010-02-16 15:39:57)

Alex, thanks for the links. The new book sounds very promising.

vic (2010-02-16 18:01:48)

Also agree with everything, except the last paragraph. I don't know if Levitt's work is high status or low status, but one thing it's not is economics, nor is it useful, correct, or insightful. It is cute though.

Patrik (2010-02-17 00:32:20)

Seth is 100 % right about the paradox of Levitt. Levitt himself is high-status and that high-status allowed him to low-status type data exploration e.g. baby names, the economics of drug dealers etc etc (I should mention before Levitt, Steven Landsberg and David Friedman were also writing economics books in a similar vein. However, I don't believe they did extensive research into some of these low-status subjects, generally only doing theoretical exploration of these e.g. why does popcorn cost so much in movie theaters? etc etc I know more than a few macro-economists who sniffed (jealously) at Levitt's massive mainstream success, commenting on how "un-serious" and "unimportant" his work was.

1 (2010-02-17 00:46:56)

If psychiatry is so harmful, then what would be helpful for the mentally ill?

M (2010-02-17 02:37:54)

Turning again to the economics profession, a good example of high/low status problem is the gap between economists who work on policy (say in think tanks or government) and academics. Relatively simple analysis of data is essential input for policymakers and top decision-makers. And government is an important part of our economy. So, in this sense, policy economists do very useful work. (I'm not saying they are all good – just that they have an important role.) The majority of the person-hours expended by academic economists has nothing to do with improving policy analysis. We also seem to have a system in the US (and other countries) where some of the very top economist positions in government are filled by those who first made their name as academics. In other words, they had to spend a long time demonstrating their high status to other academics (in not very useful ways) before getting the chance to employ relatively "simple" analysis in the public service.

seth (2010-02-17 09:03:20)

"What would be helpful for the mentally ill?" Helping people with a personal stake – they have the problem, or a loved one has the problem – do research. Helping them publish the results. Shift resources from those whose main goals are status and career advancement to those whose main goal is useful progress.

Michael Metcalf Bishop (2010-02-17 10:54:50)

Great posts by both you and Gelman!

Exploratory vs. Confirmatory Data Analysis « Permutations (2010-02-17 12:28:54)

[...] Exploratory vs. Confirmatory Data Analysis Seth Roberts vs. Andrew Gelman [...]

Overcoming Bias : Function of Stat Academia (2010-02-18 08:22:32)

[...] See the flaw in that argument?Â Right – being useful to other academics in trying to impress each other isn't at all the same as being useful to the wider world.Â Now consider a recent exchange between Seth Roberts and Andrew Gelman (who I debated on this topic in July.)Â Seth: [...]

1 (2010-02-18 22:09:09)

Seth, I've never heard you talk about this before. This idea is big. I was wondering if you could go into more detail on your blog, if you have time.

1 (2010-02-20 10:46:02)

Yesterday, I spoke with an economics professor at Cal about this blog entry and he agreed with Seth's view of Freakonomics.

seth (2010-02-20 18:32:57)

that's interesting, I, what did the economics professor say?

1 (2010-02-20 20:21:21)

Seth, the economics professor said that he agrees that Freakonomics is low- status research. He said, "But I would use the word 'popular [instead of low-status]' " and "it's not real economics research." I am in contact with a lot of professors at Cal everyday and I enjoy speaking with them about your blog entries!

1 (2010-02-20 20:39:01)

Seth, I just looked up the professor online, he is the chair of the department! I didn't know that when I was talking to him, now I know.

seth (2010-02-20 21:03:57)

yes, to many professors popular = not good. For example, "pop psychology".

Robert Reis (2010-02-24 21:00:54)

I am a retired, overweight, insulin dependant diabetic with severe peripheral neuropathy. I recently bought a preparation at a vitamin store that claimed to burn off body fat. It didn't. But it did produce an immediate and dramatic improvement in the feeling in my feet. It is called Lipo 6 by Nutrex.

### **North Korea and Penn State (2010-02-18 07:26)**

In an excellent talk last week about North Korea – linked to his book [1]The Cleanest Race – Brian Myers, a professor in South Korea, said that people don't fear dying, they fear dying without significance. Without their life having meant

something. Life in North Korea is far more attractive than Americans realize, he said. The border between North Korea and China is easy to cross, and about half of the North Koreans who go to China later return, in spite of North Korea's poverty. How does the North Korean government do such a good job under such difficult circumstances? Partly by playing up external threats (U.S. troops in South Korea), the obvious way politicians win support, but also by telling the North Korean people they are special. Maybe it plays this card because it has to – they can't afford a police state – but there is no denying how well it works. In contrast, Myers said, the South Korean government offers its citizens no more than consumerism. That doesn't work well, and South Korea, in spite of high per capita income, has high rates of depression and suicide.

I think the attractiveness of North Korean life has a lot to do with why Penn State students like Penn State so much. This American Life did [2]a show about Penn State a few months ago. Life at the nation's top party school said the description. Sounds boring, I thought, so I waited to listen to it until I'd run out of stuff to listen to. It turned out to be one of their best shows ever. Mostly it's about the large amount of drinking – this is why they did the show – but at the very end is a short segment about how much Penn State students love their school. Not much detail but I was convinced. The attractive school cheer ("We Are Penn State") comes up in conversation! A few people reading this won't know that Penn State has an extremely successful football team. A large fraction of the students attend its games. After graduation, a lot of them continue to attend the games.

Here is a powerful and neglected force in human life. The bland technical term is group identity.Â As the South Korea comparison indicates, governments don't routinely use it to govern. As Penn State exceptionalism indicates, colleges don't routinely use it either. Faculty routinely disparage football. [3]Beer and Circus: How Big-Time College Sports Has Crippled Undergraduate Education was written by a professor – of course. The Penn State chancellor seemed mystified that his students were so proud and supportive of their school. (They're just that way, he seemed to say.) A lot of my self-experimentation has been about discovering what we need to be healthy, such as morning faces. I can't self-experiment about this but I would if I could. It's yet another thing that people must have routinely gotten in Stone-Age life but don't get any more – unless you happen to be a rabid sports fan or an alumnus of a college with a sufficiently successful football team. Or live in North Korea.

Anonymous (2010-02-18 08:08:43)

I found something similar in the reactions to the MTV show The Jersey Shore. Our country's "faculty" (i.e. the media, ivy league graduates that I know, Manhattan tastemakers) disparaged the guido subculture depicted on the show and continue to do so: on the talk show Ellen the show's stars were subjected to trivia questions they couldn't answer to show how stupid they are; on other shows they were "treated" to makeovers, etc. Somehow people seem to think guidos need to be rescued from being guidos. Meanwhile, the guidos themselves are (of course) proud to be guidos! I think a lot of people told themselves they watched that show in order to make fun of it, but I suspect many of them were jealous of the obvious pride and joy on display.

Eric Arias (2010-02-18 09:11:33)

My wife and I sometimes do a little cheer just for the 2 of us where we say "1, 2, 3, supercouple!" I started as goofiness and now when we do it we really do do it at moments where we feel great about who we are and have faith in our ability to contribute

something worthwhile. We do it irregularly, but after reading this I may try to do it more often. It's an easy way to get a lift. Even now I feel good just thinking about it.

seth (2010-02-18 09:26:55)

Anonymous, that's a good example. Eric Arias, I too feel I have something to learn from this. That I should spend a lot more time telling my students they are special. And not just saying it, but also encouraging it and giving persuasive reasons.

bjk (2010-02-18 09:59:51)

In some sales organizations the salespeople are measured by the team and not by individual production . . . which makes peer pressure a very valuable motivator. I would imagine that working for the team is also more rewarding than working for yourself. Or not, depending on the team.

peter (2010-02-18 11:34:01)

people have a tendency to adapt to all sorts of bizarre and harsh environments, which is exactly what the North Koreans apparently have done. It's difficult to imagine that period mass starvation is attractive; In fact it sounds nutty to me. Reaching for meaning in one's life usually follows satisfying basic and other needs, aka as survival and minimum comfort.

Hal (2010-02-18 12:00:22)

Maybe North Korea then is like a country-sized version of Penn State. Everyone feels special and unique, proud to be part of their collective. But at the same time, this does not translate into motivation to work hard and excel. At Penn State the students party; perhaps in North Korea the people avoid work as much as possible. That would explain the starvation. We need a social system which combines the group pride and solidarity of these examples with some way of motivating people to work hard so that there is plenty of production and people's needs are met. Sounds like neither western consumerism nor the Korean or communist models have managed to achieve that.

Paul (2010-02-18 13:29:02)

I'm surprised at the naivete of this post. Human beings have many moral emotions; Jonathan Haidt has classified them into two broad groups, which one might call individualist and collectivist. All people have these moral emotions or intuitions, but for some people collectivist moral instincts are stronger and for others the individualist ones are stronger. The individualist moral sentiments are a concern for justice and fairness, and a concern for the well being and suffering of others. The collectivist moral sentiments are a concern with purity/holiness/defilement, deference to authority and submission and support of hierarchy, and in-group loyalty. These same collectivist moral sentiments which give meaning to North Koreans are the same psychological underpinnings of false scientific consensus and the gatekeeper syndrome. I'm surprised that other commenters haven't pointed out the trade offs that come with such a meaningful life yet.

seth (2010-02-18 18:36:40)

Paul, thanks for the reference to Haidt's work, which I didn't know about. The correlations are interesting. The correlation with purity/cleanliness fits the North Korean case but not the Penn State case (or any football-loving-alumni case). Penn State students don't think they are unusually clean. Nor do they seem especially hierarchy-oriented or authoritarian. With all their drinking and partying, they seem less authority-obeying than the average student, not more. I don't see the trade-offs you do. What harm is done by how much Penn State students love their school?

Dennis Mangan (2010-02-18 19:00:36)

"The border between North Korea and China is easy to cross, and about half of the North Koreans who go to China later return, in spite of North Korea's poverty." On the other hand, half of them never come back.

Nathan Myers (2010-02-18 19:57:35)

"What harm is done by how much Penn State students love their school? " Maybe they could be getting them some education somewhere else.

Bryan (2010-02-18 20:32:22)

»And not just saying it, but also encouraging it and giving persuasive reasons. This seems to be the key. Going to California public schools in the 80s and early 90s, I was subject to my fair share of self-esteem programs, the essential message of which is "You are special". I can't say me or my classmates were positively impacted.

seth (2010-02-18 20:55:30)

Bryan, that's a good point. I think group membership is required for this special mechanism to kick in. You have to convince people they are part of a special group. Telling someone they are special (by themselves) doesn't work. Perhaps the more special you think you are the LESS this works because the less you feel like joining your inferiors in some big group.

1 (2010-02-18 22:35:46)

At UC Berkeley, I've always asked students why they didn't go to a different school they live near. So far, they have always said something like, "Because Berkeley is better." A professor at Cal told me that he works so hard on papers. I said, "Why?" He said, "That's why Berkeley is the best!" So people at Berkeley feel special, too! I guess because of the prestige of the school. I didn't realize it was prestigious around the world until foreign summer school students told me. Today, I asked a former Tsinghua student why Tsinghua accepts a small percentage of students. He said, "There's a lot of people in China!"

David (2010-02-19 06:46:11)

It's not just the students, it's the entire community. I grew up in the shadows of the University of Illinois, where people walk around in orange clothing as if it's normal. A few years ago the basketball team won thirty+ games in a row and my father basically said it was the best year of his life. Everyone around town was in a good mood, looking forward to the games, etc... Perhaps you can start going to Raider games?

Cyan (2010-02-19 07:38:32)

Is a rate of emigrant return of 50 % higher than expected? I think that before we can say what NK's rate of emigrant return is evidence for, it has to be compared to other rates of emigrant return in an analysis that takes important covariates into account.

seth (2010-02-19 07:54:01)

David, the dark side of what I'm saying is that perhaps this sort of group identity can develop only in situations where there are winners and losers – meaning that people who belong to the losing side aren't happy. I hope not. I'd like to think it can develop around excellence of any sort. Or even something less than excellence, such as competence. As for Raiders games, I used to be a 49ers fan. Watched every game (at home). I enjoyed the games a lot but it didn't give my life meaning.

prase (2010-02-19 09:33:25)

The rate of return may not be a good indicator of how well a government is doing its job. Imagine two countries A and K. 10 % of citizens of both these countries would prefer to live somewhere else. In country A, the government doesn't care a bit about emigration (if government exists in that country at all). The country is mainly producer of agricultural goods, with minimal international trade. Nearest country with substantially better living conditions, country X, is 3000 km away. In country K, the government is afraid of all its citizens emigrating, and tries to make it as difficult as possible, by issuing passports only to loyal people, for instance. Emigration is portrayed as treason. X is a neighbour country. Now, in country A (African type) there is no need for people to travel abroad, except emigration. Business travelers are rare, since there are almost no businesses owned by A's citizens, and to travel 3000 km for pleasure is out of reach for almost all of A's inhabitants. Therefore, meeting A's citizen in X, we can expect that he is an emigrant with 99 % probability, and the return rate would be in order of 1 %. In country K (Korean type) the people who can travel abroad are workers of government organisations sent on business trips, people from border areas coming to X to do some private business (if there are private businesses in K) and the K's elite on vacations. Now, meeting K's citizen in X, the probability that he is an emigrant is much lower. So we have expected high return rate for A and low for K, whereas the average desire to emigrate can be the same. If one compares North Korea to African

countries (which I assume you've done actually), one could be surprised that not all travellers are emigrants. If one compares it to East European communist regimes (which I have done implicitly when reading the post), one can conclude that if half of the travellers never return, certainly even much of the loyal supporters of the regime betray it when they have an opportunity - and there would be nothing to explain by group identity. To make sensible analysis, we should take into account rather the ratio of emigration to overall population. Of course, such analysis would be distorted due to different difficulty of emigration from different countries. The return rate seems to overcome this distortion, but it probably brings at least as big own problems. (this is an edited version of a comment I've made here: [http://lesswrong.com/lw/1s4/open\\_thread\\_february\\_2010\\_part\\_2/1n3q](http://lesswrong.com/lw/1s4/open_thread_february_2010_part_2/1n3q))

Tom in TX (2010-02-19 09:50:25)

How did Brian Myers find out how pleased the North Koreans are with their lives?

seth (2010-02-19 14:39:15)

Tom, that's a good question, which his talk didn't completely answer. But he showed a comparison of the Berlin Wall (heavily enforced) with the wall separating North Korea and China (practically nothing). I think his conclusion was also based on visits to North Korea.

Tom in TX (2010-02-19 19:14:33)

Seth, I would be suspicious about info based on visits to N Korea. If a foreigner visits, he is accompanied by a government escort. If you were a N Korean citizen, you would not want to be the person who said something negative about life in N Korea in front of that government official. I have read that China does not like N Koreans sneaking into their country. They send them back. So maybe the half who return are just the ones who got caught. 8-(

seth (2010-02-19 19:32:15)

Tom, of course government escorts reduce how much one can learn from a visit to North Korea. Sure, residents aren't negative in front of them. That doesn't mean there isn't plenty to be learned. Letters of recommendation are never negative but I learn lots from them. You'll have to look at his book to learn more about the basis of his conclusion. That North Koreans are happier than you'd think was only one of several points he made.

vic (2010-02-19 19:39:20)

I went to penn state. The amount of partying there is no different than at any other large state university. Many many students rarely party. And while many students love the school, many are indifferent or dislike it. I doubt it's much different than for most other schools. Don't believe everything you hear at NPR.

Eric Arias (2010-02-20 09:43:41)

Another thought: I just noticed this effect on Ben Casnocha's blog when he brought up Cal Newport referring to readers of his blog as freakishly intelligent. I know you read Ben so I won't go into it but after I read that bit I did feel more encouraged to think over the post's content more than I otherwise would have.

seth (2010-02-20 09:59:09)

Vic, have you been to any other colleges? The This American Life report made Penn State sound different than any of the colleges I've had experience with. And quite apart from whether Penn State is much different from other schools, the whole phenomenon of alumni attending football games for decades suggests something powerful is at work. The alumni are incredibly protective of this thing they do; it must mean a lot to them. I've been to some of those games. I don't think it's because college football is incredibly fun to watch; it surely has something to do with group identity.

## Dealing With Referee Reports: What I've Learned (2010-02-19 07:31)

[1]Alex Tabarrok discusses a proposal to make referee reports and associated material publicly available. I think it would be a good thing because it would make writing a self-serving review (e.g., a retaliatory review) more dangerous. If Reviewer X writes an unreasonable review, the author is likely to complain to the editor. If the paper gets published, the unreasonableness will be highlighted – and nominal anonymity may not be enough to hide who wrote it. On the other side, as a reader, it would be extremely educational. You could learn a lot from studying these reports and the replies they generated, especially if you're a grad student. I would like to know why some papers got accepted. For example, [2]my Tsinghua students pointed out serious flaws in published papers. Were the problems noted by reviewers and ignored, or what?

My experience is that about 80 % of reviews are reasonable. Many of those are ignorant, but that's no crime. (A lot of reviewers know more than me.) The remaining 20 % seem to go off the rails somehow. For example, Hal Pashler and I wrote [3]a paper criticizing the use of good fits to support quantitative models. The first two reviewers seemed to have been people who did just that. Their reviews were ridiculous. Apparently they thought the paper shouldn't be published because it might call their work into question. A few reviews have appeared to be retaliation. In the 1990s, I complained to the Office of Research Integrity that a certain set of papers appeared to contain made-up data. (ORI sent the case to the institution where the research was done. A committee to investigate did the shallowest possible review and decided I was wrong. I learned my lesson – don't trust ORI – which I applied to [4]the Chandra case.) After that allegation, I got stunningly unfair reviews from time to time, presumably from the people I accused. A small fraction of reviews (5 %?) are so lazy they're worthless. One reviewer of [5]my long self-experimentation paper said it shouldn't be published because it wasn't science. The author (me) should go do some real science.

The main things I've learned about how to respond are: 1. When resubmitting the paper (revised in light of the reviews), go over every objection and how it was dealt with or why it was ignored. Making such a list isn't very hard, it makes ignoring a criticism much easier (because you are explicit about it), and editors like it. This has become common. 2. When a review is unreasonable, complain. The theory-testing paper I wrote with Hal is one of my favorite papers and it wouldn't have been published where it was if we hadn't complained. [6]Another paper of mine said that some data failed a chi-square test many times – suggesting that something was wrong. One of the reviewers seemed to not understand what a chi-square test was. I complained and got a new reviewer.

I'm curious: What have you learned about responding to reviewers?

---

epistemocrat (2010-02-19 08:25:34)

Hi Seth, When Aaron and I presented our clinical poster – "The Role of Nutrition in the Epigenetics of Health: a Patient-Driven Approach – at UCLA a few weeks back and listed our two individual e-patient self-experimentation cases as content, one academic looked over our poster and then told me, "This is not science. There's no real science here. This is just two cases." Clinical medicine is founded on the patient narrative, the study of individual patient cases. Somehow this spirit has not translated into the empirical side of medical inquiry. Clinicians engaged with patients in self-experimentation, I suspect, is one practical way to fill that gap. Best, Brent

Cyan (2010-02-19 08:59:22)

A discussion of some of your non-mainstream theories (e.g., fermented foods, Shangri-La diet) viewed through the lens of that paper might make a good blog post or series of posts.

seth (2010-02-19 09:03:57)

"Viewed through the lens of that paper"? I'm not sure what you mean. The Shangri-La Diet derives from Example 10 of that paper. My interest in fermented foods derives partly from Examples 1-5 of that paper, which suggested that modern life lacks lots of stuff we need to be healthy.

Cyan (2010-02-19 09:40:59)

Sorry, that was dumb: there's more than one paper linked in the post, and I didn't specify which one! Yeesh. I meant the paper criticizing the use of good fits to support quantitative models. As I recall, it doesn't just criticize, it sets out guidelines for what ought to count as good support. That's the lense I meant.

seth (2010-02-19 09:51:55)

Cyan, now I understand. Yeah, that's an intriguing idea, I'll think about it.

Jim N. (2010-02-19 15:12:46)

This kind of reminds me of how you often learn a lot about an issue from the Wikipedia "discuss" page that you don't get in the main article. I think bringing some of the approaches used in formal debate to academic squabbling could only benefit mankind.

Scot (2010-02-20 07:24:44)

A few years back, a retiring editor of a journal wrote in his goodbye letter that the most enjoyable thing to him while he was editor, and what he would miss the most, were the comments that the reviewers gave to him, the ones not to be shared with the authors. I once worked on a paper as a coauthor down on the list that took six rounds of revisions and objections by mainly one reviewer. The lead author on the paper, who had written a lot in the area, knew who the dissenting reviewer was, just by how s/he wrote. I often wondered what the editor thought about letting it go on that long.

Scot (2010-02-20 07:29:32)

One last story. I found a brief article on review etiquette and courtesy written by a famous psychologist a lot of years ago, read it, and found it very inspiring and helpful. I mentioned it to my advisor, describing to him how good an essay it was. He told me that 15 years prior to that he had received a review from that same individual that was the rudest one he'd ever received.

Barkley Rosser (2010-02-22 12:29:49)

Seth, In my comments on MR I noted that the most intense complaints about reports resemble yours, about bad reports that lead to a paper being rejected. These will not be revealed by publishing the reports of papers that are accepted. Your Xinhua students may have found errors in published papers (in which case there is an opportunity to write a publishable comment), but do not expect editors under such a system to publish papers with reports whose critical comments have not yet been responded to. I argued that such a setup will make it less likely that editors will do the brave thing and publish papers that have outstanding critical comments in any report. Some of the most cited papers I have published in JEBO have had exactly that sort of situation, reports from referees or even associate editors opposing publication. Maybe publishing these would be interesting, but most editors are chicken shits who would not publish such papers so as to avoid any embarrassment on their part. This proposal would only lead to more mediocrity than we already see in published journal articles.

Barkley Rosser (2010-02-22 12:51:45)

BTW, allow me to modify my remarks a bit. I do not think that "most" editors are "c.....n s....s." However, enough are that the system you support would on net tend to have the effect I warn of, that we would see more mediocrity and less innovation in published journal articles.

seth (2010-02-22 18:23:35)

Barkley, I see your point. That makes sense. But I wonder if it would be like cameras on reality shows: After a while the contestants forget about them. Or at least that is my impression, given how much the contestants embarrass themselves. And perhaps the possibility that their comments might become public would lead to better behavior by editors.

Barkley Rosser (2010-02-23 09:54:58)

Seth, Again, the worst behavior by referees is when they are recommending rejections or are simply sitting on papers. This stuff will not get revealed by publishing reports for accepted papers, generally speaking, unless the editor has overruled them or the author has kowtowed to ridiculous demands ("cite me, me, me, me...!"). Nobody is going to publish unpublished papers to show the comments on them, nobody.

## **Widespread Loneliness (2010-02-20 18:19)**

I'm fond of arguing that the Ten Commandments was a very political document. Notice it's aimed at men? Notice that women aren't protected, much less children? That's because men had all the power. No one has said they already knew this or that I was wrong.

I thought of the Ten Commandments when a friend from Amsterdam wrote me about a recent experience of hers:

A very old man asked me to come to his apartment, and he would donate a bike to the project.Â I went over to get it, and it was half a bike, and it was locked to a pole...had obviously been there for years.Â The temperature was well below zero. Â It became clear that he was in fact super-lonely, and torn between usual Dutch suspicion of strangers... and desperation for human contact. Â He finally pleaded with me to come up to his apartment (where he obviously lived alone) but not before we spent 15 minutes trying to saw that rusty old bike loose, with his World War II-vintage hacksaw with missing teeth.

You may know that Dutch people are the tallest in the world, reflecting a very high standard of living. But – if this old man is not unusual – alleviating the loneliness of old people isn't part of the Dutch social contract, admirable as it may be.

I recently watched the Frontline program [1]Sick Around the World. It suggested that that old man isn't unusual. In England, where doctor visits are free, a doctor said he has several patients who come weekly, purely because they're lonely. In Japan, some patients have their blood pressure measured very often – presumably for the same reason. In Taiwan, if you see a doctor 20 times in one month someone from the government will come to talk to you. Not about loneliness – about overuse of medical care. The Frontline program made nothing of any of these facts, which were included to show that access was easy. That's not all they show. What if the British doctor had said that several patients visit him often because they need water? Then we'd be shocked. Yet the idea that everyone needs human contact isn't mysterious or controversial.

My explanation is there's a double whammy: Not only do lonely old people have little power, it's also clear that their problem (loneliness) isn't caused by a "chemical imbalance". So no drugs can be sold to treat it. And there's no diagnostic category. It's another example of [2]gatekeeper syndrome. When these lonely old people exert what little power they have by visiting their doctor, the doctor – I'm assuming – doesn't do anything to get rid of the loneliness. Even if you visit 20 times in a month.

1. <http://www.pbs.org/wgbh/pages/frontline/sickaroundtheworld/>

2. <http://www.blog.sethroberts.net/2009/11/17/gatekeeper-syndrome/>

---

KenF (2010-02-20 19:21:22)

Your point is that the ten commandments require us to honor our father and mother, and if people followed this commandment, most old people would not feel the loneliness you describe?

Sam (2010-02-20 21:18:32)

I'm fond of the Dutch, but when you say that "alleviating the loneliness of old people isn't part of the Dutch social contract, admirable as it may be," you're putting it mildly. Have you seen that the Dutch state (which now leads the world in the proportion of the elderly who die from some sort of euthanizing) is now considering the provision of medical euthanasia to anyone 70 years old or older who expresses the thought that he or she is tired of living? I guess that's at the very least a way of discouraging elderly Nederlanders from over-indulging in doctor's visits! I'm not sure what the connection is to the 10 commandments and the male sex - but surely the 10 commandments are directed at 10 commonly-committed faults, such as adultery and not entertaining one's parents. But in a world where the old are older than they've ever been, where everyone has some sort of old age pension, and where more people are childless by choice or by force (as in China), this is one of those sad "diseases of affluence" that is going to become more common. Except in the Netherlands, of course.

Comment\_Whatever (2010-02-20 21:22:58)

When the ten commandments said "Thou shalt not kill" that was sexist how? What about the commandment to not worship false gods? Sexist how? Keeping the Lord's day holy? Sexist how? "Thou shalt not covet thy neighbor's goods. " is DEFINITELY going to pose a problem for the chics, but then again. "Thou shalt not covet thy neighbor's wife. " is DEFINITELY going to be a problem for men. So really, I've just gone through five out of ten, and I'm failing to see your point. Maybe "Thou shalt not take the name of the Lord thy God in vain. "? Or "I am the Lord thy God and thou shalt not have any strange gods before me. "? No..... not really there either. Maybe you could explain where in the last three is the proof positive of sexism..... even by your standards.

seth (2010-02-20 23:17:40)

The Ten Commandments are all about protecting men from other men – e.g., "thou shalt not covet thy neighbor's wife." Men owned stuff. Men were killed by other men. (I'm assuming more men were killed than women or children. Revenge killings usually involve men being killed – I believe that's what this is about.) Note the absence of: Thou shall not beat your wife. Thou shall not rape. Thou shall not beat your children. The religious stuff is merely what Moses wants. The commandments contain some of what men want (protection against more powerful men), some of what Moses wants. As in any deal, both sides get something.

thehova (2010-02-21 00:56:44)

It's a really difficult situation. My grandmother was a widow and was extremely lonely. Most of her friends had either passed away or moved. My family encouraged her to move to a retirement home in Florida to be around more people. Reluctantly she did and she was miserable and moved back to her previous home. You can't just pressure senior citizens to live together and expect them to make deep friendships and overcome their loneliness. It has to be organic. Probably the best situation for a widow is for them to move into one of their children's homes. But in our modern society, there are many legitimate obstacles to making that work.

Jason (2010-02-21 06:00:27)

re: Comment \_Whatever, On sexism, remember the full wording: "You shall not covet your neighbor's house; you shall not covet your neighbor's wife, or male or female slave, or ox, or donkey, or anything that belongs to your neighbor." It is not about adultery per se! It lists the possessions in descending order of property value: don't covet anything belonging to your neighbor, like his wife. And so saying the commandment not to covet possessions is a problem for women is sexist on your part (an offensive stereotype about women) and misses the context of the commandment which is clearly directed at property-owning men. One can see the same things in the laws in the Bible on fines for crimes like rape—in which virgins and married women have steeper fines than women who are not "owned" by a man. The problem of rape is treated as a property-loss for the male-owner of the woman in the Bible!

david (2010-02-21 06:40:11)

Seth, This post reminded me of the section on age discrimination in the original Freakonomics (where the only kind of discrimination they find in "The Weakest Link" is age discrimination). David

seth (2010-02-21 07:21:22)

Kenf, I thought of the Ten Commandments because to me it is an example of how people without power are ignored. Lonely old people have very little power so their problem – loneliness – is ignored. That's the connection.

dilys (2010-02-21 09:13:18)

A troubling and increasingly relevant topic. I'm thinking of recent discussions of "power," distinguishing domination power and prestige power. Whereas young lonely people have at least fantasies of both, and of the future bringing improvement, old people have neither, unless they are wealthy, well-connected, surrounded by loyal clan. And of course people's willingness to associate with others seems inversely proportionate to the other's prestige. In a restaurant where I worked, the older PR person (me) had to be careful not to sit at a table with the waiters in meetings, because my 50+ age was a contact "Cool Killer." I think there has been a shift with television-and-internet saturation to an image-obsessed society (perceptually and emotionally). Whereas befriending or including an old person used to have some moral prestige, now in many circles it is image suicide. I think we need, quite practically, to self-experiment on loneliness, rather like Seth's work on faces in the morning to alleviate depression. Certainly forced contact like churches or retirement homes, well, just shoot me now (please don't). IMO, the Ten Commandments is about inner and outer order and the moral infrastructure for an ultimately happy and productive life. Of course it was directed to men, whose agency was much greater than women's at that time. Doesn't keep me from noticing I'm much happier when I don't envy/covet, though it's put in male terms in the text. Even though I wouldn't want a donkey, and servants, who can find servants anyhow?

seth (2010-02-21 09:35:21)

I think a blend of ChatRoulette and internet forums and chat rooms would do a lot to reduce loneliness – you could go online and chat (with audio & maybe visual) with people about common interests. I think hearing voices is important for reducing loneliness.

Alexandra Carmichael (2010-02-21 10:30:29)

This reminds me of the article I just read about loneliness as a "socially transmitted disease" - spreading in social circles like obesity and happiness. <http://expertvoices.ndsl.org/cornell-info204/2010/02/20/loneliness-a-socially-transmitted-disease/>

1 (2010-02-21 11:45:05)

Many MDs have told me that some of their schizophrenic patients enjoy hearing voices in their head so much that they (the patients) didn't want to increase their antipsychotic medication to reduce the voices.

Nile (2010-02-21 14:23:51)

So much to say on this - I once did an hour radio show on loneliness. Let me leave it at this. Loneliness is VERY simple to cure. How? Introduce your self to as many people as you can. As you introduce yourself ask their name. Remember their name. You may have to write it down if you see the other person infrequently. Next time you see them use their name and ask about them. In time, less than a year, you will have many acquaintances, quite a few casual friends, some friends and a few best friends and you won't be lonely any more. It really is that simple. Schools should teach this, doctors should teach this.

MC (2010-02-22 03:30:25)

Makes sense to me. This explains why many old people, like my grandmother (who is a widow and lives alone) typically try to engage in random interactions several times a day: she'll chat with the doctor, the people in the waiting room at the doctor's, random people on the bus, random people in the park, at the store, etc., much to my parent's amazement and anger ("you can't go chatting up strangers like that! they can't possibly be interested in what you have to say! And it's creepy!" etc etc.).

Edgar M. (2010-02-22 05:31:33)

Seth's post reminds me of a time in the mid-1990s when I became quite depressed. I went to a psychiatrist, who prescribed an antidepressant drug to treat my chemical imbalance. When that drug didn't work, we tried a series of other drugs, sometimes in combination, none of which really worked, either. (Incidentally, the drugs caused a rapid and quite dramatic weight gain, most of which has stayed with me to this day.) During that time, I was living alone in a new city and had few friends. I was working at a job that was quite inappropriate for me. My sleep habits were terrible (I'd stay up late at night watching sit-com reruns), I didn't exercise, my finances were a mess, and I ate a lot of junk food. The psychiatrist didn't address any of these issues, at least not in any substantial way. To do so would be to engage in low-status work, using Seth's paradigm. Looking at this situation in retrospect, I think what I *really* needed was some sort of life coach who would offer practical help instead of hokey "chemical imbalance" theories.

justin (2010-02-22 07:36:08)

I think there's another angle at play here, which is that living by yourself tends to afford an individual total control over their environment with zero feedback. This control can allow an individual to cater to neurotic behaviors without consequence. Allowed to continue for long periods of time, it becomes harder for individuals to interact with other people not only because doing so means losing control, but also because the behaviors they've been doing alone may be come off neurotic to others, and thus be off putting. Assuming I'm anywhere near the mark here, solitude can beget solitude in a sort of downward spiral. The cure is, of course, interacting with people, but it can be hard to do if someone's been alone for long enough. This is where having family can save the day – they have to put up with the loner. And if they stick to it, maybe they can help mitigate his/her neurotic behaviors. Spouses work in this regard, too. All of this is (in my view) tied into self-experimentation. We all make little experiments to try and control our environment – an environment typically populated by other individuals doing the same thing. When these experiments work, they are reinforced and we use them further. For a loner, it's a lot more likely that odd-ball experiments are conducted that work for lack of accurate feedback mechanisms (other people saying – NO you can't walk around with your hand constantly scratching your butt ... bad example, but you can think of more).

seth (2010-02-22 09:04:15)

yeah, I think there's something to your downward spiral idea. I've been thinking along similar lines and I'll blog about it soon.

sr2323 (2010-02-23 08:01:24)

The 10 commandments ultimately protect women. If a woman commits adultery, then the man doesn't know the paternity of her children, so he has no reason to protect or provide for her or her children. Not being murdered is nice too.

G (2010-07-15 19:02:36)

Old folk should be directed to voluntary programmes where they can help and be helped.

## The Hollywood Economist (2010-02-21 13:12)

Edward Jay Epstein, [1]a wonderful journalist, has just published [2]The Hollywood Economist. I asked the publisher for a free copy. About two-thirds I'd already seen, mostly in Slate. The back cover says "Freakonomics meets Hollywood saga" but I'd say "Spy meets The New Yorker" – not that many people would understand "Spy". It has a Spy-ish "here's how things really are" aspect but with fewer embarrassing stories. And it has a New-Yorker-ish broad and deep view. (Epstein has often written for The New Yorker.) Like both Spy and The New Yorker it is very well-written. Although I've visited [3]his website many times, I didn't know about The Assassination Chronicles: Inquest, Counterplot, and Legend (three books combined) nor Who Owns the Corporation: Management vs. Shareholders (69 pages). He's currently writing a book about the 9-11 commission. From his profile: "I taught political science at MIT and UCLA for three years but then decided that researching and writing books was a far more educational enterprise."

### **The Twilight of Expertise (by-the-book professors) (2010-02-22 10:54)**

Imagine if, to get the news, you had to go somewhere and have it read to you! What a joke. From [1]an article in the Washington Monthly about on-line education:

If Solvig needed any further proof that her online education was the real deal, she found it when her daughter came home from a local community college one day, complaining about her math course. When Solvig looked at the course materials, she realized that her daughter was using exactly the same learning modules that she was using at StraighterLine . . . The only difference was that her daughter was paying a lot more for them, and could only take them on the college's schedule. And while she had a professor, he wasn't doing much teaching. "He just stands there," Solvig's daughter said.

The excellent article misses something big, however:

A lot of silly, too-expensive things "vainglorious building projects, money-sucking sports programs, tenured professors who contribute little in the way of teaching or research" will fade from memory, and [2]won't be missed.

Via [3]Aretae.

david (2010-02-22 11:55:28)

Don't forget Veblen though. The very expense and lack-of-added-value of an education at a traditional university is part of its utility as a class marker. With large lectures at big state schools, you already have the lack of interaction of distance learning with the inconvenience and expense of a traditional university.

Stewart Canby (2010-03-07 01:17:45)

Not to detract from your larger point, but StraighterLine (and several others like it) have a really weak set of course offerings. David's point (above) is spot on. We need (?) those class markers in order to establish those stratification layers that keep the unwashed where they belong. Our system of education and credentialing is one of the most powerful ways in which we determine these class markers.

seth (2010-03-07 07:34:33)

Stewart, I'm not sure who "we" is in your statement "we need those class markers." In certain situations I'm sure you're right. I'm told that certain employers use what school you attended as a big part of the hiring process. And lawyers, I'm told, use the law school you attended to determine your status.

### **Boring + Boring = Pleasant!?** (2010-02-23 07:42)

Fact 1: For the last few weeks, I've been studying Chinese using a flashcard program called [1]Anki. It's an excellent program but boring. I've never liked studying – maybe no one does. Fact 2: I've had a treadmill for a very long time. Walking on a treadmill is boring so I always combine it with something pleasant – like watching American Idol. That makes it bearable. I don't think listening to music would be enough.

Two days ago I discovered something that stunned me: Using Anki WHILE walking on my treadmill was enjoyable. I easily did it for an hour and the next day (yesterday) did it for an hour again. The time goes by quickly. Two boring activities, done together, became pleasant. Anki alone I can do maybe ten minutes. Treadmill alone I can do only a few minutes before I want to stop. In both cases I'd have to be pushed to do it at all. Yet the combination I want to do; 60 minutes feels like a good length of time.

I've noticed several related things: 1. I could easily study flashcards while walking. This was less mysterious because I coded walking as pleasant. 2. I can't bear to watch TV sitting down. Walking on a treadmill makes it bearable. This didn't puzzle me because I coded TV watching as pleasant and sitting as unpleasant (although I sit by choice while doing many other things). 3. I have Pimsler Chinese lessons (audio). I can painlessly listen to them while walking. While stationary (sitting or standing), it's hard to listen to them. 4. When writing (during which I sit), it's very effective to work for 40 minutes and then walk on my treadmill watching something enjoyable for 20 minutes. I can repeat that cycle many times. 5. [2]Allen Neuringer found he was better at memorization while moving than while stationary. 6. There's some sort of movement/thinking connection – we move our arms when we talk, we may like to walk while we talk, maybe walking makes it easier to think, and so on.

You could say that walking causes a "thirst" for learning or learning causes a "thirst" for walking. Except that the "thirst" is so hidden I discovered it only by accident. Whereas actual thirst is obvious. The usual idea is that what's pleasant shows what's good for us – e.g., water is pleasant when we are thirsty. Yet if walking is good for us – a common idea – why isn't it pleasant all by itself? And if Anki is good for us, why isn't it pleasant all by itself? The Anki/treadmill

symmetry is odd because lots of people think we need exercise to be healthy but I've never heard someone say we need to study to be healthy.

The evolutionary reason for this might be to push people to walk in new places (which provide something to learn) rather than old places (which don't). To push them to explore. [3]David Owen noticed it was much more fun for both him and his small daughter to walk in the city than in the country. He was surprised. When I drive somewhere, and am not listening to a book or something, I prefer a new route over a familiar one. If I am listening to a book I prefer the familiar route because it makes it easier to understand the book.

Maybe the practical lesson is that we enjoy learning dry stuff when walking but not when stationary. Pity the 99.9 % of students who study stationary. Ideally you'd listen to a lecture while walking somewhere, perhaps around a track. Now and then I've interviewed people while walking; it worked much better than the usual interview format (seated). The old reason was I disliked sitting. Now I have a better reason.

q (2010-02-23 08:07:51)

i've always studied while walking. it's one of the reasons i studied math. i could memorize some stuff without a lot of understanding and then think about it while walking for a few hours until i understood it.

marmolillo (2010-02-23 08:20:20)

[http://en.wikipedia.org/wiki/Peripatetic\\_school](http://en.wikipedia.org/wiki/Peripatetic_school)

M (2010-02-23 08:56:01)

I've been using Anki for Chinese for about a year now. I sometimes do it standing up, which is good. I don't have the technology to use it walking - an iphone might help in that regard. One problem is that I often annotate the cards as I review them which would be hard when walking. One way to spice up your Chinese Anki decks is to use subs2srs - a program that allows you to chop up (Chinese) movies into flashcards!

bjk (2010-02-23 09:26:16)

When I'm reading on a bus or on a train, I have no problem zipping through my book. Sitting down and reading I want to get up and walk. When I was in grad school I thought about getting on the train in the morning and just riding to the end of the line and back to get some work done . . . never did it, though.

Douglas Clegg (2010-02-23 09:32:08)

Seth, I find that I read via my iPhone - novels, primarily, but some nonfiction - while on the elliptical trainer, bicycle or treadmill. I also have a set up at home with a treadmill and exercise bike where I can put my laptop in front of me and surf and write, as well. I am, in fact, writing this note while on the exercise bike. I do it primarily because - as you mention - it makes something enjoyable that I might avoid otherwise (for me, it's exercise. I have to fight being sedentary, and I'm a full-time novelist.) You might enjoy this - Dr. John Medina is a developmental molecular biologist focusing on genes related to human brain development. In this area of his website, he talks about exercise and learning: <http://www.brainrules.net/exercise> So

perhaps the combination of study and exercise together is enjoyable because, in fact, that's exactly how the brain is supposed to work. I love studying and I hate exercising. But I LOVE exercising when I'm learning something or actively writing at the same time.

seth (2010-02-23 09:46:55)

Using Anki on a treadmill is a little complicated. I put a board across the handlebars. On the board I put a stand on top of which I put my laptop, which is now at eye level.

Charles (2010-02-23 09:50:47)

Interesting that you would have this post the same day as another one, with different but interesting insights: <http://squatrix.blogspot.com/2010/01/boring.html> And this quote: Like anger and other emotions, boredom most often fools us into diverting our energies entirely to an external situation. Thus it keeps us from liberating ourselves by seeing our relationship to the emotion itself. We make a great mistake about boredom when we think that it comes because of a particular person or situation or activity. So much of the restlessness in our meditation practice and in our daily lives derives from this fundamental misunderstanding. How often do we try something new to recapture our interest, something more stimulating or more exciting? And how often does that too quickly become boring and dull, so that we range off again, looking for something "better"? To realize that boredom does not come from the object of our attention but rather from the quality of our attention is truly a transforming insight. Fritz Perls, one of those who brought Gestalt therapy to America, said, "Boredom is lack of attention." Understanding this reality brings profound changes in our lives. Then boredom becomes a tremendously useful feedback for us. It is telling us not that the situation or person or meditation object is somehow lacking, but rather that our attention at that time is halfhearted. Instead of wallowing in boredom or complaining about it, we can see it as a friend saying to us, "Pay more attention. Get closer. Listen more carefully." -Insight Meditation: The Practice of Freedom (pg. 80) My 80-year-old mother says that she likes to drive long distances in the country because "driving takes just enough of my attention to allow me to really think about important things." So maybe the walking is taking just enough attention to free your mind? And then the interesting question becomes what is that other mental/physical activity that we need to engage that allows higher functions to flower?

MikeY (2010-02-23 10:16:35)

Walking gets a little bit of blood moving, a little arousal, which probably keeps you focused compared to just sitting down and drifting off into a book. Also Michael Kane has some work on mind-wandering that suggests people have an optimal amount of mental busyness, and people try to match. So maybe the walking + learning chinese keeps your brain occupied enough to not wander off to other tasks.

jay (2010-02-23 12:12:20)

I am generally unable to force myself to do the dishes unless I have a podcast or audio book going on my mp3 player, it's just too mind numbing. The same is true for working out with heavy weights and taking a shower. What's weird is I can't focus on those auditory information sources by themselves without a mindless task to focus on. So, like your example, they go together. I guess that's why all cars have radios, but space shuttles, less so.

epistemocrat (2010-02-23 12:25:51)

Hi Seth, As an undergraduate, in the hours before a midterm or final, I would walk around quite parts of campus with my notes to prepare. It worked well. I also recorded lectures so I could listen to them while walking and doing yard work (and listen in the car). That was very efficient. Best, Brent

Boring + Boring = Pleasant?! | dv8-designs (2010-02-23 12:41:31)

[...] Boring + Boring = Pleasant?! [...]

Ben (2010-02-23 12:43:06)

I've found that the use of Anki is highly dependent on keeping the daily volume of cards low: this is an incentive to keep learning, and stops it becoming drudgery. This does mean learning more slowly (by adding cards less often), or doing a few

cards now and again throughout the day (using the web interface on my iphone). I did a little talk about my use of anki that you can watch: <http://vimeo.com/5129091> (I start at 36m)

aretae (2010-02-23 14:28:08)

Seth, This fits in with flow-type theory. Ideal functioning requires using lots of one's available resources. If one is not using all the resources, you have a concern. I also note that the examples you gave are both cases of mixing moderate physical activity with moderate mental activity. This may be relevant to your findings.

Riley (2010-02-23 16:44:05)

Seth, Nice discovery. You might check out this site: <http://www.treadmill-desk.com/> I have one myself. Currently attached to the handles, but this causes too much vibration. I'm going to make a free standing desk. They're also available from Steelcase, but fairly expensive, \$5K. Riley

jwcavanaugh (2010-02-23 17:06:27)

perjunkte fibers maybe? afterall, they take care of all the memorized processes (walking, writing, riding bike).

fellaini (2010-02-24 03:30:28)

I think that this is a stimulation issue: only by combining two undemanding activities can one's attention be satisfied. The uber-polyglot Alexander Arguelles recommends doing language work whilst walking briskly and upright (he cites arousal): <http://www.youtube.com/watch?v=VdheWK7u11w> MikeY's reference to an optimum level of mental business is interesting: in social situations I risk becoming temporarily mute if the interactions are not intense enough (I disengage completely), so I try to keep the heat up by starting debates or bantering.

Dennis Mangan (2010-02-24 07:47:47)

"Never trust a thought that didn't come by walking." - Nietzsche

Chloe (2010-02-24 08:15:57)

I thought you might want to check out Skritter. It's this sweet site that helps you learn Chinese (and Japanese) characters by actually writing them and tracking your progress. You can sign up for a free trial using my referral link (<http://www.skritter.com/refer/Chloe>), and if after the two-week free trial you decide to buy a subscription, we'll each get a free two weeks of Skritter.

Linkzomania for February 24, 2010 | Primer (2010-02-24 10:29:30)

[...] As someone who just procured a laptop shelf for his elliptical trainer, I can also confirm that combining two relatively boring activities usually results in a pleasant experience (in my case, working on the computer and exercising). However, it is not a universal truth â€" watching a bad television show while vacuuming, for example, does not increase the enjoyability of either. [...]

Make a Boring Thing Fun by Adding More Boredom | Things Are Good (2010-02-24 11:12:21)

[...] Read more at Seth's blog [...]

Michael (2010-02-24 17:54:09)

Practicing a musical instrument is boring. What activity can be combined with it to make it more interesting?

Move It! at 10,000 Monkeys and a Camera (2010-02-25 09:56:48)

[...] Not only is it good to get up and move around, but if you're doing something boring, it might be far more enjoyable to do it while you're huffing away on the treadmill. And especially if you're trying to memorize stuff, it might go quicker if you're walking while learning. Maybe the practical lesson is that we enjoy learning dry stuff when walking but not when stationary. Pity the 99.9 % of students who study stationary. Ideally you'd listen to a lecture while walking somewhere, perhaps around a track. [...]

fellaini (2010-02-25 10:48:20)

Practise the instrument by playing along to your favourite music. Once you have a piece nailed, you can modify it to your taste and develop your improvisational skills as well as your musical ear. It's also cooler to have a repertoire drawn from the rich variety of modern popular music than to know a bunch of fusty old standards by those dead guys in wigs.

Kringes (2010-02-25 13:02:17)

I put a shelf on my treadmill so I can put my laptop there and edit academic texts while walking. It is the best thing to do while treadmilling because it takes so much concentration. Win-win!

Working It Out While Working Out « Undecided (2010-02-25 13:20:47)

[...] Here's the backstory. We came across a tiny little blurb on Slate the other day that referenced a blog by Seth Roberts, Ph.D., a professor of psychology at Tsinghua University in Beijing and a professor emeritus of psychology at the University of California at Berkeley. He discovered that when you add boring and boring, you end up with pleasant. In Roberts' case, task No. 1 was studying Chinese via a flashcard system called Anki. Stone bore. Task No. 2 was riding the treadmill. Another big yawn. But when he combined the two, he found that both became pleasurable. He walked, he learned, he enjoyed. All about the distraction? Diversion? Multi-tasking with a purpose? Nope, writes Roberts. More like evolution: The Anki/treadmill symmetry is odd because lots of people think we need exercise to be healthy but I've never heard someone say we need to study to be healthy. The evolutionary reason for this might be to push people to walk in new places (which provide something to learn) rather than old places (which don't). To push them to explore. [...]

Robyn (2010-02-25 23:26:27)

Seth, I remember learning in my M.Ed that people learn better while moving and that we should therefore incorporate kinesthetic activities into instructional design. I thought it was flaky until we had to read the research on it... amazing!

seth (2010-02-26 07:45:39)

Robyn, thanks, I didn't know there was a whole body of research about that. That's good to know.

Brian (2010-05-08 15:31:56)

I'm surprised it hasn't been obvious to most people that movement is good for thinking and learning. Perhaps what we really need is to overcome bias in perceptions about ourselves in order to better recognize these performance factors. I believe trying to improve performance at sports through training and diet helps us become more accurate evaluators of performance factors. It has made a difference for me but I think you have to push yourself to the limit. If you're winning every race without trying, you probably won't be striving for accurate evaluations. Your blog topic reminds me of one of Richard Feynman's anecdotes about walking in order to think about physics, but doing it in the middle of the night. He was stopped by police that wanted to know why he was out walking at an unusual hour.

Alex Chernavsky (2010-02-24 14:14:51)

That's an interesting article about the expiration dates printed on food packages, but I think that this section needs to be explained better: "we should focus our efforts on what really matters to our health" not spoilage bacteria, which are fairly docile, but their malevolent counterparts: disease-causing pathogens like salmonella and Listeria, which infect the food we eat not because it's old but as a result of unsanitary conditions at factories or elsewhere along the supply chain." Are there no spoilage-associated bacteria which are harmful? Is it possible that very low levels of disease-causing pathogens can grow exponentially over time and rise to the level where they are dangerous?

seth (2010-02-24 17:12:08)

Alex, I'm not worried about spoilage-related bacteria because I believe that bacteria that prosper in one environment (old food) are going to die in a much different environment (inside my body). I throw away spoiled food, sure, but not because I'm afraid of it. I'm much more afraid of bacteria that have grown successfully in someone else's body.

Alex Chernavsky (2010-02-25 04:28:38)

Seth, Like you, I've never been one to worry about expiration dates, and I've been known to eat leftovers that I found in the back of the 'fridge and that were well past their prime. In fact, this is a frequent subject of conflict with my wife, who won't eat any leftovers that are more than a few days old and who is quite diligent about checking expiration dates. That having been said, a few months ago I had a pretty serious bout of gastrointestinal illness that I suspect was food poisoning and not

the flu. I never figured out where I got it. I'm not suggesting that I had botulism, but *Clostridium botulinum* doesn't grow in someone else's body and yet is quite dangerous if ingested (or, at least its toxin is dangerous). So I wonder if it's at least possible that under certain conditions, with certain foods, that spoilage in an of itself, can make the food harmful. Is there a clinical microbiologist in the house?

seth (2010-02-25 06:05:50)

Alex, yeah, that's a good point. The bacteria is dangerous not because it grows in your body but because of its byproducts. Perhaps that's why we seem to have a built-in aversion to spoiled food. As I said, I throw it away even though I'm not afraid of it. (I agree with you, I should be afraid of it.)

### **Robert Reich Lectures at Berkeley (2010-02-25 07:16)**

Yesterday I worked in a Berkeley cafe. The student sitting next to me said she was taking a course from Robert Reich called Wealth and Poverty. Most famous profs she'd found disappointing, she said, but not him. I was impressed that Reich was teaching undergraduates. Most profs in the Goldman School (UC Berkeley's public policy school) don't teach undergrads. The class is once/week for 1.5 hours (followed by a half-hour "salon" – meaning discussion) in a large lecture hall (Wheeler, 5 pm Wed). It met in a few hours. I went.

The topic was communities attracting large businesses, such as Boeing. Today's topic should make you feel bad, Reich said. That was one of his goals, clearly – to make students neither complacent nor despondent. And he wanted them to be sophisticated: He didn't want them to have a "bad-guy theory of the world". Fine. I liked the way he walked around the big room, instead of staying on stage, and he had a great conversational manner. I also liked the way he used the first ten minutes to sum up what he'd said earlier.

What I didn't like was the content. It was example-free – unless you count saying that Boeing moved to Chicago. As the lecture continued, my eyes widened: Is this what a good undergraduate lecture at Berkeley is like? There were no stories! Not one. He discussed, in purely hypothetical terms, how Boeing might decide where to move. They're considering a number of cities, Chicago, Long Beach . . . Los Angeles. What will Los Angeles offer them? Tax breaks and subsidies, said Reich.

STUDENT What about good weather?

Reich didn't answer. He went on to ask, rhetorically, were the tax breaks and subsidies a good thing? No, because they left less money for education. At this point I left. Except for being surprised by the low-quality content and amused by the student's comment, I'd been bored. As education, it was thin gruel. The disjunction between Reich's excellent intentions, great reviews (the room was packed), and great manner and his dreary content didn't remind me of the [1]name-dropping throat-clearing Yale prof but of the [2]Los Angeles graduation where none of the speakers told a story. Somehow this simple point about how to teach – tell a story – had been forgotten.

1. <http://www.blog.sethroberts.net/2009/12/03/philip-greenspun-on-universities/>

2. <http://www.blog.sethroberts.net/2008/05/30/high-school-graduation-confidential-lack-of-stories-speaks-volumes/>

Glen Raphael (2010-02-25 11:49:51)

John Searle still teaches Philosophy of Language, right? I recommend you go sit in on one of his lectures if you get the chance, while he's still around. When I took his class 20 years ago, he owned his stage like a Shakespearean actor. You could also try Anthro 160 - "Forms of Folklore". That's a class \*about\* stories so the lectures can't help but feature them...

seth (2010-02-25 12:26:24)

Glen, I heard Alan Dundes lecture about folklore. He gave plenty of examples, yes. I wouldn't say he taught by telling stories except in the obvious sense that he gave examples (which were stories or jokes). But maybe it didn't matter: The examples were interesting and that made the lecture interesting.

Tom in TX (2010-02-25 13:15:54)

"He went on to ask, rhetorically, were the tax breaks and subsidies a good thing? No, because they left less money for education." OTOH, if a thousand people move to the area to work at the place, then they are paying taxes. So did that leave more or less money for education? It is a tougher question than Reich makes it out to be. Thinking about such second-round effects is common in economics. In fact, according to Henry Hazlitt in *Economics in One Lesson*, it is *the* defining characteristic of economics.

seth (2010-02-25 13:34:00)

Tom, yes, what you say is one reason I left when I did.

Adam (2010-02-25 23:47:38)

What you say is such an obvious point, that I feel silly saying that I agree with you. \*I feel less silly sharing examples from a favorite professor at the University of Texas. <http://fwd4.me/HBr> \*During our American Literature courses, Professor Winship would include stories about the books and authors. His stories made the authors and books more real. But, his trump card, was taking us to the Harry Ransom Center and showing us proof that confirmed the story. \*For example, we got to see every edition of *Leaves of Grass* and found out that Whitman used a fake paper/cardboard butterfly for his famous photo. \*We saw order sheets for *Tom Sawyer* and *Huck Finn*...it was pre-sold door to door. We even got to see one of the rare copies of the first run of the first edition of *Huck Finn*, which made it through the publisher with a very proud print/illustration of Uncle Silas. \*We learned a lot about American Literature too, but the stories help orient me...even to this day, writing a comment on your blog. \*Cheers and thanks for the memories.

1 (2010-02-26 10:05:50)

I just spoke to a public health student here at cal about Reich and she said, "Oh my God!! He's amazing!!" Might go next Wed.

economist (2010-02-26 15:46:15)

What has Reich ever done to make anyone expect anything but "thin gruel" from him? Making 20-year-olds swoon is not a very good signal of quality. Neither is having politically powerful friends.

1 (2010-02-26 20:18:16)

Economist, after I go to Reich's lecture, I'll comment here about what I experience.

Stephen M (Ethesis) (2010-03-01 17:40:03)

Well, there is a great story about the Boeing move, with lots of documentation. The bottom line was that the CEO wanted to move to a place that offered him a large in-land lake for sailing, so Boeing moved to Chicago. The rest was mostly show, which came out eventually. There are all sorts of things that could have been developed in that case study. Too bad he did not. Why didn't he do the work to go into how Boeing approached the search, where they looked and what the parameters appeared to be and then what they turned out to be? That would have made a great lecture. My land use prof in law school used to do that, over and over again, in his lectures. I still pay attention to the topic, even though it has nothing to do with my professional practice, because of the interest his examples stirred in me.

seth (2010-03-01 18:27:52)

Wow, I didn't know that, Stephen. It reveals big problems with Reich's approach. As you say.

1 (2010-03-03 22:56:27)

I went to Reich's class tonight, because of what I read in Seth's blog. The class was: Wealth and Poverty, Wed, 5pm, 150 Wheeler. I stayed from 5pm-615pm. Reich started out with "By the way, Bill Clinton says 'hi' to you," because Clinton had dinner with him in San Francisco when Clinton visited Cal last Wed. Reich talked about how he called and left a message to Clinton, asking him to make a surprise visit to the class, but he couldn't get through to Clinton. Later, Clinton told him how he tried to respond back, "I couldn't get through to you!" So Reich said back, "I'm a busy guy!" Everyone laughed. The lecture was about labor unions and wage raises. Reich was really funny. The hall was PACKED. Students sat on the floor and stood up in the back. I've never seen so many students so excited to be in a professor's class. One student shouted out, "This class is so fun!!" Another student brought both of her parents to listen! Reich told stories about his experience in Washington, as Secretary of Labor under Clinton. He talked about how one of his jobs was to promote NAFTA among unions. He was booed in halls filled with 800+ people because they opposed NAFTA. He described a meeting between the national labor unions and Bill Clinton. To make a very long story short: Clinton didn't give them anything, but he was able to make them think, as one of the union leaders said, "It was a fabulous meeting!" Reich acted out on stage what Clinton was doing at the meeting, how he was able to make these extremely angry union leaders "melt." It was hilarious! In addition, Reich talked about the AFL-CIO. He showed graphs from Harvard Law School showing the decline in labor unions in America since 1967. Reich talked about labor law reform and how he tried to convince Clinton to set up such laws. However, Clinton chose to focus on NAFTA. I don't know anything about economics, but tonight I learned a lot!

Michael (2010-07-27 17:41:13)

At Berkeley, our lectures are usually theoretical. The "examples" are "learned" outside of class. The methods by which and the tools with which we analyze those examples are introduced in class. We're taught thinking strategies and methods (hence Reich's apparent socratic approach) but we're not taught what to think or exactly how to think.

1 (2010-02-26 23:14:00)

The kaleidoscope game was fun! Very colorful and entertaining! About the links on Goodwin- I know many bipolar patients, including those who tried Lamictal. If they did not take their medicine, they would be more likely to manifest harmful conduct, such as: attempting suicide, going on a spending spree, or quitting their job. Perhaps then their focus should be on quality, not quantity of life. Yes, psychiatric medications have deleterious side effects, such as weight gain, neuroleptic malignant syndrome, and tardive dyskinesia. Right now, what else could these patients do? I'm not advocating medicines for everyone, but I've seen how they could make someone's life productive.

Nansen (2010-03-01 17:14:34)

@ 1 re: "Perhaps then their focus should be on quality, not quantity of life." After the acute phase has been managed, does our quick-fix society have a primary concern in quality-of-life outcomes for the mentally ill? Probably not. Life-long medicating to the max is simple, standardized, and profitable.

1 (2010-03-02 02:26:34)

"...does our quick-fix society have a primary concern in quality-of-life outcomes for the mentally ill?" Nansen: There is a stigma against the mentally ill, yes. Support from family and friends, in addition to taking medications, is more helpful than medications alone. Psychiatrists try to keep medications doses low, unless one is in a psychiatric hospital, then psychiatric medications start out very high to stabilize the patient. Doctors know how to solve problems with medication, so that is how they're going to treat someone, not just the mentally ill. I agree, medications are expensive and people must work for their health care or get help from the government, etc. For the mentally ill who can be independent, doctors don't force them to take additional medication, they can choose what they want to take. I agree, medications are very profitable for the pharmaceutical companies, but if it improves life for the patient, it's profitable for them, too. Just because "the acute phase has been managed" doesn't always mean a patient should go off his or her medicine, or else the symptoms can come back to haunt the patient.

Nansen (2010-03-02 16:09:18)

"For the mentally ill who can be independent, doctors don't force them to take additional medication, they can choose what they want to take." True enough.

## **More Movement, More Learning (2010-02-27 06:51)**

[1]This comment on my [2]boring+boring=pleasant post persuaded me to look for research on how movement affects learning. I found [3]this comment by Anne Green Gilbert:

Movement is the key to learning. I first became aware of this as a third-grade student . . . Movement was central to my teacher's curriculum. . . . Everyone liked school that year, we all got along, and the knowledge imparted is still in my memory bank forty years later. . . .

When I became a third-grade teacher myself fifteen years later . . . I remembered this concept and used movement and dance to save myself from drowning in a classroom so heterogeneous I felt I was teaching in a one-room schoolhouse. Spelling words by forming the letters with bodies, forming punctuation marks and expressing the feeling of sentences through movement, learning multiplication by moving

in sets of threes and fours, discovering the difference between lunar and solar eclipses through planet dances, and choreographing our way across the Oregon Trail somehow made everyone equal. The gifted children discovered a new and exciting way to learn, the slower learners quickly became actively engaged and successful, the non-English speaking students could finally understand the curriculum through our new nonverbal approach. Instead of dreading the long school day, we eagerly awaited our next movement experience. Attendance went way up; test scores rose substantially: there was laughter; racial tension dissipated. . . .

Five years after my own experience as a third-grade teacher in Illinois, I was training teachers at the University of Washington and received a federally funded grant to conduct research in the Seattle Public Schools. During the 1977 school year, 250 students from four elementary schools studied language arts concepts through movement and dance activities for twenty weeks. The third grade students involved in the study increased their MAT [?] scores by 13 percent from fall to spring, while the district wide average showed a decrease of 2 percent! The primary grade project [?] students also showed a great improvement in test scores. Most significant was the direct relationship the research showed between the amount of movement the classroom teacher used and the percentage increase of students' test scores.

I find this very convincing: three situations, many measures. The way the movement lessons attracted diverse students is especially interesting; IQ tests were invented to reduce diversity in classrooms.

Partly I'm struck how this idea seems to have been ignored . "Everyone liked school that year." Which seems to imply less liking of school other years. So the third-grade teacher used lots of movement, her kids loved it, but somehow second- and fourth-grade teachers didn't imitate her. (Perhaps they did later.) "When I became a third-grade teacher myself . . . I remembered this concept." Implying it wasn't taught in her teacher-training program. On the other hand, it was emphasized in the teacher-training course that the commenter took ("I remember learning in my M.Ed that people learn better while moving and that we should therefore incorporate kinesthetic activities into instructional design").

I've read many studies about learning by experimental psychologists and never encountered any study of the hedonics – what makes learning more or less pleasant. Learning is one topic, motivation (e.g., thirst, hunger) is another. There are a few studies of curiosity (in animals, not people) but they don't show how to vary it. A professor of psychology might pooh-pooh the Gilbert stories: Sure, third-graders don't like to sit all day. But my treadmill/language-learning story suggests it's not that simple.

---

grace (2010-02-27 09:48:36)

I was struck by this somewhat related post (not spam Seth \*haa\*): <http://blog.exuberantanimal.com/the-biggest-sensory-organ-in-the-body/>

q (2010-02-27 11:41:12)

this seems completely different from what's in your walking post. the fact that kids learn better from play acting is distinct from learning better while walking.

seth (2010-02-27 11:54:18)

"completely different"? No, in both cases adding plenty of movement to a learning task was really helpful. Sure, there are big differences, mainly in the nature of the activity. But it isn't obvious why walking should be so different than moving around a room. Nor is it obvious why language learning should be so different than the vocabulary and simple-concept learning which is a big part of what third-graders do. My work sheds a new light on the work that Gilbert describes. It suggests a new explanation: Movement makes kids more curious. In terms of their effect on the average reader, I suppose, yeah, they are completely different. The subjects (me versus third-graders) are worlds apart and the effects differ greatly in how surprising they are. At least those are the differences that strike me. But I believe the underlying mechanism may be the same.

Matt Goff (2010-02-27 12:24:43)

There's a book I was recommended (though haven't read yet) called "Smart Moves: Why Learning is not all in your Head" by Carla Hannaford. The product description on Amazon says: "Neurophysiologist and educator Dr. Carla Hannaford brings the latest insights from scientific research to questions that affect learners of all ages. Examining the body's role in learning, from infancy through adulthood she presents the mounting scientific evidence that movement is crucial to learning." (and more, but I figure this is enough to establish a connection with what you are talking about). The second (revised, expanded) edition was published in 2005.

seth (2010-02-27 13:33:00)

Thanks, Matt, that should help me learn more about the connection.

q (2010-02-27 14:56:42)

sure, i overstated when i said 'completely different'. in your case you changed one thing and you got an effect, so the effect was probably due to that change. in the kids' case they changed probably hundreds of things and so we could discuss whether one or another of those things was important. my first assertion / strawman would be that play-acting aids child learning a lot. it might be difficult to tease this out from movement. i think it would be difficult to get kids to pay attention to something like math or reading while walking around and if they aren't paying attention there's no point. i suppose my base assertion is that if kids pay attention they will learn. desk learning is partially about removing distractions in order to encourage focusing on something. you have to ask yourself how well this works. i wouldn't think it would work that well, but i prefer and have always preferred chaotic environments. there are other things besides walking that you could think of too. you could test 'i learn better when i talk to myself out loud' or 'i learn better when i sing.' you could do isometric abdominal exercises while sitting at a lecture and see if that helps or hinders learning. (it would probably help your balance if nothing else.) on another subject, have you heard of any experiments with eating with your hands and weight loss?

Adam (2010-02-27 15:50:33)

The military trains people while moving all of the time. Memorization of basic lists occurs while running and doing other physical training, while transiting between classrooms and mess halls, etc. \*During classroom instruction, if you feel drowsy, it is expected that you will stand up and move to the back of the classroom and stand for the lecture. \*Wrong answer = push ups.

seth (2010-02-27 16:55:15)

q, I haven't heard of any experiments about eating with your hands and weight loss. In Gilbert's article, there's plenty of reason to think that the change in curriculum caused the change in results. Which aspect(s) of the new curriculum made the difference is a different question.

wcw (2010-02-28 00:33:56)

Please see "Arbeit und rhythmus". The 1899 version has been digitized at <http://books.google.com/books?id=yHezvFAV4sQC>

seth (2010-02-28 05:58:14)

wcw, unfortunately I don't read German. What does the book say?

vic (2010-02-28 18:05:49)

you don't read German? what a boorish rube...

Stephen M (Ethesis) (2010-03-01 19:09:12)

One of the more overwrought parts of the book Nurtureshock (which I enjoyed, all in all) had to do with the positive impact of role-playing activities on the learning in the young. On the other hand, the classic lecture in the Agora occurred as the lecturer led people about on a walk. Makes a lot of sense, both ways.

1 (2010-03-01 21:07:59)

Seth, You do a brilliant job of generating new ideas. You are very successful at it. I am so proud of you!

Movement Learning | Certification Map (2010-03-02 08:02:23)

[...] A new blog post by Seth Roberts discusses the theory of movement learning: Five years after my own experience as a third-grade teacher in Illinois, I was training teachers at the University of Washington and received a federally funded grant to conduct research in the Seattle Public Schools. During the 1977 school year, 250 students from four elementary schools studied language arts concepts through movement and dance activities for twenty weeks. The third grade students involved in the study increased their MAT [?] scores by 13 percent from fall to spring, while the district wide average showed a decrease of 2 percent! The primary grade project [?] students also showed a great improvement in test scores. Most significant was the direct relationship the research showed between the amount of movement the classroom teacher used and the percentage increase of students' test scores. [...]

## **Mood and Attentiveness (2010-02-28 22:26)**

In [1]Jonah Lehrer's article about the benefits of depression, nothing seemed solid until I came across this:

[Joe] Forgas [an Australian psychology professor] placed a variety of trinkets, like toy soldiers, plastic animals and miniature cars, near the checkout counter. As shoppers exited, Forgas tested their memory, asking them to list as many of the items as possible. To [vary] mood, Forgas conducted the survey on gray, rainy days " he accentuated the weather by playing Verdi's "Requiem" and on sunny days, using a soundtrack of Gilbert and Sullivan. The results were clear: shoppers in the "low mood" condition remembered nearly four times as many of the trinkets. The wet weather made them sad, and their sadness made them more aware and attentive.

I found the scientific article that reports this experiment, in Journal of Experimental Social Psychology. Memory for the trinkets was measured two ways – recall and recognition – and both ways the "sad" shoppers did much better. I didn't know about this; the size of the effect suggests it's important. Calling it variation in "memory" is odd, since the remembered event was only a minute ago. Variation in attentiveness is a better summary.

Whatever you call it, I like the general point made in the scientific article. When you are in a good mood, you pay less attention to your surroundings than when you are in a bad mood. When you're in a good mood, the model of the world in your head is working well. No need to change it. When you're in a bad mood, the model of the world in your head isn't working well. Time to gather more data and revise it.

My colleagues and I have studied a different effect along these lines (in rats): [2]When things aren't going well, you

vary your actions more. You try new things more. That's another way to update your model of the world.

---

Eric (2010-02-28 22:55:28)

Sometime ago I practiced Tibetan Buddhism and read Chogyam Trungpa "an interesting monk by any measure. I could be off since I'm working with memory, but I recall in one of his books I read he was stressing not only attentiveness"no surprise there"but also how important it was to feel melancholy as a way of life. As if melancholy were the only emotion underlying a present and attentive life.

Alex Chernavsky (2010-03-01 05:25:07)

The results that Seth discusses seem to be somewhat inconsistent with other research which shows that happy people are better at problem-solving. See also Barbara Fredrickson's "broaden-and-build" theory of positive emotions: [http://bit.ly/broaden\\_build](http://bit.ly/broaden_build)

seth (2010-03-01 06:19:40)

Good point, Alex.

karky (2010-03-01 08:27:08)

The question that came to my mind was this- Did the happier, more upbeat people focus more on the other people (cashier) than the items around the checkout, and did the melancholy shoppers focus more on the items and less on the cashier?

seth (2010-03-01 09:40:57)

yes, karky, that's a good question. This is the sort of result that I'd like to see repeated under lab conditions where the two conditions (sad and happy) are more equal. I looked around for such evidence but couldn't find it.

mark tyrrell (2010-03-01 15:46:17)

Depressed people certainly are better at some things than non depressed (never depressed) people-such as processing negatively weighted words <http://tinyurl.com/yj8kc5s> The trouble is the things they tend to be better at may not help them. Better recall for negative events but worse recall for positive ones and less accurate and exaggerated recall for their own physical ailments <http://tinyurl.com/yzzhgb> Interesting post thanks, Mark

donny (2010-03-01 21:24:17)

"This line of research led Andrews to conduct his own experiment, as he sought to better understand the link between negative mood and improved analytical abilities. He gave 115 undergraduates an abstract-reasoning test known as Raven's Progressive Matrices, which requires subjects to identify a missing segment in a larger pattern. (Performance on the task strongly predicts general intelligence.) The first thing Andrews found was that nondepressed students showed an increase in "depressed affect" after taking the test. In other words, the mere presence of a challenging problem "even an abstract puzzle" induced a kind of attentive trance, which led to feelings of sadness. It doesn't matter if we're working on a mathematical equation or working through a broken heart: the anatomy of focus is inseparable from the anatomy of melancholy. This suggests that depressive disorder is an extreme form of an ordinary thought process, part of the dismal machinery that draws us toward our problems, like a magnet to metal." Obvious implications for the benefit of meditation, here. Putting aside a little bit of time to very pointedly not solve any problems. If concentrating on a problem is depressing, the drive to concentrate on solving problems might be implicated in depression. Or the depression itself might only be coincidental,

happiness might compete with problem-solving for resources. Happy people might be better at problem solving because they have more of these competed-for resources.

Timothy Beneke (2010-03-02 10:38:15)

One general finding of emotion researchers is that inducing positive mood, by having the experimenter tap the subject on the shoulder and smile, or offer cookies, or various other manipulations, results in a greater range of more creative associations to words, so at least the imagination is opened up. I don't know how the "trinket" finding fits into the overall research. I'm a writer who is very depressive – the one word people use repeatedly to describe my published writing is "thoughtful," for whatever that is worth... Depression can make you question the point of doing anything; it can paralyze motivation, which in turn may free your attention...

mood and attentiveness « aquamap (2010-03-04 00:29:49)

Dennis Mangan (2010-03-03 09:38:37)

Interesting about addiction to classical CDs. I like 'em myself, but I probably haven't spent \$8000 in my entire life on them. Anyway, apparently the vast majority of classical CD collectors are men, though why that should be I don't know. Women collect certain things, dolls or whatever, plus classical music in today's culture is not considered the most masculine of areas. I have a theory about stamp and coin collecting, namely that their appeal lies in the fact that these items are "official", that is they are products of governments and thus might appear to a certain mindset as being somehow more real, in perhaps a Platonic sense. Notice how so many collectible items are "official", easily identifiable products of corporate entities. Maybe classical CDs are similar in that classical is considered the summit of music, therefore "official", and collecting classical CDs gives a kind of security to those with a certain mindset. Sorry, way out in left field, and not totally relevant.

1 (2010-03-06 05:44:20)

I like the yoga quote. At my work, we participated in a program where a personal trainer would come and lead an exercise group. This took place every week. Almost every time, there would be all us ladies exercising and only some men, but every time, there were a lot of my male coworkers there and they would just watch and make comments. These guys wouldn't even exercise, even if the trainer would try to motivate them! At the time I didn't understand why they would do this, but now I know!! Very funny!!

### **One Man Vs. All Education Professors (2010-03-04 12:10)**

According to [1] a recent New York article about Rupert Murdoch, Robert Thomson, one of Murdoch's top editors,

thinks most [journalists] are liberals overly concerned with writing stories that will impress other liberal journalists and win prizes in journalism competitions.

Well, yes. Not everyone is a liberal, of course, but basically everyone wants to impress their colleagues. Scientists have an amusing spin on this: They call it "peer review." The amusing part is that somehow no one else's opinion should matter. (E.g., all journals must be peer-reviewed.) Scientists get away with this bizarre view of economics (thinking someone should pay you and get nothing in return) perhaps because it is indeed difficult to assess the quality of this or that bit of science if you're not in the field and because science has produced huge benefits for the rest of us in the past.

As I said, this is just human nature. As far as I can tell, professors act this way – try to impress colleagues – in every academic department. In schools of education, [2] the result is this:

Amy Treadwell . . . received her master's degree in education from DePaul University, a small private university in Chicago. . . . But when she walked into her first job, teaching first graders on the city's South Side, she discovered a major shortcoming: She had no idea how to teach children to read. "I was certified and stamped with a mark of approval, and I couldn't teach them the one thing they most needed to know how to do," she told me.

It's no secret that many schools of education do a poor job of training their students to teach – which is nominally one of their main goals. I am just repeating what Veblen said long ago.

What's new is this: One man, Doug Lemov, working mostly alone, [3]has figured out how to make people better teachers. One man. Not a professor. Did he build on the work of others? No, he started from scratch. He's made a list of about 50 techniques. They are teachable. He gives workshops about them. As far as I can tell from [4]this magazine article, Lemov has done a better job of figuring out how to train teachers than all the education professors in the world put together. If you arrived on earth from outer space, and didn't understand human nature, you'd think this couldn't possibly be true, but apparently it is. It's like something out of a comic book.

Alex Chernavsky (2010-03-04 12:26:54)

Yes, education programs don't teach people how to teach, and English programs don't teach people basic writing skills, like grammar, organization, and clarity. I think Stanley Fish said as much in a recent *NY Times* column: ===== A few years ago, when I was grading papers for a graduate literature course, I became alarmed at the inability of my students to write a clean English sentence. They could manage for about six words and then, almost invariably, the syntax (and everything else) fell apart. I became even more alarmed when I remembered that these same students were instructors in the college's composition program. What, I wondered, could possibly be going on in their courses? ===== <http://opinionator.blogs.nytimes.com/2009/08/24/what-should-colleges-teach/>

seth (2010-03-04 12:33:45)

Until now, education professors could say that what makes a good teacher was very difficult to figure out. "Great teachers are born, not made." Whether they actually said this I don't know.

Nathan Myers (2010-03-04 13:53:51)

Your mistake, Seth, is in believing "educators" have any interest in teaching, or in children learning. Their whole focus is on driving out any initiative that might lead them to disrupt class or, later, society. They'll mostly pick up reading, eventually, but that's no great shakes. What matters is a supply of docile proles, and that 1848 never, ever happens again.

Eric (2010-03-04 15:26:52)

It is disappointing. The Cold Call technique listed in the article reminded me of a moment where my Communications professor had wondered (more to himself but in front of the class) better ways to teach us. He was doing pop quizzes with us and most of us didn't care enough to do well. I approached him the next class asking him to cold call us instead of asking us to raise hands and he regarded it apathetically and didn't implement it in the class. I felt bummed out about it. Got an A in his class but privately have thought of him as one of the worst teachers at my university. In spite of this, he remained popular because of his charisma. Generally, I'm incredibly skeptical whenever people say you either have it or you don't. I think growing up in a culture filled with data has made me wonder about specific techniques which people may unconsciously use to be successful in an activity. Given such mediocre products and processes coming from universities I wonder how a better university would work and how to finance and start one. But I digress. I've got Lemov's book marked to get from the library whenever it comes out. Thanks for pointing it out.

Fred (2010-03-04 21:03:42)

+1 for Nathan Myers' comment. There was a study published in the late 90s (can't find the ref right now) that indicated that Education students had the lowest collective SAT scores of all undergrad demographics in the US.

fellaini (2010-03-05 02:33:22)

In the UK at least, teacher trainer/lecturers tend to be highly politically motivated, and almost always on the left. They can be reluctant to subject teaching approaches to fine-grained empirical analysis or value quantitative study (they prefer qualitative studies, as they highlight the experiences of valued social outliers). On my post-grad teacher training course, I was taught plenty about working class disengagement and its relation to the teaching of reading, but received little or no indication of the comparative success of different methods. Bear in mind that not only education students but also their professors tend to be less able than their peers in other departments.

Michael Metcalf Bishop (2010-03-05 07:49:00)  
hyperbole

Phil (2010-03-05 10:39:24)

I share your disdain for trying to impress one's colleagues by doing respected work. That's why I make sure all of my work has obvious mistakes. Makes it hard to get published in peer-reviewed journals, of course, but every now and then I sneak one through.

seth (2010-03-05 10:48:37)

Phil, there's nothing wrong with trying to impress one's colleagues – among other goals. It's when that's your only goal, or almost your only goal, that there's a problem. The reason that one person could do a better job of training teachers than all education professors put together, I submit, is that they cared far too much about impressing their colleagues and not nearly enough about other goals.

Shane (2010-03-05 12:02:40)

There was an article in the Atlantic on this topic the other month, whose thesis was that Teach For America had been collecting crazy amounts of data to figure out what works, and coming up with actionable guidelines. A bit confusing as the article you linked would seem to indicate otherwise. I don't want to be flagged as spam, so I won't include a link, but you can find the Atlantic article by googling "what makes a great teacher." I'd also like to add that I find the sort of comment made by Nathan Myers tiresome in the extreme. I know a great many teachers, and while they vary in their effectiveness, they don't vary in their lack of membership in the far-reaching conspiracy to crank out mindless drones that he describes. A pretty pedestrian set of incentives is all that is required for the generally poor educational outcomes in this country. Tinfoil hats and Illuminati can be left out of the analysis, I think.

More on the uselessness of university « Anthny (2010-03-05 15:10:54)  
[...] More here. (Also see here.) [...]

Phil (2010-03-05 17:37:48)

Seth, I was trying to point out — by yanking your chain a little — that peer review serves an important purpose of making it harder for people to publish work with obvious mistakes in it. I've had my own struggles with peer review — twice in my career, I've had journals reject a paper not because they found something wrong with it, but because one or two reviewers thought it didn't advance the field in an interesting way; my response has been to publish in other (less respected! But still peer-reviewed) journals. I don't want to sound like I'm entirely satisfied with the normal peer review process. But I don't have an alternative to propose, either. I certainly would have no interest in reading a journal that published whatever anyone chose to submit, because most submissions would be garbage. \_Somebody\_ has to serve as gatekeeper.

seth (2010-03-05 18:51:11)

Phil, thanks for explaining that. You're right that I misunderstood. I agree, some sort of filter is needed. I think a diversity

of filters is a good idea. I'd prefer a system in which, rather than every journal peer-reviewed, some journals were merely editor-reviewed (less democratic than peer review) and other journals published almost everything but had rankings based on reader response – e.g., rankings by number of times downloaded (more democratic than peer review).

1 (2010-03-06 05:04:14)

I remember a few years ago, Seth's long self-experimentation paper was the most downloaded out of all University of California published papers. Not only that, but there was a shorter paper he wrote that ranked high in downloads, at the same time. I think the rank these papers occupied were #1 and #4. Way to go! I just found out recently!

Albert (2010-03-06 10:48:49)

Interesting article about Lemov. Sounds like he has a promising approach. One thing that I didn't like about the NY Times article is that I had to get to the bottom of the entire gushing article to find out that they really don't have any real studies showing whether or not his results are replicable. It would be nice if the next steps were someone funding studies to find out whether or not his work could be reproduced on a wide scale using average teachers and administrators (and are not simply the product of an extremely gifted individual being able to lift those around him to great heights). Albert

Nathan Myers (2010-03-08 17:32:29)

Shane: I have also known teachers dedicated to their craft, and (unfortunately not redundantly) to seeing their charges learn. My mother in law was one. But that says nothing about *educators*, a nearly disjoint population. The origins and aims of the education establishment were published openly and without shame in the 19th century, under names such as Mann and Carnegie, and it has remained true to its traditions. There are great teachers, but they never, ever become educators. At my university, the School of Education was where people washed out into when they failed everything else. It was closed a few years after my graduation, for reasons that probably had nothing to do with that fact.

Nathan Myers (2010-03-08 18:09:12)

I will add (and this is true in general): *it's only a conspiracy if it's against the law*. Sabotaging American education for commercial or political gain is manifestly not against the law.

Adam @ College (2010-04-29 13:00:18)

"basically everyone wants to impress their colleagues" This happens in every profession. A lot of musicians love Jazz because it allows the artist to show off their talents better than other music genres.

## Why Do We Dislike Short-Range Repetition? (2010-03-05 22:14)

Here's something I wrote a few days ago:

In graduate school, I studied experimental psychology. I wanted to learn how to do experiments. The best way to learn is to do, I thought, so I started doing self-experiments in addition to my regular research (with rats). One thing I studied was my acne. My dermatologist had prescribed tetracycline and benzoyl peroxide. In a few months, my self-experiments showed that tetracycline didn't work and benzoyl peroxide did work – the opposite of what I originally believed.

Emphasis added. I wanted to write "the opposite of what I originally thought" but the earlier use of thought made me use believed instead. Avoidance of this sort of repetition is standard practice. It's even important scientifically. The linguist David Stuart [1] made a big advance in understanding ancient Mayan when he realized that different symbols mean the same thing. The different symbols appeared in the same block of text, like my thought and believed.

My question is: Why? What's the evolutionary reason? Maybe it's part of a push toward novelty, so that nobody says, "Today I went to the store. Today I went to the store." Or maybe it's a way of pushing us to make distinctions, invent new words, and learn new words. It pushes us to make distinctions because it pushed me away from lazily writing " . . . thought . . . thought".

One reason this interests me is [2]my interpretation of why we like repeated decorative elements. Many sorts of decoration involved repeated elements – identical things or pictures placed side by side. I believe we like this sort of thing so that we will place similar things side by side. When we place them side by side it's easy to notice small differences that would otherwise be hard to see. Noticing small differences makes us connoisseurs. Connoisseurs are important economically because they are willing to pay more for finely-made stuff. They support cutting-edge artisans.

The invent-new-words explanation strikes me as the most plausible. First we do what the Mayans did: invent new words that mean exactly the same thing as the old words, purely to avoid short-range repetition. As the words get older, their meanings drift independently and they start to mean slightly different things (such as job and profession). Thereby the language does a better job of keeping up with technical/economic progress, which keeps generating new things that need new names.

1. [http://www.pbs.org/wgbh/nova/transcripts/3506\\_mayacode.html](http://www.pbs.org/wgbh/nova/transcripts/3506_mayacode.html)

2. <http://www.blog.sethroberts.net/category/human-evolution/my-theory-of-human-evolution-directory/>

---

1 (2010-03-06 05:07:33)

I like the part about connoisseurs! That's exactly what I do, too! I think it makes my job worth working at because I can do something with the money. It helps to make my life worth living, too.

ChristianKI (2010-03-06 11:12:40)

It's about signaling status. Signaling that we have a large vocabulary.

seth (2010-03-06 20:46:08)

If I wanted to signal status, I'd write convoluted sentences and use obscure words. Signalling that I didn't care if other people understood me. That's how Veblen saw it, anyway.

Nancy Lebovitz (2010-03-06 20:55:19)

Repeated words can be a pleasure if they're used for emphasis.

jt (2010-03-07 01:55:16)

In your excerpt, using 'thought' a second time would be more confusing than using 'believed', as the reader may refer to the previous instance of the word and take that you are contradicting 'the best way to learn is to do' rather than your beliefs on the comparative uses of acne treatments. Looking at the derivation of 'job' and 'profession', they meant different things to start off with: the former a discrete piece of work - 1557 'jobbe of work'; the latter suggesting a long-term commitment, the taking of a vow or declaration of intent ('professio').

Alrenous (2010-03-07 16:31:40)

To add to jt, repeating words has a purpose, which is to create a link. This means if you don't want to create a link, you have to come up with different words. Compare: "To add to jt, repeating vocabulary has a purpose, to create a link. This means if you don't want to tie your prose together, you have to come up with different words."

## Teaching: What I Learned Last Semester (2010-03-06 22:10)

[1]Andrew Gelman's thoughts about teaching led me to mull over what I learned last semester from teaching at Tsinghua. I taught two classes: a freshman seminar that covered a wide range of psychology research; and a class for graduate students about R.

Some things worked well:

1. In the freshman seminar, one of the assignments was to design a Mindless-Eating-type experiment. (Mindless Eating by Brian Wansink was one of the reading assignments.) One of the students designed a really good experiment in which people on different buses get different treatments. She happened to be a senior applying for graduate school and her work on that assignment helped me write a really strong letter of recommendation for her.
2. I graded the students on their comments on the reading and set the bar very high to get a full score (3 out of 3): they had to say something that interested me. A fair number managed to do this. The bar wasn't too high.
3. I had lunch with all the students in the seminar (about 5 per week). The students seemed to like it. I certainly did.
4. There were classroom debates about which paper was the best (one week) or the worst (another week). They got everyone involved, was far less passive than listening to me talk, and gave them practice speaking English.

But there was plenty of room for improvement:

1. Students in the seminar were frustrated by the vague criterion ("interest me"). Toward the end I posted the comments that got the full score and that seemed to help.
2. In the seminar it was hard to get feedback about how well I was being understood. The best I could do was pass out slips of paper and have the students write down what percentage of what I said they understood. More immediate feedback (e.g., when I used a too-difficult word) would have been better.
3. In the R class I hoped the students would analyze their own data. This was too hard for quite a few of them. In the future I'll give them a data set.
4. One student dropped the R class because my English was hard to understand.
5. In the seminar, some students (freshmen) complained that other (older) students, whose English was better, talked too much. They had a point and I should try calling on people randomly. I also should try to get general feedback after each class (e.g., "tell me one thing you liked and one thing you didn't like about today's class").
6. In spite of my constant complaint that professors treat all of their students alike (e.g., all students get the same assignment) when they aren't all alike – they differ substantially in what they're good at, for example – I pretty much did the same thing.
7. I should have at least tried to learn my students' Chinese names.

---

1 (2010-03-09 02:12:37)

When you were teaching your last classes at Berkeley: weight loss and bipolar/depression, I wanted to ask if I could sit in and listen, but I was afraid. Then you retired! I've regretted that ever since. I was just too scared to ask... Your talk at Stacey's bookstore (a few years ago on June 15) was memorable for me. I believe everyone in the audience had bought your book! You were great! I really like the "interest me" part of your class. If I were in your class, I would have used my creativity and thought of ways to impress you. If that phrase were on your syllabus, I would have crossed out "interest" and replace it with "impress" just to motivate myself as a student.

### **Top and Bottom Versus Middle (2010-03-08 05:02)**

I liked many things about [1]this talk by Jacqueline Edelberg, a Chicago artist and political science Ph.D., about how she and other moms transformed their local school. Edelberg has written a book about it called *How to Walk to School: Blueprint for a Neighborhood Renaissance*. The man who introduced her told a story: In a classroom, he noticed a girl drawing a picture. What are you drawing? he asked. I'm drawing God, she said. You can't do that. No one knows what God looks like, he said. They will soon, she said.

Edelberg's story did sound miraculous: Her crummy neighborhood public school, within a year, became an acceptable place for her children. The change had many elements, including an after-school program, a farmer's market, and painted doors, but I think the most important piece – which Edelberg said little about – was this: Parents were allowed to attend every class. Within two years, said Edelberg, all the bad teachers left.

I call this way of governing top and bottom versus middle. In this case the top was the school's principal (Susan Kurland, Edelberg's co-author), the bottom was the parents, and the middle was the teachers. Acting alone, the principal couldn't control the teachers – she couldn't fire the bad ones, for example. With the parents' help, she could control them.

It's as old as Moses:

1. [2]As I've blogged, the Ten Commandments was an agreement between Moses (top) and the preyed-upon men in his community (bottom) against the men who were preying upon them (middle) – stealing from them, for example.

There are other examples:

2. One reason [3]surgical checklists – implemented by hospital administration (top) – work so well, I believe, is that they give nurses (bottom) power over doctors (middle). A nurse can tell a doctor to follow the checklist. The details of implementation also empower the lower-ranking members of the surgical team.

3. In China, what are called (in Chinese) [4]human-flesh searches – a kind of cyber-vigilante-ism – go on with the approval of the central government (top). These searches, which are actually mini-crusades, allow ordinary citizens (bottom) to punish corrupt or otherwise misbehaving local government officials (middle).

I predict that someday someone in the American government (top) will realize that a way to greatly improve health care is to empower patients (bottom) against doctors (middle).

1. <http://www.booktv.org/Program/11257/How+to+Walk+to+School+Blueprint+for+a+Neighborhood+Renaissance.aspx>
2. <http://www.blog.sethroberts.net/2010/02/20/widespread-loneliness/>
3. <http://www.blog.sethroberts.net/2010/01/30/the-checklist-manifesto-by-atul-gawande/>

---

doctorsh (2010-03-08 05:31:32)

I take umbrage at your statement about empowering patients against doctors. In today's system it is not the docs with all the power, but the insurers and the government regulators. If obamacare becomes law it will give more power to the insurers and govt and even less to patients.

seth (2010-03-08 09:43:48)

doctorsh, that's an interesting point you make. However, I'm not sure I completely understand, much less agree, without examples. For example, I don't know what you mean when you say obamacare will reduce patient power. Could you expand on what you mean? I've had plenty of experiences where patient empowerment would help. One involved a surgeon to whom I was referred: <http://www.blog.sethroberts.net/2010/02/02/a-call-from-dr-eileen-consortis-of-fice/> Another involved my dermatologist: He wasn't terribly interested in whether the drugs he prescribed actually worked. Which hurt me, of course. A third involved the mother of a friend of mine. She was given so many drugs they were actually killing her - her doctors didn't notice. It was only discovered by accident.

bjk (2010-03-08 10:03:11)

This is the idea behind "if you didn't get a receipt, the bill is on us" policies. It makes the customers the policers of the cashiers.

seth (2010-03-08 10:16:11)

bjk, yes, and the system in China where restaurant receipts have scratch-off areas. A small fraction of scratch-off areas provide money. Taiwan has a slightly different system.

david (2010-03-08 11:45:36)

Another top/middle/bottom example is described in Gladwell's *Outliers*, the part about the airline crashes due to co-pilots not feeling empowered enough to be forceful when notifying about a dangerous situation.

pat (2010-03-08 13:23:01)

I really enjoyed that about the "How to Walk to School." As an aside, I've always found it notable that God delivered Israel from Egypt by parting the Red Sea, and THEN the 10 commandments came. Kind of like if you love and are grateful for what your neighbor, business partner, wife has given you, you do not even need to be told not to kill, lie, steal, etc. . . . Anyway, I digress, as a Chicagoan, really interesting idea to help prevent the exodus of young vibrant families to the 'burbs.

seth (2010-03-08 15:51:10)

david, yeah, that's another good example. And the more examples I know of, the harder it becomes for me to believe (as doctorsh seems to say) that patient empowerment would not be a good thing.

jt (2010-03-09 14:20:44)

This is probably why being in middle management is supposed to be especially stressful.

doctorsh (2010-03-10 07:33:24)

Seth Empowerment in a workable system would be shared between patients and doctors. Presently all the POWER is held by the payers and rule makers who happen to be government regulators and insurers. Doctors have let the system be taken over by these entities. This has changed the way docs are able to care for their patients. Try going to a private solo doc who does not participate with the third parties and you may find a truly free and empowering system that works.

seth (2010-03-10 09:36:03)

Thanks, doctorsh.

Justine (2010-03-10 13:47:47)

Seth, Really interesting idea. Do you think this could also be applied to the medical research system? I work for a nonprofit organization (the Myelin Repair Foundation) which recently launched Where Are The Cures? (<http://wherearethecures.org>) to give patients (and friends/family) a voice and knowledge on how the medical research system is broken. As a nonprofit organization, the Myelin Repair Foundation (<http://myelinrepair.org>) is trying to speed up that process by bridging the gap between academic scientific discoveries and pharmaceutical companies. There are so many players in the process (NIH, FDA, other nonprofit disease research orgs, clinicians, patients, etc.) How could you create a Top & Bottom vs. Middle in this system? /Justine

Top Bottom Middle Smart « Rhymes With Cars & Girls (2010-03-27 06:59:47)

## **Optimal Daily Experience (2010-03-09 14:45)**

Everyone knows about RDAs (Recommended Daily Allowances) of various nutrients. In [1]a speech to new University of Washington students, [2]David Salesin, a computer scientist, advised them to "maintain balance" by getting certain experiences daily:

- something intellectual [such as a computer science class] (not so hard in college);
- something physical (like running, biking, a team sport);
- something creative (like music, art, or writing); and
- something social (like lunch with a friend).

This served him well in college, he said, and he continued it after college.

I think he's right – we need certain experiences to be healthy just as we need certain nutrients. My rough draft of such a list would be this: 1. Social. 2. Physical. [3]Nassim Taleb's ideas about exercise seem as good as anyone's. This is really several requirements, for different sorts of exercise. 3. Travel. About an hour per day. 4. Hunger. T[4]he data behind the up-day-down-day diet suggest we should experience a substantial amount of hunger every week. 5. [5]Face-to-face contact in the morning. About an hour. 6. [6]Morning sunlight. An hour? 7. Being listened to. I suspect the therapeutic value of psychotherapy derives from this. I believe this is one reason blogging is popular – it provides a sense of being listened to. 8. Being helpful. 9. Being recognized as having value. Blogging helps here, too. 10. [7]Being part of a group effort, something larger. Of course #1 (social) and #5 (morning faces) can come from the same experience, and so can #2 (physical) and #3 (travel). I wouldn't say we need #7- #10 every day but perhaps several times per week.

I might add two more things: 11. Learning. After I started studying Chinese [8]via Anki/treadmill, I started to sleep better. It wasn't the treadmill; that wasn't new. Several studies have found that people sleep more when they are learning intensely. After I became a professor, instances of concentrated learning – such as learning to use R – became rare. I remember how good they felt. How intense learning could go on throughout your life during the Stone Age isn't obvious, however. Presumably all the experiences we need to be healthy were easily available then. 12. Foot stimulation. In a Beijing park, I came across a cobblestone track about a hundred yards long. Walking on it is supposed to be beneficial. I took off my shoes and socks and tried it. I was astonished how painful it felt – but day by day I could stand on it longer. This is a topic for another post but of course in the Stone Age people got a lot more foot stimulation than anyone reading this. [9]Commercial cobblestone track. Thanks to Tim Lundeen for reawakening my interest in this.

Anthony (2010-03-09 15:56:30)

"How intense learning could go on throughout your life during the Stone Age isn't obvious, however." Have you ever tried to survive in the wild? I'm guessing there's lots of learning involved ...

Alex Chernavsky (2010-03-09 19:04:02)

I would add: 13. Working on a project (i.e., an on-going activity that is directed toward a specific, meaningful goal).

seth (2010-03-09 23:27:41)

that's an interesting idea, Alex. Would working on an assembly line count? what about teaching kindergarten? What about garbage collecting? What about being a reference librarian?

Vic (2010-03-10 00:24:47)

Seth, how many more interventions can make your sleeping better? I thought you were already at around a 99.99 in terms of restedness after adding more animal fat to your diet...

seth (2010-03-10 05:12:42)

Vic, if I stand for 9 or 10 hours, there's no discernible room for improvement. But it's really hard to stand that much so I don't. And I probably do less than the optimal amount of one-legged standing. The Anki produced an increase in how long I slept, without a big increase in how rested I felt when I awoke – which, as you say, was already really high.

Alex Chernavsky (2010-03-10 05:55:04)

Seth, I wasn't thinking of a job. I was thinking more of writing a book, restoring an old car, losing weight, creating a family scrapbook, or planting (and maintaining) a vegetable garden.

seth (2010-03-10 06:39:11)  
Thanks, Alex.

Alexandra Carmichael (2010-03-11 06:45:45)

Fascinating as always, Seth!! Having come to rely perhaps too much on tracking devices to homogenize my life, I'm cautiously warming up to a life of extremes... I'm especially curious about the daily travel though - what's the reasoning behind that? For my own list I would add a good laugh and a long hug each day (tied in to social connection), and a monthly meta-layer of re-evaluating my life goals and my optimal daily experience list. :)

bjk (2010-03-15 06:33:59)

Stories are important, telling or hearing stories. An enormous amount of caveman entertainment must have been in the form of stories, maybe at dinner or right after, perhaps in the form of "we chased this animal and then hit him over the head like this and then" stories. This might go under social or creative, but they're not the same.

seth (2010-03-15 08:34:29)

Alexandra, long ago (the 1970s?) someone found that commuters tend to travel about an hour per day – regardless of the length of their trip! so people who had short distance trips made them longer duration than necessary. And I've come across lots of personal stories that back this up. For example, a friend who worked at home would travel about an hour outside her house every day. Purely by choice.

Ram Robuck (2010-06-03 06:28:04)

Insofar as I can see it, the optimum daily experience is one which leads to high productivity and can only be determined in retrospect. Some people's most productive days are borne in solitude.

Self-experimentation, unusually effective « Artificial Intelligence Church (2010-06-04 22:08:11)

[...] A paper by Seth Roberts on how/why self experiments are so effective (PDF) via Quantified Self. Over 12 years, my self-experimentation found new and useful ways to improve sleep, mood, health, and weight. Why did it work so well? First, my position was unusual. I had the subject-matter knowledge of an insider, the freedom of an outsider, and the motivation of

a person with the problem. I didn't need to publish regularly. I didn't want to display status via my research. Second, I used a powerful tool. Self-experimentation about the brain can test ideas much more easily (by a factor of about 500,000) than conventional research about other parts of the body. When you gather data, you sample from a power-law-like distribution of progress. Most data helps a little; a tiny fraction of data helps a lot. My subject-matter knowledge and methodological skills (e.g., in data analysis) improved the distribution from which I sampled (i.e., increased the average amount of progress per sample). Self-experimentation allowed me to sample from it much more often than conventional research. Another reason my self-experimentation was unusually effective is that, unlike professional science, it resembled the exploration of our ancestors, including foragers, hobbyists, and artisans. Some of the most prolific makers I know seem to enjoy improving themselves as well as the things around them - they're like little laboratories of optimization. Pictured above, a photo from my recent visit to Instructables. Christy and Eric who run the show there found they work better if they walk all day slowly at the computer - a challenge, so they built treadmill computer desks. Dan (2011-06-01 16:58:45)

Hey Seth, I like your post it really speaks some truth in the matter of physical needs. The body needs to be constantly releasing certain chemicals like endorphins and adrenaline which are commonly produced by exercise. It also needs to get into the habit of breaking down fat cells and fatty acids, and of course burning calories. I agree with the other stuff but mainly support the point of physical activity as I'm a professional fitness blogger myself. Cool blog by the way! Feel free to drop by mine anytime. Take care

### Science in Action: Mysterious Mental Improvement (2010-03-10 09:15)

For a few years, I've been making daily measurements of how well my brain works. I got the idea after I found that omega-3 (from flaxseed oil) improves my balance. It improved other mental functions as well. Tim Lundeen, using an arithmetic test, [1]found similar results. These results suggested to me there might be a lot we don't know about how our environment affects our brain.

If so, tracking myself might turn up interesting anomalies – clues to big environmental effects. [2]The first one I found involved flaxseed oil. There turned out to be a short burst of improvement after I took it. [3]The second anomaly I found also involved flaxseed oil. When I switched from Chinese flaxseed oil to American flaxseed oil (Spectrum Organic), a few days later my arithmetic scores suddenly improved. Something was wrong with the Chinese flaxseed oil. The third revealing anomaly – which doesn't involve flaxseed oil – happened yesterday (see below). Each point on the graph is one testing session. Each session consists of 32 simple arithmetic problems (e.g., 3+5, 7-6) and takes about 3 minutes. I use R on my laptop to collect the data. I type the answer or the last digit of the answer (e.g., if the answer is 13 I type "3") as fast as possible. Here are the results from almost a year of this task:

[4]

The Y axis is the time it took to do one problem. Yesterday, the graph shows, I suddenly got much faster. My score dropped about 50 msec – far more than normal variation.

What caused the drop? I can think of four possibilities:

1. The test was standing. Usually I test myself sitting.
2. The test happened after I'd been walking on my treadmill for 10 minutes. That too was very rare.

3. I'd had about 30 g of butter 2 hours earlier.

4. I'd stood on my cobblestone mat 2 hours earlier.

My guess is that it's #2 (10 min walking). The previous record low score, in January, might have come after I did Dance Dance Revolution for 30 minutes or so.

q (2010-03-10 09:40:47)

laptop clocks are not always good for calculating time intervals. they sometimes 'jump'. (the reason for this is that it's potentially very bad for computer clocks to ever go backwards - software almost never covers that possibility) so manufacturers calibrate clocks to go slowly and then jump forward discontinuously. one laptop i worked with jumped 7.2 seconds once or twice an hour. if you get more than one such outlier in a row you can probably rule out a clock anomaly though.

Timothy Beneke (2010-03-10 10:23:57)

What strikes me about the flaxseed oil is how emotionally and physically soothed I feel for about half an hour after I take it. It has a calming effect; I'm tempted to say that it induces a state of serenity, or near-serenity. It certainly assuages hunger far more than an equivalent number of carbohydrate or protein calories does. I'd be very curious to see ANS physiology measures or other measures of things associated with calmness and soothing - oxytocin or vagus nerve activation. Also, does anyone else find flaxseed oil soothing?

seth (2010-03-10 12:29:41)

q, the faster-than-usual performance I saw on the latest day came from many individual trials, not one. And of course the problem you describe would make performance slower than usual, not faster.

tetsuwanatom (2010-03-10 12:58:02)

that's interesting! i suppose the average of the scores is probably more to do with repetition of the task => being able to complete the task faster. it would be interesting to see if the average for a month would change if you only take the tests after an exercise.

Michael (2010-03-10 21:29:08)

You should consider varying the math problems so you don't get used to them. To help my arithmetic skills when I was a trader, I set up an excel worksheet which made random two digit numbers and added or subtracted them (also randomized) to a second two digit number. I hide the solutions column when I printed off the worksheet.

Scot (2010-03-10 21:44:38)

Arousal facilitating a dominant/well-learned response?

Alex Chernavsky (2010-03-11 09:01:23)

Seth, do you have a suggested list of computer-based tests (memory, arithmetic, reaction time, etc.) that self-experimenters can download to assess mental acuity?

Nancy Lebovitz (2010-03-11 12:15:51)

Have you tried [1]Dual N Back- it's supposed to improve fluid intelligence. I haven't been keeping records, but I think it's been doing my mood and mental focus some good.

1. <http://brainworkshop.sourceforge.net/>

seth (2010-03-11 13:27:34)

No, Alex, sorry, this is in the home-brew phase. Nancy, I've heard of the task but haven't tried it. Thanks for the link.

vimal (2010-03-11 14:00:59)

What brand of flax seed oil do you use? I use <http://www.barleans.com/flaxoil.asp> Also is the math test here comparable to your homebrewed test? <http://www.brainmetrix.com/math.htm>

seth (2010-03-11 14:51:28)

I've used Spectrum Organic and Barlean's flaxseed oil. I never found a difference. The math test I do is simpler than the math test on that page. I only use addition, subtraction, and multiplication - no division. And the two numbers being combined are always single digits (0-9). My test doesn't have the awkward interface of the web test-you keep your hands on the number keys and type a single digit. And each trial is separated from previous trials by a few seconds at least. I go at my own pace.

q (2010-03-12 19:45:50)

you're right about the problem i described making it slower. guess i failed the math test.

Dan (2010-03-16 10:56:07)

Timothy, Yes, very soothing. I started taking flaxseed oil a month ago, and noticed the calming effect pretty much immediately. I'm not a particularly anxious person, so I'm curious to see if people with anxiety problems respond the same way.

ben lipkowitz (2010-04-28 22:55:53)

it seems like you are measuring response time more than anything, with times in the sub-second range. perhaps you should do less trials of larger digit additions, so that you'd have to do multiple operations and juggle numbers. I think long pauses for "duh" moments ought to be included in the data. could you post your R code?

seth (2010-04-29 05:21:21)

ben, the reason for using very simple arithmetic problems is so that little learning will be involved - I already know really well that  $3 + 1 = 4$ . Use of larger numbers will allow more learning. I don't know really well that  $17 + 39 = 56$ . I have posted most of the R code - see the R code category.

peter (2010-05-04 12:21:26)

interesting results. now to turn it into a real self-experiment, you might need a few more controls to turn it into a significant trial. placebo, dose-dependent use, time of day (stress v. relaxed times), some positive control (e.g. ritalin), etc...

Physiological Computing : Better living through affective computing (2010-07-08 15:17:22)

[...] In my opinion, both arguments are sound. I would add another strand to the same debate - it seems to me that interest in self-tracking systems, such as those lifelogging experiments described regularly on the excellent Quantified Self blog, is on the rise. The technology to self-monitor is used principally for sports training, see this range of apparatus described recently in Wired. Ambulatory systems to monitor physiology are generally used for fitness training but their mere existence opens

the door for self-experimentation, outside the laboratory (to borrow from Prof. Picard's title), for the people by the people.Â As one example, see this blog posting by Seth Roberts on the effects on omega-3 on physical and mental ability: if you're really interested in self-tracking and self-experimentation, I'd recommend his paper published recently in Medical Hypotheses – full text is linked from this QS post. [...]

**Science in Action: Mysterious Mental Improvement (part 2) (2010-03-11 23:02)**

[1]Yesterday I blogged about a sudden improvement in how fast I could do arithmetic. The improvement was much larger than normal variation and happened after I did four things that I rarely did. In chronological order:

- 1. Ate about 30 g of butter.
- 2. Stood on a cobblestone mat (for 5 minutes, which was all I could bear).
- 3. Stood during the test.
- 4. Walked for 10 minutes just before the test.

To find out which mattered, I did them again in the same order and at the same times of day, but with tests before and after each one.Â If performance suddenly improved after one of them, then I'd know.

Here's what actually happened.

[2]

The last six points are the relevant results. The first of the six points (627 msec) was before everything. The second (613 msec) was after butter but before the cobblestones. The third (630 msec) was after the cobblestones but before standing. The fourth (610 msec) and fifth (603 msec) were while standing but before walking. The final one (581 msec) was while standing after walking.

I was surprised and pleased how closely the first and last scores repeated the earlier difference. The first score was close to the previous baseline; the last score was close to the previous outlier. A big improvement seems to be under my control.

Before doing these tests, my best guess about what caused the improvement was the walking. But the scores were improving before the walking so that's unlikely. Perhaps the walking was one of several factors that helped. The data suggest, if anything, a shocking conclusion: butter made my brain work better. An alternative, less consistent with [3]Occam's razor, is that butter, standing, and walking all produced smaller improvements, which together added up to the big improvement. The cobblestones produced a short-lived decrement.

That [4]pork fat improved my sleep obviously supports the butter interpretation. I should be less surprised than anyone else, but still . . . Last week I noticed something else that supports the butter explanation. At a restaurant with a friend, the waiter brought bread and olive oil. I asked for butter. I spread all of it on a piece of bread, then asked for more butter, and spread all of that on another piece of bread. (About 30 g butter total.) It was the first time I'd eaten a large amount of butter at a meal. An hour or so later, I felt unusually good, some combination of calm and warmth. I never noticed this after eating pork fat, but butter may be to pork fat as hamburger is to steak: Easier to digest. The pork fat is within cell walls; the butter fat isn't.

4. <http://www.blog.sethroberts.net/2009/10/31/effect-of-animal-fat-on-sleep-more/>

---

David (2010-03-12 00:58:12)

You're catching on, Seth...despite all the demonizing it gets from the mainstream media, animal fat is the stuff of life. I suggest looking up the Paleo movement (this guy, a well-written, levelheaded MD, is a good place to start: <http://www.paleonu.com/what-is-panu/>); most of us eat diets primarily composed of animal fat, and credit it with improved fitness, sleep, mental functioning, and general health. As for the difference between pork and butter, the difference isn't whether the fat is trapped in cell walls, but whether it's saturated or unsaturated. Butter is 51 % saturated fat by weight; pork belly is only 19 % (calculated from [nutritiondata.com](http://nutritiondata.com)). Repeat your comparison with other foods high in saturated fat (such as coconut), and I suspect you'll find the same results.

Alex Chernavsky (2010-03-12 05:55:28)

Seth, how does your testing program account for mistakes in arithmetic? Do those data points just get dropped? Just curious.

seth (2010-03-12 07:09:30)

David, thanks for the link. As for pork fat vs. butter, I divided my pork belly into meat and fat – physically divided it – and made sure I got plenty of fat. For example, 100 g in one meal. Pork fat is about 40 % saturated fat. So I got more saturated fat from my pork fat than I got from my butter. I'm not sure I'm catching on: butter is not a paleolithic food. Pork fat is much closer. Standing and walking and walking on rocks are very paleo. Butter was the least paleo thing I did, yet it appeared to be the most effective. Alex, trials with errors are dropped from the numbers used to compute average reaction times. I do an analysis that adjusts for overall error rate.

Eric (2010-03-12 10:24:58)

I'm curious if coconut oil or palm oil(the stuff which is called organic vegetable shortening at my store) would have a similar effect? It should by your theory. But I have no idea how available those things are in Beijing.

Aaron Blaisdell (2010-03-12 11:35:04)

Great self-experimenting! I think it would be very useful to redo your experiment with the four manipulations delivered in various orders to really isolate the individual factors by balancing out order effects. If you replicate the butter effect (which is not surprising to any one who knows of the work of Weston A. Price), then it would be interesting to do direct comparisons among various dietary lipids, such as coconut oil ( 90 % medium chain saturated fats), lard, tallow, butter, olive oil, and fish liver oil. I'd love to see a comparative analysis of the effects of fatty acids on cognition.

Ed M. (2010-03-12 19:16:37)

I would second David's suggestion of Panu and add Peter over at hyperlipid... <http://high-fat-nutrition.blogspot.com> I've been on a ketogenic diet for almost a year and have never felt better.... Lost quite a bit of weight too... -Ed

Isa Test (2010-03-12 23:51:44)

Will this help to raise my metabolism as well?

Jaroslav (2010-03-13 13:07:27)

"Pork fat is about 40 % saturated fat. So I got more saturated fat from my pork fat than I got from my butter." Actually pork fat reflects what the pig ate because of how it's digestive system works. If you feed pig corn and soy, it's fat is going to be a lot more unsaturated then the nutritional tables are telling you. On the other side cow has bacterias in rumen that will saturate the polyunsaturated oils she eats. Rest assured that you ate a lot more saturated fats with butter then with lard. "I'm not sure I'm catching on: butter is not a paleolithic food. Pork fat is much closer." I would not fall for this paleo dogma. We are mammals. It's paleo only in the mythological thinking of the "let's do every stupid thing hunter-gatherers did" kind, but metabolically speaking it's a nonsense. Butter is easier to absorb because it's higher ratio of short and middle chain fatty acids mean that it needs less action from your digestive system, and for the same reason it's also better fuel. Same for coconut oil.

CTB (2010-03-13 14:42:26)

As an addendum to Jaroslav's comment: I remember hearing a story in nutrition class about how farmers in Great Britain tried to up the ratio of unsaturated:saturated fat in pigs by modifying their feed. They were so successful that when the slaughtered carcasses were hung up on the meat hooks, the fat just dripped off like oil.

Dean (2010-03-14 11:16:45)

Hand activity prior to solving equations could count as another parameter. Since buttering the bread could be counted as hand activity, it might be more accurate experimenting to butter the bread before the baseline is measured, or solve equations after buttering but before eating the butter. Also how long after eating the butter do you solve the equations? Maybe there is an optimal time to wait to obtain the best results.

seth (2010-03-14 13:16:22)

Dean, why do you think that hand activity might matter? In the case of the anomalous results, I ate the butter a few hours before the test. And the effect - the improvement caused by the butter - seemed to grow during those hours, which is what you'd expect as a nutrient is gradually absorbed.

Marly Harris (2010-10-03 10:13:43)

I'm a bit late to the party (your entry was dated March, 2010) but as a sexy old woman (77), my mantra is butter is a reason to wake up in the morning. I've gone through every type of butter available, hoping that the organic grass-fed type (truly deep yellow in color) would be the best but Jana Valley (Czech butter) is number one for me. People are always asking how, at my advanced age, I am wrinkle free and when I say that I eat lots of good saturated fat, they shudder.

q (2010-03-12 19:44:58)

Wish I could read more of the food on brain link without spending \$32. Library, maybe.

Dave Lull (2010-03-13 06:41:13)

'A Sceptical Look at "A Skeptical Look at Karl Popper' by J.C. Lester: <http://www.la-articles.org.uk/popper.htm>

Dennis Mangan (2010-03-13 06:54:56)

You can read it for free, here: <http://www.physci.ucla.edu/research/Gomez-Pinilla/publications/nrn2421.pdf> Quite often, searching for the paper at Google Scholar will turn up some site that has posted the paper, in this case it looks like Physical Sciences at UCLA.

Dan (2010-03-13 10:41:54)

What do you think of the evidence in your second link? They say "diets that are high in saturated fat are becoming notorious for reducing molecular substrates that support cognitive processing and increasing the risk of neurological dysfunction in both humans [3] and animals [4].", which seems to be evidence against your animal fat hypothesis. [3] Greenwood, C. E. & Winocur, G. High-fat diets, insulin resistance and declining cognitive function. *Neurobiol. Aging* 26 (Suppl. 1), 42â€“45 (2005). [4] Molteni, R., Barnard, J. R., Ying, Z., Roberts, C. K. & Gomez-Pinilla, F. A high-fat, refined sugar diet reduces hippocampal brain-derived neurotrophic factor, neuronal plasticity, and learning. *Neuroscience* 112, 803â€“814 (2002).

Andrew Gelman (2010-03-13 16:04:28)

Hi, Seth. Martin Gardner is a good writer and a serious person but I don't think he knows what he's talking about on this topic.

thehova (2010-03-13 19:50:06)

I've always been a big fan of Karl Popper for his support of experimentation and his skepticism of Freud and psychology of his time (that, by itself, makes him important....Popper was an early proponent of Cognitive Behavioral Therapy).

seth (2010-03-14 13:24:58)

thehova and Andrew, I included that link because I've always been anti-Karl Popper. His ideas seemed to point in the wrong direction if you wanted to do good science. For example, his emphasis on falsification. In practice, quite often, I don't "test" theories, I assess their value – their value in finding solutions to problems, for example. When I use evolutionary ideas to suggest treatments to try, I'm not testing evolutionary theory. Nothing I know of Popper's work shows any sign he understood this basic point. As someone has said, all theories are wrong but some are useful.

Andrew Gelman (2010-03-15 02:12:34)

Seth: What's relevant to me is not what Popper "understood." Based on my readings, I think Lakatos understood things much better, and in fact when I speak of Popperian ideas I'm generally thinking of Lakatos's interpretation. (Lakatos himself did this, referring to constructs such as Popper \_1 and Popper \_2 to correspond to different, increasingly sophisticated versions of Popperianism.) What's relevant to me is not what Popper "understood" but what he contributed. I think his ideas, including his emphasis on falsification, have contributed a huge amount to our understanding of the scientific process and have also served as a foundation for more sophisticated ideas such as those of Lakatos. When considering contributors to human knowledge, I think it's best to take an Earl Weaver-esque approach, focus on their strengths rather than their weaknesses, and put them in the lineup when appropriate. (As the publisher of two theorems, one of which is true, I have a natural sympathy for this attitude.) Regarding the specific question of how Popper's ideas of falsification relate to applied statistics (including the quote at the end of Seth's comment), you can take a look at my [1]2003 and [2]2004 papers and my recent [3]talk. The basic idea is that, yes, we know our models are wrong before we start. The point of falsification is not to discover that which we already know, but rather to reveal the directions in which our models have problems.

## **QuietComfort 15 Headphones (2010-03-14 19:07)**

The [1]QuietComfort 15 headphones ( \$300) are Bose's newest noise-cancelling headphones. I had two of an earlier model, the QC 2, because when they broke I couldn't bear to be without one for two weeks. I used them while walking on my treadmill and riding the subway. BART is noisy.

The model numbers went 1, 2, 3, 15. And, yeah, the QC 15 is much better than the QC 2 and QC 3, which were about the same. The first time I wore them on BART, when I got out of the subway I noticed I didn't feel exhausted, the way I usually did after a subway ride. I felt normal. The noise had been exhausting.

1. [http://www.bose.com/controller?url=/shop\\_online/headphones/noise\\_cancelling\\_headphones/quietcomfort\\_15/index.jsp](http://www.bose.com/controller?url=/shop_online/headphones/noise_cancelling_headphones/quietcomfort_15/index.jsp)

---

Robin Barooah (2010-03-14 19:23:08)

I did the same experiment on BART after noticing how much less exhausted I felt after flying with QC2s. I've ended up using Apple's in ear ( \$80) earbuds which block out a lot of sound as a regular compromise. They aren't as good as the QCs, but they are a lot easier to wear in public. I find that the noise of busy streets is similarly exhausting, and these have made a huge difference to my general sense of well-being.

Timothy Beneke (2010-03-14 23:03:55)

My days typically involve a total of 24 minutes walking to and from BART stations along a big noisy street, about 10 minutes of waiting on BART platforms and 16 minutes of BART rides – I now always wear Mack earplugs, have been for 3 or more years – life is much calmer. I can relax and "hear myself think". It seems to accentuate my vision – I notice more visually. I would predict that it lowers my blood pressure a little... It took a few days of adjustment before I became comfortable wearing them, but now, they are essential....

wcw (2010-03-15 00:28:29)

I agree, steady noise causes fatigue. Airplanes are the worst for this. I very strongly recommend '[1]musicians earplugs' instead of noise-canceling headphones.

1. <http://www.etymotic.com/ehp/erme.aspx>

Ben Casnocha (2010-03-15 14:26:01)

This finally pushed me over the edge. Just bought them.

griff (2010-03-15 15:12:42)

I prefer the in-ear headphones that suppress external noise due to their flanged plugs (like earplugs). They are very small and require no power source. They are great for yardwork when using the lawnmower or leaf blower which is also a great opportunity to listen to a good book.

Nansen (2010-03-16 15:29:48)

@ Timothy Beneke, you might want to try Flents "Quiet! Please" Ear Plugs. The NRR 29 gives you 7 extra decibels of noise reduction over Mac's. 25 pair cost \$8.00. Downsides: a little time-consuming and solipsistic.

Stephen M (Ethesis) (2010-03-16 17:30:21)

I used to buy foam ear plugs by the industrial case for my wife when she was in nursing school and then working on her CRNA – she would use them and give them to friends. They work very well. You can clean them by tossing them in the laundry, just put them in a button down pocket on a pair of pants or a shirt. They really worked well. Flents is a brand of foam ear plugs. Of course you can't listen to music or podcasts with the earplugs the way you can with noise cancellation ear phones.

seth (2010-03-16 22:40:58)

the new headphones make possible something that wasn't possible before: Watching a film on BART on the way home from San Francisco. The below-bay portion of BART is very noisy.

### **Scary Kombucha (2010-03-15 06:04)**

[1]During a 2009 FBI/NYPD raid of a house in Queens

A hazmat team in full protective gear was brought in to investigate a jar of kombucha tea fermenting in the basement.

The police seized a Mao Zedong refrigerator magnet, among other things.

### **Sandy Tesch on Fund-Raising (2010-03-15 15:01)**

At Berkeley, one of my most unusual students was a psychology major named Sandy Tesch, who by then had risen through Red Cross volunteer ranks to be on their national youth council. A few years later she was head of the youth council. During college, she assumed that after she graduated, she would work for a non-profit. Now, however, she does fund-raising for the UC Berkeley library.

She won a post-graduate fellowship and during her fellowship year she met a woman who worked in fund-raising. She realized she liked it. Why? I asked. Because when you do fund-raising, you're working with a lot of caring people, she said. They're like the volunteers she worked with during her Red Cross years. Instead of giving time, they're giving money.

[1]Peter Hessler on Peace Corps volunteers.

1. <http://www.newyorker.com/online/blogs/newsdesk/2010/03/peace-corps.html>

---

Melissa (2010-03-15 17:38:30)

People sure are different. When I did fundraising I thought it was absolute hell- boring, beggingly, and not actually producing anything real. I always thought the people who solicit strangers in the street for Greenpeace and other assorted causes had a hellish job too...but recently I met someone who loved doing that too! I guess people think my job, web development, is boring, but I love creating things and solving difficult technical problems.

Andrew Gelman (2010-03-16 02:29:01)

Seth: Why do you say "however"? The university library is non-profit, no?

seth (2010-03-16 07:15:05)

Andrew, UC Berkeley is not called a "non-profit", no. The noun and the adjective have different meanings. The "however" is essentially hers, not mine. She said, "I thought I would work for a non-profit".

## Learning Chinese (update) (2010-03-17 03:53)

I've spent seven months living in Beijing. Since that started (October 2008) I've wanted to learn Chinese. I've tried many things. Now, finally, I think I've found a method that works for part of it (written vocabulary).

There are four aspects:

Content. I'm learning the basic 800-odd words covered in [1]Learning Chinese Characters by Alison and Laurence Mathews, which are those required by a certain standard Chinese Language test (HSK Level A). I use their make-a-story method for each character.

Study Method. I use [2]Anki. It's like flashcards, but with a near-optimal mix of old and new cards. [3]Comparison of Anki with similar software. When I used actual flashcards, I didn't do a good job of mixing old and new cards. I found a Anki deck already made for the Mathews book. The Mathews will be glad to know that the (free) Anki deck plus (free) Anki software make their book more valuable. I constantly consult it for help.

Catalyst. [4]I walk on a treadmill to make studying pleasant.

Minimalism. When I told a Chinese friend I was just learning the meaning of each character, not the pronunciation, she frowned. After that I tried to learn the pronunciation, too. But now, trying to learn the pronunciation at the same time, the whole thing goes too slowly. The pronunciation is much harder than the meaning and less useful. Learning just the meaning is much faster and makes the whole thing seem more doable.

More [5]The origin of Anki-like programs. [6]An approach similar to the Mathews's.

---

Sam (2010-03-17 06:46:43)

The best language-learning experience I ever had was a summer course at age 20 at the U of C (the good one, in Illinois, called French for Reading Knowledge. We paid no attention at all to pronunciation, conversation - we just ground through the grammar as we read more and more. I was left with the memory of many sentences that worked which I picked up from Gide and Giono, and can still read it easily. When I met a Frenchman in the next few years, I would amuse him with my pronunciation but amaze him with the complex ideas I could express - had I continued or lived in France for a few months, I would have been fluent. Alas, I didn't. On the other hand, in German classes from 3rd grade to Freshman in college, I learned it all - and now have very little (although I can sort of answer questions put to me in German in English). My "sense" of French after 6 weeks of study remains better than my sense of German after 10 years of study - 35 years later. Let your Chinese friends frown. Pronunciation excellence avails you naught if you can't find the words, or can only bore your hearers.

M (2010-03-17 08:08:54)

It seems you have independently discovered the philosophy of [www.alljapaneseallthetime.com](http://www.alljapaneseallthetime.com) (Which is also a very useful

approach to learning Chinese!)

Kevin Miller (2010-03-17 08:23:17)

I would echo the advice to learn pronunciation as well as meaning, for two reasons. First, because as you learn more characters they become more regular, with useful keys to both pronunciation and meaning. The more cues you have to a character the less like you are to have retrieval failures. Second, since you spend time in Beijing, it makes to learn as much spoken Chinese as possible, and to do that it is important to integrate spoken and written language (particularly because Chinese has so many homophones at the level of characters, given that there are an order of magnitude fewer syllables than English has). A really fascinating book, now out of print, that touches on these issues is David Kelley's "Deciphering the Maya script." It describes two attempts to decipher non-alphabetic scripts (Mayan and hieroglyphics) that only succeeded when they were able to connect them to the closest remaining spoken languages. I believe he also says that students at Harvard in the mid 1900s would try to learn classical Chinese using a meaning-based method (since we don't really know how classical Chinese was pronounced) without great success. I think you're right that if you had to pick one thing to focus on, meaning over pronunciation would be the right thing to do with characters. We published a study a few years ago in JEP:LMC looking at how readers of English and Chinese responded to errors that are either visually similar to or phonologically similar to what should have been there (e.g., "Paul Revere rode/robe/road his white horse"). The basic finding was that Chinese readers used visual and phonological similarity as about equal cues, but English adult readers just used phonology beyond the very first fixation, so "road his white horse" is usually fine and "robe his white horse" never is. (Feng, G., Miller, K., Shu, H., & Zhang, H. (2001). Rowed to recovery: The use of phonological and orthographic information in reading Chinese and English. *Journal of Experimental Psychology: Learning, Memory, and Cognition*, 27, 1079-1100.) But the neat thing about the trek you're on is that you can try different strategies and go back and relearn what you missed. Really a perfect field for self-experimentation, which has certainly been my experience.

Eugene (2010-03-17 08:31:21)

This sounds familiar to James Heisig's approach, where he also separates the meaning from the reading (pronunciation) of Chinese characters, and focuses on creating mnemonic clues based on the radicals. Scroll down to the bottom of this Wikipedia entry for links to free sample PDFs. [http://en.wikipedia.org/wiki/Remembering\\_the\\_Kanji](http://en.wikipedia.org/wiki/Remembering_the_Kanji)

Aaron Blaisdell (2010-03-17 10:09:51)

Seth, don't be scared off by the shallow learning curve at first when trying to learn pronunciation along with meaning. The learning curve is non-linear and will accelerate as you continue, for the reasons put forward above by Kevin.

Lucky (2010-03-18 07:49:58)

I once had to learn enough Chinese to get by thanks to a quick unexpected trip (for a funeral of all things) to China. I heard from a military intelligence friend of mine that in his unit, he learned that when you need to learn a new language, if you engage in cross-dominant physical activities (crossing your legs and arms, doing things with both hands at the same time, etc, there is actually an exercise program called Brain Gym that they used), then you will learn at a significantly faster rate. It worked for me, it worked so well, that I now use those Brain Gym exercises when I need to learn anything at all!

Patrik (2010-03-18 17:46:32)

Funny how little we actually know about the best way to teach/learn/acquire a language in adulthood. Bottom line: for the vast majority of us, learning to speak another language fluently, after the age of 13 or so, is really effin' hard.

## **Journalists and Scientists (2010-03-17 16:48)**

[1]A few days ago I quoted an editor who works for Rupert Murdoch as saying that journalists care too much about impressing their colleagues and winning prizes and not enough about helping readers. [2]Here is Walter Pincus, a

Washington Post reporter, saying the same thing:

Editors have paid more attention to what gains them prestige among their journalistic peers than on subjects more related to the everyday lives of readers. For example, education affects everyone, yet I cannot name an outstanding American journalist on this subject.

I quote this to support the Veblenian view I've expressed many times on this blog – that scientists would rather do what gains them prestige among their peers than what helps the rest of us, who support most science. I think it's hard to understand the success of [3]my self-experimentation (e.g., new ways of losing weight) until you understand this aspect of science. I was successful partly because my motivation was different.

1. <http://www.blog.sethroberts.net/2010/03/04/one-man-vs-all-education-professors/>
2. [http://www.cjr.org/essay/newspaper\\_narcissism\\_1.php](http://www.cjr.org/essay/newspaper_narcissism_1.php)
3. <http://escholarship.org/uc/item/2xc2h866>

---

Nathan Myers (2010-03-17 22:17:34)

This isn't a statement about scientists. It's a statement about all identifiable groups everywhere. It arises from the Iron Law of Institutions, which notes that people will almost always act to raise their standing within their immediate organization even where such action interferes with the goals of the organization.

tom (2010-03-18 15:05:45)

I'm not sure journalism is a good example of peer prestige driving decisions, and I'm really not sure that education is a good example of it: 1. Most papers are very customer-driven and less peer-driven. They don't include big sports sections, or comics, or offer Sudoku, for their peers. They include them because readers like them. They also do a lot to try to keep their advertisers happy. Scientists may be different because their customers and peers are often the same, or at least in the same group. (I'm guessing this about scientists.) 2. Papers probably don't do more education reporting for very good reasons. First, few readers care enough to buy a paper based on education reporting, whether local or national. Second, big papers are deeply constrained by what it is publicly permissible to discuss about education. My own view is that 90 % of the education debate today is about pretending that the biggest difference between good and bad schools is NOT the qualities of the students who go there. A big city newspaper cannot ever come out and agree with that, so it must always report some version of "x students are doing poorly; therefore we must not be doing/spending enough to support x students." I'm probably happy that they don't do more of that than they already do. 3. The journalists and editors who are peer-centered are probably looking for Pulitzer bait stories. But I'd bet that's a small part of budgets and focus.

Anthony (2010-03-18 15:30:59)

"Second, big papers are deeply constrained by what it is publicly permissible to discuss about education. My own view is that 90 % of the education debate today is about pretending that the biggest difference between good and bad schools is NOT the qualities of the students who go there." This is a good point. Also, because the US is multiracial, there is also the large Black-White (and Black-Asian, and to a lesser extent White-Asian) average IQ score differences lurking in the background. I.e., the reason Black inner-city schools do so poorly is partly because the Blacks at them have low average IQs. But you can't say that. Rather, the whole debate is about how to remove differences in educational outcomes, but those are of course largely correlated with differences in IQs.

seth (2010-03-18 15:58:10)

"Scientists may be different because their customers and peers are the same." Only if you don't think science should benefit those who pay for it. Tom and Anthony, Pincus had other examples.

Patrik (2010-03-18 17:43:13)

This desire for peer-praise is a very human condition. I work with web designers on large, e-commerce projects and often see them design such that their peers would approve, when they should designing for conversion from visitors into buyers.

Alex Chernavsky (2010-03-18 18:34:08)

"People everywhere enjoy making their messages sound more complicated than necessary. In all professions, people enjoy using language to convey the feeling, 'my field is so complex ordinary mortals could never understand it.' Children establish superiority over peers with pig Latin. Lawyers do it with gobbledygook, truck drivers with citizens' band jargon, and scientists (and educators) with the language of grantsmanship. [...] Many perfectly honorable people write in heavy language because it is an ego trip; they are writing to impress, not to express." –Albert Joseph, *Quarterly Review of Doublespeak*, July, 1981

tom (2010-03-19 18:00:59)

Seth, I meant that you are more likely to be right about scientists than Pincus is to be right about journalists. Complaints like Pincus' have been made for years, but journalism has always gotten much more independent feedback from large numbers of non-journalist users (readers and advertisers) than scientists do from large numbers of non-scientist users. Pincus' complaints and his examples in the ungated excerpt (education, food, subprime mortgages) are weak. Each of these subject could be customer/reader focused. But I think Pincus is thinking of something different. He wants the paper to push for social change at the government level with exposes of bad systems in need of better and bigger regulation. If you were an editor, you would probably commission articles on what individual readers should do differently with their own food, education, and finances. If Pincus was an editor, he would want stories that would encourage Congress to review/fund government programs, etc.... So I think you're misreading Pincus' complaint as being similar to yours. If anyone found a non-gated link, please post it.

Michael Metcalf Bishop (2010-03-23 17:04:34)

A washington post reporter can't name an education reporter? Jay Matthews is probably the best in the business <http://voices.washingtonpost.com/class-s-truggle/>

## Best Use of Smiley Face (2010-03-17 17:21)

:) :> :) – I'm bad at emoticons. But I appreciate other people's work. From [1]an article about the Lehman report:

“So it's legally doable but doesn't look good when we actually do it? Does the rest of the street do it?” one Lehman employee asks another in emails included in the report. The answers, respectively, are yes and no, followed by a smiley face.

## Michael Lewis Echoes Veblen (2010-03-17 21:16)

Describing those who made money in the subprime mortgage market, [1]Michael Lewis said this:

They were outsiders to the market that they were betting on. And in addition, they were, in many cases, personally curious people, not clubbable members of the group. And I think that was a key to the success. I think that the fact that they didn't feel compelled in any way, on any level, to think like other people gave them an advantage.

This is what Thorstein Veblen said about Jews in a 1917 essay titled "[2]The intellectual pre-eminence of Jews in modern Europe." Being outsiders gave them freedom of thought. Lewis may have read that essay. A few years ago, he compiled [3]an anthology of economic classics, one of which was Veblen's Theory of the Leisure Class. I mentioned this essay [4]earlier.

Nile (2010-03-18 19:39:24)

The man who did more than anyone else in the 20th century to prevent nuclear war [Herman Kahn] has a few illuminating paragraphs on educated incapacity. I have observed it is very difficult for the average American, raised in a protective cocooning environment to engage in "reality testing" [http://www.hudson.org/index.cfm?fuseaction=publication\\_details&id=2219](http://www.hudson.org/index.cfm?fuseaction=publication_details&id=2219)

seth (2010-03-18 19:49:36)

Thanks, Nile. Kahn attributes the term "trained incapacity" to Veblen. An example: "If a new cure happens to be developed that is at variance with accepted concepts, the medical profession is often the last to accept it. This problem has always existed in all professions, but it tends to be accentuated under modern conditions."

## **Eczema, Nighttime Cough, Antibiotics, and Fermented Food (more) (2010-03-18 19:24)**

This comment was made recently on [1]an earlier post:

I am so glad I found this blog.

My daughter has had coughing fits for 24 months (she's 5 1/2 yo).

Inhalers, several doctors, nothing helped. She routinely coughed until vomiting. After one 10 hour coughing fit I reached my limit and scoured the web.

After putting in her whole medical history as search qualifiers I found this [post]. The prior eczema and antibiotics were key indicators.

After 3 days of drinking 1 probiotic shake a day, she showed very marked improvement. After 1 week, no symptoms. This is a girl who's been unable to run and play for 2 years. Who woke up coughing and gagging most nights.

After 6 weeks of the same regimen, she still shows no symptoms and is running and playing full blast.

The pulmonary specialist discounts the results we've seen as a fluke . . . we'll see. Previously my daughter's lung capacity was measured at 47 % of expected.

"Unable to run and play for 2 years"! I'm impressed. Not only (a) the improvement is huge, but also (b) it resembles verification of a prediction, not just something a theory can explain, (c) it wasn't obvious to "several doctors" or (d) the rest of the Internet, and (e) after it happened it was dismissed by an expert, even though the evidence for causality is excellent. The verification aspect reminds me of [2]Pale Fire:

If on some nameless island Captain Schmidt  
Sees a new animal and captures it,  
And if, a little later, Captain Smith  
Brings back a skin, that island is no myth.

Sam (2010-03-19 14:44:10)

I introduced my daughterinlaw to kombucha. Both her and my granddaughter have suffered horrible skin rashes all there lives. After drinking a glass per day for a week there was a marked improvement and shortly after that the rashes were completely gone. Many "cures" had been tried previously including subsription medicines with no improvement at all.

John (2010-03-26 21:12:02)

I have been stunned at how my sinuses have improved over the last four months after ingesting larger quantities of probiotics. After reading Huffnagle's book The Probiotics Revolution and your writing on the umami hypothesis (which led to an attempt to make the most umami-infused high-fat burger ever), I'm now eating 1-2 c yogurt day, taking Culturelle Lactobacillus (1/day) and several other bacteria-laden products. While I still have allergies, I have only had stuffed sinuses twice (for one day each time) for the last four months! I had been known at work as the guy who sneezed coming in and had suffered from extreme sinus closure (neti pots didn't help, decongestant rebound was a problem). I still sneeze from allergies at times but they seem to have gone down as well. Also, 4 caps of flaxseed oil per day--still helping my gums. Fish oil seems to work better for my mood and thought process, though. Am now trying the Shangri-La diet (appetite suppression strategy)....you're a star, Seth!

Top Bottom Middle Smart « Rhymes With Cars & Girls (2010-03-27 07:06:44)

[...] You need to read this post from (again) Seth Roberts. If I'm reading correctly, he (a blogger) basically cured a 5 year old girl of coughing fits that were ruining her childhood. By blogging. [...]

## Natto is Nothing . . . Try Funazushi (2010-03-21 10:46)

From [1]a travel guide to Hikone, a town near Osaka:

But natto is nothing. The real test of gastronomic mettle in [Japan] is funazushi.

A challenging plate of funazushi.

This forerunner of all sushi comprises fish that have first been salted and then had the salt soaked out before being packed into large crocks between layers of cooked rice and left to "mature" for two or three years. The resulting utterly ungodly stench from this finny fare is enough to make a grown man practically keel over.

But, reflecting that some fine-tasting cheeses have a rancidity not unlike that of diaper contents, I tried it. And of course the stuff tastes exactly like it stinks. The official guide to Hikone cheerfully observes that funazushi is often referred to as the "king of delicacies."

1. <http://search.japantimes.co.jp/cgi-bin/fv20100321a1.html>

---

Aaron Blaisdell (2010-03-21 11:48:56)

I'll try anything twice. Although it took more than 2x to come to enjoy durien--the king of fruits. I wonder how long it would take me to come to enjoy funazushi? If it's anything like the fermented high-vitamin cod liver oil I drink daily, then perhaps not long at all. ;-)

marmolillo (2010-03-21 13:02:19)

Sound like the Roman Garum: <http://en.wikipedia.org/wiki/Garum> For them it was a delicatessen, but not for everybody even in those days. According to experts the taste of fermented garum would be challenging for standards gourmets.

Melissa (2010-03-21 20:30:54)

Sound like the Swedish Surströmming

### **Noseclipping Success (2010-03-21 18:42)**

If you read [1]Andrew Gelman's blog, [2]this will be old news:

The other day I was talking with someone and, out of nowhere, he mentioned that he'd lost 20 kilos [44 pounds] using Seth's nose-clipping strategy.

1. <http://www.stat.columbia.edu/~gelman/blog/>

2. [http://www.stat.columbia.edu/~cook/movabletype/archives/2010/03/clippin\\_it.html](http://www.stat.columbia.edu/~cook/movabletype/archives/2010/03/clippin_it.html)

---

### **Millennium Village Evaluation (2010-03-22 07:17)**

When I started college, I started reading harder books. I noticed something no one had told me about: Only some of them made sense. In some cases (e.g., Theory of the Leisure Class), there was a general statement I could understand and examples that clearly supported it. In other cases (e.g., Freud), I had difficulty understanding what was being said. I stopped reading the puzzling stuff.

I thought of this experience when, thanks to [1]Marginal Revolution, I read [2]Michael Clemens's comments on how the Millennium Village project should be evaluated. This makes sense, I thought. His points are clear and he has evidence for them. (I wish he hadn't used the words scientific and scientifically, which confuse me, but that's minor.)  
In contrast, when Jeffrey Sachs [3]explains the absence of comparison villages like this:

he [Sachs] does not like the idea of going into a village, subjecting poor people to a battery of questions and then leaving them empty-handed.

I'm confused. In grad school I learned that a good way to test for causality in an experiment is to test different dosages of the treatment; if the treatment has an effect, different dosages should have different effects. (And the two groups will be more alike than a treated group and an untreated group.) Other villages could have been given small amounts of aid in return for cooperation.

The whole Millennium Village Project reminds me of a 7th-grade science-class demonstration I [4]mentioned earlier. Our teacher, Mr. Tanguay, put a bunch of ingredients (water, sodium, calcium, etc.) mimicking the composition of the human body into a big graduated cylinder. This is what the human body is made of, he said. When we put them all together let's see if we get life. The final ingredient he added caused the whole thing to swirl around for a little while but needless to say there was no life.

The easy way to create life is to connect new ingredients with existing life. (As I do when I make kombucha and kefir.) Likewise, the easy way to create new economic life is to connect dead economies with existing economic life. It can be as simple as people in poor villages moving to cities, as is happening in China. No one is paying them to move. To pump money into this or that poor Chinese village could easily delay the migration – which is why the long-term effects of the Millennium Village Project could easily be negative.

1. <http://www.marginalrevolution.com/marginalrevolution/2010/03/michael-clemens-on-the-millennium-village-project-1.html>
2. [http://blogs.cgdev.org/globaldevelopment/2010/03/why-a-careful-evaluation-of-the-millennium-villages-is-not-optional.php?utm\\_source=feedburner&utm\\_medium=feed&utm\\_campaign=Feed%3A+cgdev%2Fglobaldevelopment+%28Global+Development%3A+Views+from+the+Center%29](http://blogs.cgdev.org/globaldevelopment/2010/03/why-a-careful-evaluation-of-the-millennium-villages-is-not-optional.php?utm_source=feedburner&utm_medium=feed&utm_campaign=Feed%3A+cgdev%2Fglobaldevelopment+%28Global+Development%3A+Views+from+the+Center%29)

Alex Chernavsky (2010-03-23 06:34:23)

And speaking of books that make no sense, I once had a girlfriend whose favorite book was [1]*Memories, Dreams, Reflections* by Carl Jung. I tried reading it, but I never made it past the half-way point. It seemed like the most unbelievable collection of pretentious, pseudo-profound codswallop. But a small part of me had some doubt – perhaps I was just too stupid to understand the depths of Jung's thinking. Thus, many years later, it was gratifying for me to read the following book [2]review of a biography of Jung: ===== Jung was a preternaturally unclear writer and thinker: he would never say anything clearly when obfuscation would do. Whether this was from lack of talent or an unconscious appreciation that clarity led to the possibility of contradiction and even refutation, no one can say... What was Jung's lasting legacy? He founded a small and on the whole harmless esoteric psychotherapeutic cult. His doctrines will never attract large numbers of people because his writings and teachings are diffuse, contradictory, and overloaded with erudition that partakes more of pedantry than of scholarship. [...] To read Jung is to enter a world more of connotation than of denotation, of meanings hinted at rather than expressed forthrightly. To extract a definite opinion from Jung is like trying to catch an eel with soapy hands, or trap steam with a butterfly net. His esoteric erudition is formidable: it is difficult to refute a man who will not say what he means, but backs whatever he means up with a plethora of references to fourteenth-century texts. Actually, Jung was grossly superstitious, had no idea what a logical argument was, and was capable of believing the purest nonsense. =====

1. <http://www.amazon.com/Memories-Dreams-Reflections-C-G-Jung/dp/0679723951>
2. [http://findarticles.com/p/articles/mi\\_hb3345/is\\_3\\_22/ai\\_n29044108/](http://findarticles.com/p/articles/mi_hb3345/is_3_22/ai_n29044108/)

Andrew Gelman (2010-03-23 13:02:52)

Seth: I'm not saying you're wrong, but . . . you're awfully sure of yourself here. Remember how the other day on my blog you criticized an author for "taking 10 minutes to call" a person mentioned in her book . . . and it turned out that she \_had \_ tried to call him? No big deal, just a point to illustrate that sometimes you go a bit over the top.

### **Chairman Mao's Brain Food (2010-03-22 20:28)**

Hoping to learn why Chairman Mao, like me, considered pork belly "brain food", I found [1]just this:

The local government in Hunan [where Mao was from] has sought to standardize the cooking of the dish [Mao's favorite pork belly dish], in order to stem the tide of imitations that crowd Chinese restaurants.

According to stringent instructions from the government's food quality supervision and testing institute, true hong shao rou [red braised pork] can only be made with the meat of rare pigs from Ningxiang county. Officials have designated the pig, which has been bred for nearly 1,000 years, as an "agricultural treasure".

I tried pork belly from different sorts of pigs (e.g., black pigs) but never noticed a difference.

Hunan Province is also the location of West Lake restaurant, one of the largest restaurants in the world. I've been watching [2]"The Biggest Chinese Restaurant in the World," a wonderful BBC documentary about it. The owner attributes her success to her first husband, who made her furious.

1. <http://www.telegraph.co.uk/news/worldnews/asia/china/7102740/China-sets-standard-for-Chairman-Maos-favourite-dish.html>

2. <http://www.youtube.com/watch?v=VOVXQQrvEAY>

---

Marko (2010-03-23 09:07:43)

So is this restaurant bigger than Damascus Gate? <http://calorielab.com/news/2008/09/08/damascus-gate-worlds-largest-restaurant/>

seth (2010-03-24 16:21:57)

Nope, not larger than Damascus Gate. Thanks for the correction.

Andr   (2010-04-26 19:21:36)

Chairman Mao also decided to rub his teeth with green tea leaves instead of brushing them ... giving them a jade tinge.   A tiger,    he reasoned,   never brushes his teeth.    He followed his own path, but he was definitely a man with brown stained teeth!

## Science in Action: Mysterious Mental Improvement (part 3) (2010-03-23 04:31)

Previously on Seth's Blog: A few weeks ago, during a brief test, [1]I did simple arithmetic (e.g.,  $3+8$ ,  $4*0$ ) substantially faster than usual. The next day, under the same conditions, [2]it happened again. I thought of four possible reasons for the improvement:

- 30 g of butter I'd eaten a few hours earlier.
- A[3] cobblestone mat I'd stood on earlier for 5 minutes.
- Walking for 10 minutes before the test.
- Standing (rather than sitting) during the test.

I guessed it was the walking.

Since then I've been gathering data to choose between these possibilities. I've been eating butter regularly to see if there's a chronic speed-up. And I've been doing pairs of tests 20 minutes apart. The first test provides a baseline against which to judge the results of the second test. To measure the effects of the cobblestone mat I stood on the mat between the tests. To measure the effect of walking, I walked during the time between the tests. To measure the effect of standing, I stood during the second test but not the first.

The results so far suggest, to my surprise, that two of the four factors helped: butter and standing. How wrong I was!

At Berkeley, one of my students did a self-experiment that compared different ways of studying. She measured how long she stayed awake while studying foreign vocabulary. Worst turned out to be the conventional way: sitting at her desk in silence. Best was lying on her bed listening to hard rock. My new results are sort of a bigger version of the same thing: conventionally we avoid butter and sit while doing intellectual work.

Walter (2010-03-23 07:46:23)

Seth, Could it be related to the fact that butter produces a rapid rise in insulin? <http://heartscanblog.blogspot.com/2010/0-3/butter-and-insulin.html> Did you have any other food along with the butter? Walter

Original Jeff (2010-03-23 10:21:42)

Can you explain the cobblestone mat reference? Thanks, Jeff

Aaron Blaisdell (2010-03-24 07:54:15)

@Walter: After you read the Heart Scan blog, read Peter at Hyperlipid's blog: <http://high-fat-nutrition.blogspot.com/2-010/03/butter-insulin-and-dr-davis.ht ml>

Walter (2010-03-24 20:14:17)

@Aaron, Many thanks for the link. Walter

seth (2010-03-24 23:51:00)

"the cobblestone mat reference": the link shows what a cobblestone mat looks like. Chinese medicine says walking on them is good for you. I can't yet walk on mine, I just stand.

q (2010-03-26 07:13:11)

one question. i bet you've covered this before, but are you doing data entry during this test or just simple arithmetic? do you see the arithmetic questions sequentially (ie do you have to finish one before starting the next) or do you see many of them at once? are you set up to do this test without glancing up or down – without having to, say, refocus your eyes? (i'm just wondering what factors besides doing arithmetic are at play.)

### **Kombucha Popularity (2010-03-25 07:35)**

[1]A New York Times article all about kombucha! I didn't know about [2]Kombucha Exchange, where you may be able to find someone to give you a starter culture. [3]Here's a recipe that's close to what I ended up with after trying several alternatives.

Thanks to Dave Lull.

1. <http://www.nytimes.com/2010/03/25/fashion/25Tea.html?emc=eta1>

2. <http://www.kombu.de/suche2.htm>

3. <http://www.instructables.com/id/How-to-Make-a-Big-Batch-of-Kombucha/>

---

LemmusLemmus (2010-03-25 10:41:30)

OT: I thought this might interest you: <http://kottke.org/10/03/high-fructose-corn-syrup-linked-to-obesity>

Nathan Myers (2010-03-25 12:27:45)

There's no need to "find someone to give you a starter culture". You just pour in a bottle of whatever kombucha you've found you like from the grocery store. Likewise for yogurt.

Raw Food » Blog Archive » Kombucha in New York Times (2010-03-26 05:55:45)

### **Science in Action: Mysterious Mental Improvement (part 4) (2010-03-25 14:17)**

I [1]blogged earlier how I suddenly got better at an arithmetic task. The apparent causes of the improvement were butter and standing. I'm not sure this is right; I will do more tests.

While I was trying to figure out the cause something even more extreme happened:

[2]

Notice the last two points. The previous anomaly was slightly below 600 msec. The new one is close to 550 msec. After observing it, I repeated the test 20 minutes later and got essentially the same result.

I'm blown away. I've been doing tests like this – simple measures of mental function – for about two years. Nothing like this happened during those two years.

My scores on this particular test averaged about 640 msec. Sometimes they'd be lower (as low as 610) but I had no idea why. The average stayed around 640. Now, within days, the average goes down to about 600 (presumably because I was eating butter regularly) and then down to almost 550. In other words, that 640 could be improved almost 20 %! The improvement has nothing to do with practice; I was extremely well-practiced on this task. (And practice doesn't produce such a sudden improvement.)

This is something we care deeply about – how well our brains work. Unless I'm a lot worse at arithmetic than everyone else, this suggests that for many people great improvement is possible. In an astonishingly small way. (I didn't make any big changes during this time.) In a week.

1. <http://www.blog.sethroberts.net/2010/03/23/science-in-action-mysterious-mental-improvement-part-3/>

2. <http://www.flickr.com/photos/sethroberts/4462588807/>

---

Margaret (2010-03-25 15:38:32)

I've been following this series and am curious about a couple things that I don't think you've explained (I could have missed it somewhere). How do you decide when to take the test? Is it at least somewhat at random? When you take the test do you also record covariates of interest (like in this case, animal fat consumption, exercise or the mat thingy)?

seth (2010-03-25 17:20:47)

Thanks for your questions, Margaret. When do I take the test? Usually once per day, whenever I want. I don't do the test if I'd obviously do badly. There's a small effect of time of day, for which I can correct. Do I record covariates? I record

a few covariates of interest, but the current results of interest (this anomaly and the one last week) don't make use of those recordings. I can remember what was unusual recently – perhaps 4 things – and then test one by one those unusual things to see which made a difference. If I get an unusual result at Monday 3 pm and my results the previous day at 7 pm were normal, it's easy to remember, without writing anything down, what was unusual between 7 pm Sunday and 3 pm Monday.

1 (2010-03-25 20:10:33)

This is groundbreaking work! Seth is really great at being aware of himself and his ideas are all original. This blog has changed my life. I have read it since its beginning. I will share more of these ideas I read here with my customers at UC Berkeley! I have finally decided to give the book, SHANGRI LA DIET to the chair of the nutrition dept at Berkeley, who is a friendly customer of mine. I think now is a good time.

Alex Chernavsky (2010-03-26 08:17:58)

Seth, can you give any pointers to people who want to try similar experiments themselves? In particular, where can we get the software that does things like tests your memory, reaction time, arithmetic ability, etc.? I could probably write it myself, but no sense in re-inventing the wheel.

seth (2010-03-26 09:20:27)

Alex, thanks for your interest. I will post a description of the task I used. My functions are written in R. You would need to know R to use them.

q (2010-03-26 12:51:51)

yes, that would be informative. a video would be informative.

John (2010-03-27 06:57:10)

I'm as fond of animal fat and standing as much as the next guy, but how do you make sure you just aren't getting better at math from doing it over time? That's not a judgement, just an honest question...

seth (2010-04-29 21:38:45)

John, improvement due to practice long ago levelled off.

The Data Driven Life « John Suhar (2010-04-30 07:52:19)

[...] Roberts told me about his own method of measuring mental changes, a quick test he programmed on his computer that involves 32 easy arithmetic problems. The test takes about three minutes, and he has found that it can detect small changes in cognitive performance. He has used his self-tracking system to adjust his diet, learning that three tablespoons daily of flaxseed oil reliably decreases the amount of time it takes him to do math. Consuming a lot of butter also seems to have a good effect. [...]

dylan (2010-05-01 18:38:25)

hey seth, i'm an R user. can you send me your functions please? thanks!

seth (2010-05-01 23:25:23)

dylan, I have posted the functions under the category "R code".

Tommy Schmitz (2010-05-02 14:00:41)

Seth, Interesting observation about butter, and it got me perusing some of your other posts. At one point a pop-up question (an ad, perhaps) appeared asking if I were aware of Lank o Lakes spreadable butter with canola oil. Well, a few days ago we had our own weird (and off-topic) observation about butter. My girlfriend was cooking with both margarine and butter. Two spoonfuls of each were on the kitchen counter, inches apart, when a line of ants approached the spoons. Hundreds. They all went for the margarine. Not a single one approached the butter. Not to monkey with the Land o Lakes marketing strategy, but math-test mileage may vary for the ants. - Tommy.

Dan (2010-05-03 12:00:50)

Seth, my family is a strong believer in the benefits of butter. Glad to see your experiments confirm that. @TommySchmitz got me thinking about the effects of different kinds of butter. Seth, have you worked on anything like that? I was specifically thinking about organic butter and butter from cows who have no antibiotics and are grass fed ... things like that. I just found your writings today but am going to look more closely into your thoughts. Thanks.

Mike P (2010-05-03 22:24:08)

Hi Seth, It is interesting to me that you so quickly dismiss the effects of practice and time. My experience as a juggler (as well as the admittedly anecdotal experience of my juggling friends) does not bear out what seem to be the underlying assumptions[1]. In particular there is the phenomenon of the "click", a sudden increase in the ability to perform a certain trick or maintain a pattern, usually accompanied by a sense of increased understanding or an improved ability to feel what is going on or even a sense of time slowing down. These clicks sometimes happen after long, regular periods of practice and sometimes even when returning to a skill after taking a break of a month or two. Often progress is marked by several clicks, and while steady progress does occur sometimes (typically when improvement is a matter of increased endurance or speed), this seems to be the exception rather than the rule. Following a click, there is rarely complete regression to a previous level of competency, even after a prolonged lapse, a little rustiness notwithstanding. Now I'll admit, I was not paying close attention to my diet or habits when I experienced my most recent clicks (nor indeed the less recent ones), so it is possible that they were more likely to happen when I consumed a greater than usual amount of butter or fish oil. And that would indeed be interesting. I would suggest, though, that one has to be extremely careful when drawing conclusions from such a limited set of data, especially when we have so little knowledge about how the brain's abilities change over time absent the effects of dietary changes. - [1] To wit, that skill in a given area improves with practice in a more or less continuous way and tends to asymptotically approach a ceiling. Please correct me if I'm misinterpreting.

seth (2010-05-04 03:00:53)

Mike P, you write: "we have so little knowledge about how the brain's abilities change over time absent the effects of dietary changes." Take a look at the experimental psychology literature. You will find thousands of studies that measured "how the brain's abilities change over time absent the effect of dietary changes."

Lisa (2010-05-04 09:07:14)

It would be wonderful if someone could create a simple Windows application for your test. Those of us who aren't programmers could definitely benefit from this kind of cognitive check-up! It would be especially helpful for determining how well certain medications are working, and if they're throwing us off.

RJB Boston (2010-05-04 11:37:01)

Why do you suppose butter improves your arithmetic abilities? Are the French, who typically eat a lot more butter than most, better on average at arithmetic? or is this simply a case of your personal physiology and the way your biochemistry is altered with butter?

seth (2010-05-05 01:20:02)

RJB Boston, I think butter helps because our brains need certain fats to work their best. And my diet wasn't supplying enough of them. Butter has the missing fat or fats. I believe this effect isn't restricted to me, for four reasons. 1. the brain is more than half fat. 2. As far as I know, everyone thinks fat tastes good - and this reflects an underlying need, I'm sure, just the way we like salt reflects an underlying need. 3. Long ago, people ate lots of animal fat. 4. There are cultural traditions that animal fat is "brain food".

Phil E (2010-05-06 19:52:13)

Wow, you may be the only person in western society not getting enough dairy fat!

Self-Tracking is the Future « The Floating Library (2010-05-09 16:41:34)

how is this relevant?

### **Terrible Dreamhost Support (2010-03-25 21:27)**

Don't ever use [1]Dreamhost to host your website. I've had trouble with them in the past but the current problem is way over the top.

The Shangri-La Diet forums were hacked. A file was replaced and caused the forums to malfunction. It was easy to figure out what happened. To fix it, I merely needed to replace the two bad files with the correct ones.

And I had a recent backup. No problem, right?

Yet I have now exchanged six emails with Dreamhost Customer Support and have yet to figure out how to use the backup they automatically made for me and which I downloaded. I suggested that I send them the backup so they could figure out how to use it and in response they said I should make another backup! They would work with that one! They're willing to work with a backup I don't want but not with one I do! Ridiculous.

More No wonder I couldn't extract the file I wanted. [2]It wasn't there! And the tech support people had - judging from their emails to me - no idea this was possible!

1. <http://dreamhost.com/>

2. <http://www.blog.sethroberts.net/2010/03/26/even-more-astonishingly-bad-dreamhost-support/>

---

david (2010-03-26 06:07:49)

Next time they say the word "backup", say "You keep using that word. I do not think it means what you think it means."

Alex Chernavsky (2010-03-26 08:14:47)

Seth, when I Google the words "seth roberts blog" (minus the quotes), the third link on the results page has this heading: "BUY CIALIS 40 MG ONLINE | BUY CIALIS® Without Prescription | #1 ." Strangely, though, it takes me to your site, which seems to

be OK.

seth (2010-03-26 20:26:46)

Thanks, Alex. I fixed it so eventually that should go away. If you notice any other problems please let me know.

Todd (2010-03-27 22:30:34)

Seth, I also use an SMF forum for my "Getting Stronger" blog, but it is hosted by SiteGround. By coincidence, I also had my forum hacked on Thursday, and it crashed! It was being overrun by spambots (computer generated spam) from Russia and China, posting Viagra ads and the like. I thought I was getting good traffic this weeks, but it was the spambots. I contacted SiteGround and they fixed the problem immediately. I found their service is terrific. You don't get to talk to humans (except their sales department), but they have you post tickets on their site, and I got immediate response, within 15 minutes. They rebuilt my site completely from backups. I'm very satisfied. (Incidentally, I've altered my registration procedure to require reading of more difficult letter patterns, and confirmation by e-mail. So far, no more spambots.

seth (2010-03-28 04:00:02)

Thanks, Todd. I'm glad to hear that Dreamhost is much worse than other hosting services.

### **Even More Astonishingly Bad Dreamhost Support (2010-03-26 06:56)**

Dreamhost supplies a way to backup your website. You click a button, a few hours later you get an email telling you to go to a certain place to download a set of files. Those files are supposed to be the backup. That's what I did. I got a message that said:

Ta da! Â Your ENTIRE DreamHost account has been backed up now here: . . .

Note the emphasis: ENTIRE. Now it appears those files don't work. They aren't a complete backup of my website!!!

In spite of this astonishing fact, someone in Dreamhost Customer Support told me " We havent had any users report issues with the backups that we create." Amazing. No users ever!

I want to hire someone to fix the problem. If you have the technical skills to (a) repair the SMF forums (which will require upgrading) and (b) help me transfer to a new hosting service, please contact me. You can reach me at twoutopias ..[at].... gmail.com.

More Someone kindly offered to help me and the problem has been fixed. I still hate Dreamhost. When I complained bitterly about their bad backup, in reply they sent me an email that implied it was my fault! If you send me your stories about bad experiences with Dreamhost, I would be happy to post them.

Christine (2010-07-20 16:54:06)

I have had severe digestive problems with food ever since I had a breakdown 3 years ago. I was also suffering from TMJ which had not been diagnosed & was taking aspirin every 2 hours from months for the pain. Before this I had celiac disease, was lactose intolerant, and also stayed away from corn, but I was doing quite well. After this, many of the things I could eat before, including a little tomato began to really upset my stomach. I started the Intro diet with 1 tsp of sauerkraut juice (and have been taking a probiotic before I started) for 3 days & now my stomach feels on fire. I haven't done any of the rest of the diet (the bone broth). Also I have quite a rash. Should I cut the sauerkraut juice to 1/4 tsp. or stop for a bit?

Sarah Schatz (2010-08-16 12:15:11)

I would slow down on the sauerkraut and do the broth instead.

## **Why I Use Arithmetic to Measure Brain Function (2010-03-27 20:14)**

At the latest Quantified Self Meetup, I described [1]my recent arithmetic results. Gary Wolf asked why I used arithmetic to measure brain function.

The simplest answer is that it won a competition. I tried eight or so different ways of measuring brain function and it was the best. I had high hopes for all of the tests and spent a lot of time on most of them. I hoped to find a test that was as fun as playing a game yet provided the detailed and controlled info of a typical cognitive psychology task. I didn't quite get there.

The other tasks had several problems:

1. Long learning curve. My belief that our environments might be having big and unnoticed effects on how well our brains work began when I noticed that my balance was better the morning after taking 6 flaxseed oil capsules. A small amount of flaxseed oil substantially improved how well my brain worked – at least on one dimension. [2]The test I devised to measure this effect confirmed its existence but after doing it for a year my score was still improving. Obvious learning during testing makes it harder to interpret the results – you need to correct for the learning. I wanted a task where there was less room for learning. I already know arithmetic well so an arithmetic test took less practice until learning stopped.
2. Not so portable. Some of the tasks required props (e.g., a printed sheet of paper for a paper-and-pencil test).
3. Trial-to-trial interference. Wanting to cram as many trials as possible into a short time, I started with an arithmetic task with 5 blocks of 20 trials each. There were pauses between blocks. During a block, however, as soon as I finished one question (e.g.,  $3+4$ ), the next one would appear. At first, this was fine. As I got faster, though, I started to make a large number of mistakes quite often. I required 85 % accuracy and it started to take longer and longer to do 5 blocks with acceptable accuracy. The arithmetic task I use now has separated trials. Instead of 100 trials in 3 minutes I do about 32 trials in 3 minutes, but there has been no increase in the amount of time they take. (I found that 3 minutes was as long as I would comfortably do the test; 32 is simply the number of trials I can do in 3 minutes.)
4. Carpal Tunnel Syndrome. After doing a lot of an earlier task that involved just two fingers, my wrists started to hurt. The arithmetic task uses eight fingers (excluding the thumbs) equally. 1, 2, 3, 4, 7, 8, 9, and 0 are possible answers; 5 and 6 are never answers.
5. Subjective. One of the tasks I tried involved making a single motion on the touch pad. It wasn't easy to be sure I'd made one motion rather than two.
6. Small number of measures. One task I tried only generated five scores in four minutes. The arithmetic task I use generates 32 scores in three minutes. Each of the 32 scores can be corrected for the difficulty of the problem (e.g.,  $0+0$  is faster than  $6*7$ ).
7. Unpleasant outcomes. Some of the tasks were frustrating. When I didn't do well it was irritating. For some reason that doesn't happen with the arithmetic task.

A more game-like task would be better but for that I may need a new input device, like a joystick. R – the language I use to collect the data – is great for data analysis but poor for data collection. It is unlikely to work with joysticks anytime soon. My arithmetic task needs an R function that only works with Windows, which shows how bad the problem is. It's a miracle that R function exists. Maybe it was written by an experimental psychologist.

mike packard (2010-03-27 23:49:04)

Any chance you would be willing to post the source to your R program(s)?

Justin Wehr (2010-03-28 08:50:21)

I was wondering the same thing as Mike ... step-by-step instructions would be much appreciated.

Ming-Chih Kao (2010-03-28 10:46:21)

I really enjoyed your talk at the QS meetup Professor Roberts. Reaction time with simple mental tasks measure peak performance. Whereas arguably one may find average performance more directly relevant for day-to-day work. And statistically it may enjoy smaller measurement variations for making inferences. It was the first QS event I have been to. Hope to hear more of your findings in the future. Thanks!

seth (2010-03-28 11:34:42)

Justin & Mike, thanks for your interest. Okay, I will post the R code. Ming-Chi, I would think that peak performance is less variable than average performance. In peak performance, everything is pushed up against a ceiling, not so in average performance. I also don't understand how average performance could be measured.

Darrin Thompson (2010-03-29 07:28:40)

What were some of the other tasks you rejected? I had a friend who played a great deal of blitz chess on ICC. They give you a quantified rating. He had a lot of variation between 2100 and 1600. Thinking back, I wonder if that wasn't a good measure of his brain function. He had a lot of late nights. On a particularly late (early?) morning even I beat him once. I think the only factor I would control for is how much chess I played recently. I noticed that my rating would go up if I played a lot and go down quickly if I quit. Maybe that's just too big of an effect. Anyway... what did you reject?

seth (2010-03-29 07:37:34)

I rejected: 1. a two finger classification task. 2. a balance task. 3. a short-term memory task (digit span). 4. a paper-and-pencil classification task. 5. an arithmetic task where the problems are blocked rather than separated. 6. a one-finger typing task with preview (the string to be typed is shown before the signal to start typing). 7. a one-finger typing task without preview. 8. A time-discrimination task (the interval between clicks). 9. A task requiring me to move the pointer a precise distance using the touchpad. 10. A task where I move the pointer from place to place on the screen as quickly as possible. Task 9 was the most fun and I'm sorry I couldn't use it.

Patrick (2010-03-30 02:24:56)

I'd also be interested in seeing the source code for this. Pretty please :-)

jimmy (2010-04-20 22:05:59)  
i see. sounds interesting. keep us posted.

### **A Chinese Farmer Fights Back (2010-03-28 06:58)**

This is from [1]China Daily:

Every day before sunrise, Zhang Zhengxiang leaves home to walk along Dianchi Lake, one of the major attractions in Yunnan province.

The 62-year-old retired farmer carries a camera, tripod and telescope to record the pollution encroaching on the country's sixth-largest freshwater lake.

During weekends, Zhang collates his observations and sends letters to the local government, informing them of the growing pollution.

He has been doing this for 30 years.

Sounds good to me. Like my self-experimentation, he is (a) trying to change something he cares a lot about and knows a lot about and (b) slowly collecting data. In contrast to a great deal of American good works, such as [2]Jeffrey Sachs's.

In this case, unlike a lot of philanthropy, we know how the story ends:

His efforts slowly began to pay off.

In 1998, the local government shut down six mines near Dianchi because of his warnings.

In 2003, 56 large and medium-sized mines, chemical factories, and fertilizer and lime plants were closed.

Since 2008, the local government has invested about 12 billion yuan ( \$1.7 billion) to clean up the lake. .  
. .

[In 2005], Zhang was selected as one of 10 outstanding grassroots environmental activists. In 2007, he became a member of the Chinese Society for Environmental Sciences.

Last year, he was selected as one of the 20 people who have warmed Chinese hearts.

This supports what Jane Jacobs told an interviewer: "It's a funny thing. [3]You can only change something if you love it."

1. [http://www.chinadaily.com.cn/china/2010-03/05/content\\_9539996.htm](http://www.chinadaily.com.cn/china/2010-03/05/content_9539996.htm)

2. <http://www.blog.sethroberts.net/2010/03/22/millennium-village-evaluation/>

3. <http://www.blog.sethroberts.net/2008/06/21/can-you-change-something-if-you-dont-love-it/>

---

Michael (2010-03-30 15:43:35)

"one of the 20 people who have warmed Chinese hearts" What a wonderful expression. I wonder who US citizens would choose for that honor.

## How Long To Build a Subway? (2010-03-29 07:00)

From [1]New York:

**1972:** Workers use cut-and-cover to break ground on the Second Avenue subway line; only a mile of tunnel is completed before the seventies financial crisis halts construction. . . .

**2007:** Ground breaks once again on the Second Avenue subway, to be called the T line.

Slow, yes, but not [2]off-the-charts slow:

Between 1965, when construction of the Beijing subway began, and 2001, workers laid only 42 km of track.

Faster is [3]possible:

By next year, Beijing aims to have another 100 km of track up and running.

As I searched for Beijing subway info, I came across [4]this surprising blog on the [5]Beijing City Government English website. It reminds me of something that happened to me in Alaska. I went to visit a glacier. Near the glacier was a visitor's building, which had a small room with a slide show. The taped narration told how the glacier shrank during the summer and grew during the winter and described the animals that lived nearby. It was all very bland but you could tell the narrator really cared about the glacier. I was struck how rare that was: To see that someone really cared about something other than themselves and their family. I suppose this is why I was impressed [6]how much Penn State students love Penn State. This blog gave me the same feeling. The writer likes (or rather liked) living in Beijing and, much more impressively, manages to convey that. I nominate it for best blog on a government website. Unfortunately it has stopped. It's so much easier to learn when the person you are learning from really cares about the material. There's a lot I can learn from that blog.

A nice video about building Beijing's subway.

---

Kevin Miller (2010-03-29 07:39:32)

I assume the increasing progress in Beijing (at least in the underground part of the system) is due in large part to a big change in digging technology. I don't know if this link will come through, but here's a fascinating article on the Swiss company that developed the new machines: [http://www.newyorker.com/reporting/2008/09/15/080915fa\\_fact\\_bilger](http://www.newyorker.com/reporting/2008/09/15/080915fa_fact_bilger)

seth (2010-03-29 10:59:35)

Kevin, the video I link to discusses the role of these machines in Beijing subway building. There's only one in Beijing.

Nathan Myers (2010-03-30 02:15:43)

You can find lots of people who really care about all the species that will go extinct as isolated islands of habitat heat up, driving them out but offering no places left to move to.

Marko (2010-04-04 21:15:11)

I wonder how Tokyo compares. It seems there is a new subway line or extension every year that I had never even known was under construction. You can go anywhere within the Yamanote Line circle of central Tokyo and easily walk to one station or another in a few minutes. They have some lines now that are really, really deep, many escalators segments down, because they have to tunnel under other subway lines. There was a book by an ex Japanese TV journalist about "underground Tokyo" that I started to read (before I figured out it was an insane conspiracy theory book about secret underground bases and institutions) that had some interesting subway construction data, including that the cost doubles with every X meters of depth. Among other things, the amount of water seepage gets worse and worse the deeper you go.

## **Andrew Gelman's Top Statistical Tip (2010-03-30 06:04)**

Andrew Gelman [1]writes:

If I had to come up with one statistical tip that would be most useful to you—that is, good advice that's easy to apply and which you might not already know—it would be to use transformations. Log, square-root, etc.—yes, all that, but more! I'm talking about transforming a continuous variable into several discrete variables (to model nonlinear patterns such as voting by age) and combining several discrete variables to make something [more] continuous (those "total scores" that we all love). And not doing dumb transformations such as the use of a threshold to break up a perfectly useful continuous variable into something binary. I don't care if the threshold is "clinically relevant" or whatever—just don't do it. If you gotta discretize, for Christ's sake break the variable into [2]3 categories.

I agree (and wrote [3]an article about it). Transforming data is so important that intro stats texts should have a whole chapter on it – but instead barely mention it. A good discussion of transformation would also include use of principal components to boil down many variables into a much smaller number. (You should do this twice – once with your

independent variables, once with your dependent variables.) Many researchers measure many things (e.g., a questionnaire with 50 questions, a blood test that measures 10 components) and then foolishly correlate all independent variables with all dependent variables. They end up testing dozens of likely-to-be-zero correlations for significance. Thereby effectively throwing all their data away – when you do dozens of such tests, none can be trusted.

My explanation why this isn't taught differs from Andrew's. I think it's pure Veblen: professors dislike appearing useful and like showing off. Statistics professors, like engineering professors, do less useful research than you might expect, so they are less aware than you might expect of how useful transformations are. And because most transformations don't involve esoteric math, writing about them doesn't allow you to show off.

In my experience, not transforming your data is at least as bad as throwing half of it away, in the sense that your tests will be that much less sensitive.

---

Alex Chernavsky (2010-03-30 06:40:57)

And speaking of statistics, here's an interesting debunking of John Gottman's research into marriage & divorce: <http://www.slate.com/id/2246732/>

Matt Weber (2010-03-30 09:44:09)

Thanks for the links to the articles. I'm about to run a fairly large test battery using a number of different types of measure (accuracy, RT, differences in RT) and different tests of related abilities, so I'll be needing to think hard about both transformations and principal components in the weeks to come. In your experience, does using transformations and PCs make reviewers skittish? I could easily imagine people wondering why you transformed the data (cf. "less aware than you might expect of how useful transformations are"), or being disinclined to believe the results of a statistical test that wasn't significant on the raw data.

seth (2010-03-31 18:01:53)

Matt, About 10-20 % of reviewers in my experience are bothered by transformations. I simply explain to the editor the importance and acceptedness of transformations. I haven't had a problem.

jay (2010-04-01 07:05:19)

## **My Favorite Japanese Pickle: Narazuke (2010-03-31 05:24)**

I think the Japanese have the most sophisticated fermented food culture in the world. The French have cheese and grape wine; the Japanese have miso, natto, rice wine (sake), and a wide range of pickles. It's no coincidence, I believe, that the Japanese and French have two of the lowest rates of heart disease in the world, in spite of high smoking rates. Perhaps fermented food gives you a taste for smoking, which provides complex flavor.

My favorite Japanese pickle is called [1]Narazuke. It is melon or vegetables such as cucumber and eggplant pickled in sake lees (the rice left over from making sake) for 1 to 3 years. Two days ago I had a pickle from [2]Guss' Pickles

(a "New York barrel-cured sour pickle") and a piece of narazuke. After eating the narazuke, the Guss pickle, no disrespect, tasted like it was made by a 10-year-old. The complexity of the narazuke is so much greater. Which is hardly surprising because it is aged so much longer. A Guss pickle might be aged two weeks.

1. <http://en.wikipedia.org/wiki/Kasuzuke>

2. <http://www.gusspickle.com/>

---

david (2010-03-31 07:33:32)

Or maybe smokers' sense of taste is so dulled that they need strong, complex flavors. But I suspect that these fermented food traditions predate the introduction of tobacco from the Americas.

Sean Brown (2010-03-31 15:03:57)

Korean fermented-food culture is also very sophisticated. <http://en.wikipedia.org/wiki/Cheonggukjang> (my personal favorite) <http://en.wikipedia.org/wiki/Doenjang> (used in a wide variety of foods including a the Korean staples of [http://en.wikipedia.org/wiki/Doenjang\\_jjigae](http://en.wikipedia.org/wiki/Doenjang_jjigae) and [http://en.wikipedia.org/wiki/Doenjang\\_jjigae](http://en.wikipedia.org/wiki/Doenjang_jjigae) also known as "Korean miso") <http://en.wikipedia.org/wiki/Kimchi> [http://en.wikipedia.org/wiki/White\\_kimchi](http://en.wikipedia.org/wiki/White_kimchi)

Nathan Myers (2010-04-01 02:10:50)

Tobacco is also heavily fermented – it's hung in a humid barn for weeks. Smokers have many more and graver lung infections than nonsmokers, likely because they inhale so much bacteria. "Silly smokers! Bacteria belong in the guts."

Andrey Shpak (2010-04-02 08:38:55)

Russian traditional food culture also has lots of fermented food - primarily centered around cabbage, cucumbers and mushrooms (and apples in older times) - this, however, does not translate in the benefits you mention ...

## 5.4 April

### The Chinese Military and the Umami Hypothesis (2010-04-01 07:29)

In [1]an article about China's military, James Fallows says American forces are much stronger, partly because:

In modern times, American forces are continually in combat somewhere in the world. This has its drawbacks, but it means that U.S. leaders, tactics, and doctrine are constantly refined by the realities of warfare. In contrast, vanishingly few members of the People's Liberation Army have any combat experience whatsoever.

He could have used the word readiness. One reason I believe my Umami Hypothesis – that we require a steady stream of bacteria in our diet to be healthy – is the underlying logic: That a steady stream of bacteria continuously activate the immune system, keeping it in working order. Without low-level activation, the immune system will (a) react too slowly, causing noticeable colds, and (b) overreact, which causes allergies and other immune system disorders, such as arthritis.

I wonder if the same logic applies in other situations – if a constant low-level threat improves performance. Is Chinese

governance better because Chinese leadership feels threatened?

1. <http://www.theatlantic.com/magazine/archive/2010/03/cyber-warriors/7917/>

---

Darrin Thompson (2010-04-01 08:12:28)

That's why I like Arch Linux. It's a rolling release. Instead of 1 to 2 very risky upgrades per year, you do a 365 little upgrades per year. You amortize your upgrade risk.

Nathan Myers (2010-04-01 11:35:39)

Is Chinese governance better? No.

bennetta (2010-04-01 15:13:24)

"One reason I believe my Umami Hypothesis â€” that we require a steady stream of bacteria in our diet to be healthy â€” is the underlying logic: That a steady stream of bacteria continuously activate the immune system, keeping it in working order." I'll never forget the last few words of my professor in the "History of Infectious Diseases" course I took at UC Davis: "OK guys, so the moral of this story?" He chuckles, "The next time you drop a sandwich on the ground, wait five minutes, then pick it up." If you were to ask a few microbiologists, I'm pretty sure they'd agree with you.

Sheila Buff (2010-04-01 17:36:43)

For an interesting take on why it's important to keep your immune system on its toes by constant exposure to germs, see *Why Dirt Is Good* by Mary Ruebush, Ph.D. (Kaplan Publishing, 2009). Dr. Ruebush would agree wholeheartedly with the professor from UC Davis.

Laura (2010-04-01 21:31:26)

I was feeling really, extremely depressed this week because I just moved to a new place. Then, I bought Straus butter at Berkeley Bowl, since I was there. I instantly felt really happy after I ate the butter!! That's great because I have to work tomorrow morning. I bought it at Berkeley Bowl for about \$7. I will continue it to see its effects.

Larry (2010-04-05 16:06:45)

Something totally off subject. I went to see a movie a couple of months ago. When I walked in there was no one around to take my ticket so I just walked into the theater. After the movie was over I decided that I enjoyed it so much that since I still had my ticket I would leave the theater and come back and watch it again in fifteen minutes. When I returned and started watching the movie again it felt like I had seen the movie numerous times. After the movie was over and since then I can remember every single scene from the beginning of the movie to the end. I can't do this with movies I have seen dozens of times. I only recently realized the amazing recall I have of this movie so I haven't tried it again to see if it works with another movie or with anything else for that matter.

## **Health Benefits of Miso, According to the Marukome Company (2010-04-02 07:05)**

The Marukome company calls itself "the leading miso manufacturing company in Japan." As a corporate brochure says, "world-renowned Japanese longevity is deeply related to the traditional food of Japan." Miso is probably the most traditional food of Japan, in the sense that the Japanese eat a lot of it per capita, far more per capita than people in any other country. They eat lots of fish, too, but that's not unusual.

A corporate brochure for the Marukome company that I got at the recent Fancy Food Show makes many health claims for miso. Some involve the whole product. Two are interesting. 1. "Miso soup also helps prevent heart disease and diabetes." This is vague, unfortunately. 2. "In 1981, researchers at Japan's Cancer Center announced that miso soup lowers the risk of stomach cancer when consumed every day. Miso soup also lowers the risk of other cancers including liver cancer." This sounds like a survey result: daily consumption of miso was associated with lower risk of various cancers. At least it is specific enough to check.

The brochure also makes health claims based on components: Vitamin B2, Vitamin B12, Vitamin E, "Enzyme", Sabonin, etc. Each somehow improves health – for example, Vitamin B12 "reduces mental fatigue." What interests me is that "improves immune function" isn't on the list, nor does the list mention the microorganisms that grow in miso. Improves immune function I believe to be the main benefit of miso and the reason it reduces cancer. Judging by this brochure, you'd think this is a new idea in Japan, where lots of fermented foods are eaten. In Japan I met someone (a nurse) who said that perhaps a third of Japanese think that to be healthy you should eat fermented foods regularly. Perhaps the usual belief is that they improve digestion and better digestion somehow wards off cancer.

---

### **QuietComfort 15 Headphones (more) (2010-04-03 05:48)**

I wrote [1]earlier – sounding like an ad – that my new Bose QuietComfort 15 noise-cancelling headphones made me feel much better after a subway ride. The usual exhaustion was gone. Along the same lines, I recently wore the headphones during a one-hour flight. When it was over, I felt like I hadn't flown at all – I'd been sitting in a chair for an hour. This had never happened before.

1. <http://www.blog.sethroberts.net/2010/03/14/quietcomfort-15-headphones/>

---

Kyle Cordes (2010-04-03 07:51:59)

When I posted about the QC15: <http://kylecordes.com/2009/11/08/bose-qc/> ...it also sounded like an ad. I swear, it is not. As a maker of products, you know when you have done well people your customers spontaneously write things like this.

david (2010-04-03 14:58:23)

Here's the problem I've had with the (admittedly inexpensive) noise canceling headphones I've had: I leave the switch on and drain the battery. The feature I would like to see is that the headphones automatically switch off the noise canceling after, say, 3 hours. That way if you leave them on and put them away for a few days, you won't pull them out and find your batteries dead. The other feature I'd like to see is a very durable cord. I've had headphones go bad because a wire in the cord (usually where it goes into the plastic) eventually shorts out. I'd be bummed if that happened to \$300 headphones. How do QC15's rate on these points? Thanks, David

Patrik (2010-04-05 18:34:47)

I too have used noise-canceling headphones, albeit cheap ones, and they are amazing.

Brian (2010-04-29 19:03:46)

I bought cheaper noise cancellers (Panasonic) and found they didn't cancel much. They also give me a headache from the pressure. This makes me wonder if my head is wider than what the designers expected. I'm still fairly happy with earplugs for reducing fatigue when traveling.

### Assorted Links (2010-04-04 15:01)

- [1]Matt Ridley reviews The Hockey Stick Illusion. "One of the best science books in years. It exposes in delicious detail . . . how a great scientific mistake of immense political weight was perpetrated, defended and camouflaged by a scientific establishment that should now be red with shame." Of the response to Stephen McIntyre's damning critique: "I find the reaction of the scientific establishment more shocking than anything. . . Shut-eyed denial."
- [2]Answer to medical mystery is food allergies. If doctors can't recognize food allergies, they are even further from understanding their cause.
- Der Spiegel [3]looks skeptically at man-made global warming. Will Elizabeth Kolbert (the New Yorker writer) ever realize she's been credulous?
- [4]Low cholesterol bad? "Cholesterol levels in men with dementia and, in particular, those with Alzheimer disease had declined at least 15 years before the diagnosis and remained lower than cholesterol levels in men without dementia throughout that period." [5]Body weight also declines before the diagnosis.

Thanks to Peter Spero.

---

Charles (2010-04-04 16:05:34)

Of course low cholesterol can be bad. Many studies show that. In fact, after age 50 or so, low cholesterol is associated with higher mortality risk. Lowering your cholesterol for the sake of lowering it is simply a bad idea. There are a lot of other health markers you need to look at and deal with that will affect your health in more positive and wholistic ways. Cholesterol count is just the simplest way to generate profits from pharmaceuticals.

Alex Chernavsky (2010-04-04 18:15:54)

Regarding cholesterol levels as a health marker - see also this interesting article by Gary Taubes: <http://www.nytimes.com/2008/01/27/opinion/27taubes.html>

NNM (2010-04-05 10:39:44)

It's interesting that the author of the allergy essay is a professor of applied behavioral science. That seems like a very relevant

area of expertise when navigating the medical system.

Pedro J. (2010-04-05 13:24:18)

"One of the best science books in years". I love this. There is 36 reviews on Amazon and all of them give five stars. What is the probability of that?. Just look at a very popular book [http://www.amazon.com/Surely-Feynman-Adventures-Curious-Character/dp/0393316041/ref=sr\\_1\\_1?ie=UTF8&s=books&qid=1270498753&sr=8-1](http://www.amazon.com/Surely-Feynman-Adventures-Curious-Character/dp/0393316041/ref=sr_1_1?ie=UTF8&s=books&qid=1270498753&sr=8-1) and make your own statistical analysis. I guess that is probably saying something more interesting about the book than any review. :-)

seth (2010-04-05 14:15:42)

well, Pedro, I'm inclined to think it is one of the best science books in years – and I haven't seen it yet. The story of how one person put a big dent in a view held by "thousands of scientists at hundreds of universities in dozens of countries" as Elizabeth Kolbert puts it (<http://www.newyorker.com/talk/#ixzz0kGLWuGii>), sounds pretty great right away.

Nathan Myers (2010-04-06 02:00:04)

Seth, can you think of any sort of evidence that could possibly change your mind about this global conspiracy of unscrupulous climate scientists, bent on depriving Exxon of its just profits? Or does every conceivable bit of evidence lead you to the same conclusion?

Dennis Mangan (2010-04-06 05:37:38)

Nathan, you mention Exxon and "its just profits", and most AGW believers often mention Big Oil and the money it throws around. Yet climate scientists and hangers on get millions, maybe billions if you count NGOs, in grants etc. Their very livelihoods depend on adhering to the consensus and keeping the money flowing. And there wouldn't be any money for saying everything's normal, go home and take a nap. Not evidence of anything, but it calls their objectivity into question. "It's difficult for a man to believe something when his livelihood depends on him not believing it."

Nathan Myers (2010-04-07 01:37:22)

Dennis Mangan: Do you have any idea what an *order of magnitude* is? Do you think a million and a trillion are about the same, more or less? Climate scientists get paid the same whether species go extinct *en masse* or not – until civilization collapses from loss of whole ecosystems, famine, and consequent global war. They, like I, and like anybody not entirely blinkered, have an interest in that not happening. The cockroaches will survive regardless. Some humans, too, probably, but certainly not you.

Dennis Mangan (2010-04-07 06:45:17)

Nothing like an *ad hominem* when you don't have an answer.

Pedro J. (2010-04-07 11:03:28)

"Their very livelihoods depend on adhering to the consensus and keeping the money flowing" That is true in any scientific discipline. In almost any sense, being in the mainstream science is incentivized, but that does not mean mainstream science is necessary wrong (in fact, it is mainstream science because it reached some threshold where an important part of the community of experts thought there was strong evidence to support it). To judge a theory just look the peer reviewed literature... Yes, I know your next comment will be about peer review process. So to save a few words from you, everybody knows it is far from perfect. Maybe 50 per cent papers are wrong, but one thing you can be sure of is that outside the peer-review literature the wrong claims are 100-epsilon percent.

Nathan Myers (2010-04-07 11:59:23)

Dennis: Do you have any idea what *ad hominem* means? It's easy to look up. Hint: it's not just a magic spell to recite when you don't want to address substance.

Dennis Mangan (2010-04-07 12:27:34)

"Dennis: Do you have any idea what ad hominem means?" There's another one.

Nathan Myers (2010-04-07 17:22:19)

No, it wasn't. So, you can't even be bothered to look it up.

### **"My Porphyria Went Away" (2010-04-05 13:12)**

I asked Aaron Blaisdell what was most surprising about his experience with "[1]ancestral health" – adopting a evolutionarily reasonable diet. "That my porphyria went away," he said. Aaron's porphyria is/was a form of sun sensitivity. "My mother has it. Her father had it," he said. It was obviously genetic. Scientists had located the genes involved. Aaron assumed that someday, not soon, it might be possible to fix the genes involved. Until then, he didn't think anything would change. It was a rare and not particularly damaging disease – it wouldn't attract a lot of research.

How reasonable the gene-fix idea sounds, in spite of being wrong. I've heard dozens of scientists, including Bruce Ames and James Watson, say that we are entering a new age where we will figure out the causes of diseases (their genetic causes) and fix them. A new age of rational medicine. To fix a car or dishwasher, you figure out the part at fault and repair or replace it. The metaphor is so convincing that nobody points out another possible metaphor: Your washing machine isn't working because you haven't plugged it in. [2]You need to read the owner's manual. Most health-care researchers, especially at medical schools, are studying the parts diagram of the washing machine, trying to figure out what part is at fault, when the problem is elsewhere: Not plugged in. Much easier to fix.

1. <http://ancestryfoundation.org/>

2. [http://www.sethroberts.net/about/2002\\_medical\\_research--a\\_bettor%27s\\_guide.pdf](http://www.sethroberts.net/about/2002_medical_research--a_bettor%27s_guide.pdf)

---

Aaron Blaisdell (2010-04-05 15:57:59)

Thanks for featuring my experience on your blog. One small quibble, however. I wouldn't say that the "fixing the gene" approach is necessarily wrong. Rather, I think it is often a much less viable, and much more expensive option than fixing the environmental cause (e.g., removing wheat gluten and omega-6 laden vegetable oils from my diet in my case). This environmental-change approach did not, however, clear up my red-green colorblindness. A group of researchers that recently created a red-green colorblind squirrel monkey were subsequently able to correct the deficit with gene therapy and return the afflicted individuals to full trichromatic vision (<http://www.wired.com/wiredscience/2009/09/colorthrapy/>). My point is that all of our phenotypic effects reflect the interactions of genetic and environmental factors. In some cases, the environmental contribution is easy to manipulate to fix the problem, but in other cases it may be necessary to intervene at the genetic level (if possible). But your point is very well taken that the overemphasis on modern, highly technical approaches used in modern medicine, stemming from the dominant body-is-machine metaphor, blinds medical science and the lay public (and government and funding agencies) to the body-as-natural-system framework that we are advocating with our Ancestral Health Symposium and Ancestral Health Society. Parkour!

seth (2010-04-05 18:01:20)

Thanks for the comments, Aaron. I don't think it's a mistake to think of the body as a machine – but let's read the owner's manual.

Usually when the dishwasher doesn't work, you just need to clean out the trap. We don't get an owner's manual for our own bodies. At issue, anyway, is often to a large degree that they can't patent your typical "owner's manual" solution. They certainly don't get a Nobel for it. (Barry Marshall and Robin Warren did, but they couldn't patent it either.) This story seems apropos: <http://blogs.discovermagazine.com/notrocketscience/2010/04/01/scientists-disc-over-gene-and-part-of-brain-that-make-people-gullible/>

@Nathan Thanks for linking that story. That made my morning! Especially the WTF1 gene responsible for the supra-credulous, LOL!

[Below is some of the R code that runs the arithmetic test that I use to measure my brain function. This function (newmath2.add) is the top-level function – the function I actually call when I run the test. Later posts will give the subroutine code. The variable newmath2 is the database – the variable (a data frame) that holds the data.]

2461

```

tr=1
pr=1
while(tr<=trials) {
t=newmath2.trial(trial=tr, total.trials = trials, wait.range=wait.range, num.possible = num.possible, problem = problems[pr,], condition=condition, note=note)
if(t[1]=="end session") break
if(t$status!="okay") {
if(t$status=="abort trial") this.trial.note="trial aborted"
if(t$status=="abort session") this.trial.note="session aborted"
t$include=FALSE
}
else this.trial.note=note
new.line1=c(current(),condition,tr,t$wait.msec, problems[pr,1])
new.line2=c(t$answer.msec,t$actual.answer,t$correct,t$include,this.trial.note)
newmath2<-rbind(newmath2,c(new.line1,new.line2))
newmath2.set.types()
pr=pr+1
if(t$status=="abort session") break
if(t$status=="abort trial") next
if(!t$correct) next
tr=tr+1
}
msg=paste("total time",round(difftime(Sys.time(),start.time, unit="mins"),1),"minutes\n")
paint(above = "all done", below=msg, duration = 3)
save.ws()
newmath2.plot()
}

```

---

Andrew Gelman (2010-04-06 08:24:21)

Wow-this looks more like Fortran than any R code I've ever seen!

seth (2010-04-07 08:12:47)

And I thought these posts would receive no comments...

Evelyn (2010-04-07 09:09:21)

There are quite a few formatting changes in the code, because of the blog publishing software. Could you publish it to a pastebin? <http://pastebin.org/> And Andrew's comment made me laugh out loud.

seth (2010-04-07 19:54:31)

Evelyn, I cut-and-pasted the code from my blog into R without any problem. The formatting changes in the blog (differences between how it looks in R and how it looks in my blog) disappeared when it was back in R. Before I cut-and-pasted it, I made the type on my blog relatively small to make sure that there were no inserted line breaks.

Bryce (2010-04-10 19:52:53)

Seth, it may have worked for you, but because of character encoding weirdness there are some issues when pasting the code in some environments (for me pasting from chrome on OS X into my item emacs -nw session). R sees some of the quotes as \342, as well as some additional significant white space. I've cleaned it up a little bit and pasted it here: <http://pastebin.org/146455>

jimmy (2010-04-19 14:20:23)

hi seth, can you give some context? why are you running these tests to measure your brain function? like do you want to make sure you are at your sharpest before operating heavy machinery?

seth (2010-04-19 17:56:35)

Jimmy, I want to understand what makes my brain work better and worse – so I can make it work better. See my earlier posts about "mysterious mental improvement" for details.

Peter (2010-05-15 10:17:37)

Like others I'm intrigued by this code. I couldn't get it to run without knowing the code for the paint function. Any chance you could share that with us?

Seth Roberts and Citizen Science « My Year of Data (2011-12-10 20:55:40)

Brian (2010-04-29 18:57:03)

Seth, Why do you have these 226 hardcoded arithmetic problems and answers? Is there something special about how you've selected these problems? I know you did not want answers to be 5 or 6, but are there other criteria? Regards, Brian

seth (2010-04-29 20:37:41)

Brian, the main constraint is that each answer be equally likely. (Except that no answer is repeated – e.g., if the answer on trial 5 was 7, the answer on trial 6 will not be 7).

### Arithmetic Test R Code (part 3) (2010-04-07 06:13)

```
> newmath2.set.types
```

```
function ()
```

```
{ # set variables in newmath2 to proper types
```

```
#
```

```
newmath2 $year< <-as.integer(newmath2 $year)

cat("tracking workspace saved",as.character(Sys.time()),"\n")  
  
}
```

---

Alex Chernavsky (2010-04-07 09:39:39)

Seth, I plan on installing R and playing with this stuff in about two weeks (I won't have time until then). I'm fairly tech-savvy, but is there anything else that is non-obvious that I will need to know in order to avoid potential headaches and cursing when I go to implement this stuff? I have a Windows XP machine. Thanks for posting the code.

Seth Roberts (2010-04-07 10:27:07)

Alex, the crucial function runs on Windows but not other operating systems. So at the most basic level you are okay. However, to solve problems that come up I think you will need a basic knowledge of R. And the data analysis requires a bunch of data (e.g., 100 trials) to work properly. In other words: this will be difficult for a non-R user to use. You will need to have basic R proficiency AND study the code carefully to get things to work.

Karen (2010-05-02 11:39:52)

Seth, Thanks for posting thigs. I have most of this working in R, but I get the error message could not find function "newmath2.problem". It seems like there should be functions defined for newmath2.problem() and newmath2.feedback(). If so, could you post them? Thanks,

Karen (2010-05-02 11:43:41)

Found the code. A link to the part 4 of the code from this page would help. I thought this was then end of the code postings.

seth (2010-05-02 16:33:38)

Karen, to find all the R code, go to the "R code" category under "Categories".

## **Your Gut Bacteria Are What You Eat (2010-04-08 04:28)**

[1]A new study found that Japanese people, but not Americans, have gut bacteria that help them digest seaweed. The Japanese eat a lot more seaweed than Americans, of course. Presumably they acquired the gut bacteria from

eating seaweed that wasn't hyper-sterile. It's more evidence that we are not designed to eat hyper-sterile food.

Thanks to Aaron Blaisdell and Deborah Estrin.

---

Kevin Miller (2010-04-16 05:33:57)

This is one of your most important posts, I think, because it suggests both the mechanism and the use of fermented foods. Fermented versions of the foods we regularly eat will give us bacteria that will help digest the (unfermented versions of) the foods we regularly eat. Sounds like Americans should try to find ways to eat fermented corn. Perhaps like the Andean drink chicha - <http://beverages.suite101.com/article.cfm/chicha> This reminds me of the idea that some of the selection process that helped plants evolve into more useful forms was a function of people eating the "best" plants and then shitting the seeds out near where they lived. Rinse and repeat over a long time, and you end up with a proliferation of plants suited to human consumption.

Tim McCormack (2010-07-21 07:57:40)

How do you think raw vs. cooked factors into the fermented foods issue? The live cultures in yogurt and kombucha clearly make it to your stomach alive, but when I make miso soup or cook tempeh, I can't imagine the high heat is great for the bacteria and/or fungi. Do you know of any research on whether they can make it through the cooking process? (Some bacteria can encyst, for instance.) I'm also curious about some claims that the fermentation process (for some substrates) ends with the death of the microbial community, via high acidity or alcohol content. Any pointers?

seth (2010-07-21 10:12:38)

Tim, my understanding is that Japanese cooks add miso to soup at the very end to avoid exactly the problem you mention: killing the bacteria. I haven't read about how fermentation, if it lasts long enough, ultimately kills the bacteria but I'm sure it's true. They run out of food, are poisoned by their own waste. So wine may be less healthy than other fermented foods where the bacteria are alive (or more alive).

## Arithmetic Test R Code (part 4) (2010-04-08 04:55)

Evelyn (2011-03-26 10:57:16)

<http://www.inside-r.org/pretty-r/tool> A tool for formatting R code for publishing on the web.

Dafydd (2011-04-03 09:13:51)

I've just spent the day learning R and trying to get this code to work. Final hurdle (I think) is that the function `newmath2.plot()` is missing. Any chance Seth can share?

Seth Roberts (2011-04-03 22:13:09)

I have sent you an R workspace by email that should work.

## Grass-Fed vs. Grain-Fed Beef (2010-04-08 05:31)

[1]A new review article compares them. Here is most important info, as far as I'm concerned:

A healthy diet should consist of roughly one to four times more omega-6 fatty acids than omega-3 fatty acids. The typical American diet tends to contain 11 to 30 times more omega -6 fatty acids than omega -3, a phenomenon that has been hypothesized as a significant factor in the rising rate of inflammatory disorders in the United States[[2]40]. Table [3]2 shows significant differences in n-6:n-3 ratios between grass-fed and grain-fed beef, with and overall average of 1.53 and 7.65 for grass-fed and grain-fed, respectively, for all studies reported in this review.

Grass-fed really is better.

1. <http://www.nutritionj.com/content/9/1/10>

2. <http://www.nutritionj.com/content/9/1/10#B40>

3. <http://www.nutritionj.com/content/9/1/10/table/T2>

---

Aaron Blaisdell (2010-04-08 07:03:52)

And tastes better, too! But you have to remember to cook it at lower temps than grain fed beef. I've made some remarkable grass-fed beef in my Sous Vide Supreme.

Michael Pope (2010-04-08 11:07:17)

Wow, feeding cattle original developmental fuel yields a superior food. Who wudda thunk. Sorry, I just couldn't help myself. I agree with Aaron the taste is superior. I can't even eat the grain fed stuff anymore.

Jake (2010-04-09 09:14:56)

No doubt that grass fed beef is better. In fact, I try to eat grass fed buffalo whenever possible rather than beef. But to put the omega 6 question on beef in perspective: 6 oz of grain fed beef hamburger contains 600 mg of omega 6. One tablespoon of salad dressing made with soybean oil contains 14,000 mg of omega 6. So the omega 6 problem is not meat, it is the industrial vegetable oils.

griff (2010-04-09 15:44:15)

Not only are grass fed cattle better for you, they can reduce gases attributed to the supposed global warming: <http://www.telegraph.co.uk/earth/environment/climatechange/7564682/Cows-absolved-of-causing-global-warming-with-nitrous-oxide.html>

tut (2010-04-14 09:29:03)

So the omega 6 problem is not meat, it is the industrial vegetable oils.

You generalize too much. If you are talking about soy or corn oil you are right, they are no good. But rapeseed oil and olive oil have a healthy omega 3/6 quotient. And if you look at something like linseed or sunflower seed oil they look more like omega 3 supplements than like corn oil.

Ashish (2010-04-20 22:44:08)

Where does one find this "grass fed beef"? Both Trader Joe's and Whole Foods, at least in Palo Alto, will certify only that their best cuts of beef were fed a "vegetarian diet."

seth (2010-04-21 05:27:48)

At the Berkeley Whole Foods, I can get buffalo, which they tell me is grass-fed. I also buy grass-fed beef at farmer's markets.

Randi Miller (2010-04-24 05:35:40)

Vegetarian diet would also include corn (stating the obvious here). I don't know you "guys'" situations, but you may look for a local ranch for your beef needs. There has been a trend toward smaller cattle, so smaller ranchers are raising beef. It is much less expensive to buy beef by 1/4, 1/2 or whole and you don't have to go to the store as often; although you do need a freezer. Email me if you would like some help or more information :)

Bruce (2010-04-25 18:39:23)

Anyone aware of a similar study in poultry? I'm not a beef-eater, but I do like my chicken and turkey.

Tom Grabovsky (2010-06-04 23:40:12)

We've all got to start requesting (demanding) grass fed beef or the companies that produce the meat will take the quickest, cheapest option to get meat ready for slaughter. Currently that cheap option is the force feeding of a cocktail of corn, protein and antibiotics ... No wonder outbreaks of E-Coli are on the rise when the prevalence of the E-Coli bacteria in cattle is increased by feeding them corn - newflash - cattle are grass eaters - and then we wonder why E-Coli is on the rise in things like spinach ... It doesn't take a rocket-scientist to work out that the run-off from cattle farms makes its way to other farms in many different ways. Wake up America! Do something ... Write a letter to your congressman/woman. Get the lobbyists out of congress. Vote with your wallet. Spread the word to your friends.

## **Why Cory Doctorow Won't Buy an iPad (2010-04-09 08:25)**

I loved [1]this Boing Boing post by Cory Doctorow about why he won't buy an iPad. One of his points:

Relying on incumbents to produce your revolutions is not a good strategy. They're apt to take all the stuff that makes their products great and try to use technology to charge you extra for it, or prohibit it altogether.

Just as I believe that relying on the medical establishment to improve health care is not a good strategy. Those in power (incumbents) will resist change, especially revolutionary change. Science – connecting beliefs with reality – is surely the most revolutionary activity invented yet professional health researchers, simply because they have something to lose, now resist change.

One of Doctorow's complaints:

Then there's the device itself: clearly there's a lot of thoughtfulness and smarts that went into the design. But there's also a palpable contempt for the owner. I believe – really believe – in the stirring words of the [2]Maker Manifesto: if you can't open it, you don't own it. Screws not glue.

Likewise, I believe it's possible to do health research where everything is understandable. Where you can understand the data. Where you can understand the connection between the data and better health. The simple situations, treatments and measurements I use in my self-experimentation I judge to be an improvement over obscure health research, whereas I suspect most professional scientists instinctively think something must be wrong with it. Real science, they think, cannot be done by amateurs.

Ed M. (2010-04-09 11:03:24)

Interesting point, but most people don't want to open up their gadgets and tinker... The Open Source ethos is great at an individual level, you get freedom, but you pay for it in time and frustration. A friend of mine spent over 40 hours making a MythTV box as a replacement for his Tivo. Sure his customized box has more capabilities, and he saved a couple bucks, but his wife can't figure out how to use it... Typical Consumers want an experience, not a hobby. The Apple platform, while it may cater to incumbents, provides a platform for all comers. –Ed

Nathan Myers (2010-04-09 13:04:56)

"Most people". "Typical Consumers". "All comers". Each is an insult, applied to any individual. Of course "most people" are well indoctrinated not to stray from their appointed place, and consume what has been homogenized for "all comers". Each who strays makes it easier it is for the next to break loose.

Jake (2010-04-10 09:44:06)

Cory Doctorow has a quaintly old fashioned view of computers and it is a hacker's view. Computers are a tool. Who cares how it was put together as long as it works and is fast. All the innovation, all the excitement is in the software. And there are very few limitations on the creative energies of software designers. I don't have an Ipad but all reports are that this tool works and is fast. That's all I care about. I am waiting for genius developers to create apps that will better my life in new and unique ways. Cory Doctorow will ignore all the magical apps to come because he will be too busy trying to pry open the Ipad case with a pocket knife.

Philip Kilner (2010-04-11 05:08:21)

I'm with Seth on this. @ Ed M. This stuff is a self-fulfilling prophecy. As long as tech is manufactured in a way that makes it hard to tinker, it /will/ be hard to tinker. If we create a demand for openness, we may nudge things the other way. I'd like to think most people aspire to be more than /just/ consumers. @ Jake You say "there are very few limitations on the creative energies of software designers" and you are right - but your argument falls here because one of those limitations is the control Apple impose on iPad apps. Cory Doctorow's peice was as much about that as the hardware.

## The Man Who Would Be Queen (2010-04-10 09:23)

[1]The Man Who Would Be Queen by [2]Michael Bailey, about male homosexuality, is easily the best book about psychology ever written. It is emotional, persuasive, non-obvious, important, and well-written. Few books manage three of these adjectives. One sign of its emotion, persuasiveness, importance, and non-obviousness is [3]the vilification Bailey underwent for writing it - led by people as smart as Deirdre McCloskey and [4]Lynn Conway. Their campaign against it risked drawing more attention to it, of course. Now you can [5]read it for free.

[6]Can professors say the truth?. My correspondence with Deirdre McCloskey: [7]part 1, [8]part 2, [9]part 3, [10]part 4, [11]part 5, [12]part 6. [13]Alice Dreger's article about the controversy, including a short version of my correspondence with McCloskey.

---

"Mark Rutherford" (2010-04-10 20:46:29)

Prof, thanks for re-opening this - you are a brave man. It's interesting that what really drives the passion on this book, in the case of Deirdre McCloskey and at least one other commenter in your 2007 threads is - if I may generalize - the desire to shift the blame from a) close family members - parents or children - who (b) had a violently negative reaction to the "transition" to another sex (there's a (c) coming - to a third party - that is, poor Professor Bailey. The (c) is that the violently negative reaction on the part of parents or children, while deplorable, while to my knowledge by no means universal - though I have no idea of its frequency in such cases - is entirely predictable and almost inevitable - at least in a non-violent, repressed, perhaps never mentioned way. And while the naive young person who thinks that her mother was changed by Bailey's book may be naive, surely McCloskey is enough of a grown-up to realize that her children might well react that way - not to forgive them, not to wish that they didn't - but on some level to understand that they would have such a reaction. The sheer unfeelingness on the part of someone like McCloskey in refusing to acknowledge that Bailey, his opinions, your opinions, etc., have nothing to do with the private tragedy that is being enacted within the McCloskey family (according to her own account) and many others. It's ironic: from the accounts of the transgendered that one reads, and even in McCloskey's emails, it is clear that transgendered people experience more than their share of misunderstanding at the hands of others. It's a pity that they can't pity and at least inwardly forgive others - their parents or children particularly - for feeling the same way. And it's a particular kind of blindness to blame one poor shnook for the very human kind of fallibility and unintentional cruelty that they experience at the hands of people who, wrongly, feel themselves betrayed. Bailey, if wrong, surely has something to teach them about how others might feel - if they cared to. Instead, McCloskey and that other, much more dreadful woman, tried to turn what they might have seen as an intellectual sin into a family romance. Refuting him would not be enough - they immediately embarked on the enterprise of trying to get "the authorities" to turn Bailey out of an imagined family. People don't need to read Bailey or to find him persuasive to be loathsome. They do quite well on their own, as the amazing behavior of McCloskey demonstrates.

seth (2010-04-11 10:35:43)

Mark, yes, I agree it's loathsome to file a human-subjects complaint against someone because you dislike something they said.

Alex Chernavsky (2010-04-11 12:35:57)

I don't know anything about this book, but Seth's post reminds me of the controversies (and vilification) surrounding Elizabeth Loftus and her work debunking recovered-memories. And I remember the big brouhaha that erupted when *A Natural History of Rape* was published in 2000. And then there's also Susan Clancy's recent book, *The Trauma Myth*. Lots of psychology research seems to touch a raw nerve with people.

Erik (2010-04-11 19:51:33)

Thank you so much for posting a link to the .pdf file of Bailey's book. It's nice to have it available since the book itself is out of print.

Nathan Myers (2010-04-12 16:49:58)

I haven't read the book. Is he saying all trans women fall into those two categories? 'Cause I know of ones who don't. I did find his explanation I read here, of Michael Jackson - as someone who fetishized imagining himself pre-pubescent - as illuminating as I can conceive of anything on the subject being. It seemed to make sense of many other cases. Seth: "All" trans women? No. Just most of them.

Deirdre McCloskey (2010-04-27 17:45:32)

Dears: The blogosphere, which has enriched conversation so splendidly, has the one flaw that people tend to stay in it, and accept as an unquestioned basis for the conversation the accounts given there-as Mark Rutherford does in his sensible remark.

I do not blame Professor Bailey for my troubles, small as they are (the only bad news in my transition was the attitude of my marriage family: otherwise I lived as Donald and now live as Deirdre a very happy life). My complaint about Bailey is that his book adds a little to the burden that gender variant people have, especially poor and ignorant ones who cannot defend themselves against power (thankfully I can, and have). Bailey is no big deal in the larger scheme, and his writings will result in the deaths of only a few additional transgendered people. My only point is that adding to the burden is not the direction a liberal society should want to be going. We should be increasing tolerance, not reducing it by introducing a locker-room theory of queers. That's Professor Bailey's theory: male to female gender crossers are homosexuals; and homosexuals are all girly. (About born women he and his group have nothing to say.) I do not understand the unreasoning passion that our good host Seth has about all this. He fell early on for the Bailey-camp claim that complaining about Bailey's "research" was some sort of out-of-line "censorship." Now he won't modify his views, regardless of new evidence. If you ever get to see his exchange with me ("What Exchange Seth Doesn't Want You To See," to borrow his amazing courtroom tactic in attacking me) you'll see that he is uninterested in quiet, serious exchange. That's worrisome in a scientist. The power is all on the other side, yet Lynn Conway and I in Seth's fevered account are the toughs. Bailey was the chair of Psychology at Northwestern. Bailey's mentor in Toronto (from whom he got his ideas) is the current chair of the American Psychiatric Association's subcommittee on gender dysphoria for rewriting the Diagnostic and Statistical Manual of Mental Disorders, version five (according to which, btw, most of the people listening to this blog, if a random sample of humans, are in urgent need of mental health attention). The DSM-V will therefore regress from a liberal position, such as the one the Association took in 1973 when it banished homosexuality from the list of disorders. I didn't file a human subjects complaint against Professor Bailey because I didn't like his work—alho I freely admit to not liking it. I filed it because he violated elementary standards in the treatment of human subjects, one of whom was a personal friend. He got away with it, as far as an outsider can judge, because he agreed to resign from being Department Chair and because the women he abused were frightened and strange. He got away with practicing psychology without a state license (he used as bait for getting material for his book a signature on a letter for gender reassignment surgery) because by the time people savvy in such matters found out about it the statute of limitations (written you will not be surprised to hear by the psychologists themselves) had run out. Nice guy: powerful but irresponsible. But I don't expect much from trying to be reasonable. It hasn't worked very often about this subject in the past, and never on Seth's Blog. Regards, Deirdre McCloskey

seth (2010-04-27 18:01:36)

Again, Professor McCloskey, I am glad to hear from you. Seriously. "[Bailey's] writings will result in the deaths of only a few additional transgendered people." As you say, nothing like "quiet serious exchange" to help us find the truth of things. "The power is all on the other side." If Lynn Conway sees herself as powerless, why did she do so much? For example, her massive website. As for the "Exchange [between us] Seth Doesn't Want You to See" I've done everything I could to publicize it, including putting the published version [http://sethroberts.net/articles/2008 %20Dreger.pdf](http://sethroberts.net/articles/2008%20Dreger.pdf) on my website and linking to it (in this post). If there's more I can do to publicize it, let me know.

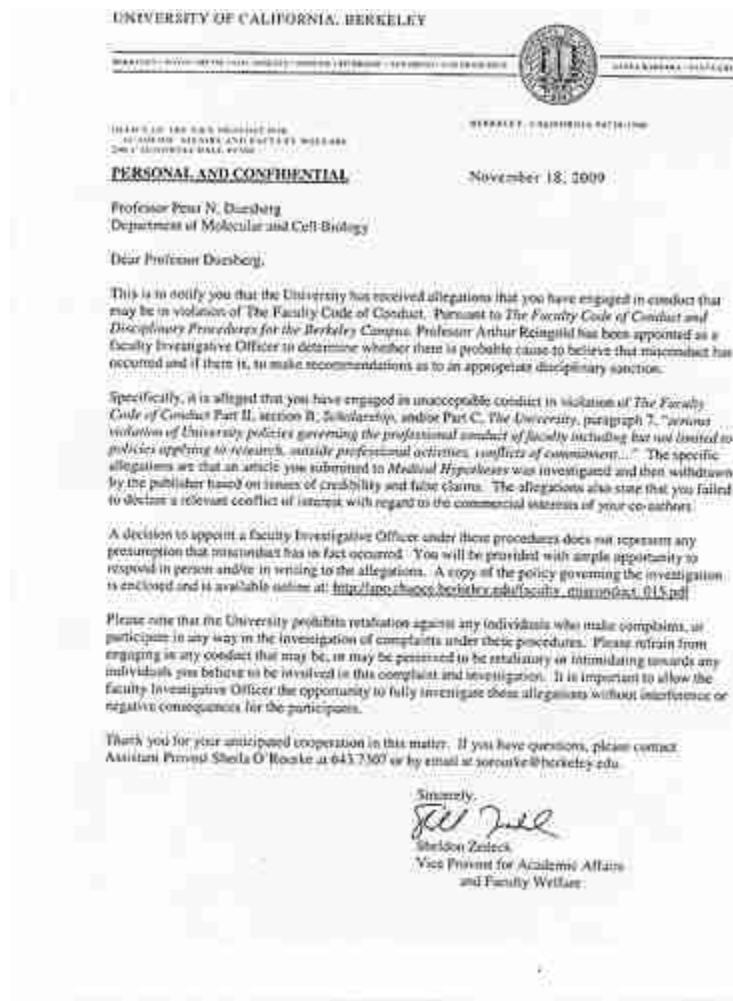

The Man Who Would Be Queen « A Fistful of Science (2010-07-21 19:30:41)

[...] The Man Who Would Be Queen July 21, 2010 On the recommendation of Seth Roberts, I picked up a book from the library called *The Man Who Would Be Queen: The Science of Gender-Bending and Transsexualism* by J. Michael Bailey (full pdf [here](#)). You might have heard of it, as it caused some controversy a few years back. One of the book's major premises is that gay men tend to behave in feminine ways and probably do so from a young age. [...]

## Academic Horror Story (UC Berkeley - 2) (2010-04-11 10:25)

Peter Duesberg, a professor at UC Berkeley, has been accused of misconduct for writing a paper espousing an unpopular idea (that HIV doesn't cause AIDS) – and the university administration is taking this seriously! Here is the letter Duesberg received.

[1]

This is major-league harassment, similar to [2]the human-subjects complaint against Michael Bailey. And it's Berkeley's second [3]Academic Horror Story. Previously, [4]Berkeley administrators carefully delayed an experimental subject from learning she had a big lump in her brain.

More "[5]You can be as nasty as you like" (John Cleese on extremism, via [6]Marginal Revolution).

2. <http://sethroberts.net/articles/2008%20Dreger.pdf>
3. <http://www.blog.sethroberts.net/category/education/academic-horror-story/>
4. <http://www.blog.sethroberts.net/2008/01/31/academic-horror-story-uc-berkeley/>
5. [http://www.youtube.com/watch?v=HLNhPMQnWu4&feature=player\\_embedded](http://www.youtube.com/watch?v=HLNhPMQnWu4&feature=player_embedded)
6. <http://www.marginalrevolution.com/>

Andrew Gelman (2010-04-11 14:56:34)

Seth: Setting aside the details of the complaint, the criticism of Duesberg was not that his ideas are unpopular, it's that his ideas are false and unsupported by scientific evidence and are dangerous. Neither you nor i is an expert on Aids research (although

you did publish an article on the topic once in Spy). But I think you're trivializing the opposition to Duesberg by characterizing it is an opposition to an "unpopular" idea. I don't know what's the best way for universities to deal with people like this, but it's a bit embarrassing to the university when it's always "UC Berkeley scientist Duesberg" this and "UC Berkeley scientist Duesberg" that. He's trading off the university's reputation. Maybe nothing can or should be done about it, but I can understand the administration's frustration.

Hal (2010-04-11 17:20:06)

"The specific allegations are that an article you submitted to Medical Hypotheses was investigated and then withdrawn by the publisher based on issues of credibility and false claims. The allegations also state that you failed to declare a relevant conflict of interest with regard to the commercial interests of your co-authors." Not clear how you get from this that he "has been accused of misconduct for writing a paper espousing an unpopular idea".

vic (2010-04-11 21:41:50)

Gotta agree with Seth here - what's "science" is determined by social consensus, and the very reason tenure exists as an institution.

kevin denny (2010-04-12 04:10:16)

There are two allegations: that he wrote an article that was withdrawn by the publisher [over credibility and false claims] and the failure to declare a vested interest. I'm unclear about the first allegation. If I submit an article claiming the moon is made of cheese should I be disciplined? I am not trivializing the issue. Won't the peer review process sort this out? This is complicated by the fact that Medical Hypotheses was not a conventional peer review journal although the publishers were changing this. Credibility is capricious and many scientific claims, now believed to be true, were considered crazy in their time. Even if I suspect that Duesberg's main claim is crazy [though not an AIDS expert either], it's not a hanging offence. By "false claim" are they saying he's wrong or that he lied? It can't be an offence to be just wrong. The conflict of interest allegation seems a valid concern. In any event, however embarrassing this guy is to Berkeley this is no reason to take a pop at him if that is what they are doing.

seth (2010-04-12 07:08:40)

Andrew & Hal, it's like Driving While Black (except the punishment is much worse than a traffic ticket). Duesberg is being investigated for stuff that is ordinarily never a matter of investigation. In recent times, I suspect no other professor has been investigated because a co-author was accused of having a conflict of interest or because of something as vague as "false claims" or insufficient "credibility". Kevin, undeclared conflicts of interest have been a massive problem for American medical schools. Senator Grassley has spent a lot of time on this. As far as I know no professor has ever been investigated by his university for the problem - much less the fact that a co-author had the problem.

Andrew Gelman (2010-04-12 08:30:52)

Seth: It sounds more like Driving While Speeding than Driving While Black.

Alex Chernavsky (2010-04-12 08:48:11)

Seth, you wrote, "As far as I know no professor has ever been investigated by his university for [undeclared conflicts of interest]". Psychiatrist Charles Nemeroff was investigated by Emory University and forced to resign his chairmanship of the department: [http://shared.web.emory.edu/emory/news/releases/2008/12/conflict\\_of\\_interest\\_action.html](http://shared.web.emory.edu/emory/news/releases/2008/12/conflict_of_interest_action.html) Nemeroff is a real piece of work. If you're interested, do some Google searches on him.

Patrik (2010-04-12 16:00:12)

@Peter Duesberg [in case, you are reading this] As Rush noted in 1982, "Conform or be cast out!" @Andrew Gelman Speeding is illegal. Being Black isn't. So, what was it that Duesberg did that was illegal?

peter duesberg (2010-04-12 16:28:53)

To Andrew Gelmanâ€“ Several points: 1) Yes, the allegations are that "the ideas are false, ... un-supported by evidence, and dangerous". Yes. But, to this day I have not received evidence from UCB or elsewhere to support these allegations. The evidence for unpopularity is, however, overwhelming - rejection by the Journal of AIDS, censorship after publication in Medical Hypotheses by Elsevier, and now a "misconduct" investigation by UC Berkeley â€“ the cradle of free speech! Would you read the paper that has been censored, if I send you a copy? Please send your email request to duesberg@berkeley.edu Don't say you are not an expert please, until you had a look at it. 2) Yes, I am "trading on my university's reputation". For a long time this was, however, quite mutual - when I was elected California Scientist of the Year, elected in the National Academy, and received \$ million grants on retroviruses, the same ones that are said to cause AIDS. Only an impartial review of my current evidence against HIV-AIDS or history can tell, whether some day it won't be the other way around - when UCB might derive reputation from now mis-conduct suspect professors like me - and perhaps even the torture-advocate professor Yoo.

Nathan Myers (2010-04-12 16:37:17)

Cal hired and tenured John Yoo in full knowledge of his war crimes, and he is actually teaching undergraduate constitutional law just as if he were qualified. Does that leave Cal with any reputation left to protect? Maybe each college is now on its own, with the Law school's reputation thoroughly flushed. Duesberg has revealed himself as a full-scale crank. Is that a crime? No. Is Cal Med obliged to let him use their name to endorse his fantasy life? Surely not. Seth runs on about the statistical offenses he perceives in climate researchers, but he doesn't drag Cal into it.

seth (2010-04-12 17:56:52)

Alex, you have misquoted me. Here's what I wrote: I suspect no other professor has been investigated because a co-author was accused of having a conflict of interest. Here's what you wrote: Seth, you wrote, "As far as I know no professor has ever been investigated by his university for [undeclared conflicts of interest]â€“". See the difference? I've blogged about Nemeroff several times, e.g.,

Patrik (2010-04-12 18:53:23)

@Peter Duesberg and @Seth Perhaps you could send the paper to Seth, who may be inclined to update this blog post with a link to it? @Andrew Gelman Seriously, you gotta back up your "his ideas [are false and unsupported by scientific evidence] and are **dangerous**". Sounds a lot like what they said about Semmelweis.....

Robert Reis (2010-04-12 19:31:56)

When a vote decided whether or not homosexuality was an illness, academia revealed it was a fraud.

Nanonymouse (2010-04-12 21:39:30)

@Peter Duesberg: Clearly you did nothing to warrant investigation. This is another PC witch hunt, yes.

Andrew Gelman (2010-04-12 22:32:24)

Sorry, I should've said allegedly driving while speeding.

Nathan Myers (2010-04-12 22:39:00)

As far as I can tell, the charge is not about having a paper withdrawn: it's about the false claims made in the paper that were the reason for the withdrawal. The wording in the letter is unfortunate, but there's no need for us to be confused by it - unless, of course, we choose to be confused, or to pretend to be confused. Does it matter whether anyone had been investigated before, about keeping his co-authors' commercial interests secret? If it's part of his responsibility to reveal all conflicts of interest in his submission, then why does it matter whether it's him or his co-authors who have the conflict? It would only matter if they had concealed the conflicts from him, and I don't think anybody suggests that. By analogy to criminal law, conspiracy to commit a crime is itself a crime.

Alex Chernavsky (2010-04-13 03:09:52)

Seth, I didn't misquote you. I quoted a different part of your post than the one you THINK I quoted. All I did was replace your words "the problem" with "[undeclared conflicts of interest]". Here is the full paragraph, part of which I quoted and responded to in my comment: "Kevin, undeclared conflicts of interest have been a massive problem for American medical schools. Senator Grassley has spent a lot of time on this. As far as I know no professor has ever been investigated by his university for the problem" much less the fact that a co-author had the problem."

seth (2010-04-13 06:09:28)

Alex, sorry, I'm in a third-world city with terrible internet access (Chicago). As I was writing my comment I lost access. I had coded the Nemeroff case as one where the accused (Nemeroff) had misstated to his university how much drug companies had given him. But, yeah, you could call that a conflict-of-interest problem. That Nemeroff understated those payments by hundreds of thousands of dollars and was investigated only after a US Senator complained and the case received national attention just goes to show how bizarre the charge against Duesberg is. It really is Driving While Black. A black person might get pulled over for going 1 mph over the speed limit. No one else is.

Dennis Mangan (2010-04-13 07:41:40)

Linda Gottfredson: "Lessons in academic freedom as lived experience" <http://www.udel.edu/educ/gottfredson/reprints/2009academicfreedom.pdf> Gottfredson is a well-known IQ researcher and was harassed repeatedly for several years.

Tommy (2010-04-13 12:49:59)

What?! I don't think there is any conflict of interest, just because one of the author's former employers is a vitamin re-seller... I don't get it. If you want to call this a conflict of interest, then what do you call Essex, Gallo and all the other AIDS scientists, many of whom literally make millions out of patents and pharma connections... That's what I call a conflict of interest!

vic (2010-04-13 22:37:53)

That Nathan Myers talks about war crimes, yet has the mentality of a Gestapo Agent, advocating selective enforcement of vague conflict of interest declaration policies (as if declaring them makes them go away) in order to suppress the views of those he disagrees with. Typical hand-wringing, moralizing liberal.

seth (2010-04-14 03:54:07)

yes, Tommy, the idea that there is a conflict of interest because a co-author used to be employed by a company that would benefit from the paper makes no sense.

Christian Fiala (2010-04-14 10:58:24)

I am one of the authors of the paper in Medical Hypotheses you are discussing here. In the paper we collected official data from South Africa and Uganda and compared them with previous predictions. Surprisingly, a close examination of the current data (as opposed to public health and media driven beliefs) showed a dramatically increasing population growth due to constant fertility combined with stable or declining mortality. In summary current public data do not provide the slightest evidence for a deadly (HIV/Aids) epidemic in Africa. In violation of all scientific principles, and lacking a shred of evidence to support the charge, our paper was withdrawn under the pretext that our 5-page article (citing public data) 'could potentially be damaging to global public health.' We were never invited to engage in any factual, scientific exchange about these accusations--instead, after it was accepted and published, the paper was suddenly withdrawn. The Times Higher Education [Jan.14, 2010] reported that "prominent AIDS researchers" had contacted Elsevier and demanded the paper's withdrawal. To this day we don't know who they are, nor what their monetary and professional conflicts of interest are. In short stand accused of very grave charges, and censored, by an anonymous tribunal with its own conflicts of interest. This case is currently pending in the courts in The Netherlands, the headquarter of the publisher of Medical Hypotheses. We are looking forward to our day in court, when the true roots of this shameful witch-hunt and attack on academic liberty will be brought to light. Sincerely, Christian Fiala MD, PhD Vienna, Austria

Nathan Myers (2010-04-14 13:38:38)  
vic: Godwin FAIL.

Michael Ellner (2010-04-15 08:13:45)

If people actually read the withdrawn papers, they might realize that they have been intentionally duped and the HIV/AIDS gang can't have that. I believe that the serious crimes like sexual terrorism, scientific fraud and medical murder that were committed in the name of HIV/AIDS will become common knowledge and as soon as it does, there will be no place to hide for the "public health" officials, "science" editors and journalists who were/are responsible for the fraud or the medical professionals who have mindlessly murdered their patients in the name of science and medical care. It's no wonder the AIDS mafia strives to silence their critics. Waiting for the day...

Tom (2010-04-16 05:49:06)

Duesberg was attacked by pharma lobbyists such as M. Essex and his friends. They publicly blamed him for millions of deaths in Africa, which is not only absurd, but unbelievable, because they forget and forget to mention their own, REAL responsibilities for the many AZT victims. (btw, Duesberg warned early and clearly about the AZT problems, but was already ignored) Now they've denied Duesberg to defend himself against their outrageous allegations, by putting pressure on Elsevier. They've also claimed a co-author would have a conflict of interest, which isn't true, because his employment was years before.... and they again forget to mention their own REAL conflicts of interest, like patents for the medicals that were supposed to be sold in Africa... Did I miss the point?

Lisa (2010-04-24 03:28:25)

Hi - so what can we do about this? How can we support Mr. Duesberg? Who to contact at Berkeley to complain?

seth (2010-04-24 16:55:44)

Lisa, I suggest you ask Peter Duesberg this question. He can be reached at [duesberg ..at... berkeley.edu](mailto:duesberg@berkeley.edu). Feel free to post here his answer.

Frank (2010-04-25 08:01:58)

Having a paper withdrawn by Elsevier should be worn like a badge of pride and vindication of truth in this matter. It was Elsevier who commissioned no fewer than 6 bogus journals in Australia alone that were nothing but advertisements for pharmaceutical companies. Elsevier makes millions on advertisements in its mainstream journals from pharmaceutical companies. To think that the sticky hand of BIG PHARMA is not at work here is simply naive. One of the main protagonists in the withdrawal of the offending paper was one Seth Kalichman of denying AIDS infamy. Seth has stated that a part of his duties at UConn involve the running of his vitriolic blog that regularly slanders Duesberg and Bauer. UConn receive millions in grants from the NIH and BIG PHARMA to pay the salaries of the ilk of Kalichman. The main complainant to Duesberg's university is Nathan Geffen, who is a member of AIDSTRUTH and the South African Treatment Action Campaign. TAC is funded indirectly by Anglo Gold and various Pharmaceutical Companies. Kalichman regularly quotes and praises Geffen on his blog. They can scream hysterically all they want, but talk about conflicts of interest? Give me a break these guys are up to their armpits in conflicts of interest, they have all the moral fortitude of crack whores. Shortly we should see the entry of J Todd Deshong and Poodle Stomper et al posting here with their own version of AIDS Dogma, vomiting back argumentoid comments and generally muddying the waters. The Emails will have already been sent out from AIDSTRUTH HQ rallying the forces to attack. I too am no expert on the topic of HIV/AIDS but I definitely know the smell of RAT. Whether Duesberg is right or wrong, he does not deserve a concerted attack driven by financial greed dressed up as public health concern. They talk about Denialists, this lot still state AZT did not kill anyone, now that is DENIALISM, and has all the hallmarks of the tobacco companies saying smoking did not cause cancer when they were facing billion dollar damages payouts. And that surely gives the best indicator of their true masters, as none of the lawyers representing the pharmaceutical companies will permit any admission of wrongdoing from anyone on the payroll. I think Clark Baker has coined the best term for these people, "Pharmasluts". Apt.

Jonathan Swift (2010-05-06 03:38:53)

Dr. Duesberg has proven that HIV does not cause AIDS, and is instead caused by lifestyle, drug consumption, and malnutrition. I've accepted Duesberg's view. But that leaves me uncertain as to how to explain why HIV-positive, non-malnourished, non-drug-affected infants develop AIDS. I'm also saddened that, given that recreational drug use causes AIDS, Duesberg hasn't done any research into which specific drugs cause AIDS, what dosages are required to produce it, and why the vast majority of recreational drug users never develop AIDS. In a bizarre coincidence, only those who are HIV-positive do.

Pam Quinn (2010-05-22 07:38:55)

Infants develop AIDS mostly because they are given cell-killing drugs. If a child is unlucky enough to have an HIV test, they may test positive for HIV particularly if they've been unlucky enough to have any number of vaccinations, typically initiated at 2-3 months of age. This has been proven with the polio vaccine.

nck (2010-08-25 20:46:23)

Im no where as smart as all of you guys posting here. But, I DO have a good sense of who SOUNDS like a conman and who doesn't. Why are the "wacko denial guys" posting simple statements and what they consider facts, and the "truthers" go with name calling and character assassinations? Every single time I read ANY thing from PD or Dr. Fiala, I find them calm and to the point. Now, this Seth Kalishman or whatever, its an insult a line. Guess who sounds more believable? Dr. Duesberg, if you really believe what you are saying, and all this hideous backlash is the OUTCOME of your beliefs, God bless you. A man who stands by his convictions, regardless the outcome. Oh, and that Africa thing.....COMMON SENSE tells you its one big con.

Shawn (2010-09-04 22:59:29)

The idea that AIDS is a result of vaccines is ludicrous. This is far too easy to prove wrong and is readily apparant when one looks at the HIV testing results. Poor, drug user families are 100X more likely to have an HIV positive child than a middle class family. Yet the vaccination numbers are the exact opposite. The evidence is so overwhleming for this, that it's embarassing to argue or debate. If AIDS was a pharma drug issue, the western world - especially the white middle class and their pill popping obsession - would dominate the AIDS statistics. Yet, there is no AIDS epidemic in suburbia. Sadly, the only epidemic is seen in those who somehow come into contact with another person's blood. Whether through birth, transfusion, sex, needles, or transplants. Isn't it weird how that works. If anyone comes out with some new data, I'm all ears. Until then - all I have is the present research and it sure does look like a blood pathogen (virus) is the cause.

jaime (2010-09-23 13:00:21)

Couple of notes.... Johnathon Swift... When Duesberg first started disputing hiv=aids, he was effectively stripped of any credibility, thus rendering his ability to receive research grants gone. Hiv testing... it's NOT reliable. Tests to not look for HIV. They look for antibodies that are not specific to anything. Which is why when children get vaccinated their blood is full of antibodies, they sometimes test positive. Also, if you get tested and test positive and go back, you can go back even a week later or a day later and test negative. Antiretrovirals (which still include AZT) have very, very serious side effects. to prescribe these to a people that have immune systems already comprised doesn't make any sense. Secondly, in Africa, all you have to do is be sick and depending where you are, they won't even test you. They'll claim you had HIV that has progressed to AIDS. btw... AZT was a chemotherapy drug intended for cancer patients in the 70s, but was shelved because of its toxicity. I could go on, but if you look for it, the information is out there.

Steve (2011-05-07 13:09:16)

LOL!!! I think it's an absolute jOkE that people can't figure out why professor Duesburg looks so damn ignorant in the eyes of so many, even though he's far from it. Gallo said himself that "NOBODY KNOWS MORE ABOUT RETROVIRUSES THAN PETER (DUESBERG)." That quickly changed when Duesberg started ripping on Gallo, of course. Who didn't see the studies that Duesberg along with so very many others have personally done (BECAUSE I WILL SHOW THEM TO ANYONE WHO MISSED THE BOAT ON THE SUBJECT.) that explain why the professor says what he says, Duesberg's far from stupid. I'm a virologist, H.I.V. viruses didn't come from monkeys either, regardless of the color, green, blue or TuTi-FruitY. Whats "Idiopathic CD-4 T-Lymphocyteopenia" (ICL) What do you think the reason is that Anthony Fauci (NIH) or the NCI hasn't mentioned anything regarding Dr. Yamamoto & GcMAF ? Because Yamamoto is correct maybe ? Who knows what I'm talking about in regards to

any of this & that ?

### City Air Makes Free (2010-04-12 07:35)

"City air makes free" is a medieval saying quoted by Jane Jacobs. I thought of it a few months ago when I visited an experimental private school near Shanghai. The founder of the school wanted to encourage creativity among students, in contrast to the main Chinese educational system with its overwhelming emphasis on memorization. His school was itself an example of city air makes free. There are many factories around Shanghai, filled with migrants from rural areas. These workers moved without official permission, which made their children ineligible for public school. This created a market for private schools, such as the one I visited. The school's founder was previously a school teacher. The rural-urban migration had made him free to start his own school.

By growing up in a city instead of a village, regardless of what school she attends, regardless of overall economic growth, a Chinese student will have more access to the Internet, much bigger libraries, better teachers, far more students of different backgrounds, far more occupations in action, and a much wider range of culture. Her parents' increased income may allow her to have a computer. Her family will suffer less from corrupt government officials. The increase in freedom – in opportunity – is profound. Her creativity and productivity will increase because she will better match her talents and her job. This is why Chinese creativity will increase enormously in the coming years whether the education system changes or not.

That such thinkers as Bill McKibben (who doesn't understand [1]the importance of cities for saving energy) and Jeffrey Sachs (who doesn't understand the importance of cities for economic development) fail to understand this point shows how non-obvious it is. One more reason Jane Jacobs was a great economist.

"[2]She and other Chinese I met on my trip had a much broader sense of what was possible, or what they were missing out on, than previous generations."

Joyce Hilkevitch (2010-04-13 22:53:40)

Very interesting info about Chinese schools and how they may be changing.

Chris Burd (2010-04-14 13:24:40)

It's sounds better in the original German: Stadtluft macht frei, although there's a nasty echo of the infamous Nazi slogan "Arbeit macht frei" (a case of false advertising if ever there was one).

Nathan Myers (2010-04-14 13:35:04)

"Arbeit macht frei" was, rather, a nasty echo of the medieval original. The original referred to a legal effect: a serf who managed to stay in a city for a year was free of claims by his former landlord. That out was abolished in 1231, for the case of royal cities and princely landlords. Network effects of city life were rather tertiary to the popularity of the saying.

Nansen (2010-04-14 16:22:53)

Which economist would you say is most influenced by Jacobs?

vic (2010-04-14 19:35:57)

no economist is influenced by Jacobs - economists are only influenced by mathematical proofs, not by logic or economic arguments.

seth (2010-04-14 20:10:06)

Most influenced by Jacobs: Ed Gaebler, of Harvard. He told someone that he's going to spend the rest of his career bringing Jacobs into the economic mainstream. I heard that a few years ago and it is a fair description of his work since then.

Joyce Hilkevitch (2011-01-24 21:15:35)

Hi Seth Roberts: in a January New Yorker, I read an article about the growth of psychoanalysis in China. Fascinating! Would like to hear your views. When are you returning for a visit? Regards, Joyce

Crowd Funding Notes « Efficacy and Activism (2011-06-11 03:28:15)

[...] Most people see Jacobs as someone who wrote about cities. She saw herself as someone with new ideas about economic development – especially innovation. Cities are important above all because city people are more innovative than rural people. Tractors, for example, grew out of city inventions (the internal combustion engine, etc.). The same person (same IQ, same wealth) will be more innovative in a city than outside of one. [...]

That link that should be <http://www.overcomingbias.com/2010/03/masking-movie-manipulation.html> is broken.

seth (2010-04-13 09:25:14)  
Allen, thanks, I've fixed it.

Tara (2010-04-13 10:42:59)  
The Robitussin/fertility connection is fascinating. I had heard cold medicines could affect cervical mucus, but for some reason I thought it negatively impacted fertility. I'm not trying for kids yet, but this is great info to keep in mind for the future.

Nathan Myers (2010-04-13 13:18:43)  
If guaifenesin helps fertility, I'll bet going off dairy does too.

Sheila Buff (2010-04-13 15:55:01)  
Very surprised to see this reported as news. My niece, now 25, was conceived after my sister's doctor recommended Robitussin.

James (2010-04-14 23:09:50)  
Sheila: That's why it is news - something that was cheap and commonly recommended 25 years ago has been pushed out by expensive IVF therapies.

### **Venous Multiple Sclerosis: A Website (2010-04-14 08:27)**

I've blogged several times about [1]Paulo Zamboni's discovery that his wife's multiple sclerosis was due to poor blood drainage from the brain and the wonderful implications of this discovery for many persons with MS. Here's [2]an excellent website about the topic. It's of great interest to me because it suggests the power of people with (a) the subject-matter knowledge of insiders, (b) the freedom of outsiders and (c) the motivation of someone with the problem. Medical researchers, who get the billions of dollars spent on health research, don't have the freedom of outsiders nor (almost always) the motivation of someone with the problem. My self-experimentation had those characteristics: I had the subject-matter knowledge of an insider, the freedom of an outsider, and the motivation of someone with the problem. For example, I knew a lot about sleep, I didn't care what sleep researchers thought of me, and I had a sleep problem.

I just spoke with Marc Hellerstein about SLD!

### **Memristors (2010-04-15 06:14)**

If you're like me, you failed to grasp the importance of [1]this recent report in the New York Times. Much like the prediction of new elements using the periodic table, in the 1970s an engineer named Leon Chua predicted the existence of a fourth circuit element (the first three are resistors, capacitors, and inductors) that he called [2]memristors - resistors with a memory. Their resistance varies depending on their history.

A few years ago Hewlett-Packard researchers studying titanium oxide found puzzling results that turned out to be due to memristors. Only at very small sizes, they found, does memristance become large relative to other effects. How easily you can walk through a room depends on where the furniture is. Memristors involve moving the furniture (atoms). If these new devices can be made practical (e.g., fast enough), they will provide memory much smaller and more power-efficient than current devices. But it's hard to predict the impact of this discovery – it's like discovering a new dimension.

1. <http://www.nytimes.com/2010/04/08/science/08chips.html?hpw>
2. <http://en.wikipedia.org/wiki/Memristor>

---

Nile (2010-04-15 12:32:36)

I think HP plans on introducing memory devices based on memristors within a couple years. If successful would replace flash devices - faster, much higher capacities

Nile (2010-04-15 12:38:26)

Found the reference from a cheeky Brit site called the Register. A good read if you are interested in technology. Here is the memristor link [http://www.theregister.co.uk/2010/04/08/hp\\_memristor/](http://www.theregister.co.uk/2010/04/08/hp_memristor/)

Nathan Myers (2010-04-15 15:09:54)

Flash replacement is a sadly limited use of memristor properties, akin to using train cars as abacus beads. It's what will happen, though. If memristors don't succeed in displacing flash that way, that might be the end of memristors. If they do succeed, we might eventually see much better uses that depend on fundamentally different models of computation. The first such uses will probably be in specialized real-time image or signal processing, and others only decades later.

Duncan (2010-04-16 06:57:16)

New Scientist's recent article about this mentions Wei Lu of UMass, who's working on a memristor neural computer made from more traditional semiconductors. There's also a previous (gated) article about the potential of memristors in this field. <http://www.newscientist.com/article/mg20527515.900-electronic-marvel-brings-neural-computing-a-step-closer.html>  
<http://www.newscientist.com/article/mg20327151.600-memristor-minds-the-future-of-artificial-intelligence.html>

## **Animals Like Fermented Food? (2010-04-16 02:50)**

I've blogged a zillion times about the value of fermented food. [1]Animals seem to agree with me:

At least twice in the past ten years [1998-2008], [elephant] herds in India have stumbled upon barrels of rice beer, drained them with their trunks, and gone on drunken rampages. (The first time, they trampled four villagers; the second time they uprooted a pylon and electrocuted themselves.) Howler monkeys, too, have a taste for things fermented. In Panama, they've been seen consuming overripe palm fruit at the rate of ten stiff drinks in twenty minutes. Even flies have a nose for alcohol. They home in on its scent to lay their eggs in ripening fruit, insuring their larvae a pleasant buzz.

It's possible that the elephants were thirsty, of course, but these stories support the idea that our liking for fermented foods goes back a long way and has a genetic basis. I heard a story about horses preferring rotting apples to fresh

ones, which shows how to improve the evidence: give animals a choice between fresh and older food.

1. [http://www.newyorker.com/reporting/2008/11/24/081124fa\\_fact\\_bilger](http://www.newyorker.com/reporting/2008/11/24/081124fa_fact_bilger)

---

karky (2010-04-16 06:02:14)  
or maybe they just like getting drunk. LOL

SB (2010-04-16 10:28:38)

On Polyface farm: "He (Salatin) puts the cows in a 3-sided, roofed barn, and as they poop and the level rises, he puts straw and corn on top of it, then repeats until the end of winter. The heat of anaerobic decomposition keeps the cows warm. Then in spring, he lets the pigs in, where they root through it to dig out the fermented corn."

### **Why UC Berkeley is Investigating Peter Duesberg (2010-04-17 06:05)**

In November, [1]UC Berkeley launched an investigation of Professor Peter Duesberg for misconduct associated with a paper of his retracted from Medical Hypotheses. According to [2]the letter sent Duesberg informing him of the investigation, there were two allegations. One was that his paper had been withdrawn by the publisher due to "issues of credibility and false claims." The other was that "you failed to declare a relevant conflict of interest with regard to the commercial interests of your co-authors." Duesberg tried to learn more about what he was accused of, without success. Finally the university sent him the letters of complaint that led to the investigation. Here they are.

[3]

President Mark Yudof, Office of the President  
University of California  
1155 Franklin Street  
Oakland, CA 94607-0200

Mary Croghan Chair, Universitywide Academic Sen.  
University of California  
1155 Franklin Street  
Oakland, CA

August 25, 2020

Regarding Professor Peter H. Duesberg

An article recently submitted by Professor Peter H. Duesberg to *Medical Hypotheses* was investigated by the publisher and subsequently withdrawn by the publisher based on issues of credibility and false claims. The article sought to deny HIV as the cause of AIDS and as the cause of extensive HIV related mortality in South Africa – a number estimated at over 300,000. The damage produced by Professor Duesberg and his attempts to discredit the scientific community are inconsistent with the ethical and academic standards of the University of California. In addition, one of the co-authors, David Kasnick failed to declare his conflict of interest.

This event should be of great concern to the University of California at a time when President Yudof has been assisting us, "groups around the state about the need to protect and enhance UC's role in producing the innovative ideas and human capital that can lead the state out of very difficult times." It is still history not a tale to have the credibility of the University questioned.

Retraction of a manuscript is a serious event reflecting on all of us as faculty members of the University of California. If the University of California is to maintain a reputation as one of the most outstanding academic institutions in the world, it cannot support the use of the University of California or an academic position as platforms to disseminate dangerous opinions and deny principles which are the very foundation of science.

I need to emphasize that this incident is not a remote event but is once again reminding world wide attention questioning the role of the University of California in its academic oversight.

Sincerely,

28 August 2009

President Mark Yudof  
Office of the President University of California  
1111 Franklin Street Oakland, CA 94607-5200

[Mary.Croughan@uocc.edu](mailto:Mary.Croughan@uocc.edu)

Dear President Yudof and Chairperson Croughan

**REQUEST FOR INVESTIGATION INTO PROFESSOR PETER DUESBERG**

I am writing to request an investigation into the conduct of Professor Peter Duesberg. I am concerned that he has possibly breached the ethics and practices of scientific publishing in relation to a paper that recently appeared in the journal 'Medical Hypotheses', of which he is the first and corresponding author. [1]

Since publication the paper has been withdrawn by the publisher, Elsevier, states, "... we have received serious expressions of concern about the quality of this article, which contains highly controversial opinions about the causes of AIDS, opinions that could potentially be damaging to global public health. Concern has also been expressed that the article contains potentially libelous material." [2] Since the paper is withdrawn, I have attached the article as it was originally published before withdrawal.

My concern however regards Professor Duesberg's failure to declare a relevant conflict of interest. In the paper, he states, "I and my co-authors have no commercial or other non-scientific conflicts of interest with our AIDS paper for Med. Hypotheses."

This statement appears inaccurate to me. One of the central themes of the paper is an attack on the use of antiretroviral drugs to treat HIV infection. As an example, the abstract states, "We call into

question the claim that HIV antibody-positives would benefit from anti-HIV drugs, because these drugs are inevitably toxic and because there is as yet no proof that HIV causes AIDS."

Dr. David Rasnick is a co-author of the paper by Duesberg et al. Until recently, he worked as a researcher for a company, the Dr. Rath Health Foundation Africa. This organization promoted and distributed (and in terms of South African law, sold) micronutrient products as alternatives to the use of antiretroviral drugs to treat HIV infection in South Africa. The organization, with Dr. Rasnick's direct involvement, also conducted an unauthorized clinical trial to evaluate its products as alternatives to antiretroviral drugs for treatment of people with HIV infection. The company has never published the results of this trial in a peer-reviewed medical journal, but has instead published paid advertisements purporting to report the trial's results, a practice that is considered unethical in medical research. Dr. Rasnick is described in these advertisements as one of the researchers who conducted the trial.

A case was brought by the Treatment Action Campaign and the South African Medical Association against the company's owner, Matthias Rath, the Rath Health Foundation Africa, Dr. Rasnick and others in the Cape High Court. The court was requested to interdict the unauthorized trial from continuing. The court found in favour of the plaintiffs and ruled that the defendants, including Dr. Rasnick, had indeed conducted an unauthorized clinical trial [3]. Several deaths occurred on the trial [4]. Also of note is that Dr. Rasnick has previously misrepresented his affiliation with the University of California, Berkeley [5].

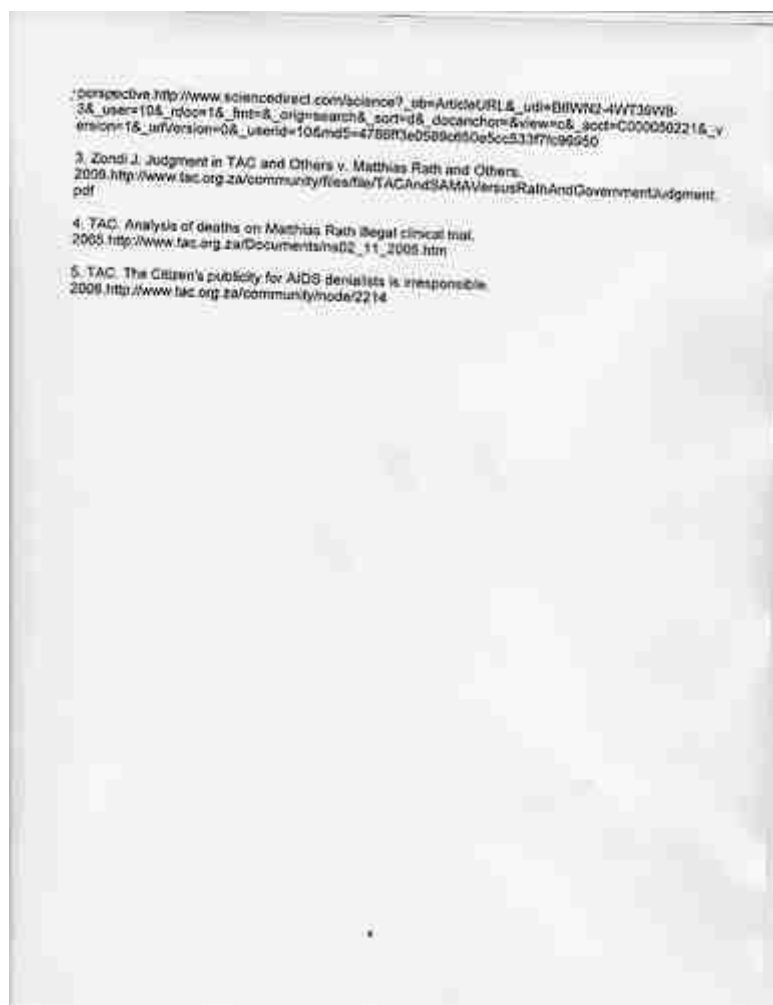

In summary, the facts are that Dr. Rasnick, a co-author of the paper by Duesberg et al., has worked to boost the sales of an alternative (but ineffective) way to treat HIV infection. His employer, the Dr. Rath Health Foundation Africa, has actively attacked the use of antiretrovirals (a proven, effective way to treat HIV infection) as part of its marketing campaign for its products. Dr. Rasnick has helped to promote these products in paid advertisements. A paper co-authored by Dr. Rasnick that attacks the use of antiretroviral drugs is therefore of commercial value to his former (and possibly current) employer, Matthias Rath.

The affiliation between Dr. Rasnick and Matthias Rath is therefore a material and relevant fact that should have been disclosed in the paper by Duesberg et al. As the responsibility for making such a disclosure is the corresponding author's, it appears to me that Professor Duesberg has likely committed an ethical breach that should be investigated by the University of California, Berkeley.

Regards

2. Duesberg, P.H., Nicholson, J.M., Rasnick, D., Fiala, C. & Bauer, H.H. WITHDRAWN. HIV-AIDS hypothesis out of touch with South African AIDS - A new

The first letter is incredibly vague. The "issues of credibility and false claims" aren't spelled out and it is unclear why the University of California should care that "Bruce Rasnick failed to declare his conflict of interest." The idea that publishing a dissenting paper about AIDS is an "attempt to discredit the academic community" is worthy of Orwell.

The second letter has several strange features. First, it contradicts itself. It says:

[Statement 1] Until recently, he [Rasnick] worked as a researcher for a company, the Dr Rath Health Foundation Canada [owned by Matthias Rath]

[Statement 2] [Rasnick's] former (and possibly current) employer, Matthias Rath.

Statement 1 says Rasnick no longer works for Rath. Statement 2 says he might still work for Rath.

Second, its logic is outside the way conflict of interest is normally understood. Because you used to work for someone that might benefit from your paper, you now have a conflict of interest? This makes no sense.

Finally, there is the weird idea that because something is "possible" – Matthias Rath is "possibly" Rasnick's current employer – it deserves a misconduct investigation. It's possible that a flying saucer will land on the White House lawn tomorrow.

In spite of all this, UC Berkeley administrators allowed themselves to be used to punish dissent.

Kevin Miller (2010-04-17 07:39:42)

It does seem prudent to investigate when a paper is withdrawn by a journal, and I think I would have that policy if I were UC Berkeley. Wouldn't you? (And speaking of Yoo, there are others I'd personally want to investigate first). The particular journal is an odd duck as scientific journals go, because falsifying results is obviously not at issue, and I don't know why the article was withdrawn. But it seems to me that whether or not this is punishing dissent depends more on how the investigation is conducted and its outcome than on the fact that there is an investigation, annoying as it will be for the target of the investigation in either case.

seth (2010-04-17 08:34:52)

Kevin, UC Berkeley does not have a policy of investigating when a paper is withdrawn by a journal, as shown by the fact that this investigation was triggered by these letters, not by the withdrawal. To answer your question, I don't think such a policy would be a good idea. This case illustrates why such a policy is a poor idea – because one giant publisher (Elsevier) is too susceptible to outside pressure and because UC Berkeley administrators seem to have trouble understanding basic concepts (here, conflict of interest). This investigation is punishment, no doubt about it. If your investigators take seriously the notion that a conflict of interest exists because a co-author was previously employed by a company that might benefit from your paper, who knows what they might do?

spacenookie (2010-04-17 10:38:34)

Yeah, the Duesberg paper is basically a rebuttal to Chigwedere P, Seage GR, Gruskin S, Lee TH, Essex M (October 2008). "Estimating the Lost Benefits of Antiretroviral Drug Use in South Africa". Journal of acquired immune deficiency syndromes. I don't have access to this paper, but according to wikipedia, it implicates Duesberg in over 300,000 AIDS deaths in South Africa. Incidentally, you should look at Duesberg's wikipedia page, they actually have a section titled "Consequences of AIDS Denialism". Humorously, they cite a newspaper article on the Chigwedere paper as a "independent study", one study + a newspaper article on the study make 2 independent studies.

Kevin Miller (2010-04-17 18:56:21)

Seth - I'm not going to assert that Berkeley is well-run, because I don't know, and I'm happy to concede that the people who instigated the complaint aren't disinterested. Still, if you were an administrator and this came to you, with an article that was withdrawn by the journal that published, you really wouldn't get a committee together to investigate it? Investigations and audits are a pain, but it's a pretty mild sanction when compared with, say, the freedom that the tenure system gives faculty to publish unpopular views.

ChristianKI (2010-04-18 03:07:53)

According to popular understanding Cheney had a conflict of interest when the US administration gave billions of dollars to Halliburton because Cheney previously worked in that company. Working with a company means that you become friends with other people at the company and feel certain loyalty to them. In politics much more harm is created by that sort of conflict of interest than by direct corruption where the politician profits directly. It similar to your allegation that ghost writing

is plagiarism. You can have a very strict definition of plagiarism which doesn't include plagiarism or you can have a broad definition. Here they have a broad definition of conflict of interests.

seth (2010-04-18 04:24:03)

ChristianKI, to find an example to convince me that "conflict of interest" applies to someone who employed you three years ago you'll have to find a less unusual case. There are thousands of conflict of interest statements published every week in scientific journals; I have never seen one that mentioned someone who employed the author three years ago. And even with your broad definition of conflict of interest, it is still harassment/punishment for the simple reason that no one is ever ever investigated for it. Just as no one – unless you happen to be black – is ever pulled over for driving one mile over the speed limit. I don't follow your point about ghost-writing. Call it plagiarism or not, it still reflects very badly on those med school profs who publish ghost-written articles without acknowledging the assistance. Those articles are supposed to be unbiased reviews of treatment options; they aren't. They seriously mislead readers by making some drugs sound better than they are. That's the crux of the problem, not "plagiarism". The reliance of med school profs on drug money is a huge problem. People's co-authors having been employed three years ago by a company that might benefit from their paper is not a huge problem. Kevin, administrators should read letters of complaint they receive, yes. But these two letters aren't convincing. They are too vague about what's wrong with the paper and far outside normal usage when it comes to conflict of interest. As an administrator I would think three things: (a) The pair of letters reflects an organized campaign. The purpose of the campaign is to punish someone they disagree with. It has nothing to do with public health–the paper has already been withdrawn. (b) The complaints about "credibility" and the like are incredibly vague because there is nothing there. If there was something serious, it would have been made clear. (c) The conflict of interest complaint is not just absurd, it's clearly harassment. The whole thing reeks of harassment for an unpopular view.

Kevin Miller (2010-04-18 08:42:06)

Seth, I suspect we just come to different conclusions from the same facts. I don't think that investigation necessarily equals harassment; it all depends on how the investigation is done. The easy call is always to say that "where there's smoke, there might be fire" and do an investigation. I don't think it's warranted to conclude that either because the accusers have their own axes to grind or because they don't lay out convincing evidence, that such evidence doesn't exist. Often people who take small shortcuts also take larger ones (think "third-rate burglary"). I'm not accusing Duesberg of this, or anything else. But I think that I would have a strong bias toward putting together an investigation but trying to make sure the committee consisted of people who had both relevant expertise and no animus in either direction. Coincidentally, I listened to a sad sermon last weekend in my local Catholic church presenting a very defensive attitude to the pedophile scandals, including calling attention to the anti-Catholic biases of many of the people who are making much of them. My reaction to that as well as this is, "so what?" You still need to investigate and respond to what you learn. It's a cost of doing business in any field that presumes a high level of trust in what people say or write. If academics and researchers are relied on to police themselves (and we are, to a large extent), we need to show that we investigate claims of abuse. In this case, the withdrawal of the paper, for whatever reasons, is a concrete piece of evidence that's pretty hard to ignore. I think investigating remains the responsible decision, even if the person who makes that decision thinks it's likely to lead to no action. I think that, if you were an administrator, you probably would go through the steps you list but then also say, "what if I'm wrong?" If the administrator is right in thinking there's nothing to this, then Duesberg has to endure the unpleasantness of an investigation but can then say he was cleared by the University. If he's wrong, then it's *\*really\** important that people can't look back in the future and say that Berkeley swept this under the carpet despite multiple complaints and a withdrawn paper. Or so it seems to me.

seth (2010-04-18 11:05:00)

Kevin, you write "I don't think investigation equals harassment." I gather from this you have never been investigated – much less investigated by idiots who are capable of anything. If UC Berkeley administrators wanted to be "cautious" they could have written back to the authors of these two letters and asked them to spell out exactly what was bad about the paper. The conflict of interest complaint is obviously ridiculous. I'll say it again: the reason the "credibility" etc. accusation was so vague was because actual examples would have been unconvincing – would have appeared trivial. "It's a cost of doing business in any field that presumes a high level of trust." Nobody is accusing Duesberg of making up data – that's where trust comes in.

You really do have to trust scientists to report accurately their data and not make up data. Theories, on the other hand, are inherently UNtrustworthy – and the withdrawn paper was about a theory. You don't judge a theory by the institution from which it came, you judge it by evidence. There is no need to "trust" UC Berkeley professors when they propose a new theory, either it is supported by the evidence or it isn't. I am not overly concerned that UC Berkeley profs will come up with theories that turn out to be wrong. I am much more concerned that they will take refuge in careerism and fail to work on problems that the rest of us care about. There's a reason for the term "ivory tower". There's a reason "pure" research is higher status than "applied" research. Because scientists tend to dislike being useful. Duesberg was the opposite of careerist and put forth a new idea on a question that the rest of us care about. I happen to disagree with him, but I am glad for the absence of careerism.

Patrik (2010-04-19 01:58:56)

***I am not overly concerned that UC Berkeley profs will come up with theories that turn out to be wrong.*** Exactly! The question is not whether Duesberg is right or wrong (I have no idea) – but if he is to be allowed the academic freedom to question the conventional wisdom.

eh (2010-04-19 13:34:52)

Read the third paragraph of the first letter. I have not read Duesberg's paper, and don't know enough about the topic to give an informed opinion even if I had, but reading that paragraph should tell you all you need to know about the motivations of the person or people behind this.

The Berkeley Inquisition Exposed at Semmelweis Society International (2010-04-19 17:38:10)

[...] Geffen also alleges that co-author David Rasnick PhD should have reported his brief association with health advocate Matthias Rath MD. To assert that a co-author's relationship (that ended in 2006) represents a punishable conflict of interest against Duesberg is absurd – especially when considering the breathtaking conflicts of his accusers and employer. [...]

Semmelweis (2010-04-21 12:20:21)

The Semmelweis society fully supports the investigation into Duesberg's misconduct. Furthermore, a vote has been taken to sign on any petition to have Duesberg's conduct sanctioned. The entire membership has voted to strip Duesberg of any award previously given. Semmelweis has launched its own investigation of Duesberg's misconduct, and we find that his misconduct is real. Clark Baker has used under-handed tactics to steal our website. However, do not be fooled by Baker's identity theft. We fully support the best care possible for AIDS patients.

ggh (2010-05-21 11:05:07)

Duesberg - "conflict of interest" - Some of the above writers may have a conflict of interest but if Duesberg has a conflict of interest it is for a lot less money than his attackers. Who is this Semelweis - "we find his misconduct is real" - take it easy buddy, finish the investigation first. The best care for AIDS patients may just be to not load them up with something too dangerous to give to cancer patients ( the intended patients of AZT).

whereistheproof (2010-06-21 21:45:30)

well - looks like duesberg is in the clear. the university concluded the investigation and found duesberg at no fault. :)

## Assorted Links (2010-04-17 17:28)

- "Your body's resistance to an activity isn't an obstacle to be overcome, it's a message that you're being an idiot, just like when your hand hurts after you punch a wall. The right solution isn't to start punching the wall harder, it's to look around for a tool to help you do the job . . . With losing weight, the key is things like the Shangri-La Diet." [1]Aaron Swartz argues that if something needs a lot of will-power to do, it's a mistake. I agree.

- [2]Reed Hundt on "Bandwidth, Jobs, and the Future of Internet Freedom".
- [3]Art DeVany interviewed on Econtalk. Agrees with Aaron.
- In China, [4]"what censored actually means". "One day last summer, an anonymous member posted something on a Baidu forum devoted to the online game World of Warcraft, and it became an Internet meme: Jia Junpeng, your mother wants you to go home to eat. The cheeky, mysterious sentence received seven million hits and 300,000 comments on the first day. . . . Around the time the post originally appeared, a famous blogger named Guo Baofeng was arrested [by the Mawei police] for posting allegations of an official cover-up in the brutal rape of a 25-year-old woman named Yan Xiaoling in Mawei, a district in the city of Fuzhou. She later died of her injuries. . . . Bloggers began calling on people to send postcards to the Mawei police: Guo Baofeng, your mother wants you to go home to eat. Similar messages sprouted on bulletin-board sites. A few days later, Guo was released."

Thanks to Evelyn Mitchell.

### **Tsinghua Student Clubs (2010-04-18 04:41)**

[1]Here is a list of Tsinghua student clubs. Some are puzzling or intriguing:

- Student Anti-Cult Association
- Student Collection Association
- Student Du Xing Association
- Student Edge Landscape Studies Association
- Student Informatized Service and Consultation Enthusiasts Association
- Student Insurance Association
- Student Project Management Association
- Student Web Surfing Enthusiasts Association
- Student Xi Lu Association

No restaurant club. Neighboring Peking University has such a club. I wonder what the Student Social Interaction Development Association does. The Student Redology Association is devoted to study of the book Dream of a Red Chamber. I mentioned [2]earlier a student club whose name means "sing your heart". Here that club is called Student

Education Aid-the-Poor Service Association.

## The Silver Lining of a Cloud of Volcanic Ash (2010-04-18 09:58)

A [1]New York Times article on the volcanic ash preventing air travel ended like this:

Leo Liao, a Hong Kong businessman who was stranded at the Frankfurt airport, was cheerful and philosophical. "It's a natural issue," he said. "Never complain. You can't change this."

Not cheerful enough. I once heard Edward Teller, the physicist, give a talk. In the middle, he said if we managed to control the weather we would take away the last topic of civilized conversation. Several years ago Berkeley had the rainiest winter in memory. It was never so easy to talk to strangers – you could commiserate about the rain. The stranded travelers have an unparalleled opportunity to meet people different from themselves, people they would ordinarily never be able to meet.

[2]How to Talk to Strangers. [3]Paris Syndrome.

1. <http://www.nytimes.com/2010/04/18/world/europe/18ash.html?pagewanted=2&hp>
2. <http://www.blog.sethroberts.net/2009/09/20/how-to-talk-to-strangers/>
3. [http://en.wikipedia.org/wiki/Paris\\_syndrome](http://en.wikipedia.org/wiki/Paris_syndrome)

---

q (2010-04-18 14:28:18)

> The stranded travelers have an unparalleled opportunity to meet people different from themselves, people they would ordinarily never be able to meet. Yes, but people like me, who were supposed to fly to Europe during the window but who are at home instead, have fewer chances to step outside their habitual mold.

seth (2010-04-18 17:45:22)

q, you can go to Europe later.

Nathan Myers (2010-04-19 17:49:32)

Funny, I would have described Teller as "the H-bomb promoter". The U.S. probably wouldn't have made and detonated them without his insistent promotion. He's also known for publishing papers that sneakily exposed classified methods to improve yields of nuclear weapons, for the benefit of those still working on their designs.

## Oprah Meets Veblen (2010-04-18 18:41)

An assistant manager at Marshall Fields, the Chicago department store, told [1]Gawker the following story:

I was walking through the floor, and I hear a voice call my name. . . . Once she started speaking to me, I realized it was Oprah. Honestly, she is unrecognizable without the spackle/wig. Anyway, she was very nice, and asked me if I would offer my opinion on a china pattern she was looking at for her house. It was Villeroy and Boch (German, middle-range) "Petite Fleur." Very cute, kind of French-country, with a small, scattered floral design. I said, "What's not to like?" Oprah responded, "Well, it's not that expensive, and I don't want people who come to my house to think I'm cheap."

## Where to Find Umami (2010-04-19 05:00)

[1]Here is a list of umami-rich foods. As regular readers of this blog know, I believe we like umami flavor so that we will eat more bacteria-rich foods. In this list, notice that fresh foods tend to have much less umami than older foods. Cured ham (337 units) is much higher than pork (2.5). Cheese (182-1680) is much higher than milk (1-4). Soy sauce (412-1264) is aged; so is fish sauce (621-1383).Â Seaweed (kombu) is high (241-3190) but since seaweed is sold dried, I suspect the drying process is at least partly responsible for the high umami content. [2]Marmite (1960) is not aged – but its main ingredient is yeast.

As far as I know, all meat sold commercially in America is aged: it doesn't taste right until it's aged. Umami is sometimes described as a "meaty" taste.

1. <http://www.starchefs.com/features/rediscovering-umami/html/umami-chart.shtml>
2. <http://en.wikipedia.org/wiki/Marmite>

---

q (2010-04-19 06:32:18)

a few weeks ago i made miso soup with blue cheese and it was really tasty. it's very simple as all the ingredients dissolve in hot water. i made it in a cup.

Nancy Lebovitz (2010-04-19 06:49:20)

You can get fresh seaweed in some Asian grocery stores. I don't know whether the seaweed in the chart was fresh or dried.

Alex Chernavsky (2010-04-19 19:39:02)

And speaking of fermented foods, here's an article about coffee beans that ferment in the stomachs of cat-like creatures called civets: <http://www.nytimes.com/2010/04/18/world/asia/18civetcoffee.html> These beans are very expensive and are said to "produce a brew described as smooth, chocolaty and devoid of any bitter aftertaste."

MT (2010-04-20 21:05:16)  
What are the units, and how are they derived?

seth (2010-04-20 21:42:56)  
unit = milligrams of glutamate per 100 g

### Two Months on the Shangri-La Diet (2010-04-19 09:59)

Good results.

In 2 months I’ve lost 13 pounds . . . I have even skipped days due to a hectic work schedule. . . .

I was stopped outside church on Sunday by someone who had noticed the weight loss and wanted to know how I did it. I have still yet to convince my fiercest critic – my loving wife, but at least she’s stopped calling it a placebo!

---

Andrew Gelman (2010-04-20 10:34:15)  
Good job, Seth! This sort of thing should make you feel very happy.

seth (2010-04-20 18:50:38)  
Thanks, Andrew. You have reminded me that I forgot to categorize this under self-congratulation.

q (2010-04-20 19:24:36)

me: three and a half months, down 13 pounds or so. i don't have a snazzy graph like the above, but it would look similar albeit with a less pronounced slope. people are starting to ask questions. is there a good starting point online where i can send people for information?

seth (2010-04-20 21:44:31)

send them to [boards.shangriladiet.com](http://boards.shangriladiet.com)

fbnops (2010-04-21 10:03:43)

Wait a minute, I thought you were the Shangri-La guy. Didn't you develop and have great success with the Shangri-La diet several years ago? Didn't I read somewhere you attained your ideal weight, but still took a maintenance dose of flaxseed oil?

Hal (2010-04-23 12:27:25)

I believe Seth is quoting someone else's success on the diet. I joined Weight Watchers a few years ago and lost 10-15 pounds the first two months, eventually taking off 45 pounds or so. Kept it off too for a couple years. I'm not sure many Shangri-La-ers have such good results. But my case was exceptional for WW. I had tried Shangri-La the year before (even bought the book) but it didn't do much for me, and I felt nauseous drinking the oil. Personally I suspect that's how it works, for the people it works for.

Sam (2010-04-28 11:57:43)

Good job! Your ability to get results puts you in a rare class. However, I feel that your data is undercut by the quality of the graph you use. The lowest point your graph can represent is 210; it's impossible to represent zero. For anyone familiar with graphs, it seems like you are adjusting your scale to dramatize the change. This wouldn't be fair to you, and I'm sure you didn't intend it. It's a problem common enough for Edward Tufte to discuss it. Here's a brief explanation: <http://20bits.com/articles/politics-and-tuftes-lie-factor/> You also see this whenever financial news programs swoosh a new chart onto the screen; it drives me crazy!

Anthony (2010-04-28 14:02:33)

@Sam, I think you're misapplying that idea. The point of the graph is to clearly show the changes occurring. At the very least, using 0 lbs as a base line would be odd - no one is going to go to 0 lbs. Maybe 175 lbs or something (or whatever the desired weight is for the person).

## Why Are Volcano Jokes So Bad? (2010-04-20 07:18)

You may remember What does NASA stand for? Need Additional Six Astronauts. This circulated after the Challenger blew up. In contrast, [1]the volcano jokes I've heard are curiously bad:

6. Dear

Iceland

, We said send cash, not ash.

7. Woke this morning to find every surface in the house covered in a layer of dust and a foul stench of sulphur in the air.... Yes, I've been married to that bone-idle slob for 20 years.

8.

It was the last wish of the Icelandic economy that its ashes were spread all over

Europe

.

9.

There's no pleasing the English. The last time they got the Ashes they were over the moon.

10.Â

Went outside today and got hit by a bag of frozen sausages, a chocolate gateau and some fish fingers.

Someone said it's a fallout from

Iceland

.

1. <http://www.mirror.co.uk/news/top-stories/2010/04/20/iceland-volcano-jokes-top-10-gags-to-help-you-on-your-journey-home-115875-22198852/>

---

Igor Carron (2010-04-20 08:59:09)

I'd rather see bad jokes and no death. The NASA joke got some revival when K.C, Rick, Dave, Will, Laurel passed away in '03. It's funny nobody made a reference to the fact that the ashes might be a by-product of the fake money the Icelandic banks generated in the last crisis. Igor.

pat (2010-04-20 14:22:26)

you don't even need a joke, just get your friends to pronounce Eyjafjallajökull three times fast.

Chris (2010-04-20 15:14:13)

For number 10, you need to understand that Iceland is the name of a supermarket in the UK which specialises in frozen food.

Bob (2010-04-22 16:11:50)

Because there are few Jews in Iceland?

Roger Sweeny (2010-04-23 11:41:34)

Given how deeply Icelanders were involved in the speculative excess of the 2000s and given how badly the collapse has hit them, I find 8 hauntingly hilarious.

Alasdair (2010-04-24 18:18:06)

Wait - first they declare bankruptcy. Then, they set fire to their own island. Insurance scam? (from the same place I saw the other ones first...)

## Is English My Native Language? (2010-04-21 05:33)

Here's the last paragraph of [1] a New York Times book review by Janet Maslin:

“The Publisher” [a biography of Henry Luce] has its parched passages, most notably when it ventures into the thickets of Luce’s “big” ideas. It works best when the man is well within sight. But Mr. Brinkley is dauntless in assessing Luce’s most important accomplishments, like his “American Century” essay and other efforts to tell Americans what American life was like. Life magazine had no temerity about devoting a major series in the 1950s to “Man’s New World: How He Lives in It.” Now that Man’s New World is so different from anything Henry Luce could imagine, his life and times are more poignant than they once seemed.

As I read this, I wondered if English was my native language. It was so hard to understand. Then I wondered if New York Times writers are paid by the big word. “Parched”? “Thickets”? At least I know what that sentence means. I don’t know what she means by “Mr. Brinkley is dauntless in assessing...” – dauntless means fearless. Nor do I understand what “Life magazine had no temerity about” means. Temerity means recklessness or boldness. The logic of the last sentence (“Now that . . .”) with its big word poignant also escapes me.

Perhaps Maslin has found that if she writes like this her editors will edit her less, not being quite sure what those words mean. I attended many talks at UC Berkeley in which the speaker left out crucial information, such as the meaning of the y axis of a graph. And, virtually every time, no one asked about it – not even the four or five professors present. Gradually I realized why: They were insecure.

1. <http://www.nytimes.com/2010/04/20/books/20book.html?hpw>

---

Byran (2010-04-21 06:31:09)

This "insecurity hypothesis" explains what I have observed: Graduate students are less likely to ask questions in a class than a professor who might be sitting in. In this case, the professor is much more secure in his/her knowledge; the grad students are afraid of looking foolish. Which flies a bit in the face of your assertion that professors are insecure as well; I'm sure they are but probably not, on average, as insecure in their knowledge as grad students.

Alex Chernavsky (2010-04-21 08:23:16)

Having been to my share of god-awful boring seminars, I can say that people may not be asking questions because they're not really paying attention, or they don't really care. If the whole talk is pointless, why worry about the Y-axis?

Alex Chernavsky (2010-04-21 10:34:01)

And speaking of poor writing found in the *New York Times*, check out the first paragraph of this book review (the review was written by one Walter Kirn): ===== According to the perverse aesthetics of artistic guilty pleasure, certain books and movies are so bad "so crudely conceived, despicably motivated and atrociously executed" that they're actually rather good. "Solar," the new novel by Ian McEwan, is just the opposite: a book so good "so ingeniously designed, irreproachably high-minded and skillfully brought off" that it's actually quite bad. Instead of being awful yet absorbing, it's impeccable yet numbing, achieving the sort of superbly wrought inertia of a Romanesque cathedral. There's so little wrong with it that there's nothing particularly right about it, either. It's impressive to behold but something of a virtuous pain to read. ===== <http://www.nytimes.com/2010/04/18/books/review/Kirn-t.html>

Wayne (2010-04-21 10:36:22)

To be honest, the Maslin paragraph sounds like it's been computer generated from a corpus, using statistical methods. The thesaurus-sounding big words are the least of its problems. Back on topic, I have to agree with Alex: if you're interested enough in a topic/presentation, questions will naturally come up. Strong curiosity pushes back against fears of appearing to be the fool.

seth (2010-04-21 11:55:19)

Alex, I was at these talks because I chose to be. So were the other professors, in most cases.

Alex Chernavsky (2010-04-21 12:02:50)

Choosing to go does help motivate you to pay attention, but sometimes the speaker turns out to be quite horrible, or the subject is different from what you expected it to be. Seminars are like a box of chocolates...

Nathan Myers (2010-04-21 12:13:37)

Do you suppose she meant "timidity", for "temerity"? This really is all nonsense, and all because the words don't mean what Maslin appears to be trying to say. Shame on her, and shame on her editors.

Jeff Thomas (2010-04-21 14:58:30)

I agree with Nathan - she meant "timidity". Other than that error I don't find the writing that bad and the overall meaning is pretty clear. I found the use of "parched" instead of "dry," the term commonly used to refer to uninteresting passages of writing, amusing, but I can see how someone could find it overblown. I agree with the use of "poignant" in the last sentence. That is not an overly fancy word.

Christopher Burd (2010-04-21 15:01:17)

"Do you suppose she meant 'timidity', for 'temerity'? " I think so, probably via "timorous".

seth (2010-04-21 16:23:23)

Ordinary usage would be "Life magazine had the temerity to devote . . ."

Timothy Beneke (2010-04-21 23:33:06)

Some tangential comments about intellectual posturing. John Searle says he asked Michel Foucault why he wrote so badly. Foucault told him that if he wrote as clearly as Searle, no one in Paris would read him or take him seriously. Foucault said that in Paris, at least 10 % of what you write must be utterly incomprehensible for you to be taken seriously. Later, Searle asked the sociologist Pierre Bordieu if what Foucault said was true. Bordieu said it was more like 20 %. Noam Chomsky was once asked about dialectical materialism. Chomsky said that he had no idea what it meant; that it had something vaguely to do with recursive processes, he guessed. He said that when something important happens in physics, he can meet with his physicist friends and they will explain it to him and he can grasp it at his own level, with a little bit of work. But with some ideas, especially in social theory, he feels that if he worked for a million years he would never understand it because it's simply not coherent. I'm in a social theory group, with a lot of people who have taught social theory. Much of what we read and some of what is said strikes me as incoherent. But there is a pretense in the field that very abstract generalizations that have the rhetorical flavor of science are revealing some deep truth. I think it's mostly intellectual fraudulence... Psychologists are mostly trying to be scientists, even if they are unclear. Some of the stuff that passes for thought in social theory and the humanities seems like pure bluff...

Alex Chernavsky (2010-04-22 04:30:19)

The best essay I've ever read about intellectual posturing is this one, by Richard Dawkins: <http://richarddawkins.net/articleComments,824,Postmodernism-Disrobed,Richard-Dawkins-Nature,page6> Here's a sample: ===== Suppose you are an intellectual impostor with nothing to say, but with strong ambitions to succeed in academic life, collect a coterie of reverent disciples and have students around the world anoint your pages with respectful yellow highlighter. What kind of literary style would you cultivate? Not a lucid one, surely, for clarity would expose your lack of content. The chances are that you would produce something like the following: "We can clearly see that there is no bi-univocal correspondence between linear signifying links or archi-writing, depending on the author, and this multireferential, multi-dimensional machinic catalysis. The symmetry of scale, the transversality, the pathic non-discursive character of their expansion: all these dimensions remove us from the logic of the excluded middle and reinforce us in our dismissal of the ontological binarism we criticised previously." This is a quotation from the psychoanalyst F lix Guattari, one of many fashionable French 'intellectuals'... =====

seth (2010-04-22 06:05:04)

Tim and Alex, in an earlier draft of this post I wrote: "Veblen pointed out that professors use big words to show off, but I don't think that's what's going on here." I don't think Maslin is trying to sound smart, or impress the general public, or be taken seriously. It's just a book review. She churns them out. She isn't a professor, who might write three articles per year. As a journalist who wrote for Newsweek put it to me, "Then it goes to editing, where every editor feels the need to piss on it." It's not just Newsweek. My guess is Maslin is reacting to that treatment.

Taylor (2010-04-22 08:31:31)

There was an interesting discussion of this in the book 'The Economic Naturalist'. Unfortunately I can't remember offhand what the explanation was. Something like an arms race of obscure vocabulary.

griff (2010-04-22 12:26:02)

Reading this reminded me of the Sokal Affair ([http://en.wikipedia.org/wiki/Sokal\\_affair](http://en.wikipedia.org/wiki/Sokal_affair)). Essentially, a bunch of nonsense was written and submitted to peer review, and it made it through.

Kirk (2010-04-22 15:00:30)

Rewriting can yield useful insights. I took a run at the paragraph, and in so doing discovered three unclear areas. (1) The third sentence begins with a "but", however, that sentence appears to support the previous sentence. The "but" forces the reader to

stop and wonder, "what's she objecting to?" (2) I was forced to interpret the "temerity" sentence as admiration. She may have actually meant something else, in which case the sentence would wander into a different thicket. (3) The "poignant" word has multiple meanings. Choose your favorite: (a) his life and times are more physically painful than they once seemed (b) his life and times appear more keenly distressing to the mind than they once seemed (c) his life and times appear more profoundly moving than they once seemed (d) his life and times appear more incisive than they once seemed (e) his life and times appear more neat and skillful than they once seemed (f) his life and times appear more astute and pertinent than they once seemed (g) his life and times appear more agreeably, intensely stimulating than they once seemed My version follows. "The Publisher" can be dry at times, especially when it explores the thickets of Luce's "big" ideas. It works best when it concentrates on the man himself, and especially excels when it assesses Luce's most important accomplishments, like his "American Century" essay, as well as other efforts to tell Americans what American life was like. For example, Life magazine devoted a major series in the 1950s to "Man's New World: How He Lives in It." Now that the life of an American looks nothing like Henry Luce could imagine, his life and times appear more astute and pertinent than they once seemed.

Vic (2010-04-23 00:24:42)

Suppose you are an intellectual impostor with nothing to say, but with strong ambitions to succeed in academic life, collect a coterie of reverent disciples and have students around the world anoint your pages with respectful yellow highlighter. What kind of literary style would you cultivate? Not a lucid one, surely, for clarity would expose your lack of content. The chances are that you would produce something like the following: — — — This is a fairly apt description of the whole academic field of economics

Kirk (2010-04-23 11:12:01)

In retrospect, given the importance of the final paragraph in any essay, I conclude that her form implies her meaning. She intends to warn off the reader but could not, politically, state it clearly, something along the lines of, "This book is a bore. You'd have better fun, and learn more, by watching reruns of I Love Lucy."

## The Hockey Stick Illusion (2010-04-22 05:40)

Recently [1]a WSJ columnist told this story:

I was chatting with a friend who, over the years, has helped her kids slog through the obligatory science-fair projects.

"The experiments never turned out the way they were supposed to, and so we were always having to fudge the results so that the projects wouldn't be screwy. I always felt guilty about that dishonesty," she said, "but now I feel like we were doing real science."

Yes, science with a human touch. The Hockey Stick Illusion by [2]Andrew Montford (sent to me by the publisher) is a great book because it tells a great story. That story has a hero (Stephen McIntyre) and a villain (Michael Mann) and illustrates a basic truth about the world: A consensus of the "best people" can be wrong. This point was first made, as far as I know, by [3]The Emperor's New Clothes. It was later made by the [4]Asch experiment (about line-length judgments). It's not obvious; Elizabeth Kolbert and her editors at The New Yorker, not to mention Bill McKibben, have yet to understand it. ("No one has ever offered a plausible account of why thousands of scientists at hundreds of universities in dozens of countries would bother to engineer a climate hoax," [5]Kolbert recently wrote, with the permission of her editors.)Â It's a sad comment on our education system that I first learned it via self-experimentation. My results showed that an acne medicine that my dermatologist prescribed didn't work – a possibility for which my

dermatologist (in consensus with other dermatologists) hadn't allowed. As truths go, this one is scary: It means you have to think for yourself. But it is also the most liberating truth I know.

The Hockey Stick Illusion tells how McIntyre, skeptical of Mann's hockey-stick result (a sharp increase in global temperature to unprecedented levels during the 20th century), tried to get the data and computer code that Mann used. Mann put him off. He still hasn't released the computer code he used. Mann found a hockey stick where none existed because (a) he used principal-components analysis to summarize a lot of temperature series (bad idea), (b) he used that method in an unusual way, making a bad idea worse, and (c) one of his time series had a serious problem. After McIntyre noticed this problem and pointed it out, the story really begins: How did everyone react? Much as a reader of The Emperor's New Clothes would expect. Nature denied it. The Washington Post denied it. Most climate scientists denied it (and continue to). Montford started writing the book before Climategate, whose overall message was the same – that climate scientists have been distorting the truth, that the case for man-made global warming is far weaker than they say, that a consensus of experts can be wrong. As Montford puts it,

None of the corruption and bias and flouting of rules we have seen in this story [and in the Climategate emails] would have been necessary if there is, as we are led to believe, a watertight case that mankind is having a potentially catastrophic effect on the climate.

Climategate and the story within The Hockey Stick Illusion are bad news for some very powerful people, such as Al Gore and those who gave him a Nobel Prize, but are helpful to the rest of us. When Big Shot X says "This is incredibly clear, everyone knows this" . . . maybe they're wrong.

---

Jake (2010-04-22 08:31:35)

Contrary to what you read, only a small minority of scientists believe in global warming. Al Gore wrote that global warming is supported by 2,500 scientists. Since he exaggerates, I would take his number as the absolute maximum. Yet, in 2008, President Bush received a petition signed by 30,000 scientists expressed grave doubts about the global warming theory. So how did so few gain such great power? The emails from climategate outline how they accomplished that. Plus they had help from powerful politicians who saw global warming as a way to greatly increase their political power. So why did these scientists pervert science? The global warming industry is a \$2.5 billion industry in America alone. That means that every person or organization that promotes GW(whether it be political or educational) receives a flood of grants, subsidies or contributions.

seth (2010-04-22 08:38:46)

Jake, I have no idea why you say "only a small minority of [climate] scientists believe in global warming". (I'm less concerned what non-climate scientists think.) Can you explain why you believe this?

Jeff Thomas (2010-04-22 09:37:21)

Seth, while I don't know exactly where Jake is coming from, I would say that metaphorically it could be described as an underground bunker that is shielded with a special type of tinfoil to prevent the government's fleet of black helicopters from locating it. You can expect to make many more new friends like Jake as you continue to deny the overwhelming scientific consensus on global warming.

Nathan Myers (2010-04-22 12:56:24)

It's easier to understand why stories like *The Hockey Stick Illusion* are made so appealing. The authors are lying. It's so much easier to make a compelling story when you have no commitment to truth. This is the deep lesson hammered out by the Bards, codified by Edward Bernays in the '20s, refined by J. Goebbels in the '30s, and industrialized wholesale in the modern world by the Ad Council. The Big Lie technique really works. Climate scientists, constrained to mere facts, will always be at a disadvantage. The fact remains that we have just experienced the hottest twelve-month period in at least a thousand years. Spin as you like, even Exxon doesn't pretend any more; they only pretend now that it's *not their fault*, and spend more persuading lying liars to blow smoke about it than the entire population of climate scientists are paid for honest work.

Brandon (2010-04-22 13:46:31)

I have no opinion regarding the merits of climate change (on either side of the argument) but it would be naive to think a group of people could promote incorrect ideas about something very important to a lot of people for a long time. The high carbohydrate, low fat diet dogma for decades is a great example. I should have known when I was taking a nutrition class in college (circa 1987) taught by my 300+ pound instructor.

Tim (2010-04-22 14:06:30)

I am little confused, Seth used the hockey stick to question global warming Nathan says people who used the hockey stick are lying, but man made global warming is true ??????????

Peter Tuckey (2010-04-23 00:20:07)

For Nathan Myers: Follow the moneyâ€¦as always. This man, Dr Richard North (and others of course), has helped reveal what is behind it all. <http://eureferendum.blogspot.com/2010/01/new-american.html>

John A (2010-04-23 01:03:30)

It's easier to understand why stories like *The Hockey Stick Illusion* are made so appealing. The authors are lying. It's so much easier to make a compelling story when you have no commitment to truth.

Yes of course, that must be it.

This is the deep lesson hammered out by the Bards, codified by Edward Bernays in the '20s, refined by J. Goebbels in the '30s, and industrialized wholesale in the modern world by the Ad Council. The Big Lie technique really works.

Wow, argumentum ad hitlerium. It must be true.

Climate scientists, constrained to mere facts, will always be at a disadvantage.

Yes they're constrained by mere facts. Here come those mere facts.

The fact remains that we have just experienced the hottest twelve-month period in at least a thousand years.

And how do you know this? Because the statistical techniques used to produce such a result are invalid. This was confirmed by the NAS Panel and the Wegman Report. The NAS Panel chairmen gave evidence to Congress backing Wegman's report, and what he said was that the mathematics is simply wrong and the conclusion that the earth was the warmest it has been in a

thousands years "cannot be sustained by his [Mann's] analysis. All of the other "independent" reconstructions bar a couple, use the same key proxies, and many of them use the MBH PC1 as a proxy to give that HockeyStickness they required. The couple that did not use Mann's bad proxies or their derivatives showed the Medieval Warm Period as warmer than today. I'd say you had swallowed a very Big Lie and only "shut-eyed denial" is your refuge.

Latimer Alder (2010-04-23 01:48:40)

@Nathan Myers Another correspondent who comments on the book without having bothered to read it! You have clearly just taken the title, assumed what you think it about and then written your review. And accused the noble Bishop of lying along the way. Whether we have experienced the hottest decade in a thousand years or not is completely irrelevant to the argument in this book. Though having read it you may conclude that the evidence for that is a bit thinner than you think. But read the bloody book first before reviewing it! Your views will be taken with more conviction if you do.

John Hewitt (2010-04-23 02:08:59)

A couple of comments. Jake you comment on Al Gore saying that 2,500 scientists believe in global warming. That number comes from the 2,500 who contributed to the last IPCC report. If you look at Ross McKittrick's site you will see that they were not asked if they were "believers". The conclusions were written by a small cadre of absolute "believers" and we have no idea how many of the 2,500 agreed with the conclusions. Many probably did but many did not. Actually the number of scientists in other disciplines who are "sceptical" about AGW is growing. This is for two reasons. First their own research findings which contradict parts of the AGW hypothesis and secondly their disbelief at the methodology used by virtually all climate scientists. The models can be used to predict almost any climate scenario, the data is weak and finally the tightly knit of climate scientists involved are impervious to any criticism. Nathan you clearly show you have not even opened the cover of the Hockey Stick Illusion. Its a book that you find hard to put down once you start. - I'm reading it for the third time and it changed my mind totally!

Peter Risdon (2010-04-23 02:11:54)

What a disgraceful comment from Nathan Myers, untruthful and libellous. Not one alleged "lie" from the book is identified, for the simple reason there are none. Some sceptics received some tens of millions in funding, mainly a decade or more ago, from energy companies. Alarmist climate science has received *billions* in funding. Individual climate researchers, like Professor Wang of Albany ( \$7M+), have received close to ten million *each*. We do not know for sure how the most recent decade compares with warm periods in the past - that's the problem. In the northern hemisphere, temperatures were clearly warmer in the past - crops were grown in Greenland, vines in northern Britain, in the middle ages, within the last thousand years. It's less clear what conditions were like in the southern hemisphere, but increasingly, evidence suggests they were the same.

Marko (2010-04-23 02:30:32)

So I take it you read the book? I follow Joe Romm's website [climateprogress.com](http://climateprogress.com) for the hard non-denialist viewpoint, so when I heard of this book I went to see what he thought of it. Apparently he's never mentioned the book or its author. I searched using his own site search engine, plus Google in the form ... [site:climateprogress.com "montford"](http://site:climateprogress.com/montford) ... and so on. Absolutely nothing, and this from a guy who loves to lay it on the skeptics. He went nuts over the second Freakonomics book. He posts several lengthy posts daily, including entire post criticizing things like innocently tendentious words used in New York Times article headlines on global warming. His headlines are longer than most blog posts. Every sentence has a link in it to one of his previous posts. Is Montford's book just too minor to warrant a mention? Is it a needle in a haystack of denialist rants such that it's under Romm's radar? I wouldn't think so, since it's getting press like this: <http://www.prospectmagazine.co.uk/2010/0-3/the-case-against-the-hockey-stick/> So I'm really intrigued. Is this book the first recipient of a new strategy among global warming activists of "Tachy Goes to Coventry," of "I don't hear you la la la"?

Watchman (2010-04-23 02:32:18)

Interesting that the last two commentators react with two non-scientific lines of attack, one of which accuses someone who doubts there is a consensus (however well informed this criticism is) by accusing him of denying the consensus, and therefore has clearly failed to understand the point of the original post, that consensus can be wrong... The second asserts that Mr Mountford is lying, which is peculiar considering that the errors in Dr Mann's codes are in the public domain and proven, which

would suggest the conclusions are erroneous, and that attempts to defend these conclusions are therefore duplicitous. But then again, he then refers to Exxon, apparently the villain funding the deniers (despite the fact there is no evidence of this and that other oil companies have been funding e.g. the Climate Research Unit at UEA). So to expose a perceived lie, Nathan asserts that the people using the evidence are lying, and that those defending the flawed conclusions are therefore truthful, and then backs this up with what appears to be a lie, even if Nathan is unaware of this. As to the hottest twelve-month period, where was this experienced? This is not a temperature, but an anomaly calculated by an decreasingly small number of thermometers and a complex system of gridding and averaging. It is not accurate. There may be global warming, but trotting out the hackneyed 'consensus' and 'lies' answers does not actually prove it. Science allows criticism, and where it is valid, it should be recognised as such.

Peter Wilson (2010-04-23 02:49:48)

Nathan Myers Says: "It's easier to understand why stories like The Hockey Stick Illusion are made so appealing. The authors are lying." Really Nathan? Perhaps you would be so good as to explain this rather libellous assertion. Having followed the Hockey Stick saga for years, I think Montford has summed it up very well indeed. I wonder if you have even read the book? "The fact remains that we have just experienced the hottest twelve-month period in at least a thousand years." This is not a fact at all, but a product of your imagination. Even CRU don't say 2009 was hotter than 1998! And as comprehensively demonstrated in the book under review, there is no basis at all for believing the current period to be warmer, or even as warm, as the middle age warm period. You just made both your claims up. Don't talk to us about "the Big Lie" - you seem pretty practised yourself!

Scott (2010-04-23 03:49:23)

Nathan, do you really imagine that this sort of overblown undergraduate rhetoric is going to convince anyone, even those who have not bothered to look into the state of climate science?

John (2010-04-23 05:50:11)

"The authors are lying." Care to provide evidence of this? Quote page number and explanation will suffice. "The fact remains that we have just experienced the hottest twelve-month period in at least a thousand years." No we have not.

John Carter (2010-04-23 06:12:02)

Nathan Myers. To suggest, as you do, that Andrew Montford is a liar says more about you than you know, particularly in the light of the other parts of your post. What Andrew has written is the truth. The truth about the lies and deception of climate science. You adopt the usual alarmist stance of attacking the man and ignoring the facts, something you continue to do with your claims about the climate. Evidence is abundant and overwhelming that the MWP was warmer than present and was not a local phenomenon, so your claim that the current temperatures are the highest in 1,000 years is not just incorrect, it is a blatant lie. You also confuse yourself about what most sceptics believe. The climate varies. It always has and it always will. The temperature rises and falls but anthropogenic CO2 emissions are but a tiny factor in that variability. Your myopic stance, and that of much of climate science, will continue to cause injustice and misery to millions, whilst real and pressing issues are ignored in order to line the pockets of the carbon cheats.

Humphrey (2010-04-23 06:40:59)

Nathan Myers, obviously you haven't read the book "The Hockey Stick Illusion". After reading it, could you please detail in which part the author is lying? Climatology is a very challenging science because the investigators must be high experts in - the very least - meteorology, physics, biology, geology, oceanography, astrology, and God knows what more. What helps is that they never have to release their data and methods because everybody knows they are right. Although there actually is no formula or real life observations and data to be agreed on. But it does not matter, as long as the politicians, big corporations, private financing sector/bubble creators, public money, and the green movement are with them. If a climatologists happens to discover that there really is no problem here - that it is overwhelmingly about natural cycles - 95 % of them will be out of job.

Dean Cairns (2010-04-23 06:58:00)

Nathan, As a fairly impartial observer (I am ex researcher in the field and surface physics and polymer chemistry and now a science teacher) I have read 'The Hockey Stick Illusion' and found it to be very convincing. All claims, anecdotes and analyses

are well documented and verifiable, as far as I can see. The questions that arise in the book do not appear to have been convincingly answered by any of the climate research groups involved. If you believe the contents of the book to be a lie, could you be more specific about which parts? I would like to check them out.

HROwen (2010-04-23 07:31:20)

Nathan Please feel free to elaborate on what "lies" are contained in The Hockey Stick Illusion. The central arguments of the book are correct, they may be inconvenient for people who are concerned about AGW but they remain correct. Without relying on Mann's Hockey Stick it is impossible to assert that we have just experienced the hottest twelve month period in a thousand years because reliable research on the MWP suggests that this is not true, or is at least debatable. The Hockey Stick only received such world wide attention because it was convenient to those trying to convince the public of imminent climatic disaster. Hence its startling conclusion that the MWP and the little Ice Age did not exist or were dwarfed by the scale of recent temperature rises were not sufficiently rigorously critiqued by the climate science establishment. In addition the statistical methods used by Mann do not appear to have been understood by the majority of climate scientists or there would have been no need for a trained mathematician such as Steve McIntyre to take an interest in the subject.

MDAdams (2010-04-23 09:00:45)

@Nathan Myers - You claim that "The authors are lying." As we are discussing The Hockey Stick Illusion, please give us a specific example where the author (Montford) is lying. I suspect you can't. Further, I suspect you haven't seen or read the contents of the book. I have read it, and it provides a very well documented chronology of events, writings and analyses. You might disagree with some conclusions, but the evidence is factual. If I disagree with you, is it logical that you are therefore a liar? That seems to be your argument. I guess you are a true believer.

Shibui (2010-04-23 09:07:36)

Nathan writes, "It's easier to understand why stories like The Hockey Stick Illusion are made so appealing. The authors are lying." Obviously he hasn't read the book ... however if this kind of assertion is representative of the mooted "fight back" campaign by advocates of global warming, sceptics have little to be concerned about. Nathan also claims, "The fact remains that we have just experienced the hottest twelve-month period in at least a thousand years."... Perhaps Nathan might like to substantiate that ...

YFNWG (2010-04-23 09:41:55)

Nathan Myers, apparently you haven't read The Hockey Stick Illusion because 99.9 % of the information in it is verifiable in the public domain. Are you asking to be sued?

Pascal (2010-04-23 09:58:16)

Uh... The 30 000 petition Jake is referring is a hoax. As for Stephen McIntyre, he is very good to talk about himself, but has never added any convincing data to the corpus. What he does since 10 years is pointing things he feels are wrong, which is very good, but in the long term, not very productive. And as for the hockey stick controversy, it has been demonstrated over and over that it was not a mistake, neither than an illusion

Tom Gray (2010-04-23 10:41:18)

Nathan Myers wrote

The fact remains that we have just experienced the hottest twelve-month period in at least a thousand years

There exists no valid temperature reconstruction for the last 1000 years. Depending on which proxies are chosen the relationship between modern and medieval temperatures will vary. So the above statement has no scientific basis.

Hal (2010-04-23 12:20:01)

I enjoy your blog but I am afraid your methodology for getting at the truth is completely flawed. Your global warming

contrarianism is just a symptom of a larger failure. You rely far too heavily on your own personal experiences and discount those of others who disagree with you. Of course this is a nearly universal flaw, but you have made it the very foundation of your intellectual endeavors. Society benefits from having people like you around, because occasionally you will be right about something and it is good to have advocates for many points of view. But it is to your detriment because you end up believing so many false things. Fortunately being wrong about global warming is not too harmful, unless you intend to bequeath to your descendants a beautiful piece of property that happens to be only six inches above sea level, or some such.

Turning Tide (2010-04-23 13:04:27)

@Nathan Myers It's much easier to CALL someone a liar than to prove them so. Please list the deliberate factual inaccuracies in Andrew Montford's book (which of course you MUST have read), otherwise your post is nothing but unsubstantiated assertion.

vic (2010-04-23 14:49:25)

Nathan Myers: Godwin Fail

seth (2010-04-23 20:12:55)

Hal, you know I'm wrong about global warming because . . .

vic (2010-04-23 22:53:57)

where did all these comments supporting the book come from? I posted my above comment this afternoon and it was only the 6th comment on the blog entry (Hal's war 5th and right above mine).... very odd.

ray (2010-04-23 23:16:03)

wow, some emotional outbursts here when belief systems are challenged! Many of the alarmist claims in the latest IPCC report have had to be retracted as based on advocacy, not science. The climate models are not validated and rest on shaky foundations (the key issue is assumptions made regarding feedbacks and climate sensitivity). No empirical evidence exists to support their conclusions. The past temperature record is uncertain and some mainstream climate scientists admit it probably needs reworking (the raw data are adjusted by processes which are not divulged and cannot be scientifically checked, Phil Jones of Climategate's CRU says he has "lost" the original data on which trillion dollar decisions are based). The infamous hockey stick, whose story Andrew Mountford so ably describes, is recognized as an artifact of the invalid statistical methods used. Cap and Trade is being pushed by big banks and politicians, real environmental and social problems are being sidelined.

Peter Wilson (2010-04-24 00:48:55)

Pascal Says: "Uhâ€¦ The 30 000 petition Jake is referring is a hoax." A hoax? That's interesting, Pascal, so you have evidence that all 31,000 signatures on the Oregon Petition are fraudulent? Please be more forthcoming, we are dying to hear more. But of course you don't, the petition is exactly what it claims to be - nothing more nor less than a large number of people holding scientific degrees who, when asked, signed a statement opposing AGW alarmism. It has never been claimed to prove anything, merely to DISPROVE the phony claim of a scientific "consensus" (whatever that could possibly mean) on this eminently debatable subject.

harold (2010-04-24 10:36:34)

I feel a bit sorry for Nathan, the moderation queue played a big part in this clobbering I think. Montford/Bishop Hill is an entertaining and lucid writer, buy the book or start here: <http://bishophill.squarespace.com/blog/2008/8/11/caspar-and-the-jesus-paper.html>

Marko (2010-04-24 19:44:24)

I think first-time commenters are put in the moderation queue, causing an apparent reordering of comments when Seth approves comments.

Blockquotes « Rhymes With Cars & Girls (2010-04-25 08:06:17)

[...] Seth Roberts on The Hockey Stick Illusion: That story has a hero (Stephen McIntyre) and a villain (Michael Mann) and illustrates a basic truth about the world: A consensus of the "best people" can be wrong. [...]

Ed Snack (2010-04-25 15:54:05)

Nathan, I believe that you are incorrect to state that Mann's code has never been released, a copy was released as a consequence of the Wegman inquiry and the Senate hearings. The code as released (a spaghetti like mess of Fortran) does not run, and a number of people have struggled to make it work without complete success, so it is unlikely to be the version finally used despite Mann's claim at the time. However the code makes at least one item quite clear; as presented the code calculates both the RE and R2 statistics for each step in the reconstruction, thus the authors must have been aware that the reconstruction lacked statistical significance in the early steps contrary to the claims in the paper. The paper even quotes the R2 statistic for a later step (the 1815 step as I recall) where it is supportive, but omits it for the early steps where it is not. That is, prima facie, scientific fraud. The excuse (as endlessly repeated at propaganda sites like Realclimate) that RE alone is sufficient is obviously false, RE has been known to be inadequate with correlated data since the 1920's at least, and Mann was well aware of the significantly auto-correlated nature of the residuals from his reconstruction. It is possible that the errors are simply the result of incompetence, but the failure to correct them is dishonest and fraudulent, and it is a great pity that commentators such as Nathan, Hal, and others above cannot recognize and acknowledge such errors and deliberate falsification of the scientific record.

Pascal (2010-04-25 19:57:47)

@Peter: before concluding anything about the "seriousness" of the Oregon petition, you should read this: <http://greenfyre.wordpress.com/2009/07/12/what-if-the-oregon-petition-names-were-real/> and this: <http://www.skeptic.com/eskeptic/08-11-12/> And for those who didn't follow the last news (last 10 years) about the hockey stick, you should read this: <http://www.skepticalscience.com/broken-hockey-stick.htm>

Hal (2010-04-25 22:23:56)

Wow that is a lot of first time posters, weird how my comment got moved down. I wonder if some AGW skeptic site decided to come over here and pile on. Seth, I don't \*know\* you are wrong. I think you are very probably wrong because the scientific consensus is usually right; further, it is unlikely that they would be so far wrong that a non-expert in the field could immediately see through their mistakes.

Anthony (2010-04-25 22:56:51)

"I think you are very probably wrong because the scientific consensus is usually right" Really - in what sense? Most of what we believe today is wrong, or at best incomplete. There is a pretty straightforward inductive argument to this effect.

seth (2010-04-26 00:45:55)

Hal, thanks for explaining that. Judith Curry, a mainstream climate scientist, [1]wrote this recently:

No one really believes that the "science is settled" or that "the debate is over." Scientists and others that say this seem to want to advance a particular agenda. There is nothing more detrimental to public trust than such statements.

As for the speed involved, it took McIntyre years to reach his conclusions. A professional couldn't have done what he did. You can't take years to reach an unpopular conclusion that makes someone powerful look bad. That's a career killer.

1. <http://www.earthzine.org/2010/03/22/judith-curry-on-the-credibility-of-climate-research/>

Nathan Myers (2010-04-26 14:02:03)

Climate scientists aren't powerful. Exxon is powerful. Exxon spends more on lobbying alone, *every year*, than the entire population of climate scientists has ever been paid, cumulatively, since there were any.

The Emperor's New Science | Les Jones (2010-04-27 04:55:58)  
[...] Seth Roberts reviews The Hockey Stick Illusion. [...]

Alex Chernavsky (2010-04-27 13:32:31)

Hal wrote, "I think you are very probably wrong because the scientific consensus is usually right." I think that there are many recent (or relatively recent) cases where the scientific consensus was wrong. For example, Portuguese neurologist Ant3nio Caetano de Abreu Freire Egas Moniz received the Nobel Prize in 1949. He pioneered the use of lobotomy as a "treatment" for mental illness.

Hector M. (2010-04-28 11:04:46)

Many comments confuse two separate issues. The Hockey Stick Illusion (and the hockey stick issue in general) is not the same as the question of global warming. The climate might be warming because of GHG emissions, even if the hockey stick is wrong. Discuss, please, one thing at a time. Both Montford and McIntyre have denied been "deniers" or "denialists". They simply pose technical question, with indefatigable patience and unfailing courtesy and politeness. Besides, many dismissal's of Montford's book (exemplified by several in this thread) are just sweeping assertions (as those of many "deniers") whereas the book is a very detailed and precise description of a host of technical problems, and of various manoeuvres by Mann and others during several years to avoid releasing data, code, and information about how they had proceeded to construct the Hockey Stick chart, and the temperature records and reconstructions on which it is based. The Climategate mails show they were very well aware of the problems, as mentioned (briefly) by Montford and (in more extensive form) by his Bishop Hill blog and McIntire ClimateAudit blog. One should expect a serious discussion of the specific issues more than sweeping anathemas.

### **Books I'm Looking Forward to Reading (2010-04-23 20:19)**

- Made by Hand: Searching For Meaning in a Throwaway World by Mark Frauenfelder
- The Big Short: Inside the Doomsday Machine by Michael Lewis
- Fat: An Appreciation of a Misunderstood Ingredient, with Recipes by Jennifer McLagan. By fat she means animal fat.
- No One Would Listen: A True Financial Thriller by Harry Markopolos
- Wide Awake: A Memoir of Insomnia by Patricia Morrisroe
- Malignant Medical Myths: Why Medical Treatment Causes 200,000 Deaths in the USA Each Year, and How to Protect Yourself by Joel Kauffman
- The Strangest Man: The Hidden Life of Paul Dirac by Graham Farmelo
- Country Driving: A Journey Through China From Farm to Factory by Peter Hessler
- China's Megatrends: The 8 Pillars of a New Society by John & Doris Naisbitt. Just a teensy bit more persuasive than The Coming Collapse of China (2001) by Gordon Chang.
- The Thing Around Your Neck by Chimanda Adichie

Kirk (2010-04-24 10:36:54)

I liked Malignant Medical Myths. I plan to revisit it every year, just before my annual physical, to refresh what he writes about blood pressure. And statins. The man obviously has no holdings of Big Pharma stock.

Aaron (2010-04-26 08:28:50)

I am curious, how many books do you read per year?

seth (2010-04-26 15:36:13)

Not many. In China, a few per month if I'm lucky. In Berkeley, I leaf through 20-30 books/month and read cover to cover maybe 3.

griff (2010-04-27 14:14:46)

The Strangest Man was excellent. You should really enjoy it. Also good and along the same subject was American Prometheus. Having listed to these as well as Einstein, it is interesting to listen to biographies with overlapping characters (e.g. Oppenheimer and Einstein to Dirac, Dirac and Einstein to Oppenheimer, etc).

### **Harry Markopolos, Meet Stephen McIntyre (2010-04-24 16:40)**

After The Hockey Stick Illusion by Andrew Montford (about Stephen McIntyre's criticisms of Michael Mann's hockey-stick graph), I read No One Would Listen by Harry Markopolos (sent to me by the publisher), about the Madoff case. They have plenty in common.

Size. [1]According to Elizabeth Kolbert and New Yorker fact checkers, "thousands of scientists at hundreds of universities in dozens of countries" are sure that humans are disastrously warming the Earth. Madoff stole about \$60 billion from thousands of investors. Helped by dozens of hedge-fund managers.

Hans Christian Andersen. The lesson of The Hockey Stick Illusion was that of The Emperor's New Clothes, [2]as I said. Markopolos mentions that story at least twice.

Failure at the top. In The Hockey Stick Illusion, Nature magazine and the National Academy of Sciences dismiss McIntyre's criticisms. In No One Would Listen, the Wall Street Journal was given the story and, for three years, failed to do anything with it. They covered it only after Madoff confessed.

Regulatory failure. Science is said to be "self-regulating," meaning that mistakes will be noticed and fixed by other scientists. Unfortunately for that homily, McIntyre wasn't a scientist. In No One Would Listen, the no one of the title means no one at the SEC (Securities and Exchange Commission). After hearing Markopolos's story, a congressman says the SEC "couldn't find steak at an Outback".

"It cannot be". Just as Kolbert believes that a "hoax" of such size isn't possible, many people told Markopolos that what he was claiming wasn't possible. One of the best stories in No One Would Listen is about a colleague of Markopolos's named Frank Casey, who helped Markopolos investigate Madoff. Casey's job is selling financial products. After a sales call at an insurance company, the prospective customer, after declining to buy anything, asks Casey about Madoff. Casey is stunned. It felt like a random sales call. Casey tells him what he knows. It takes a half hour. Then the insurance executive explains his question. He recently married into "an extremely wealth Jewish family." Madoff was at his wedding. After the wedding, Madoff took him aside and said he'd get him "set up" (meaning invested in Madoff). The insurance executive, after studying Madoff's claimed returns, thought something was fishy and refused to invest. This got him in trouble with his father-in-law. "It's your job as my son-in-law to take care of my daughter, and you should be putting your money with Bernie," the father-in-law said over and over. His refusal to invest with Madoff is causing serious friction, he tells Casey, andÂ begs Casey to put what he said in writing so that he can convince his

father-in-law to withdraw his money.Â Casey writes a long email. The insurance exec brings it to his father-in-law and reads it out loud. "It can't be," says his father-in-law. "Bernie wouldn't do this to me." The father-in-law does nothing. They lose everything.

---

Vic (2010-04-25 00:38:38)

Seth, I am more than willing to believe that global warming might be a hoax, but a far bigger hoax is the entire academic discipline of economics (as related by Nassim Taleb among others). To a greater degree than climate science, economic "science" rely on mathematical models to model that which cannot be modeled. And the economic hoax is costing us far more than any possible climate hoax, as bogus, but scientific sounding, economic theories underlie everything from fiscal and monetary policy to individual and pension plan investment decisions, from the structure of markets and financial instruments, to policies on immigration, free trade, taxation, and welfare and to social norms about executive compensation, etc. etc.

John Blake (2010-04-25 09:29:14)

This bears on society's "clean hands" preference for abstract, disembodied theory rather than any resort to grubby fact-checking of "reality", if you will. Empirical scientific method stands wholly opposed to such elitist privilege, which partially explains why mere verbalizers gravitate to model-making disciplines such as "climatology" (sic), economics, even law. For some decades now, deconstructionists and feminists in particular have explicitly rejected reliance on objective, rational argument in favor of contentious attitudinal assertions lacking any basis in socio-cultural reality whatever. So long as this unreasoning prejudice against hands-on, non-ideological integrity persists, so long will politics remain in thrall to incompetent, corrupt insiders of all persuasions. Perhaps the worst offenders are those high achievers, men of wealth, who gravitate to politics with the object of suppressing free markets not only in competitive products but ideas. Delusions of grandeur foster the endemic societal disease which celebrates such as Bernie Madoff until all is lost.

Robert E. Phelan (2010-04-25 09:52:41)

Interesting parallel - but the claim of "thousands of scientists at hundreds of universities" is a bit disingenuous. The overwhelming majority of those thousands have not the time, interest or expertise to evaluate the claims of climate scientists on their own. Most would not dream of lying about their science and do not expect to be lied to. Much like the father-in-law of Casey's insurance executive, they take the word of people they believe can be trusted. When that word also supports other elements in a person's world view (man is greedy, corporations crush human freedom, capitalism serves the interests of elites) that word is more readily accepted. The conspiracy of thousands is simply a straw-man. Vic's complaint above deserves a far more nuanced response than I can supply here. I'd just like to make a few points: 1. Science is nothing more than the systematic and careful observation of events in the real world followed by the development of explanations (theories) for their occurrence. 2. All theories are models. Mathematical/computer models are simply dynamic extensions of those models to generate predictions of future events (i.e. if what we know is true, and all other things remain equal, changing this should result in that...) 3. Theories will always be used to justify a course of action. Any theory can be used to justify diametrically opposed courses of action. Economic Theory does not mandate bloated executive compensation, but bloatedly compensated executives will use theory as their justification. 4. Science is not TRUTH. It is a way of "knowing".... but there are other ways of "knowing", much like the words from a duet in "The Woman In White": "...I believe my heart. It believes in you. It's telling me that what I see is completely true..." 5. You don't submit your emotional life to scientific scrutiny, you don't base public policy on the yearnings of your heart.

GregO (2010-04-25 10:48:21)

Vic - I with you on this...but I'd like you to consider your use of the word hoax in a slightly different context. To me, both the economic modelers and the AGW modelers perhaps weren't attempting a deliberate fraud as much as simply falling in love with their ideas; falling in love with their Frankenstein creations; all of it a fantasy built on a firm bedrock of unquestioned assumptions and false beliefs and a willful ignorance of and contempt for real-world measurement. That Madoff was perpetrating a fraud is clear and he's in prison - is the intent of the AGW crowd to perpetrate a similar fraud? Maybe not...But the objective result ends up equally harmful if not more so (COP15 alone had 45,000 of the world best talkers talking about and agreeing on nothing - that couldn't have cost much...hmm....so much for good intent).

Duncan (2010-04-26 10:22:59)

"Bernie wouldn't do this to me." I've heard it suggested that plenty of the fund managers who gave their and their clients money to Madoff were pretty sure he was up to something. They just thought he was doing something cleverer and playing someone else, or "the system", not them.

Nathan Myers (2010-04-26 13:49:13)

I have cousins who would have been Madoff victims. I asked, and was told they avoided him because the word had gone around to stay clear. The untold story of Madoff is likely to involve pervasive bribes, kickbacks, and cooked audits. Normally a guy like Madoff never gets to jail, because he's too valuable as a stoolie. In this case, evidently, nobody was interested in who he could finger.

MC (2010-04-26 08:08:05)

Hi Seth, I was curious what you might think about this article ([http://www.boston.com/news/globe/ideas/-articles/2007/10/07/some\\_like\\_it\\_hot/](http://www.boston.com/news/globe/ideas/-articles/2007/10/07/some_like_it_hot/)) which argues that the American appetite is becoming spicier as the large, aging Boomer generation "are losing their ability to taste" and turning to spicier, higher-flavor foods to overcome their dulled senses. Are people mistaking spiciness for complexity, or are complex flavors like umami also affected by an aging person's gradual loss of tastebuds? Cheers! Mara

seth (2010-04-26 15:50:40)

Mara, the article sounds reasonable. But the whole fancy food industry is booming, not just the spicy portion of it. Sushi, for example, is far more popular now than 20 years ago. Making a new spicy food is much easier than making a new bland food.

### **The Big Short (2010-04-26 15:29)**

The Big Short (sent to me by the publisher) is Michael Lewis's best book, and that's saying a lot. Moneyball was excellent. The Blind Side was excellent. All three are stories of underdog triumph but The Big Short is about a far more important subject, a far more complicated subject, and has a tremendously dark side. You know the saying: Fool me once, shame on you; fool me twice, shame on me. Well, shame on Wall Street for creating the worst financial disaster ever. But then, as Nassim Taleb puts it, the school-bus driver who crashed a bus full of children were given a new bus. Those who created the disaster were put in charge of fixing it. As Steve Eisman, one of Lewis's main characters, puts it, "I can understand why Goldman Sachs would want to be included in the conversation about what to do about Wall Street. What I can't understand is why anyone would listen to them." (Not just listen. They were allowed to dominate the conversation.) Showing that the foolishness of people at the top in American society has no clear limit.

I could hardly stop reading. Endless fascinating detail. Michael Burry, another main character, discovers he has Asperger's after his son is turned down by several kindergartens and he tries to understand why. I've been talking and reading about data analysis my whole professional life, yet Lewis's story about how means can be terribly misleading is the best I've heard. An average credit score of 600 can be due to two scores of 600 or to scores of 500 and 700, with vastly different consequences. (This escaped the averagers.) Sure, I knew about [1]the conflict of interest of bond rating agencies, such as Moody's, but Lewis describes it so well I loved reading about it again.

Long ago, I [2]blogged about the importance of insider/outsiders – close enough to understand what's going on yet far enough away to see the truth. Lewis's heros, who saw that a tremendous crash was coming, are exactly that. Like [3]Harry Markopolos, they were on the fringes of the financial industry. One of them (Eisman) had a gift for tactlessness, another (Burry) had Asperger's, and a third group ran their fund from a Berkeley garage. Without them, the people at the top (e.g., the head of Goldman Sachs), who run and crashed our financial system, could plausibly say Nobody could have predicted this. Because of Lewis's heros, they can't.

Zach (2010-04-26 20:50:16)

Isn't it a little disingenuous to talk about this as confirmation of the importance of insider/outsiders when Michael Lewis has explicitly mentioned that he chose the people profiled in large part for their outsider status? You refer to them as his heroes, and that is precisely because they fit an appealing narrative. At the same time, more and more insiders (or at least a certain contingent thereof) are being exposed as having prior knowledge of the coming collapse and exploiting it. Are you saying that the difference lies in their response to that recognition?

Adam (2010-04-27 00:40:24)

I so wish our library would get this book...I requested that they order it about a month ago...your review is not helping me to

be patient!

seth (2010-04-27 02:58:34)

Zach, that's a good point ("isn't it a little...") if I'd seen the comment you mention. But I haven't. Where did you see it? I heard Lewis say he thinks his main characters were able to see the coming collapse because they were outsiders. Just what I'm saying. See this: <http://www.blog.sethroberts.net/2010/03/17/michael-lewis-echoes-veblen/>

Zach (2010-04-27 14:44:28)

I reread the article you linked to, which was my main source for the complaint. On second reading, I see that I misinterpreted a couple of passages. However, I still think it would instead be correct to assert that he failed to profile the folks at Goldman in greater depth because they are insiders, and therefore denied him access. As we are seeing more and more, many of these people did have a sense of what was to come and chose to profit (much like the outsiders). However, because they are complicit, they have an incentive to cover up, whereas the outsiders had no reason not to scream bloody murder. I suppose this expedited the exposure of their wrong doing, which plays further into your portrayal of evens. Thanks for pushing me to re-examine this post. I hope sometime in the future you will explore further the notion of insider-outsider, above just pointing it out where it appears. For me the notion still has the unsettling air of the anecdotal, though we see it praised quite a bit.

Nathan Myers (2010-04-27 15:01:51)

Seth: I'm not getting a clear picture of what importance you are attaching to narrative. I can understand that a compelling narrative is important, maybe essential, to maintaining reader/viewer/student interest while absorbing complex information. But you seem to be saying, also, that the presence or absence of a compelling narrative helps to indicate whether the information itself is correct and worthy of attention. Are you saying that incorrect information is inherently difficult to construct a compelling narrative around?

seth (2010-04-27 16:22:36)

Zach, yeah it is incredibly hard if not impossible to quantify this stuff. Mendel, an insider/outsider, discovered genes. There were maybe 100 biology professors at the time whose research was about the same topic. They were the insiders. But how many people were in Mendel's position, with both scientific knowledge and outsider freedom? That's really hard to know. Nathan, no I'm not saying that. If you make enough stuff up, you can come up with a compelling story. The Hockey Stick Illusion contains a vast number of references. Its assertions can be checked.

Alex Chernavsky (2010-04-28 09:45:58)

Seth, check out this interesting story about an outsider who understood the financial meltdown: <http://blogs.wsj.com/deals/2010/03/15/michael-lewiss-the-big-short-read-the-harvard-thesis-instead/>

## **The Emperor's New Clothes Trilogy (2010-04-27 16:12)**

In The Emperor's New Clothes, the king is naked but only a little girl says so. The king's advisers don't tell him. I suppose the intended lesson was that powerful people have trouble getting frank answers. That's pretty obvious. For a CEO, it's said, the scarcest commodity is truth. Bosses learn this all the time. I learned it the first time I asked one of my students what he thought of the class.

Andersen's story can be taken differently, partly conveyed by the phrase elephant in the room: Something big and important is overlooked by the supposed experts (in the story, the king's advisers). It should be obvious – but it isn't. Or at least no one says anything. This is how Harry Markopolos used the term emperor's new clothes in [1]No One Would Listen: Madoff was a gigantic fraud, his returns were (to Markopolos) clearly too good to be true, he was enormously visible (in certain circles), but no one said anything. It was as astonishing as a king parading naked. How come no one sees this? Markopolos thought. If you looked at Madoff the right way, he was naked.

That this sort of thing happens isn't obvious at all. Yet three books – which I've just blogged about – have recently appeared with examples. One is the Markopolos book. Another is [2]The Hockey Stick Illusion. Surely there's overwhelming evidence that humans are causing global warming, right? Well, no. The only clear evidence was that hockey stick – and that's a statistical artifact. (It looks like an artifact.) The third is [3]The Big Short. It wasn't easy to find the right sight line from which it was clear that Goldman Sachs et al. were taking on far more risk than they realized but such views existed. I call these books The Emperor's New Clothes Trilogy. Their broad lesson: Sometimes the "best people" aren't right. Sometimes there's a point of view from which they're glaringly wrong. The Hockey Stick Illusion is about how Stephen McIntyre found this point of view. In No One Would Listen Markopolos found this point of view. In The Big Short several people found this point of view.

This relates to my self-experimentation in two ways. First, the "best people" say self-experimentation is bad. No weight-control researcher does self-experimentation. No sleep researcher does self-experimentation. Surely they know how to do research. It's their job. Whereas to me it's glaringly obvious that self-experimentation is an excellent research tool, not just because of [4]my results but also because it makes it so much easier to try new things. The best way to learn is to do, IÂ believe; self-experimentation makes doing much easier. Second, my self-experimentation uncovered all sorts of results that implied that the expert consensus on this or that was glaringly wrong. The Shangri-La Diet is just one example. Breakfast is good, right? Well, no, breakfast may wake you up too early. And so on. At first, I didn't grasp the broad lesson I stated earlier ("Sometimes the "best people" aren't right. . . ") and was amazed by what I was finding. To me, The Emperor's New Clothes Trilogy is support.

q (2010-04-27 19:01:12)

my uncle, a neuroscientist, told me a story recently when i asked him if, within my son's lifetime, sleep would be obsolete. he told me about a colleague of his, a sleep researcher. one day after twenty years or so of study he concluded that there was no reason he could think of that sleep was necessary, and so he decided to cut back on sleep, one minute per day. he started at 8 hours per day and was fine. six hours per day – fine. four hours per day – fine. around the time he reached two hours per day, he was diagnosed with leukemia.

seth (2010-04-27 19:36:04)

yeah, sleep is certainly important for immune function. If he didn't know that...

epistemocrat (2010-04-27 19:56:40)

Hi Seth, One of my favorite personal paradoxes is Searching versus Acting: I like to think of my self-experimenting as operationalizing this paradoxical form of inquiry and learning. Best, Brent

Anthony (2010-04-27 20:03:13)

^ What?

Thon Brocket (2010-04-28 03:32:54)

Data point: Barry Marshall, the Bacteria-and-stomach-ulcers Nobel laureate self-experimented by infecting himself with H pylori.

Gian (2010-04-28 03:46:52)

Science progresses via framing of falsifiable hypotheses, I hope you would agree. Now has your self-experimentation has led to frame falsifiable hypotheses and have you actually falsified any hypotheses suggested from or leading from self-experiments (That is, if your procedure confirmation or falsification). Though I am aware that falsification procedure has been criticized (by philosopher Stowe) but I myself unable to judge the criticism.

James P (2010-04-28 05:10:03)

Sometimes self-experimenting is the only way to do it. I'm thinking of Barry Marshall, who has only recently received a Nobel prize for work he did in the 80's on helicobacter pylori, the bacterium responsible for stomach ulcers. The well entrenched view was that bacteria couldn't survive in stomach acid, and since no-one would believe otherwise, he drank the stuff and proved them wrong. It still took 20 years for the medical establishment to accept this, though, so the Emperor's New Clothes were much in evidence, too.

On thinking for yourself | The Rational Optimist (2010-04-28 09:15:05)

[...] Seth Roberts has read three new books about how emperors are often more naked than people tell them they are. I've read two of those books and had much the same reaction. The trust-the-experts inertia of the financial markets described by Michael Lewis in The Big Short is much like that in the climate debate described by Andrew Montford in The Hockey Stick Illusion. Roberts's third book is about Bernie Madoff. [...]

Nathan Myers (2010-04-28 14:01:58)

Infecting himself with *H. pylori* would much more accurately be described as a stunt than as an experiment. As a stunt, though, it worked: hint to those seeking a Nobel.

dr deb (2010-04-28 23:00:36)

Through experience(experimentation) we gain the most valuable knowledge, its better than reading it in a book,or a lecture. interesting that you should blog on this as I blogged about my personal experience and experiments on attaining bliss( as opposed to trying to understand it by reading about it). love drdeb

Duncan (2010-04-29 06:29:36)

I tried the one-minute-less-sleep per day regimen. After six months, I realized I was spending most of my new-found time screaming at inanimate objects, so I gave it up.

Vince (2010-04-27 21:38:01)

Do you know what the Earth was like when dinosaurs roamed the planet? To give you an idea, [1]here's a map of what we think the Earth looked like during the Cretaceous period, about 90 million years ago. Replicating those conditions would be far worse than what climate "alarmists" have warned about.

1. <http://en.wikipedia.org/wiki/File:LateCretaceousGlobal.jpg>

Nathan Myers (2010-04-27 22:04:04)

"When dinosaurs roamed the earth", the earth had no ice caps, and the sea level was such that today it would drown more than half the world population's homes. We don't want to go there. Conditions on earth have changed – you could say evolved – since then. Why not look at real evidence being collected in the *present*? There's lots, and adding it up, it points unambiguously in one direction. [www.skepticalscience.com/broken-hockey-stick.htm](http://www.skepticalscience.com/broken-hockey-stick.htm)

thehova (2010-04-27 22:35:09)

I always thought that omega 3 consumption elevated my mood because it helped me sleep. But according to this NYtimes blog, maybe I was wrong: <http://opinionator.blogs.nytimes.com/2010/04/07/in-sleepless-nights-a-hope-for-treating-depression/> It goes counter to my thinking that regular sleep elevates mood (and I thought the deeper the sleep, through sunlight exposure, omega 3 consumption, exercise, etc., the better ). It is true that when I'm in a bad mood, I tend to not be able to fall asleep. Maybe it's my body trying to elevate my mood through sleep deprivation. Who knows. One thing is certain. There's definitely a strong link between sleep and mood.

Stephen M (Ethesis) (2010-04-28 20:21:11)

<http://www.foresight.org/nanodot/?p=3553> was very interesting for long term analysis.

Barnaby (2010-05-23 17:14:31)

Low levels of Omega-3 is possibly the largest health epidemic to hit Western society for years. Resulting in obesity, heart disease, depression, ADHD, behavioural and learning difficulties, restricting brain and CNS development, impairing focus and cognitive function, increasing chance of tumors, cancers, stroke and diabetes. The list is endless. Some sites for further information on the epidemic and the need for Omega-3s: [www.nutriska.com](http://www.nutriska.com), [www.omega-3centre.com](http://www.omega-3centre.com)

## Jane Jacobs on Several Types of Bad Behavior (2010-04-28 15:55)

What do the following have in common?

1. Doctors who view patients as "profit centers".
2. Chinese universities that open art departments because art students pay much higher tuition than other students. The classes in these departments have high student/teacher ratios and are taught by inexperienced teachers.
3. Corrupt government officials.
4. Katherine Weymouth, publisher of the Washington Post, [1]organizing salons where, for a hefty price, important people would meet Post reporters.

All can be seen as cases where guardians abuse the trust they've been given by trying to profit from it. Jane Jacobs wrote about guardian/commercial ethical differences in [2]Systems of Survival. Jacobs's answer to why two ethical systems? why not twenty? was that there are two different ways to make a living: taking and trading.

Jacobs wasn't trying to tell people how to act. She was trying to describe and explain differences in behavior she'd seen. As a one-pass view of how people make a living, taking and trading is a good division. Looked at more closely, teaching (education) and learning (science) are also central. They underlie both taking and trading. Following Jacobs's logic, maybe they need different ethical codes to function well. Yesterday I spoke to a Tsinghua professor who complained that other Tsinghua professors simply taught what they wanted to teach, as opposed to what would help their students. I said, yeah, I'd blogged about it ("[3]For whom do colleges exist?", "[4]For whom do law schools exist?").

aretae (2010-04-28 19:56:48)

This was the direction of my [1]first response to reading Jane Jacobs (on your recommendation). Since then, I've drifted back in the direction of the belief that she was right, and I was over-thinking it.

1. <http://aretae.blogspot.com/2009/08/master-merchant-monk.html>

### **Jane Jacobs on Bad Behavior (continued) (2010-04-29 07:26)**

I was pleased that Matt Ridley [1]quoted me in his blog about [2]the Emperor's New Clothes Trilogy and out of curiosity I read his previous post ("[3]Chiefs, priests and thieves"). Strangely enough it's closely related to [4]the post of mine that followed The Emperor's New Clothes Trilogy: about Jane Jacobs's view of two moral systems, guardian and commercial.

In "Chiefs, priests and thieves", Ridley wrote about what he'd learned from what sounds like a truly fascinating book: [5]Empires of the Sea by Roger Crowley.

As always, ordinary people wanted to carry on with commerce, but chiefs, priests and thieves – sultans, emperors, popes, pashas, holy knights and corsairs – just kept plundering the fruits of that commerce for their own enrichment and their own glory. Little wonder that, as the historian Meir Kohn concludes, preindustrial government was[6] predominantly predatory in nature. Not that it is entirely free of that suspicion today.

This is exactly what Jacobs was talking about – the close connection between government and predation, in contrast to trading (commerce). And it's what Russ Roberts is talking about in [7]his terrific essay about the cause of the financial crisis. When large financial firms become close to government ("In the week before the AIG bailout that put \$14.9 billion into the coffers of Goldman Sachs, Treasury Secretary and former Goldman Sachs CEO Henry Paulson called Goldman Sachs CEO Lloyd Blankfein [8]at least 24 times"), they become predatory rather than commercial. Was Goldman Sachs providing useful innovation when it provided and sold the bonds that the SEC is now complaining about? No, it was basically predatory, under the guise of being commercial.

I think the rest of us let this sort of predation happen because of apocalyptic stories spun (always in future tense)

by leaders: The infidels will . . . The terrorists will . . . The financial system will . . . Under cover of these stories, leaders do stuff that strengthens them and weakens the rest of us. But recently a countervailing story has gathered strength:Â Guardians as idiots. These stories are past tense: Harry Markopolos went to the SEC five times with incredibly persuasive evidence of Madoff's Ponzi scheme, and the SEC did nothing. I think the hearings about this were incredibly embarrassing to SEC officials and a big reason they're now doing something about Goldman. Another example of the genre is [9]...First Do No Harm, wherein doctors nearly prevented an epileptic child from getting life-saving therapy. And, of course, Al Gore is looking more and more foolish as it becomes clear he trusted research (that hockey-stick graph) he had no clue about.

More More future tense: [10]"To the Indios they said, "If you don't work, this God will kill you."

Nathan Myers (2010-04-29 14:24:19)

When businesses are in a position to exploit people, they are just as happy to do it as any government, or any church. When a government represents the interests of the people a business or other government seeks to exploit, it's generally all they have to protect them. It's absurd to suggest that businesses become predatory only when a government is involved. In any group of people enabled to exploit others, some will happily step up. [blogs.discovermagazine.com/notrocketscience/2010/04/27/power-breed-hypocrisy- %e2 %80 %93-the-powerful-judge-others-more-harshly-but-cheat-more-themselves/](http://blogs.discovermagazine.com/notrocketscience/2010/04/27/power-breed-hypocrisy-%e2%80%93-the-powerful-judge-others-more-harshly-but-cheat-more-themselves/)

Hal (2010-04-29 16:22:25)

I'm surprised you are joining the criticism of Goldman Sachs. You say they were being predatory in selling the bonds. But the bonds were known to be from spotty mortgages. They were basically a way for people to bet on whether those mortgages would be paid off. Investors got high interest rates in return for accepting the risk of default. But they took that risk voluntarily. Goldman is accused of not telling investors everything about how the mortgages were chosen. But apparently the basic facts about the deal were available. It's going to be something of a judgment call as to whether Goldman was obligated to share everything they knew. Many observers are skeptical about whether the SEC will prevail in court (if it gets that far). Given the legal ambiguities, it's a stretch to call this predatory behavior. In finance people take opposing positions all the time. Long vs short, buyer vs seller. Differences of opinion are what make markets possible. It's good because it means that voluntary trades make both sides happier. Plus these transactions benefit bystanders by providing information about fair prices and future trends which are crucial to allocating resources. Goldman was an important part of this picture, and from what I read the Abacus bonds fit pretty well into this model.

vic (2010-04-29 22:37:35)

The problem is the idiotic pension fund managers, cities, and other institutional investors that bought these bonds because

they were so easily deluded by financial charlatans carrying pie charts, credentialed investment experts and theories, and ratings agencies. All those morons kept their jobs, the taxpayer gets screwed.

vic (2010-04-29 22:37:51)  
sorry, not bonds... derivatives

seth (2010-04-30 14:40:39)  
vic, you think institutional investors should ignore ratings? that seems like asking a lot.

## The Data-Driven Life (2010-04-29 22:05)

Gary Wolf's article about self-measurement in the New York Times Magazine is [1]here. I am quoted in it. The story I identified with most is Bo Adler's. He has sleep apnea:

“Here’s what they told me was the normal surgical course of treatment,” Adler explained. “First they were going to cut out my tonsils, and if that didn’t work, they would break my jaw and reset it to reposition my tongue, and finally they would cut out the roof of my mouth. I had one question: What if my case is different? They said, “Let’s try the standard course of treatment first, and if that doesn’t work, then we’ll know your case is different.”

I started long-term self-experimentation because I woke up too early in the morning. The notion of taking drugs for it – what a doctor would prescribe – was too horrible to take seriously, just as Adler resists the idea of surgery before less harmful solutions have been ruled out. Adler hopes he can learn something about sleep apnea his doctors don’t know, just as I hoped I could learn something about early awakening nobody knew. Eventually – ten years later – I managed to.

1. <http://www.nytimes.com/2010/05/02/magazine/02self-measurement-t.html?ref=magazine&pagewanted=all>

---

Melissa (2010-04-30 04:27:40)

Bo Adler’s on to something. The technology for tracking at home is becoming more readily available / affordable - and research indicates that there are some new ideas that might prove useful for self-experimenters, e.g. tongue exercises (available on youtube - link below) and anti-inflammatory agents (Gozal uses medication on children - Adler might use turmeric / aspirin / diet, etc.). <http://www.webmd.com/sleep-disorders/sleep-apnea/news/20090507/tongue-exercises-may-ease-sleep-apnea> tongue exercises: <http://www.youtube.com/watch?v=RB3nCDA1uic> <https://louisville.edu/medschool/pediatrics/research/kchri/Faculty/Igozal>

Laura (2010-04-30 05:03:12)

Seth, this is a really wonderful blog. I’ve learned a lot about how to solve my problems without relying too much on doctors. I don’t depend on them as much as I used to, and that has really changed my life. Your ideas have helped me do better and I enjoy sharing your ideas with other people. I like the reactions they get and I have made so many friends just by talking with others about your self experimentation. I have even told other professors about your website. They were excited to know about it. Thank you so much.

vic (2010-04-30 19:29:15)

Hey Seth, are you going to comment on the "chilling effect" of the Harvard dean's attack on her own student for the student's private reflections on race: <http://abovethelaw.com/2010/04/the-harvard-law-school-racist-email-controversy-dean-minow-weighs-in/>

seth (2010-05-01 05:09:35)

vic, the Dean's statement is horrible, yes. Free speech is supposed to be accompanied by "responsibility," the Dean says, but doesn't make clear what "responsibility" means. It's always awful when someone with great power (in this case the Dean) picks on someone with much less power (the student). Not only was the Dean's statement unnecessary, it amounts to name-calling: She is calling the student "irresponsible". It's barely different from calling the student a jerk. For expressing an opinion the Dean dislikes. A reasonable statement by the Dean would have been to condemn the student who leaked a private email.

Rachael (2010-05-03 15:47:31)

I have very much reduced my UARS/sleep apnea through a variety of lifestyle changes and self experimentation. You might peek at CPAPtalk.com where there are many patients taking control of their therapy and solving problems together. Some solutions that worked for me: writing my own sleep quality questionnaire and adjusting my cpap levels based on my own assessment of my sleep quality. Learning to sleep with my mouth shut and my tongue on the roof of my mouth, learning to sleep only on my stomach, and using anti-inflammatory herbs and an ancestral diet to reduce the swelling in my airway that caused my problem. I have been off CPAP for a year now and am doing very well. I would never have guessed how much reducing inflammation improved my sleep disorder, I was told it was a purely structural result of my narrow airway. But the reduced inflammation gives my airway enough space to breathe easily. If I drink too much, or eat grains I immediately swell back up and have to use my CPAP or suffer a headache and fatigue the next day.

Matthew Cornell (2010-07-26 15:43:53)

I think this work is important, and Gary's piece was seminal. These ideas generalize into a wider life-as-experiment perspective, and I'd like to link to my response and outline of how it all might fit together here: The Experiment-Driven Life (<http://www.matthewcornell.org/2010/06/the-experiment-driven-life.html>). Also, we're working on a tool for self-experimenters, called Edison (<http://edison.thinktrylearn.com/>). Great stuff!

## 5.5 May

### New Way to Quit Smoking? (2010-05-01 06:50)

A woman named Melissa Francis recently thanked me for helping her quit smoking. I was surprised. She said she had applied the ideas behind the Shangri-La Diet to smoking. At the center of SLD is the idea that we learn to associate the flavors (smells) of foods with the calories they contain. If you reduce your exposure to those associations, you lose weight.

Francis took this to suggest that the reason people smoke has a lot to do with the association between the flavors (smells) of smoking and nicotine. If she could reduce her exposure to those associations, it should be much easier to quit. So she did two things: 1. Smoked nicotine-free cigarettes (brand name Quest). 2. Used a nicotine patch. The second thing corresponds to ingestion of smell-free calories, such as sugar water or extra-light olive oil or any food nose-clipped (classic SLD). The first corresponds to exposing yourself to the flavors of foods without swallowing them, an experience whose effects you can read about on the SLD forums [1]here and [2]here. Learning researchers know that uncorrelating the CS (e.g., smell) and US (e.g., nicotine), as Francis did, is a great way to reduce the association between them.

Francis had previously tried to quit using nicotine-free cigarettes alone. She had failed. She had previously tried to quit using nicotine patches alone. She had failed. With the combination (Quest 3 and 21 mg patch), however, she was successful. "I stopped smoking the cigarettes pretty much altogether within a week or so. From that point, I just stepped down on the patch over the course of five or six weeks," she wrote. How easy that sounds! My college advisor told me that quitting smoking was the hardest thing she'd ever done. Francis had been smoking twenty years and smoked about a pack a day. She'd quite for two years about fifteen years ago.

Francis had the idea herself and hadn't heard of anyone else doing this. The closest precedent seems to be the work of a Duke researcher named Jed Rose, for example [3]this study.

2. <http://boards.sethroberts.net/index.php?topic=7603.0>
3. <http://ntr.oxfordjournals.org/cgi/content/abstract/10/7/1139?maxtoshow=&hits=10&RESULTFORMAT=&fulltext=rose%2C+j.e.&searchid=1&FIRSTINDEX=0&resourcetype=HWCIT>

---

q (2010-05-01 09:16:01)

wouldn't that kind of logic imply that eating calorie-free food with a lot of flavor would help you lose weight or help SLD along? i'm not saying it does or doesn't, but i haven't heard anyone say they had this experience.

seth (2010-05-01 15:22:27)

q, no, it doesn't imply that. The flavor-calorie associations I'm talking about are not between flavor in general and calories (e.g., "a lot of flavor" -> calories), they are between specific flavors and calories (e.g., basil -> calories). You need to eat calorie-free food with the same flavor as your calorie-containing food to weaken the flavor-calorie association that your calorie-containing food has created. When people do that, as the links I gave show, they do lose weight.

Tom in TX (2010-05-01 20:24:46)

Seth, something does not seem right about that. If it were true, wouldn't people lose weight by drinking diet soft drinks?

Aaron Blaisdell (2010-05-01 22:18:27)

Tom, they might, if they drank their diet sodas at least an hour or two from having consumed any calories. I doubt most people try this, and likely often the diet soft drinks accompany a meal. Thus, the calories (from the meal) and flavor (from the soft drink) are paired, not unpaired as required by the theory and empirically validated.

q (2010-05-04 03:33:28)

i see seth's point here. i don't think that diet sodas taste exactly like non-diet sodas so they aren't a good example, and anyway the aspartame in diet sodas is a drug anyway so it is going to have effects of its own. one of the things i'm happy about with SLD is that i almost completely stopped drinking diet sodas. i didn't set out to do it, but i stopped wanting them. i used to drink a can or two per weekday (they are free in my office) and now i open maybe two cans a month and drink half. they are an interesting case maybe. the less you drink, the worse they taste. i can't think of any other 'food' that has that property.

Frank (2010-05-06 04:29:15)

I think nobody ever has, or ever will lose weight because of sugar-free, but artificially sweetened, soft drinks. For christ's sake, how could anyone ever seriously think that artificial sweeteners, which for decades have been successfully used to \_fatten \_ up livestock, could make you thin, of all things?

## Why Do Inmates Hide Butter? (2010-05-02 01:05)

When Marion Jones, the Olympic athlete, was in prison, "[1]several inmates befriended her and showed her . . . how to hide sticks of butter." Just as others carry water bottles so they can drink throughout the day, I carry butter in my backpack in a jar so I can eat small amounts throughout the day. As far as I know, no one else does this. I value butter so much because [2]it makes my brain work better. If anyone reading this knows why inmates value butter so much, please let me know.

1. <http://www.nytimes.com/2010/05/02/magazine/02jones-t.html?src=smt3&pagewanted=all>

adeeplust (2010-05-02 01:56:04)

Last Tango in Paris? <http://www.youtube.com/watch?v=8rpgjTNCEJI> On a more serious note, I went to a military school and carried around a tube of toothpaste because we couldn't have candy and the mint would hit the spot. I wonder if snacks are available in US prisons - I guess not - and so this may just have been a simple hunger / pleasure thing, rather than anything more. Also, I'd be curious if butter sticks were easy to snag during meals - easier than (say) bread, sausages and so on.

Laura (2010-05-02 07:10:07)

I know some people who work at the prison in Vacaville and San Quentin. I can ask them for you.

David (2010-05-02 09:39:14)

About butter and the brain: I've been making ghee (clarified butter) recently, and find I crave it. It has some practical advantages over plain butter—it tastes especially good, doesn't scorch when being used for frying, and it doesn't spoil at room temperature. I do seem to function better mentally when I eat it daily. In any case, it turns out that ayurvedic medicine already has an account of ghee being good for the brain. For example, see: [http://www.mapi.com/ayurveda\\_health\\_care/newsletters/ghee\\_clarified\\_butter.html](http://www.mapi.com/ayurveda_health_care/newsletters/ghee_clarified_butter.html) I don't know whether there's any significant difference in the fats themselves, between plain butter and ghee. I learned about making ghee from a friend who grew up Sikh. It's my favorite cooking fat, these days.

SM (2010-05-02 16:17:25)

In "A Handmaid's Tail" Margaret Atwood has the main character stealing butter to use as moisturizing lotion. I doubt Seth is using it as moisturizer, even indirectly. Suppose you had just two snack choices, butter or saltines. Having carbohydrates, saltines raise leptin (a hormone that suppresses appetite) and insulin levels and make you hungry later. Butter will not do this. Seth: I'm curious to see if omega 3 might play a role in your arithmetic gains. If so, butter in the US might not help since it's from grain-fed cow. Butter in China might be from grass-fed cows.

Alex Chernavsky (2010-05-03 08:47:30)

Does anyone know if a plant-based fat – like coconut oil – would have comparable beneficial effects? I don't eat dairy products. I already take flax oil daily.

Mark L (2010-05-03 18:57:39)

Maybe they use the butter in "prison gourmet cooking" like this recipe from <http://www.squidoo.com/prisongourmetcooking>: Cracker Toffee Steal some butter from the chow hall. Layer crackers on the bottom with sugar and butter on top. Microwave on something other than plastic which melts. Microwave with a glass of water so you don't kill the microwave. Sucks when your down to 1 microwave for a 100 people, or worse when the sadistic guards take them away to satisfy their anger. After microwaving a few minutes, take a crumbled hershey bar with almonds, and put that over the top. The chocolate will melt.

Wait 30 minutes and you will have the finest inmate toffee.

David (2010-05-04 00:30:06)

You might consider getting Pastureland Butter from Minnesota, made from grass-fed cow milk, if you don't already have a preferred grass fed butter source. They are still not shipping because they ran out of last year's butter, but should start any time now. It isn't expensive to buy locally, I'm not sure what they charge on over the web.

Tom Moertel (2010-05-04 22:45:15)

In Julie Sahni's *Classic Indian Cooking* (1980), I came across this fascinating passage on clarified butter as a "brain food": "In the last decade in India, just as in Western countries, there has been a growing awareness of the possible harm in consuming excessive quantities of highly saturated fats... As a result, many Indians today ... have substituted unsaturated oils for saturated fats in much of their cooking. There still exists a segment of the population that feels otherwise. The vegetarians, which include Hindu Brahmins, Jains, and Buddhists, and the people from Kashmir, ... do not like the substitutes. For vegetarians, usli ghee [clarified butter] is the primary source of nutrition. The Brahmins consider it brain food with supernatural powers, and attribute the development of one's intelligence to it. Even today, young Hindu children, particularly males, are given a spoonful of usli gee every day to sharpen their intelligence. The old Brahmin ritual of feeding a newborn infant a spoonful of usli ghee within minutes of his birth is still followed by all Indians." (pages 41-42)

seth (2010-05-04 23:46:36)

SM, I'm getting lots of omega-3 from flaxseed oil. So I doubt a little more from butter would make such a big difference. The butter I'm using, by the way, is from grass-fed cows. It's Straus Dairy butter. Tom, thanks, that's very interesting. It's definitely support for my findings.

m. t. (2010-06-17 16:49:45)

I understand the reasoning for self-experimentation when the effect in question is neurological (fast response time, reliable data, reversible effects, etc.), but have you thought about and/or tested yourself for the non-neurological effects of the high butter consumption? I am not asking this question to be confrontational, and I'm aware of the potentially shaky evidence connecting saturated fat intake to heart disease. But have you done any simple tests, like measuring blood pressure before/after starting a high-butter diet? Or had cholesterol or circulatory measurements? Also, what about long-term effects that you cannot possibly predict (e.g. atherosclerosis) based on neurological feedback? Perhaps this has been addressed elsewhere in the blog, so forgive me for resurrecting an old thread without reading the entire contents of the site first.

seth (2010-06-17 19:27:27)

The butter has replaced pork fat. The pork fat clearly improved my sleep, and I'm sure the butter does too. I'm sure that better sleep improves health. Neither the pork fat or butter has had any clear effect on my blood pressure, which I measure. Probably has improved my blood sugar, to the extent that it has replaced carbohydrates. I haven't yet had a circulatory system scan but I will. Because the whole body must be optimized to work best with the same diet, I believe that the diet that is best for the brain will turn out to be best for the rest of the body, including the heart. I don't think that all the evidence is in, but from what I know so far I believe the butter is healthy - with clear benefits on the brain and sleep and no clear costs.

## **Brent Pottenger and the Benefits of an Ancestral Diet (2010-05-03 01:38)**

I read somewhere that [1]Brent Pottenger (blog [2]here) had benefited from adopting an ancestral diet. (Brent, Aaron Blaisdell and I are organizing [3]the Ancestral Health Symposium.) I asked him for details. His answer:

I had debilitating migraines and chronic sinus infections for years, despite being a top-performing multi-sport athlete and following Conventional Wisdom (Food Pyramid, etc.) nutritional recommendations

diligently. I've always been interested in living as healthy as possible, so I had made sure to do things like eat lots of whole grains. Essentially, components of my diet were causing chronic inflammation, but I did not know it. As a result, I had to take antibiotics (Z packs, erythromycin, amoxicillin, etc.) repeatedly for many years (a scary thing in light of the importance of gut flora), usually about 5 to 10 times per year for infections. My migraines got so bad that I had to go to the emergency room four times during a 1.5 year span to get pain medications because my prescription migraine drugs and painkillers (like Vicodin) did not work. The migraines were so painful that I would shut down and could not even take a nap to let them pass.

I talked about it in part at BIL:PIL:

[4]<http://www.youtube.com/watch?v=QzdmwLO17-Q>

[5]<http://www.youtube.com/watch?v=utNGhwIDV4U> &feature=related

[6][http://www.youtube.com/watch?v=\\_4BFZ1uHJgU](http://www.youtube.com/watch?v=_4BFZ1uHJgU) &feature=related

I did not set out to cure myself, but that's what happened. I started down what turned out to be the right health path because I read Nassim Taleb's *The Black Swan*. In that book, Nassim referenced Art DeVany. I read Art's work on Evolutionary Fitness. Nassim and Art dovetail nicely, and the idea that evolution could inform health decisions made sense to me. That nudged me to cut grains (and other things) out of my diet. Art also tipped me to Mark Sisson, and I related really well to Mark's personal story as an athlete with a passion for health, and I enjoyed the logic behind his Primal Blueprint framework. From there, I got actively involved in what I call the Ancestral Health epistemocracy—that has emerged in the blogosphere—Mark, Art, Robb Wolf, Matt Metzgar, Tim Penn, and I actually co-authored an unpublished book together in 2007. At this point, though, I still did not know that I had resolved my health problems for good; I just knew that these ideas were working—I gained lean muscle mass, had more energy, felt great, etc.—as I tested them on my own body. Through this involvement as both an e-patient and a hobbyist blogger/essayist, I realized that a few years had passed and I had not experienced a migraine or a sinus infection. Now, after over three years without a migraine and having only been ill one time, I realize that I cured myself nutritionally, as a side-effect of tinkering with the aforementioned ideas. During this process, I also found out about your work from Nassim. For lots of reasons, your work on self-experimentation seemed really valuable to me. For example, my neurologist examined me and prescribed some drugs that were, looking back, quite dangerous to take for a problem that was caused by things like grains, legumes, processed vegetable oils, and Conventional Wisdom nutritional guidelines. My self-experimentation was, ironically, much safer and ultimately more sophisticated from a philosophy of science perspective because I could react to local feedback that my neurologist did not have access to: my own body. From there, I realized that we are all experts in our own body and that physicians must partner with us respectfully if they want to act as agents who help us find cures for health problems. I've written about my experiences in bits and pieces elsewhere, but this is a brief synopsis that captures most of the highlights in one place.

Basically, thanks to an inquiring mind and persistence that I owe to my mom's mentorship, I transformed my physiology remarkably thanks to trial-and-error solution searching with things I learned from Nassim, Art, Mark, and you. From there, I've added more "maps" into my portfolio of health practices from Doug McGuff, Keith Norris, Kurt Harris, and many others (many are listed on the Symposium presenter list). As a result, I no longer consume health-care resources and these resources can go to treat real medical problems. How remarkable were the improvements? One way to capture that besides the disappearance of my health problems is to look at my weight changes: at the same waist size, I've gone from 135 lbs. in 2002 to 145 lbs. in 2004 to 170 in 2010. That says something.

He later added:

Things I did to relieve my migraines that didn't work:

- prescription glasses (theory = eye strain)
- cutting out caffeine (theory = ? stress)
- napping more (theory = better sleep)

None of those experiments cured my health challenges. Only nutrition worked. Very few environmental factors have fluctuated much over the past ten years: I've lived in the same house, slept in the same bed, been a student, played the same sports in the same places around town, etc.

His old diet and his new diet:

Pre-Ancestral Health diet: I followed the Food Pyramid and associated concepts closely, so I consumed lots of whole grains (breads, pastas, granola, bagels, etc.), fruits (whole and juiced), vegetables, non-fat milk, non-fat yogurt, some meat (all kinds), coffee, tea, beans (black, pinto, others), and some cheese (pasteurized) and nuts. I ate things like Cliff Bars, drank Odwalla smoothies, etc.

Ancestral Health diet: I follow a very carnivorous paradigm, so I consume lots of meats (from pork bellies to raw Ahi tuna) and eggs, lots of cultured butter, coconut butter & oil, full-lipid Greek Yogurt (highest saturated fat content of any yogurt on the market), some vegetables (onions, avocados, greens) and mushrooms (sauteed in butter with onions and meats), essentially no fruit (I'm in a 'Fructose Detox' self-experiment), a little raw cheese, coffee, tea, essentially no alcohol. I also supplement with some Vitamin D, which is anabolic I think as well. I take fish oil when I have not had fish for awhile. I've eaten fish my entire life, though.

I attribute my health improvements directly (and completely) to diet. As my diet evolved, I also altered how I train, transitioning a bit from 'some long-distance running and sports playing' to 'mainly high-intensity, short-duration training (more weights and sprinting) and still sports playing as my exercise approaches. This energy expenditure evolution has, in my opinion, contributed to my stark body composition changes (lean muscle mass gain), but I think that my health improvements are due to diet and that my body composition would be much worse off if my diet had not changed like it has.

I will comment on this in my next post.

Nathan Myers (2010-05-03 17:14:52)

A bit off-topic, I keep hearing about people's migraines cured with heart surgery to close septal defects. Apparently heart surgeons are doing this procedure in great numbers, without benefit of studies that demonstrate their effectiveness, and some doctors are decrying surgeons' opportunism for preying on patients' desperation. I don't know how the patients are paying for such unrecognized treatment, but insurance coverage seems unlikely. Could it be that migraine pain motivates seeking effective treatment? I know someone who had heart surgery for some other reason, and her migraines did vanish. It seems like just the sort of side effect that would be noticed and commented on (although experience suggests it would take a very long time for anyone to write about it). Similarly, the heart surgeon who noticed that most of his patients, but not colleagues, had a crease in their ear lobes, which did turn out to be strongly correlated with blocked arteries. I wonder if surgeons can be persuaded to perform work to improve cranial venal flow in MS patients, despite the lack of studies demonstrating its effectiveness.

epistemocrat (2010-05-04 01:34:54)

Thanks to Dave Lull Need to add that into this thread as well: He's taught me as much about nutrition as anyone. And he's a librarian.

Stephen C (2010-05-04 14:36:19)

Great post. That's a nice summary showing what didn't work and what worked. Also found it interesting that you've gained all that muscle mass without gaining inches in your waist. I agree that physicians need to work with their patients and patients should be more doubtful, think critically and don't follow the blind faith of their physician...just because "they're the doctor". Regarding Nathan's post...that reminds me of an article showing that diabetes can be "cured" with bariatric surgery. They don't know the mechanism but it seems to cure it instantaneously, before a change in diet can take effect. <http://www.parade.com/health/2010/05/can-this-surgery-cure-diabetes.html>

Alex Chernavsky (2010-05-05 09:07:52)

My wife and I are heavily involved with animal rescue, so we travel in vegan circles. I've heard many stories told by people who claim that their health problems went away after they stopped eating animal products and switched to whole grains, vegetables, fruits, etc. It's hard to know what to make of impassioned but utterly contradictory testimonials.

Anthony (2010-05-05 10:40:05)

@Alex, Aye, there's the rub. My guess is: 1. Often when people change their diets, they change a whole slew of things (including extra-diet factors). 2. Different people probably respond to food differently. This is most obvious with things like lactose intolerance, or people who metabolize alcohol differently, or gluten allergies. My guess is it's also true for other things. If 2. is right, then self-experimentation becomes more important, as typical studies will bring up (surprise) conflicting results.

epistemocrat (2010-05-05 12:57:02)

Thanks, Stephen. I agree with @Anthony. @Alex: The goal isn't to share impassioned testimonials; the goal is to share experiences and all the unexpected turns that those experiences take. We are all limited to some extent by our own experience, so we can look at other people's experiences as sources of conjectures to test on our own bodies. I never set out to cure myself; I just assessed the logic of some other people's self-experiments and ideas on health and then decided to test them on myself. I did not falsify these conjectures (and I experienced positive benefits), so I kept tinkering with them. My  $n=1$  may be helpful to others who can relate to my tale. However, the problem of induction and biochemical individuality make it such that your own personal experience trumps everything else. See my recent essays: "Black Swan Logic for  $n=1$  Health": <http://epistemocrat.blogspot.com/2010/02/black-swan-logic-for-n1-health.html> & "Self-Experimentation with Meta-Rules: Quality of Knowledge & Overcoming the Justificationist Addiction": <http://epistemocrat.blogspot.com/2010/04/self-experimentation-with-meta-rules.html> Meta-Rules say nothing about whether or not you should eat meat; they say, "Listen to your body, then iterate." I like to say, "Self-experimentation rises to the surface as the most effective *modus operandi* in the face of nutritional opacity." That's German for: Test things on your body and just see what happens. But, when it comes to testing potentially dangerous things, I also like to say, "Outsource your body to Aaron Blaisdell and let him be your lab rat for a few days. It's safer to live vicariously anyways." lol Cheers! Brent

seth (2010-05-05 19:46:16)

Alex, your story about vegans doesn't strike me as contradictory as it might strike you, for three reasons: 1. I don't see meat protein as special. Beyond being good for building muscle, I don't think it has special benefits. It's animal fat that makes a huge & surprising difference. Your vegans probably went from one diet low in animal fat to another. 2. I'm sure vegetables are healthy. I believe we like sweetness so that we would eat more vegetables – vegetables have far more sugar than meat does. Changing from a diet of meat & potatoes (and few vegetables) to all vegetable could be an improvement. At least you would be getting a decent amount of vegetables. 3. As Anthony says, any big change of diet (e.g., from high meat to meatless) will involve dozens of changes at the micro- and macro-nutrient level. As far as I can tell, the average American diet is so terrible that randomly picking another diet could easily be an improvement – I'd say the odds are about 50 %. Even better (regression to the mean) if you have a health problem caused by diet.

Aaron Blaisdell (2010-05-06 07:32:53)

@Alex and @Seth, One more reason why going vegan might result in at least short-term improvements in health is by getting away from animal products from factory-raised animals. These have a very different fatty-acid profile than their ancestral brethren that our hunter-gatherer ancestors hunted and fished for. The omega 6:omega 3 ratio is very skewed in factory meat, closer to 15:1 than in wild animals and pastured animals (e.g., grass fed cattle, chickens, etc.) which have ratios in the realm of 1:1 to 3:1 O6:O3. The imbalanced ratio found in factory farmed animals is a likely contributor to chronic systemic inflammation, which seems to be a source of many of the diseases of civilization, in particular metabolic disorders and cancer. The hormones factory farmed animals are pumped with are also likely contributing to modern health woes. Like humans, cows were not meant to consume the seed grains from annual grasses (wheat, corn, etc.). The evidence is incredibly strong for just how damaging this is to both humans and our farm animals, especially when the grains are not properly treated (see <http://wholehealthsource.blogspot.com/2010/05/traditional-preparation-methods-improve.html>). Unfortunately, grains do not come with a "handle with care!" warning label, and it took humans millennia to figure this out. We seemed to have lost our ancestral wisdom over the last few hundred years, however.

Elenor (2011-05-14 20:19:50)

The question that comes up for me is, sure, vegans get healthier when they chuck the standard (rotten) diet for a cleaner, non-processed diet. How much of that is merely the recovery from years of eating crap – and what happens to long-term vegans? It seems to me – from those I know and those whose blogs or experiences I read on the web – very many of them get better for a while, and then, as their body continues to get insufficient nutrition, they get sicker, or weaker, or reproductively damaged, or more and more allergic to more and more of the few things they WILL eat. Sure, some vegans do just fine – but is it most? (And how many of those "vegans" who do fine turn out to be eating some meat some of the time?) hard to count, hard to tell. But it seems less than optimal to ignore the human \*animal\* in nutrition decisions.

## Positive Side Effects (2010-05-04 02:44)

[1]What happened to Brent Pottenger – when he improved his diet along ancestral lines, a serious health problem unexpectedly went away – also happened to Aaron Blaisdell. He improved his diet along ancestral lines and [2]his sun sensitivity went away. A non-nutritional version happened to me: By adopting elements of Stone-Age life, I slept much better. And, [3]at the same time, I stopped getting colds. Another example involves flaxseed oil. My discovery that [4]flaxseed oil made my brain work much better implied that prehistoric diets contained more omega-3. A dosage that produced brain improvement also [5]greatly improved gum health and [6]recovery from injury.

This is the opposite of conventional medicine. As far as I know, every major drug has serious bad side effects. The drugs often help the problem for which they are prescribed, but your health has a good chance of becoming worse – sometimes much worse – in other ways. Against Medical Advice (2008) by James Patterson and Hal Friedman is the true story of a boy (Friedman's son) with severe Tourette's. (Recommended by Alexandra Carmichael.) In an epilogue,

Friedman says, "Our family is convinced that his most extreme symptoms were caused by medicines prescribed but with unhappy results, almost without exception." The cure was worse than the disease.

The phenomenon of positive side effects isn't mysterious. Our bodies need certain inputs to work well. The whole body evolved with the same inputs. When something crucial is missing, several things break down. And when the missing thing is supplied, several things get better. We write all our words using the same 26 letters. If one letter is missing, many words will be misspelled. When the missing letter is supplied, many words will be spelled correctly. Fixing one word fixes many words. For example, suppose you lack "k". Blink will be spelled "blin", mark will be spelled "mar", and so on. When you realize you need "k" to spell blink, at the same time you will improve the spelling of many other words.

The implication of positive side effects is profound. Finding the right inputs isn't a new wrinkle on current health care, it's a whole new way of being healthy. Public health officials haven't had much luck selling prevention but maybe that was because their ideas about prevention have been poor – telling people to eat according to the Food Pyramid, for example. And if you are sick (as Brent was), you are highly motivated to do something about it. The old saying an ounce of prevention is worth a pound of cure should be revised: a ounce of the right cure is worth a pound of prevention. The dietary improvements that cured Brent's migraines will prevent many other problems. Going from the old saying to the new saying is like going from thinking the sun revolves around the earth to realizing the earth revolves around the sun.

A great change is coming.

---

Aaron Blaisdell (2010-05-04 07:01:40)

Hey Seth, thanks for the great pair of articles! They sound like the synopsis of your talk for the Ancestral Health Symposium next year. Cheers to bringing theory to health care, and to our modern-day Copernicuses!

epistemocrat (2010-05-04 12:36:24)

Hi Seth, Today, in parallel, Mark Sisson posted a nice essay too on the importance of inputs and their remarkably interrelated effects: <http://www.marksdailyapple.com/gut-flora-inflammation/> One input he highlights is prebiotics, for instance. Best, Brent

NNM (2010-05-04 15:38:18)

"A great change is coming" Seth, Why do you think this great change is coming now, rather than 10 years ago or whatever? Is it mainly the internet, which disintermediated the medical profession and made it much cheaper to disseminate the results of self-experimentation?

epistemocrat (2010-05-05 00:02:32)

I suspect that the Internet is linking up patients (as e-patients) in powerful ways that we have never experienced before in human history. Health information flows so rapidly now that ideas can be tested and results can be captured quickly and widely. Many people are tinkering in the "fat tails" of health inquiry, and we are able to falsify more conjectures in less time, creating conditions for rapid evolution of health understanding. The challenge is structuring these interactions strategically to "Cure Together" efficiently and effectively.

seth (2010-05-05 00:28:46)

Aaron, thanks, maybe you're right, maybe I should talk about this broad stuff at the Symposium. NNM and epistemocrat, yes, I agree – the Internet, in particular blogs. Not only do blogs spread the results of self-experimentation, they also help like-minded people find each other. And I believe blogs will also empower those people. The Ancestral Health Symposium can be advertised entirely through blogs. If there is enough interest (and attendance) that makes possible a second symposium and other related activities, such as publications. All this without needing the blessing/approval of anyone in power.

### **Better Thinking By Standing (2010-05-04 23:21)**

Dan Wich, a faithful reader of this blog, told me that my work had helped him. I asked for details. He wrote:

I have a desk job and began to experience back pain that was aggravated while sitting. So I bought a desk designed for both sitting and standing, and spent most of my time standing.

I was on the lookout for improved sleep patterns because of your experiments, and I noticed similar results. But the biggest benefits I observed were unexpected. First, my ability to focus and prioritize improved while standing; sitting for long periods made me more likely to avoid challenging tasks. Second, I felt more creative while standing, avoiding the problem-solving tunnel vision I'd often get after sitting for a while.

Being able to switch between standing and sitting without changing anything else has led me to dismiss other causes for those mental benefits. And I wasn't expecting to receive them, making me doubt the placebo effect is at work. So, I think I can corroborate your results of improved mental function while standing.

---

epistemocrat (2010-05-04 23:51:51)

I stand while working at the computer too; I like to "think on my feet." Mark does too: <http://www.marksdailyapple.com/standing-at-work/> There are a few other pieces that have covered this as well: <http://opinionator.blogs.nytimes.com/2010/02/23/stand-up-while-you-read-this/> <http://www.nytimes.com/2010/04/22/technology/personaltech/22basics.html> I stand (and walk) as much as possible while working too. Seth was on the cutting-edge of this transitional movement. Walking and standing make us human. Best, Brent

Edwyn Chan (2010-05-05 22:27:11)

Seth, Read this recently that also claims that but standing helps produce enzymes that deal with fat in the blood better "If you're standing around and puttering, you recruit specialized muscles designed for postural support that never tire," he says.

"They're unique in that the nervous system recruits them for low-intensity activity and they're very rich in enzymes." One enzyme, lipoprotein lipase, grabs fat and cholesterol from the blood, burning the fat into energy while shifting the cholesterol from LDL (the bad kind) to HDL (the healthy kind). When you sit, the muscles are relaxed, and enzyme activity drops by 90 % to 95 %, leaving fat to camp out in the bloodstream. Within a couple hours of sitting, healthy cholesterol plummets by 20 %." [http://www.businessweek.com/print/magazine/content/10\\_19/b4177071221162.htm](http://www.businessweek.com/print/magazine/content/10_19/b4177071221162.htm)

vic (2010-05-06 19:16:47)

When I first read Seth's musings on the benefits of standing, I searched google scholar, and a few studies have found that people in similar occupations that stand versus sit tend to have greater carotid atherosclerosis.

seth (2010-05-07 13:35:53)

vic, yes, I know about those studies. I don't think it is a good idea to stand in one place for a long time, as the standing jobs in those studies required. I can get the benefits of standing on sleep from one-legged standing for a much shorter period of time.

Patrik (2010-05-12 01:12:11)

@Dan Wich or @Seth Which desk did Dan buy?

Dan Wich (2010-05-16 16:21:40)

Patrick, I bought it custom-made from BenchDepot.com. They were about 40 % cheaper than any other vendor, and the desk is well-built. I recommend them.

Chris (2012-03-08 12:39:30)

Seth, what did you mean by "I can get the benefits of standing on sleep from..."? I can either sit at a desk and work on a computer, or stand at a tall table and work on a computer. Which is better? Seth: When I stood 8 hours/day or more, I slept better than when I stood less. I can sleep better just by standing on one leg to exhaustion several times. That's what I meant. As for sitting versus standing when using computer, I personally stand (30-60 min/day?) more than I sit (0 min/day) when I have a choice but I lounge while using a computer (6 hr/day?) far more than either one.

## **Brent Pottenger Comments (2010-05-05 19:54)**

I asked Brent if he had any comments on [1]his experience (after he adopted an ancestral diet, his migraines and sinus infections stopped). He wrote:

The quality of my life (mental + physical health) improved even further when I started eating slices of butter throughout the day awhile back. For awhile, I was using spoonfuls of coconut butter/coconut oil and/or Greek yogurt for this satiation role, but once I added butter slices to the mix, I beefed up my nutritional 'bag of tricks' quite a bit. Of course, I had cooked in butter for a few years, but I never made the link to simply eat it in slices, despite enjoying its taste so much. And, a little bit goes a long way. I eat cultured butter from a few different brands and a few different locations of the world (hoping this diversification may carry extra beneficial side-effects: different strains of micro-organisms, etc.). I try to find brands that are pastured too (more naturally-occurring Omega-3's, evidently). I usually suck on/chew on the butter slowly because I've found this has improved my oral health too: animal lipids (plus coconut oil) are good for epithelial tissue health (that's why I rub coconut oil on my face and skin and rub butter, coconut oil, and yogurt on my hands). Pairing butter and coffee (I eat the butter; I don't put it in my coffee; I drink my coffee black) has become a nice start to my day (Dave Lull even found a study speculating on the benefits of coupling hyperlipidity and anti-oxidants together in this way; I think it's also a useful approach to detoxifying the liver), particularly when I know I am going to workout that morning—this little hyperlipidity kick seems to help in the gym too (when I am not fasting). Using butter slices in this

manner is a nice compliment to fasting intermittently—these two practices allow me to enjoy low-caloric intake periods pleasantly. They set up my "feasts" nicely. Whenever I have a "grumbling" stomach, or I feel a "biting" sensation in my stomach, I eat a small piece of butter, and my mood and body tend to stabilize. And, like bacon and yogurt and eggs, it's cheap. Butter has certainly been an excellent 'cheap health option' for me.

He later added:

Now I am working intently on Meta-Rules. Meta-Rules are simply 'rules for making rules' to live by. Three dynamics concern me deeply: (1) The problem of induction; (2) biochemical individuality; and, (3) factoring for the unseen. For instance, one of my nutritional Meta-Rules is: "Don't consume anything that causes a negative physiological reaction." From this Meta-Rule, I have deduced the following rule to live by (as one example): "Don't consume high-fructose corn syrup." A marker for monitoring this rule could be facial inflammation and 'puffiness' post-consumption, as one possibility. That's an example of a higher-level precept empowering an individual to deduce for him or herself how that concept applies (or does not apply) in his/her own specific case (I like the term: Patient of One). Over time, I suspect that something like William Baines' Biomedical Mutual Organization (BMO) could emerge if enough people were self-experimenting with Meta-Rules and interacting about their experiences and results. Amongst this cohort of parallel  $n=1$  clinical trials, some convergence of Meta-Rules may occur, indicating ways that our bodies are the same, and also showing how our bodies differ individually when it comes to things like diet, exercise, and lifestyle design.

To explain why headaches can be due to inflammation, he pointed me to [2]this.

epistemocrat (2010-05-06 14:59:30)

Thanks to my friend, Will Eberhardt: He tipped me to cultured butter (and FAGE Greek yogurt and lots of other great nutrition things). And he's a vegetarian golfer (among other things). Nutrition is the ultimate non-expert expertise: we are all engaging in its science and discovery each and every day. Also, my ancestor, Dr. Francis. M. Pottenger, Jr. (see Price-Pottenger Nutrition Foundation), did fascinating research on the beneficial effects of animal fats and saturated lipids on skin and hair (epithelial tissue generally) health. Good hyperlipidity is a protective against skin cancer, for instance, most likely.

Stephen C (2010-05-07 15:00:00)

Very interesting, never thought of a stick of butter as biscotti before! My question is how would you, and other non-traditional lifestyle people educate and gain acceptance from the "mainstream" audience. I am imagining Brent working out at the gym, then pulling out a stick of butter, instead of sugar filled power bars or gatorade. That won't fly with even "health conscious" workout nazis. Yes, health conscious is a relative term, as many of them follow conventional beliefs when it comes to dieting. How do you make it stick with people? Also, I'm partial to the idea of MetaRules. Sounds like there are a lot of "don'ts" and absolutes and it sounds discouraging to me. Probably a necessity and some are humorous, but still not very positive sounding. I tried my own  $n=2...2$  because my girlfriend and I both experimented with a 90/10 mix of protein/veggies/fruits to 10 % carbs and in about 4 weeks, we both lost a combined 8 lbs... A positive side effect was that I ate more variety of veggies and meat, and more often because we weren't filled up with "empty" carbs, like all the refined

grains we were eating before. So instead of a side of carbs, we would replace that with more greens and a larger portion of meat.

### **One Million Chinese in Mexico (2010-05-07 02:36)**

Contradicting the notion that you can find anything on the Internet, I cannot find any info about what I was told in a Beijing Starbucks: A few years, a city was started in Mexico where a million Chinese workers will manufacture stuff. Because of NAFTA, the stuff they make will have tariff-free access to the American market. And shipping from Mexico will be cheaper than shipping from China. The Chinese workers will come over for a limited time, such as one year.

---

Toli Galanis (2010-05-07 08:31:19)

I have contacts in Mexico. Let me look into this for you.

John (2010-05-07 09:21:16)

Well, Seth, welcome to the world of the "rumor" as we call it out here, one of the sometimes more fun aspects of culture. Reminds me of the one I was told in South America where a Taiwanese factory was supposedly bottling up their clean air and shipping it to Asia. Given people's health anxieties, maybe they were thinking about it but there is no factory there. Told with anxiety and a straight face. Do you really think Mexico has a labor shortage? When you are in another country, rumors seem to be more real than they might in another context. Do Chinese people fear "fan death"?

Toli Galanis (2010-05-07 10:54:17)

Okay, here is something referring to the benefits of NAFTA for China: [http://www.thefreelibrary.com/CHINESE+AU-TOMOBILE+COMPANY+ANNOUNCES+PLANS+TO+C+OMPETE+IN+MEXICO %27S...-a0167668617](http://www.thefreelibrary.com/CHINESE+AU-TOMOBILE+COMPANY+ANNOUNCES+PLANS+TO+C+OMPETE+IN+MEXICO+%27S...-a0167668617) "Zhongxing's medium-range plans include constructing a plant in Tijuana through its Chamco subsidiary, which would allow the Chinese company to enjoy tariff benefits available through the North American Free Trade Agreement North American Free Trade Agreement (NAFTA), accord establishing a free-trade zone in North America" It doesn't say however if the Chinese people will be brought for that, which is highly unlikely. However, Tijuana is where the biggest Mexican Chinatown is located, with over 100,000 people of Chinese descent in the area.

Adam (2010-05-10 00:14:44)  
@John Hey - Fan Death is real...Just ask anyone in Korea!

seth (2010-05-10 03:14:05)  
John, you ask, "Do you really think that Mexico has a labor shortage?" China has been far more successful than Mexico at turning low-cost labor into a trade surplus. This is why it makes sense to try to reproduce as much of the winning formula as possible.

max wilde (2010-05-29 22:22:53)  
Dear all, It seems that some clarification to the discussion I had with Seth at Starbucks is needed. I mentioned that a long standing idea for a project was to move a million Chinese to an industrial park in Sweden. The concept is "made in China", but actually Sweden (the European Union). The amount "one million" was meant only to illustrate a large number. My comment to Seth at Starbucks was that I had pretty much laid the idea on ice since it had already been realized by entrepreneurs in Mexico with a little less regard to the business ethics involved. (Please see the attached link for more information <http://www.cimacnoticias.com/site/06110610-Mujeres-chinas-trab.15464.0.html> ) There are a host of reasons why Chinese guest workers in Mexico makes sense from a business perspective. First, a recent survey conducted by Judith Bannister in China on behalf of the U.S. Bureau of Labor Statistics show that Chinese labor cost approximately one fifth of Mexican labor. (Please see the attached link for more information [http://www.businessweek.com/magazine/content/04\\_50/b3912051\\_mz011.htm](http://www.businessweek.com/magazine/content/04_50/b3912051_mz011.htm) ). Second, some sources have mentioned that the Mexican maquiladoras have suffered as it is due to the low labor wages in competing Chinese industrial parks. Third, other sources yet point out a problem that has limited the growth potential of maquiladoras, this is the fact that Mexicans apparently have been unwilling to relocate. This has created a labor shortage in the areas surrounding maquiladoras. Given this picture, perhaps it now makes more sense why someone instead would try their hand at importing Chinese labor to Mexico rather than moving business to China.

Fred (2010-08-26 13:10:08)  
I was looking up the same thing! I was told, during a recent trip to Zac. Mexico, that hundreds of Chinese workers (apparently to build cars?), had up until recently occupied a small town. Rumor has it that they had been there for a few years. I didn't ask for details.. as I thought I could just look it up... guess not.

max wilde (2010-09-12 20:46:25)  
here's the latest from ny times on this issue. this time regarding garment industry in Italy.  
<http://www.nytimes.com/2010/09/13/world/europe/13prato.html?hpw> cheers, max

## **What We See: Advancing the Observations of Jane Jacobs (2010-05-07 03:38)**

[1]What We See: Advancing the Observations of Jane Jacobs, a collection of essays, has just been published by [2]New Village Press (who sent me a copy). Several of the essays are very good, such as those by Pierre Desrochers, Janette Sadik-Khan (in charge of improving New York City's streets), Daniel Kemmis, Robert Sirman, and Mary Rowe, but my favorite was the one by Janine Benyus. Benyus came in contact with Jacobs when Jacobs phoned her to ask her to speak at the 1997 Toronto conference Jane Jacobs: Ideas That Matter. Benyus was thrilled to be speaking to the person whose writing she'd studied to learn how to write. Benyus wrote about increasing appreciation of the value of [3]biomimicry, learning how nature has solved this or that problem to help us solve the same problem.

[On the Galapagos Islands] I watched a quiet engineer named Paul stand motionless before a mangrove as if in deep conversation. He finally called me over and pointed: "This mangrove needs fresh water but its roots are in saltwater, which means it somehow desalinates using only the sun's energy. No fossil fuels, no pumps. Do you know how we do it? We force water through a membrane at 900 pounds of pressure

per square inch, trapping salt on one side. When it clogs, we apply more pressure, more energy.”

Then Paul asked the question I’ve been working to solve ever since: “How is it that I, as a desalination engineer with a five-year degree and twenty-year experience, never once learned how nature strips salt from water?”

epistemocrat (2010-05-07 06:47:52)

Hi Seth, Mimicry is the foundation of Ancestry: [http://ancestryfoundation.org/Foundation\\_Home.html](http://ancestryfoundation.org/Foundation_Home.html) "Ancestry is a human development foundation that respects human beings' innate capacity to learn and grow via mimicry." It sounds like Benyus attended Ancestry. I learned how to write by mimicry too. I mimic folks like Nassim and you. "Myth as mentor," I say. Cheers, Brent

A new book about Jane Jacobs | Undercover Economist | FT.com (2010-06-07 01:04:11)

[...] I've been sent a book titled "What We See: Advancing the Observations of Jane Jacobs". Interesting. The book is a series of essays; contributors include Saskia Sassen. There are some economists involved but not names I had yet encountered. It looks essential reading for serious scholars of Jacobs. Here is Seth Roberts on the book. [...]

## More About Treadmills and Learning (2010-05-08 06:30)

In Beijing, a friend and I were talking about how to improve high-school teaching. I said two things would help: more personalization, and more movement. Movement really helps learning, I said. I read something about that recently, my friend said. She meant [1]this post of mine (treadmill walking made it pleasant to study Chinese)!

Paul Sas has drawn my attention to [2]a man with a remarkable memory:

JB is an active, articulate septuagenarian who began memorizing Paradise Lost at the age of 58 in 1993 as a form of mental activity to accompany his physical exercise at the gym. Although he had memorized various poems in earlier years, he never attempted anything of this magnitude. JB stated that he wanted to do something special to commemorate the then-upcoming millennium. “Why not something really challenging like, oh, 'Paradise Lost'?” he said. He began by walking on a treadmill one day while trying to memorize the opening lines of the poem.

He eventually memorized the whole poem, about 11,000 lines. [3]Apparently the scientists who studied him ignored the treadmill.

A learning psychologist might say that walking provides mental activation, we learn better when we're stimulated. (For example, we learn better when we're scared.) My point is treadmill walking produced an hedonic change: I found learning more enjoyable when I was walking.

---

Steve G. (2010-05-08 12:35:10)

Seth, You might find this interesting. Polyglot Alexander Arguelles recommends learning to speak a language while walking briskly. The description is here: [http://foreignlanguageexpertise.com/foreign\\_language\\_study.html](http://foreignlanguageexpertise.com/foreign_language_study.html) #svd, and a video demonstration here: <http://www.youtube.com/watch?v=VdheWK7u11w>. I think that he claims to have discovered the value of this on his own, although I can't say for sure (it's been a while since I read his site). It seems to track your conjectures on learning while moving. Thanks,

Tedderick (2010-05-16 20:01:50)

I love walking and thinking. But my wife hates when I pace! I try to think of excuses to walk around the warehouse to figure out problems at work!

Matt Weber (2010-06-09 11:27:50)

Just saw this article in J. Neurosci and thought of this post: <http://www.jneurosci.org/cgi/content/abstract/30/23/7845> I'm not that familiar with all the biochemistry stuff, but even I can spell "LTP."

Greg (2011-02-16 03:19:30)

Here's what neuroscientist (and educator) John Medina has to say about exercise and learning: The brain appears to have been designed to solve problems related to surviving in an outdoor setting in unstable meteorological conditions and to do so in near constant motion. As I was writing Brain Rules, it hit me [that] if you wanted to design a learning environment that was directly opposed to what the brain is naturally good at doing, you would design something like a classroom. We know from our evolutionary history that [our ancestors] probably were walking anywhere between 10 to 20 kilometers per day. We grew up and made our really fancy, really big fat brains based on the single idea that we were constantly in motion, aerobic motion. If you were to sit still for as little as 15 minutes in the Serengeti, from which we evolved, you'd probably become someone's lunch. Well, if we were moving 10 to 20 kilometers per day and the brain is used to getting that experience, yet we don't allow a lot of exercise in the classroom, you might hypothesize that we are sub-optimizing the performance ability of the organ. And that's exactly what you see: The first research literature that came out of this actually came from asking questions about aging populations. It was shown that in aging populations, people who lead a sedentary lifestyle were not able to mobilize their IQ as effectively. That's particularly true of something we call "executive function," which is the ability to problem solve and plan. The people who had a sedentary lifestyle did not have as good executive function and could not mobilize their IQ in the same way that somebody who had an active lifestyle could.

### **Distinguished Scientists Fail to Think for Themselves (2010-05-09 03:15)**

A long list of National Academy of Science members, including several Nobel Prize winners, have published [1] a letter in Science supporting the idea that humans have caused/will cause serious global warming. The letter is striking in several ways – how preachy it is, how it overstates its case, how it fails to provide evidence, and how it ignores the main arguments of skeptics (at least, intelligent skeptics).

It begins:

All citizens should understand some basic scientific facts. There is always some uncertainty associated with scientific conclusions; science never absolutely proves anything. When someone says that society should wait until scientists are absolutely certain before taking any action, it is the same as saying society should never take action.

"Citizens", huh? This might interest third-graders; if they think that the brighter skeptics or most readers of Science don't know these "basic scientific facts" they are mistaken.

The letter goes on to claim that the idea that humans are seriously warming the planet is as well established – at least, in the same category of firmly-established theories – as the conclusion that "today's organisms evolved from ones living in the past". That is an overstatement.

And the letter ends with hand-waving. In place of evidence that supports what they claim, they simply repeat the claims in detail (e.g., "Natural causes always play a role in changing Earth's climate, but are now being overwhelmed by human-induced changes").

The letter is unintentionally revealing. Here's what I would consider reasonable evidence for serious human-generated global warming:

1. Temperature higher now than in the past.
2. Temperature increasing at a higher rate now than in the past.
3. Good (= verified) model shows serious human-generated warming.

No. 1 isn't clearly true; the Medieval Warm Period appears to be as warm as now. (Mann et al. understood this point; they tried to diminish the Medieval Warm Period.) No. 2 isn't clearly true. For example, the 1930s may have been as warm as recent decades. No. 3 isn't true. Models such as Hansen's haven't been shown to predict correctly. There's no reason to take them seriously.

So No. 3 is off the table (current models are untrustworthy). That leaves Nos. 1 and 2, the failure of which to be clearly true points in the direction of no serious human-generated warming. If a theory makes two predictions, both of which appear wrong, it would be wise to start doubting the theory rather than lecture the rest of us on "basic scientific facts".

This line of reasoning (ask whether the humans-have-caused-serious-warming idea makes correct predictions) isn't complicated or obscure but does require you think for yourself rather than accept what you're told. Apparently no one in this long list of distinguished scientists has done so.

If a letter from 100 United States Senators was full of spelling and grammar errors, would you trust it? Well, no . . . and you might wonder about a world with such a poorly-educated ruling class.

1. [http://www.pacinst.org/climate/climate\\_statement.pdf](http://www.pacinst.org/climate/climate_statement.pdf)

---

Alrenous (2010-05-09 07:21:18)

So...were the prize winners actually responsible for the writing, or did they just sign off on it? It doesn't seem to scan like the stuff these people write to each other. I would be interested in knowing which one of the signed names is actually responsible for the initiative. It certainly looks bad, but there are a lot of reasons to suspect it has little or nothing to do with what the signatories actually care about. To bring it near a blog theme, an unmotivated gatekeeper is just about the last person to go to if you really need frank advice on a fraught subject.

Andrew Gelman (2010-05-09 12:53:28)

Seth: See [1]here. Phil is a physicist and knows much more about climate change than either of us do. More generally, you're an experimental psychologist, and I'd trust your word on many issues relating to rat learning (and to self-experimentation). When it comes to physics, I'll trust the experts. Even if they produce preachy reports with spelling and grammar errors. You can feel free to be skeptical but it seems laughable to me that you think you know more about this than the actual experts in the field do. This is not like your weight-loss study, where you were able to leverage your extensive knowledge of experimental psychology, along with years of data on yourself. On a question of physics you're about as much of an expert as I would be if asked to, say, adjudicate a question about a translation of the Koran.

1. [http://www.stat.columbia.edu/~cook/movabletype/archives/2009/12/say\\_a\\_little\\_pr.html](http://www.stat.columbia.edu/~cook/movabletype/archives/2009/12/say_a_little_pr.html)

seth (2010-05-09 14:03:33)

Andrew, my expertise is more relevant than you seem to realize. Hal Pashler and I wrote a paper about modeling that said that a 50-year tradition (within psychology) was absurd. I submit that how much to trust models is relevant in the climate-change debate. In the post you link to (by Phil), Phil appears unaware of a long literature in psychology about overconfidence in confidence intervals. On a wide range of topics, people's estimated confidence intervals are too narrow. Here again my expertise (in psychology) is relevant. Feel free to punch holes in my easy-to-understand argument. I don't think it's "laughable" to disagree with expert opinion because the experts can be glaringly wrong, as the books I call the Emperor's New Clothes Trilogy illustrated. Don't you have a copy of The Experts Speak?

Shane (2010-05-09 14:13:10)

Bravo, Andrew. Well said. What bugs me about posts in this vein, which seem to be appearing with increasing frequency, is that what started out as a sentiment that expressed something like: "just because someone's an expert doesn't mean you should cede to them all responsibility to think and reason" has become something much closer to: "he's an expert, so he must be some combination of a buffoon and a criminal." Like that string of posts about how what motivates academics is to be purposefully useless and obscure. Probably there is, somewhere, an academic with such a bizarre and twisted motivation, but in any substantial number? Really? This is the atmosphere at Berkeley, then, is it? Well, not among the people that I know. And not at my institution, either – not a single person that I've met believes this, or acts like it. Every so often there are real gems on this blog. But mostly I find myself reading it because it infuriates me; and I have this idea that it's good to be infuriated by stuff to keep you honest.

seth (2010-05-09 14:30:21)

Shane, thanks for reading and commenting. You write: "Probably there is, somewhere, an academic with such a bizarre and twisted motivation, but in any substantial number?" And outsiders call academia an "ivory tower" because . . . ? Surely academics don't do research that is useless by mistake. It's Veblen's idea, not mine, that academics try to be useless and obscure. In The Theory of the Leisure Class, he gave plenty of evidence for such motivations inside and outside of academia. Alrenous, Peter Gleick is responsible for the letter. See <http://dotearth.blogs.nytimes.com/2010/05/09/sweating-the-details-in-climate-discourse/> for more details.

ChristianKI (2010-05-09 16:02:48)

@Shane: I actually have heard a scientist say in response to the question: "How will your research in neuroscience help people make better decisions?": "My goal isn't to produce theories that help people to make better decisions. If they do that's fine but

I'm rather interested in doing basic research." Sure no academic would admit that they want to be useless but they want to do pure basic research instead of solving real problems. Just like artists paint for the sake of art there are scientists who want to do science for the sake of science. Just like art loses it's purity when it's done for money science can lose it's purity when it's done to solve practical problems.

Alrenous (2010-05-09 17:44:52)

Thanks Seth. So the actual author of the letter is the co-founder of the Pacific Institute, with the mission, "We envision a world where the basic needs of all people are met, where resources are managed sustainably..." and I need not read more. If global warming gets dethroned, such an institute can expect to lose substantial amounts of both leverage and funding. Conflict of interest? What's that? Hmm, I clearly should have checked the hosting url of the letter...but on the other hand I got you to do the work for me. Never underestimate a human's ability to ensnare others to their goals. Ironically, I have to agree with Gleick's water policy suggestions. (E.g. he thinks you should charge for use where water is scarce.) But then, that's where his actual expertise is. What he actually cares about.

Hal (2010-05-09 18:52:38)

Seth what do you think about the post by "Phil" linked to above, specifically in terms of climate sensitivity? The question is, how many degrees C will the temperature increase, given a doubling of CO<sub>2</sub>? Would you be willing to share your ideas in what this value should be? As far as your 3 points, ISTM that we could still face serious human caused warming even if 1 and 2 were false. Even if there were warm and warming periods in the past worse than today, eventually those past warming periods were followed by cooling. But today with our high CO<sub>2</sub> load, we have grounds to be much more concerned that current warming trends will not be reversed, due to the aforementioned climate sensitivity.

Marc (2010-05-09 21:36:40)

thanks Seth, The so called "experts on global warming" need a grade school refresher course in the basics of life of the majority of plants and animals and combustion on this planet. Most plants require CO<sub>2</sub> ( carbon dioxide) to live ... and give off O<sub>2</sub> (oxygen). Most animals require O<sub>2</sub> to live ... and give off CO<sub>2</sub>. combustion requires O<sub>2</sub> to occur ... and gives off CO<sub>2</sub>. More CO<sub>2</sub> = more plants = more O<sub>2</sub> for the planet. This is our plant's major natural balancing mechanism between plants and animals and combustion, which keeps CO<sub>2</sub> and O<sub>2</sub> in dynamic equilibrium.

seth (2010-05-09 22:00:48)

What do I think of Phil's analysis? I think it ignores two facts that argue against big sensitivity of global temperature to CO<sub>2</sub>. One is the way carbon dioxide concentration lagged – not preceded – global temperature changes for a long time. Presumably as the temperature changed, the oceans changed how much CO<sub>2</sub> they dissolved. If CO<sub>2</sub> sensitivity was great, as the CO<sub>2</sub> concentration increased, the CO<sub>2</sub>/temperature relationship should have changed somehow. It didn't. The other is the fact that global temp is not now increasing at an unprecedented rate, in spite of the fact that CO<sub>2</sub> is now increasing at unprecedented rate.

Kim Åyhus (2010-05-10 04:34:48)

Absence of evidence is evidence of absence. It is precisely this absence of evidence of global warming that makes me suspicious about it. However, each time I tried to make this point, in real life or in web forums, lots of people protested by claiming that absence of evidence is NOT evidence of absence, and of course providing no evidence that their claim was true, and also claiming I was an idiot for believing something so stupid. So I proved my claim to be true, as a way to shut them up. The proof is in conditional probability, is quite simple, and can be found here: <http://kim.oyhus.no/AbsenceOfEvidence.html> Their reaction to it, was interestingly, to ignore it, misunderstand it, and lie about it. Kim0+

seth (2010-05-10 05:18:43)

yes, Kim, I agree: absence of evidence is evidence of absence – and it is sort of amazing that people claim otherwise. Likewise, correlation really is evidence for causation, even if there are other explanations. There are always other explanations.

Kim Å~yhus (2010-05-10 05:49:44)

Perhaps I should make a similar proof that correlation is evidence for causation. Kim0+

seth (2010-05-10 06:51:07)

Kim, your web page about evidence of absence is very clear and convincing. If you do a proof for correlation/causation I will link to it.

Andrew Gelman (2010-05-10 07:53:48)

Seth: Yes, Phil is indeed well aware of the long literature in psychology about overconfidence in confidence intervals. He and I have discussed this topic extensively. You and Phil both are aware that famous people have made mistakes in the past. Where you and Phil differ is that Phil (and the physicists who signed that letter) know about physics and you do not. I'll go with the consensus of the physicists on this one.

Shane (2010-05-10 09:44:39)

@seth: the 'ivory tower' thing is real, for sure, in the sense that people are suspicious and contemptful of academics. My tendency, based on extensive personal experience with humans, is to think that says a lot more about the people than about the academics. @ChristianKI, there's a huge, HUGE difference between 1) not worrying too much about how the things you do will be used by other people, and 2) trying, on purpose, to do things that are purposefully useless to other people. You have given anecdotal evidence for the former, which I would never contest. As to the latter, though, like I said, I've never seen hide nor hair of it, except when uttered by number theorists in a fit of pique. I think I'll read Veblen this summer, though. I know Seth is smart, and at this point I'd like to see what he finds so compelling.

seth (2010-05-10 15:23:16)

Andrew, you mention "the physicists who signed that letter." The NAS has about 2000 members. The letter was signed by an eighth of them. Making it likely that most NAS physicists didn't sign that letter. If physicists are divided on this issue, your reliance on Phil because he knows more physics than me doesn't make sense. If Phil is in the minority in his profession, it makes even less sense. Shane, I don't know if you are a professor or not but really among many professors there is a disdain for useful work. "Basic research" (sometimes called "pure research") is higher status than "applied research", for example. Even in departments that you might think have to be useful. In engineering, an assistant professor complained to me that all her colleagues valued was theory, actually-useful stuff was nothing. The attitude goes beyond "not worrying too much about how the things you do will be used by other people." Again, professors are just part of a much larger pattern, which Veblen was the first to describe.

Nathan Myers (2010-05-10 16:43:16)

Of course research scientists aren't interested in solving problems. Solving problems is called engineering. People who are interested in solving problems, and can and care to develop the skills to do it, become engineers. The rest do other things. Research scientists do research. That's good, because not many people have the peculiar sort of patience needed to do research. I wouldn't want research scientists wasting their time being bad engineers, when there's so many questions of basic research going begging. People who want to understand things become scientists. They don't always remain scientists, though, because real science is frustrating, rarely yielding up the answer you wanted. Many become, instead, believers in whatever they were taught, or in whatever feels more comfortable. The less they know about something, the less scientific feel they need to be about it.

seth (2010-05-10 18:58:26)

"Of course research scientists aren't interested in solving problems." Of course? Physics began with problem solving – aiming artillery. Chemistry began with alchemy. Statistics began with practical problems, such as improving agricultural yields. Because being useful is low-status and difficult, scientists moved away from practical applications as soon as possible.

Stephen M (Ethesis) (2010-05-10 19:52:51)  
Nathan Myers – he was talking about engineering.

Hal (2010-05-10 21:37:05)

I agree that if there were substantial disagreement among the members of the NAS, that would be evidence against global warming. But if that were the case, I'd expect the dissenters to vocally object to this much publicized letter which was released in their name. What do you think are the chances that we will see a counter-letter from the NAS?

Nathan Myers (2010-05-10 21:42:31)

Of course engineering is a low-status activity among scientists. When you're a scientist, being useful is *somebody else's job*. Your job as a scientist is to understand and explain what is mysterious. If you want applause for engineering, look to other engineers, or to people with problems they need a solution invented for. That's what engineers do. Similarly, making stuff work right is low-status among engineers, for the same reason: that's what technicians do. An engineer doing technical work is probably procrastinating. Technicians you're likely to encounter include auto mechanics, airline pilots, cooks, and clinical physicians. Other technicians, and people who need things done right, appreciate technicians. Physics (really, dynamics) started with artillery and developed into a science. That is always how it happens: practice, followed by systematic refinement, followed by theory. Scientists pretend it happens the other way, to pump up their status. People are often fooled. I should mention that professors of engineering are far from the same as engineers. It's rare to find engineering being done by the faculty at an engineering school. (Likewise, it's rare to find the faculty at a hairdressing school cutting hair.) The students do it. Real engineering is done out of sight by professional engineers at Boeing, at Intel, at Bechtel, and at a million other companies.

seth (2010-05-10 22:40:15)

Hal, this letter wasn't supposed to represent the official NAS view or anything like that – just the views of those who signed it.

Hal (2010-05-11 12:19:31)

Seth, OK, well it will be interesting nevertheless if a contrarian letter appears from others in the NAS. My real interest in this topic is as an example of applied rationality and the methodologies we use to get at the truth. Along these lines I thought I might mention a perhaps little appreciated requirement of rationality and honesty. Basically, you have to expect to be surprised by the future. That is, whatever percentage estimate you give to the likelihood (in this case) that anthropogenic global warming theory is true, you have to expect that future data is equally likely to make you either more or less confident in your belief. Your percentage estimate is equally likely to move in either direction. The reason is simply that if you think it is much more likely to move in a certain direction, then you are really misstating your belief today. As a simple example, a person can't say he is 50-50 on an issue but believes that he is very likely to be 60-40 in the future. That belief means that he is more than 50 % believing in it today. The upshot is that you have to expect to be equally likely to have to say "maybe I was wrong" as "see, I told you so", as future data comes in. It is a simple requirement of rational and honest, evidence-based belief. Unfortunately our human psychology doesn't give nearly as much credit and prestige to people who say "maybe I was wrong" as those who say "see, I told you so". This causes people to overstate their beliefs, and leads to polarized and hostile discourse, as we so often see.

Phil (2010-05-11 12:26:56)

Seth, as you might imagine I disagree with almost everything you say here. But let me give just one example. You say: "Here's what I would consider reasonable evidence for serious human-generated global warming: 1. Temperature higher now than in the past. 2. Temperature increasing at a higher rate now than in the past. 3. Good (= verified) model shows serious human-generated warming." But in fact, neither of the first two would be reasonable evidence of serious human-generated global warming if they are true, and the absence of them does not indicate absence of serious human-generated global warming if they are in fact absent. Here's the key fact that you seem to be unaware of (but that scientists who study this know very well): MORE THAN ONE PARAMETER AFFECTS THE TEMPERATURE OF THE EARTH. It's not all about carbon dioxide concentrations. If high temperatures in the Medieval Warm Period were due in part to higher solar activity, then those temperatures don't tell us much about climate sensitivity to CO2. So your point 1 doesn't really make sense. The issue with point 2 is pretty much the same, except with regard to the derivative of temperature rather than temperature. And for the models...you assert that the

models aren't good enough to estimate temperature sensitivity, but you're wrong. Yes, I know that scientists, like everybody else, tend to be overcertain. But I don't think that means that nobody knows nuthin'. I asked you before, more than once, to give YOUR estimate of climate sensitivity (defined as the steady-state change in global average over preindustrial levels in response to a doubling of CO<sub>2</sub> over preindustrial levels). You still haven't answered that question. But it seems that for some reason you put very little of your probability in the range that almost all climate researchers think is most likely. So who is being overcertain?

seth (2010-05-11 15:24:30)

Phil, you write "you assert that the models aren't good enough to estimate temperature sensitivity, but you're wrong." What's an example of a good-enough model? I predict that the model you put forward as good enough will turn out to not have been verified, "verified" meaning "found to make accurate predictions about global temperature".

q (2010-05-11 16:13:32)

i'm the only one here who can sign a letter. all the rest of you can't, because your signatures are longer than a letter.

Phil (2010-05-12 08:50:13)

Seth, the Intergovernmental Panel on Climate Change has an uncertainty window about 6 C wide, for their estimate of "climate sensitivity." That's very wide. You refuse to say what your interval is, but it seems that it is narrower than 6C. It also seems that you put far more probability near very low values of climate sensitivity. So, the implicit "Seth Model," or perhaps it is a family of models, has a narrower confidence interval and a much lower central estimate than the experts do. Since you are the one making the extreme claim here, I think YOU are the one who should justify what you are saying. What is YOUR "good-enough" model of global temperatures, that predicts the temperature rise of the past century and especially the past decades, is consistent with solar intensity measurements, is consistent with the physical laws governing energy transfer, but does NOT have a climate sensitivity of at least 2C per doubling of CO<sub>2</sub>?

seth (2010-05-12 14:47:11)

Phil, you wrote "but you're wrong" without any explanation of why I was wrong. I requested an example to try to understand what you wrote. I'll provide you my confidence interval in a few days.

Phil (2010-05-12 14:55:46)

Check the IPCC report, chapter 8: <http://www.ipcc.ch/pdf/assessment-report/ar4/wg1/ar4-wg1-chapter8.pdf> there is an extensive discussion of climate modeling and why it is good enough to be sure that anthropogenic climate change is real and why the key parameters are likely to be not extremely far from the (admittedly wide) range of estimates. But what I am taking issue is with much larger than your three assertions, though I think they are all incorrect. You are criticizing people for being "overcertain" because their estimate of climate sensitivity has an uncertainty of "only" 6C, but your own estimate has less uncertainty than that, in addition to being centered much lower than the experts think is reasonable. I do not think you have any basis for having a narrower confidence interval than the experts do, and I do not think you have any basis for having a much lower central estimate than the experts do.

Michael Tobis (2010-05-13 12:10:04)

To your first two points, there is nothing that says that warming has to be simultaneous with greenhouse forcing. Under present circumstances we in fact expect the contrary: the thermal inertia of the oceans and the masking of industrial dust mask the committed warming. So your proposed tests simply aren't valid. Also, climate models make effective predictions of many things, not limited to global mean surface temperature. As a particular point, they show and have shown since the 1980s that greenhouse forced warming is a near-surface phenomenon, accompanied by stratospheric (upper atmosphere) cooling. They also show a pattern of warming that concentrates on land areas in continental interiors. These long standing predictions did in fact emerge. So your claim that climate models are without skill are without foundation. All of this is silly; it treats "global warming" as a falsifiable theory, a claim of a causation that is either true or false. This is foolishness. The underlying phenomena, (thermal radiation, absorption and reradiation in gases) is two hundred year old physics that is as well established as anything in science. What's at issue is not "whether" but "how much". As Phil correctly points out, those who call themselves

"skeptics" are not making an argument from ignorance, they are making an argument from certainty. If we really had no idea what the sensitivity was, we should be more concerned than ever. The attitude suggested by people who claim to be "skeptics" is utterly inconsistent with a lack of confidence in the underlying science. It is a claim that the the sensitivity is certain to be much less than all prevailing evidence indicates. (Phil's a bit pessimistic; I'd say the consensus range is 2 C to 4.5 C per CO2 doubling. <http://www.nature.com/ngeo/journal/v1/n11/abs/ngeo337.html> ) And what if it were zero? Would we be out of the woods? No, even with a global sensitivity of zero we could have huge forced climate change, say, warming the poles and cooling the tropics. There is no doubt that the amounts of CO2 and other gases we are adding to the atmosphere change the way energy flows through the system, a system which at heart is fluid and easy to change. Even in the absence of knowledge and a low global sensitivity there are huge risks. And then there is ocean acidification. [http://en.wikipedia.org/wiki/Ocean\\_acidification](http://en.wikipedia.org/wiki/Ocean_acidification) Sorry. We have to deal with this.

ChristianKI (2010-05-14 00:04:01)

@Phil: If you claim as the scientists did that global warming is a fact that has the same certainty as evolution than your confidence interval is very small. The members of the academy probably all agree that p(Evolution is wrong)

Robert (2010-05-14 00:33:56)

To add to what Phil said (that the physics of thermal radiation, absorbtion and reradiation in gases is well established), we have in the rock record repeated examples of global climate having been warmed and cooled by alterations in CO2 sinks and flows. We even have record of a methane induced warming event. Is it so hard to believe that injecting a significant percentage of the world's fossil carbon into the atmosphere at an – and this truly is novel, in the history of the planet – unprecedented rate will have profound, global effects?

Mac (2010-05-14 03:07:41)

" the Medieval Warm Period appears to be as warm as now." Are you sure of that? Here's a good graph of the various reconstructions: <http://www.ncdc.noaa.gov/paleo/pubs/ipcc2007/ipcc2007.html> Yes - there was a Medieval Warm Period in the reconstructions - but even if ignore most reconstructions and cherry pick the ones that give the warmest results they are still lower than the average current temperatures. Obviously these temperatures are averaged - there of course can be a day in that period which is higher than a day now !

Jason Olshefsky (2010-05-14 06:02:12)

I think the broad question is, "are humans ruining the planet". From there, we get the compound, "humans are causing an increase in CO2 that is causing an unusual increase in global temperature that is ruining the planet." Four parts there: 1. Humans are causing an increase in CO2. 3. Global temperature is increasing. 2. CO2 causes global temperature increase. 4. Increased global temperatures of that scale are bad. I think we all can agree on #1. Perhaps not, but I'll not bother addressing it. I find that #2 and #3 are often presented side-by-side ... I have to rely on my intuition and faith in what constitutes bias, and what I think is an "unbiased source". I have seen models and data that I largely don't understand, but if I rely on the conclusions of the presenters, the consensus appears to be that CO2 affects global temperature and increases it in a measurable (but not huge manner compared to other forces like solar output). Nobody is saying that CO2 decreases global temperature, so those who disagree claim that CO2 either has no effect, too little an effect, or that the effect of CO2 cannot be measured. I believe it's possible to isolate factors in muddled data like global temperature just as I believe it's possible to divine a sum of sine waves from a complex waveform without understanding how Fourier transforms work, so I favor those who can come to a conclusion. But is #4 true? Is it really that bad? I don't think it is possible to answer that question without running the experiment. My gut tells me that expending effort to reduce CO2 to avoid further affecting global temperature seems to be the wisest course of action. I strongly believe that #2 is true, but even if #3 is false, I feel the effort gambled is relatively small. What it comes down to is a gambling problem. The potentially devastating outcome (i.e. massive bad global changes) has some probability P(bad). You are to select an action that may change P(bad). If you find an action that will significantly reduce P(bad), then you'd clearly take it. The trouble is, will acting to suddenly reverse CO2 output actually increase P(bad)? I am under the belief that taking action will not increase P(bad) and may reduce it, so I lean toward taking action. I am frustrated that there is not a better way to isolate P(bad) and how it is affected by changes in behavior.

seth (2010-05-14 06:16:36)

Jason, the answer to your broad question is surely yes – and the narrow focus on CO2 is a big mistake that wastes a lot of effort. No one has to wonder if pollution is a problem – it is right now. No one has to wonder if we've had profound stagnation in development of new forms of transportation. We have, no doubt about it. No one has to wonder whether we should reduce energy costs and improve long-term supply by developing new sources of energy – of course we should. Let's start by solving the obvious problems.

Robert (2010-05-14 11:53:04)

We have in the geologic record many changes to global climate that had a variety of causes, change in atmospheric chemistry having been one such cause. Local and mass extinctions were sometimes caused by these changes. The change we're witnessing now in global climate is on the order of the larger of these events – for example, the amount of CO2 we've injected and are likely to inject is will probably put us in a climate state similar to the Miocene/Pliocene warm period. The current rate of warming far exceeds anything seen in the Pleistocene, let alone anything in the current interglacial period, including the medieval warm period. The current extinction rate matches that of the 5 global mass extinctions that have occurred in earth's history, and the unique imprint of humans is the likely cause: humans have fragmented gene pools, and humans are causing a change in climate that is occurring at an unprecedented rate. To reiterate: the rate of change is as significant as the change itself. Remember, within Pleistocene glacial periods there were changes in sea levels of up to 50 meters (there were five such sea level maximums during the Wisconsinan, and they mark interstadials). Despite these radical fluctuations, mass extinction did not result. Our period is unique in that we've already exceeded some of the variations that were typical of the last few million years.

Robert (2010-05-14 11:53:04)

We have in the geologic record many changes to global climate that had a variety of causes, change in atmospheric chemistry having been one such cause. Robert (2010-05-14 11:56:01)

oops,this phrase: "weâ€™ve injected and are likely to inject is will..." should just read "weâ€™ve injected and are likely to inject will..."

## **Colony Collapse Disorder and My Self-Experimentation (2010-05-10 13:52)**

At the risk of being extremely self-centered, my self-experimentation is related to [1]this depressing news:

The decline of [America's] estimated 2.4 million beehives began in 2006, when a phenomenon dubbed colony collapse disorder (CCD) led to the disappearance of hundreds of thousands of colonies. Since then more than three million colonies in the US and billions of honeybees worldwide have died and scientists are no nearer to knowing what is causing the catastrophic fall in numbers.

The number of managed honeybee colonies in the US fell by 33.8 % last winter.

The bees vanish from the hives. What has surely happened is that their navigational systems have malfunctioned. Bees have dozens of things that must work for them to live, all of which need a certain environment. The bees live in a degraded environment. Which system will fail first? A neural system turns out to be the most sensitive to environmental degradation.

No one predicted this, nor did I predict that my self-experimentation would find many ways in which our environment, like the bees's environment, has come to lack crucial stuff. But one reason for the two outcomes (colony collapse disorder, discoveries of my self-experimentation) is the same: The nervous system is especially sensitive to the environment. I've studied stuff controlled by the brain: sleep, weight, mood, arithmetic. Just as bee brains are the first part of bees to be crippled by a bad environment, our brains are the first part of us to improve when given a better environment.

1. <http://www.guardian.co.uk/environment/2010/may/02/food-fear-mystery-beehives-collapse>

---

Laura (2010-05-11 09:01:14)  
I love this!

Jeff R (2010-05-11 10:45:48)  
Seth, What could possibly justify this level of certainty about what happened to bees, when the quoted section says the cause is unknown? "What has surely happened is that their navigational systems have malfunctioned." Jeff

seth (2010-05-11 17:32:22)  
Jeff, the quoted section means that the environmental cause is unknown. I know of no plausible alternative to the navigational explanation. It explains why the dead bees are never found in their hives.

(original) Jeff (2010-05-11 19:02:32)  
Seth, Possible causes on wikipedia include mites, infectious disease, environmental changes, pesticides, or malnutrition. Only some of these causes are the environmental reason you are so sure about. There are many examples of an infectious disease decimating a population absent any change in environmental factors. You refer to a "degraded environment" with no indication of what this refers to or how it would affect the bees. I think you would do a service to your non-scientist readers if you emphasize the amount of evidence that is necessary to believe a hypothesis to be true. There has already been some study of colony collapse disorder and there will be much more in the coming years. You give no indication you have read any of this literature and you give no indication of why any particular reason should be favored based on this literature. That you have discovered deficient aspects of the human diet says very little about the cause of a disease in bees. People shouldn't believe things because "they seem right." (not quoting you there) That is absolutely not science. I think your blog is excellent in general and I have made changes to my diet because of your writing. But, I think you write much too casually at times for a blog that is about the scientific method, among other things. You preach being a skeptic somewhat selectively, depending on what the subject is. Jeff

Jeff R (2010-05-11 19:03:31)  
above is me, the log-in was saved on this computer

Kit Carson (2010-06-13 13:21:20)  
I used to have a few bees, at one time I had 17 hives. Then most of my bees just vanished also. I live in South Carolina in a somewhat rural setting away from any extensive farms and pesticide areas. Thing is pesticide and those ideas simply does not seem to be very intelligent reasoning, I have read many reasons and viewpoints on the reason why. No one takes the following

into consideration. When you find a hive with no bees it is as if they have just all swarmed. All of them. However the whole hive does not swarm. There are simply no bees. None on the ground None away from the hive that I could find dead The queen never leaves the hive and some workers do not either, so that kinda blows the they got lost idea. Actually I think they do just leave, I noticed that with the use of some of the comb base I had purchased, the bees simply did not like it, would not build on it, and then they just were gone. So maybe they did all swarm at once, I do know each and every one of them were gone. That alone to me does not lend itself to disease, or pesticide as I used to check them weekly and it was always the entire colony gone, with not a bee to be found. Kit

Kit Carson (2010-06-13 13:29:30)

Also my reasoning is quite simple, I meant to include it above. If pesticide or sickness then some bees would still be in the hive. If not alive, they would be dead on the bottom of the hive. Thing is there is not one single bee to be found. Not one. Kit

Kit Carson (2010-06-13 13:37:03)

Another thing, been awhile since I thought of this. If one or two colonies of bees were gone, for one thing normally the honey stores and brood would be a bit slack, but the other bees in other hives would not raid the empty colony. Seems they know something is in there that is harmful. Normally they would raid the hive and steal all the honey. They do not do that. So I think for whatever reason, something in the hive is known to the bees and they just leave. They always clean the hive and toss out a dead bee, so maybe they clean house and then just go.

seth (2010-06-13 15:42:46)

that's very interesting. I agree, if the queen never leaves the hive under normal conditions and is found to have left the hive, it's hard to explain that with the lost explanation. Jeff is right, I was too certain.

### **Life Imitates Art: Climate-Change Edition (2010-05-10 15:33)**

In [1]a previous post I wrote about one of the silliest letters ever signed by a group of very smart people. At the end of my comment, I wrote:

If a letter from 100 United States Senators was full of spelling and grammar errors, would you trust it?

The letter was written by Peter Gleick, a MacArthur Prize winner. In [2]a follow-up essay in the Huffington Post, he twice called ice floes "ice flows" ("there really are polar bears on ice flows"). Who says life doesn't imitate art?

1. <http://www.blog.sethroberts.net/2010/05/09/distinguished-scientists-fail-to-think-for-themselves/>

2. [http://www.huffingtonpost.com/peter-h-gleick/remarkable-insight-into-t\\_b\\_569076.html](http://www.huffingtonpost.com/peter-h-gleick/remarkable-insight-into-t_b_569076.html)

---

Anthony (2010-05-10 15:50:23)

You're just trying to divert public attention once again from the facts of climate change, and grasping at spelling-error straws to muddy the waters and confuse the public!!! Admit it, Seth, you are part of the evil climate change denial machine.

David (2010-05-11 07:50:12)

Clearly, these bears need to relax and just go with the flow.

Hal (2010-05-13 12:04:37)

I see they've fixed the spelling, perhaps thanks to you. No editorial note records the correction. Another item for your Orwell file.

### **"Psychology is the bridge between art and science" (2010-05-11 14:15)**

Yesterday I attended interviews of Tsinghua students who want to transfer from another major to psychology. Almost all of it was in Chinese, but at one point, as part of an explanation of her interest in psychology, a student said (in English), "Psychology is the bridge between art and science."

Well put. Maybe she read that somewhere, but I doubt it. I'd never heard it before. Notice how we think art can be done by anyone yet science can only be done by scientists (in extreme cases, only by physicists). Psychology, especially self-experimentation, may lead us out of that desert.

[1]The wisdom of Tsinghua freshmen.

1. <http://www.blog.sethroberts.net/2009/12/17/the-wisdom-of-tsinghua-freshmen/>

---

Alex Chernavsky (2010-05-11 18:13:51)

When I was taking introductory neurobiology with Professor Timothy Goldsmith at Yale, he told us in the first lecture that neurobiology is the interface between the sciences and the humanities.

James (2010-05-11 19:38:46)

At my university, you can major in psychology in both arts and science degrees.

Rachael (2010-05-13 13:49:53)

I (an art teacher) would argue that most people believe that art can only be done by "artists." The biggest part of my job is either convincing my students that any one can be an artist, or if that fails convincing them that they are artists. I certainly held that belief about science and math as a young woman, and have only begun to realize how much the keen observation required in the arts is often a great path to scientific understanding.

Scott (2010-05-14 01:27:35)

I believe that art requires such a subtle, unconscious input that it is easy to see how psychology could be 'a' bridge between it and science. Psychology may not be a pseudo-science per se, (I'm a behavioral science major by hobby) but there are certainly large segments of it that even the most experienced psychologists don't understand - yet there certainly is a deep connection between what can be garnered from analyzing art as it pertains to the science of people. Just as much, there is definitely a provable science behind most of today's psychology. Art is a wonderful breath of life to subconscious thinking. As such, used correctly (whatever that means), art can be a doorway into the thinking of people in order to understand the underlying science of what is going on, making it a perfect intermediary just as psychology could explain the science behind art.

## Is Sony Back? (2010-05-11 18:55)

A girl sitting near me in this Beijing cafe is using a [1]Sony Vaio Series X notebook. I'm blown away how thin and light it is. It cost about \$1100 and has a 60G hard drive. Another girl near me is using an iPad, big and clunky by comparison.

1. <http://www.sonystyle.com/webapp/wcs/stores/servlet/CategoryDisplay?catalogId=10551&storeId=10151&langId=-1&categoryId=8198552921644667494&N=4294954366>

---

Laura (2010-05-11 20:18:48)

This reminds me of a time last week at the haas business building. A student had forgot his laptop and left it on a desk near me for many hours. It looked just like the Sony! Very thin and flashy. This week is finals week at cal. I used to go to cafes, but I can get free internet in the buildings on campus. Now, I am listening to a student practice piano in the music department. I just don't want to pay for the expensive drinks anymore. Plus, the doe library is open 24 hours for this week. Very exciting!

Robin Barooah (2010-05-11 20:23:54)

That's a really impressive laptop. It's reasonably comparable with the MacBook Air on most specifications apart from thickness - where the Sony wins hands down. It's also cheaper, and it's very elegant looking - the monochrome keyboard is, in my opinion, cleaner looking than the Apple product (although clearly modelled on it). It's weak points are battery life, and weight. It gets around 3 hours compared to 5 on the MacBook, and is 17 % heavier. The iPad 3G on the other hand - which is an almost identical volume is only 45 % of the weight of the Vaio, and has a 10 hour battery life. You have to try very hard to use up the battery on an iPad in a single day unless you spend all your time playing 3d games. This is very important for a more 'personal' mobile device that people will be using as an e-reader. So - although the Sony does \*look\* think and light, and is a truly great Windows laptop, it's qualitatively totally different from the iPad. Note - on Sony's site they quote a 14 hour battery life. If you look carefully, you'll notice that that only achieved if you attach a giant external battery which pushes the thickness and weight up dramatically. Having said that, the external battery is included in the price which makes this thing into a great deal, though one with a number of compromises.

seth (2010-05-11 21:32:58)

The iPad weighs much less than the VAIO? The Vaio Series X weighs almost nothing. Looking up stats I find Vaio < 700 g, iPad = 1.5 lb = 680 g, that is, the same. But I agree, the two products have much different uses and the iPad is more portable due to the longer battery life.

Glen Raphael (2010-05-12 10:28:21)

The iPad battery life is actually *too good* for comparison with general-purpose laptops. Had they been willing to settle for the usual 5 hours the product could indeed have been a lot thinner and lighter. But Apple wanted iPad to be an excellent e-book reader, which means the Kindle is part of the comparison set. Sony makes great super-thin laptops and has been doing so for more than a decade. The two minor nits I've had with the line in the past were: (1) those perfectly-flat perfectly-rectangular screens and bases can be a little fragile - prone to flex or break. (The Air's curviness probably makes it better in that regard) (2) one cost of all the sleekness tends to be a frequent need to plug in a mass of dongles or an extra battery to get Real Work done. Still, these are all great machines. And iPad is in many ways an odd compromise that might not be right for you yet.

Robin Barooah (2010-05-12 10:28:47)

Seth - you're absolutely right. I must have misread the figures for the Vaio. That makes it extremely impressive. It's worth saying though that the battery life isn't just 'more' - the reason why I used the word qualitative is that the effect of battery life doesn't just increase linearly - there are important thresholds that change the nature of the device. The iPad is in a different

category as far as this is concerned - you can safely rely on not having to charge it during the day, which means you never have to think about carrying a charger or planning your usage of it. That's one of the things that makes it interesting, because it enables different behavior. Sony realize this too - which is why they include the giant external battery. Given that there was clearly no way for them to get close to this in an ultralight laptop, this seems like a really good decision.

Anthony (2010-05-12 10:50:46)

@Robin, "the effect of battery life doesn't just increase linearly - there are important thresholds that change the nature of the device" Good point.

Vic (2010-05-12 15:38:05)

I bought a Vaio a few months ago, the top of the line f-series that just came out. The performance has been great, but I'm otherwise disappointed. The screen sucks (too dim), the battery life is listed at 3 hours, but often runs out after just over an hour of not that heavy use, the hdmi and vga cable are adjacent to each other so I can't plug both in at the same time, the fan is extremely noisy (which message boards indicate is a problem on all the recent Vaio's of my model type), and to get it repaired I have to deal with Sony's horrible customer support and ship in, meaning losing access to my computer for possibly weeks (simply not a viable option). Apple tends to get all the little things right.

Robin Barooah (2010-05-13 00:40:11)

I had a chance to handle one of those vaio x's tonight at the QS show and tell. It's pretty amazing and it does feel noticeably lighter than the iPad even though the difference is very slight. It's also very expensive for the spec - it has a single core atom processor and integrated graphics, so it's basically a netbook.

Stephen M (Ethesis) (2010-05-14 20:52:20)

I'll note that you can run dragon dictate on an iPad. I'm really curious how the next generation of iPads turns out, though it is, in many ways, a more functional itouch for people with old eyes.

Wayne (2010-05-18 14:51:13)

What posture were the two users adopting to interface with their devices? The problem with a laptop is that it's essentially a desktop with a convenient hinge joining screen and keyboard: you interface with it in the same way and with the same posture (and attitude) as a desktop. The iPad, by comparison, is addressed as you would a pad of paper, a book, a stack of photos, and that makes it much less "clunky" than mere size might indicate. I think that's the hidden feature of the iPad that many techie critics miss.

seth (2010-05-18 16:09:40)

Both users were sitting at cafe tables. The iPad is hunt and peck, a laptop touch typing. So if you're doing a lot of pointer movement stuff the iPad is much better, if you're doing a lot of typing a laptop is much better.

## **Preventive Stupidity Exists (2010-05-12 14:26)**

In [1]the world of Orwell's 1984,

To the end of suppressing any unorthodoxy, the [ruling] Party inculcates self-deceptive habits of mind to the inner and outer members, thus crimestop ("preventive stupidity") halts thinking at the threshold of politically-dangerous thought.

Three sayings popular in scientific discussions show that in our world, preventive stupidity exists – and works. In [2]a comment, Kim Ayhus has brought my attention to this.

1. Absence of evidence is not evidence of absence. [3]Ayhus explains why this is wrong. That such an Orwellian saying is popular in discussions of data suggests there are many ways we push away inconvenient data.
2. Correlation does not equal causation. In practice, this is used to mean that correlation is not evidence for causation. At UC Berkeley, a job candidate for a faculty position in psychology said this to me. I said, "Isn't zero correlation evidence against causation?" She looked puzzled.
3. The plural of anecdote is not data. How dare you try to learn from stories you are told or what you yourself observe!

Orwell was right. People use these sayings – especially #1 and #3 – to push away data that contradicts this or that approved view of the world. Without any data at all, the world would be simpler: We would simply believe what authorities tell us. Data complicates things. These sayings help those who say them ignore data, thus restoring comforting certainty.

Maybe there should be a term (antiscientific method?) to describe the many ways people push away data. Or maybe preventive stupidity will do.

1. [http://en.wikipedia.org/wiki/The\\_Theory\\_and\\_Practice\\_of\\_Oligarchical\\_Collectivism](http://en.wikipedia.org/wiki/The_Theory_and_Practice_of_Oligarchical_Collectivism)
2. <http://www.blog.sethroberts.net/2010/05/09/distinguished-scientists-fail-to-think-for-themselves/#comment-432095>
3. <http://kim.oyhus.no/AbsenceOfEvidence.html>

---

Jlonsdale (2010-05-12 15:51:26)

While these sayings are used incorrectly many times, there are good reasons these types of arguments are mentioned in public discourse. Rhetorical strategies in the public space often make use of really bad arguments that are countered by those sayings. Your annoyance is how much of a crutch these arguments are among people who should be arguing in good faith and at a higher level than average. 1. "Absence of evidence is not evidence of absence." This was a very useful concept to point out to those people who believed that because nominal national US housing prices had never dropped before that they wouldn't drop in the future. 2. Correlations are assumed to be causation in many cases where it is incorrect. People make arguments all the time that point out correlations, think up some mechanic that explains why the correlation is causation but fail to even consider whether the correlation is actually coming from an underlying factor driving both conditions. 3. Politicians always like to bring out a few people who would be really helped or harmed by the policies. Obvious examples include the widow in need of medical care for her sick kids or Joe the Plumber who would be caught in the higher tax bracket. Obviously there are places where arguments 1 through 3 work. So the main problem isn't about the arguments themselves, but that people use these responses when they assume the person is either arguing in bad faith or is relatively ignorant when that isn't the case. Furthermore, they often feel like 1 through 3 are enough to settle the question entirely when more argumentation is needed to make their point.

seth (2010-05-12 16:07:47)

"This was a very useful concept..." Sure, and  $1 + 1 = 3$  can also be a useful concept, "useful" in the sense of supporting a conclusion you want to reach. It's still misleading. If someone thinks housing prices will always go up, don't reply with a slogan, find some evidence that contradicts that belief. Reply with evidence. If you think Data X is misleading, fine. You might be right. If you're right, you should be able to present Data Y that points more conclusively somewhere else. In other words, misleading

data is best answered with more data – not sloganized away. Here's my anti-slogan: Data, not slogans.

jld (2010-05-12 23:24:31)

Shhhh, Shhhh, do NOT contradict the believers it makes them [1]dumber.

1. <http://www3.interscience.wiley.com/journal/123328312/abstract>

Alex Chernavsky (2010-05-13 04:13:24)

How about this one? "You can't prove a negative". That aphorism is false, as long as you assume that to prove something means to establish it to such a high degree of certainty that it would be perverse to withhold at least provisional acceptance.

Kim Å~yhus (2010-05-13 05:25:28)

Wow. I am honored. Still pondering that correlation-causation proof.

seth (2010-05-13 05:31:21)

Kim, thank you for pointing this out. Maybe I will be mentioning it for years to come. Orwell's book has lasted a long time and this was one of its main points. Alex, yes, "you can't prove a negative" is another example. I haven't heard it in a long time, though.

Alrenous (2010-05-13 10:33:19)

Can't you often convert an absence of evidence into positive contradictory evidence? For a hypothesis to have meaning, it must impart some prediction. Using miracle healings as an example, I would expect at least one properly documented departure from general clinical experience. Say, a cancer remitting faster than cancer cells can be absorbed by the body. That there is no such document (that I know of) contradicts the hypothesis. Am I missing anything?

Hal (2010-05-13 11:59:49)

But if we invert these we get even wronger maxims: 1. If something has never happened, it probably never will happen. 2. When two things happen together, one usually causes the other. 3. A few examples of something mean it usually happens. I can't help wondering if you are following these principles when you reach conclusions that seem incorrect.

Antongarou (2010-05-13 14:21:59)

No. 2 is actually true- correlation does not equal causation, but is a necessary(and insufficient) requirement for it- i.e. having only correlation or lack thereof you can disprove causation but not prove it. thus it isn't equal to causation although it is linked to it. no.1 and no.3 depend on the definition of "evidence" and the number of said anecdotes as well as the amount of data they contain(most anecdotes contain next to none).

Tom (2010-05-13 15:11:31)

When the general public hears or reads correlation, they are thinking it means a correlation near 1.0. Rightly or wrongly, to them a correlation of 0.0 is just random stuff happening. #2 is correctly used when you have two types of events that can, in fact, both occur because of an underlying cause, but do not directly cause each other. It may be that every time it gets hot I drink a beer and my dog drinks water, but in general, I don't have a beer every time my dog drinks water (it might be fun, but unproductive), and my dog does not feel the need to drink water whenever I have a beer. I use #3 whenever someone tries to tell me the equivalent of "the cousin of this guy that my friend's sister met on a bus" makes an assertion that is untestable / unimaginable / unmeasured. Anecdotes are stories, not measurements and yes, "How dare you try to learn from stories you are told or what you yourself observe" is a reasonable response in many cases. For example, hallucinations that are told to me or that I, myself, observe are no basis for the existence of ghosts or gods.

Charles (2010-05-13 15:15:20)

Hal, The claim is that the maxims are false, which means that their negation is true. So to properly "invert", simply negate the sentences and remove double negatives: 1. Absence of evidence is evidence of absence. 2. Correlation equals causation. 3.

The plural of anecdote is data. #1 is amenable to logical proof as shown. #2 is false on its face, but the obvious implication from the discussion is not that the statement is false per se, but deployed as code for something that is in fact false. If #3 is false I'm not sure why people continue to do case studies.

Nate Stearns (2010-05-13 15:30:18)

You know, I really appreciate the post because it's made me think. I have said all 3 of those and I want to rethink why I do. Now, you suggest I'm doing this in order to push away data I don't like. I don't think I am (of course, cognitive bias being what is I wouldn't, would I?). In Saying 1, I'm trying to make the point that not having any good data or examples doesn't necessarily mean it's so. But, at least, I should say that it's not PROOF of absence. Except now I have to sortof believe in elves. In saying 2, I'm talking about how post hoc logical fallacy which can at least be suggestive if not proof. In the last, I think we're really trying to make the point that just because you had an experience and someone else did too, that doesn't mean that you're done. Is that slogan too vague to mean that an n of 2 or 3 ain't enough?

ShaneS (2010-05-13 15:39:30)

As a general rule, I like your posts, but this one bothers me. There are many excuses and tricks people use to alleviate cognitive dissonance. These three are no worse than any other, and are in fact actually useful logical tools - unlike many of the the other ways. I REALLY don't like the criticism of 'plural of anecdote' - because it is painfully true, and it points out a MAJOR weakness in human cognition. We ALL tend to over estimate the prevalence of opinions and ideas that we hear often - whether we agree with them or not. We have the same problem in risk assessment. Ask most people whether they are more likely to be struck by lightning or die in a terrorist attack. We hear more about child abductions so they must be on the rise - also not true. It has \*nothing\* to do with learning or not learning from your experiences. It has everything to do with making sure what you do learn is both useful and true. It is a defense against over-generalization, and a reminder that 'most of the time' needs only happen 50.1 % of the time to be true.

Scatterbrane (2010-05-13 15:48:17)

Alrenous, I believe that applying the saying to controlled experiments would rather strain its heuristic value. All of these pearls of wisdom would likely have the word "necessarily" in there if not for simplicity's sake. Even the more universally accepted heuristics produce absurd conclusions when taken to their logical extreme, that applies doubly to these rules of thumb.

Ryan (2010-05-13 16:33:02)

A few comments on each point: 1. This can be usefully deployed in discussion when evidence is lacking and there hasn't been much (or any) effort to find evidence. If you have evidence of everything, then sure an absence of evidence is evidence of absence. We don't live in that world. This also really hinges on your ontology and on what kinds of physical traces you expect to find from the thing that you argue exists. 2. This is true. A correlation between two variables does not necessitate a causal link between them. The fact that causation requires correlation is irrelevant to the previous point. I am shocked that the candidate didn't realize this. To make this more concrete, umbrellas opening do not cause barometers to dip and low barometer readings do not open umbrellas, even though the correlation between them is close to 1. 3. The plural of anecdote isn't data because data assume some standardized way of gathering or collecting the individual datums. If your anecdotes are all comparable, then the plural of those anecdotes is data. In most cases this isn't true. This, however, does not diminish the role of case studies (as someone above mentioned). They can excel in areas where large-n studies fail, such as handling complex causal processes. Case studies can also use process tracing to get at causality, which is often hard to do in large-n work. I agree that everyone should be open to information that contradicts their worldview or their theories, but in making that point you radically misinterpret some very good advice.

C. Scyphers (2010-05-13 17:08:40)

Actually, I have to quibble just a little bit on number 3: "3. The plural of anecdote is not data. How dare you try to learn from stories you are told or what you yourself observe!" This reminds me of comment attributed to Pauline Kael (erroneously, but the point still stands) when Nixon was elected; "I don't know how Nixon won. No one I know voted for him." Just because the stories you are told (else how would racism ever end when dealing with racist communities) or what you yourself observe (pick

your favorite bigotry here) all say one thing does not necessarily make it true. At the same time, if the standard of truth is to be an empirical measurement of all possible data points, nothing will ever be decided. I suppose that's the failure of aphorism...

aaa (2010-05-13 17:15:11)

Then if (or rather, since) #1 is not true, Orwell is twice right, or rather his evil alter-ego, the character O'Brien & his Inner Party of Ingsoc. I can destroy the evidence, and CREATE the absence. "Collective Solipsism, if you like...."

seth (2010-05-13 18:10:19)

Ryan, you write that these three slogans are "very good advice." The underlying message of all three is "shut up". I believe that is almost never good advice. Perhaps you can supply an actual example – not a made up one – where one of these three slogans was said and was "very good advice"?

WHITE DRAGON (2010-05-13 18:19:45)

Comment on Seth observations 1) It is..... 2) It is not..... 3) It is..... 'Preventive Stupidity' is a real thing and can be found in all Red states.

fmwoodward (2010-05-13 19:20:57)

correlation is a necessary but not sufficient condition to indicate a causal relationship. Lack of correlation is pretty good evidence of the null hypothesis. Multiple anecdotes do not equal data. Data are the result of experimental observation under carefully controlled, repeatable conditions. Unless you are a social scientist where data consists of careful observation of multiple anecdotes.

pjcamp (2010-05-13 19:21:29)

It is true that zero correlation is evidence against causation. However, it does not follow from this premise that nonzero correlation is evidence for causation. A implies B does not mean that not A implies not B. The plural of anecdote is NOT data. Data is rigorous. Anecdote is random. But in between lies observation, semistructured and containing hints about how to obtain data. Kim Åyhus is wrong as he assumes that absence of evidence is the same nonexistence of evidence. This ignores the possibility that evidence may not have been looked for yet, or may not have been looked for in the proper way. When one is trying to prevent stupidity, one should avoid being stupid oneself.

chuko (2010-05-13 19:51:32)

Seth, it doesn't sound like you're listening to what people are saying. The first commentator is absolutely right. At least numbers two and three are simple admonitions against poor reasoning. I'm sure that some people are saying 'shut up' when they say these things, but certainly some people are saying 'maybe you should be a little more careful in your thinking.'

Seth Roberts on Orwell's "preventive stupidity" – Boing Boing « Firesaw (2010-05-13 20:01:40)

[...] Preventive Stupidity Exists via boingboing.net [...]

RevWubby (2010-05-13 20:28:18)

I can understand what you're trying to say with #1 and #2, but your objection to #3 has a serious problem. It's that there are 2 huge things stacked against our ability to know the truth through simple personal experience: Flawed perceptions and selection bias. Before you dismiss flawed perception, go research the reliability of eye-witness testimony and the malleability of memory. We absolutely SUCK at understanding and processing what we experience and constructing accurate models based on them. Really. It's more likely that any memory you have is more wrong than it is right, no matter how accurate you THINK it is. Selection bias forces us to think that what happens to us is somehow common, even if we know it isn't. Our brains are in no way required to get things right, only just right enough to not die (poison plant, man-eating beast, location of cliff etc.). That includes an enormous amount of false information. We just aren't adapted to create correct assumptions. These glib (and occasionally inaccurate) sayings are just shorthand ways of pointing out common errors in the ways we judge evidence. They are only useful if the people using them actually understand what they expand to mean. They only being to sound Orwellian if

repeated like a mantra or a magic spell, devoid of meaning and thought.

Vic (2010-05-13 21:12:49)

Say what you will about some of Seth's posts, he does attract interesting commentators...

Ben (2010-05-13 21:16:54)

Sorry Seth, I disagree. These are useful heuristics, along with Hume's and Occam's razors. I think of them as a primary level BS filter. For example: so you've invented a perpetual motion machine, Seth? Interesting. Sounds like complete BS but I'm prepared to entertain the very slight possibility that you have actually discovered something unusual. Knock yourself out - show me the data. Get your results replicated. Mix, repeat, collect your Nobel. But until you do, don't expect me to believe you just because the fact that nobody else has managed to do it somehow implies that your solution must be correct one. The underlying message of these things is not about 'shutting up', it's about not fooling oneself - with yourself being the easiest person to fool, to paraphrase Mr Feynman. Humans are fallible, unreliable and biased. This is why scientific method is used and why science is superior to 'other ways of knowing' in trying to understand how the universe works.

Ryan (2010-05-13 21:49:13)

Seth, I've never really interpreted these slogans as saying "shut up." They just seem like things that you should keep in mind when you are working. Sometimes people run a regression (to find a correlation), see the result they expect, and then make a leap to assume that they have found a causal relationship. I can't think of a specific example right now, but this kind of mistake shows up frequently in undergrad and grad student work and I know I have noticed instances of it in major journals. If you truly find that hard to believe I can dig up a specific example. I can't help but notice that you didn't actually respond to any of my three critiques. If your claim is that people can use these slogans to silence other people, or reduce the prestige of competing work, or block out information that doesn't fit their worldview, then I agree. These slogans can be used poorly and their effect can be negative. Maybe I am just young, but I haven't had these phrases used against me (yet) and when I have heard them I really have found them useful. I have learned from having people point out if I jump from correlation to causation. I have also learned from people challenging me on the generalizability of my findings ( #3). I think that, like so many things, in the right hands these slogans can be used positively and in the wrong hands they can be used negatively. However, logically, I think that they are far more neutral than you are letting on.

seth (2010-05-13 22:09:56)

Ryan, you write: "Sometimes people run a regression (to find a correlation), see the result they expect, and then make a leap to assume that they have found a causal relationship. . . . I know I have noticed instances of it in major journals. If you truly find that hard to believe I can dig up a specific example." Yes, please dig up a specific example. I'm guessing that when you look closely at your example, you will see that the researchers did not "assume they have found a causal relationship" but rather "assumed [usually reasonably] they have found evidence that makes more plausible a causal relationship." There's a big difference. Ben, you say these are "useful heuristics". Could you give an actual example? I gave two examples that supported my points. One was Kim's experience, where "absence of evidence . . . " was used to ignore a perfectly good point. The other was the case of the job candidate, where "correlation does not equal causation" had led a very smart and accomplished person into misunderstanding how correlation and causality relate. To other critical commentators: let me repeat, I gave examples. Not hypothetical ones, stuff that actually happened. None of you has done so. Of course I might be wrong but data-free arguments aren't going to convince me of that, nor should they. Where's the data? That's another problem with these slogans: They encourage data-free argumentation.

Ryan (2010-05-13 22:46:03)

Okay, here is one quick example of how someone could have used a reminder that correlation is not causation (I just googled "example of correlation and causation mixup" and then started reading). In 1999, Nature published an article by Quinn, Shin, Maguire, and Stone entitled "Myopia and ambient lighting at night". The general claim was that children that have lights on at night are more likely to develop myopia. Other later studies found that what was actually happening was that parents who were nearsighted were passing that on to their children. By coincidence, parents who were nearsighted also were more

likely increase the light in rooms at night”because they have poor eyesight. You can read about the later studies here: <http://researchnews.osu.edu/archive/nitelite.htm> This is an excellent example of how, while ambient light and myopia in children correlate, it is wrong to assume causation. The original result was published in Nature. You do seem rather aggressive on this, so I can't help but push back and ask you to respond to my original points. Do you really think that, given the world of imperfect information that we live in, absence of evidence is consistently evidence of absence? Do you actually think that your rebuttal to the job candidate said anything about the logically necessary relationship between correlation and causation? Do you really think that data is nothing more than a collection of (unsystematically gathered) anecdotes? Again, I understand how these slogans can be used negatively, but I think you are very wrong to call them "preventative stupidity" and I feel bad that you have obviously spent a lot of time dealing with closed-minded researchers. These slogans contain important lessons and they can be used well.

Ryan (2010-05-13 22:53:26)

Another weird point that I noticed as I skimmed the comments, is that you are demanding data as evidence for arguments that are often based on pure logic. I would like to see you give me a data-based proof for  $1+1=2$ . It isn't going to happen. I'm starting to worry that you are intentionally misrepresenting people's comments in your responses.

Ben (2010-05-13 23:08:24)

Seth the utility of each one of those heuristics is demonstrated by counter-examples: The anti-vaxers who are convinced that autism is caused by vaccinations. The AIDS denialists who believe that HIV does not cause AIDS. The 911-truthers who think the US government blew up the twin towers as part of some arcane conspiracy. AGW contrarians who think that blog science trumps 150 years of physics.

Tim (2010-05-13 23:24:02)

Hi Seth, I do really like the general argument you make here but I have to chime in with some more support for 'correlation does not equal causation' being not only good advice with a proper understanding of its true meaning, but also logically true. In your example the main problem seems to be that the person has an educational level which should allow them to differentiate between "absence of correlation IS absence of causation" and "correlation does not (always) equal causation". The implied 'always' is the big clue here. She should have known better. By contrast a young child could draw the conclusion that birdsong brings the newspaper which is a clear example of causation and correlation being different. By pointing out that the same cause (the sun rising) brings both effects you encourage them to think more deeply about problems. In fact 'correlation is not causation' should be used to encourage greater data gathering rather than a cessation. If there is a correlation it is a great idea to determine if it's causal or resulting from an additional extra cause. The third paragraph of the relevant [1]wikipedia article gives a very good clinical example of why correlation should be further examined to discover if it is or is not causation. Tim PS. I'm also forced to point out that your 'example' is an anecdote and not data. By your own third point it is merely a chance to go explore new data ;)

1. [http://en.wikipedia.org/wiki/Correlation\\_does\\_not\\_imply\\_causation](http://en.wikipedia.org/wiki/Correlation_does_not_imply_causation)

Tim (2010-05-14 00:22:23)

PS. I just realised that I misread your third point so my PS up above is wrong. Whoops. Sorry!

Kim Å~yhus (2010-05-14 00:28:30)

Pjcamp, you have misunderstood my proof a little. Even though absence of evidence and nonexistence of evidence are different, they look the same, and give the same conclusion in my proof. This is good, because it is more general. Since it is a proof, it is true. There are only 2 things to do to get knowledge: 1. Gather more data. 2. Get better explanations, models, theories. (These are fundamentally the same) When people do neither, I take this absence as evidence they have nothing to contribute. This may be the sanest discussion I have seen involving my proof. The usual reaction is to arrogantly misunderstand it, claim faith is better than proof, etc.

[citation needed]» Blog Archive » in defense of three of my favorite sayings (2010-05-14 01:25:09)

[...] Seth Roberts takes issue with three popular maxims that (he argues) people use "to push away data that contradicts this or that approved view of the world". He terms this preventive stupidity. I'm a frequent user of all three sayings, so I suppose that might make me preventively stupid; but I do feel like I have good reasons for using these sayings, and I confess to not really seeing Roberts' point. [...]

Buster (2010-05-14 01:46:49)

I have used #2 on multiple occasions and always as a response to conclusion-jumping. Mostly in response to arguments such as (and I do not quote directly ) "People of specified ethnic group(s) are overrepresented in the statistics of criminal act X; therefore persons of said ethnic group(s) are more by nature prone to commit said act." Persons using this line of argument almost always have a political agenda attached to it that is fundamentally not based in fact but in emotion. They focus on one factor that suits that agenda and ignores all other data. They are not interested in other correlations that disproves the importance of the ones that support their agenda. And because they already know what results they wish to find, their logic will always be corrupt. One augmentation one could propose is "Correlation does not equal causation but is a cause for further open minded inquiry." To use a completely different example where correlation = causation leads to faulty conclusions I would like to mention the phenomenon of the Cargo Cult. [http://en.wikipedia.org/wiki/Cargo\\_cult](http://en.wikipedia.org/wiki/Cargo_cult)

Scott (2010-05-14 01:47:49)

I believe all three of these statements can be valid as arguments in themselves. They are absolutely not proofs of one thought, nor do they read as such: 1. Absence of evidence is not evidence of absence. Just because you haven't seen evidence of something doesn't mean it doesn't exist - it still might. This is a valid argument. 2. Correlation does not equal causation. Just because a particular scenario exists in some circumstances along side another scenario does not mean that the one caused the other - although this is possible, it's mere correlation does not warrant proof of causality. This is a valid argument. 3. The plural of anecdote is not data. By definition, anecdotal evidence cannot be used as data, at least as far as any scientific study is concerned because by the very definitions (which may vary slightly by source, this set gathered from wikipedia for expedience although more traditional sources will still support my argument): - (1) Evidence in the form of an anecdote or hearsay is called anecdotal if there is doubt about its veracity; the evidence itself is considered untrustworthy. - (2) Evidence, which may itself be true and verifiable, used to deduce a conclusion which does not follow from it, usually by generalizing from an insufficient amount of evidence. If your argument is that anecdotal evidence is just evidence that has not been set in a laboratory environment then perhaps enough of it could be used as data but the term data means groups of information that represent the qualitative or quantitative attributes of a variable or set of variables. Being 'anecdotal' means colloquially that the data has no compensated or measured qualitative or quantitative measurements to put with other 'data' in order to reach a conclusion. I believe you have a very valid argument that these three errors in logic are misused to dismiss data that could very well prove valid. I also believe that your argument against them swung the pendulum too far in the other direction by basically stating (unless I misread your intentions) that anyone who uses these as fallacies of logic has missed the point and is incorrect.

Dan Kaminsky (2010-05-14 02:39:10)

I've been thinking about this all night, and I've finally come to a recognition of what you're experiencing: The missing negative. Suppose, if you will, that you have a thousand hypothesis' guided by absence of evidence. When you stop to collect data, will you see evidence of absence at a statistically significant rate? Suppose, if you will, that you recognize a thousand correlations. Upon further analysis, will you see that a statistically significant number of them are causations? Finally, listen to a thousand n=3 unstructured and uncontrolled stories. Upon actually generating solid experimental data behind all one thousand, how many of the stories will be significantly shown to have reflected reality? You'll note that I'm not telling you the answers to these questions. But this is the path you should be considering. The problem with following absence of evidence, correlation, and anecdote is that when you actually do get data, the agreement rates are simply not high enough. Prediction rates are too low. I may be the first person ever to tell you you just weren't sufficiently meta :) (That being said, all three are very good tools for forming questions and hypothesi.)

C Solberg (2010-05-14 04:36:20)

On the "correlation is not causation". As many others have noted correlation CAN be a necessary, but insufficient condition of causality. However correlation only reliably detects linear relationships, so there are good reasons to deny that correlation = causation. Over on Boing Boing someone brought up the example of the relationship between "human ability to live" and "levels of oxygen". At low levels of oxygen the ability to live is low, at medium levels it is high, and at high levels it is again low. There is a perfectly causal relationship between levels of oxygen and ability to live, but no linear relationship. And the same goes for every non-linear relationship you can care to think about.

Jason Olshefsky (2010-05-14 04:57:51)

It took me a while to untangle the negatives to make sense of this post (i.e. "'correlation does not equal causation' is not true".) What I found was that by spinning them into simpler truisms made more sense (although my logic terminology is very very rusty): 1. Absence of evidence is evidence of absence. 2. Causation implies correlation. (That is, causation -> correlation; therefore (no correlation) -> (no causation) but correlation does not imply causation.) 3. Data (deliberately collected information) is stronger evidence than anecdotes (arbitrary information). They are all intertwined as well, which I think confuses the lay person. Anecdotes can refute causation but not correlation: causation requires stronger evidence than correlation. Thus, anecdotal evidence does not refute evidence of absence. Because data is stronger evidence than anecdotes, absence of anecdotes alone is poor evidence of absence.

A handful of things to ponder – Orrill Reports (2010-05-14 05:32:26)

[...] Preventive Stupidity Exists, which linked to a page titled "Absence of Evidence" (containing a proof that I can't follow) and the inevitable comic that all this reminds me of. [...]

seth (2010-05-14 06:26:16)

Kim, very well put about the two ways to increase knowledge. I completely agree. Ryan, I looked up your example – the paper where you say the authors "could have used reminding" that correlation does not equal causation. Here's what that paper concluded:

Although it does not establish a causal link, the statistical strength of the association of night-time light exposure and childhood myopia does suggest that the absence of a daily period of darkness during early childhood is a potential precipitating factor in the development of myopia.

The authors didn't need reminding.

Sam Fent (2010-05-14 07:00:28)

Seth:

"Ryan, I looked up your example – the paper where you say the authors "could have used reminding" that correlation does not equal causation. Here's what that paper concluded: [...] Perfectly good conclusion."

But this is still an example where correlation did not imply causation, and the author's conclusions, however hedged, turned out to be wrong. A more scientific approach would have been to publish the paper saying that there was a correlation, nothing else, and then start a study to find out whether the link was actually causal, or whether there was a separate underlying cause. Your "gotcha" question to the job candidate still isn't remotely valid. What the job candidate \*should\* have said, if she had been on her toes, was "No correlation may imply no causation, but that doesn't prove that correlation implies causation. Correlation may be a necessary feature of causation, but it is not a sufficient feature. Since it's necessary, we can say that the absence of correlation implies the absence of causation, but since it's not sufficient we can't say that correlation implies causation." To put it another way, being able to read does not imply that one is a tenured professor. "But," you say, "doesn't \*not\* being able to read imply that one must \*not\* be a tenured professor?" Yes... but that still doesn't suggest that being able to read implies one is a tenured professor.

seth (2010-05-14 07:44:17)

Sam, the authors didn't need reminding that "correlation does not equal causation". Contradicting what Ryan said.

Jen (2010-05-14 08:40:39)

I like the term "data deniers"

Michael Bishop (2010-05-14 08:51:22)

[http://lesswrong.com/lw/ih/absence\\_of\\_evidence\\_is\\_evidence\\_of\\_absence/](http://lesswrong.com/lw/ih/absence_of_evidence_is_evidence_of_absence/)

Ryan (2010-05-14 10:14:29)

I fear the post I just typed was lost in the aether. I'll try again. Dambisa Moyo's book *Dead Aid* is another good example of mixing up correlation and causation. Here are two reviews from across the political spectrum that mention the issue: <http://www.opendemocracy.net/article/dead-aid-review> [http://www.prospect.org/cs/articles?article=is\\_foreign\\_aid\\_a\\_bad\\_thing](http://www.prospect.org/cs/articles?article=is_foreign_aid_a_bad_thing) Her basic problem is that aid can cause poverty (or low savings, or low economic growth) or respond to poverty. An OLS regression won't tell you what is going on, and she make a very forceful argument for causation from this correlation. It is interesting to note that in the introduction Niall Ferguson distances himself from Moyo, "The correlation is certainly suggestive, even if the causation may be debated." Moyo should have been reminded that correlation  $\neq$  causation. For a contrasting take, here is a responsible scholar reviewing the state of the literature: <http://www.cgdev.org/content/publications/detail/2745>

seth (2010-05-14 15:15:43)

Ryan, I believe Moyo knows quite well that "correlation does not equal causation". To convince me that the saying is helpful, please give an example – a case where it was used and seemed helpful. In my experience, someone makes a good point, well aware that a correlation doesn't prove causation but does increase its plausibility (e.g., the ambient lighting paper), and then someone makes this data-denying comment. No help at all. If I say " $1 + 1 = 2$ " and you say " $1 + 1$  doesn't equal 3" it isn't helpful.

bennetta (2010-05-14 20:39:47)

"Absence of evidence is evidence of absence." Reading the proof involving this has had me going for the past few hours. Let me provide two personal academic experiences that go both ways in favor and against the claim. When I was in law school, absence of evidence was evidence of absence. This is also true for legal practice. If you do not have evidence to back up your accusation, then your accusation is false. The reasoning behind it is obvious. But when I was an undergrad in Philosophy, we were taught to think that absence of evidence was, well, (usually) absence of evidence. Take the question of evolution vs. creation. The last class I took as an undergrad dealt with ethics, religion, and the human experience in general as evolutionary constructs. We read David Sloan Wilson (*Darwin's Cathedral*), Kim Sterelny (*Thought in a Hostile World/The Evolution of Human Cognition*), that sort of thing. The instructor was absolutely clear that lack of evidence did not exclude possibility. Yes, it is technically possible that we were created in seven days by a divine being. Similarly, it is technically possible that giant, purple monkeys are floating around the dark side of Pluto. But is either probable? Probably not, when you look at the body of evidence, so we will assume, for the sake of the class, that evolution is correct. We were taught not to exclude either the as bona fide fact, but to "place our chips" on probability, not possibility. This was especially true for Epistemology. Perhaps the instructor was just making a PC move to make the class sound more palatable to creationists. I am not an instructor, but I am sure there was also some conditioning going on in both cases. Law school professors condition their students to think one way, because it's how the profession works. Same thing with Philosophy professors. I can also see the benefits of the practical approach of the law vs. the speculative approach of Philosophy within each discipline. The former approach efficiently cuts out all the junk in a no-nonsense fashion, while the latter opens the gate for all sorts of wild speculation, much of which could be false. The former approach also distills the most "useful stuff" out of the "information sludge." So if one of the goals of science is to provide useful, applicable information, it is preferable to scientists to think like a lawyer, rather than a philosopher. I can also see the truth to the law school approach. If someone says there is a cat in my room, and I search my room thoroughly and find no cat, then there is no cat in my room. But conversely, there are also these things called externally unverifiable truths, questions that can't, by their very definition, be currently proven outside of any individual, questions like life on other planets,

God, etc. All externally unverifiable claims are false under the law school approach, even if they aren't false, regardless of how rational they may be. So, doesn't the truth of "Absence of evidence is evidence of absence," or "Absence of evidence is not evidence of absence," boil down to the goals of the actor? Don't you adopt one stance or the other depending on what you are trying to accomplish? Isn't it just a matter of functionality?

James (2010-05-14 20:47:28)

Buster above gives real world examples of how mistakenly thinking that correlation implies causation leads to real human misery. People usually use statement #1 to justify their belief in God, people may sometimes use statement three to ignore useful data (though it seems more like a snarky response to someone pointing out that their grandparents all smoked and never got cancer), but honestly statement #2 is the proper response to a logical mistake that people make all the time and is very literally true. Examples in real life abound, watch FOX News for five minutes. You say that it is important not to apply these statements liberally because we use them to ignore data that does not fit our world view. Statement #2, however, does not say anything about data, it says something about the conclusions being drawn from data. The comments here contain multiple anecdotes of real life mistakes being made and harm being done by believing that a correlation was a causation. If these multiple anecdotes are data (not #3) then should this be evidence that the statement is a useful reminder? Or is this data too inconvenient for your world view?

seth (2010-05-14 22:14:59)

"Buster above gives real world examples." Buster's second example – about Cargo Cults – is irrelevant. Of course people sometimes draw conclusions from correlations (doing X might help) that turn out to be wrong (doing X doesn't help). It would be unwise not to test our imperfect conclusions. By testing them, we learn. In the first case (racial differences) I have no idea what happened after Buster said what he said. So it's hard to tell if what Buster said was helpful. (I claim these three sayings aren't helpful.) Did Buster use the saying to push away data he didn't like? Possibly. Another problem with these examples is that neither of them involve "scientific discussion" which is what I'm talking about here. bennetta, I think it's unfortunate that your philosophy professor didn't teach you that absence of evidence for X reduces the plausibility of X, in the sense that the greater the absence, the lower the plausibility. Your belief in X can start off anywhere – high, medium, low. But as absence of evidence increases – as more time passes, for example, without evidence for X showing up – your belief in X should go down. This is one of the points made on Kim's webpage. I haven't seen it made elsewhere.

Mr. Topp and the Big Bad Blog » Links, with more Star Wars than usual (2010-05-15 03:13:38)

[...] Orwell's preventative stupidity does exist. [...]

Cedar Riener (2010-05-15 10:34:10)

I think the problem is that these sayings are used in different ways by different people. For a working scientist, each of these is a request for more data, or more information about the current data. It often reflects considerable background knowledge about the particular things being measured. In the myopia example above, a discussion about correlation and causation does involve the logical implication of a correlation between night light and myopia, but this is also in the context of what these scientists know about the mechanisms of lens and corneal distortion, and genetic mechanisms in eye development. The same goes for "the plural of anecdote is not data" – scientists certainly use anecdotes in reasoning as any other human does, but they use these as inspirations for controlled experiments. Much of psychology begins with a skepticism of common sense (I know Seth knows this, but others might be interested in Stanovich's *How to Think Straight about Psychology*, or Lilienfeld et al's recent *50 Great Myths of Popular Psych*). So, I think each of these aphorisms can be deployed as requesting more data (or more information and context about the current data), reflecting the skepticism of science. But the danger is when moves from a skeptic, who is dubious, but able to be convinced, to a cynic, who uses these sayings to dismiss all correlations, anecdotes, or absences of evidence as equally meaningless. When these sayings are wielded by a cynical layman (or sometimes even a cynical scientist) they can lead to preventive stupidity. The way I try to handle this in the psychology classes that I teach is to first try to get students to be skeptical (using at least the second two of these sayings). But then (and this usually has to wait until senior year, both for knowledge, and for maturity) try to get them to see that all correlations are not equally lacking in causative indication. For example, comparing the correlations between IQ on identical and fraternal twins raised together and

apart, does let you know a bit about how complex the nature and nurture question is when it comes to (at least this particular kind of) intelligence. But to evaluate these correlation is not a purely logical exercise, but one which needs a fair amount of background knowledge.

Tom in TX (2010-05-15 13:31:48)

Regarding 2: If A and B are correlated, then there are several possibilities: a. A causes B. b. B causes A. c. There is some C that causes both A and B. d. There is no causation. It is just a coincidence. If, for the sake of argument, the correlation looks good enough to exclude d, then, yes, you can say that you have reason to think there is causation. But the mischief enters when you decide what causes what. Some cases might not be too hard. Does the rain cause the umbrellas to appear? Or do the umbrellas cause the rain? Or do weathermen cause both the rain and the umbrellas? Even experts can have trouble in harder cases. Gary Taubes discusses one in Good Calories, Bad Calories in the chapter on the Conservation of Energy:  $\text{Energy stored} = \text{EnergyIn} - \text{EnergyOut}$ . The left side of the equation correlates with the right side (and correlates *\_very\_* well, since they are always equal). But everyone jumps to the conclusion that the right side *\_causes\_* the left side. And thereby we get a whole bunch of diet-and-exercise advice that doesn't seem to work very well. We could think of a bunch more examples involving global warming and economics and so forth - some silly, some serious. Just knowing that there is *\_some\_* causation doesn't settle much. Thomas Aquinas said almost a millennium ago that every event is caused by another event. The correlation seems very good - events seem to always happen right after other events happen.

seth (2010-05-15 14:57:07)

Cedar, I agree that teaching students that correlations vary in persuasiveness is a good idea. If everyone who said "correlation does not equal causation" could name 10 important research projects that began with the observation of a correlation . . . the world would be a better place.

Dan Kaminsky (2010-05-15 18:32:39)

Seth, If your slogan is data, not slogans, why are you proclaiming the value of an absence of data? Burdens of proof matter. The problem is that there are a tremendously large set of things for which we lack data. It is tempting to convert that into an information source - well, we don't know that the core of the earth isn't, in fact, made of giant radioactive turtles - but down that path comes insufficient predictive powers. Your problem is you see the world through too clear a lens. Bear with me a for a moment. You're a really smart guy (and I enjoyed your diet, btw). Your experience of absent evidence comes only after a presumption that, were certain things to be true, there would be specific things present. So you're seeing violated predictions, which is not actually the same thing as absent evidence. It's similar for your experience of correlations and anecdotes. These things are preconditions for your entire processing framework. You've *\_already filtered out\_* the useless correlations and anecdotes, a massive number of which could simply be dumped into this comment thread. And that's OK. Without course grain loose data to guide us, we'd never be able to form a useful hypothesis to test. Exceedingly noisy data has its uses. What you're missing is the alternate universe, where the burden of proof is shifted, where correlations guide policy, where one person's story is enough to guide the reality we operate in. That world sucks, Seth. Consider the situation of alternative medicine. Some of it works. Damned if we have any idea what - there is so much noise pretending to be signal. What you're missing about the alternate universe, specifically, is that not everybody is you, and there's an infinite set of unevidenced correlated anecdotes that *\*you'd\* filter* and *\*they\* wouldn't* that *\*the truth\* would have to compete with*.

Ryan (2010-05-15 22:30:23)

Seth, I am glad that I pursued this because I think I have found at least one core point of disagreement between us. Let me see if I state your views clearly: You think that correlation says something about causation because causation requires correlation. You think that finding a correlation between X and Y can make us more confident that X causes Y (than we were before finding the correlation). On this particular issue, what bothers me is that finding a correlation between X and Y might make us more confident that X and Y are related, but it says absolutely nothing about causal order (or spuriousness). Moyo uses a correlation (poverty/low savings & foreign aid) to argue for causation. You could just as easily use the same regressions to argue that poverty causes aid to increase, because aid is intentionally directed at poor countries. So, while finding a correlation should increase our confidence that something is linking X and Y together, it should not increase our confidence that X causes

Y, because it adds an exactly equal amount of evidence to the argument that Y causes X. This is why we can't move from correlation to causation. Obviously, pointing this out is useful a starting point instead of an ending.

seth (2010-05-16 00:13:00)

Ryan, I'm afraid this is beside the point – I was writing about whether sayings such as "correlation doesn't equal causation" are helpful. Not about what can be inferred from correlations. But you're right, we do disagree here. Let's say X causes Y. Then usually we would expect them to be correlated. We start with four possibilities: X causes Y, Y causes X, both are caused by something else, and X and Y are unlinked. When we observe lack of correlation it reduces the plausibility of X and Y are unlinked. The plausibilities of all 4 events must add to 1. Reducing one of the four must increase the sum of the other three. Thus unless we're sure of an alternative explanation for the correlation, observation of the correlation should increase the plausibility that X causes Y.

Dan Kaminsky (2010-05-16 03:18:39)

seth– If I may distill your argument, "Since lack of correlation makes causation less likely, correlation must make causation more likely." Here is another logical statement in this family: "Since I am not drowning, it is more likely that I am flying." Yep. That is entirely true. It is more likely. Very, very, microscopically more likely. And there's your problem right there: You are allowing any increase in confidence to imply plausibility, no matter how small. And that, unfortunately, is untrue. Consider, for a moment, the number of metrics in the universe right now that have increased in the last year. They are all correlated, Seth. They are not all causative. In fact, the odds that any two randomly selected correlative metrics have even a remote chance of being reflective of a causative relationship is infinitesimal. Now, you can filter your correlative sets, looking for those where a relationship is plausible. But – and here's the key – the plausibility doesn't come from the correlation. The plausibility comes from the fact that you're a really smart guy, with a theory of the world, against which you can compare sets of relationships. It is your theory that allows you to know where to look, to design your experiments. Mere correlations are rough filters. It is in fact the case that there are more metrics overall than there are correlative metrics. But it is a very, very, \*very\* low quality information source – good for exclusion, but wayyyyyyyyy too conflated for inclusion.

David (2010-05-16 13:58:04)

And "preventive stupidity" is data, and not a slogan, right? :-)

seth (2010-05-16 14:13:55)

"preventive stupidity" is an anti-slogan. A slogan antidote. Fight fire with fire.

Good Sunday Night Listening « Theory to Practice (2010-05-16 18:59:48)

[...] Along that line of thinking, check out Seth Roberts' recent, relevant, and most excellent posts here and here. [...]

Sam Fent (2010-05-17 13:50:54)

Seth: The problem seems to be that you think that "Correlation does not imply causation" is a useless slogan because scientists already know that correlation does not imply causation. However, the fact is that many non-scientists also read studies, see correlations and then leap to "causations." Such non-scientists may be people in decision-making positions, such as legislators and educators. When faced with arguments assuming causation when there is only evidence for correlation, I think that reminding people of the slogan is useful. For instance: there are numerous statistics that show a correlation between increased helmet usage and increased bicycle accidents. This has lead many people to assume that wearing bicycle helmets causes accidents. An example can be seen at <http://www.ctcyorkshirehumber.org.uk/campaigns/velo.htm>. The authors cite the statistics showing the correlations, mention in passing that there could be other causes for the increase in bike accidents (such as increases in ridership), yet still go on to state multiple times that "evidence shows helmet use increases the accident rate." No, the evidence cited does *not* show that helmet use increases the accident rate, and yet this is a serious legislative campaign that may seriously affect bike helmet laws. (Whether one agrees with bike helmet laws is irrelevant with respect to the science involved.) In a similar vein (this time from Freakonomics): after studies showed that there was a strong correlation between children's test scores and the number of books in a child's home, then-Governor Blagojevich announced a plan to

send every child in the state one book a month until they reached kindergarten, apparently under the assumption that the physical presence of books in the home would actually cause the children to become smarter. Again, a time when the mistaken assumption that correlation implies causation almost had large legislative effects. (Again, one might agree with sending books to children's homes, but one should not conclude from the correlation studies that the books might make the kids smarter.

seth (2010-05-17 14:32:37)

Sam, when Person Y says "correlation does not equal causation" to Person X, it's above all Person Y who is made stupider. Person Y is made stupider because he responds with a slogan rather than something substantial. I believe butter is good for us. If you eat margarine, it's bad because it prevents you from eating butter. In your two examples, let me suggest that in the first case the writers knew perfectly well that correlation doesn't prove causation and in the second case the Governor's idea had a lot to do with using those books as campaign literature. I'm sure you act on imperfect inferences every day – do you KNOW the supermarket will be open before you go there to buy something? So it isn't clear why others shouldn't do so.

bibliolept (2010-05-17 15:29:20)

There is a simple phrase for these sayings: Rules of Thumb. Not always true, but most often worth remembering and considering. These "principles" – I consider "principle" an apt word because they provide a reasonable starting point for analysis – do not cease being exceedingly useful simply because they are occasionally wrong. After all, "there's an exception to every rule," right?

Dan Kaminsky (2010-05-18 01:46:23)

Seth – Now hang on a second. Sam just brought up two perfectly legitimate instances where correlation/causation confusion led directly to bad public policy, in bike helmets, and in early childhood education. Your reply, unless I'm totally misreading it, was that neither action was the result of science, just politics: The bike helmet study authors knew they were being misleading, the the governor knew he was doing something worthless but it looked good for the voters. On the one hand, sure, that's the real world, we don't necessarily have policy based on science. On the other hand, you're not exactly being a neutral advocate here. In fact, you seem to be advocating this baldly unscientific behavior. But maybe I'm being presumptuous. So let me put it to you very plainly: From your perspective as an apolitical scientist, should raw correlation be used as a guide to public policy, as in the two instances Sam Fent described?

colin (2010-05-18 08:09:07)

I'm sorry, Seth, but you would fail a logic class. 2 is correct. Your counter claim is wrong, you're committing the classic logical fallacy of confusing predicate and proposition: Zero is a predicate not a proposition. That is, you cannot talk of the 'zero' of something, because, if it's zero then there is no 'something' there. So zero correlation does not equal zero causation - because zero correlation means that there is no correlation at all! Zero correlation equals zero. So it does not exist, so it cannot even enter into a argument. If there is zero correlation then the right hand side of this equation is simply blank! If there is no correlation then there is nothing to be said about correlation. If two things aren't correlated, then the question does not even arise as to whether or not they are caused. Consider another example: if i have two non-existent apples, and i polish them what do i have? Two non-existent shiny apples? No - you never had any apples to begin with, coz , they dont exist! Thus if there is 'zero correlation', which is another way of saying there is a 'non-existent correlation'. Then an 'non-existent correlation' is the same as 'non-existent causation'. Well duh! 'Non-existent correlation' is also exactly the same as 'non-existent magic elves', and the same as 'non-existent santa clause'. Ofcourse two things that are dont exist are are going to be equal. All you've proved is that zero equals zero. Look let me spell it out in an argument form example: Argument A: Correlation is not the same as causation But no correlation is the same as no causation Therefore, correlation is exactly the same as causation is the same as: Argument B: Marriage is not the same as Happy Marriage But not being Married is the same as not being Happy Married Therefore, being married is exactly the same as being happily married. The Argument B is clearly wrong and loopy, and your Argument A is loopy because it commits the same logical fallacy. To use a more common analogy: it's like you divided by zero. As for 3, "The plural of anecdote is not data." Depends, the word data could have two different meanings here. Both of which you confused. By data you might mean information, in which case 3 is right. But really data is different from information. But when you recognise the distinction, then your criticism is true but irrelevant. The word 'Data' comes latin, and means 'to give'. It is what is 'given' for free. Data, or what is given, has to be worked on and refined into 'Facts'. Fact from the latin 'Fac' meaning 'to make' (as in factory and manufacture). In computer science Data is just a

collection of meaningless points, then it has to be refined and processed into Information (or facts). BUT only information (or facts) can form the evidence for an argument. Where as, data is meaningless and valueless it should never be used as evidence for an argument. So when you claim that people can learn things by reasoning from the data, this is flatly wrong... The data 'the given' stuff first needs to be examined to discover if it is of any worth or value, and to say what that worth or value is. Data is value neutral, it can be either good or bad, useful or worthless; it is all still data. When you have discounted the data that is rubbish, and analysed the remaining data according to it's worth, then it has become Information. INFORMATION CAN be used as evidence in an argument to reach conclusion. DATA should NEVER be used as evidence for anything.

seth (2010-05-18 10:32:19)

Dan, you ask, "should raw correlation be used as a guide to public policy, as in the two instances Sam Fent described?" Sure, in some cases. For example, the idea that smoking causes lung cancer is/was mostly based on "raw correlations" (if I understand what you mean by that). It would have been a bad idea to wait for better evidence of causation. When making public policy, I think it's a poor idea to ignore data – which means not ignoring correlations. Should a single correlation of 0.10 be used to guide the spending of a billion dollars? Of course not.

Jasper (2010-05-19 16:20:40)

The proof isn't incorrect, but the definitions are unreasonable. [http://ojasper.nl/essays/recent %20incorrect %20argument.html #recent %20incorrect %20argument](http://ojasper.nl/essays/recent%20incorrect%20argument.html#recent%20incorrect%20argument)

seth (2010-05-19 18:19:03)

definitions "unreasonable"? I'm afraid I don't know what that means.

Alan Crowe (2010-06-23 08:46:35)

Privileging zero correlation as a reliable indicator of the absence of a causal connection is dangerous because we are often interested in systems with feedback. Think about a room with a thermostat. Perhaps there is broken cloud and the room is intermittently warmed by direct sunshine. If the heating is on, the thermostat turns it down when the sun comes out. It zeros out the correlation between room temperature and direct sunshine by creating a cancelling inverse correlation between direct sunshine and heat from the heating system. One might argue that the thermostat can only weaken the correlation, there must be some change there to drive the operation of the thermostat. Not so fast. If the sunshine is hitting the thermostat we may well find the room cools down when the sun comes out and shuts down the heating. Feedback can drive the correlation down, down, down, right through zero and into confusingly negative. Now think about the kinds of things we argue about. Consider, for example, a mature social democracy with taxes that have, for many years, wobbled about the Laffer Curve tipping point. The political system provides feedback that tends to null out the correlation between tax rates and tax revenue. Does zero correlation provide evidence that they are not causally connected?

SkepticalCynical (2011-03-20 17:55:53)

Seth, I find it a little bit bizarre that you regard "correlation is not causation" as a slogan intended to make you go away, rather than a core lesson from epistemology encouraging you to think more carefully. If I may restate your views, you correctly state that there are four possibilities for the relationship between variables A & B: (1) A causes B, (2) B causes A, (3) A & B are caused by C, and (4) A & B are not related. If we discover that A & B are correlated, you view this as reducing the likelihood of (4), and therefore necessarily increasing the likelihood of (1)-(3). This is false. A & B are just as likely to be unlinked as they were before and you've improperly updated your priors. There are plenty of robust correlations (think super bowl winners and election results, cyclical & counter-cyclical stocks, etc.) between variables that are, in fact, unrelated. Modern social science tools like GSS make it almost trivially easy to hunt for such correlations. Suppose someone told you there is a very robust correlation between holding a college degree and adult income level (this is a true statement). Do you therefore conclude that awarding twice the number of college degrees next year will substantially increase the lifetime wealth of the recipients? I would hope not, and anyone who so argued would indeed need to be reminded that "correlation is not causation". The bottom line is that if you want to show causation, you need to show it (c.f. Mill's Methods). The fact that no correlation is evidence for no causation does not imply the converse.

Seth Roberts (2011-03-20 21:31:19)

SkepticalCynic, you write: "If we discover that A & B are correlated. . . A & B are just as likely to be unlinked as they were before." I disagree. I can think of hundreds of cases where the correlation between A and B reflected a linkage between them (linkage = A causes B, B causes A, or both have a common cause). That you can cite a few examples where you claim that A and B are correlated but none of these three cases is true doesn't make my hundreds of examples go away. Throughout scientific history, people have observed correlations and used them to suggest ideas that were then tested in various ways, such as experiments. Many of these ideas turned out to be true. One example is the idea that smoking causes lung cancer. It began with a correlation. Another example is the idea that maternal lack of folate causes neural tube defects in the fetus. It began with a correlation. A third example is the theory of continental drift. It began with a correlation.

Steamy the Punk (2012-05-02 11:51:24)

In regards to the Absence of Evidence is Evidence of Absence. I ran into this earlier and nearly fell out of my chair. While the logic is right the interpretation is false The logical conclusion is Probability of existence given evidence is greater than the probability of existence given absence of evidence. which of course is TRUE.. but this doesn't suggest that Probability of existence given absence of evidence is equal to ZERO. So ultimately this proof just says that absence of evidence is evidence of probable absence. Which is like saying "I haven't seen one, so maybe it doesn't exist" which is an unremarkable conclusion

### **More Anti-Science (2010-05-13 19:25)**

Professional scientists mostly ignore the slogans (e.g., "absence of evidence isn't evidence of absence") I discussed in [1]my previous post. For example, the professional-scientific conclusion that smoking causes lung cancer came mostly from correlations. This conclusion was criticized, sure, but not by saying "correlation does not equal causation".

Professional scientists have a much worse problem, which is that they criticize much more easily and fluently than they praise. ([2]Marginal Revolution is an excellent blog partly because it doesn't suffer from this.) This can be depressing (lots of work is underappreciated), exciting (anyone who sees this has a big advantage), or merely amusing, as in [3]this example to which Stephen Marsh drew my attention:

I just returned from the [4]MS4 conference. It is the fourth year that a group of philosophers of science have gathered to try to tease apart the implications of computer simulation in science. . . .Several presentations gave harsh criticism of climate science models. Bayesian tools (a statistical technique) were given some especially harsh criticisms. Everyone agreed the models were problematic in some sense or another. That the results were subject to all kinds of errors and suspicions, and there were substantially difficult difficulties to sort out. . . . Despite this, everyone concurs the models are robust . . . No one disagreed that the planet was warming.

The poor ability of professional scientists to praise means that comparison of A and B (two theories, say, or two experiments) mainly consists of comparing how much A and B have been criticized. How much A and B would have been praised, had scientists been better at praise, is unknown. This is a very poor way to compare stuff. Inability to praise also means that there is too much criticism. In my experience, scientists have trouble separating serious criticisms from trivial ones. For example, that climate-change models haven't been shown to predict correctly is a serious criticism not emphasized enough (e.g., at the MS4 conference).

---

Nathan Myers (2010-05-13 20:26:51)

How about praising climate models for, conservatively, underpredicting the worldwide temperature rise? Every time we get a new data point, it's right at the top of the confidence interval. In other words, the climate trend is not only worse than we hoped, it's worse than we expected, and exactly as bad as our worst-case fears.

Mac (2010-05-14 02:35:51)

"For example, that climate-change models haven't been shown to predict correctly is a serious criticism not emphasized enough (e.g., at the MS4 conference)" Is that really true? When this started becoming a political issue, Hansen produced the basic projections back in 1988, with 'B' being the expected outcome, and 'A' & 'C' bracketing it. Back in 2007 (about a decade later) we looked to see how those projections went. Sure enough, the next decade had been predicted well by the climate model. Scenario B Prediction : 0.21 to 0.31 oC/decade GISTEMP real data: 0.14 to 0.24 oC/decade HadCRUT3 real data: 0.14 to 0.24 oC/decade So the Scenario B Prediction (1988) looks marginally high - although it was within error bars. However, the model was simple - it didn't include some things that are included in the 2004 model. Despite this, however, the main problem is simple - short term data can't be used to test a long-term model. It's getting up to a couple of decades since we started doing this seriously so we are only now being able to test the early predictions with 'REAL' data (rather than running the model forwards and comparing against historical data). The good news is that it looks like the models are working.

Mac (2010-05-14 02:42:34)

BTW - There are plenty other examples of the models being shown to predict correctly too. For example, this diagram shows the mapping of future ocean temperatures against the 1990 model. The filtered trend is well inside the modeled range. [http://www.realclimate.org/images/IPCC\\_Fig\\_1\\_1.jpg](http://www.realclimate.org/images/IPCC_Fig_1_1.jpg) So, again, it simply isn't true that the models aren't predicting correctly. The hard part is remembering that you need to smooth the data because it is so 'noisy' due to short term uncertainties. The models are working well, though.

seth (2010-05-14 05:11:45)

Mac, when I said "predict correctly" it was shorthand for the idea that a model is useful if it tells us (correctly) something we didn't already know. I didn't literally mean "predict correctly". Consider a model that predicts that a not-yet-measured correlation will be between 0.99 and -0.99. Even if this prediction turns out to be correct, it doesn't increase your confidence in the model. When Hansen produced three widely-varying "predictions", I assume all three were predictions (outcomes consistent with the model). Since it was very likely a priori that the actual temperature would be somewhere between the three, this is not a success for the model. Perhaps someday Hansen will tell us what the model actually predicted given the events during the decade on which the model depends (e.g., number of volcanic eruptions). Then we will be able to see how well the Hansen model predicted - asking whether it did better than a naive predictor would have done. If temperature has been rising for 100 years it is no great success to predict it keeps rising at the same rate.

Darrin Thompson (2010-05-14 06:14:27)

Can you demonstrate what good praise looks like? Maybe you have...

dearieme (2010-05-14 06:39:23)

"Despite this, everyone concurs the models are robust . . .": then they are chumps. I've spent more than 40 years working with mathematical models, and without good data from controlled experiments I wouldn't make such a claim - and my physico-chemical systems had many fewer variables than the climate has. "No one disagreed that the planet was warming": I can neither agree or disagree since the quality of the observations is dubious, and the data-manipulations used are kept secret or, according to Phil Jones, simply were never recorded. I suspect that there has been warming - consistent with the ex-

pression "little ice age" - but I see too few data that have been sceptically scrutinised with intelligence, competence and honesty.

seth (2010-05-14 22:37:56)

Darrin, see my post on appreciative thinking: <http://www.blog.sethroberts.net/2008/12/12/whats-appreciative-thinking/>

Laura (2010-05-15 13:01:08)

I like the website on Jane's Walks. When I first learned about Jane Jacobs from this blog, I started asking the architecture professors and students what they knew about her. We had very memorable conversations. Today, students are at graduation ceremonies around the university. I always miss the students when they leave Cal, because some are so memorable and I will never see them again. An ESPM professor had to tell me how to cope with this. It is very hard.

### **Preventive Stupidity: A Nuanced View (2010-05-15 22:15)**

I learned something from the comments on [1]my preventive stupidity post (also [2]here). [3]The best comment was from Kim Oyhus, whose earlier comment had started it all. Were I to discuss the subject from scratch, here's what I'd add (mostly elaborating what Kim said):

Scientific discussions are usually about data and theory. From Data A, someone has "concluded" - more precisely, raised the plausibility of - Theory X. At this point, preventive stupidity often begins: Someone says "correlation doesn't equal causation" or "the plural of anecdote is not data" or something similar.

Here's what I think. More data are better. Two data sets are better than one. To go from one data set (A) to two (A and B) is a step forward. Less data are worse. To go from one data set (A) to none is a step backward. If you respond to the assertion that A supports X by mentioning more data that bears on the truth of X, that's a step forward.

The more convincing the new data (in either direction, pro or con), the bigger the improvement.

Likewise, more ideas are better. Two plausible explanations of A are better than one. To go from one idea (X) to two (X and Y) is a step forward. Fewer ideas are worse. To go from one explanation (X) to none is a step backward. If you respond to the assertion that A supports X by mentioning another plausible explanation of A, that's a step forward. The more plausible the new explanation, the bigger the step forward.

The sayings I wrote about (e.g., "absence of evidence doesn't equal evidence of absence") make their users stupider because they push them from thinking about one data set to thinking about none (they dismiss Data A) or from considering one idea to considering none (they dismiss Theory X). They make the rest of us stupider because they prevent their users from making useful contributions. They really are preventive stupidity, as Orwell said.

If these sayings were used as transitions, as throat-clearing, fine. If somebody wrote, "Look, correlation doesn't equal causation. Here's another plausible explanation for what you observed . . ." that would be okay. In my experience, that's not what happens. They're used to support an overall dismissiveness. Several months ago I [4]wrote about my observations that connected socks with foot fungus. [5]Some of the comments provided new relevant data – steps forward. A few comments, however, made this or that preventive-stupidity point ("[6]Sample size of 1, no control . . . you can't seriously think you've proved anything here", "[7]your post is post hoc ergo propter hoc reasoning"). The comments didn't go on to make a step forward. They were steps backward.

Kim Åyhus (2010-05-16 03:37:32)

I almost blush with all this praise. Seths simple rules of what is better, are surprisingly identical to my own. They are the hart of science. It is a pity they are not taught in school. 1 hour of this was all I got in my first 12 years of school, and that was about Popperian falsification, and I was lucky to get that much. Here is my current "Correlation is Evidence of Causation" proof, which became quite simple: <http://kim.oyhus.no/CorrelationAndCausation.html>

Laura (2010-05-16 05:24:24)

I've always enjoyed sharing your ideas with other people. I do like to try your ideas. I bought some Straus butter again. I don't know if the other light affected my sleep, because my moods were strange when I used it. My sleeping was erratic, so I added fluorescent lights again.

Patrik (2010-05-16 20:17:30)

@Seth Came across this essay regarding anthropogenic global warming. I thought you might find it interesting. <http://wuphys.wustl.edu/katz/climate.html>

Nathan Myers (2010-05-17 01:46:26)

To get some idea of how destructive this campaign is, consider a short history. Back in the '80s and '90s, some people noticed that their children were being injected with increasing amounts of a mercury-based toxin, thiomersal ("Thimerosal"). Vaccination defenders *correctly* pointed out that there was no evidence of any harmful effects from injecting any amount of thiomersal into children. This was *correct* because, in fact, there was *no evidence of any kind*: no tests had been done with thiomersal. It was grandfathered in at the FDA's inception. All that was known was that if thiomersal did have an effect, it wasn't especially obvious, because it had been used for a long time, although never in amounts nearly as large as was lately being done. These assurances, being transparent deceptions, only increased suspicion. Later, as limited studies were finally completed, the results were routinely inflated far beyond the authors' conclusions, further inflaming suspicions. Today, having run the experiment to completion directly on the public, we can say with fair confidence now that thiomersal was not, by itself, causing autism. We don't know if it caused other problems; each possible effect would need to be checked individually, but most haven't. It's all considered moot now, since as of about 2002 children's vaccines in the U.S. haven't had it. (This is, by the way, a few years later than had been misleadingly announced.) The damage, though, is done. A big swath of the population has become irredeemably distrustful of the vaccine industry administration, and vaccination rates have declined dangerously. The only answer those parents had, when being so hamhandedly misled by denials, was "absence of evidence of harm is not the same as evidence of absence of harm". To have evidence, you must collect evidence, and none had been collected. The administration fought such collection tooth and nail. Without evidence, there was no bad news; with evidence, who knew? There might be lawsuits; there was heavy litigation over asbestos. Bad news would lead to declines in vaccination rates, which would certainly be harmful too. You might be tempted to say the administration turned out to be right, and the parents wrong, but that would be dishonest. The parents were right to be suspicious under the circumstances, because absence of evidence really *isn't* evidence of absence. Real evidence of absence of harm is what parents reasonably expect before allowing you to inject toxins into their children. It didn't exist. Lack of evidence is no substitute. We're still living with the tragic consequences, in reduced vaccination rates and increased incidence of preventable illnesses, of public officials trying to pass off lack of evidence as if it were itself evidence.

Darrin Thompson (2010-05-17 07:19:00)

Nathan, We as autism parents were not only suspicious in the past, we will continue to be suspicious in the future. We're suspicious of nearly anything we hear coming out of the culture that bred what you described as the vaccination administration. I include in that culture general health advice, and global warming advocacy smells the same to me. I don't know of any evidence that the dysfunctional groups in the science community that are setting public policy and media narratives have changed any. Your comment summarized my feelings on the subject articulately.

Nathan Myers (2010-05-17 12:14:06)

Darrin: I am an autism parent myself, and quite aware of structural impediments to sound public health policy. Still, everything I have studied carefully indicates that climate scientists are both careful and sincere, and that global-warming denialists are not. I don't doubt that some are sincere, but that's not enough for me.

Glen Raphael (2010-05-17 14:12:03)

> *Still, everything I have studied carefully indicates that climate scientists are both careful and sincere, and that global-warming denialists are not.* For me, that was one of the big revelations of the climategate emails - that people like Michael Mann *really believe* the goofy things they say - they aren't being *deliberate* propagandists. I'm now pretty sure everybody in this debate is sincere. The real question is whether people on one side or the other or both are *deluded* to believe the things they sincerely do believe. It seems to me there's a lot of carelessness on both sides. On both sides the people who are the most careful aren't the ones who do the most talking or get the most press.

Nathan Myers (2010-05-17 14:39:47)

I'm perfectly certain that many in the debate are not sincere. However, that is far from saying everyone on the one side is insincere, or that everyone on the other side is as careful as I would like. Unsound reasoning is so pervasive in our culture that it's often hard to tell outright lying from expressions of self-deception. People who fear change will use unsound reasoning to

conjure up reasons to justify resisting change, in the face of any amount of evidence.

Glen Raphael (2010-05-17 20:35:18)

> *People who fear change will use unsound reasoning to conjure up reasons to justify resisting change, in the face of any amount of evidence.* That framing might be more ambiguous than you intended. I don't think I agree that that's the true nature of the primary dynamic in this debate but if it were, it might make sense to apply that idea to "people who fear change" *in the average world temperature*, people who fear change *in the atmospheric CO2 level*, people who fear change *in the average sea level*, people who fear change *in glacier coverage*, and so on. Having done that - having described one side as applying unsound reasoning because they fear the possibility of environmental change and are going to great lengths to justify resisting said change, you could then describe the opposing side as simply "those who don't fear change". Or at least don't fear it enough to justify extreme measures resisting it. Or perhaps just fear change less than the other guys.

Nathan Myers (2010-05-17 20:43:59)

The word you're looking for there isn't "change", but "worldwide famine, mass extinction, hundreds of millions displaced". It's rational to do what you can to avoid those, but it would involve some changes in economic flows.

Glen Raphael (2010-05-17 22:08:02)

No, using your framing it would be the fact that people fear environmental *change* - and possibly technological progress in general - that *leads them to invent* and preach ridiculous apocalyptic scenarios like those you list. The doomsday scenarios are part of what you called "unsound reasoning" above. You just "conjured up" three alleged reasons to keep doing what you're doing - to keep the same worldview and fight for the same policies and demonize the same people as before, rather than accept the world as it is. Because I don't intensely fear environmental change - don't regard the environment as particularly *fragile*, I don't feel the need to invent disaster scenarios that I can then claim to rescue the world from, if only people everywhere will join my faith, fear the same things I do, and follow all the policies advocated by the priest class of my chosen religion. BTW, the earlier-linked Jonathan Katz essay is pretty good.

Nathan Myers (2010-05-19 05:17:41)

Not even Exxon still denies that all of the above will occur in this century. Their story now is that it's not their fault, and that switching to other energy sources won't make any difference. Their motivation for saying so is obvious. The dishonesty and sloppiness is overwhelmingly on one side.

Glen Raphael (2010-05-22 10:37:36)

Okay, I guess I'll bite: What combination of assumptions leads to the joint conclusion that: (a) we'll have "worldwide famine" due to AGW in this century, and (b) ...but this is preventable by switching to other energy sources? My guess is that you might be able to get there by assuming a "steady state" with regard to farm locations, crops, and farming technologies - assuming that those somehow can't or won't gradually change over time in response to changing climate as they always have in past centuries, also assuming a "steady state" with regard to economic activity - meaning that it won't hurt productivity at all to switch to less polluting technologies, yet NOT assuming a "steady state" with regard to energy technologies or political policies so we can hypothesize changing those willy-nilly to whatever The Regulators think is best. But I'd like to see it spelled out: what assumptions are being made and what is the evidence for those assumptions actually being true? Is there actual science behind this? Or are you just talking about the IPCC's speculations on drought and famine in Africa such as discussed here: <http://www.telegraph.co.uk/comment/columnists/christopherbooker/7231386/Africa-crops-yield-another-catastrophe-for-the-IPCC.html> <http://www.heliogenic.net/2010/01/27/more-ipcc-advocacy-not-science-africa/>

## **Preventive Stupidity: An Example (2010-05-17 05:43)**

[1]The very first comment on my preventive stupidity post said this:

“Absence of evidence is not evidence of absence.” This was a very useful concept to point out to those people who believed that because nominal national US housing prices had never dropped before that they wouldn’t drop in the future.

At 39:59 in [2] this excellent podcast, Barry Ritholtz says, “It’s just not true [that US housing prices have never declined]. Obviously in the post-Depression era home prices really collapsed.” The saying absence of evidence is not evidence of absence kept those who said it from looking into the facts of the matter.

1. <http://www.blog.sethroberts.net/2010/05/12/preventive-stupidity-exists/#comment-433011>
2. [http://www.econtalk.org/archives/2010/03/ritholtz\\_on\\_bai.html](http://www.econtalk.org/archives/2010/03/ritholtz_on_bai.html)

---

Nathan Myers (2010-05-17 14:21:43)

But in fact it didn’t matter whether prices had dropped: the (correct) point was that they could drop in the future, regardless. That poster’s ignorance of pricing history, coupled with sound reasoning that discounted any conclusions from that ignorance, led to the correct conclusion. If in fact people were actually misled about house pricing history (which seems to be the case), sound reasoning would have protected them. Reasoning promoted here would lead one to look at a period in which prices had not (or were said not to have) dropped, and take it as evidence that they would not drop.

jlonisdale (2010-05-17 14:52:11)

It is weird that you think this is an example of preventative stupidity rather than that of an incomplete argument. Side note, the phrase “evidence of absence” in the context of the phrase you think of as “preventive stupidity” seems to have a more specific meaning than your more literal interpretation: [http://en.wikipedia.org/wiki/Evidence\\_of\\_absence](http://en.wikipedia.org/wiki/Evidence_of_absence) I didn’t make the other good arguments against housing price movements never going down because it seemed off topic - but there is a whole lot of other data driven analysis that could have been made about the likely path of housing prices such as price to rent or income ratios, affordability indices, real prices historically dropping, rising interest rates, unsound lending and the financial condition of the average borrower, the prevalence of ARMs and the future path of interest rates, other regions in the US with falling housing prices such as Texas in the 80’s and CA in the 90’s and other countries with falling housing prices. The key here is that even the above arguments are just surface arguments. I can’t just make an argument about price to income ratios without addressing whether or not there is something truly significant about that ratio. If we are having an in-depth discussion, I also have to address the counter arguments that try to give a justification for why those higher ratios are sustainable in today’s environment. The question is whether or not the other arguments on your list of “preventive stupidity” are good in the same way as the price to income ratio is useful for learning about housing markets - they make a point but are otherwise incomplete. I still stand by my statement in the original comment - In the case of housing markets, knowing that something can still be possible or even likely despite it not happening in recent history can be very useful. It is actually more useful than knowing that housing prices went down in the Great Depression, because while many people believed that the future path of the economy was tied to the housing market, the point that housing markets fell in the Great Depression is just not that interesting unless people thought another Great Depression was likely independent of the housing market. Now, when discussing ideas with other people we do not always give them the benefit of doubt and dig down into the data with them. The salesman/huckster and politician are two groups of people where we know they are biased so if we do engage them we might not engage them fully. It is insulting to explain that I am not weighting their ideas very much because I think their anecdotes or correlations are just convenient coincidences or carefully cherry-picked data. In these cases it is often easier to tell them that the plural of anecdote is not data and correlation is not causation rather than go into the details and accuse them of dishonest data manipulation. It is very annoying to be on the other side of this style of confrontation because the person making the “preventive stupidity” arguments, when not followed up with the below arguments is being a little (or if it is about your own research, very) disrespectful

to the person who sees themselves as trying to learn the truth in an unbiased manner. 1. The underlying cause for the correlation. 2. When the absence of evidence would be significant or what evidence would disprove the view (The housing market hasn't fallen in recent history, but if the market is still rising when the mortgage credit to GDP ratio falls I'll take that as evidence that the market has moved for fundamental rather than speculative reasons) 3. The reasons why the anecdotes were collected in a biased manner and how this bias skews the results From this point in a conversation, you can either label their actions preventive stupidity and halt discourse entirely, or you can ask for more depth about what they think the underlying causal factor is, what would qualify as evidence of absence or why the anecdotes are significantly biased/unrepresentative.

seth (2010-05-17 15:57:26)

yeah, I agree. To respond to "correlation doesn't equal causation" by saying "that's preventive stupidity" is little help. It's much better to do the various things you list (e.g., ask "the reasons why [the person speaking believes that] the anecdotes were collected in a biased manner and how this bias skews the results.")

Stephen M (Ethesis) (2010-05-17 19:29:35)

**example of preventative stupidity rather than that of an incomplete argument** so that an incomplete argument is preventative stupidity. Black swan events are an interesting study because in complex systems they happen so often.

### Restless Legs Syndrome, Niacin, and Web Search (2010-05-17 16:50)

Gary Wolf and I have [1]a post on Boing Boing today about how [2]Dennis Mangan cured his mom's Restless Legs Syndrome. I mentioned this accomplishment [3]earlier. Mangan's story is an example of what I call personal science – doing science yourself about something you care about.

More One comment on Boing Boing is that niacin is also known as Vitamin B3 and if we searched "restless legs syndrome AND Vitamin B3" we'd get lots of hits. I tried that search and got zero hits.

1. <http://www.boingboing.net/2010/05/17/restless-legs-syndro.html>

2. <http://mangans.blogspot.com/2009/05/niacin-for-restless-legs.html>

3. <http://www.blog.sethroberts.net/2009/06/19/acne-cured-thanks-to-self-experimentation/>

---

Mike Kenny (2010-05-17 20:28:45)

I used to have a hard time with restless feelings in my legs. I found cutting out caffeine after 4pm and stretching when the feeling kicked in (touching toes with straight legs, more or less) helped a lot for me. My dad has trouble with restless legs, and I don't think he's found leg stretches help much for him.

Charles (2010-05-17 21:47:12)

I read through the comments, and as usual you had the vitamin-scaremongers out in force. Almost no one dies from vitamin toxicity. Wikipedia: "In 2008 there were no deaths reported from vitamin overdose,[7] as has been the case for 17 of the last 25 reporting-years.[8]. Deaths from eating laundry products typically produce more deaths than vitamin poisoning." I have been telling people for 30 years that some supplements work for some people for some things; some supplements do nothing for some people with some conditions; and some supplements are harmful to some people with some conditions. The only way to find out is to try them, self-experiment, and learn to distinguish placebo effects. Speaking of self-experimentation, I just got a blood sugar monitor, which seems to be kind of a fad among low-carb people these days. But it's really fascinating

to see how your blood sugar reacts to certain foods. If you're into self-experimentation, I highly recommend it. It's not only interesting, blood sugar is one of the more important things to monitor for your long-term health.

Laura (2010-05-18 05:55:23)

If a psychiatric patient is restless because of a medicine (like Abilify), a psychiatrist might prescribe propranolol (Inderal). Propranolol (generic name) is also used for other things, such as performance anxiety.

Dennis Mangan (2010-05-18 06:49:39)

Hi Seth, thanks for writing about it; hopefully this will help some people. When I wrote a short piece on my blog about my mother having success with niacin, it was noticed by Bruce Charlton, a regular reader of my blog and then the editor of the Medical Hypotheses. The journal will be familiar to most of your readers as you've discussed it here, and is (or was) dedicated to publishing "radical ideas". Dr. Charlton invited me to write a letter for his journal about my and my mother's experience, so I did. So he deserves a lot of credit for recognizing that this had some significance. Unfortunately, Bruce's penchant for publishing radical ideas proved too much for certain sectors of the scientific/medical establishment, and he was sacked from his job one week ago, on May 11. And you, Seth, of course, have been pretty enthusiastic about it since you learned of it; kudos for your article.

Brody (2010-05-18 14:55:19)

Interesting post! I found out that taking promethazine hydrochloride (an anti-nausea drug under the name of Phenergan) for migraine-induced nausea or airsickness gives me a bad case of something that sounds very similar to RLS while it's in my system. (Found this out the hard way after taking Phenergan on a cross-country flight). Next time I have to take it (thankfully only once every month or two) I'll supplement with some niacin and see if it helps. Who knows?

### **Gouda Cheese Did Not Stimulate Immune System (2010-05-18 10:42)**

[1]A recent study in Finland found that cheese with added lactic acid bacteria (sold commercially) stimulated the immune systems of elderly subjects. Earlier studies had found similar effects when the bacteria were put in milk or yogurt. To me, the most interesting result was that the cheese alone (Gouda, a fermented cheese) had no detectable effect. I take that to mean that some fermented foods contain too little bacteria to make a difference. I'm going to have to stop using my umami hypothesis as an excuse to eat cheese – although cheese may also be good for the fat it contains.

Thanks to Anne Weiss.

Laura (2010-05-18 22:00:18)

There is a lot of cheese in the San Francisco Ferry Building! I went there today and there was a lot of people!!

dearieme (2010-05-19 10:01:28)

But who, given the choice of all the cheeses of France, Italy and Britain, would opt for Gouda?

## Harvard Student Almost Gets Away With It (2010-05-18 12:06)

If [1]Adam Wheeler, a former Harvard student, hadn't applied for a Rhodes Fellowship, it appears he would have gotten away with four years of academic dishonesty. While at Harvard, he won several prizes. On his Rhodes application, he listed "numerous books he had co-authored, lectures he had given, and courses he had taught". "Numerous books"? Yet this is how he was caught:

A Harvard professor first became suspicious of Wheeler while reviewing his application for the Rhodes scholarship. He discovered that Wheeler had plagiarized his piece almost completely from the work of another professor.

His "piece"? What's that? When you apply for a Rhodes fellowship you don't submit an academic article as part of your application. Why didn't the reviewer check if the "numerous books" that a college senior claimed to have written actually existed? What's next, a sixth-grader says she's won a Nobel Prize and a Harvard prof doesn't notice a problem?

Like Wheeler, [2]Ranjit Chandra was caught toward the very end of his academic career. My impression with Chandra is that, as he repeatedly escaped detection, the falsifications became more extreme.

1. [http://www.huffingtonpost.com/2010/05/17/adam-wheeler-harvard-stud\\_n\\_579177.html](http://www.huffingtonpost.com/2010/05/17/adam-wheeler-harvard-stud_n_579177.html)

2. <http://www.sethroberts.net/chandra/index.html>

---

Alex Chernavsky (2010-05-18 20:31:55)

And speaking of falsifications: I bought [1]*A Million Little Pieces* not long after it was published. However, I stopped reading it after the first couple of chapters, because I became convinced that the author (James Frey) was making it up, or at least greatly exaggerating. To this day I can't understand why it took so long for him to be exposed as a fraud.

1. [http://en.wikipedia.org/wiki/A\\_Million\\_Little\\_Pieces](http://en.wikipedia.org/wiki/A_Million_Little_Pieces)

## Resveratrol Revisited: The Plural of Data is Not Data (2010-05-19 14:25)

In 2007 I got an email from Preston Estep, a gerontologist and former Chief Scientific Officer of Longevity, Inc., offering me a place in an informal trial of the benefits of resveratrol that he was organizing. Recently I wrote him to find out what happened. Here's his reply:

We got a few people to volunteer but not enough for an organized trial to be worth the effort, partly because initial reported benefits evaporated under scrutiny and we couldn't decide what variables/biomarkers to test. There are a couple of efforts that have taken off since then to try to collect data on therapeutic modalities, including resveratrol. The largest-scale effort I know of is [1]CureTogether but it isn't very useful because the vast majority of reports appear to be subjective and unreliable (e.g. "I feel that resveratrol has slowed my aging ..." and so forth). Such a web-based approach would be much more useful if objective tests like those you have done could be implemented but I'm skeptical you could get many people to produce and report data in an unbiased fashion. I have found that the desire to believe

whatever you're doing is good is incredibly strong and can be rationalized ad infinitum.

Interestingly, it looks like professional scientists and even big pharma might have gotten caught up in that mindset. Many of the reported benefits of resveratrol have been controversial from the beginning and recent reports suggest that neither scientists nor pharma can reproduce key results. Matt Kaeberlen, one of the first discoverers that sirtuin overexpression extends lifespan and co-founder of a biotech company with me in the early 2000s, returned to academia and has raised some red flags about the resveratrol research. He showed that the key assay used to discover resveratrol in a drug screen seems to depend on a biochemical artifact. Sirtris, a biotech company specializing in sirtuin research and that was bought by Glaxo for \$720M, developed some resveratrol analogs that were reported to have multiple benefits, including control of type 2 diabetes. But recently Pfizer and Amgen have published studies saying they cannot reproduce Sirtris's results. You can read many reports of this mess on the web but here are good, recent accounts of the controversy:

[2][http://www.boston.com/business/healthcare/articles/2010/05/17/cambridge\\_biotechs\\_work\\_on\\_resveratrol\\_cuts\\_to\\_basics\\_of\\_biology/](http://www.boston.com/business/healthcare/articles/2010/05/17/cambridge_biotechs_work_on_resveratrol_cuts_to_basics_of_biology/)

In [7] a recent New Yorker article about cancer chemotherapy Malcolm Gladwell told a similar story: High hopes for a cancer drug disappeared when more data came in. I am more positive than Estrup about the CureTogether study of resveratrol. If the collected data suggest benefits, it supports more work; if the data do not suggest benefits, it argues against more work. Above all, the CureTogether data will others decide whether to try resveratrol.

7. <http://www.gladwell.com/pdf/treatment.pdf>

---

Vic (2010-05-19 16:01:12)

Well, as they say, the plural of anecdote isn't data

seth (2010-05-19 16:05:55)

yes, apparently the plural of data isn't data.

thehova (2010-05-19 19:51:13)

yes, the New Yorker was a quite a downer last week.

Hal (2010-05-21 11:40:06)

I have a rare, fatal and incurable disease myself, and just this week a major trial finished with a negative result. No benefit found, despite promising preliminary results. Earlier this year another major trial failed, similar story. So far there have been dozens of treatments tried after earlier positive results, and only one has showed any benefit - and that only extends survival by two months. I am a member of an online site called PatientsLikeMe which lets everyone record what treatments they are trying - supplements, experimental drugs and therapies, etc. You also record your rate of deterioration. Everyone can see everyone else's data and the goal is to try to find common elements among people doing better than average. Unfortunately it doesn't seem like anything works consistently. It relates to the distinction between anecdotes and data. If one person said they felt a little better after trying, say, fish oil, that's an anecdote. But you can go to PLM and see dozens of people who have tried it, when they started, what dose they used, and whether their progression changed. That starts to look like data. I think the difference is that PLM is not a fish oil forum. That is just one of literally hundreds of different things people have tried. There is no reason to think there is a selection effect in reporting results, positive or negative. Anecdotes are more likely to be biased. Someone who gets benefit from fish oil is more likely to talk about it than someone who noticed no change. This is why we are cautioned not to accept even multiple anecdotes as objective data. You need to get away from selection effects.

seth (2010-05-22 05:00:21)

yeah, PatientsLikeMe is a great thing.

Dennis Mangan (2010-05-22 10:44:11)

As I understand it, the non-reproducibility of results concerns the mechanism of action of resveratrol analogues, not the reported benefits of resveratrol itself.

Marko (2010-05-23 00:53:45)

Is there a global warming connection here?

Mark (2010-05-23 01:00:59)

The general pattern for new or fringe theories is that initially they are supported, and then many fall apart. I think this is partly because initial studies are done by true believers, who may not be qualified researchers and who work in an undisciplined way on a small scale. Nevertheless, their results are published in the media and, nowadays, become conversation fodder on the internet. Serious researchers avoid the topic at this stage. They don't want to be stigmatized as cranks, and for controversial theories they don't want the internet anonymous attack machine to come after them. But as evidence seems to be building up, they finally break down and start to look at things. This is when problems are found, and the initial theory starts to look flakey. This process cycles over and over as the initial theory is modified. Because theories never, ever die, no matter how much evidence there is against them.

seth (2010-05-23 01:42:27)

Marko, yeah, as stuff gets looked at more closely, the initial conclusions may not hold up. I guess that's the connection with global warming.

Nathan Myers (2010-05-23 21:59:43)

Curious, too, is the assumption that all fish oil is the same. How about trying bug oil? There are only a million or two species of bugs to try, but surely they're all more or less alike. Next we can try bacteria. Bacteria must be good for us.

Stephan (2010-06-02 22:16:14)

I think the resveratrol thing is mostly hype. I worked with Brian Kennedy and Matt Kaeberlein until just recently and they had been predicting for some time that the sirtuin assay was bunk- it was finally demonstrated in a recent study that Dr. Estep alluded to above. We used to crack jokes about resveratrol all the time in the lab because we thought the whole thing was ridiculous. It does seem to activate SIRT1 in vivo, but it's not a direct effect as claimed. Resveratrol is certainly not a "calorie restriction mimetic". Any time high-impact publications, high-power labs, the media and private money are involved, you

have to take results with a big grain of salt. Once the hysteria sets in, you get labs that pump out crappy studies that get published in Nature or Science without proper scrutiny. Then people can't replicate the results, but they don't publish that because who wants to contradict a Nature paper that everyone has already taken as fact? Either that or it gets published but it's low-impact. So the grumblings usually remain in the dark corners of scientific meetings. This kind of intellectual pollution seems to travel along with hot topics like nutrition and aging. It was shocking to me when I first began reading diet-health papers.

### Assorted Links (2010-05-19 22:30)

- [1]fermented shark, an Icelandic delicacy

Laura (2010-05-20 00:57:06)

I wonder what it's like being around the fermented sharks. It is hard enough for me to be around the cheese at Whole Foods! It smells really weird!!

Allen K. (2010-05-20 03:42:03)

Is there some connection between the ABC links here and your other usual topics? (This is not a critique; I'm genuinely curious.) It's rather notable how well-written that vicious comment section is, and I thank you for pointing it out.

Mara (2010-05-20 04:23:25)

If I understood it correctly, the ABC issue is the equivalent of a Corporate Horror Story...

seth (2010-05-20 05:19:07)

yes, the ABC issue is a Corporate Horror Story – that is one connection. But the main connection is the leveling (loss of monopoly power) produced by the internet. Self-experimentation is a kind of leveling: you should have to have a grant to do science, self-experimentation makes it possible for anyone. Blogs are a kind of leveling; anyone can have a blog. And the ABC comments are a kind of leveling: They don't fix the problem because the source of the problem has left but at least they allow the victims to speak up. I also thought the ABC comments were a great picture of what one workplace was really like. Self-experimentation doesn't just allow anyone to do science, it also allows a more thorough sort of science to be done – for example, sleep can be studied for much longer periods of time. I can easily test 10 different ways to lose weight via self-experimentation; doing conventional research it's hard to test even one way. The ABC comments were probably more detailed than any one writer could ever assemble.

## Losing Weight By Eating New Food (2010-05-20 10:33)

The theory behind the Shangri-La Diet predicts that new food is less fattening than familiar food. At the center of the theory is the idea that smell-calorie associations raise the set point. New food is less fattening because its smell is less associated with calories. This prediction explained why I often lost weight after visiting foreign countries, but not after visiting other places in America.

A few days ago, I got an email from a 40-year-old man who has taken this a step further:

I've developed a variant of your diet which works really well for me, and which I haven't read about so much on your blog, so I thought you might be interested. I live in NYC, and I'm obsessed about different foods. I'm constantly on the hunt for new restaurants, novel ethnic cuisines I've never had, etc, and NYC is a great place to indulge this hobby. A couple of years ago I was about 210 lbs, which on my 6'0 frame is at least 30 lbs overweight. I read your book, and tried the oil, etc, and it worked well for me, but it felt like a lot of trouble, and I was actually dropping weight faster than would normally be considered healthy. So I changed the strategy, and simply made up a rule, never to eat the same thing twice.

If I want to lose weight, I follow the rule religiously. I go to different restaurants, order radically different things off the menu, choose unfamiliar beers, wines, cocktails etc when I'm out at bars and clubs. If I follow the rule 100 % of the time, I drop about 1 lb per week consistently. If I "cheat" one or two meals a week, I maintain my weight. Any more than that and I slowly gain weight. I'm currently 179 lbs, and have been between 175 and 185 for about two years. Although I'm active, I'm no gym rat, and this "system" is the only nod towards a healthy lifestyle I've made during that time. Apart from never repeating a meal, I eat and drink whatever I feel like.

The dose-response relationship (the more he does it, the bigger the effect) makes other explanations less plausible. He later added:

One thing I forgot, which is important, is I absolutely don't eat when I'm not hungry, and I've never had a problem walking away from food if I'm full. Some people might have problems with that, I guess. Also it requires more discipline than I made it sound. Especially when you're busy, it's very tempting to hit the same lunch spot every day.

---

q (2010-05-20 12:24:25)

interesting idea. but i really wonder where he finds menus with 'radically' different things in new york city. restaurants – even ethnic ones – are pretty homogeneous these days. restaurant kitchens are simple and tend to use the same ingredients. for instance, if you are talking about thai food, how many different brands of fish sauce are there, and how many dishes can you get that don't have it as a major element of the taste? is taste/calorie association really that specific that a piece of beef or pork seasoned one way or another would trigger or not trigger it?

the man in question (2010-05-21 03:44:14)

There are literally thousands of restaurants in new york, and almost every one of them has something on the menu which is quite different. in a given week, I might eat fish tacos, a meatball sandwich, pho, chicken and rice from a street cart, a hamburger from five guys, an australian meat pie, linguine with clams, a sesame pancake with sliced beef in the middle, chicken

vindaloo, a banh mi, etc. All of these things, and many many more, are available within about half a mile of my office. If I'm really stumped, it's usually a failure of imagination rather than actual availability. I read numerous new york food blogs, and I'll dig through those for inspiration. Check out <http://www.eatingintranslation.com/> for an idea of what's available.

bennetta (2010-05-21 13:57:34)

How different are we talking, here? Is not one ingredient the same for two days in a row, or will it work to say, eat sweet and sour pork one day, and then a carnitas burrito the next? The reason I ask is because this would be very interesting (and fun!) to test, but is just not feasible where I live. If I could eat somewhere different for every meal, I could see myself losing weight just by virtue of the amount of running around I'd have to do, but I can't. And buying so many single portions just isn't practical or cost-effective. I could, however, change it up by cooking the same thing multiple ways. My spice rack is pretty extensive. For instance, instead of just making one big bowl of brown rice, I could do simple brown rice one night and curried brown rice with cayenne the next. This sort of thing is completely feasible for your average person.

the man in question (2010-06-01 05:53:34)

Well, I mostly just try and keep it as different as possible. Certainly I'll eat carnitas tacos one day, and schnitzel or something the next. Obviously it's no good to just change the shape of the pasta and leave the sauce the same :-). If you can cook for yourself (I rarely do, you should see the size of my new york kitchen), then you can easily do this technique exactly as you describe. The biggest problem I have on the rare occasions that I do cook, is what to do with the leftovers, which are by definition, the same thing twice. If they're freezable, I freeze them, and put off eating them as long as possible (at least 6-8 weeks), if they're repurposeable in some manner (roast chicken -> chicken soup, etc), then I'll do that.

### **College in Other Countries (2010-05-21 13:41)**

At the Chinese University of Hong Kong, students have real power over teachers because of the importance of teaching evaluations. If your teaching ratings are low, you can be fired.

A friend of mine works there.Â Recently he taught a two-hour class. One student tended to be extremely late, often arriving only 10 minutes before the end of class. One day,

MY FRIEND (friendly) You come so late, why do you bother to come at all?

STUDENT I have another class after this one.

She was serious.

---

thehova (2010-05-21 19:45:15)

My undergraduate school also took evaluations seriously. They directly linked them to pay. The problem is that challenging professors tended to get bad evaluations (especially those who are stingy graders).

John S. (2010-05-22 02:44:05)

I have a lot of stories like that from my time as a TA at an American university. One young woman, who had already been absent three or four times in the first month of class, stopped coming altogether. She missed a lot of homework and an hourly exam. After three weeks she came to my office and asked if she could make up all the work. I asked her where she had been.

She said she had decided to drop the course, but then changed her mind.
