Ever since I found that [1]pork fat improved my sleep, I've tried to eat a substantial amount every day. A few months ago, I knew I couldn't eat any that day so I had a lot of butter at lunch (about 30 g). About 1-2 hours later, I felt in an unusually good mood – in particular, unusually calm. I hadn't noticed such an effect with pork fat, perhaps because it is digested more slowly. (It's easy to see that pork fat melts more slowly than butter.)

Now a friend has reported a similar effect:

My mood is better with the Straus butter, but I am concerned about my cholesterol, so maybe I'll just use it when I feel depressed.Â But it does work.

I'd guess that [2]Straus Family Creamery butter, which is from grass-fed cows, has more omega-3 than other butter but I haven't noticed mood elevation from flaxseed oil, so I doubt that's involved. Moreover, I've always been drinking plenty of flaxseed oil so I doubt I'm omega-3 deficient.

Maybe this has something to do with why certain food is "comfort food".

[3]A new study found that consumption of unprocessed meat was not associated with more risk of heart disease but that consumption of processed meat (such as bacon) was associated with greater risk of heart disease. The whole American fear of animal fat (including butter) may be due to an unrecognized confounding: those who ate more animal fat also ate more bacon.

---

Jim (2010-05-22 17:47:10)

I use lots of unsalted butter with my pan-fried wild salmon, with my fried omega-3 eggs, and drizzled all over my steamed veggies.

Laura (2010-05-22 20:02:13)

Seth: Your new idea about butter is innovative! You didn't note that your friend has schizoaffective disorder, which is a combination of bipolar disorder and schizophrenia. So the butter is not just dealing with normal sadness, in this case. I believe the butter can save suicidal, depressed people from going to the psychiatric hospitals, which cost way more than Straus butter. I will tell my friends in the depression group about it. I am interested to know about their experience eating it. I will bring my Straus butter to them, so they don't have to buy it. Straus butter is cheaper at Whole Foods than at Berkeley Bowl.

seth (2010-05-22 20:58:50)

Laura, thanks for the additional info. I would like to know what your friends in the depression group say about this.

Laura (2010-05-22 21:07:12)

Seth: okay, I will tell you.

John H (2010-05-23 00:18:47)

About that new study linking bacon and other processed meat to heart disease, Gary Taubes's comment about earlier epidemiological studies seems relevant: . . . in observational studies, such as the ones used to indict processed meat, the statistical significance is not nearly as meaningful as the confounders â€” those other factors that might explained the statistically-significant effect observed. With cigarettes and cancer, itâ€™s virtually impossible to imagine anything that could explain the 20-fold increase in lung cancer among heavy smokers (not that the tobacco industry didnâ€™t try). With these smaller relative risks, even those considerably larger than 2, itâ€™s all too easy to imagine confounding variables that the researchers either didnâ€™t measure or didnâ€™t properly assess . . . Imagine for instance all the possible ways that the highest quintile of processed-meat eaters in the 1990s or 2000s might differ from the lowest quintile, particularly considering the fact that processed meats have been generally perceived as carcinogenic for thirty years or more. What youâ€™re comparing are people who donâ€™t seem to give a damn whether something is healthy or not (or people on the Atkins diet who are predisposed to gain weight easily) to health-conscious, quasi-vegetarians. The latter are probably better educated â€” a typical finding in all these studies â€” of a higher socioeconomic class; they go to better doctors, get better medical care, eat generally healthier diets (whatever that means), etc. etc. The reason to do randomized trials is to render irrelevant all these possible confounders â€” disseminate them equally among all the arms of the study. Without randomization, that an effect is statistically significant says virtually nothing at all about whether or not the cause of that effect is what you set out to study. The fact that RCTs are effectively impossible to do in these kinds of situations . . . doesnâ€™t negate the fact that theyâ€™re necessary to learn anything meaningful. Meta-analysis can be meaningless in this context because itâ€™s quite easy for every study done, in every population, to have the same confounders. The only way to learn anything meaningful â€” short of getting an effect as large as the lung-cancer/cigarette association â€” is to do a randomized trial. One of the lessons I learned from my early life reporting on high energy physics is known in that field as Panofskyâ€™s law (after Pief Panofsky, founder of the Stanford Linear Accelerator Laboratory): If you throw money at an effect, and it doesnâ€™t get bigger, it means itâ€™s not really there. In nutritional epidemiology, if you throw money at an effect and it doesnâ€™t get bigger, you do a meta-analysis. It always struck me that the very fact of having to do a meta-analysis is pretty compelling evidence that the effect youâ€™re trying to nail down isnâ€™t real. I may be wrong, but Iâ€™ve yet to meet the epidemiologist who could explain why. from "Diet and health. What can you believe: or does bacon kill you?" [#p=1435](http://www.dcsience.net/?p=1435) #\_jmp0 \_

seth (2010-05-23 00:25:51)

Thanks for posting that, John. Taubes's argument cuts both ways. Surely people who eat a lot of (unprocessed) meat are different from those who eat much less, such as vegetarians. Yet in spite of all those differences, no difference in heart attack risk. That means something – which is what I was trying to say. This contradicts Taubes's claim that RCTs are "necessary to learn anything meaningful."

bill (2010-05-23 03:51:58)

Seth, The authors of the study write that lumping red meat and processed meats together is a mistake. I think it may also be a mistake to lump together luncheon meats and bacon. An article of a study by Shawkat Razzaque, M.D., Ph.D., from the Department of Medicine, Infection and Immunity at the Harvard School of Dental Medicine published on the Science Daily web site (<http://www.sciencedaily.com/releases/2010/04/100426151636.htm>) finds that phosphates found un processed meats and sodas shorten the lives of mice by as much as 25 %. I have not found phosphates in bacon. Bill

Chris Robbins (2010-05-23 06:25:13)

I think it should also be noted that the cow's stomach has already done the work for you and changed the grass into beneficial Omega-3, DHA/EPA. Whereas, the ALA in flaxseeds & its oils is not as easily converted in our bodies to the more desirable Omega-3.

Jscott (2010-05-23 09:10:21)

Flaxseed oil (if I am not mistaken) has a lower bioavailability than omega 3 from fish oil. So, it would be interesting to test that.

Perhaps with Krill oil as opposed from fish that tend to give you the headaches?

Chris (2010-05-23 23:52:26)

I don't think your friend should worry about cholesterol....

Michael (2010-05-24 01:23:45)

I suspect that pork in China is different than pork in the USA. The Chinese frequently feed their pigs sweet potatoes (but sometimes wheat or corn). The Americans feed pigs corn. Feeding pigs sweet potatoes will result in the pork having lower omega 6 and higher saturated fat compared to corn feeding.

bennetta (2010-05-24 10:37:55)

Strauss is unique in that it is barely pasteurized and not homogenized. Pasteurization is a process which slows microbial growth, while homogenization keeps fat globules from separating out from the rest of the milk. Maybe these are also factors?

Rachael (2010-05-24 14:08:47)

I have found a huge personal correlation between my mood and my fat intake. I experienced severe depression after dieting and losing 60 pounds. It wasn't the weight loss, even after I regained most of the weight, but maintained my low fat diet I was still depressed. I started a high fat low carb meat based diet, and my mood improved greatly. Now, there are plenty of confounding issues, higher fat, lower carb, resumption of meat eating, etc. But it really seems to me that there is a great improvement in my mood with fat consumption. (My sleep disorder has improved as well.) I am experimenting with different kinds of fat, coconut vs. grass fed butter, etc.

Alex Chernavsky (2010-05-25 07:09:36)

Rachael, I'd be very interested in your self-experimentation on the effects of coconut fat as compared to butter. I don't eat butter, but I'm looking for some plant-based substitute that has comparable beneficial effects. Can you e-mail me at alexc@aya.yale.edu? Thanks!

seth (2010-05-25 07:53:17)

Rachael, I'm also interested.

Viorel (2010-05-26 10:53:31)

I'll second Seth on the butter ... I've felt positive results (calm and happy state) after having several meals with large (a quarter stick) amounts of butter.

JC (2010-08-04 22:11:05)

Hi Seth After reading about using butter to "feel better" in your forums somewhere that mentioned this blog post, I decided to look into it. I read that butter is actually pretty good for you, assuming of course it's "actual" butter (not a veggie spread) and organic, raw is best if one can get it. Aside from it including vitamins A, E, K and D(!) it is apparently also rich in Selenium and Iodine (another !), not to mention the Omega 3's and 6's you already brought up. So, coupled with what you stated and what I found, I was convinced enough to give it a go. For the past couple of days (not much time - I know), I used a couple of straight teaspoons and noted that I am much happier and accepting than before - I laugh more too. Also, I seem to be sleeping better, but not if I take it right before bed time, which simply had me awake after roughly a 40 minute nap. I "feel" like I have a more energy, but want to wait a little longer to see how all this works out in the long run. I did find an interesting way of taking it though. The Tibetans apparently make a butter-tea in large quantities and are said to drink upwards of 40 cups a day as it provides them with a large amount of energy, esp. during the winter months. I gave it a go in regular black tea, by melting a tablespoon into it and adding just a smidge of creamer for colour. To my surprise it's actually really good! It's a rich, creamier texture and I will have no problems drinking this on a regular basis. I did use salted, non-organic pasteurized butter for this as it was the only type I could find on short notice - but will check out our local natural food place soon. I have also wondered if using butter, in a non-tasting way (somehow), could be a different way of taking in non-flavoured calories? I may have read

this somewhere though. The thinking is that, esp. with the Iodine, butter may be a decent way of bringing the weight down with your method. Any thoughts? Anyway, thought I would share and thank you so very much for everything you do! JC

will (2012-01-07 18:58:03)

Bacon is just smoked pork belly. Are saying the smoking makes it unhealthy. Because pork belly is what you used to improve your sleep, right?

Seth Roberts (2012-01-07 19:19:36)

Does smoking make pork belly unhealthy? I think there are other differences between bacon (the stuff you buy in stores) and unprocessed pork belly. Processed meat contains other preservatives, namely nitrites and nitrates.

### **Foot Fungus Revisited (2010-05-23 14:01)**

I [1]described earlier my theory about foot fungus – that mine, at least, has been caused by socks. It recently got worse. Consistent with my theory, I had just gotten a dozen new pairs of socks of a new material. My theory suggested I buy new socks of a different material (I did), change socks more often (I did), and go sockless more often (I did). As soon as I made these changes, the fungus went away. More support for the theory. A few other people (see the comments to [2]my earlier post) and [3]a friend have had experiences that also support the theory.

My Berkeley doctor didn't know this theory. He looked at my foot fungus and repeatedly suggested certain non-prescription medicines. I haven't seen this point made elsewhere, although you can find a list of 20 things to do that includes "change your socks often".

Sometimes doctors (and medical schools) are criticized for lack of emphasis on nutrition. Sometimes they are criticized for lack of emphasis on prevention. This was neither: it was cure and non-nutritional. Curing infection is one of the main things doctors try to do, which is why antibiotics are heavily-prescribed.

Suppose you bring a task to Programmer A. He has done a long education in programming followed by a long internship, and then passed a difficult screening test to become "board-certified". To maintain his certification he takes "continuing education" classes. He returns with a 100-line program that fails to work. (The medicines my doctor recommended failed to work. He thought the failure was due to my not following the directions closely enough.) Then a 10-year-old boy gives you a 3-line program that works perfectly. You would realize your society is fond of make-believe – in particular, making believe that those who teach programmers understand their subject.

---

Laura (2010-05-23 14:18:25)

I agree with you, Seth. I find that I learn more from you and my therapists, not my psychiatrist. My psychiatrist really tries to push medication as a coping skill, but he gives me a choice. In the past, if I am not doing well, though, psychiatrists have to give me a medication forcefully, but when I am doing well, I can make a choice. If I need a doctor's letter, my psychiatrist can help me get a lot of stuff in this society!! That's my advantage. From my experience, I don't think it's necessary to depend on your doctor for everything. Your blog really helped me to be more independent. I actually didn't learn to think this way until I read

your blog. I've been reading it for years.

Nancy Lebovitz (2010-05-23 15:31:17)

I don't think your foot fungus is currently caused by socks. You've got a background fungus which gets really active when you aren't meticulous about your socks. I don't know what would really cure it so that you don't have to care about your socks any more than most people do, but it might be worth thinking about.

seth (2010-05-23 15:36:42)

Yes, it's true that one foot is sensitive to what socks I wear and the other isn't. But if I wear the right socks the problem disappears – whether a background fungus remains or not. Perhaps wearing the right socks long enough will make the background fungus disappear.

Kerry (2010-05-24 07:59:26)

Could the fungus be candida-related, from eating too much sugar or yeast?

Aaron (halotek) (2010-05-24 12:39:06)

Honestly, I've personally noticed that the "TYPE" of sock matters the most. Certain socks — even the ones that say they wick the most moisture, were some of the socks that made my foot fungus the worst (because they fit so tight on the foot). Now that I wear thin socks made out of mostly bamboo – I have never had a problem, even if I rewear socks the second day. Also, I notice that the type of shoe matters too. You have to have shoes that are not too constrictive and let air in – which is why I pick shoes with a lot of holes. I know I've solved the problem because I had the problem from age 15 to 2 years ago which then I was 28. Now I walk barefoot in gyms in the bathing area – so i know I figured out the problem. Bamboo socks or very very thin material that breathe='s NO FOOT FUNGUS. Shoes that breathe ='s NO FOOT FUNGUS.

Aaron (halotek) (2010-05-24 12:42:46)

Also, I'd consider switching shoes once your problem goes away – the fungus seems to take root in the shoes when you have an active infection.

seth (2010-05-24 13:19:20)

Aaron, thanks, that's very interesting. Where did you get your bamboo socks? I see online they are \$8/pair. Whereas socks in China are 30 cents/pair. And what observations are behind your idea about getting new shoes? It isn't so easy to see that point of that, since I've managed to get rid of the visible problem without doing so.

Coconut Oil Cures Foot Fungus | Coconut Oil (2012-04-15 17:21:33)

[...] later I discovered that socks matter. With a much larger number of socks, my foot fungus got much better. Apparently the fungus died if it didn't come in contact with my foot within a week or so. (I had [...])

## **Dangerous Fish Oil (2010-05-23 19:42)**

Many people take fish oil to get omega-3. (I get mine from flaxseed oil.) Fish contain PCBs, therefore fish oil does. How much? More than we're told. [1]A lawsuit has been filed about this:

Mateel Justice Foundation, in conjunction with two individual plaintiffs, brought a lawsuit against six fish oil manufacturers and two retailers for labeling violations of the California Safe Drinking Water and Toxic Enforcement Act, also known as Proposition 65. Filed March 2 in Superior Court of San Francisco, the suit alleges several fish oil products sold in California failed to include label warnings for levels of PCBs (polychlorinated biphenyl compounds) found in the products by testing initiated by the plaintiffs . . . Named

as defendants in the suit were two retailers—“CVS Pharmacy Inc. and Rite Aid Corp.”—and six manufacturers—“General Nutrition Corp. (GNC); NOW Health Group Inc.; Omega Protein Inc.; Pharmavite LLC (Nature Made brand); Solgar Inc.; and Twinlab Corp. . . . The plaintiffs conducted testing on 10 products produced or sold by the defendants, looking at all 209 known PCB compounds . . . Many fish oil companies test for as few as seven such compounds.” [emphasis added]

The plaintiffs plan to post testing results [2]here (I have been unable to reach this site).

1. <http://www.naturalproductsinsider.com/news/2010/03/major-fish-oil-products-face-prop-65-suit.aspx>

2. <http://www.fishoilsafety.com/>

---

M (2010-05-24 04:45:39)

I looked at the “natural products insider” link. It seems that most of the “fish oil” supplements they’ve tested so far have been brands that claim to be from shark and cod liver. I’ve long heard that these are types to avoid because of contamination. Instead, I tend to go for fish oil that is “molecularly distilled” and from sources like sardines. I would be interested to see their testing results from these types. I hope it will be better! I know you have found evidence to contradict the claim that flaxseed oil is less effective than fish oil. My personal experience (though I have not collected data) is that fish oil seems to be better for me than ground flaxseed. Have you considered doing any comparative analysis using fish oil?

Chris Robbins (2010-05-24 06:38:08)

Yeah, I think the general consensus is that the conversion of ALA is not efficient and is inhibited further if the diet is rich in the omega-6 fatty acids, which are found in most vegetable oils and processed food. Add to that the possible link of flaxseed oil to increased prostate cancer in men which is most likely due to the lignans being removed from the flaxseed. Seems like the best idea is to eat real fish most days of the week.

Alrenous (2010-05-24 07:41:28)

Eat fish that often and you’ll get a substantial dose of mercury. With fish it’s basically pick your poison, though now I have to look into a couple things. Apparently it’s not impossible to make good fish oil, if you believe this review. <http://www.healthy-oil-planet.com/carlson-cod-liver-oil.html> You can also go for krill oil, which is a bit pricier but has lots of pros over fish oil. <http://ca.news.finance.yahoo.com/s/04032010/29/link-f-prime-zone-neptune-krill-oil-tests-below-strictest-detection-limits.html> <http://www.proteinpower.com/drmike/uncategorized/why-krill-oil/> (I don’t supplement oil at all...yet.)

Richard A. (2010-05-24 08:44:07)

PCB exposure from common foods – <http://www.omegavia.com/fish-oil-supplements-and-pcbs-should-you-worry-part-2/>

Richard A. (2010-05-24 09:50:15)

Ultra Refined Omega-3 Product Reports – <http://www.ifosprogram.com/IFOS/ConsumerReport.aspx> The above site gives the PCB content along with other pollutants by specific brand.

Sam (2010-05-24 12:23:32)

As long as you’ve brought up the subject, Seth, shouldn’t you also mention high degree of uncertainty regarding the harmfulness of PCBs and dioxin at these dosages? Even if it were undoubtedly harmful, the harm must be measured against the harm that is caused by refraining from being dosed with omega 3 from marine sources. Which is not to say that one shouldn’t purchase

the purer brands of oil if you can afford the difference in price.

Chris Robbins (2010-05-24 14:40:49)

Alrenous, Depending on which fish you eat will you get a substantial dose of mercury. Stick to wild alaskan salmon & smaller fish like sardines you should be fine. It has also been shown that the selenium & vitamin E that you get from fish reduces mercury toxicity. <http://www.nutraingredients.com/Research/Vitamin-E-and-selenium-could-reduce-mercury-toxicity>

James (2010-05-24 19:54:52)

Are PCBs found in fish worldwide, or just in the US/Europe? Although I guess supplements could be manufactured where fish oil is cheapest and shipped everywhere.

Alrenous (2010-05-25 07:18:43)

Interesting Chris, thanks.

Robert Reis (2010-05-25 08:20:49)

Hemp oil (not hemp seed oil), does it cure cancer? <http://www.cannabisculture.com/articles/5169.html>

Nemod Kedem (2010-06-17 00:39:14)

I absolutely agree! However, there is a better source for Omega 3 than flaxseeds. This is the Clary sage seeds oil, which contains 50 % ALA, just like flaxseeds oil, but it is highly stable, up to two years in room temperature, and contains over 100 other components that work together for our health. Check out my blog for more info, or contact me directly. Stay healthy!

DamnDirtyApe (2010-07-11 15:12:13)

Omega 3 supplementation is only one side of the equation - lowering O-6 intake in the first place is the other. From what I've read, the overall 3-6 ratio is more important than pure O-3 intake. Thus, the less PUFAs you consume the less one needs to bolster O-3 from the start. Grass fed meat and avoiding most seed oils in the diet are the best way I am aware of to do that.

gwern (2011-01-15 10:57:14)

The site seems to be up now, eg. [http://org2.democracyinaction.org/o/6491/p/salsa/web/press\\_release/public/?press\\_release\\_KEY=36#test\\_results](http://org2.democracyinaction.org/o/6491/p/salsa/web/press_release/public/?press_release_KEY=36#test_results) worked for me just now to get the 10 tested brands and the graphs of test results. Unfortunately for me, my brand (Nature's Answer) isn't up there. It of course says it's been tested for PCBs, but I suspect the tested brands' labels also say that...

ToniRoberts (2011-06-17 01:39:26)

I've read that fish is a good source of omega-3, but the problem was that in eating fish, you can get a dose of mercury. Then along came krill oil and fish oil. fish oil is okay, except that it has less antioxidant content that makes it more prone to oxidation and becomes easily rancid.

## **Autism and Prenatal Ultrasound (more) (2010-05-24 11:58)**

I [1]blogged earlier about Caroline Rodgers's idea that prenatal ultrasound may cause autism. She believes this idea isn't getting the attention it deserves.

Recently she wrote to the head of Health and Human Services:

The latest autism prevalence figures released in December showed that while the overall autism rate increased more than 50 % in the four years ending in 2006, there were significant differences across eth-

nic groups. White women had a much higher incidence of autism among their children than Black or Hispanic women. White mothers had 9.9 autistic children per 1,000, versus Black mothers who had 7.2 and Hispanic mothers who had 5.9.

There were also geographic differences. Among the 10 states with monitored sites, Alabama and Florida had the lowest autism rates, with averages of 4.2 and 4.6 per 1,000, respectively – far lower than the two states with the highest autism rates, Arizona and Missouri, which tied at 12.1 per 1,000. One interesting apparent statistical anomaly occurred among Alabama’s Hispanic population, which had a 68 % decrease in autism while the overall national increase was 57 %. In trying to understand why Alabama Hispanics had such a decrease in autism, I searched for evidence of public health policy changes. What I found was a surprise: according to a CDC multi-state surveillance report, Alabama and Florida were two of three states that had cutbacks in Medicaid funding for prenatal care during the time mothers in the study were pregnant. (The third state, West Virginia, was not among those monitored for autism in the latest study.)

Digging deeper, I turned up a CDC report on the timing of entry into prenatal care. The report showed that although most women started prenatal care in the first trimester, the percentages of both Black and Hispanic women who lacked early (first trimester) prenatal care were nearly twice that of White women . . . Over the span of the 10-year study, more women [in] all ethnic groups received early prenatal care, but the 2-to-1 ratio remained the same. . . .

Taken together, these three CDC reports tell a disturbing story: as more women . . . received more early prenatal care, the autism rate among their children increased, with those women receiving the most early prenatal care having the highest percentage of autistic children. . . .

A rigorous UC Davis study, published in January, of California children born between 1996 and 2000 identified 10 autism clusters . . . Highly educated women were much more likely to have children diagnosed with autism than parents who did not finish high school. In six of the clusters, the rate was as high as 4 to 1. Returning to the CDC Entry into Prenatal Care report, it is striking to note that in 1997 only 8.5 % of pregnant women with some college education had delayed prenatal care, versus 29.9 % of women who were not high school graduates – further [linking] early prenatal care [and] autism.

A study published in November on prenatal ultrasound trends from 1995-2006 found that the odds of a woman receiving an ultrasound during a prenatal visit nearly doubled over [those] 10 years. . . . The geographical and ethnic differences . . . dovetail with many of the geographical and ethnic differences found in the latest autism prevalence report. For instance, Southern women were 40 % less likely to receive an ultrasound during a prenatal visit than Northeastern women, which could help explain why Florida and Alabama had the lowest autism rates among the states monitored. Also, Hispanics, who had the lowest overall autism prevalence rates in both the 2004 and 2006 CDC reports, were 20 % less likely to receive an ultrasound during a prenatal than White women.

Not all the statistics available in these reports support the idea that prenatal ultrasound is causing autism. For instance, Southern states such as Georgia and North Carolina did not have low autism rates, but [perhaps this is because] the ultrasound trends study did not take into account “keepsake” ultrasound . . .

She also notes that a study by Yale neuroscientist Pasko Rakic “found that prenatal ultrasound disturbed neuronal migration in mice.”

Here is the broad argument. 1. Autism is correlated with wealth. It is absurd that autism causes wealth; it is unlikely that both are caused by something else. Thus this correlation makes it plausible that autism is caused by something

that rich people have more of than poor people. Obviously rich people have more prenatal ultrasound. 2. A localized decrease in autism happened at the same time autism almost everywhere was increasing. At the same place and time prenatal ultrasound screening surely declined. This correlation is very difficult to explain with other ideas about what causes autism. Dozens of things (e.g., genes, diagnostic criteria) previously proposed as explanations of autism remained roughly constant at the same time as the decrease. 3. The mice data make the linkage considerably more plausible, assuming (a) the ultrasound dosage was reasonable and (b) humans with autism have unusual neural wiring that resembles the changes seen in the mice.

The full letter is on [2]her blog. [3]An article by Rodgers about this

1. <http://www.blog.sethroberts.net/2010/01/23/does-prenatal-ultrasound-cause-autism/>

2. <http://carolinerodgers.wordpress.com/>

3. <http://midwiferytoday.com/articles/ultrasoundrodgers.asp>

LemmusLemmus (2010-05-24 12:31:30)

Not the definitive study, but here's a quick idea: What about countries in which ultrasound is paid for by universal healthcare systems? I'm thinking specifically of my native Germany where, it seems to me, pretty much every pregnant woman gets a few ultrasounds - the number of ultrasounds mothers get seems to not be related to socioeconomic status. (I'm basing this solely on anecdotal evidence.) This suggests that the social gradient in autism should be less extreme or nonexistent in Germany and similar countries - if there is truth to the theory.

david (2010-05-24 13:04:28)

This reminds me of the story of Ignatz Semmelweis in Superfreakonomics...

seth (2010-05-24 13:26:41)

Good point, David. That was another disease of wealth. Cured by studying correlations.

Rachael (2010-05-24 14:00:00)

I wonder what the Autism rates are in communities that decline medical care like Christian Scientists and Amish? Also, I have always been curious to see the accidental death adjusted life expectancy rates for those groups, I suspect that they have as much if not longer life spans as people with the full benefit of western medical care. How to explain the high rates of Autism in recent African immigrants? I suspect they do not get ultrasound at a high rate. Many attribute the difference to vitamin D status. I also think that there are in fact a range of physical syndromes that are lumped together as autism spectrum. I can't imagine the cause will be a single environmental stressor, but rather a variety of stressors added to particular genetic traits.

MT (2010-05-24 14:02:17)

Thanks for blogging about this. I remember your original post, and this is still the only place I've heard anything about it. Any idea how to get the NYTimes or Washington Post or the like to pick it up? It seems incredibly important and I have the feeling linking this post to my FaceBook account won't be enough to get people's attention. Obama isn't on my friends list. Perhaps a tangential thought, but in a competitive information environment, what are the ways to help things that are both important and reasonable enough to deserve wider audiences go viral? Obviously, you're doing your part by blogging about it, but what else could launch this idea to another level of attention? Rodgers needs a PR agency to help her get her important message out.

Alasdair (2010-05-25 01:08:52)

Seth, you say "[i]t is absurd that autism causes wealth" – but I thought there was at least one psychology study that suggested Fortune-500 CEO's were more likely than most to have at borderline autistic tendencies? And isn't the wealth factor potentially part of the "worried well" syndrome? To have a child diagnosed autistic, isn't it an advantage to be white, middle class, to have appropriate health insurance, with enough free time to worry about the possibility and to take the child round the specialists? I don't mean to rain on anyone's parade – I love your work on personal observations – I just wonder whether this correlation has rather more possible common contributing factors than most ideas that reach your blog.

seth (2010-05-25 06:19:16)

Alasdair, it is absurd that having an autistic child makes the parents or their neighbors wealthier. You are raising the "both X and Y caused by something else" possibility, which I do not say is absurd for the reason you say. But that possibility and your worried well idea only explain one of Rodgers's three lines of argument, which I list at the end. This is why her case is so persuasive (compared to other theories of autism): It is supported by three disparate kinds of evidence. MT, I suppose the NY Times would write about this if something relevant was published in a good scientific journal.

jay (2010-05-25 08:47:48)

Of all the speculation as to the causes of autism, I believe this theory: [http://seedmagazine.com/content/article/when\\_two\\_minds\\_think\\_alike/](http://seedmagazine.com/content/article/when_two_minds_think_alike/) I highly recommend his book "The Essential Difference" if you have not read it. It changed the way I look at everyone by giving me a new framework of understanding, even if you don't agree with everything laid out.

MT (2010-05-25 19:41:13)

What if Stephen Levitt got interested and did a back of the envelope analysis for his blog? Seems like the data would be readily accessible. Maybe you could put Rodgers in touch with him :)

seth (2010-05-26 00:17:40)

jay, I don't like the theory you mention because, in my experience, genetics has never been shown to cause any common problem, in spite of many claims to the contrary. To bet on that theory is to bet on a horse that has never won a race. Autism runs in families, the author says – yes, and so did pellagra.

jay (2010-05-26 06:57:29)

If you don't think genetics plays a part in brain function or personal tendency, I invite you to do a little anecdotal research on hoarding in families – and not just parent to child, but with uncles and grandparents that have little contact with offspring and so on, when it skips a generation and so forth. I've seen it with my own eyes on several occasions. Certainly not the foundation for a theory, but, perhaps a hypothesis for an experiment... I'd still suggest reading Simon Baron-Cohen's book, even if you think it's wrong, because you never know.

Links « Rhymes With Cars & Girls (2010-05-26 18:43:22)

[...] Does prenatal ultrasound cause autism? [...]

questioneverything (2010-05-28 20:44:26)

Interesting [beginning] look at data...however extrapolating that ultrasound is the cause of such a problem is pretty far fetched. there are a lot of other factors that most likely are playing into such a phenomenon. more education quite often means older maternal age, which is linked with a higher rate of birth defects, for women as well as men for many types of diseases. while none of these studies specifically point to this it may play a role. access to prenatal care can often be similar to access to consistent/frequent pediatric care. if children with subtle behavioral differences do not receive frequent care, their chance of being diagnosed with such a disorder is less likely. this is a fact. autism is a disease with a wide spectrum of presentations. these studies are also incapable of closely examining the myriad of variables such as the intricacies of diet, exposure to cell phones and other radiation, as well as any other thing to could be added to this potentially endless list. the truth is...autism is a vague umbrella of a diagnosis. it encompasses what we will probably list as a hundred variations of behavioral disorders

once the technology and true understanding of the pathophysiology is there. until then blogs like this poke vague assumptions using series of unrelated data.

seth (2010-05-28 23:52:01)

question everything, of course there are plausible alternatives. Who said otherwise? But you have failed to give a reason that prenatal ultrasound – which unlike more prenatal care, has been shown to cause neuronal abnormalities (in mice) – is NOT plausible. Autism has greatly increased over the last 20 years – maternal age has not. Nor has prenatal care. Prenatal ultrasound has greatly increased over the same period. jay, my claim is that genetics hasn't been shown to be important in any common health problem (e.g., diabetes, obesity, heart disease). Hoarding isn't a common health problem. Sure, there are gene by environment interactions for common health problems. But in the right environment, nobody would have the problem – at least that is what the data seem to say. A theory that ignores environmental causation is a hard sell, given that data. But I agree I should read Baron-Cohen's book.

Alex Chernavsky (2010-05-29 13:02:11)

Regarding genetics and its role (or lack thereof) in common health problems: Seth, [1]this paper claims that BMI has a heritability of about 33 %. Is that figure an over-estimate in your opinion, or is 33 % below the threshold at which you would consider it to be important?

1. <http://www.bvsde.paho.org/bvsacd/cd65/Stunkard.pdf>

Mark (2010-05-31 20:01:32)

The classic "Mere coincidence?" story. A couple of my favorites are that the obesity epidemic was caused by the metric system (kilojoules harder to keep track of than calories), and by electric blankets (nighttime energy use decreased). Make a timeline of changes in society and correlate them with whatever bad trend and see what aligns. It's especially easy with autism since there is no real hard start date for the epidemic, to the point that many informed researchers think the whole epidemic may very well be fake. This is similar to the data mining for correlation research that 95 percent of "science" is these days. Dump 1,000 characteristics each for 1,000,000 people into a computer and discover that cancer correlates highly with people who wear blue paisley neckties.

nyxpooka (2010-06-30 03:09:02)

I can say from personal experience that having an autistic child has definitely not improved my economic condition! It is very expensive to get all the treatments my son needs and the little bit of SSI he gets really isn't cutting it at all...

A link between ultrasound and autism? « A Fistful of Science (2010-07-15 19:48:26)

[...] So naturally I perked up when Seth Roberts blogged about a possible link between autism, which has defied easy genetic explanation, and fetal ultrasound. Science writer Caroline Rodgers has done the leg work.Â From her 2006 article in Midwifery Today (an old favorite from my days at the NYU interlibrary loan department): Early studies showed that subtle effects of neurological damage linked to ultrasound were implicated by an increased incidence in left-handedness in boys (a marker for brain problems when not hereditary) and speech delays.(5) Then in August 2006, Pasko Rakic, chair of Yale School of Medicine's Department of Neurobiology, announced the results of a study in which pregnant mice underwent various durations of ultrasound.(6) The brains of the offspring showed damage consistent with that found in the brains of people with autism. The research, funded by the National Institute of Neurological Disorders and Stroke, also implicated ultrasound in neurodevelopmental problems in children, such as dyslexia, epilepsy, mental retardation and schizophrenia, and showed that damage to brain cells increased with longer exposures.(7) [...]

A link between autism andÂ ultrasound? « A Fistful of Science (2010-07-15 19:50:31)

Dorothy (2010-07-26 15:48:29)

In this particular study they are showing that women typically White and well educated receive health care earlier and more often. So perhaps the link isn't accurate that educated white women have autistic children more often, but rather well educated white women know what the signs are, and know that something may be wrong and can afford to get tests and seek further health care for their child. Where women of other ethnicities or lower education levels don't know what they are looking for/do not have the financial means to get their child properly treated/diagnosed. This shows nothing more than faulty statistics and lacks scientific evidence. What about a study showing the actual effects of sound waves on a fetus.

AB (2010-08-02 02:00:15)

Back in 1987 when I was pregnant with my last child I researched ultrasound which was not around for the first two. Not only was there a book out about the dangers but the head of radiology for a New England hospital said it was dangerous for the fetus and he would never have his wife use it. I was convinced. I would not use it for fear of harming my child. I am white and educated (if you overlook the fact I didn't finish my dissertation at Stanford). I chose a birth center over a hospital. I was in at 4 am and home by 9 am. The less intervention the happier I was. I was an outlier and didn't give a damn. I fail to understand why educated women bow down to the medical mafia instead of researching. I think the poor know better - danger lurks in the white coats. (My father was a board certified MD who taught at a med school, had a private practice and published many articles. Maybe this is why I know white coats can hide danger.) @Dorothy - all that has long ago been taken into consideration and found to be of no consequence

Drew (2010-08-05 23:14:40)

As the expecting father of twins currently in the care of a high-risk OB practice that uses frequent ultrasounds, I read Rodgers' Midwifery Today article with great interest. (And, before continuing, I want to disclose that my wife and I originally began our care with midwives and wanted desperately to deliver naturally, preferably in water, with little-to-no modern-medicine micromanaging.) In fact, I've spent the last 4.5 hours reading the full text of every linked reference (and then some) and found it to be little more than a fear-mongering propaganda piece full of logical fallacies, irresponsible generalizations and academic dishonesty (most notably in the distortion of quotations and scientific data from the original sources, as well as the selective ignoring of authorial conclusions that contradicted her own argumentative goals). I could produce a publishable response to Rodgers' disinformation at least equivalent in length. Most notable, however is that: -The mice study has no scientific bearing on an argument re: human fetuses. Read the full text (I could quote a dozen or more passages discrediting Rodgers' use of this data); then read the peer-reviewed commentary/response to the study's findings, also published in the Proceedings of the National Academy of Sciences, found here: <http://www.pnas.org/content/103/34/12661.full> -Pay special attention to the way Rodgers equates the actual FDA language of the way ultrasound "heats the tissue slightly" to hyperthermia (a gross exaggeration) and then goes on to equate the negative effects of hyperthermia (true) to fetal development. -Note that her direct quotation (from the Cochrane Database) about Doppler ultrasound was pulled from the headline of the summary/abstract without reading the full text of the findings (lazy would be a compliment here). Even the Main Results portion of the summary states, "there were unexpected findings suggesting possible harmful effects, but the explanation for this is not clear." <http://www2.cochrane.org/reviews/en/ab001450.html> I could seriously go on and on (sources since pulled from publication for being outdated, 28 year-old WHO data, the lack of a single reputable source cited in the article that uses both the terms "ultrasound" and "autism"...). As a faculty member in a university composition program, I'm tempted to use Rodgers' article in my courses as an analytic example of how writers use fallacy and manipulation to obscure truth in research-driven argumentative writing. I'm not claiming that ultrasound technology is 100 percent safe in all circumstances. (In fact, during my wife's next ultrasound, I plan to hover over the technician and not only inquire as to whether she can

accurately read the thermal monitor on the machine (doubtful, so the literature implies), but implore her to remove the transducer from my wife's stomach at the exact moment that it's no longer medically necessary.) No, I'm writing simply to say Rodgers's hasty (another compliment) correlative conclusions about ultrasounds and autism are little more than the unfounded autism explanation du jour. Please: Read some of the cited sources, carefully, and compare them against Rodgers' version of the facts. I think you'll be as astounded as I am. <http://www.fda.gov/downloads/ForConsumers/ConsumerUpdates/ucm095602.pdf> <http://www.medpagetoday.com/Radiology/GeneralRadiology/3882> <http://www.truth-out.org/article/ultrasound-can-affect-brain-development> [#corresp-1](http://www.pnas.org/content/103/34/12903-abstract?maxtoshow) <http://www.pnas.org/content/103/34/12661> <http://mrw.interscience.wiley.com/cochrane/clsysrev/articles/CD001450/frame.html> <http://www.newscientist.com/article/dn1639-fetuses-can-hear-ultrasound-examinations-.html>

Seth Roberts (2010-08-06 05:56:40)

Drew, I looked at the first two links you gave. I saw nothing reassuring in them. Then I looked at the PNAS link. It referenced an Australian experiment I didn't know about. The experiment found no clear differences between children given five ultrasounds and children given only one. That is reassuring, yes. But it also referenced three studies I hadn't known about that did find clear differences. In one, children exposed to ultrasound had lower birthweights. The other two studies were with animals and found damage due to ultrasound. (You can find details [1]here.) So I ended up more concerned than I began. I don't understand why the following quotation – "there were unexpected findings suggesting possible harmful effects, but the explanation for this is not clear." – supports your case. Just as puzzling, you complain that Rodgers quoted a headline "without reading the full text". You seem to be saying that the full text makes the headline misleading or wrong but I have no idea why. You don't provide a good explanation of why autism is more common among rich parents than poor ones, or a good explanation of the anomaly in autism rates Rodgers noticed (in a certain place autism went down rather than up). I thought the anomaly in autism rates was her strongest point. In summary, I'm unable to understand the force of any of your criticisms. And you seem to have ignored the epidemiological evidence for what Rodgers says. I'm sorry we can't communicate privately about this because I think you have something valuable to say – I just can't figure out what it is.

1. Drew (2010-08-06 07:55:57)

Hi Seth. Thanks for responding to my thoughts. I wonder if our links are shooting to different places. <http://www.pnas.org/content/103/34/12661.full> sends me to "Our Unborn Children at Risk?," the aforementioned commentary critique of the mouse study. The first paragraph under the "How Well Matched..." subsection clearly explains the scientific invalidity of the mouse study for human understanding (bone density, brain size, concentrated wave length, duration of waves, etc.). The second paragraph of this subsection would nicely sum up my own conclusions about ultrasound on human fetuses – let's be careful with this technology, use it prudently, but not assume it's causing harm, because we have no reason to believe such. Do you not link to the information I'm referencing? I clicked to your link, which is also quite interesting, and I noticed the bit about lower birth weights, but you had to have noticed the follow-up sentence stating that none of the children remained underweight or at risk. Quite the contrary, that, "There were no significant differences indicating deleterious effects of multiple ultrasound studies at any age as measured by standard tests of childhood speech, language, behaviour, and neurological development." Compounded with the other two animal studies you alluded to – which, if they were anything like the mouse study, have little-to-no bearing on humans because of the way they're conducted – I don't understand how you're more concerned than you began. You chose not to acknowledge the fact that Rodgers equated the slight thermal effect of ultrasound waves on humans with hyperthermia, then equated hyperthermia with autism. This would be like saying that every time I'm in the frozen-foods section of the grocery store my body temperature drops a degree (F) or two, and that hypothermia can cause the loss of extremities, so there's as good a chance as any that the frozen-foods section is causing the loss of extremities. I will admit that I may have wrongly assumed that Rodgers did not actually read the Cochrane study

because A) she quoted verbatim from the overly generalized headline/abstract (poor form at even the freshman undergraduate level) and the Cochrane study is the one that was removed from publication for being outdated. Considering Rodgers wrote her original article in 2006, it's possible she clicked through and paid the fee to read the entire article. Possible. I'll leave it at that. I cannot explain the correlations between socioeconomic status and autism rates because I'm neither social nor medical scientist. Neither is Rodgers. Besides evidentiary problems, I took great issue with the manner in which Rodgers' original article was written. Before I get to the host of logical fallacies present in her argumentative assertions, consider the 6th paragraph of her article, which (referring to the mouse study) claims that, "The research also implicated ultrasound in neurodevelopmental problems in children, such as dyslexia, epilepsy, mental retardation and schizophrenia." Yet, the wording of the mouse paper actually states, "Furthermore, there are numerous human neuropsychiatric disorders that are thought to be the result of misplacement of cells as a consequence of abnormal neuronal migration." Thought to be. In a study/paper about how ultrasound can cause abnormal neuronal migration in mice, the inference to connect the previous statement with ultrasound is there. I'll admit that. But what Rodgers claimed and what the researchers claimed are two different things. It's an irresponsible inference, in my opinion, to drop the buzzword "ultrasound" into the Midwifery Today article when it didn't appear in the original context "just because most readers won't notice. Finally, as for logical fallacies, I spotted all of the following: -Hasty Generalizations (not enough examples or untypical examples) -Post Hoc, Ergo Proper Hoc, which translates to "After this, therefore because of this." The example here is, "Wealthy babies have better health care (and probably receive more ultrasounds) and have higher rates of autism, so wealthy babies have autism BECAUSE they have better health care (and probably receive more ultrasounds). -Non Sequitur ("it does not follow"). An example from Rodgers' article might be, "Therefore, if repeated experiments show that elevated heat caused by ultrasound damages fetal brains in rats and other mammals, one can logically assume that it can harm human brains, too." No, one can't, for a number of reasons. -Ignoring the Question (Instead of dealing with the topic under discussion, the writer deliberately creates a diversion). See the sections on Hot Tubs/Saunas and the flashback to the vaccination debate, the former autism explanation du jour championed by Jenny McCarthy and taken seriously by no one except the socioeconomically privileged suburban housewives these fear tactics are meant to scare. -Question Begging (assuming the truth of a debatable point and basing the rest of the argument on that shaky assumption). I don't think I need to even explain here. My problem with Rodgers' article, you see, is about both scientific validity and presentation, though mostly with the latter. The bottom line for me is that Dr. Rakic (from the mouse study) clarified, "Our study in mice does not mean that use of ultrasound on human fetuses for appropriate diagnostic and medical purposes should be abandoned. Instead, our study warns against its non-medical use." Yes. Okay. No more boutique, keepsake ultrasounds. Great. But for Rodgers to skew this data (along with the FDA's and others') into claiming that ultrasounds under the care of an Obstetrics professional (and for medical use) are causing autism is disingenuous at best, unethical propaganda for the Midwifery Way at worst.

Seth Roberts (2010-08-06 08:52:57)

Drew, thanks for the clarification. I now understand your position much better. There's no way to deal with your comments briefly so I hope at a later date to write about them in a blog post. If/when I do I will notify you by email.

Seth Roberts (2010-08-06 11:53:13)

see reply: <http://www.blog.sethroberts.net/2010/08/06/unnoticed-conflicts-of-interest/>

dana (2010-10-23 00:14:23)

Go to you tube: type in "Behaviorally Fragile Autistics" on you tube. This is a most interesting case of autism, self injurious behavior and seizures. Very complex, but not without hope. There are some very important points seen in videos that would help professionals and anyone working with this unique population.

## Restaurant With No Menu (2010-05-25 08:13)

Today I had lunch at a Beijing restaurant with no menu. You choose dishes in discussion with your waiter. The restaurant's theme is kung fu. Somehow having no menu is kung-fu-like. A sword hung on the wall and there were other

martial-arts decorations. As we left, the wait staff said an ancient Chinese good-bye loudly in unison. It meant "the mountain and river will still be here [a metaphor for enduring friendship], let's make a concrete date to meet again." Only one of our two dishes was really good but I'll go back.

---

### **Prenatal Ultrasound and Autism: Lack of Study (2010-05-25 13:53)**

Caroline Rodgers, whose ideas [1]I blogged about yesterday, wrote to me about lack of research on the possibility that prenatal ultrasound causes autism:

I have heardÂ confidentially that applications for funding of prenatal ultrasound studies (not specifically investigating autism) have been repeatedly denied over the years – whichÂ helps explain the great paucity ofÂ safety studies, especially since the early '90s, when the FDA approved anÂ allowable eightfold increase in acoustic output.Â As recentlyÂ as this year, funding was denied an ambitious, multi-site study that would have investigated if there was a relationship between ultrasound and autism.

In 2006 when Yale neuroscientist Pasko Rakic announced the results of his study that found prenatal ultrasound interrupted neuronal migration in mice in a way that was consistent with the brains of autopsied autistics, I was surprised that several scientists, including Rakic, did their best to downplay the results. At the time, Rakic was one of many of Autism Speaks's scientific advisors.

I have spoken with various people throughout the NIH about my concerns [about ultrasound]. They all pointed to various large studies they believe are investigating ultrasound as a possible environmental cause of autism – most recently, the National Children's Study and EARLI, but when I tracked down the study designs, it turned out that ultrasound is not being studied.

In [2]a report at the time Rakic's study was published, he indeed downplayed the results:

Dr. Pasko Rakic, chairman of the Yale department of neurobiology and leader of the study, was quick to offer parents reassurance about the safety of ultrasound – done for the proper reasons – in human pregnancies.

"If I had a daughter and she was pregnant, I would recommend she had it for medical reasons," Rakic said.

Another researcher agreed:

"I couldn't agree with him more," said Dr. Joshua Copel, a professor of obstetrics, gynecology and reproductive sciences at Yale and spokesman for the American College of Obstetrics and Gynecology (ACOG).

He was not involved in the study. . .

The researchers noted that mice are very different from humans, so the results of their study must be interpreted with caution.

"The forms of migration [of brain cells] and the timing of migration differ in primates like humans than in mice," Copel said. "In humans, there is a much longer period in which neurons [nerve cells] are migrating."

Does that sound "very different"?

1. <http://www.blog.sethroberts.net/2010/05/24/autism-and-prenatal-ultrasound-more/>

2. <http://www.dentalplans.com/articles/15759/ultrasound-might-affect-baby-s-brain-development.html>

---

Steve (2010-05-26 15:41:23)

Well, if someone "20 years experience as an editor in daily and weekly journalism" (her [1]bio from Midwifery Today) disagrees with some prominent researchers in neurobiology and obstetrics from a backwards school like Yale ... our instinct should be to trust the editor over the two people who have spent their life studying the subject. Obviously. (Rodgers also [2]compares herself to Einstein. Seriously.) And if it doesn't sound "very different", it means that Copel is having a hard time dumbing it down for us. Ask him to provide the information like he would to one of his grad students. Sure, it might take you eight years before you can figure out how to digest it properly, but at least you won't think that he's BS-ing you. Two experts believe the correlation is noise in the data. One complete non-expert thinks that there's something there. The math is simple.

1. <http://midwiferytoday.com/bio/biopop.asp?name=rodgers>

2. <http://carolinerodgers.wordpress.com/about-me/>

seth (2010-05-26 16:27:38)

"If it doesn't sound "very different" it means that Copel is having a hard time dumbing it down for us." Sure about that? I have no idea what you mean about a "correlation" (what correlation?) being noise. Have you heard the term "praise with faint damn"? If all you can say against Rodgers's case is that she compared herself to Einstein and has less credentials than a Yale professor, you make her case sound very good.

Steve (2010-05-27 07:55:58)

Sorry - but the Yale professors are pointing out that mouse brains develop very differently from human brains. Given the end result - most of us are smarter than the average mouse - that seems quite fair. Can mice even be autistic? Rodgers is using the difference in Autism rates amongst black, white and hispanic populations to claim that Autism is caused by *ultrasounds*. She does not attempt to control for any factors, whatsoever. Using her arguments, I can compare black and white populations and conclude that sickle cell anemia can be prevented by increased exposure to ultrasounds. The difference between these populations is more than just a difference in access to medical care. Medical care amounts to more than just ultrasounds. The link is so tenuous to be laughable. And people who understand how a fetus develops, how a brain develops, and how an ultrasound works find the theory too laughable to investigate. The cause for autism is unknown. Hard to think that a neurobiologist would not be interested in discovering it. And yet, despite having already done work on ultrasound and brain development, he laughs off the idea instead. The bottom line is that Rodgers has identified that different ethnic groups within the United States have different rates of autism. That suggests that there are genetic factors involved. Instead, she made some sort of leap to ultrasounds; but that's most certainly not what the evidence appears to suggest. Then add in a few easily found facts: 1. A healthy pregnant woman with a normal pregnancy should receive 2-4 ultrasounds, depending on how early she began her care, and where she is. 2. Ultrasounds have been standard for pregnant women (in the Industrialized world) since

the late 1960s. So why the recent spike in autism diagnoses?

seth (2010-05-27 14:11:46)

"The Yale professors are pointing out that mouse brains develop very differently than human brains." I would use the verb "claiming" rather than "pointing out" but since you seem to agree with them, please tell me: what are the similarities and differences in development? Your distortion of Rodgers's argument is extreme. The notion that ultrasound may be dangerous is far from "laughable". Rakic did his study to investigate that very possibility. "She does not attempt to control any factors" – please read my post and you will see that I say that the localized correlation she noticed controlled many factors. Her argument has a lot more to it than comparison of different ethnic groups. Why the recent increase in autism? Prenatal ultrasound has been increasing and the dose has been increasing – that's one possible answer. If you think prenatal ultrasound exposure for pregnant women in the industrialized world has been constant "since the late 1960s" you are wrong.

Joseph Paysse (2011-05-09 17:28:38)

"THEY" made fun of Semmelweis also and denied any connection between unwashed hands and childbed fever (post partum sepsis). I think I read that he (Semmelweis) eventually committed suicide because of the ridicule about his theory. I think demographic studies would be the easiest line to pursue to establish a connection, e.g. the incidence of autism in primitive peoples, those whose prenatal care was done by midwives and who received no prenatal ultrasound scans etc. vs. those who had multiple scans for whatever reason especially when done in the first trimester.

## Columbia University Valedictorian Plagiarizes Comedian (2010-05-25 19:27)

Columbia, you have a problem. First, [1]President Lee Bollinger. Then [2]former provost Jonathan Cole. Then [3]several business school professors. Now [4]this.

A fish rots from the head, as they say. I disliked [5]The Sociopath Next Door (repetitive, preachy) but it may be relevant here.

Thanks to Bryan Castañeda.

Vic (2010-05-26 12:22:39)

I fail to see what harm was done. He retold a story that was appropriate for the occasion. The value of ideas is that they can be recycled. Seems like it would have encumbered the speech to include a citation in the midst of it.

seth (2010-05-26 14:30:53)

"I fail to see what harm is done." The harm to Columbia University's reputation is considerable – this guy was supposedly the best in his class. One comment was "Stupidest valedictorian EVER." Damage to Columbia is why a Columbia administrator got involved and publicized the speaker's apology. Moreover, people like to get credit for their ideas. [1]This paper was based on [2]my work. Notice the great similarities and how poorly it credits my work. The lack of attribution bothered me then and bothers me now. See also [3]this perfectly appropriate rant by Patton Oswalt (whose joke the valedictorian stole) complaining that Nick Madson, another comedian, stole his work (via [4]Andrew Gelman). At the time my work was used with poor attribution I consoled myself that intellectual theft was the sincerest form of flattery; now I can console myself that it also happened to Oswalt, whom I admire.

Bryan (2010-05-26 15:26:29)

It "encumbers" the speech to say, "The comedian Patton Oswalt said..."?

Sam (2010-05-26 17:55:18)

Seth, not everyone endorsed Bollinger's performance in front of Ahmadinejad - I pointed out at the time that his performance was cowardly, narcissistic and hypocritical - which makes him the perfect leader for the Columbia you describe: <http://politicalmavens.com/index.php/2007/09/25/bollinger-the-coward/>

seth (2010-05-26 17:58:25)

Sam, thanks for pointing that out. I am glad that someone agrees with me.

Vic (2010-05-27 15:44:09)

There's a difference between a scholarly article and a feel-good speech. And, yes, the anecdote is much more enjoyable to the audience when told as a first-person account rather than through citing a source as one might do in the case of a scholarly article.

Tom (2010-05-28 20:41:44)

Vic, I think the audience's enjoyment might have been tempered when they later heard that they'd been lied to – and their expensive education devalued – by the fraudulent Brian Corman.

seth (2010-05-29 20:10:38)

The very last bit of the Columbia education of the Class of 2010 includes some high-profile plagiarism in which they were taken in . . . it will be interesting to see how their later charitable contributions to Columbia compare to earlier and later classes.

jack (2010-06-09 23:21:19)

This post neglects to mention that the plagiarized joke was delivered by the Valedictorian of the School of General Studies, not Columbia College, which is the undergraduate program most people assume is being referred to when Columbia University is mentioned. [http://en.wikipedia.org/wiki/Columbia\\_University\\_School\\_of\\_General\\_Studies](http://en.wikipedia.org/wiki/Columbia_University_School_of_General_Studies)

## **Excellent Jonathan Franzen Story (2010-05-26 16:42)**

The current issue of The New Yorker has [1]an excellent story by Jonathan Franzen. I enjoyed reading it (unlike most recent New Yorker fiction, unfortunately) and it's closely related to stuff I blog about.

It tells what happens after a girl is raped by a boy with powerful parents. Her coach wants her to report it but her

parents dissuade her. They are afraid of what the boy's parents would do to them. The mother is active in the local Democratic Party and says "I wish it had been anyone else." They have three other children – this one, they seem to decide, is disposable.

The story is so wrenching because the parent-child bond is usually so strong. But smaller abandonments happen all the time. When I was a graduate student at Brown, I was a teaching assistant. One of the papers I graded turned out to be plagiarized. I told the professor about it; he did nothing. I'm sure I know why: It would have been costly for him. Time-consuming, for example. He abandoned the student. Teachers, like parents, should teach right and wrong.

I [2]posted yesterday about a Columbia University valedictorian named Brian Corman who plagiarized part of his speech. Was this the first time he's plagiarized? Of course not. It's merely the first time he's been punished for it. I believe he's plagiarized many times and in some cases the teacher noticed. The teacher did nothing – thereby abandoning the student – because to do something would have been costly for the teacher. Had Corman been punished earlier, he would (a) not have been valedictorian (it would have gone to someone more deserving) and (b) not face ridicule for the rest of his life, since this episode will be preserved by Google. Likewise, [3]Adam Wheeler – a flagrant liar who almost graduated from Harvard without being caught – will be ridiculed the rest of his life. He too was abandoned by his professors, who surely noticed before now that he plagiarized.

That Brown, Columbia, and Harvard professors put their own comfort ahead of doing right by their students is unsurprising, given the examples set by countless university presidents and underlings. (Examples [4]here.) Why did Columbia University President Lee Bollinger [5]show a shocking lack of understanding of the purpose of free speech? (He's a law professor whose specialty is freedom of speech.) Because he thought it would be crowd-pleasing – and it was.

---

Nancy Lebovitz (2010-05-27 05:21:01)

There's an emotional difference between not punishing people when you owe it to them, and not defending them when you owe it to them. There are plenty of parents who will punish but not defend, and plenty who will defend but not punish.

Alex Chernavsky (2010-05-27 07:14:10)

Adam Wheeler *should* be ridiculed for the rest of his life, but he probably won't be. Jayson Blair (disgraced former *New York Times* reporter), Stephen Glass (disgraced former *New Republic* reporter), Elliot Spitzer ("Client #9"), and James Frey (author of *A Million Little Pieces*) all made come-backs to one extent or another. One wonders what you actually have to do in order to disappear from the public sphere altogether.

Kirk (2010-05-27 07:49:03)

I worked at a Fortune 50 firm for 25 years and saw many cases of managers failing to address problem employees. Sometimes it was due to conflict aversion; many people just don't like to get in the midst of conflicts, and improving (or firing) an incompetent

employee is definitely full of conflict. It didn't help that the rules and regulations about firing, which probably came from a few justified lawsuits, made it near impossible to remove someone for just incompetence. My father saw the same thing in the firm he worked for. Eventually, though, bad economic times came, and management ordered a percentage of employees to be dropped, and these people were fired during a recession. These people were mistreated two times; they had 'jobs' without producing real work or real results for too many years, and then were dumped into a poor job market without real skills. And the shareholders were ripped off all those years because these people not only didn't work, they were negative producers; they caused other people to cover for them. Productivity went up after the cullings. In summary, it's not just academia.

lance (2010-05-27 12:22:35)

"Was this the first time heâ€™s plagiarized? Of course not." Not "probably not" or "in most cases like this, there is a pattern of behavior" but "of course not." Sometimes Seth just goes over the deep end . . . he has no idea what this guy's past is. Of course not.

dilys (2010-05-27 12:24:59)

Over a good many years, I have run across a number of women who had been "interfered with" (as the saying used to be) by neighbors, family friends, more distant relatives. In about 90 % of the cases, parents, especially mothers, made it clear that family unity or social hierarchy meant that either the girl was blamed, or at least it was hushed up and the complaint ignored. This is a subset of the defining moment, particularly for females and particularly in more traditional & authoritarian societies (and I think Franzen is picking up on tribalism in the Progressive environment), when the child realizes that the don't-make-waves business-as-usual of the collective trumps individual happiness and welfare in the eyes of the parents. So frequent it is difficult to consider it cowardice. Likewise in business. Exceptional heroic myths to the contrary.

Vic (2010-05-27 15:55:03)

The whole notion of date-rape prosecution bothers me. I don't condone rape, but how can you build a case on one person's word? I know guys (or I should say, I believe their side of the story) who have had their lives upended by false accusations of rape. We also have the prominent example of the Duke Lacrosse case. On Adam Wheeler, I don't particularly condone what he did either, but you could also view it as acting out against an unfair system that rewards all sorts of unworthy people on the basis of arbitrary or shallow criteria, like accomplishment in sports or "leadership" in the case of a Rhodes or affirmative action (i.e., racism) in the case of admission to Harvard. I'm always astounded when people have such a black/white view of morality.

Mathew Ferguson (2010-06-03 00:49:52)

In my first year of uni we had a bunch of fellow computer science students steal programs from other students and pass them off as their own. The action taken over this blatant theft? An extension of four days was given (on an original 7-day project) for the thieves to resubmit their own work. No punishment, no consequences. End of the year and most of the thieves drop out of university entirely. This article makes me wonder if they had been plagiarising their way through high-school, consequence free, until it finally catches up with them where it means a hell of a lot. Are kids who are punished strongly but fairly when they are young less likely to commit bigger crimes when they get older?

#### **Four Transitions: Population, Forests, Obesity, and Fast Food (2010-05-27 14:37)**

Long ago Paul Ehrlich, a Stanford professor, wrote The Population Bomb. Yet you probably know about the demographic transition: A sharp decrease in family size when countries reach a certain level of wealth. Which implies a big problem with Ehrlich's forecasts. You probably don't know about three related transitions:

1. Forests. For a long time humans destroyed forests and forest area decreased. More recently, however, [1]forests have been regrowing as people leave rural areas for cities.
2. Obesity. In poor countries, rich people are fatter than poor people. In rich countries, the opposite is true: the

poor are fatter than the rich, presumably because the rich eat less factory food.

3. Fast food. On a recent visit to Tokyo, I was told that the number of fast food restaurants in Tokyo is declining.

1. [http://books.google.com.hk/books?id=\\_GgQ9poHECwC&pg=PA51&lpg=PA51&dq=reforesting+of+the+amazon+due+to+migration+to+cities&source=bl&ots=9p59U0aAtQ&sig=WRo0LwI5oTgPurv0KUg16r\\_5808&hl=zh-CN&ei=G7\\_3S5TzPIHY7AP3iLX6BQ&sa=X&oi=book\\_result&ct=result&resnum=4&ved=0CC4Q6AEwAw#v=onepage&q&f=false](http://books.google.com.hk/books?id=_GgQ9poHECwC&pg=PA51&lpg=PA51&dq=reforesting+of+the+amazon+due+to+migration+to+cities&source=bl&ots=9p59U0aAtQ&sig=WRo0LwI5oTgPurv0KUg16r_5808&hl=zh-CN&ei=G7_3S5TzPIHY7AP3iLX6BQ&sa=X&oi=book_result&ct=result&resnum=4&ved=0CC4Q6AEwAw#v=onepage&q&f=false)

---

Jim (2010-05-27 15:29:10)

QUOTE: "... More recently, however, forests have been regrowing" With the decline of print media, fewer trees are needed to produce those quaint 20th Century relics known as newspapers and books.

Alrenous (2010-05-28 01:46:06)

Paper use has been rising. <http://www.businessedge.ca/archives/article.cfm/paper-consumption-on-rise-study-14161>  
<http://chrislang.files.wordpress.com/2008/02/paper.png> Most pulp is from reforested places anyway, making up a whopping 75 % of pulp, with a further 16 % from wood farms.

Dirk (2010-05-28 04:58:42)

Dear Seth, I usually enjoy your blog, but today you got something seriously wrong. Please allow me a comments regarding "1. Forests:" There are huge problems with the so-called "Environmental Kuznets Curve" (EKC, referred to in your link). People start to understand now that all systems on Earth are interacting constantly. What the EKC actually shows is not a decline in pollution in wealthy countries, but an EXPORT of polluting practices to poor countries.

seth (2010-05-28 06:23:18)

Dirk, I wasn't referring to the Environmental Kuznets Curve in Point 1. I was referring to a graph (plus supporting data) showing that in many countries forests are in fact regrowing - a much more specific point than Kuznets was predicting.

Dirk (2010-05-29 02:04:28)

Seth, the link you provide directs to page 51 of the book - and there is no graph on this page. The point with forest regrowth is the same as with the EKC: the resources of rich countries get protected by importing wood (products) from poorer countries - which globally leads to continued deforestation, while it allows some countries to report regrowth of forests. But country statistics are calculations limited to artificially drawn areas, they are usually insufficient to show what is going on in nature...

seth (2010-05-29 11:08:23)

Dirk, the graph is on a different page. I think the interpretation you raise (export of pollution, export of deforestation) is plausible but less certain than you seem to say ("actually shows"). People in poor countries really are moving to cities in great numbers, as the more beneficent explanation implies. When rich people stopped getting fat, did they "export" the consumption of factory food to poor people? I think these transitions are important to know about no matter what the explanation turns out to be.

Dirk (2010-05-30 02:52:00)

FAO statistics show that global forest cover is still decreasing - and that is what counts in globally connected ecosystems, in my opinion. National statistics always only show one frame of the picture. Regarding the factory food I would not say it was 'exported' to poor people, as this usually happens within the same country. Middle class and rich people eat less factory food, but they are getting fewer. At the same time, the increasing number of poor lower class people within many industrialized countries continually increases their consumption of factory food, leading to the success of McDonald's and Starbucks - and to

the "obesity epidemic" of the masses, as we can see in many rich countries today. By the way, thank you for your time, the interesting discussion and the objective tone - it really is much appreciated!

seth (2010-05-31 01:01:42)

You're welcome, Dirk. Re the FAO statistics: I think it's important whether the rate of deforestation is increasing or decreasing. If the rate is decreasing, I think it suggests the transition I describe may be playing an important role. If not I would agree with you the deforestation is merely being exported. World population is still increasing, as far as I know, but I think the rate of increase is decreasing. I've never heard a demographer doubt the huge importance of the demographic transition.

## **The Unreasonable Effectiveness of My Self-Experimentation (2010-05-28 07:28)**

A good way to have new ideas, it's said, is to talk about the ideas you already have. After I [1] posted about advantages of self-experimentation, Bruce Charlton, the editor of Medical Hypotheses, invited me to write an editorial about it. Wondering what I thought gave me some new ideas and the editorial turned into a full-length article called "[2] The unreasonable effectiveness of my self-experimentation." For 20 years I'd been mystified by this. I'm not exaggerating, I had no idea what I was doing right. I wanted to know - so I could do more of, or at least continue to do, whatever it was - but I just couldn't figure it out.

1. <http://www.blog.sethroberts.net/2009/11/05/nassim-taleb-on-incompetent-experts/>

2. <http://sethroberts.net/articles/2010%20The%20unreasonable%20effectiveness%20of%20my%20self-experimentation.pdf>

---

epistemocrat (2010-05-28 10:53:18)

Hi Seth, I alerted Bruce to our Ancestral Health Symposium, which is, in part, an event that will bring ancestrally-minded self-experimenters together to share stories, socialize, and form a Biomedical Mutual Organization (according to Baines). Best, Brent

Mike Kenny (2010-05-28 19:14:28)

this was a great article, thoroughly enjoyed it, going to have to reread it i'm sure.

Dennis Mangan (2010-05-29 05:26:25)

Great, Seth. I'm printing out your article as I write. But do you think I should actually read it? It hasn't been peer-reviewed.

Dennis Mangan (2010-05-29 08:19:40)

Seth, your article is very good. I particularly thought that your invocation of Veblen and high vs. low status science was insightful. You mentioned the progress made in obstetrics by the relatively low status obstetricians, and I recently came across another example. Until the 1960s, many women who had Rh negative blood type gave birth to stillborn babies, the babies' condition being known as erythroblastosis fetalis (today, hemolytic disease of the newborn). In 1941, an M.D. named Philip Levine noticed that a woman who had a stillborn baby then proceeded to have a transfusion reaction from blood donated by the baby's father, and Levine connected the two incidents as related. As a result of his discovery of the Rh blood group, probably millions of lives have been saved. A chance observation by a prepared mind in a field of immediate practicality.

seth (2010-05-29 11:29:38)

Thanks, Dennis. The Rh negative story is a good example. In the 1940s, it was higher status to study that stuff than it is today. In the 1940s, UC Berkeley had a Human Nutrition Unit – a floor devoted to isolation experiments. Now such (relatively practical) studies are "old-fashioned" (that is, low status), such experiments are much less common, and the floor is used for other things. The ketogenic diet used to treat childhood epilepsy was developed in the 1920s but such treatments became low-status with the growth of the drug industry and more "scientific" treatments.

Hal (2010-06-01 13:17:22)

The Medical Hypotheses journal has unfortunately been involved in a major scandal recently which will essentially destroy it. The editor accepted an article by Peter Duesberg advancing his theory that AIDS is not caused by HIV. This led to a backlash and the publisher ordered the editor to switch to peer review to choose articles, which would probably force the journal closer to the mainstream. The editor refused, and was fired. It is unclear whether or in what form the journal will continue.

Cooking as science | Anthony Burgoyne (2010-06-29 15:22:09)

[...] Cooking is a particularly good science, because a) it can be done on a personal scale (no big bureaucracies required), b) experiments can be repeated and modified relatively easily (lots of trial and error rapidly and with little cost), and c) there is an immediate practical benefit to it (see Seth Roberts' concept of exploitation-exploration in his paper linked to here for one reason why this is important). [...]

The Incredible Success of the Amateur Scientist Model | Anthony Burgoyne (2010-07-04 11:46:03)

[...] 1. There is more flexibility in research and exploration, and in particular a scientist can work on a personally motivated problem. (See Seth Roberts' paper linked here for a discussion of some of these sorts of considerations.) [...]

Jianshe Liu (2010-07-27 03:56:51)

Hi, I'm very glad to read yr article, because I'm same like, have done some experiments on myself like a lab mice. I will publish my manuscript soon. Wish to talk with you sometime. Regards, J.S.Liu

## **The Foxconn Suicides (2010-05-29 11:39)**

Foxconn, located on the coast of China, is the largest electronics manufacturer in the world. They make iPhones, Wiis, and many other famous products. You may have read about [1]the epidemic of suicide that has broken out among its employees. There were two in the last few days, for example. The count now stands at something like a dozen suicides in about a month. The factory complex involved is gigantic, with perhaps 300,000 workers, but no question this is a terrible thing. The victims are all or mostly men in their early twenties. The median length of employment at Foxconn might be about a year.

Foxconn has appealed to my university (Tsinghua) and in particular my department (Psychology) for help. I'm told their assembly line was designed at Tsinghua. In any case, several people from my department (faculty and graduate students) have gone to the factory and tried to do something.

At a department meeting we discussed our department's involvement. I said it's really hard to make progress on such problems for reasons that might not be obvious. When I had trouble waking up too early, I started to study the problem via self-experimentation. All I cared about was solving the problem. Any answer was acceptable. I would spend as long as it took to find it. It took me 10 years to make visible progress. The first thing I figured out was that [2]the problem was partly due to eating breakfast – which sleep researchers had failed to discover.

Consider the Foxconn suicides. It would be incredibly helpful to figure out what's causing them. But few professors want to study a problem that they have no idea if they can solve nor how long it will take. They don't want to wait ten years to write a paper. By then their funding will have run out. If funding is assured regardless of progress, then

how does the funder ensure they are actually doing something? And few professors have total academic freedom. Their graduate school advisor, their academic friends, the people who control their career have certain beliefs. About which theories are good and which are bad. About which methods are "correct". If their results contradict these beliefs, if they use a "wrong" method, they will suffer, just as all heretics suffer. So there is pressure to come up with an acceptable answer using proper methods. This gets in the way of coming up with the actual answer.

This doesn't mean academic research is useless, but it does mean that professors work in shackles that outsiders are, in my experience, unaware of. I wrote about this in [3]my Medical Hypotheses paper. It is a big reason my self-experimentation found new and surprising answers to old questions: I had total freedom. All I cared about was finding the answer. I didn't care about publications. I didn't worry about funding. I had as much time as it took.

1. <http://www.nytimes.com/2010/05/22/technology/22suicide.html?scp=1&sq=foxconn&st=cse>

2. <http://escholarship.org/uc/item/2xc2h866>

---

Adam (2010-05-29 17:03:02)

Seth, this story is getting coverage here in Korea. I hope that there are changes that can be made. Awareness of the problem and not trying to cover up the issue may be a good start. Note, the US military faced similar concerns with suicides by members returning from the early deployments to Iraq and Afghanistan. A program designed to raise awareness of the issue was the response...not sure of its effectiveness. Also, there was/is a concern that the suicide rate may be higher than reported, as some may be reported as motorcycle and auto accidents. Q: Is there a higher than expected accidental death rate at Foxconn?

thehova (2010-05-29 21:00:31)

I've read about the incidents. A lot of people of the far east are frustrated by the entire economic model. Indeed, they produce the entire product but make little money compared to Apple, Microsoft, Dell, etc... Marketing and design is where the vast majority of the profit is made. Still, that doesn't really explain the higher suicide rate.

Vic (2010-05-29 21:21:31)

Considering that thousands of Chinese coal miners die each year and that tens, if not hundreds, of millions of Chinese have their lives shortened by lack of safety and environmental regulations, 13 suicides among a population of 300,000 of mostly young males suggests that preventing suicide is more high-status than preventing other forms of morbidity and mortality.

seth (2010-05-30 01:01:36)

Vic, my guess is that the owner of Foxconn feels embarrassed by what has happened. Due to the publicity of course. Whether journalists think it is higher status to cover Foxconn than a coal mine I don't know. Manufacturing is a much larger business in China than mining, so in some sense manufacturing is a bigger story.

thehova (2010-05-30 02:40:03)

Doesn't America have a startlingly high suicide rate for students who move off to college and live in a dorm (like Foxconn, where most workers live in dorms)? Dorm life (moving away from family, friends, and community) can initially be brutal.

John (2010-05-30 13:28:15)

Seth I'm on my final year, hopefully, of my phd. I learned the hard way why you don't take on a problem like the one you describe. I hate to say it, but it's really hurt my career. I love to take chances and try to push science in new directions but you

can't as a student or even as an academic unless you have such a reputation and huge research program that it won't cripple you. I'm really down on science right now as a result of these sorts of issues

Mark (2010-05-31 19:51:24)

This is not a problem. 12 out of 330,000 in 5 months. See the Wikipedia page on national suicide rates. Do the math. Half of these are probably copycat suicides which will fade out when the publicity dies. One thing Foxconn could do is not pay 6-10 years of "suicide compensation" to families. Foxconn has no obligation to them.

Linx « Rhymes With Cars & Girls (2010-06-12 06:31:28)

[...] Seth Roberts in talking about the Foxconn suicides has a critique of academia: It would be incredibly helpful to figure out what's causing them. But few professors want to study a problem that they have no idea if they can solve nor how long it will take. They don't want to wait ten years to write a paper. By then their funding will have run out. If funding is assured regardless of progress, then how does the funder ensure they are actually doing something? And few professors have total academic freedom. Their graduate school advisor, their academic friends, the people who control their career have certain beliefs. About which theories are good and which are bad. About which methods are "correct". If their results contradict these beliefs, if they use a "wrong" method, they will suffer, just as all heretics suffer. So there is pressure to come up with an acceptable answer using proper methods. This gets in the way of coming up with the actual answer. [...]

Patrik (2010-05-31 12:02:25)

Hi Seth, A bit off-topic but FYI with regard to one of your (and my) favorite themes, animal fat and sleep, one of my PaleoHackers reports similar effects: *"OK, so I know this isn't exactly rigorous clinical research, but I swear I need less sleep during the weeks in which I consume a lot of eggs (approx. 6-8 eggs/day). I can't think of any other factor off the top of my head. Anybody notice this?"* <http://paleohacks.com/questions/5411/more-eggsneed-less-sleep>

### **Ernst Wynder on the Nurses' Health Study (2010-05-31 15:42)**

It says a lot about the Nobel Prize in Medicine that Ernst Wynder, co-discoverer that smoking causes cancer, never got one. Wynder was also one of the founders of modern epidemiology. [1]Here's what he believed about the Nurses' Health Study:

He had a strong skepticism about methods of dietary assessment, and always felt that the failure of analytic studies such as the Nurses' Health Study to report associations between cancer and diet were due to a combination of random misclassification related to the imprecision of food frequency questionnaires and the narrow range of nutrient intake within a given population. I feel certain that he would have criticized the recent negative findings from the Women's Health Study on dietary fat and breast and colon cancer on similar grounds. This was one area where he felt that international comparisons at the ecological [country-by-country] level provided better etiologic support than [more] analytic studies, and he published many studies over a period of decades to make just that point.

For example,

He developed a friendship with Kunio Aoki at the Aichi Cancer Research Institute in Nagoya, Japan, which resulted in our study which found that Japanese men with smoking habits similar to American men had considerably lower lung cancer risks.

I didn't know that. It suggests that either Americans eat something that promotes cancer or the Japanese eat something that protects against it. I suspect it's the latter – specifically, the big consumption of fermented food in Japan and not in America. I'm sure the food-frequency questionnaires Wynder criticizes, written by Americans, are tone-deaf to fermented food. I doubt they ask about kimchi or kefir or miso consumption, or distinguish between pickles aged for a day and pickles aged for a year. In Japan, people eat fermented food in many forms: vinegar drinks, yogurt, other fermented milk drinks, and alcoholic beverages. Above all, they eat miso and long-fermented pickles daily. They also have [2]the longest life expectancy in the world.

peter (2010-05-31 17:34:54)

i've heard that standing bare feet in ground (i.e., grass over ground not cement, sand) drains one of electromagnetic frequency that accumulates in one's body, thereby eliminating the adverse health consequences of EMF's. I'm starting to do this now and may report back to you.

Robert Reis (2010-05-31 19:47:38)

Perhaps he did not deserve the Nobel Prize. The Scientific Scandal of Antismoking By J. R. Johnstone, PhD (Monash) and P.D.Finch, Emeritus Professor of Mathematical Statistics (Monash) <http://members.iinet.com.au/ray/TSSOASb.html>

The 50 Best Health Blogs (2010-05-31 19:50:32)

QUOTE: "It suggests that either Americans eat something that promotes cancer or the Japanese eat something that protects against it." Interesting. I was just reading the WeeksMD blog, which said there is a very strong connection between sugar and cancer. I would guess that Americans eat much more sugar than the Japanese do ... but I could be wrong. [1]Cancer and sugar  
Jim

1. <http://weeksmid.com/?p=3917>

Aaron Blaisdell (2010-05-31 20:09:46)

"It suggests that either Americans eat something that promotes cancer or the Japanese eat something that protects against it. I suspect it's the latter" I suspect both. I think the high consumption of fructose, in sugar and high-fructose corn syrup, for example, coupled with the high intake of rancid omega-6 dominant fatty acids, such as in industrially processed vegetable oils, in the American diet both contribute to cancer and other diseases of civilization such as metabolic syndrome and autoimmune diseases.

Jake (2010-05-31 21:08:49)

The typical Japanese male has at omega 6 to omega 3 ratio in their blood of 2 to 1 or less. The typical American male has a ratio of 20 to 1 or more.

Sam (2010-06-01 02:45:43)

One additional thing I'd look into: do they smoke the same tobacco? Tobacco in US might be spiced a lot different than in Japan, which might have a big effect on health.

dearieme (2010-06-01 04:00:24)

Why shouldn't it be a genetic difference? By the way, the cancer-smoking link was discovered by German workers in the Third Reich. I gather that it was ignored because people assumed they'd lied to please the virulently anti-smoking Fuhrer.

Darrin Thompson (2010-06-01 06:58:17)

The Nurses' Health Study was discussed extensively by Taubes in Good Calories Bad Calories. IIRC it came out with the "wrong" answer. Dietary fat was not showing up as linked to heart disease. That led to ideas like "we live in a toxic environment." That became a justification for ignoring previous study results and promotion of forms of study that could only confound results. The Seven Countries study which ultimately became the foundation for the belief that dietary fat is bad was the result of this kind of thinking. If it is indeed true that smoking is not linked to lung cancer, (using the Taubes "bad scientist, bad result" hypothesis) my head is going to hurt. I've got a lot of anecdotal evidence in my head that says smoking -> cancer... Although I wonder about dose and other forms of tobacco... Woof. I'm still not going to take up smoking.

seth (2010-06-01 06:59:26)

Robert Reis, thanks, very interesting article about problems in the case against smoking. Wynder had experimental evidence (from mice) that cigarettes were carcinogenic - evidence not mentioned in that essay. And all that rating of evidence ("second-rate") is misleading because the "second-rate" evidence is dismissed rather than examined to see what you can learn from it. I think the answer to the mysteries and paradoxes the article describes is that smoking does have beneficial effects. It's another example of hormesis.

Sheila Buff (2010-06-01 07:57:00)

In the US, about 90 % of people with lung cancer are smokers or former smokers, but of all smokers, only about 10 % get lung cancer. Assuming most smokers eat and are exposed to more or less the same things, this suggests that those who get lung

cancer have a genetic predisposition to it. That might or might not somehow be triggered by one or more dietary factors, one or more environmental factors, something else entirely, or some combination of factors. Interestingly, the monoclonal antibody drug bevacizumab (Avastin), which treats cancer by blocking vascular endothelial growth factor, is significantly more effective in people of Asian descent. It's possible that Japanese smokers have a genetic difference that makes them less susceptible to lung cancer. Cancer is extremely complex and highly variable and to think that single element can be responsible for causing or preventing it is simplistic. For example, mesothelioma is associated with asbestos exposure. However, most people who have extensive asbestos exposure from say a lifetime working in a shipyard never get this disease, and of those who do get it, probably less than half have any traceable asbestos exposure.

Alex Chernavsky (2010-06-01 09:07:30)

Regarding the Nurses' Health Study: Gary Taubes had a great article in the *New York Times Magazine* a few years ago: <http://www.nytimes.com/2007/09/16/magazine/16epidemiology-t.html>

Vic (2010-06-01 09:13:00)

Japanese differ from Americans in lots of habits, customs, genes, etc. If fermented food is making a difference to the health of the Japanese population though, there is likely sufficient variation in its consumption to examine whether it is associated with health among Japanese.

Wilhelm (2010-06-01 09:31:52)

This question (If Americans eat something that promotes cancer) has already been answered: It's in the milk. Casein is a powerful cancer promoter. The effect is very strong. How relevant the potential protective effect of fermented foods is, I don't know, but the negative effect of cows-milk is proven to be very strong.

PowerSource » Blog Archive » Medical researcher's skepticism about self-reported medical surveys (2010-06-01 10:08:44)  
[...] Ernest Wynder, co-discoverer of the link between smoking and cancer, was skeptical about the accuracy of dietary assessment surveys because, in part, of their "random misclassification related to the imprecision of food frequency questionnaires" [Via Seth's Blog\*\*.] [...]

Bret (2010-06-01 12:05:16)

I read something quite interesting the other week; while Japan has the longest life span, Asian-Americans in New Jersey live longer. This needs to tie into our overall understanding.

Mike (2010-06-01 17:23:29)

Sorry Wilhelm, but you're stretching when you say that "the negative effect of cows-milk is proven to be very strong." The negative effects of isolated casein have been proven to be strong but that doesn't tell us anything about milk itself. Whey, present in real milk but absent from the casein damning studies, has been shown to offer a pre-protective effect against cancer. On an observational level, where are the large amounts of cancer that we should be seeing amongst the Massai and other traditional dairy based cultures?

Vic (2010-06-01 19:52:09)

do you have any links for the effects of casein in people? In association studies, I've seen people drinking whole milk tend to have less heart disease and mortality than people who don't. Also, the timing of this is fitting: [http://news.yahoo.com/s/nm/20100601/us\\_nm/us\\_cancer\\_cigarettes](http://news.yahoo.com/s/nm/20100601/us_nm/us_cancer_cigarettes)

Nicole (2010-06-05 03:53:56)

The Japanese also eat a lot more sodium and LOT more iodine containing foods (seaweed and seafoods) than we do. It's hard to compare their diet to America, I think. There's just too many differences to pull out one variable.

seth (2010-06-05 04:20:29)

Nicole, I can't think of any reason that eating lots of sodium or iodine will add 5 years to your life. On the other hand, there are plenty of reasons to think that fermented food is tremendously healthy.

Tom (2010-06-05 08:36:39)

Not gain-saying you on fermented foods, but Dr. Davis writes a lot about how rampant iodine deficiency in the US has contributed to thyroid dysfunction (and a resultant susceptibility to heart disease and breast cancer.) [http://www.lef.org/magazine/mag2009/oct2009\\_Halt-on-Salt-Sparks-Iodine-Deficiency\\_01.htm](http://www.lef.org/magazine/mag2009/oct2009_Halt-on-Salt-Sparks-Iodine-Deficiency_01.htm)  
<http://heartscanblog.blogspot.com/2009/08/iodine-deficiency-is-real.html>

bob dobbs (2010-07-23 23:56:02)

Japan has Marlboro and Camel. They're all cigarettes. Given that seaweed is known to get rid of "hard to get rid of" toxins as well as nourish the lungs and throat (anything soft and slimy in the body), I'd say it's a safe bet that part of the Japanese connection involves mass amounts of seaweeds. Call it a hunch...

bob dobbs (2010-07-23 23:59:05)

The basic statistic is... Japanese are a nation of heavy smokers and yet have very low rates of lung and heart disease. Japanese also consume more seaweed than most. so... smoking + no lung cancer + seaweed = Japanese smoking + lots of lung cancer + no seaweed = American

George (2010-10-10 08:40:17)

I've been told that the genetic makeup of Japanese people precludes them from developing cancer from smoking. If your mother and father both smoked all of their lives lived into their 80's and had no lung problems, chances are you too can safely puff away.

## 5.6 June

### Butterfat Good? (2010-06-02 20:10)

I eat a lot of butter because I believe it makes my brain work better. [1]A new paper says it may help me in other ways. From the abstract:

Compared with those with the lowest intake of full-fat dairy [= "whole milk, cream, ice cream, yogurt, full-fat cheese and custard"], participants with the highest intake (median intake 339 g/day) had reduced death due to CVD (HR: 0.31; 95 % confidence interval (CI): 0.12–0.79; P for trend = 0.04) after adjustment for calcium intake and other confounders.

70 % reduction is huge – so large it makes the idea of direct causation (butterfat lowers CVD risk) more plausible. (However, there is a lot of uncertainty in the estimate.) The alternative is that butterfat intake is correlated with the true cause – a behavior difference, say. But that correlation would have to be very high, which isn't terribly plausible. Measured differences between the high-fat group and the low-fat group were small.

[2]Stephan Guyenet reviews other evidence that supports the idea that this reduction is no fluke. Other studies have found similar effects.

Thanks to Paul Sas.

---

Aaron Blaisdell (2010-06-02 20:56:56)

I eat cultured butter from pastured cows every day. It's one of my so-called "super foods" along with fermented cod liver oil (from Green Pastures). I discovered the virtues of butter after reading Weston A. Price's book, and have made it a staple of my diet ever since. Stephan does provide an amazing review of the evidence for its health benefits.

vic (2010-06-02 22:58:59)

the p for the trend is barely significant

Alex Chernavsky (2010-06-03 04:55:55)

Aaron, since you've researched the effects of butter, do you have an opinion as to whether it's the fat *itself* that has the beneficial effects, or some other substance (or substances) that co-occur with the fat?

Aaron Blaisdell (2010-06-03 06:55:56)

Alex, from my reading, I've gathered that a large part of the health benefits of butter come from the fat-soluble vitamins it contains, such as carotenes, D3, E, and K2. But it also contains a good fatty acid profile, with a significant amount of omega-3. And it contains conjugated linoleic acid (CLA) which -that appear to be very important in many physiological functions and possibly anti-cancer effects (in some animal studies). Then there's the self-reported anecdotal evidence of softer skin with fewer blemishes made by people who switch to using a lot of butter in their cooking. Here's a nice blog post about a study comparing butter to margarine: <http://wholehealthsource.blogspot.com/2009/10/butter-vs-margarine-showdown.html>.

CTB (2010-06-03 11:12:39)

About 9 % of the fatty acid in milkfat is butyrate (where the name butter comes from I would think). This fatty acid is unique to milkfat...other fat sources in the cow don't have it. Butyrate is known to support the colon (both differentiation and maintenance of colonocytes, as well as support of neurons which control the muscles that propel stuff through the lower gut). Usually it comes from fermentation of soluble fiber by enteric bacteria...one of the reasons to eat an apple a day...and/or to take probiotics. Don't know if butyrate that you eat makes it to the colon without being digested by the small intestine...but even then it would get dumped into the circulation in chylomicrons and presumably make its way to the blood supply in the colon. It would make sense that having butyrate in the food supply for baby calves would help their guts develop until their fecal flora increase enough to take over the job. Human babies take a few months to develop fecal flora; not sure about calves.

Hal (2010-06-03 13:03:15)

That study was in Australia, where I think most cows are grass fed. Worth keeping in mind, in other parts of the world. I do use grass fed butter (we always call it that, brings to mind huge sticks of butter grazing in the fields) but I'll have to start looking for GF milk, yogurt, cottage cheese etc.

Nile (2010-06-03 21:43:09)

I would like to suggest another explanation. But first the back story. Despite my name I am of Scandinavian heritage. My grandparents on my mother's side came from Denmark and my father didn't learn to speak English until he went to grade school. He spoke Norwegian at home. As some of you may know the north central Midwest was heavily settled by Scandinavians. My father had a joke about some Norwegian community in North Dakota that laid out a cemetery. They finally had to shoot somebody to get it started. ( Norwegian-American humor I guess ) Most of the world is lactose intolerant. From Wikipedia

“The frequency of decreased lactase activity ranges from as little as 5 % in northern Europe, up to 71 % for Sicily, to more than 90 % in some African and Asian countries.” So... perhaps high consumption of dairy fat leads to long life but I think that it is simply genetic. My sub theory is that exposure to cold winters helps “the cold stresses the body in a good way. Both my parents lived to 93 despite having “unhealthy” lifestyles. One Grandmother lived to be 96 after having 5 children and the other Grandmother lived to be 86 after having 17 children. So... dairy fat? I love it but I doubt it. Simply a coincident indicator.

Mara (2010-06-04 01:54:48)

Hi Seth, I am experimenting with butter consumption while trying to learn how to play the guitar, and so far I can really see a positive effect: on days when I eat lots of butter I feel my dexterity improves quite a lot. This got me thinking about the numerical test that you designed for your computer. Could the speed improvement in solving simple math problems be partly due to the brain working better, and partly to better dexterity? (speed of typing in the result). In my case, it seems to be doing both. I can read music faster (I have no formal training so basically I'm just learning how to read guitar tabs by myself), I learn new chords faster, and I can keep up my concentration for longer periods of time. The only problem is that my guitar doesn't have a strap, so I can't (yet) test whether standing up helps me learn better than sitting down.

seth (2010-06-05 03:29:30)

Mara, better dexterity is due to the brain. On the days that you “eat lots of butter” how much butter do you eat? Nile, you write “I would like to propose another explanation.” Another explanation of what? And what's your alternative explanation? The amount of lactase in the body depends on the amount of lactose in the diet. When you eat more lactose, your body starts making more lactase. When you eat less lactose, your body makes less lactase. That may be the reason for the differences from place to place in lactase activity.

Mara (2010-06-05 03:44:41)

About 75g (in multiple sittings). Not sure whether that qualifies as “a lot” in your experiments, but I find it difficult to eat more without getting nauseous (though eating small amounts many times during the day certainly helps, when feasible).

seth (2010-06-05 04:17:19)

Thanks, Mara. I've been eating 60 g/day, which is half a stick/day. I eat it in small amounts throughout the day.

Mara (2010-06-05 06:23:50)

Well, I live in France so I buy the 250g sticks of butter (made in Normandie) which are the standard here - not always easy to measure how much you eat, I guess 60-75g is the average amount. I try to keep this up 3/4 days per week, and eat no butter, or less than 15-20g on other days.

Glen Raphael (2010-06-07 11:16:20)

Did the study find any “overall mortality” improvement with full-fat dairy? (The abstract doesn't make this clear.) If not, you're just trading off one cause of death (CVD) for some other causes of death. Meaning the other way to say “butterfat makes you “less likely to die” from CVD” would be “butterfat makes you “more likely to die” from all causes other than CVD”. Do you just eat the butter plain, not on anything? That sounds really nauseating. Then again, so did/does drinking straight vegetable oil, I suppose...

q (2010-06-22 20:56:50)

just for kicks i tried butter instead of canola oil for my SLD oil two out of the last three days – that's about 2 1/2 tbsp per day. i plug my nose and rinse for about two minutes after eating the butter – i don't taste anything. i haven't noticed any brain effects – should i notice them without a test? as far as mood goes, i've been crabby the past few days, more than usual, but i got some bad (financial) news this week, and maybe that's why. appetite suppression is very strong. dunno if it's the butter per se or if it's just that i changed something.

seth (2010-06-22 21:01:22)

q, thanks for reporting results. You can notice the mood changes without a test. You can't notice the mental quickening without a test.

pozycjonowanie (2011-04-05 17:36:24)

I haven't looked in here for a long time for the reason that I thought it was becoming boring, however the last several blogposts are beneficial high-quality so I guess I'll add you back to my regular bloglist. You are worthy of it my friend :)

## **"A Great Change is Coming" (part 1 of 2) (2010-06-04 01:29)**

In [1]an earlier post, I wrote "A great change is coming" – meaning a great improvement in health. It will be due to better ideas. Let's call the new ideas evolutionary thinking. They will replace [2]gatekeeper thinking. With gatekeeper thinking, which began with shamans,Â you need to extract payment from sick people. Remedies and associated ideas that don't allow this are ignored. Gatekeeper thinking pervades not only mainstream medicine but also clinical psychology, alternative medicine, and a zillion advertisements. Everyone in those fields, like the rest of us, needs to make a living. The possibility that they are doing so at the expense of the rest of us – by suppressing innovation – is impolite to bring up. Perhaps the person you are speaking to has a brother who's a doctor. And for an enormously long time there was no alternative. A sick person doesn't have time to do research, even if that were possible. They are forced to rely on gatekeepers, who are interested only in certain types of remedies.

Now there is an alternative – now just a glimmer, but surely growing. It has several dimensions. One is the sort of research involved. At one extreme of that dimension is original research – for example, [3]my discovery that breakfast caused my early awakening. Gatekeeper thinking had no interest in such ideas. You could not charge for something that simple.Â I wrote about my discovery, with plenty of data. Anyone with web access can read it. At the other extreme of that dimension is "library research" – usually web search. An example is [4]Dennis Mangan searching for possible cures for his mom's Restless Leg Syndrome (RLS) and discovering persuasive stories about niacin. Again, there was no mainstream research about niacin for RLS. Anyone with web access can read what Dennis found. So for these two disorders – early awakening and restless leg syndrome – there is now a practical alternative to consulting (and paying) an expert. This isn't repackaged folk wisdom or home remedies or someone opining. There is clear-cut data and theory involved. In the case of breakfast and sleep, it makes evolutionary sense that food would cause anticipatory activity. Likewise, the case for megadose vitamins makes biochemical sense, as [5]Bruce Ames and his colleagues explained. You can judge for yourself.

Another dimension of this emerging space is the simplicity of the treatment. In my breakfast example, I established cause and effect with just one change: stopping breakfast. Dennis's example also involved a simple change: megadose niacin. In contrast, [6]Aaron Blaisdell found his sun sensitivity went away after he made many dietary changes. If you have sun sensitivity you will find it harder to duplicate what Aaron did than what Dennis or I did, but you can still come close and in any case it is a big improvement over the previous best treatment, which was to avoid the sun.

In all three cases – early awakening, RLS, and sun sensitivity – there was no gatekeeper approval. (My article with my breakfast discovery was peer-reviewed but appeared in a psychology journal rather than a medical one). In all three cases, the solution was excellent – cheap, fast, highly effective, no side effects – compared to prescription drugs (e.g., for depression). The sort of solutions that gatekeeper thinking doesn't find. In all three cases, you don't need to go through a gatekeeper to learn about them.

In a later post I'll describe why I think this emerging solution space will soon become far more important.

epistemocrat (2010-06-04 06:51:06)

One reason why this space may emerge is that the workforce shortages in the healthcare sector make access to primary care increasingly difficult and discontinuous.

Mike (2010-06-04 11:44:58)

Immediately thought of Seth Roberts when I read this. I have zero idea if it's accurate, but if so, not good: [http://reason.com/blog/2010/06/04/one-step-closer-toward-an-all?utm\\_source=feedburner&utm\\_medium=feed&utm\\_campaign=Feed %3A+reason %2FHitandRun+ %28Reason+Online+-+Hit+ %26+Run+Blog %29 &utm\\_content=Google+Feedfetcher](http://reason.com/blog/2010/06/04/one-step-closer-toward-an-all?utm_source=feedburner&utm_medium=feed&utm_campaign=Feed%3A+reason%2FHitandRun+%28Reason+Online+-+Hit+%26+Run+Blog%29&utm_content=Google+Feedfetcher)

David (2010-06-04 14:49:10)

Seth - Here is a guy who started a blog as a plea for help with his deteriorating health: <http://savemylyfe.blogspot.com/>  
On an unrelated note, here is a fascinating story on how the cure for scurvy (fresh lemon juice) was "lost" by the British: [http://idlewords.com/2010/03/scott\\_and\\_scurvy.htm](http://idlewords.com/2010/03/scott_and_scurvy.htm)

Barbarians at the Epistemic Gates | Anthony Burgoyne (2010-06-05 08:55:37)

[...] Seth Roberts, Professor Emeritus of Psychology at U.C. Berkeley, now teaching at Tsinghua University in Beijing, talks about a change in medical science away from "gatekeeper thinking" here: "A Great Change is Coming." [...]

## Cigarettes are Bad, Right? (2010-06-05 12:55)

My mom says her friends knew that smoking was harmful long before the Surgeon General's report in 1962; they smoked anyway. The evidence that smoking causes lung cancer began to be accumulated in the 1950s. At first it was a radical idea. The boss of one of the scientists involved, Ernst Wynder, [1]cut his research budget for continuing to study such a far-fetched notion.

Some of the details, indeed, did not make sense, as [2]this fascinating essay ("The Scientific Scandal of Antismoking", thanks to [3]Robert Reis) points out. Were I to teach a course in scientific method, I might make this essay the first assignment: "Tell me its strengths and weaknesses." Its strength is that it brings up new data that challenge a well-known idea (smoking causes lung cancer) that most people don't give a second thought to. The conventional view that smoking is simply bad [4]is surely wrong. The essay's weaknesses are a dismissive attitude ("second-rate") and a failure to learn from facts that don't fit the authors's ideas. For example, the big correlation between smoking and lung cancer that Wynder was the first to notice. What causes it? A more subtle lesson is that the big randomized controlled clinical trials are not the wonderful thing that most writers, including the authors of this essay, make them out to be ("the gold standard"). MRFIT was a hugely-expensive controlled clinical trial that produced no difference between the groups. It isn't clear why. What can we learn from this? I'd ask my students. One lesson is the value of doing the smallest possible study – if they'd figured out the problems with a small study (and designed a better study that avoided them) they would have had a better chance of learning something from their massive study.

---

Mike Kenny (2010-06-05 19:06:50)

i noticed when reading about some of the world's oldest people, that a couple of them were smokers late into life, though moderately so. a couple people i read about, first jeanne calment: "She smoked until the age of 117, only five years before her death.[14][1] Calment smoked from the age of 21 (1896), though according to an unspecified source, Calment smoked no more than two cigarettes per day.[15] She ascribed her longevity and relatively youthful appearance for her age to olive oil, which she said she poured on all her food and rubbed onto her skin, as well as a diet of port wine, and ate nearly one kilo of chocolate every week.[10]" that quote is from [http://en.wikipedia.org/wiki/Jeanne\\_Calment](http://en.wikipedia.org/wiki/Jeanne_Calment) the oil and chocolate consumption also catch my eyes as seth-robertsian themes–could chocolate consumption be like butter consumption, with its fattiness? then christian mortensen: "Mortensen enjoyed an occasional cigar and insisted that smoking in moderation was not unhealthy." that quote is from [http://en.wikipedia.org/wiki/Christian\\_Mortensen](http://en.wikipedia.org/wiki/Christian_Mortensen) certainly not strong evidence for smoking, but it caught my eye. their self restraint could signal high conscientiousness perhaps, which i think correlates with good health. i've wondered in the past why people are usually unable to smoke only a couple cigarettes, why they usually seem to do a pack or so a day if at all.

dearieme (2010-06-06 06:56:00)

"that Wynder was the first to notice": no he wasn't; the discoverers were in Nazi Germany.

Dirk (2010-06-06 16:09:26)

"The conventional view that smoking is simply bad is surely wrong." Following this style of argumentation I could easily point out

that putting a bullet into someones head isn't bad either - at least it will ultimately and totally prevent suffering from any and all diseases, be it Alzheimers, any cancer, diabetes, HIV etc etc. We have come a long way to expose all the lies of the tobacco companies and break free from hidden influences and paid pseudo-science (at least in the US, see <http://legacy.library.ucsf.edu/> - most other parts of the world are still struggling to break free). I can't think of any good reason to help those irresponsible criminals out...

seth (2010-06-06 17:19:42)

Dirk, you write: "Following this style of argumentation..." I linked to a long list of studies that show benefits of smoking. Whereas you are unable to link to a long list of studies that show benefits of "putting a bullet into someone's head." I think the benefits of smoking are really important to know because they support a claim I've made many times: our immune systems are badly understimulated. With huge health consequences (allergies, etc.) and an easy solution (eat more fermented foods). That's the "good reason" you can't think of. I agree that tobacco companies have horribly lied to and misled the public.

Stephen M (Ethesis) (2010-06-10 04:37:11)

In some settings there are dramatic correlations. Asbestos related health problems are extremely rare outside of two pack a day or more smokers, though they do definitely occur outside of that group. Black lung disease follows a similar pattern. Consider the overall incidence of lung cancer in America over the past twenty years. It has a definite shift. What is interesting is that you've pointed out that people who smoke one or two cigarettes a day may net an overall risk reduction. That is a thought that points to some interesting places, which you have noted, as well as alternatives (fermented foods) which have even fewer risk factors. But it takes true scientific inquiry rather than emotion driven response to think about things like this.

q (2010-06-10 19:53:44)

complete contrast with alcohol. there are plenty of studies and newspaper articles showing that a little bit of wine is good for you, yet everyone agrees that alcohol is addictive and too much alcohol will destroy your body. there is even a contrast with marijuana i suppose - people are willing to look somewhat at its beneficial effects, to a smaller extent. so why is tobacco the third rail? (disclaimer: i don't smoke at all and my father, a long-time smoker, died young of lung cancer.)

Roger (2010-07-30 16:29:05)

One problem is that there are so many "known" causes of lung cancers: arsenic (primarily in our water), radon gas, #1 diesel fuel (others are suspect), asbestos, and so on. Another problem is that the statistical report generators seem to inquire whether the patient is or was a smoker. If so, that's the cause! Science requires that every possible cause in each case be eliminated as the cause - pretty hard to do with diesel and auto exhaust fumes! Reports from at least three long-gone M.D.s (all my grandparents) had two of them heavy smokers and one of them with life-long exposure to second-hand smoke (she also had anginas from age 15). The two smokers died at 64 and 71 neither from any smoking related disease. The older one had a clear chest x-ray three months before his death - he chain-smoked unfiltered Luckies. The third, the non-smoker, died at 96 with no lung related disorders - her heart finally gave out. So let's put Sir Francis Bacon's scientific method to use on the problem and stop fooling the public. Big Oil is Big Campaign Contributor! It wasn't until the '50s that lung cancers became an issue - this ties in nicely with the rise of our trucks, cars and diesel fueled ships. That would be a start!

## **The Oneness of Fermentation (2010-06-05 16:37)**

[1]A New York article about the suicide of a Dalton student contains this [2]interesting observation. The dead boy

left filthy socks (which smelled, a cousin said, like kimchi) on his pillow

From which I conclude not only that kimchi is a good source of bacteria ("fermented foods" is a vague category - fermented for how long? - that might contain poor sources of bacteria) but also that our olfactory systems are good at

detecting bacteria or more precisely bacterial byproducts. (Kimchi and used socks involve vastly different bacteria but are lumped together.) We don't use smell to avoid predators or find food. We use vision and hearing for that. Maybe we use smell mainly to decide what to eat – to decide what contains calories (by learning smell-calorie associations, the basis of the Shangri-La Diet) and, as this observation suggests, what contains bacteria.

[3]Mark Frauenfelder says that fermenting foods (yogurt, sauerkraut, kombucha) makes him happy.

1. <http://nymag.com/news/features/66285/>

2. <http://nymag.com/news/features/66285/index2.html>

3. [http://www.happiness-project.com/happiness\\_project/2010/06/people-who-knit-are-usually-in-a-good-mood-people-who-stare-into-their-iphones-and-demand-your-attte.html](http://www.happiness-project.com/happiness_project/2010/06/people-who-knit-are-usually-in-a-good-mood-people-who-stare-into-their-iphones-and-demand-your-attte.html)

---

Jeff R (2010-06-06 11:08:11)

Mark refers to fermentation as making him happy in the context of making things. This is different from your discussion about possible mental effects of fermented food due to a dietary effect. He also says that painting makes him happy. This isn't really evidence for anything other than Mark thinking home projects are fun, which is not surprising or uncommon.

seth (2010-06-06 17:35:16)

Jeff R, you write: "possible mental effects of fermentation . . . due to a dietary effect"? I don't know what you're talking about. You can take Mark Frauenfelder's comments about fermentation to just be "thinking home projects are fun." Maybe that's all he meant. But I think the health benefits of fermented foods put making them in an entirely different class from building a bird feeder. Making fermented foods is also much easier than conventional home projects.

Alex Chernavsky (2010-06-06 18:48:23)

Seth, I'm glad that you linked to Gretchen Rubin's [1]blog ("The Happiness Project"). Although she doesn't explicitly use the term "self experimentation", that's exactly the approach that she used to determine ways to boost her own happiness. See also her book, which I enjoyed very much. She describes her book this way: "My book, [2]THE HAPPINESS PROJECT, is a memoir of the year I spent test-driving the wisdom of the ages, the current scientific studies, and the lessons from popular culture about how to be happy—from Aristotle to Martin Seligman to Thoreau to Oprah."

1. <http://www.happiness-project.com/>

2. <http://www.amazon.com/gp/product/B002VJ9HRK/>

Tom (2010-06-12 10:54:02)

Seth, you've talked a lot about the health benefits of fermentation, but I don't think you've discussed the role that vitamin K-2 may play. (The only mention of K-2 on your blog appears to be here: <http://www.blog.sethroberts.net/2008/08/12/weston-price-and-the-olympics/>) (The mk-7 form of K-2 is created by fermentation, particularly in stinky cheeses and in Japanese natto. And other forms of K-2, particularly mk-4, may be as important.) K-2 is crucial in the human body, because it activates a compound which the body uses to move calcium where the body needs it (the skeleton and teeth) and away from where it is a health hazard (the organs and the lining of the arteries.) The additional K-2 Europeans get by eating more (esp. stinky) cheese may account for part or all of the "European paradox." some links: In mice, high-dose K-2 \_regresses\_ arterial calcium deposits by 50 % in six weeks (!) : <http://wholehealthsource.blogspot.com/2008/11/can-vitamin-k2-reverse-arterial.html> <http://www.ncbi.nlm.nih.gov/pubmed/17138823> Damaged teeth can heal themselves with K-2 (with D3) [in the absence of the standard Western diet]: <http://wholehealthsource.blogspot.com/2009/03/reversing-tooth-decay.html> More on K-2: <http://wholehealthsource.blogspot.com/2008/06/vitamin-k2-menatetrenone-mk-4.html>

## Can John Gottman Predict Divorce With Great Accuracy? (2010-06-06 15:29)

[1]Andrew Gelman blogged about the research of John Gottman, an emeritus professor at the University of Washington, who claimed to be able to predict whether newlyweds would divorce within 5 years with greater than 90 % accuracy. These predictions were based on brief interviews near the time of marriage. Andrew agreed with another critic who said these claims were overstated. He modified Gottman's Wikipedia page to reflect those criticisms. Andrew's modifications were removed by someone who works for the Gottman Institute.

Were the criticisms right or wrong? The person who removed reference to them in Wikipedia referred to [2]a FAQ page on the Gottman Institute site. Supposedly they'd been answered there. The criticism is that the "predictions" weren't predictions: they were descriptions of how closely a model fitted after the data were collected could fit the data. If the model were complicated enough (had enough adjustable parameters), it could fit the data perfectly, but that would be no support for the model – and not "100 % accurate prediction" as most people understand it.

The FAQ page says this:

Six of the seven studies have been predictive—each began with a hypothesis about factors leading to divorce. [I think the meaning is this: The first study figured out how to predict. The later six tested that method.] Based on these factors, Dr. Gottman predicted who would divorce, then followed the couples for a pre-determined length of time. Finally, he drew conclusions about the accuracy of his predictions. . . . This is true prediction.

This is changing the subject. The question is not whether Gottman's research is any help at all, which is the question answered here; the question is whether he can predict at extremely high levels (> 90 % accuracy), as claimed. Do the later six studies provide reasonable estimates of prediction accuracy? Presumably the latest ones are better than the earlier ones. The latest one (2002) was obviously not about accurate prediction estimates (its title used the term "exploratory") so I looked at the next newest, published in 2000. Here's what [3]its abstract says:

A longitudinal study with 95 newlywed couples examined the power of the Oral History Interview to predict stable marital relationships and divorce. A principal components analysis of the interview with the couples (Time 1) identified a latent variable, perceived marital bond, that was significant in predicting which couples would remain married or divorce within the first 5 years of their marriage. A discriminant function analysis of the newlywed oral history data predicted, with 87.4 % accuracy, those couples whose marriages remained intact or broke up at the Time 2 data collection point.

The critics were right. To say a discriminant function "predicted" something is to mislead those who don't know what a discriminant function is. They don't predict, they fit a model to data, after the fact. To call this "true prediction" is false.

To me, the "87.4 %" suggests something seriously off. It is too precise; I would have written "about 90 %". It is as if you asked someone their age and they said they were "24.37 years old."

Speaking of overstating your results, [4]reporting bias in medical research. Thanks to Anne Weiss.

### **Probiotics Help Preterm Infants (2010-06-07 07:38)**

It has just come to my attention that [1] a systematic review published two years ago found that probiotics help preterm infants ward off necrotizing enterocolitis. Here is a summary of the review:

Necrotizing Enterocolitis (NEC) is a serious disease that affects the bowel of premature infants in the first few weeks of life. Although the cause of NEC is not entirely known, milk feeding and bacterial growth play a role. Probiotics (dietary supplements containing potentially beneficial bacteria or yeast) have been used to prevent NEC. Our review of studies found that the use of probiotics reduces the occurrence of NEC and death in premature infants born less than 1500 grams.

The reductions in the likelihood of this disease and of death (presumably from this disease) were both greater than 50 %.

1. <http://mrw.interscience.wiley.com/cochrane/clsysrev/articles/CD005496/frame.html>

---

smilinggreenmom (2010-06-12 10:14:00)

That is such great information! Probiotics really are truly amazing. I think we are going to see that much more research will start to show just how many ways they can help us. Our son takes his chewable Belly Boost everyday because it has been the one and only thing to greatly help his skin with eczema flares. They have been life-changing for us!

### **Show-Off Professors (2010-06-07 15:30)**

A new [1] Jeffrey Eugenides short story quotes Derrida. Quote 1:

In that sense it is the *Aufhebung* of other writings, particularly of hieroglyphic script and of the Leibnizian characteristic that had been criticized previously through one and the same gesture.

Quote 2:

What writing itself, in its nonphonetic moment, betrays, is life. It menaces at once the breath, the spirit, and history as the spirit's relationship with itself. It is their end, their finitude, their paralysis.

"A little Derrida goes a long way and a lot of Derrida goes a little way," said a friend of mine who was a graduate student in English. These quotes show why. In [2]Theory of the Leisure Class, Veblen argued that professors write like this (and assign such stuff to their students) to show status. I have yet to hear a convincing refutation of this explanation nor a plausible alternative. Is there a plausible alternative?

Veblen was saying that professors are like everyone else. Think of English professors as a model system. Their showing-off is especially clear. It's pretty harmless, too, but when a biology professor (say) pursues a high-status line of research about some disease rather than a low-status but more effective one, it does – if it happens a lot – hurt the rest of us. Sleep researchers, for example, could do lots of self-experimentation but don't, presumably because it's low-status. And poor sleep is a real problem. Throughout medical school labs, researchers are studying the biochemical mechanism and genetic basis of this or that disorder. I'm sure this is likely to be less effective in helping people avoid that disorder than studying its environmental roots, but such lines of research allow the researchers to request expensive equipment and work in clean isolated laboratories – higher status than cheap equipment and [3]getting your hands dirty. I don't mean high-status research shouldn't happen; we need diversity of research. But, like the thinking illustrated by the Derrida quotes, there's too much of it. A little biochemical-mechanism research goes a long way and lot of biochemical-mechanism research goes a little way.

---

Daniel Lemire (2010-06-07 18:31:34)

This may have several causes, beside vanity. (1) People tend to emulate the best researchers... and, unfortunately, they pick up both their qualities and defects. So, these English professors may simply write this way because they have trained themselves to look like other professors in order to become one. In effect, these bad habits become "social viruses". (2) It is well known that departments tend to hire new professors who look like them. It is likely that the candidates who do not write such nonsense appear different, even rebellious, and they are less likely to be hired.

Todd Hargrove (2010-06-07 18:36:51)

Another explanation is simply to obfuscate real meaning in a way that will prevent criticism and/or hide the fact that nothing new or interesting is being said. I notice this especially in papers that can be expected to receive critical review, or in papers where the conclusions are rather obvious and already known by common sense.

seth (2010-06-07 18:58:42)

I agree, sheer copying is a plausible explanation. It can't explain why it started, but it can be part of why it continues.

Alex Chernavsky (2010-06-07 19:14:43)

See also an excellent article called, "[1]Letter From Yale", by Helena Echlin. I've reproduced the first two paragraphs below.  
===== I am sitting in a windowless conference room. The walls are lined with sets of leather-bound books with gold-lettered spines. "The ode must traverse the problem of solipsism," a young man is saying. He pauses for a long time. Underneath the table, one leg is twisted around the other. A stretch of gaunt white ankle shows between trouser and sock. "In order to approach participating in." He pauses again, his body knotted like a balloon creature made by a children's entertainer. Finally, in one rush: "The unity which is no longer accessible." My fellow

students utter a long soft gasp, as if at a particularly beautiful firework. "Brilliant," says the professor. "Very finely put. But I didn't quite understand it. Could you repeat it?" I write the sentence down in my notebook, like everyone else in the seminar. *The ode must traverse the problem of solipsism before it can approach participating in the unity which is no longer accessible.* When I have pieced it together, I realise he is talking nonsense. I am struck by the thought that literary criticism "at least as it is practised here" is a hoax. =====

1. <http://www.aretemagazine.co.uk/read/03-autumn-2000/letter-from-yale/>

Eric (2010-06-07 19:19:30)

The alternate explanation is that they genuinely are able to find meaning (decode?) these fragments of Derrida/other theory guys and it isn't the bullshit you think it is. I definitely don't endorse this hypothesis, but it is there.

Sam (2010-06-07 21:18:54)

Seth, Seth - anyone who had the privilege, as I had, when as a Yale graduate student in English in the 70s, I watched Derrida, visiting for a summer or a term, spend a long lunch "fascinating" an attractive young woman at the Old Heidelberg, would not be casting about for a plausible alternative. For one golden moment - which stretched from the 60s to the early 80s - humanities professors of reputation had access to the pleasures that only poets were reputed to have had in the 19th and early 20th centuries - but with regular meals and TIAA-CREF to look forward to. And it wasn't only the male professors: an untold tale is the liberties that prominent women deconstructionists took with handsome, glowering young critics who burned with a gemlike flame. However I am too much of a gentleman to name names. When, with my Ph.D. from the greatest English department the world had ever or would ever know in hand, I arrived at my first (and last) teaching job at BU, an English professor in his late 40s put his arm around my shoulder and said, "Sam, let me give you some serious advice about your career. You're 27 now? The first thing to go is your stomach, and we [we intellectuals? we scholars?] can't afford that. Sit-ups, my boy. Sit-ups. You'll thank me in 20 years." He waved me into a seat in his office, next to the day-bed covered with an Indian cotton print I hadn't seen since the late 60s. The life of the mind.

Aaron Blaisdell (2010-06-07 21:31:32)

Look at a roschach image long enough, and you're bound to see something that is not there. The brilliance of the humanities profession was to write about it and then sell their writings to the collegiate masses.

Nathan Myers (2010-06-07 22:38:52)

I wish somebody had given me the advice Sam got. But I didn't study English. See?

david (2010-06-08 08:34:46)

Remember that humanities professors are under pressure to publish lots of original research but the research they do doesn't lend itself to any kind of qualitative measurement, so they're only evaluated based on quantity. This creates a "signal to noise" problem: there are too many articles and books published and they're all longer than they need to be. If you have a 1/2 way clever idea that merits a short article, you turn it into a book, etc. I'm sure there are some worthwhile ideas in there somewhere, but it's not worth sorting through all the crap to get to it.

ChristianKI (2010-06-08 15:19:15)

Microbiology isn't useless in the same sense that literary criticism is. DNA sequencing gets better much faster than Moore's law and DNA synthesis gets cheaper as well. While they are basic technology that don't cure illnesses by themselves, they are tools that allow us to better understand our bodies and to build proteins and RNA ourselves. <http://genome.fieldofscience.com/2010/05/breakthrough-cure-for-ebola.html> is an example of how research into siRNA's with were discovered through high status research can cure Ebola. It's cured monkey and they still have to do human trials but if we have an effective new way to combat viruses than it's worth a lot. It's not a cure that got created through researching Ebola itself. Without doing basic biochemical research we probably wouldn't even know about siRNA's. It's also not possible to do stuff like that without having the basic microbiology toolkit that high status folk created.

seth (2010-06-08 15:57:17)

ChristianK, I partly agree. Showing off isn't the only thing going on. Some sorts of work are inherently more useful than others and the desire to display status doesn't change that, it just reduces the usefulness. For example, perhaps 95 % of research done by Berkeley engineering profs is useless – I've heard that estimate. Well, 5 % useful is a lot more useful than is coming out of the English department. On the other hand, your example is telling because Ebola is incredibly minor compared to diabetes, cancer, heart disease, depression, and so on. The stuff that most people suffer and die from. Somehow the high-status researchers never get around to shedding useful light on those problems – look at what's won the Nobel Prize in Medicine in the last 10 years. And even in your example, the research has yet to demonstrate actual practical value. And I assume you're trying to find an example of practical value of high-status research.

Nick (2010-06-09 04:30:17)

It's odd that this subject consistently evokes such rancor from educated people ostensibly interested in common-sensical analysis. I'm an English PhD student at Cambridge, and about the most self-deprecating / self-loathing one you'll find. I don't think particularly highly of the field and I don't intend to make a career of it. But this critique takes a completely wrong-headed approach. You ask: '...is there a plausible alternative?' Well, of course there is: namely that, despite being an exclusionary discourse that uses difficult and seemingly unnecessary terms and concepts, literary criticism is a system of intellectual exchange that does in fact make sense to many who read it, and progressively develops relevant ideas. A little Derrida goes a long way because, as in physics e.g., a lot of thinking stands behind each little aphorism. The fact that most people not immersed in the lingo find this stuff superficially perplexing doesn't differentiate it from microbiology, economics, analytic philosophy, math, psychology ... or any academic discipline. You might as well ask why mathematicians, or better economists, communicate via equations rather than simple language. There are internal benefits to conducting closed dialogues using jargon, and it's downright naive to think that at least some of these literary critics aren't using this 'abstruse' language responsibly to help them think through difficult questions. Obviously there are plenty of "bad" professors who whip out \$5 words to bowl over the opposition, just as there are sloppy economists who use jargon of their own (or equally meaningless equations and models) to give the impression of surety. Pick up a difficult book in any field (and Derrida, by the way, is considered difficult even by the most pretentious literary critics) and you'll likely find the language almost incomprehensible. The difference is that in economics or philosophy, the chosen idiom is selected to give the impression of straightforward facticity and self-evident truths. Continental philosophy and the lit crit it inspires uses a language that appeals not to pseudo-scientific reason, but to emotive, poetic, and theological understanding. As such it's an easy target – and often rightly so – for outside criticism. But is it any different to 'demonstrate' the non-existence of God via axiomatic principles or to 'guarantee' future growth in a market using a variable-laden equation than to make a point about the metaphysics of language using saccharine poetics? Plenty of literary theory is bollocks – indeed, it's probably the case that a greater percentage of it is showy, flimsy, and superficial than is the case in economics or microbiology (I'll reserve judgment about philosophy and mathematics). What's funny is that no one has trouble accepting that they don't understand economic theory or microbiology (or even philosophy and math), but just a hint of the ridiculous in this kind of humanities work sets people on the war path and spurs an overarching critique of academia. In truth, academics are probably much less likely to bluster and pose in order to further their careers than are consultants or bankers – most have their heads too far up their own, um, Aufhebungs to act so pragmatically! In this sense academics of all stripes, microbiologists included, deserve critique. But the suspicion that they're a bunch of peacocking con men is a red herring.

seth (2010-06-09 21:46:26)

Nick, I'm not making fun of English professors. I'm saying their behavior reveals something important about professors in general. This particular trait, harmless in English professors, does plenty of harm when shown by those professors who are supposed to find solutions to our health problems.

Nick (2010-06-10 06:37:57)

Sorry, I think my longwindedness obscured my point (ironically). I understand that you're not making fun of English professors (though you can and should). My point was simply that the behavioral trait you've identified may be somewhat mis-observed, and as a result may say something different about the other professors you're interested in. i.e. Contra Veblen, English professors are for the most part not showing off for career purposes (or other nefarious ends), rather this kind of language

demonstrates a different kind of closed dialogue—one which professors in other fields may well mirror. There is definitely a cynical market force at work in academia. However I think the kind of professors we're talking about here represent a different vector: the power of believing in your own bullshit.

Alex Chernavsky (2010-06-10 07:13:12)

See this excellent [1]essay by Richard Dawkins. I've reproduced the first couple of paragraphs below.  
===== Published as "Postmodernism Disrobed", *Nature* 394, pp 141-143, 9th July 1998 and, in abbreviated form, in *A Devil's Chaplain*. Suppose you are an intellectual impostor with nothing to say, but with strong ambitions to succeed in academic life, collect a coterie of reverent disciples and have students around the world anoint your pages with respectful yellow highlighter. What kind of literary style would you cultivate? Not a lucid one, surely, for clarity would expose your lack of content. The chances are that you would produce something like the following: "We can clearly see that there is no bi-univocal correspondence between linear signifying links or archi-writing, depending on the author, and this multireferential, multi-dimensional machinic catalysis. The symmetry of scale, the transversality, the pathetic non-discursive character of their expansion: all these dimensions remove us from the logic of the excluded middle and reinforce us in our dismissal of the ontological binarism we criticised previously." This is a quotation from the psychoanalyst Félix Guattari, one of many fashionable French 'intellectuals'... =====

1. <http://richarddawkins.net/articles/824>

seth (2010-06-10 15:25:06)

Nick, Veblen didn't say – and I'm not saying – that people show off like this "for career purposes". He didn't give an explanation, nor do I. If I had to guess, I suppose it goes back to something ancient, much older than careers, whatever the reason for chicken's pecking order. When someone buys a very expensive watch, it's obviously for showing off, but not for career advancement. I'm afraid I don't understand what you mean by "the power of believing in your own bullshit."

Nansen (2010-06-10 16:45:27)

Re "the power of believing in your own bullshit", here's a quote from the artist Paul Chan in *The New Yorker* (May 23, 2008): "Part of the pleasure of reading Derrida is precisely that I do not have to understand him. Comprehension is not the game. I don't care what he thinks he's saying—I want to read word for word, and pay attention so much that I begin to hallucinate. Which I think is a very reckless way of reading, but for me a productive one."

### **Beijing Street Vendors: What Color Market? (2010-06-09 14:07)**

Black market = illegal. [1]Grey market = "the trade of a commodity through distribution channels . . . unofficial, unauthorized, or unintended."

In the evening, near the Wudaokou subway station in Beijing (where lots of students live), dozens of street vendors sell paperbacks ( \$1 each), jewelry, dresses, socks, scarves, electronic accessories, fruit, toys, shoes, cooked food, stuffed animals, and many other things. No doubt it's illegal. When a police car approaches, they pick up and leave. Once I saw a group of policemen confiscate a woman's goods.

What's curious is how far vendors move when police approach. Once I saw the vendors on a corner, all 12 of them, each with a cart, move to the middle of the intersection – the middle of traffic – where they clustered. At the time I thought the traffic somehow protected them. Now I think they wanted to move back fast when the police car went away. Tonight, like last night, there's a police car at that corner, the northeast corner of the intersection. No vendors there. The vendors who'd usually be there were now at the northwest corner. In other words, if a policeman got out of his car and walked across the street, he'd encounter all the vendors that he'd displaced.

### **Ocean Science High School (2010-06-10 18:40)**

There is a high school in Osaka called (in Japanese) Ocean Science High School. It specializes in training students for fish industry jobs. During my visits to Japan, what's most impressed me hasn't been high-end restaurant food, as great as it is, but the way everyone seems to take pride in their job and doing it well. At one point a friend's car got a flat tire. We limped to a service station. The attendant fixed the flat in 3 minutes, running around as if we were in a race. Typical for Japan, but unlike anywhere else I've been. I hope someday I can learn how this attitude is taught. Surely it has something to do with schools like Ocean Science - not Fish Industry - High School.

---

Alex Chernavsky (2010-06-10 19:27:16)

Seth, I know exactly what you mean. I had the same impression when I visited Japan some years ago. I tried to get a cash advance off my Visa card at a bank in a small town. The employees seemed genuinely upset that they were not able to help me. See also this funny Dave Barry [1]essay about his stay in a Japanese hotel.

1. <http://books.google.com/books?id=Mmd9cE9Y0rcC&lpg=PA50&ots=kLQZAJiL0K&dq=%22dave%20barry%20does%20japan%22%20%22vice%20president%22&pg=PA49#v=onepage&q&f=false>

q (2010-06-10 19:46:23)

i noticed that too when i was in japan. so much cheap high quality stuff. yesterday someone suggested that i try a pen made by muji for drawing and it was truly wonderful, and it was only \$1.25.

Sam (2010-06-10 19:53:06)

There is a high school in Brooklyn which used to be called Transit High School - which specializes in training students for jobs in the NYC subway. It has changed its name to TRANSIT TECH CAREER AND TECHNICAL EDUCATION HIGH SCHOOL. And yet . . . NYC subway employees still don't seem to take pride in their jobs.

david (2010-06-10 19:53:55)

Have you read Gladwell's *Outliers* ? Nothing in there about Japanese culture, but lots about how culture matters and also about Chinese culture.

Darrin Thompson (2010-06-10 20:05:56)

Deming's principles still hold maybe?

Aaron Blaisdell (2010-06-10 21:06:28)

I noticed the same exceptional pride in work among the custodial staff at a mall food court in Buenos Aires. They were cleaning tables after customers had left and bussing trays and the like. They circled the food court tables like vultures circling dying prey and as soon as a customer left a table vacant, one or more of them would swoop in, clean it fastidiously and rapidly, and then

move on in search of the next table to clean. They were quiet, unobtrusive, and seemed to genuinely take pride in what they did. They didn't put on an air as if it were beneath them, as I so often see among custodial staff in the US (particularly among certain sub cultures in the US, though not others).

seth (2010-06-11 01:04:26)

david, funny you should ask about Gladwell's Outliers. Yesterday I bought two copies ( \$1 each from a street vendor). To help a student with her English. I have read it, yes.

dilys (2010-06-11 05:07:01)

We just had a new roof put on in Texas, and the team of journeyman roofers, all from what may have been the same family or village in rural Mexico, swarmed onto the roof with exceptional focus and speed, and did a very good job. The dynamic seemed to be the esprit de corps, the rapid pace / specialization, and the physiological high of focus and "flow" in a demanding (and dangerous) environment.

Japan vs. China, in pictures <http://www.theatlantic.com/science/archives/2007/11/-quot-the-quot-way-vs-quot-a-quot-way-japan-v-china-dept/7835/>

vic (2010-06-11 10:43:36)

it's good when the little people are contented with their lot in life, serving the better half.

seth (2010-06-11 15:44:26)

vic, you seem to have a different opinion about this subject. What is it?

vic (2010-06-11 22:56:40)

I don't have a black or white opinion. Certainly there are positive aspects to people taking pride in their jobs, but some slaves likely took pride in their work too. A lot of people in society are performing menial service jobs for minimal remuneration, while others work much less hard and are serviced by the former - so one might understand how the former might be discontent.

Duncan (2010-06-12 11:19:36)

Nick Currie calls this state of mind among many (most?) Japanese 'superlegitimacy': The ecstasy of my train driver seemed to confirm something very important, a secret of happiness known to Collectivist societies like Japan and lost to increasingly, mistakenly Individualist ones like ours. Namely, that happiness does not lie in evading, avoiding, denying or escaping your social role, but in embracing it completely and joyfully. I've never been to Japan, so I don't know how good whether he's barking up the wrong tree or not, but I found his article extremely interesting: <http://imomus.livejournal.com/36990.html>

judith (2010-06-14 03:38:47)

My daughter went to a school like this and they had lots of strange lessons, one I noticed was a lesson in walking?????????

## **Naked Marriage (2010-06-11 08:37)**

In Beijing, sky-high housing prices have left many couples who want to get married without the traditional requirement: an apartment they own. There's a term for those who get married anyway: naked marriage. They are literally unprotected against rent increases. More abstractly, they are less comfortable than a couple rich enough to buy housing.

### **"Goes Against Everything I was Taught in Med School" (2010-06-12 16:40)**

A reader of this blog reported the following conversation with his doctor:

us: We want to put our autistic daughter on a gluten-free, casein-free diet. We have heard that some autistic kids have gotten some benefit from it.

Dr: It's not something I know about, but there is no harm in it so feel free to give it a try. You know, I had a patient whose parents put her on a ketogenic diet to treat her seizures, and it seemed to help. That goes against everything I was taught in med school, but if it works, I think that's great.

What's telling here is the word everything. In medical school, the doctor seems to say, he was taught in a dozen ways that the sun revolves around the earth (or its health-science equivalent). If the alternative – the earth revolves around the sun – explains more of the data, well, "that's great." [1] Again, it sounds like 1984: Part of the doctor's brain has been turned off by repetition of something that supports the status quo.

1. <http://www.blog.sethroberts.net/2010/05/12/preventive-stupidity-exists/>

---

The 50 Best Health Blogs (2010-06-12 20:31:43)

QUOTE: "Part of the doctor's brain has been turned off by repetition of something that supports the status quo." That's very interesting. My impression is that MDs are trained to think in a narrow, focused manner, and to reject as "anecdotal" any patient statements that don't match the Big Pharma orthodoxy. And conversely, I think that PhDs are more likely to be question-oriented, and to be on a lifelong quest for new information. But, heck, what do I know about higher education? I flunked out of pre-school. Jim

Ronald Pottol (2010-06-12 20:47:26)

The last part is just wacked, ketogenic diets have been a standard treatment for epilepsy for decades, not so popular now since no drug company makes \$ by pushing them, but our pediatric neurologist brought them up as a treatment option for our sons seizures once he is weaned. Might want an MD who at least knows what the medical establishment considers normal.

Michael R Roberts (2010-06-13 01:56:17)

It's a little bit of both, doctors are actually trained to think in a narrow, focused manner, because of so many knowledge they have to comprehend, and they are also under enormous influence by drug companies.

dustmouse (2010-06-13 21:48:30)

Hunh. There seems to be a parallel with lawyers, judging from an on-again off-again blogosphere feud that started a year or two ago. The bloggers and commenters who have studied law seem to have specific blocks when it comes to analyzing what people's words mean, as if law school overrides this particular application of logic and common sense and replaces it with a stylized formula – one which appears nonsensical to non-lawyers. Now that I think about it, I can see other professions that seem to have similar induced blind spots. Maybe it's even the rule, rather than the exception?

seth (2010-06-13 23:21:20)

dustmouse, that's very interesting. What's the "on-again off-again blogosphere feud" about? I agree that "turning off common sense" is a good way to describe what happens. Clark Hoyt, the Public Editor of the New York Times, recently claimed, seriously, that the sentence "he walked into the room and started shooting" does not mean that the two actions – (a) walking into the room and (b) started shooting – happened at the same time. See: [1]<http://www.tinyrevolution.com/mt/archives/003228.html>

The 50 Best Health Blogs (2010-06-13 05:11:25)

I have to admit that I know very little about climate change and global warming, and my opinions are influenced by a sense of guilt-by-association. What I mean is that the "climate change deniers" often seem to be similar to other conspiracy theory groups that I find very wrong-headed, like evolution deniers and holocaust deniers and tea partiers. Show me a climate change skeptic who is otherwise accepting of evolution, and I will pay attention; show me a Faux News viewer who is a tea partier and a climate change denier, and I tend to tune them out. Okay, I admit that my logic is pretty sloppy, but that's the way I look at these conspiracy theorist clusters. Besides, would a good family man like Al Gore lead us astray? Jim

## The Dreams of Geneticists (2010-06-13 23:53)

In a wiser world, we would see genetics research as we see astronomy: worth supporting, but without expecting practical benefit. In this world, however, genetics research is far better funded than astronomy and is expected to have practical benefits.

Unfortunately, the benefits have been slight. [1]A New York Times article by Nicholas Wade makes this clear:

The primary goal of the \$3 billion Human Genome Project “to ferret out the genetic roots of common diseases like cancer and Alzheimer’s and then generate treatments” remains largely elusive. Indeed, after 10 years of effort, geneticists are almost back to square one in knowing where to look for the roots of common disease.

“Largely” elusive? Completely elusive is more accurate, as far as I know. Not one treatment has come from this work.

In spite of ten years of failure, geneticists appear no wiser than before:

With most diseases, the common variants have turned out to explain just a fraction of the genetic risk. It now seems more likely [to prominent geneticists] that each common disease is mostly caused by large numbers of rare variants.

I know of no examples where a common (or any) disease has been shown to be caused by “large numbers of rare variants.” Perhaps these estimates of “genetic risk” are as misleading as asking what percentage of the area of a rectangle is determined by its width.

History repeats. Ten years ago, geneticists had zero examples of how mapping the human genome would help anyone with a common disease. Absence of any examples didn’t prevent such vast claims as human genome mapping will “revolutionize the diagnosis, prevention and treatment of most, if not all, human diseases”. From zero, they extrapolated to “most”.

It’s a sad comment on science journalism that, at the time, no one pointed out the absence of examples, as far as I know, and a sad comment on Wade, holder of a powerful and prestigious job, that he has not pointed it out now. He simply repeats a claim. At least he has noticed a gigantic failure after it happens, even if he inaccurately describes it (“largely” rather than “completely”).

Lack of examples of the practical value of genetic mapping didn’t keep a huge amount of money from being spent.

With the catalog [of common genetic variants] in hand, the second stage was to see if any of the variants were more common in the patients with a given disease than in healthy people. These studies required large numbers of patients and cost several million dollars apiece. Nearly 400 of them had been completed by 2009.

Ten failures would have been plenty; 400 failures shows the resistant-to-evidence nature of the whole enterprise. It’s an example of how [2]a little biochemical-mechanism research goes a long way; a lot of biochemical-mechanism research goes a little way.

For geneticists, to acknowledge the lack of examples is scary. Their funding might be cut! So they don’t. But nothing

prevents journalists from thinking for themselves and asking a supposedly "tough" question ("what's an example?")  
– although asking for examples is the most basic question there is.

Thanks to Alex Chernavsky. [3]More about the cargo-cult nature of modern biology. If you don't believe me, read [4]this: "Of the roughly 50 companies at the conference, not one is focused on approaches related to tracking down new genes. . . . The one corner of the genome-focused biotech industry that's thriving is the one churning out equipment and services to support researchers in their endless hunt for gene links."

---

Kevin Miller (2010-06-14 03:47:30)

I agree that this is a fascinating development, but I don't think it's one that would have been predictable (I certainly thought the Francis Collins' party line made perfect sense). Furthermore, I suspect that 1) the people who espoused it really believed it. (Funding is nice, but they all spent decades of their lives on this that they're \*never\* getting back); 2) the tools that they developed will prove to be critical in the kinds of approaches that are likely to be more powerful, such as understanding the genes of invasive organisms. This isn't my area of work by a long shot, but I'm old enough that the article reminded me a bit of all the stories in the 1990s about how the microcomputer revolution hadn't had any demonstrable beneficial effect on business productivity. I suspect that there will be really powerful effects of this technology as it proliferates, and I hope that most of them will be positive.

seth (2010-06-14 04:38:54)

Kevin, you write this "wasn't predictable." I have been saying what I say here for more than ten years – that all common diseases will turn out to have big environmental causes that we can figure out and use to our advantage. Genetics won't matter. And I had many examples, such as lung cancer, tuberculosis, etc., plus lots of other data. The geneticists had nothing to back up their big confident predictions. Not one example. They were reduced to saying stuff like breast cancer runs in families! So did pellagra. Their case has been weaker than weak for a long time.

Dennis Mangan (2010-06-14 05:06:01)

The fundamental reason for the lack of results: our genes didn't evolve to kill us.

sadie (2010-06-14 06:31:12)

Cancer treatments that target a specific tumor genotype definitely exist. I don't know how many are mainstream yet, but a relative with medulloblastoma just participated in a clinical trial that targeted the "hedgehog" gene. From the link below: "In 2004, a St. Jude team reported that an experimental drug called HhAntag, which inhibits Sonic hedgehog signaling, led to the deaths of medulloblastoma cells and the elimination of these tumors in treated mice." <http://www.stjude.org/stjude/v/index.jsp?vgnextoid=00ef921b911e8110VgnVCM1000001e0215acRCRD&vgnextchannel=3c9213c016118010VgnVCM1000000e2015acRCRD> Our genes didn't evolve to kill us, but every once in a while one of them mutates and makes a whole hell of a mess.

Nathan Myers (2010-06-14 18:46:09)

I seem to recall a Quantified Self presentation where someone got a gene workup. From the particular markers found, it predicted his risk of heart failure in twenty years would be enormously greater (as I recall, 1.5 % vs. 50 %) if he continued

gaining a pound a year. This was enough to get him focused on keeping his weight stable. That seems like a useful result, even if it didn't cure an existing illness. To me quantifiable prevention seems just as valuable as a cure.

Brice (2010-06-14 21:19:51)

Regarding "largely elusive" vs "completely elusive" - the second article in the NY Times series published today does give some examples - 1 drug just approved for treatment (supposedly based on genomics) and others in trials and potentially close to approval. They quote 1 company as saying 1/3 of their drugs in trials are based on genomics. So "largely elusive" seems about right. In 1975 or so, monoclonal antibodies were discovered. There was a lot of hype about them, magic bullets to cure cancer, etc. At one point and after many failures sentiment swung the other way - it was thought by many that monoclonal antibodies could not and would not work in humans. In 1998 (23 years later) the monoclonal antibody drug Rituxan was approved for treatment of cancer. It has grown to be the drug of choice for non-hodgkins lymphoma. So will genomics lead to many new successful treatments for many diseases? Or exactly zero treatments? I suspect somewhere in-between.

seth (2010-06-15 01:48:24)

Brice, thanks for the update. Drugs are approved if better than placebo. They may be worse than other treatments. So drug approval doesn't mean the new drug provides any benefit. It's too soon to say. Drugs can be approved and priced too high. This is why I think it's fair to say it's still impossible to point to even one clear benefit of the human genome project. In case my point isn't blindingly obvious, I think research funding should be spread more widely. Less spent on genomics, more spent on other approaches.

ChristianKI (2010-06-15 08:24:20)

I don't see something wrong with the measuring equipment branch of the industry growing. They make impressive progress by being much faster at cheaping DNA sequencing than Moore's law. Maybe there a way to give that branch money more directly to develop better tools but in a few years we will actually be able to give everyone their genomic data. Monoclonal antibody aren't only useful as drugs, they are also in the core toolkit of microbiologists to measure the concentration of a given protein or other molecule. I would think that most drugs that get developed today benefited from monoclonal antibodies somewhere in their development cycle. I think it makes a lot of sense to develop a better core toolkit instead of just evaluating the usefulness of a discovery by the fact whether it cured a specific illness. Hopefully someday the core techniques get cheap enough that the can be used for self experimentation. We even cured some children's blindness with Gene therapy: [http://www.nytimes.com/2009/11/03/health/03eye.html?\\_r=1](http://www.nytimes.com/2009/11/03/health/03eye.html?_r=1)

Cameron (2010-06-16 21:41:33)

Implying that understanding the human genome has been a waste of time and resources is irresponsible at best. So is assuming that all disease is purely environmentally derived with nothing to do with genetics. That's a really big assumption and scientists shouldn't be in the business of assumption. Anyone, including geneticists, who assumed that once the genome was mapped, that we would enter a utopia of disease-free life, was clearly mistaken. Understanding the genome is just the first step. The next step is the cataloging of all of the products of those genes. Then attempting to build a network of how those products/genes interact with each other as well as how they interact with the environment is the larger goal. We are still a long way away from that but it is not only a valid goal, but a necessary one. I don't assume that all disease is genetically based. I understand that our current understanding is limited and we simply need more information. We also need new and better tools for understanding complex interactions and complex networks. But to say that since genetics hasn't yet cured the common cold, or cured cancer, that it did not deserve to have had all the money allocated to it as well as it being undeserving of it's current and future funding, I believe, only demonstrates a lack of understanding of what genetics is and where it's going. It's already been demonstrated with epigenetics that the environment is capable of altering how genes are expressed and that those changes are heritable. Understanding how the environment interacts with our bodies necessitates a complete understanding of our genome, its products and their interactions. I would argue that you can't assume what causes a disease (and therefor, what a disease even IS) until you understand the system which the "disease" exists in. Devaluing genetics is just as myopic as devaluing investigating environmental causes for diseases. We should seek to understand all possibilities. I don't disagree that some scientists might oversell their gene to get funding. But that doesn't and shouldn't undermine the science as

a whole. Overselling is an unfortunate side effect of the competition for funding. <http://www.nytimes.com/2009/11/06/health/06gene.html>

seth (2010-06-17 07:53:31)

Cameron, you say my position is "since genetics hasn't yet cured the common cold, or cured cancer, it did not deserve to have had all the money allocated to it as well as it being undeserving of its current and future funding". I'm not just thinking of the common cold and cancer, I'm thinking of any common disease. But you're right - I think that lack of promised results should reduce funding and that the money freed up should go to support other approaches. What would it take to convince you that genetics has been overfunded?

Cameron (2010-06-17 13:47:51)

I would have to be convinced that the completion of genome was the end of the story and that all successes and failures should have been hinged upon its' completion. I would have to be convinced that understanding how genes and the products of genes interact with each other and the environment is not a worthy funding prospect. I would have to see an argument detailing the specifics of what money was spent on what and exactly why that should be considered a case of "overfunding". Furthermore, why those specific cases should be extrapolated to define the endeavor as a whole. You say that genetics has been overfunded because it hasn't immediately produced what it was promised to. I think you have to convince me that the majority of science was convinced and so promoted that once the genome was completed, again, that would be the end of the story and we all could go home. And you would have to convince me that it was precisely that promise led to what can be easily defined as "overfunding". I think anyone can make an argument that certain aspects of genetics (or certain genes) were and may have been oversold. But I think anyone can make that argument about any branch or endeavor of science if you try hard enough. You state in another response that "all common diseases will turn out to have big environmental causes that we can figure out and use to our advantage. Genetics won't matter." Well, even if it is determined that all disease ultimately exists due to outside causality, you still have to understand how the disease acts upon/within the body. It won't even be possible to make that determination until you understand how our genes/gene products work and interact. So I would say that if you are convinced that outward forces are the ultimate cause for all disease, you should be lauding the efforts of science to understand the genome and its products to so prove your assertion. Since you are your genes, understanding how your genes work on their own, interact with each other and with the environment (for instance if some environmental agent acts to shut a gene on or off epi-genetically) is vital to understanding exactly what a "disease" even is. Once you understand that neither the body nor the environment is a closed system, ultimate causality begins to become more difficult to pin down and you realize how much more we really need to understand. Making grand statements like the one I quoted above is exactly the type of statement that you contend that genetics did prior to the completion of the genome. I am not convinced that science as a whole contended that the completion would by itself cure all disease. You seem likewise convinced that genetics will have nothing to do with disease with the same combination of promise and lack of evidence that you decry geneticists had prior to the completion of the genome.

seth (2010-06-17 15:36:32)

Cameron, here's some evidence for my claim that studying environmental causes will lead to useful progress on common diseases: 1. The discovery that dirty water can spread disease led to cleaner water and less water-borne disease. 2. The discovery that folate deficiency increases the rate of birth defects led to folate-fortified foods, which led to a reduction in birth defects. 3. The discovery that smoking causes lung cancer led to less smoking and less lung cancer. 4. The discovery that scurvy is caused by lack of Vitamin C led to less scurvy. 5. The discovery that pellagra is due to lack of niacin led to less pellagra.

Cameron (2010-06-17 16:58:50)

Those are all fine examples. Not once have I said that there are not environmental causes of certain diseases and that studying that is a waste of time. I just don't understand how you go from these examples to "genetics won't matter" and that it is "overfunded". Nor is any of this a reason to lessen the funding for things like gene therapy or the study of gene networks. Again, understanding the genome and its' products will only enhance our knowledge of exactly how and when environmental agents are responsible for what we call "disease". Understanding that smoking causes cancer is only a part of the story. But what

do you do when someone has lung cancer that didn't smoke? That's a reason to understand the mechanism for why cancer is so hard to "cure". Telling people to stop smoking isn't going to "cure" cancer either. It's just going to significantly reduce the problem... which is good obviously. But that doesn't mean we stop there and don't try and understand the molecular mechanisms of cancer. Any outside agent that would cause a disease still has to act upon a system to disrupt. If you don't understand the system by which the agent acts upon, then you don't understand the disease. To only focus on any one aspect (genetics or environment) is not good science.

seth (2010-06-17 17:09:27)

"Nor is any of this a reason to lessen funding for things like gene therapy . . . " Funding is limited. Less funding for genetics research means more money for other research, in particular study of the environmental determinants of disease. So when one area of study (how environment causes disease) turns out to be fruitful, and another area (genetics) turns out to be less fruitful than the predictions made to get the funding, it is a reason to change how much money the two areas get. I'm not saying genetics research should be eliminated or is worthless, just that it should be less well-funded and the freed-up money should go to study of how the environment causes disease.

Cameron (2010-06-17 23:14:45)

That's a much different statement than "genetics won't matter." It's fine to have that opinion, but it's the type of argument that can't really leave the realm of opinion. I've already said why I think that the general realm of genetic science is vital to our understanding of disease.

seth (2010-06-18 06:00:17)

It would be interesting to know why you think further study of genetics will help us 1. prevent common diseases and 2. cure common diseases – along with any evidence that exists to support your ideas. I can't find any evidence in your comments about this. That's the point of my post – the lack of evidence for all the claims.

Cameron (2010-06-18 09:50:00)

I don't know what you define as "common diseases" but that seems an arbitrary designation. Presumably, once the mechanism of the genome and its' products is better understood, yes it will lead to better medicine. We've got the genome, but as I've explained, there is still much to do. Once we understand exactly what a disease is, it will give us the best chance to combat it. You say you want more money to understand environmental causes for disease, but without understanding the mechanism, without understanding how any environmental agent acts on the body, all you are doing is establishing correlations. It's a start, but it's not the whole story, and correlations are certainly not going to cure anything. What you fail to understand is that annotating the genome takes a long time. Computers can annotate genes but annotation algorithms are inexact. So it takes a human to clean it all up. Science, especially genetics, is a slow, deliberative process. It's not a reality TV show, it's science, and it takes a while to get it right.

alan (2010-06-18 15:16:56)

There are all sorts of diseases that have been linked to genetics The APOE-4 allele on chromosome 19 in particular has been linked to a lot of conditions such as alzhiemers as well recovery from traumatic brain injury. There are tons of other disorders and "diseases" which have genetic components that we can identify. The interesting, and I suppose you could say unfortunate, thing about the mapping is that it taught us about alleles which are basically like little switches that control the gene expression. These actually are largely influenced by the environment and the affects can be seen as far as 3 generations later (there were a lot of studies about how famines affected the grandchildren of the people who were food deprived on a genetic level). The point being genetics is just like the rest of science. We answered a very important question and it gave us more questions. How is that surprising? Science is always like that. Whether it's physics, biology, psychology, etc. As long as it is breaking new ground, why would you really expect that to be the end. Last I checked we aren't anywhere near knowing all there is to know in any of these fields. It is regrettable the answer wasn't so easy (and yes a lot of very smart people thought it was) but they couldn't see the whole picture because they didn't know what they do now obviously. Point is, we have learned a ton from mapping the genomes, you are over-simplifying.

seth (2010-06-18 15:48:20)

Cameron and Alan, your comments suggest evidence that more genetics research will help us prevent and cure common diseases is hard to find. Nothing wrong with "learning a ton" – just as there's nothing wrong with astronomy research – but preventing and curing common diseases is even more important. I think the loud claims of geneticists have drawn attention away from actual progress made by other approaches.

Cameron (2010-06-18 18:46:58)

No offense. But I think that just sounds like whining. Biology only started getting a disproportionate amount of money in the 70's. Before that it was the physicists. Things go in cycles. It won't be in biology forever. As the amount of data all this biology generates gets to a certain point, the processing of this information will become vital and then all of the biologists will complain that all of the computer scientists get all the money. The genome was only finished 10 years ago and the average FDA patent takes 15 years. So what does that tell you? Again, I think your expectations that once the genome was done that we would automatically start curing diseases vastly misunderstands the process of science. Isn't that ultimately what your blog is about? If you want to being attention to other methods then write a book and start a blog... wait. You still haven't answered the charge that even if you lock down environmental causality, you still have to understand the system that this environmental agent acts upon. External causality is not the end of the story. You are not a closed system!

alan (2010-06-18 21:03:55)

It's hard to find because using the genetic expressions to cure diseases is completely different from understanding that they are an underlying cause in pathology of the disease. Just like we understand cancer is caused by uncontrollable cell growth, it is one thing to know what is causing it and another to actually find a cure. But just for a second think about what you are expecting. That as soon as we mapped out the genes, you thought we would be able to change the expression of the genes in a living person/animal to treat someone. It turns out RNA and epigenetics are actually much more responsible for the physical expression of your genes. RNA is extremely more complicated due to the large number of types, mRNA, tRNA, rRNA, tmRNA, etc. The point is even when we understand what all these things do we still have to figure out how to actually affect single alleles on single genes which then get sent throughout the body to all the nuclei via RNA without messing up everything else. I can't really imagine anything more complicated to be honest. But that doesn't mean we are going in the wrong direction. It does seem to be extremely important. At least equally important as environment. I think environment plays a big, big role don't get me wrong. But as complicated as changing the gene expression in a human being can be, I think changing the environment is even harder. There are just too many factors. I just think you are being too impatient. What other methods would you suggest that focus on environment?

alan (2010-06-18 21:26:03)

or what other approaches are you talking about that biology has taken attention away from? I am trying hard to think of any and I think therapy and the attitude that people have play a big role. But just because people with cancer who have more positive attitudes are more likely to go into remission doesn't make it a cure. In fact it needs to be coupled with actual medical treatment or else they most likely just die. Anyways I'm trying to see it from your side but I guess I just need to know more specifically what you are saying. The main problem I had with this article is just the giant sweeping generalized statement that genetics hasn't made any progress in the last 10 years. You seem like an intelligent person. You even got your news from a reputable source, But that was still just that authors opinion, not fact. And you are allowed to have your opinion as well. But I'm trying to tell you that it has in fact made progress and just because you aren't hearing about it doesn't mean it isn't happening. Scientists almost by necessity aren't the type to step out in front of the world and make huge announcements. They are extremely dedicated to their work and about the only place they show it to other people is at science symposiums. The only way it makes it into popular culture is when we finally see the tail end of it being marketed to us as some new product or invention. They aren't going to say 'hey guess what we made a little progress' and then get asked 'what does that mean?' and then answer 'more research' every time a new development occurs because they would have to spend all their time doing stupid interviews for newspapers, radios, television and internet bloggers instead of actually conducting research. Look up some scientific articles. They are out there I assure you. If you don't see them you're not looking in the right place. There are scientific journals solely dedicated to genetic research. In the those journals are published experiments some successes, some

failures, and with each of those comes progress.

seth (2010-06-19 04:51:27)

"Changing the environment is even harder." I have changed my environment in six or seven ways due to the results of my experiments (about environmental effects). Lots of people have quit smoking. The emphasis on genetics has taken away from studying environmental effects.

Cameron (2010-06-19 16:16:39)

"The emphasis on genetics has taken away from studying environmental effects." If you say so.

alan (2010-06-19 21:03:38)

[http://en.wikipedia.org/wiki/List\\_of\\_genetic\\_disorders](http://en.wikipedia.org/wiki/List_of_genetic_disorders) These are all genetic disorders that we've learned about since mapping the genome. There is also all sorts of other crazy stuff they can tell as well. Even trivial things like if you are a person who has wet or dry ear wax. No lie. It's ridiculous but true. I just don't understand how in the face of all this evidence you refuse to change your opinion. I won't and I'm sure cameron wouldn't hold it against you if you revise your opinion. But Sadie, Brice, Christian, Cameron, and I have ALL given examples as evidence that your opinion is based on faulty information and you are in fact wrong. There's really nothing else we can do to change your mind. If you are a scientist who works on alternative treatment methods I could see how you would be bitter about not having funding. But the way you are so ill informed about the current research in genetics makes me sincerely doubt you are in any way at all involved in a related scientific field. And I am out. Good luck in the future. I hope someday you will be happy with amazing developments that come out of genetic research.

seth (2010-06-20 04:47:37)

I don't see how providing a list of genetic disorders (all rare) helps prevent or cure any common disease. "You are so ill informed about the current state of genetics research . . ." Let's put it this way: I knew of no examples where recent genetics research has helped cure or prevent a common disease. I asked for examples but none were given by defenders of that research.

Cameron (2010-06-25 11:10:44)

You also fail to listen to anything that doesn't support your view. You ignore the reality that the genome is only 10 years old. You ignore the reality that getting a patent in the US takes 15 years. You ignore the fact that no one ever said that mapping the genome would, by itself and without any follow-up research, cure disease. That's why we are saying you are ill-informed and don't understand genetics. Genes-protein-networks-environment. All of those components are required to understand disease. You only talk about one while you accuse "the other side" about talking about one of those. The problem is, "the other side" is not ignoring proteins and networks (OR environment)... you are. Not only are you ill-informed about genetics, you are ill-informed as to the scientific process.

Cameron (2010-06-25 11:21:06)

<http://www.npr.org/templates/story/story.php?storyId=126396839> <http://www.hhmi.org/genetictrail/g100.html>  
[http://www.npr.org/blogs/health/2010/04/francis\\_collins\\_dna\\_may\\_be\\_a\\_d.html?ps=rs](http://www.npr.org/blogs/health/2010/04/francis_collins_dna_may_be_a_d.html?ps=rs) Decent articles that give a basic view of the state of the science. We haven't "cured" disease yet because the genome is really really really complicated. All we have right now is some strings of correlation. But that isn't enough. And that's why we need to know a lot more.

Cameron (2010-06-25 12:07:52)

Cameron (2010-06-25 13:20:47)

The above articles are pretty good perspectives (especially the last two) and I'm going to try and express my opinion in a less confrontational way. It's understandable that people expected a lot more from the genome project immediately. There was a misunderstanding on all sides about what was expected. But as the I am learning more about this history all the time, science was and still is, in fact, surprised by the incredible complexity of the genome. This complexity has really let us know how much we still don't know and how much promises of utopia (or dystopia) were naive. Our knowledge is still nascent. If you think about it, believing that we would understand the complexity of disease once the genome was mapped is roughly equivalent to thinking that once a child is able to understand the alphabet and maybe a few basic words, that child can go immediately to reading and comprehending James Joyce.

seth (2010-06-25 16:36:32)

"Science was surprised by the incredible complexity of the genome." Perhaps it would have been better to wait a while – until after that complexity was grasped – before making promises? The main alternative to studying how genes cause disease is to study how the environment causes disease. If the first route (genes) turns out to be more difficult than expected, it argues for paying more attention to the second route (environment). Thanks for the links.

## **More Fermentation, More Anti-Cancer Effect (2010-06-14 20:10)**

[1]Doenjang is a fermented soybean paste often served in Korean restaurants – as a vegetable dip, for example. [2]This study found that the longer it's fermented, the more powerful its anti-cancer action:

Doenjang fermented for 24 mo exhibited a two- to three-fold increase in antitumor effects on sarcoma-180-injected mice and antimetastatic effects in colon 26-M 3.1 cells in mice compared with the 3- or 6-mo fermented doenjang. The 24-mo fermentation was the most effective in preventing cancer by decreasing tumor formation and increasing natural killer cell activity in spleens and glutathione S-transferase activity in livers of mice.

Many things about doenjang stay roughly the same during fermentation. This study shows that what's increasing (bacteria, etc.) is responsible for the anti-cancer effect, which supports my umami hypothesis (that we need fermented foods or something similar to be healthy).

I make yogurt rather than buy it so that I can ferment it a long time (e.g., 24 hours in a yogurt machine). The yogurt I make is much sourer than commercial yogurt.

1. <http://en.wikipedia.org/wiki/Doenjang>
2. <http://www.ncbi.nlm.nih.gov/pubmed/16504476>

---

Christina (2010-06-15 06:14:04)

Hey Seth, Great post. Quick question - is there a way to make yogurt without a yogurt machine? I'd love to start making this. Thanks! Christina

seth (2010-06-15 07:55:33)

Christina, you can find many yogurt recipes on the internet. I've made yogurt without a yogurt machine many times. It's a lot harder and the resulting yogurt less creamy than when I've used a yogurt machine.

## **The Trouble With RCTs (2010-06-15 16:33)**

In an email to a friend, I compared the obsession of med school professors with methodological purity (e.g., efficacy must be demonstrated with an RCT, randomized controlled trial) to religious ritual. More concern with appearances (ritual), I said, is linked to less understanding of substance. My friend replied:

I am actually a believer in this particular religion (The Cult of RCT)! Seriously: I think the medical world is quite right to put a huge premium on RCTs, because RCTs so often prove that things they are doing don't work. While sometimes the RCT may provide a negative verdict on something that does work, this seems to me an unusual case, and generally avoidable if one considers statistical power, possible subgroup responses, etc and avoids overgeneralizing the conclusions.

I replied:

Are RCTs better than what prevailed before? Probably. But I would say the same about religion, which has its benefits.

I think the medical world has turned off a large fraction of its brain via insistence on RCTs and failure to understand their weaknesses and the strengths of alternatives. It isn't just that "RCTs may return a negative verdict on something that works," it's also that such a requirement for very expensive research suppresses innovation – testing things via cheaper ways.Â Atul Gawande wrote about how obstetricians made a lot of progress by ignoring this requirement:

[1][http://www.newyorker.com/archive/2006/10/09/061009fa\\_fact](http://www.newyorker.com/archive/2006/10/09/061009fa_fact)

Other areas of medicine, which followed the RCT requirement, made less progress during the same period, it can be argued.

Let's say I told you that the only way you can travel to work is via an armed escort – you would be appalled, even though it's true you would be safer. An insistence on RCTs is overreaction. Given the lack of innovation in medicine/health care, for which I believe they (or at least the lack of understanding they embody) are partly responsible, very expensive overreaction.

The best way to learn is to do. The best way to learn about health is to do as many experiments as possible. Not slow, expensive RCTs. Not slow, expensive surveys, which don't involving "doing" to the extent that an experiment does. This is [2]a big reason my self-experiments taught me a lot – because I could do so many of them.

1. [http://www.newyorker.com/archive/2006/10/09/061009fa\\_fact](http://www.newyorker.com/archive/2006/10/09/061009fa_fact)

2. <http://sethroberts.net/articles/2010%20The%20unreasonable%20effectiveness%20of%20my%20self-experimentation.pdf>

---

Robin Hanson (2010-06-15 17:39:42)

Why not do a randomized experiment to test the value of non-randomized methods? For example, randomly assign patients to docs who either just do what randomized experiments advise, or to docs who use their judgment based on other inputs. See which group does better.

seth (2010-06-15 17:56:31)

Robin, yes, that would make the point. Just to be clear, the comparison I'm talking about is: group A: randomized trials evidence only. All other evidence is ignored. group B: all available evidence. Randomized trial evidence plus everything else. I'm saying the purists ignore valuable information (in addition to suppressing innovation).

Jeff R (2010-06-15 19:42:01)

Seth, The focus on RCT's is to "know" things for sure. Anecdotes, self-experimentation, cohort studies are all good for generating hypothesis. But, you wouldn't want to say "x causes y/ x prevents y" without an RCT, or at least a lot more evidence than a few people doing self experimentation. You may be right that self experimentation isn't done enough, but there also needs to be a second layer of double checking. We can't have doctors treating people based on anecdotes. People think all sorts of crazy things about health. Like, their friend's cancer was cured by copper bracelets, or magnets, or gold, or a million other things. Sometimes a correlation isn't causation, sometimes it's a placebo effect, etc..

Anthony (2010-06-15 22:21:47)

@Jeff, "We can't have doctors treating people based on anecdotes." People conclude lots of things (correctly, in a warranted way, and tentatively) based on "anecdotes". If we called them "case studies" would that make it better? Better questions - and more difficult ones - than a blanket statement about anecdotes or case studies: what kind of evidence is there in the case study? How strong is the evidence? What problems with it? What can we conclude with warrant based on this evidence? How can we fruitfully test it further? And so on. If one can conduct an RCT, then sure, go ahead. How many doctors can just whip off one of these? Instead, they should prescribe based on the evidence base available, which should include careful evaluation of case studies and even anecdotes. To ignore them would be ... willful ignorance.

seth (2010-06-15 22:53:29)

Jeff, RCTs have their place, just as armed escorts have their place. At the moment they have too much place. They loom too large in the thinking of health professionals. It's not so much that RCTs are bad or worthless, I'm not saying that at all. As you say, it's often good to do a better study. Sometimes that better study is an RCT. The huge mistake is ignoring non-RCT evidence. Claiming it isn't "real" or something.

The 50 Best Health Blogs (2010-06-15 23:24:40)

Randomized controlled trial = often self-serving research funded by a big corporation, with the results screened by the corporation, but accepted blindly by many health professionals. Reports from patients about adverse effects = too often ignored as "anecdotal." Jim

seth (2010-06-16 04:45:07)

Yes, big food companies love regulations. Because they can afford their cost and small new companies cannot. The regulations suppress innovation and therefore suppress competition. This is exactly what the emphasis on RCTs does - suppresses competition to Big Pharma.

Alex Chernavsky (2010-06-16 07:09:58)

Big Pharma certainly has a way of "influencing" the results of RCTs. If the science is incompatible with the business plan, well... so much the worse for science. See this excellent article about how Bristol-Myers Squibb managed to obtain FDA approval for Serzone (an antidepressant drug): <http://web.archive.org/web/20060212173429/http://www.washingtonian.com/health/hardtoswallow.html> The relevant part of the article starts around the middle of the second page.

lance (2010-06-16 08:28:32)

<http://robertpaulwolff.blogspot.com/2010/04/memoirs-volume-two-fifth-installment.html> Even more fascinating was Bakan's study of the roots of Behaviorism in American Psychology. He discovered that the men who developed and shaped the Behaviorist school had all come from Protestant families in small mid-Western towns and had then moved to big cities [typically, Chicago], where the culture shock of the extremely heterogeneous population mix drove them to maintain some sort of control over their shattered moral framework by seizing on Behaviorism. Bakan did a careful analysis of the experimental reports published in the leading Behaviorist journals, and also of the papers that were turned down on the grounds that the authors had not done enough experiments to make their results statistically significant. He reanalyzed the data to show that the editors and reviewers routinely overestimated the number of experiments required for statistical significance, in effect treating experiments as a place holder for Protestant good works.

Motorcycle guy (2010-06-18 14:58:56)

You have a way with words, but remember by and large, language is a tool for concealing the truth Sent via Blackberry

Sampo Syreeni (2010-06-19 07:04:57)

I think everybody can agree that small scale experimentation is good, as are large scale RCTs. And that putting emphasis on the rituals of method at the cost of genuine insight is a bad idea. And that it's all about opportunity cost as usual. So what's the problem? I think it's that the ritual has been elevated into law, and that stops small scale experimentation from proceeding at

its equilibrium, laissez-faire pace. If I'm right, then what we're talking about here is not an epistemological question at all, but a political one. Those then turn on quite different considerations from what has been said so far, e.g. on the right to consent to experimental treatment, medical ethics and the like.

### **Bruce Charlton on the Trouble With RCTs (2010-06-16 13:36)**

In response to [1]my post about the trouble with randomized controlled trials (RCTs), Bruce Charlton, the editor of Medical Hypotheses, wrote me:

The golden age of medical discovery came before the widespread usage of RCTs. This golden age was all but over by the end of the 1960s; since then the rate of progress has declined (see refs such as Horrobin, Le Fanu and Wurtman in [2]<http://www.hedweb.com/bgcharlton/funding.html>).

The earliest big and influential RCT in psychiatry was in the mid 1960s, and it was - in retrospect - misleading wrt MAOIs due to too low a dosage. Now that RCTs are regarded as indispensable, medical research is captive to Big Pharma

[3]<http://www.guardian.co.uk/commentisfree/2009/aug/08/seroxat-pharmaceutical-birth-defect>

Another area of medicine [in addition to obstetrics] that has made big progress without being RCT-led is anesthetics. Dentistry is a third. These specialties are instead technology-led.

He also pointed me to an article by David Horrobin, the founder of Medical Hypotheses, titled [4]"Are large clinical trials in rapidly lethal diseases usually unethical?" His answer was that some of their aspects are unethical: Prospective subjects (sick persons) are not told the low chance of benefit, the high chance of bad side effects, and the great financial benefit of such trials to the institutions that run them.

Horrobin's article also made the point I made: The emphasis on RCTs suppresses innovation because only big well-established companies can afford them:

50 years ago, good scientific evidence of a potential therapeutic effect would quickly have generated a small clinical trial in one or two centers with perhaps 30 or 40 patients. Such a trial would have cost almost nothing. It would certainly have missed small or marginal effects, but it would not have missed the sort of large effect that most patients want. Unfortunately, now, such an approach has become impossible. . . . The escalation of costs has therefore drastically reduced the range of compounds from which new treatments can be drawn.

My reading of history is that suppression of innovation can last a long time but eventually change comes from the outside and the system collapses. Detroit, for example, has collapsed. General Motors was once as dominant as big drug companies are now.

q (2010-06-16 13:52:33)

so the japanese and german car companies aren't part of "the inside"?

Nathan Myers (2010-06-16 21:43:17)

The insistence on RCTs (as opposed to trials with dosages that vary between groups, or other more ethical methods) looks a lot like fetishism.

Mike (2010-06-16 22:25:30)

Nathan, why wouldn't an RCT be able to have multiple groups at different dosages?

Nathan Myers (2010-06-17 01:24:39)

Mike: The "C" in RCT means "controls", implying they get placebos. One of the ways trials fail is when they shovel together a load of people with what seem to have the same symptoms, and assume their problems all have the same cause. The fraction who actually respond to treatment, because the treatment helps with their actual problem, might be too small a fraction to be "significant".

dearieme (2010-06-17 02:44:52)

Le Fanu's book is very fine. But if I remember correctly, he makes a case that it's not just drug innovation that has slowed, so RCTs can't carry all of the blame.

Jaroslav (2010-06-17 03:35:43)

Nathan, "controls" do not always get placebo (meaning inert substance or treatment). For example most omega -3 studies are done with control group on omega -6 oils to guarantee "positive" effects of intervention. Were they given placebo (some inert gum, for example), results would be most likely quite different (as small effects seen in such interventions, and also studies of PUFA deficient diets, suggest). So correctly choosing the "control group" is another way to add bias to the study to prove what you want to prove, and then trumpet the results as being "scientific".

q (2010-06-17 19:30:20)

controls generally don't get placebo. often it's not ethical to do so. for instance if i were designing a trial for a pain reliever for people with painful bone cancer, i'd have to use the "standard" pain therapy as the control, as it would be cruel to intentionally give someone an ineffective treatment.

seth (2010-06-17 19:44:57)

q, lack of innovation by Detroit car companies was one reason outside forces - foreign car companies - took over much of their market. Of course, labor costs were another reason, so Detroit isn't the best example. Clayton Christensen has written a whole book about the way big successful companies stop innovating and often collapse (The Innovator's Dilemma). Heard of Digital Equipment Corporation?

## Nassim Taleb Interview (2010-06-18 06:09)

Nassim Taleb has honed [1]his replies to common questions:

Why did economists get the crisis so wrong?

That’s like asking why fortune-tellers don’t get things right. Their tools don’t work, but they continue to use them. And the Nobel committee gives prizes to people who aren’t scientists.

Which is what I’m saying about geneticists – [2]their tools don’t work (also [3]here) and [4]the Nobel committee fails to notice (e.g., the recent award for telomere research, which hasn’t yet had practical value).

You have a great phrase in The Black Swan: "Don’t drive a school bus blindfolded." Is that still happening? Worse. I was talking about Bernanke - they’ve given him a bigger bus.

Thanks to Dave Lull.

4. <http://www.blog.sethroberts.net/2009/10/28/too-big-to-fail/>

Stephen M (Ethesis) (2010-06-18 12:01:59)

The micro-econ and the time and motion guys have such tight math and their tools work so well that it seduces macro-economists into thinking that surely they should be able to duplicate the same effect of theory to practice. But micro, in a way, is measurement that just happens to predict.

thehova (2010-06-18 20:08:12)

There's a fierce skepticism in Taleb's thinking. He loves to tear down systems of thought That's fine. There's a role for him. But ultimately we do need to make tough policy decisions and to do that, we have to build systems of thought. As William James argued, it's important to believe in something instead of being frozen by skepticism.

seth (2010-06-19 05:08:53)

Taleb's ideas are useful, unlike those of most skeptics. He used them to choose investments. I was influenced by them in my ideas about how science progresses (see my medical hypotheses paper). My theory of scientific progress has consequences. However his useful ideas can't be expressed as funny one-liners.

Dave (2010-06-24 19:55:55)

The human propensity to ridicule new ideas is not a new idea; i.e. Kuhn. What is surprising is a human being in the 21st century daring to challenge out-dated thinking. The financial disaster of 2008 and the war in Afghanistan prove that events have overtaken our ability to be responsible. It is now only our ability to react to events that has overtaken our ability to see what lies before us. And that puts us all in danger.

Tom in TX (2010-06-27 17:18:28)

As I read in some book, the opposition to any great idea comes in 3 stages: 1. It will never work. 2. It is trivial. 3. That is what we have been doing all along anyway.

### **Omega-3 Correlations in Eskimos Support Anti-Inflammation Effect (2010-06-18 17:46)**

A problem with much nutritional epidemiology, [1]as I blogged earlier, is "the narrow range of intakes within a given population". For this reason Ernst Wynder thought it better to make between-country comparisons. Of course different countries differ in many ways other than the ones you care about. A solution to both problems is to study an unusual country – a country with a wide range of intakes of the nutrient you care about – in depth.

This is what [2]a new paper about omega-3 has done. The researchers measured the blood of about 400 Eskimos, who had a much larger range of omega-3 levels in their blood than Americans or Europeans. The results aren't easy to sum up because there were plenty of non-linear associations. Here's what I think is their most interesting result:

Associations of EPA and DHA with C-reactive protein were inverse and nonlinear: for EPA, the association appeared stronger at concentrations >3 % of total fatty acids; for DHA, it was observed only at concentrations >7 % of total fatty acids.

[3]C-reactive protein is a marker of inflammation. Notice that, due to the details, the combination of (a) high intakes and (b) a wide range of intakes makes this correlation much easier to see. This result suggests that EPA and DHA (or something correlated with them) indeed reduce inflammation, as is often proposed. Perfectly consistent with my dentist's observation that [4]my gums looked a lot better (less inflamed) right after I started drinking 4 T/day flaxseed oil. Plus a reader's observation that [5]his sports injuries healed much faster after he started drinking 4 T/day flaxseed oil. (And [6]here.)

Previous epidemiology had had a hard time detecting the anti-inflammatory correlation of omega-3s. My self-experimentation plus other people's observations made it obvious there was something to it (and provided experimental evidence for causality: more omega-3, less inflammation). Better epidemiology has now supported this.

Thanks to Dave Lull.

---

Alex Chernavsky (2010-06-18 19:05:45)

I drink about three large cups of coffee per day. My dental hygienist has always remarked about the large amount of staining that she finds on my teeth (hence, I get my teeth cleaned four times per year, instead of the more-usual two). Since I started taking 3 1/2 tablespoons of flax oil every day, my teeth have become much less stained than usual. I haven't made any other changes in my oral hygiene. The last time I went to the dentist, the hygienist was amazed at the difference. I wonder if the staining is related to some sort of inflammatory response?

Alex Chernavsky (2010-06-18 19:22:00)

By the way, Seth – what's your view on taking DHA supplements (in addition to the flax oil)?

seth (2010-06-19 05:14:11)

I don't have an opinion about DHA supplements. Haven't tried them. Your story about teeth staining is very interesting. Recently I noticed my teeth stained, which surprised me. I assumed it was due to drinking ice tea, but this doesn't make much sense since I had drunken lots of ice tea in the past without teeth staining. I had been continuing to take 3 T flaxseed oil every day – but the flaxseed oil is old (I was in China) and possibly degraded. I had other reasons to suspect degradation and now you've given me another one.

Chris Robbins (2010-06-19 06:41:50)

Seth, Do you take lignan added Flaxseed oil? As I've heard (from Dr. Weil) that without the lignan it could be problematic for men in particular and could increase likelihood of prostate cancer.

lance (2010-06-19 07:16:57)

I've found there to be a high correlation between omega3 intake and my acne. First thing I did was stop eating omega6 foods, which reduced the acne significantly. Eating lots of sardines in olive oil helped, olive oil alone was inflammatory. Using flax was OK, but I don't want to take tablespoons of flax per day. Ordinary cod liver oil didn't help at all, not that I could tell. The fermented cod liver oil, using gummi fish, was the most effective of all.

vic (2010-06-19 07:38:15)

I don't consume much omega-3 because I hate the smell and taste of fish (and fish oil), but I do consume tons of nuts and seeds (some walnuts that have ALA omega-3, but also lots of omega-6, and no flax) that are rich in omega-6 and my most recent CRP

was .18 mg/L. The reference range is less than 3 mg/L.

seth (2010-06-19 13:56:32)

Chris, no I don't take the version with lignans. Thanks for alerting me. vic, everyone else says omega-6 is proinflammatory. You seem to be saying the opposite. Am I misunderstanding?

vic (2010-06-19 15:36:49)

I've never seen good evidence that omega-6 are pro-inflammatory in people. Almost every epidemiologic study I've seen that looks at nuts and linoleic acid (the primary omega-6 fatty acid in vegetable oil) finds a robust inverse association between consumption of nuts (and/or linoleic acid) and coronary disease, cancer, and mortality.

## The Future of Dentistry and Experimental Psychology? (2010-06-19 13:02)

Rereading [1]an old post, I found this:

Today I had my teeth cleaned and was told my gums were in excellent shape, better than ever before [due to flaxseed oil]. They were less inflamed than usual. "What causes inflammation?" I asked. "Tartar," I was told.

I believe that reddish gums are a great sign (so easy to see) that overall your body has too much inflammation, putting you at higher risk for many common diseases. (Perhaps due to too little omega-3, which the body uses to make an anti-inflammation hormone.) Every day my dentist measured, or at least saw, a great correlate of health (the redness of his patients' gums) and failed to notice. It's like failing to notice an oil field under your property. If dentists became experts in measuring gum redness and helped their patients lower overall inflammation, the public health contribution would be great. (Writing this makes me wonder why I haven't become skilled at measuring the redness of my gums.)

Experimental psychologists are in a similar position. I believe brain health is closely correlated with health of the rest of the body. In other words, the foods that make the brain work better make the rest of the body work better. I discovered the anti-inflammatory effects of flaxseed oil because it improved my balance. The brain is much easier to study (via behavior) than the rest of the body – it's a model system for the rest of the body. Experimental psychologists are as unaware of their good fortune as dentists. By using their skills to figure out how to have the healthiest possible brain, they could make a great contribution to human welfare.

1. <http://www.blog.sethroberts.net/2007/03/28/omega-3-and-dental-health/>

---

epistemocrat (2010-06-19 15:33:29)

I see a Meta-Rule: "Don't consume anything that increases the redness of your gums." Here is a simple rule that some may deduce from that: "Don't eat red popsicles." Just kidding. My brother is applying to dental school soon, and maybe he will

be able to tap into this good fortune sometime in the near future. Weston Price did a nice job using snapshots of people's faces and of their smiles (teeth) to provide a "window" into overall systemic health. I agree that oral health is a great proxy for the state of the machine overall. Personally, increasing my animal lipid intake has improved my oral health (epithelial health, generally) and gave me a practical feedback loop to tap into for my own self-experimenting. However, I can't think of a good way to measure redness of gums, aside from high-quality photographs. I'll keep thinking, though.

Indrek (2010-06-20 06:05:58)

There seem to be mixed reactions to flaxseed oil, as much as I've read about it online. And one needs also consider that flax basically only has ALA and no EPA or DHA, which should be the two types most identified for their anti-inflammatory effect. Have you tried any fish based omega-3 oils to see what kind of effect they have compared to flax?

G (2010-06-23 19:45:56)

The healthy baseline redness is bound to vary from person to person. Anemic persons may give a false impression of health. Is bleeding directly related to inflammation-levels? Can I just feel more or less alright so long as there's no blood on my toothbrush? I am mindful to eat omega-3 and the dentist never has the least reservation about my clean bill of dental health.

seth (2010-06-23 22:41:12)

G, I don't know the answer to your question about bleeding. About individual differences: It's not obvious that they're large enough to matter.

### **Ad Hominem Attack on The Rational Optimist (2010-06-19 15:46)**

I have yet to see Matt Ridley's new book *The Rational Optimist*, which is related to [1]stuff I've said about human evolution. But [2]George Monbiot seems to consider it damning that Ridley was chairman of the bank Northern Rock when it failed. Bailout of Northern Rock was an example of government intervention – which *The Rational Optimist* is against, Monbiot says. Hey, why not attack Ridley for drinking government-supplied water from the tap in his kitchen? What a hypocrite!

1. <http://www.blog.sethroberts.net/category/human-evolution/my-theory-of-human-evolution-directory/>
2. <http://www.guardian.co.uk/commentisfree/cif-green/2010/jun/18/matt-ridley-rational-optimist-errors>

---

Allison (2010-06-20 03:50:56)

If Matt Ridley had written a book saying the government should not be supplying everyone with water then attacking him for drinking that water would be fair. If he writes a book that says the free market has all the answers and government intervention is always a bad thing, I think it's pretty reasonable to point out when Ridley put his ideas into practice the result was catastrophic and he needed a government bailout. Ridley is the hypocrite, not Monbiot. This is obvious to any reasonable person.

seth (2010-06-20 04:43:05)

"When Ridley put his ideas into practice" – his running a bank wasn't "putting his ideas into practice." Running a bank is more complicated than that. Other people and other people's ideas were involved, I'm sure.

MT (2010-06-20 14:24:01)

Monbiot's assertion is fair – if one is going to take a public stand defending a principle, it is reasonable to ask whether they live by that principle. Ad Hominem arguments are not always fallacious. A fallacious Ad Hominem attack might have been saying Ridley was an Eton-educated son of a nobleman who owed his chairmanship to crony-capitalism and connections rather than the merit of his experience in business and banking, and that his ideas on finance and economics are divorced from reality because he was raised in a gilded cage and breathes only the rarified air of the ivory tower. It might be a fallacious Ad Hominem attack – or it might be a valid Ad Hominem attack. Ridley is a proponent of the free market and a critic of government subsidy, but when his personal interests were at stake as chairman of a company floundering due to his leadership, he sought a government bailout for himself, the friends he ran the company (into the ground) with, and the shareholders. Why shouldn't the market have determined the fate of Northern Rock? It would have cost Ridley a fortune to put his principles into practise. If that wasn't exactly the type of stand he was looking to take, he shouldn't have taken the chairmanship to begin with. He's a hypocrite. Would he have advocated bailing out any of the other thousands of companies that go bankrupt every year? The one's he has no vested interest in? The ones that don't have connections to government leaders through family connections? Northern Rock was massively leveraged and so felt the credit crunch far earlier than others. Basically, they took a huge gamble on something they didn't understand. A bigger, stupider gamble than all of the other big, stupid gambles made at the time (made by deluded bankers instead of deluded science writers). I think Ridley is the worst of the type of decision-maker Taleb is warning us against – the arrogant fool-King in experts clothing spun from his own rhetoric and leaving him distinctly naked to those more concerned with the strength of his arguments than the conviction with which he makes them. I notice that Monbiot made specific criticisms of Ridley's climate change position as well, and am wondering how accurate those criticisms are.

seth (2010-06-20 15:01:15)

MT, you are mistaken about the nature of the bailout. Shareholders got nothing. The value of Ridley's shares went to zero and he lost his job. In that sense the market did determine what happened to Ridley. See: <http://business.timesonline.co.uk/tol/business/law/article5515655.ece> See also his Freakonomics Q & A: <http://freakonomics.blogs.nytimes.com/2010/06/15/matt-ridley-the-rational-optimist-answers-your-questions/>

MT (2010-06-20 21:23:53)

My characterization was accurate – I said he "sought a bailout" and that it would have "cost him a fortune to put his principles into practise." He did seek a bailout, and the alternative would have cost him a fortune so he scrambled to avoid it. He simply failed, and I'm calling him a hypocrite for trying. If I said someone was behaving immorally for trying to extort money from pensioners, it wouldn't contradict my point to observe that they failed in their attempt. On a side-note, I love the Orwellian explanation of the situation offered by Lord Pannick in the article from the Times that Northern Rock simply had "short-term liquidity problems." What bankrupt business couldn't make the same claim? If these assets were so valuable, why wouldn't anyone else buy them? The value of financial assets is contingent on the market for them. Nobody wanted them, so they had no value. If there was a higher bidder, they would have sold to that bidder and there wouldn't have been a problem to begin with.

Jeremy (2010-06-21 01:40:22)

"[Why not attack Ridley for drinking government-supplied water from the tap in his kitchen?" Because the UK government no longer supplies water to households in the UK, since water was privatized in the late 1980s.

seth (2010-06-21 06:43:05)

Jeremy, thanks for the correction. MT, I'm unsurprised he sought a bailout – for the sake of his depositors, at least. But how he thereby saved a fortune – as you seem to think when you write it "would have cost him a fortune" not to be bailed out – I fail to see, since he lost his whole investment and his job.

Nathan Myers (2010-06-21 17:44:26)

Seth, MT already explained that. Ridley did not save a fortune by betraying his principles, but he *tried to*. He betrayed his principles without foreknowledge that he would get nothing for it. The betrayal stands on its own, and is in no way mitigated by its ultimate futility. If, in fact, he had succeeded, would that make the betrayal more or less meritorious?

Tim (2010-06-22 03:45:28)

Seth seems like most of us, he tries real hard to find parts of a story that validate his own beliefs.

JRF (2010-06-27 16:54:09)

Imo, any commenters claiming hypocrisy on Ridley's part for his these actions should be IP-blocked from commenting further as they have proven themselves to not be able to think clearly about even simple issues.

lemmy caution (2010-07-07 16:35:45)

*But it's not just Ridley who doesn't mention the inconvenient disjunction between theory and practice: hardly anyone does. His book has now been reviewed dozens of times, and almost all the reviewers have either been unaware of his demonstration of what happens when his philosophy is applied or too polite to mention it. The reason, as far as I can see, is that Ridley is telling people "especially rich, powerful people" what they want to hear.* Ridley's biology books are excellent, but it is odd that hardly anyone was mentioning his problems at Northern Rock. Especially since bank failures are so much in the news these days. He was obviously in over his head.

### **The Costs and Benefits of Overtreatment (2010-06-20 16:40)**

[1]This excellent NY Times Magazine article by Katy Butler describes the awful price paid by the Butler family when her father was given a pacemaker that kept him alive too long. The hospital, surgeon, and pacemaker manufacturer benefited by thousands of dollars. Her father was too out-of-it to make decisions about his health. His wife, who made the decision, was given too little information (not told of a much better alternative, not warned of the eventual outcome, which was likely) and, Butler seems to say, decided too fast. The pacemaker was implanted so that he could have a hernia operation – the hernia surgeon wouldn't operate without it.

Butler's article is excellent because it is personal, moving, and sheds light on a big issue that I rarely read about: the way "informed consent," in practice, favors overtreatment. The patient or their representative makes the final decision, yes, but in most cases their decision is based mainly on information they've been given by their doctor or hospital, who benefit from one decision (yes, do something) but not the other (no).

The incentives for overtreatment continue, said Dr. Ted Epperly, the board chairman of the American Academy of Family Physicians, because those who profit from them "specialists, hospitals, drug companies and the medical-device manufacturers" spend money lobbying Congress and the public to keep it that way. . . . The profit margins that manufacturers earn on cardiac devices is close to 30 percent. Cardiac procedures and diagnostics generate about 20 percent of hospital revenues and 30 percent of profits.

I liked Butler's article partly because I'd had a similar, much smaller experience. I'm still pissed that during a discussion with Dr. Eileen Consorti, a Berkeley surgeon, of the costs and benefits of surgery to fix a nearly-undetectable hernia, she said nothing about side effects other than death. There are other possible bad effects of general anesthesia, which the operation would have involved. [2]I complained to her assistant about her incomplete description of the risks. She didn't respond, other than to threaten legal action (for not removing [3]criticism of her for something else, I suppose).

Of course doctors, hospitals, and so on benefit from treatment. For me, the problem arises when (a) the benefits to patients are slight (compared to the benefits to the doctor, etc.), zero, or unknown or (b) the costs to patients are not well described. In both of these cases – the Butler family's and mine – both (a) and (b) were true. Condition (a) is

overtreatment, but Condition (b) makes things worse. If you propose to do something to me that could have an awful outcome, and from which you benefit, I would like to be warned of the awful outcome.

Dept. of Amplification. [4]My original mention of Consorti was about how I couldn't find any studies supporting her recommendation of surgery. She had said such studies existed. When I couldn't find them, she promised to find them for me, but, several years later, has yet to. In the meantime, a reader of this blog found [5]a relevant study (thanks, Kirk). Its results support my decision not to have the surgery that Consorti recommended.

[6]Robin Hanson on doctors. [7]How could we be this wrong about medicine? Thanks to Peter Spero.

Alex Chernavsky (2010-06-20 18:42:25)

As I tell everyone who will listen: Medical textbooks and journal articles are surprisingly accessible. You might need to look up some terms in a medical dictionary (or search for them on Google), but with a moderate amount of effort, an educated layman can grasp the literature. If you have any concerns about your treatment, go to the library at your nearest medical school. The reference librarians are usually very helpful, even if you don't have any affiliation with the university. You can also search PubMed (also called Medline) from home: <http://www.ncbi.nlm.nih.gov/pubmed/> When I was diagnosed with a parathyroid adenoma some years ago, I found out information that persuaded me to fire my first surgeon and change the course of treatment.

peter (2010-06-20 20:04:45)

what i found noteworthy about the article was that 58 of the positive recommendations "were based on no studies at all, only a 'consensus of expert opinion.'" and most of those received financing from cardiac-device makers or worked at institutions receiving it. "This pattern â€" a paucity of scientific support and a plethora of industry connections â€" holds across almost all cardiac treatments, according to the cardiologist Pierluigi Tricoci of Duke Universityâ€™s Clinical Research Institute. Last year in The Journal of the American Medical Association, Tricoci and his co-authors wrote that only 11 percent of 2,700 widely used cardiac-treatment guidelines were based on that gold standard. Most were based only on expert opinion. " i can't believe that this is an isolated phenomenon. it has to be duplicated relative to many medicines/procedures.

Mellors (2010-06-20 20:39:03)

Seth, I think you are incurious about incuriosity (other readers may have to be curious enough to follow almost all of Seth's links to prior posts and other comments in this post to see what I am talking about). The incuriosity you notice and deplore among physicians and other professionals is for you simply a betrayal of humanity - you note that all babies and young children are curious, and something happens to them - in school (as you like to cite Robin saying) or in med school. But surely this is too simple. First of all, there are huge differences in the kind of curiosity that babies and children are born with (I have seen a wide range of curiosity even among the five babies that my personal magnetism has caused to bring into being - if I were inventing a language I'm not sure I would have used a single word to describe the curiosity of each one of these people). Secondly, even if curiosity in the very young is a useful adaptation, isn't it also the case for our species - which has existed

in such widely different environments with such widely differing sets of competitors - that curiosity would be replaced with expertise - expertise which can, for most people, become adequate only by shutting down one's other talents and interests? (If you have never come across the New Zealand anthropologist Peter Wilson's book "Man, the Promising Primate" (1979, I think), you can see an interesting theory about the unspecialized nature of our species and how it has shaped us.) If Wilson is right, our species is good at nothing in particular, but through intense practice, individuals can become good through hard work at one thing, and relative neglect of others. Wilson's insight was that the speech-act of "promising" - I'm going now, but will be back on the 6:45 - was the originating communication that established us as human, because it recognized that most of us must do two things badly - be a husband and be a salesman, say - rather than one thing well, enabling us to perform 2 or 3 roles at once. There was a grain of truth in Aldous Huxley's early account of the experience of what became known as "psychedelics," that these drugs worked by destroying the filter between us and the assault of stimuli - and thus produced wonder and inutility (to put it mildly) at the same time. One needs incuriosity fully to realize one's potential, as well as curiosity. I have noticed that at a certain point in professional careers, for most people, it's only possible to maintain excellence and expertise by shuttering oneself from external stimuli and shuttering oneself in. (Of course, I'm sure that in professional schools, this notion is promoted far too early to people who are far too young. And there are of course a few who need not do so.) Let me give a counter-example. Myself. I am far more curious about more things than most people - I too noticed this about myself when I was a university professor in my late 20s and early 30s, teaching students who became less and less widely interested. But when one has an essentially mediocre gift - as I seem to have - curiosity can lead one to fail or thrash about in many fields, rather than succeed in one. Fortunately for humanity, I can say that one thing at which I have never failed, because I never attempted, is surgery. But it seems churlish to complain that one's physicians tend to be incurious when - according to the commentators on this blog - the best experiences as a patient with surgeons comes from docs who superspecialize in one sort of operation, and see one sort of patient. I think that there is a kind of Hegelian *Aufhebung* of which people like, say, you are capable of - moving from wide curiosity, to special knowledge and expertise, to a higher curiosity. Whereas between, say, a lawyer friend who declared to me (to my shock and disapproval) at the age of 45 that his ambition as a lawyer was never to have to learn any new law - and who remains an expert in his field - and me, who has tried his hand at so much and achieved so little that is lasting (with the exception of my children) - the world ought to prefer consulting my incurious but expert friend when it finds itself in the particular kind of jam he is good at fixing, rather than me, most anytime. In any case, I think you fix on villains rather than heroes. Overtreatment is bad, but it's a luxurious kind of evil. Undertreatment or neglect is far worse. Whereas the perfect match between necessity and solution is a miracle.

seth (2010-06-21 06:34:02)

Mellors, you're right I complain about lack of curiosity in other posts - thanks for reading them. In this case, however, what the Butler family went through was to some extent caused by the mom's lack of curiosity. Had she been more curious about other treatment options or about the costs of pacemaker implantation, she might have been saved a lot of grief. Here I'm defending the incurious.

Mark (2010-06-21 08:13:06)

It would be relatively easy to knock your blog off the first page of Google results for "eileen consorti." She needs to hire a good online reputation management consultant. She needs to set up her own Web site, maybe at [consortisurgery.com](http://consortisurgery.com), and register it in various directories like Yahoo! Directory, Business.com, PR.com, and a few others. She also needs to register [eileenconsorti.com](http://eileenconsorti.com), .org, and .net, and put some sort of genuine content on them. Having a domain name that is the same as a search phrase (minus spaces, no hyphens) will make ranking that website on the first page of Google's search results easy, especially for a rare search term like "eileen consorti." Maybe .com can be a secondary business site, .org can be an information site about various medical topics, and .net can be a personal site. Then she needs to set up Twitter, Flickr, MySpace, LinkedIn, Facebook, and other pages in her name. She needs to join every professional organization out there that offers outbound links to their members' websites. The BBB often does this, but it depends on the locality. She could start a blog or write guest blog posts for others' blogs. She could release press releases. She can write articles. She can give interviews to various media. For some of these sites she needs to register them in directories, and there should be a certain amount of cross-linking among them (but not too much). The page titles need to be "Eileen Consorti" or that plus a few other words. There are other things that she could do. It takes about 3 months to see the results. Once there is enough stuff online that outranks your site, it'll fall

to page two, and hopefully to page three. Few people look beyond page one of Google.

### **My Theory of Human Evolution (good-luck charms) (2010-06-21 06:59)**

In [1]a museum about the history of Tokyo, I saw an exhibit that showed a typical Tokyo home from hundreds of years ago. It contained an elaborate good-luck charm next to the shrine. I realized that good-luck charms can be explained by [2]my theory of human evolution as another example of behavior – along with art, ceremonies, and [3]gift-giving norms - that long ago supported technical progress. This particular good-luck charm was hard to make. Because people wanted them, they bought them. This helped support skilled craftsmen, who were the ones who made technical progress. Along the same lines, ceremonies usually involve lots of high-end hard-to-make stuff, such as fine clothes.

Visiting distant big cities has taught me a lot about human nature. The big examples are the Shangri-La Diet (Paris) and the umami hypothesis (a earlier Tokyo visit led me to make a lot of miso soup, which had surprising effects). Trips to Antigua (single words make it easy to trade), Toronto (gifts support technical progress), and now Tokyo (again) helped me think about human evolution.

Duncan (2010-06-23 15:39:11)

You may be interested in a new Wired article about Sergey Brin's attempts to discover treatments for Parkinson's disease (and other ailments). It could be complementary to self-experimentation, if enough people quantify themselves online. "Generally the pace of medical research is glacial compared to what I'm used to in the Internet," Brin says. "We could be looking lots of places and collecting lots of information. And if we see a pattern, that could lead somewhere." [http://www.wired.com/magazine/2010/06/ff\\_sergeys\\_search/](http://www.wired.com/magazine/2010/06/ff_sergeys_search/)

### Good Sleep on Long Flight (2010-06-22 19:58)

Today I flew from Beijing to San Francisco, an 11-hour flight. For the first time ever on a long flight, I slept well even though I had to sleep in my seat. (When I've been able to stretch out on several seats or on the floor, I've slept okay.) I slept so much the flight felt short – like it was four hours long. When we landed in San Francisco, I felt great. As if I hadn't traveled at all. This has never happened before. Instead of going straight home, I did some errands.

Why did I sleep so well? It surely helped that the flight started at 4 pm Beijing time, to which I was well-adjusted. But I've never before slept well sitting up, no matter what the flight time. I think this time was different because I did two things I've never done together before:

1. Lots of one-legged standing. Around 2 pm I stood on one leg to exhaustion 3 times (right leg, left leg, right leg). Around 7 pm I did it again: left leg, right leg, left leg. Six times is a really large dose, too large to be used every day because my legs would get too strong. Usually I do two or four times. I think that the two bouts (in this case, 2 pm and 7 pm) need to be widely spaced so that signaling molecules released into the blood by the exertion can be replenished.

2. Lots of cheese. Around 7 pm, I ate about a quarter-pound of Stilton. With a milder cheese I might have eaten more. It isn't just [1]the animal fat, I think something in milk makes me sleepy.

Around 8 pm I started trying to fall asleep. It didn't seem promising, I only felt a little tired and not completely comfortable, but after maybe 4 minutes with my eyes shut, I fell asleep for most of the rest of the flight.

1. <http://www.blog.sethroberts.net/2009/10/31/effect-of-animal-fat-on-sleep-more/>

---

q (2010-06-22 21:03:17)

when i flew to japan (the long leg was SF -> tokyo) i was sitting in the front row, and right in front of me was a large video screen. i thought this would make for absolute havoc; i didn't think i would sleep at all. i slept fitfully, but i felt well rested when i arrived and didn't have jet lag despite a 12 hour time change. my theory is that the randomly pulsing light from the video screen, still visible through my closed eyes, simulated REM. i wonder if anyone has done experiments with sleeping with randomly pulsing light on.

Sam (2010-06-22 21:03:52)

Did you use your Bose NC Headphones during the flight?

hong lei (2010-06-22 21:52:51)

It's really smart to eat lots of cheese instead of milk which also make you sleepy but urinate frequently.

Laura (2010-06-22 22:50:42)

I'm glad you had a great flight!!!

seth (2010-06-22 22:55:25)

I only used my Bose NC headphones when watching video – maybe an hour. It happens that I was sitting in the front row right next to the movie screen but on the aisle. The screen wasn't bright and was easy to ignore.

Mara (2010-06-23 01:17:51)

Hi Seth, This is off-topic but I just thought you might be interested by Marginal Revolution's post today on radiation hormesis: <http://www.marginalrevolution.com/marginalrevolution/2010/06/scientific-hypotheses-from-196.html> Best, Mara

G (2010-06-23 04:58:53)

Re. #1: "...too large to be used every day because my legs would get too strong." ...Huh!? Please explain. Re. #2: I guess you'll have already heard this, but hot milk is a popular old sleep-aid; I think it actually works. You reckon there's anything in the caution that cheese provokes nightmares? I haven't found this, and often gravitate to cheese as a bedtime snack. Malt drinks made with hot milk, like Horlicks or Ovaltine, seem to be a good choice.

seth (2010-06-23 05:53:29)

What did I mean by "too large [an amount of one-legged standing] to be used every day because my legs would get too strong"? If I did six one-legged stands to exhaustion every day, it would take longer and longer to reach exhaustion. 5 minutes per leg at the beginning, 20 minutes per leg a month later. I don't want to spend 20 minutes per leg – that would be a total of 120 minutes per day. I haven't noticed any nightmares after eating cheese.

Allen K. (2010-06-23 05:55:03)

1/4 pound counts as a "lot" of cheese? Uh-oh...

dr. cosa (2010-06-23 07:10:20)

the magnesium in milk and dairy might be part of the reason for sleep inducing effects,

peter (2010-06-23 07:30:38)

i practice qigong. one of the forms/postures is playing pi pa (the third form in a series of 10), which involves a kind of stressful standing on one foot. You might learn that to avoid just ordinary standing on one foot because it will reduce the time required to fully stress the leg. You'd have to find an instructor, which shouldn't be a problem in either Berkeley or China.

seth (2010-06-23 08:53:48)

Allen K., I wish I knew the exact amount of cheese but I don't, not even close. I'm not sure what you are trying to say.

Wilhelm (2010-06-23 09:10:03)

Wasn't there something like opiod in the milk. That could explain the sleep-inducing effect of the cheese.

G (2010-06-23 15:02:33)

Uh Seth, why not just squat down a bit more on the leg? You can hang onto something for balance. Just a few degrees more of knee and hip-flexion should make a big difference if you're standing for five minutes. Heh, or you could wear a backpack of heavy weights... This seems like kind of an eccentric way to encourage sleep, but hey, maybe one day everyone will do it. :-)

G (2010-06-23 15:03:44)

Also, I'm sure Allen K. was just joking about his own cheese-intake, not asking a question.

seth (2010-06-23 16:04:51)

G, yeah, that interpretation of Allen K's remark makes sense. And, yeah, I could bend my leg more. Yet it feels like there is a natural amount to bend it, and it's hard to go away from that. I worry that more bend would (more) isolate one muscle, yet the effect depends on lots of muscle being stressed. (So lifting weights with your arms won't do it because the arm muscles are much smaller than the leg muscles.) The way I do it now I move my leg up and down small amounts while bending it, so both sets of muscles are being used.

G (2010-06-23 19:41:53)

You're doing a low-intensity endurance squat; as you get stronger, deepen the squat to keep the intensity at the right level. If you have a feeling of sitting back as you stand on the leg then you will be stressing your glute as well - feel or imagine how it acts to maintain the angle between your upper leg and the floor - so your two biggest muscle-groups will be tensed. If you instead sink forwards as you stand, with your knee and head extending beyond your toes, you will over-emphasise the quadriceps and stress the knee. Some knees are more resilient than others, but it's a common problem area. Muscle-balance is a legitimate concern here, and shallow squats are less likely than deep squats to engage and strengthen the hamstrings in roughly desirable proportion - they are very much secondary to the movement; I think they're mainly stabilizers rather than pushers. If your only leg exercise is deep squats, and over time you work up to a very heavy squat, then you pretty much must have strong hamstrings, because heavier weights will make their secondary-but-significant role more demanding, but shallow squats will leave the hamstrings seriously lagging, which can have undesirable consequences. If you are already doing some form of general strength-training, with good technique, then your standing periods are unlikely to much of a difference for better or worse. If you are not strength-training your legs already, you might want to maintain muscular balance by doing something that works your hamstrings. This needn't be anything time-consuming; simple isometrics would do. Oh, and a little movement in the joints probably would be more effective than a purely static hold - just don't jerk or bounce at all; knees are precious; take it from one who found out the hard way. :-)

Allen K. (2010-07-05 10:20:54)

(Indeed, I was just joking; I can certainly put away more cheese than that without noticing.)

## **My March 2010 Quantified-Self Talk (2010-06-23 07:27)**

[1]Here it is. A 12-minute talk about what I'd learned recently from daily tests of mental function. Most of all, the value of butter.

1. <http://vimeo.com/10592092>

---

jay (2010-06-30 08:05:05)

I bet all this butter can probably make you a better liar: <http://www.bakadesuyo.com/what-can-you-do-to-someone-to-make-their-lies>

Alexandra Carmichael (2010-07-11 03:38:54)

Well, I tried challenging my body with 2 tbsp of butter yesterday after being dairy-free for a month. Half an hour after eating the butter (Strauss), I got a splitting headache, though not quite a migraine, that lasted for 9 hours. And I woke up in the middle of the night with a sore throat, stuffy nose, and wheezing. Both of these symptoms (headache/migraine and allergy-like symptoms) had been regular while I was eating cheese, and disappeared when I went dairy-free, but I wanted to do the butter test to see if it was the milk protein or something else. It's something else, but what??

Glen Raphael (2010-06-24 22:33:26)

"Parking-space maximums" reminds me that as a libertarian, I seek the staid, sensible middle ground between prohibition and compulsion. Do we really have to jump straight from banning too little parking to banning too much? Is the idea of simply letting the market decide how much parking is appropriate entirely out of the question?

### Law Guardians and Self-Experimentation (2010-06-25 04:07)

In [1]my recent Medical Hypotheses paper, I argue that scientists care a lot about status display and this interferes with good science. Failure to self-experiment is an example. I think the main reason self-experimentation is unpopular is that it looks low-status. [2]Here I explain how sleep researchers would benefit from the self-experimentation they don't do.

In [3]a May New Yorker article, Janet Malcolm gives another example of status display getting in the way of doing a good job:

Not speaking to their clients [children] is almost a badge of honor among law guardians [lawyers assigned to look after the interests of children in the legal system, such as the child of divorcing parents]. In a 1982

study by the New York State Bar Association, this practice was found to be ubiquitous. . . . Judges continue to turn a blind eye to what the Bar Association called the "phantom" attorney.

---

Dena Shunra (2010-06-25 10:46:54)

The article itself - while quite long - is very worth reading. The particular law guardian at the focus of the story not only did not meet the child he was supposed to be representing, but also met up with the journalist (Ms. Malcolm) and spent several hours explaining to her his theory of widespread conspiracy. This fact, while brought to the attention of the court, did not inspire any less confidence in the law guardian. There is so much more context than in the piece you pulled out.

Bryan (2010-06-25 13:16:11)

Seth, the New Yorker link goes to a report on Tourette's.

seth (2010-06-25 16:49:27)

Bryan, thanks for pointing that out, I've fixed it Dena, yeah, the whole article is good. I'm glad someone is pointing out horrifying features of the justice system. However, Malcolm didn't convince me there was a miscarriage of justice. There were 91 phone calls between the mom and the murderer that weren't given another convincing explanation, other than that the mom and the murderer were working together to kill her husband.

Alex Chernavsky (2010-06-25 19:45:00)

Here's another excellent (if depressing) article about how children get screwed-over by the system: <http://www.villagevoice.com/2000-06-13/news/inside-new-york-s-foster-care-system/>

Stephen M (Ethesis) (2010-06-26 10:44:35)

Err, we would crucify an ad litem (what they call them here) who acted like that.

## **Lucky Charms Can Work (2010-06-25 23:52)**

Speaking of [1]good-luck charms, [2]a study at the University of Cologne found in four different experiments with four different tasks that people did better when they believed that they somehow had Lady Luck on their side. For example, they did better when they had their lucky charm with them than when they didn't.

If lucky charms work then it's reasonable to buy them. [3]I explained why it's helpful in an evolutionary (i.e., long-term) sense to buy them: long ago, the resources paid for them supported technological innovation. Via [4]Bad Science.

## Chinese Mystery Explained: Humorous Names (2010-06-26 15:36)

Describing my first day of teaching at Tsinghua, [1]I wrote:

The students did brief introductions. Many students appeared to think that one student's Chinese name was humorous. This was briefly explained to me but I still have trouble believing it.

I don't remember the brief explanation. At the time I didn't know that my Chinese name sounds exactly like the word for eggplant, which has different characters. As the Tsinghua story suggests, this isn't rare. I met a girl whose name sounds the same as China's ruler. (Different characters, of course.) Anyway, it seems a blessing that my name has a humorous side and perhaps that's what the parents in this case were thinking.

## Assorted Links (2010-06-26 17:19)

- [1]A Chinese medicine huckster. "Zhang asserts that different body organs have their own color preferences: lungs like white food, the liver likes green food, kidneys like black food, the heart likes red food and the spleen likes yellow food."
- According to Gawker, [2]"kombucha tastes terrible". Some store-bought kombuchas [3]contain too much alcohol.

1. [http://www.danwei.org/health\\_care\\_diseases\\_and\\_pharmaceuticals/from\\_laid-off\\_worker\\_to\\_tcm\\_ma.php#comments](http://www.danwei.org/health_care_diseases_and_pharmaceuticals/from_laid-off_worker_to_tcm_ma.php#comments)  
2. <http://gawker.com/5566684/the-non+kombucha-drinkers-guide-to-kombucha-tea>  
3. <http://dinersjournal.blogs.nytimes.com/2010/06/25/kombucha-may-be-treated-like-alcohol-government-says/?src=twr>

Alex Chernavsky (2010-06-27 08:15:19)

Heh, this is my favorite comment from that "Gawker" article: "I was having lunch outside, and some girl asked if I could watch her bike while she went inside a store. When she came out, I asked how she knew I wouldn't steal her bike. She replied, 'You're drinking Kombucha, I knew it would be safe.' " I'm not sure why so many people in that Gawker thread think that kombucha tastes terrible. I'd drink it even if I didn't think it had health benefits. I suppose it's a bit like beer, green olives, or hot peppers – you may not like it the very first time you try it, but it grows on you.

Oli M (2010-07-07 02:13:01)

I have the Asian Flush thing where I turn red when I consume ethanol. Store-bought Kombucha turns me slightly red. My own brew does not.

### **Unhinged by Daniel Carlat (2010-06-27 03:41)**

Daniel Carlat, a Massachusetts psychiatrist, is the author of the excellent blog [1]The Carlat Psychiatry Blog. He also wrote [2]an excellent article in the New York Times Magazine about working on the side as a drug rep: He told other psychiatrists about new drugs. He quit (or was fired) because telling the truth wasn't compatible with the job.

Unhinged, his new book (sent to me by the publisher after I asked for it twice – that's how much I wanted to read it), covers the same ground. Its subtitle (or two subtitles) is/are The Trouble With Psychiatry – A Doctor's Revelations about a Profession in Crisis. The contents were well-written, but none of it was new to me: the "chemical imbalance" theory of depression is a convenient myth, how drug reps work, how drug companies influence doctors, diagnosis difficulties, the cases of Charles Nemeroff and the like. (I did learn that Nemeroff was called "the boss of bosses" because of his prominence and power.) If any of his criticisms are new to you, this book is a great introduction. He uses many stories of patients to make his points.

Overall, I found the book too calm. What Nemeroff and others like him did I find outrageous but Carlat doesn't sound outraged. Maybe he is, I have no idea, but his book is more reasonable-sounding than scornful and I would have preferred scornful. At one point he says he wrote [3]an "angry" op-ed for the New York Times about something and I thought: good, some emotion!

The crisis of the subtitle ("A profession in crisis") is enticing but is not borne out by the contents. Carlat dislikes aspects X, Y, and Z of his profession, but one person's dissatisfaction does not equal crisis. I saw no signs he is part of a growing movement. My take on the trouble with psychiatry is that psychiatrists don't understand what is wrong in almost every case they see and, due to lack of understanding, do a poor job of fixing the problem. Lack of understanding by doctors is nothing new and, until someone has a better understanding, doesn't pose a professional problem. This basic truth goes unmentioned in Unhinged.

2. <http://www.nytimes.com/2007/11/25/magazine/25memoir-t.html?scp=1&sq=daneil%20carlat&st=cse>

3. [http://www.nytimes.com/2006/05/09/opinion/09carlat.html?\\_r=1&scp=1&sq=%22makers%20of%20sleeping%20pills%20are%20now%20paying%22&st=cse](http://www.nytimes.com/2006/05/09/opinion/09carlat.html?_r=1&scp=1&sq=%22makers%20of%20sleeping%20pills%20are%20now%20paying%22&st=cse)

Alex Chernavsky (2010-06-27 09:31:49)

I haven't read the book, but I'm not a big fan of Daniel Carlat. He seems to specialize in mild, relatively uncontroversial criticism of psychiatry, as in this disappointing *NY Times* article: <http://www.nytimes.com/2010/04/25/magazine/25Memoir-t.html> Seth writes that psychiatrists "...do a poor job of fixing the problem." I agree, but I would go further and say that psychiatrists often create long-term harm to the very patients they are ostensibly helping. (Psychiatry has a long history of this sort of thing: lobotomies, insulin comas, unnecessary tooth extractions, etc.)

David (2010-06-27 11:19:27)

Louis Menand has an interesting piece in the *New Yorker* a few weeks back on psychiatry, and is interviewed about it on Econ Talk. A lot of it has to do with whether perfectly reasonable people are down in the dumps and whether they have a disease. In many respects, it confirms what most people probably suspect already in terms of diagnosing it. This is sort of the first-order problem before, what this post seems to address, which is the problems of attempting to treat it given extant market incentives. Here's the interview link if anyone's interested: [http://www.econtalk.org/archives/2010/05/menand\\_on\\_psych.html](http://www.econtalk.org/archives/2010/05/menand_on_psych.html)

seth (2010-06-27 12:25:44)

Alex, yeah, the article you link to is a good example of the problem with Carlat. In that article he writes:

Clearly, mental illness is a brain disease, though we are still far from working out the details. But just as clearly, these problems in neurobiology can respond to what have traditionally been considered "nonbiological" treatments, like psychotherapy. The split between mind and body may be a fallacy, but the split between those who practice psychopharmacology and those specializing in therapy remains all too real.

That there might be something deeply wrong with therapy doesn't occur to him.

Matt Weber (2010-06-28 13:32:47)

[www.thelastpsychiatrist.com](http://www.thelastpsychiatrist.com) is not always coherent, but if "calm" is what you don't want, he's worth a shot. And he's usually pretty entertaining.

nancy rappaport (2010-06-28 16:33:52)

I with trepidation would love to send you my memoir to comment on as a child psychiatrist who is trying to humanize the psychiatric profession by showing how patients/therapists share the same kind of sorrow and often that the work to heal can be life saving. Dr. Carlat even if you think is less militant, has taken many steps to bring psychiatrists into being self reflective about how we practice. Sincerely, Nancy

seth (2010-06-28 17:44:34)

Thanks for the offer, Nancy, but no. As for Carlat, I think his influence has been wonderful, as I tried to say at the beginning of my post. But, for this particular reader, his book was not wonderful.

marla miller (2010-07-13 12:33:35)

How interesting that I only recently connected to your blog and now I find another common interest: psychiatry. I just heard him on NPR. My interest goes back to my work in psychiatry as a psychiatric nurse practitioner. Though I continued my love of health care through my writing, I quit medicine when MD's decided to be bought off and nurses were powerless to do anything. In hospitals, money speaks the loudest. If you wonder why health care is in the shape it's in, look in the garages of Docs practicing during the heyday of moneyed medicine-80's, 90's and 2000s until the collapse. They love pretty cars.... They also don't-or can't- speak out too loudly about each other because most of them were in collusion actively or passively. Money's a hard drug to refuse. Most MD's I know didn't include this MD whose blog I will now check out. Best Marla Miller, RN, MSN

## **The David Healy Affair (2010-06-27 14:17)**

Bruce Charlton pointed me to [1]this website full of information about how the University of Toronto rescinded a job offer to David Healy, a British psychiatrist, after he made negative comments about Prozac. Psychiatrists at the University of Toronto got a lot of money from Lilly, the maker of Prozac. Here's something from [2]a CBC documentary about it:

Although he refuses to interviewed, Dr. Nemeroff said through his lawyer that the [University of Toronto psychiatry] center asked for his opinion of Dr. Healy that day and he gave it. . . . Later that day he flew to New York where we do know he told a meeting of the American Foundation for Suicide Prevention exactly what he thought about Healy. One scientist who was there said Nemeroff's attack was furious, angry, exercised, that the thrust was Healy was a nut.

If Charles Nemeroff calls you a nut . . .

Alex Chernavsky (2010-06-27 19:45:05)

See also the very disturbing case of Joseph Biederman, a child psychiatrist from Harvard University who placed his own financial interests above the interests of the children he was allegedly trying to help. I scarcely know which links to post. Google his name for more information. <http://www.digitaljournal.com/article/276135> [http://www.boston.com/news/local/massachusetts/articles/2009/03/21/senator\\_broadens\\_inquiry\\_into\\_psychiatrist/](http://www.boston.com/news/local/massachusetts/articles/2009/03/21/senator_broadens_inquiry_into_psychiatrist/) <http://www.nytimes.com/2009/03/28/health/policy/28subpoena.html>

Alex Chernavsky (2010-06-27 19:55:42)

PS I see that Seth has already blogged about Biederman: <http://www.google.com/search?q=biederman+site:http://www.blog.sethroberts.net/&hl=en&safe=off&prmd=lnb&filter=0>

Tricia R (2011-05-04 18:45:37)

I recently participated in a documentary with Dr. Healy on the use of SSRIs in young children. It was done by Denmark National Radio 5/2011. He is spot on! I lost my 12 year old son to what I believe is fraudulent pharmaceutical marketing practice. I hope more will listen to Dr. Healy. Remember what they say about money and what some will do for it!

## **Prenatal Ultrasound and Autism: Multiple Voices (2010-06-27 22:27)**

I [1]previously blogged (also [2]here) about Carolyn Rodgers's idea that prenatal ultrasound may cause autism. It turns out that she isn't the only person with this idea; researchers at the University of Louisville [3]recently published the same idea.

I learned about the Louisville study from Anne Weiss, who said the connection has been plausible for a long time.

Ultrasound was introduced into obstetrics in the 1970's and was generally restricted to high-risk pregnancies. By the 1980's policy statements were issued by ACOG, the NIH and equivalent bodies in Europe and Canada stating that its use should remain limited to high-risk cases. Despite these recommendations, ultrasound technology became common in hospitals and doctors' offices and routinely applied to low-risk populations. Within a short time the majority of pregnant women were being exposed at prenatal visits, during multiple scans in hospitals, and during continuous monitoring during labour (which could mean 12 to 14 hours during childbirth alone). Skills and techniques used to monitor the fetus prior to the introduction of ultrasound (in utero and during the birth process) were slowly undermined by the technology and often underutilized. Iatrogenic effects from false positive readings, - unnecessary C-sections, inductions, instrumental deliveries etc. caused harm to moms and babies, especially in the early 1980's.

Three important names in the 1980s were (1) Robin Mole, who presented a paper "Possible Hazards of Imaging and Doppler Ultrasound in Obstetrics" to the Royal Society of Medicine Forum on Maternity and the Newborn: Ultrasonography in Obstetrics, April 1985. She was former director of the Medical Research Council Radiobiology Unit, England. Also the work of (2) M.E. Stratmeyer - Research in ultrasound. A public health view. Birth and Family Journal 1980 and (3) Doreen Liebeskind - still at Albert Einstein and a prof of radiology- presented at a symposium at Columbia in 1983. She was concerned that ultrasound may be producing subtle changes in the fetal brain perhaps affecting behavioral mechanisms, possible changes in reflexes, IQ, attention span or some of the more subtle psychological, psychiatric or neurological phenomena. Referred to animal and lab studies that showed ultrasound may cause chromosomal damage, breakdown of DNA, etc. There are others who sounded the warning that this was not a benign technology but these voices were crowded out for varied reasons like threats of litigation, loss of the traditions skills of birthing etc.

There were also Japanese studies that raised concerns about ultrasound. Weiss continued:

Unfortunately the use of ultrasound in obstetrics has not declined, despite safety concerns and the lack of research to rule out serious neurological effects. It's so entrenched in modern obstetrical practice. Doctors use the machines to protect themselves from litigation - in the case of fetal abnormalities, undetected multiples, placenta previa, neurological or physical damage to the fetus during childbirth, stillbirth etc. It has almost become a form of entertainment - you can get photos and videos of baby's ultrasound. It's disturbing how benign it appears.

Within the context of the work I do, ultrasound is just one of many concerns I have with the over-management and medicalization of childbirth. My clients come to me to find ways to subvert this within the hospital setting or to prepare for a home birth with a midwife. I also get referrals from doctors whose patients are dealing with difficult issues while pregnant.

??????? (2011-12-12 04:16:53)

Hello, there is research conducted with children Aotustim Israel Hospital "Assaf Harofeh" pressure infuse oxygen in brain cells by a special cell, do you know what the conclusions from the study? And is that really helps kids Aotustim? Thank you Mickey

mirav shivok (2011-12-16 01:24:30)

Reply to Mickey I know this experiment was conducted in children with autism by Dr. Shimoni I can tell you that some children improved Porter that his children were in light condition PDD spectrum

### What Antidepressants Do (2010-06-29 00:16)

After [1]I complained about lack of outrage in Daniel Carlat's Unhinged, Bruce Charlton pointed me to [2]this essay (registration required) by [3]Simon Sobo, a psychiatrist. Sobo says something I may end up repeating every time the subject of antidepressants comes up:

Rat pups that are isolated from their mother and littermates produce ultrasonic sounds that are indicative of stress. SSRIs [the most popular type of antidepressants] reduce these sounds (Oliver, 1994). Is a chemical imbalance being corrected? I doubt it.

That's a nice summing-up. Prozac (an SSRI) really does something, but the notion that it returns to normal something broken is absurd. Sobo also gives an example of how the anti-anxiety effect of such drugs works in practice:

Mrs. L. had originally required 40 mg of Paxil (paroxetine) per day to recover from a postpartum depression. After 12 months on the medication, an incident happened that disturbed her. During her lunchtime, she was visiting her 1-year-old son at his day care center when one of the workers began screaming at another infant instead of picking her up. The next day Mrs. L. went shopping during her lunch break. Later that week a co-worker became tearful during the course of a conversation with Mrs. L. regarding her own child's day care center. Only then did Mrs. L. wonder about her decision to go shopping the day after she had witnessed the day care worker's inappropriate reaction. She wondered if her Paxil had made her indifferent when ordinarily she would have reacted and worried about such a thing.

[4]My research about mood suggests that depression is due to defective entrainment of a mood oscillator. It's caused by something missing from the environment. "Chemical imbalance" has nothing to do with it.

4. <http://escholarship.org/uc/item/2xc2h866>

---

Dennis Mangan (2010-06-29 05:54:39)

“*Chemical imbalance*” has nothing to do with it. Well, yes and no. There are definite biochemical markers in depression, markers of inflammation and oxidative stress for instance, which antidepressants appear to act upon (at least in part). Also, the co-morbidity of, e.g. heart disease and depression would seem to mean that in at least some cases, physical illness causes depression.

Willy (2010-06-29 05:56:38)

I am reading the article by Simon Sobro and Mrs. L.'s case. She did not quit the SSRI but adjusted the dose, so there is still place for its use. I liked this part: "viewing the patient's needs and her clinical presentation in terms of a psychological narrative"

Joe (2010-06-29 06:49:36)

I have been taking antidepressants for 10 years now , with a great deal of success and minimal side effects. I was reluctant to take one since I believed that there should be a natural alternative to treat the symptoms I was having. Prior to taking antidepressants I was increasingly irritable , fatigued and unable to concentrate. Most mornings I had a hard time getting out of bed. I suffered from panic attacks and overwhelming anxiety. Each month was getting worse and worse for two or three years. This was NOT a case of the blues. My doctor called this depression and treated it with antidepressants. Whatever you call these feelings they failed to respond to numerous earlier treatments of healthy eating, exercising, meditation and psychotherapy. As far as the placebo effect goes it seems incredibly unlikely since I tried numerous over-the-counter herbal , vitamin and prescription medications - some with strongly negative effects-, and each greeted by me with a great deal of hope that it would be the pill to make me feel better. They all failed until I found celexa. The only other pill that helped the anxiety at all was ativan, which did nothing for the fatigue and lack of focus . So I have a problem with studies that show placebos being as effective as SSRIS, since I tried dozens of "placebos" and junk remedies to no avail until I found the one that worked for me. It changed my life. There is a major difference between serious depression and the "blues". I don't doubt that antidepressants are way over-prescribed , much like ritalin. But that doesn't mean that everyone on them would be just as well without them.

Jorgen (2010-06-29 07:49:28)

"Also, the co-morbidity of, e.g. heart disease and depression would seem to mean that in at least some cases, physical illness causes depression." Let's say it together: "correlation does not imply causation". A more likely scenario is that both heart disease and depression have a common cause: life stress. Stress has been linked to both heart disease and depression. I have never seen or heard any argument by which heart disease acts as a causative agent for depression. However I'm always happy to learn, should you have any reference.

Anthony (2010-06-29 08:18:49)

To the extent a chemical balance is being corrected, I think it's a symptom, not a root cause. I'm with Joe Griffin and Ivan Tyrrell on this: usually "depression" is proximately caused by excessive worry, and more properly is caused by basic human emotional needs being unmet. See for example: [http://en.wikipedia.org/wiki/Human\\_Givens](http://en.wikipedia.org/wiki/Human_Givens)

Dennis Mangan (2010-06-29 08:32:57)

Am J Med. 2008 Nov;121(11 Suppl 2):S20-7. Depression in patients with coronary heart disease. Carney RM, Freedland KE. Behavioral Medicine Center, Department of Psychiatry, Washington University School of Medicine, St. Louis, Missouri 63108, USA. carneyr@bmc.wustl.edu Abstract Approximately 20 % of patients with coronary heart disease (CHD) have major depression and 20 % have minor depression at any given point in the course of their illness. Depression causes significant psychological and social morbidity, and **is a risk factor for further cardiac morbidity and mortality**. Although there are many possible biological and behavioral mechanisms, the causal pathways through which **depression increases the risk for cardiac events and death** are not well understood. Despite **the morbidity associated with depression**, and the devastating impact it has on the quality of life of patients with CHD, it is underdiagnosed and often left untreated. This article describes screening

techniques for use in primary care and cardiology settings, and discusses the safety and efficacy of available treatments for depression in patients with CHD. PMID: 18954589 [PubMed - indexed for MEDLINE] [My emphases.] "2. Correlation does not equal causation. In practice, this is used to mean that correlation is not evidence for causation. At UC Berkeley, a job candidate for a faculty position in psychology said this to me. I said, "Isn't zero correlation evidence against causation?" She looked puzzled." - Seth Roberts

rob hoffman, md (2010-06-29 09:39:46)

As the writer who finally got relief from antidepressant medication indicates, clinical depression is a serious, sometimes life threatening condition, which does respond to treatment with antidepressant medications. While excessive SSRI dosage can lead to emotional numbing, appropriate doses are a chemical short cut to "don't sweat the small stuff," and definitely help patients to manage stress more adequately with less impairment of function and better quality of life.

Laura (2010-06-29 09:50:35)

I am on psychiatric medications and have been for 12 years. I have succeeded at always being by myself and alone, without much loneliness or a feeling that I need others. I am currently taking a class at UC Berkeley and I noticed the students react differently from me. Also, I see my coworkers acting differently from me, too. I am very indifferent to many things. I see the Berkeley students worrying about their classes and saying "this class is really difficult," when I am thinking "how come I didn't see it as difficult, but everyone else did." I am not doing badly, and I am not the best in the class. I just wanted to show that my reaction is different from a lot of people's reaction. I did notice that my medication was doing this to me, and I always thought this was a way that my medicine helped me: that I didn't feel as affected as others. Also there are some "human" feelings that I don't have, that people who are not on psychiatric medications, have. Thanks, Seth, for putting these up. It really helps me. I hope you continue to post things like this.

Glen Raphael (2010-06-29 11:16:05)

Joe writes: >...so I have a problem with studies that show placebos being as effective as SSRIS The experience you describe isn't actually inconsistent with the placebo hypothesis. You say that you tried numerous "herbal , vitamin and prescription medications" before you found one that worked for you. Let us suppose for the sake of argument that depression left untreated gets worse for a while but eventually gets better on its own. Either because your brain adjusts somehow, or events in your life change - different job, different relationships, etcetera - in ways that make you happier. While depressed, you try an herb. No change. Try a different herb. No change. Try drug A. No change. Change the dosage. No change. Switch to drug B. No change. Switch to drug C, and...start to get better. As long as your depression motivated you to keep experimenting with different drugs it is absolutely guaranteed that you'd be taking \*some\* drug when you eventually got better. And you would naturally have the impression that this drug worked better than all those "weaker" drugs you tried first. One interesting question is if it had gone the other way - if you had tried the "strong" stuff first and then switched to the herbals when it doesn't work, especially if you had been told the herbal stuff \*was\* the strong medicine - would you have had the same experience? The placebo studies suggest you would have.

G (2010-06-29 14:01:57)

Close friend of mine got depressed after a relationship she'd committed to went really, really bad over a long drawn-out period of time. This environmental problem seemed to leave a mid-term dent in her emotions. She was eventually put on antidepressants. Over the phone, I could tell whether she'd taken her pills or not within about one sentence. She did not seem cold and distant; her mood was just very low, bordering on tears, all the time, unless she took the pills. She gradually weaned herself off the pills as whatever was awry recalibrated itself. A new relationship probably helped, but the pills undoubtedly helped her to hang on in there until things reset. Eventually, I could no longer tell the difference between her with and without pills. I would not say this unless I felt quite sure of my observations. I can pick up on very, very small changes and inner disturbances in this person, and although I generally have a bias in favour of drug-free solutions, it is impossible for me to harbour any regrets about this course of treatment in my friend's case. There may have been a drug-free way, but we didn't know it. She was able to keep earning a living and whatnot, and now she seems good as new. The drugs don't cure problems - they support recovery. If your problem is that you fundamentally hate yourself, or you have no good niche in

society, and you never solve these problems, you're supporting life-with-the-problem instead of the recovery. My friend's problem was not purely one innate to her personality; it was circumstantial, so it healed itself in time as circumstances changed.

Alex Chernavsky (2010-06-29 16:57:15)

G: The anecdote about your friend is consistent with the hypothesis that antidepressants are glorified placebos. See, for example, the story that's presented at the beginning of this article in *Mother Jones* magazine: [1]"Is it Prozac? Or Placebo?" The story concerns a woman whose life was transformed by taking an antidepressant during a clinic trial – except that she found out at the end of the trial that she had actually been in the placebo group, not the drug group. The "chemical imbalance" myth persists for at least two reasons: It provides drug companies with a simple (simplistic?) message to use in marketing campaigns. Also, the medical establishment apparently think that patients are less stigmatized when they're told that their depression stems from a brain disease. It's interesting to note that, in reality, it's not at all clear that the chemical imbalance myth leads to less stigmatization. Psychologists who studied this question found that the brain-disease explanation leads to *more* stigma than the theory that mental illness is the product of traumatic experiences. For more information about that last point, see this truly outstanding article that appeared a few months ago in the *New York Times Magazine*: [2]The Americanization of Mental Illness

1. <http://motherjones.com/politics/2003/11/it-prozac-or-placebo>

2. <http://www.nytimes.com/2010/01/10/magazine/10psyche-t.html>

James (2010-06-29 19:25:07)

Laura: that sounds like Alexithymia, which can occur on or off psychiatric medication. +1 to what G said, with the addition that good therapy (ideally CBT) will help change the situation. Seth, what's the current research on the reactive/endogenous depression divide, does it actually exist?

MT (2010-06-29 19:54:20)

The FDA does not require all of the studies undertaken on efficacy of antidepressants to be submitted for analysis when considering approving these drugs – it only requires two successful studies be shown, even if another eight were unsuccessful. Were the results of all the studies to be submitted together, these drugs would not be approved – they do not produce results that can be distinguished from placebo. The psychologist Irving Kirsch conducted a meta analysis of available research on SSRIs that showed 75 % of the 'effects' the cause are from placebo, and he proposes the remainder of that effect is because the strong side-effects of ADs make their placebo effect stronger. It would be great if ADs were tested against "active placebos" (placebos which also produce side-effects). Kirsch discusses his results in this opinion piece in the Huffington Post: [http://www.huffingtonpost.com/irving-kirsch-phd/antidepressants-the-emper\\_b\\_442205.html](http://www.huffingtonpost.com/irving-kirsch-phd/antidepressants-the-emper_b_442205.html) I'm sympathetic to experiences like Joe and the other commenters describe, but it seems unlikely the benefits they describe are actually from the ADs being prescribed.

peter (2010-06-29 22:21:09)

"depression is due to defective entrainment of a mood oscillator. It's caused by something missing from the environment." can you expand on this. specifically is the "defect" of entrainment genetic? Are you suggesting that some people are susceptible to depression due to their genes? It seems to me that altho morning light (which i assume is what's missing from the environment) may make it less likely to succumb to depression, that most depression arises when people simply don't get what they want/expect, i.e., it is a form of extreme unhappiness. [also, i googled "defective entrainment of a mood oscillator" and was unable to find the phrase. is it a phrase that is commonly used in psychology? ]

seth (2010-06-29 22:36:56)

Peter, please see the linked paper ("Self-experimentation as a source..."), in particular Example 2, for details of my ideas about depression. It's morning faces and morning light that are missing from modern life but were present during Stone Age life. In an environment with plenty of both, the genes that now cause the "sticky switch" behind many cases of bipolar disorder would have been neutral or even beneficial, since persons with those genes would have had more predictable moods, less dependent on the entraining events of a single day.

G (2010-06-30 01:44:43)

@ Alex - I feel a stigma about being helped by placebos! :-) It feels like kind of an insult to human dignity and all that, but maybe, maybe. Heh. @ James - She did receive talking therapy (counselling I think; don't think there was any CBT) and she felt sure it helped. I think she was lucky to have several close friends who were available round the clock most days; I live nearby and others work with her. Really, you met her now you'd never guess what a state she was in.

Vic (2010-06-30 02:12:52)

what happened to the taubes post

seth (2010-06-30 04:33:31)

Vic, turns out it was a mistake to post it. Perhaps I will post it later, perhaps the person to whom it was sent will post it.

Timothy Beneke (2010-06-30 10:47:46)

I was a night person starting at the age of 18 when I went to college; before that starting in the summers at around 10 or so I would stay up late and sleep in, and was rather sleep deprived during the school year... As an adult I suffered from a lot of dysthymia and clinical depression - I had a lot of suicidal ideation; I did a lot of therapy - I suffered a very stressful and traumatic childhood and therapists encouraged me "to uncover the emotions I was repressing that were at the root of my depression". I was even intellectually attached to psychoanalytic thought and published some theory; it was tied to a quest to save my self. At the age of 41 I started trying anti-depressants; between then and age 51 I tried 4 of them to no avail. Meanwhile I was going to bed at 3:30 in the morning and getting up around noon or later. I had also become obese. Seth told me that my biggest problem was going to bed at 3:30 in the morning, when I was 47. None of the therapists I saw ever told me this was a problem. At the age of 53, in early December of 2003, I finally started going to bed earlier, around midnight on average. Within a week or so I noticed a difference - the sensation of getting sleepy at night began to feel bodily pleasurable. My mood got better. I was in the habit of getting quite depressed on Christmas day. On December 25 of 2003, I was stunned by the fact that I felt fine - it was as if I had some magic protection. Soon after that, my love of music, which had been strong in my youth, returned in full force... I'd say on a scale of 100 my baseline mood went up 20 points at least. I was not on any anti-depressants. Then in 2006, I decided to try another anti-depressant. My baseline mood stayed much better but I wanted to see if one might now work; it did (Effexor). I think altering my circadian rhythms lifted me up substantially; from their the anti-depressant worked... I've mostly stayed out of depression since, though I am vulnerable to stress. I am happier. But the turning point was clear: finally following Seth's advice to get up earlier. I repeat: No one of the 3 psychiatrists and 3 clinical psychologists ever suggested to me that getting up earlier would help my depression... So depressed night owls might consider changing their ways....

Alex Chernavsky (2010-06-30 11:59:49)

Timothy, I've often thought that many (perhaps most) depressed patients could benefit enormously by adopting common-sense measures, such as the following: \* Engaging in regular exercise, preferably exercise that is reasonably intense \* Going to bed earlier / getting enough sleep \* Adopting one or more pets \* Managing their finances better \* Learning how to get along better with their relatives \* Re-engaging in activities that they found enjoyable at one time \* De-cluttering their home environment and work environment \* Managing their time better (for example, spending less time on activities such as watching old sit-com re-runs) \* Improving their nutrition \* Taking care of long-neglected "to do" items \* If necessary, getting couples therapy (or perhaps breaking up) \* Starting some rewarding, long-term projects, like gardening or learning a musical instrument Most mental-health practitioners would pooh-poo such advice, though, as it doesn't involve high-status interventions, such as altering neurotransmitter systems.

Nansen (2010-06-30 13:25:17)

@ Timothy Beneke, I'm surprised that you do not mention Seth's discovery about faces in the morning. Did you try that?

Simon Sobo M.D. (2010-06-30 13:37:51)

Since my articles are being quoted, I thought I'd clarify some of the issues being raised by those leaving comments. I find

SSRIs extremely helpful when used properly. My objection is to the notion that there is something wrong with serotonin in a particular diagnosis. While it is true that some people may be genetically predisposed to depression and a number of other troubles because of their serotonin utilization, so far the genetic contribution is relatively minor. (At least what we can show so far.) We do know that all kinds of environmental stressors can set off depression including experiences early in life. And as many pointed out above, we know that depression has physical effects that can be harmful in all kinds of diseases and may lead to some of them. But that aside my article is objecting to over emphasis on biology, and the idea that a particular diagnosis, presumably "biological", should be treated with a given medication because it is "evidence based" (ie when you group people by diagnosis and compare treatment with a medication to treatment with placebo it can be shown to be better than the placebo) This is not useless information but it leads to a cookbook mentality to treatment that ignores the particulars of each patient. It leads to 15 minute once a month treatments since the patient's problems reduce to symptoms of the "illness" and side effects. My argument is that SSRIs and other meds have a particular PSYCHOLOGICAL effect which accounts for their usefulness. Increasing serotonin (whether or not the patient started with a deficit) seems to lessen the intensity of emotions. I call them the "well whatever drugs" Clearly when helplessness, or sadness, or panic, or anger, or doubt, or guilt, or any emotion is tearing you apart it is a great help to be able to get these emotions under control. And SSRIs can then be a god send. But I also have found them helpful in, for instance a thin skinned teenager who is getting picked on a lot. SSRIs can supply the needed "cool". And so it goes for shyness ("social phobias" ) and other phobias. But as noted in the blog, the downside is illustrated in the patient who was disturbed by her lack of reaction to her baby being in a not great environment. (see my articles using the links above to find many other examples) The point is how is it helpful and how is it not helpful to decrease emotional intensity. Psychiatry tries very hard to create an illusion of scientific treatment (by having readily cited statistics about various diagnoses) but the real facts are that we do not know enough about these diagnoses to pass off what we are doing as scientifically based. Most psychiatric illnesses are not analogous to say, strep throat, where we fully understand the etiology and have a treatment which will work 99.9 % of the time. We are simply not there. More to the point, we are so uncertain about the value of various diagnostic categories that the DSM committee insisted on calling them "disorders" rather than actual diagnoses. The value of the various diagnosis are very controversial. Indeed, as the head of the DSM IV committee has recently written, DSM IV caused a pseudo epidemic of bipolar disorder, ADHD and autism (for more, link to my articles above) Anyway, the point is not to be all for or against meds, it is trying to figure out what is going on and try to be as sensible as we can be given our limited hard knowledge

Willy (2010-07-01 21:41:46)

Timothy Beneke, thanks for telling your story. Could you explain how you managed to get to sleep earlier? Was it sunlight in the morning as you mention in your guest post? Anything else?. I am sure quality of sleep has an effect on mood. Many times I have nightmares or vivid dreams and I do not wake up refreshed. Thanks.

thehova (2010-07-01 22:47:56)

@Alex Chernavsky, I'd imagine that most people who complete the tasks on your list aren't depressed. And perhaps healthy minded people can keep such a list in mind to help guard against the potential of depression. But once you fall into depression it's hard to get out. Many depressed people have trouble accomplishing the simplest tasks (my roommate in college struggled to get out of bed). They need some force outside of them to help them (whether it's Seth theory of watching faces in the morning, or anti-depressants, or cognitive behavioral therapy, or hiring a life coach, etc...).

Alex Chernavsky (2010-07-02 06:30:28)

@thehova, people recovered spontaneously from depression long before antidepressants (or therapy, for that matter) were invented. In any case, I wasn't necessarily suggesting that people simply pull themselves up by their bootstraps. Certainly, outside help may be beneficial. Perhaps what we need is some kind of para-professional that would be a cross between a life coach, a friend, and a parent.

Has anyone ever overcome panic attacks and depression? If so how and how long did it take? (2010-07-03 19:19:38)  
[...] Seth's blog » Blog Archive » What Antidepressants Do [...]

OpenUri's (2010-07-04 05:44:57)

There was probably not much wrong with Melissa Huckaby mentally until the community mental health system got a hold of her from her shoplifting conviction. She was diagnosed with depression (probably b/c her husband abandoned her and their child and never paid support.) She should have been diagnosed with poverty. At the time of the crime she had in her possession prescriptions that were prescribed to her for paroxetine, aprazolam, benzodiazapine, Xanax, Adderall, and others, in addition, she was using her grandmother's oxycodin. Even one of these drugs alone may cause insanity, and per her comments, it doesn't seem like she actually remembered what she did, at least she didn't know why. For examples of other manufactured lunatics, there is Kevin Underwood, who, on taking Lexapro killed a neighbor girl with the intention of eating her, Alyssa Bustamante, a 15 year old girl who killed her 9 year old neighbor after being on Prozac for 2 years, the VA Tech shooter withdrawing from antidepressants, and the Columbine shooters on court ordered antidepressants. Doctors see you for about 15 minutes before prescribing these mind altering drugs, they operate like people who have had numerous and substantial head injuries. But it is unknown whether these were all prescribed to Melissa legitimately or if she went around to numerous doctors not telling them about the other drugs. (Like Michael Jackson.)

Kevin (2010-07-06 10:32:20)

I somehow stumbled on this website and am enjoying it. On the point of ssri's and placebo, I'm a veterinarian and prescribe prozac often for separation anxiety in dogs and cats. In fact my own dog takes it. Without prozac she chews through a chain link fence trying to find her master. With it, she stays in the yard. Like acupuncture, there's no placebo effect in animals. If the canine patient stops limping, it's from the acupuncture treatment, not a placebo effect. kevin

Anthony (2010-07-07 13:03:02)

@Kevin, The question in the relevant medical literature isn't whether Prozac does something to one's brain - of course it does something, which is why it has so many detractors. The point here \*isn't\* that placebos \*aren't\* effective, it's that they \*are\* effective at treating depression. That is, anti-depressant drugs are statistically effective, but not much more than a placebo, which in turn is also effective, with humans. This isn't to deny that anti-depressants can also change one's biochemistry without a belief mechanism, as presumably it would do with dogs.

B (2010-07-08 05:36:23)

@OpenUri, while all of the incidents you are mentioning are compelling anecdotal evidence, again once cannot assume causation from correlation. Clearly there were extreme underlying struggles in all of the cases that you mentioned, which perhaps the anti-depressants failed to help, for whatever reason, but your post seems to imply that the anti-depressants caused the unconscionable behavior, an implication that I find difficult to support. For a slight paradigm shift, there has been some mention to the possibility of "recovery over time" and recovery throughout history from depression, history that existed before the invention of SSRIs or any other mood stabilizing drug. I question the assertion that "people recovered spontaneously from depression long before antidepressants," because it assumes an analogous relationship between experiences in the modern world, and experiences of some unstated time in the past. We do not live in a world (though I should say country) in which people are outdoors, active, maintaining strong familial bonds (both emotional and physical), living in non-toxic environments, interacting regularly, face to face with other human beings. I will not claim that these things are necessary to living mentally healthy lives (though they are necessary for ME to be healthy as an individual), all I am noting is that the world we are living in today is distinct from much of human history, even from that of our parents. Thus comparing peoples experience of and recovery from depression 50, 100, 500 years ago etc is not comparing like scenarios. What if we are living in a society and culture that while productive in many ways, does not conform with the psychological needs of human beings? In such an instance, short of changing our overall environment, the only treatment for depression would be treating the symptoms (medication being one route), and attempting to help the patient learn to cope in these psychologically unfavorable conditions. The other idea I would posit is that we do not know how people recovered from depression, since there was no "clinical" diagnosis and treatment of depression specifically, no advocacy for the people suffering from it, and a strong possibility that a lot of long-term self medication occurred (alcohol consumption, reckless behavior etc). Furthermore, in a more survival oriented world, are our emotions put to better use (fight or flight) and thus not as prone to become problematic? On a more personal note, I am diagnosed bipolar, and being put on Lamictal (anticonvulsant, not an SSRI) saved my life, and has helped

when diet modulation, exercise, strict sleeping regimens and talk therapy failed—not so much failed, but couldn't achieve functional stability. This being said, my ultimate goal is not to be on medication, a goal I am working towards cautiously but steadily.

OpenUri's (2010-07-18 15:37:48)

@B, Thank you for your well thought and fair comment. I don't jump to conclusions usually, but in these cases, if you think in a logical sequence about these crimes, you would have to admit that the facts are: 1.) A medication was administered, in Melissa's Huckaby's case, many medications, and then 2.) The bizarre act or crime occurred. The crime did not occur previously in the individual's life in the absence of the medication. This would favor a causal relationship at a higher rate than not, since what you're implying, that these things would have been done anyhow due to the individuals' underlying problems that the medication could not help. (I'll give you Underwood, his situation is much sketchier b/c supposedly he planned this prior to being on Lexapro, but it seems as though he was quite unstable and insane and Lexapro was not the appropriate treatment, probably indefinite commitment would have been better.) It would be impossible at this time to know if they would have committed these crimes in the absence of treatment with drugs. Only if we could go back in time and not give the drugs would we know that answer. That makes the likelihood of that theory much less than the causal relationship between the drug and the bizarre behavior. Especially in the case of Melissa Huckaby. I can't imagine why someone in her immediate area, like relatives or counselors wouldn't have seen how drugged she was with that many drugs. I would not be able to function on those, I can't see a person who could. I am not saying that these drugs are all bad, it's just the way they are handed out and then with no follow up. Everyone reacts differently to them because everyone has a different mix of chemicals in their brain and is sensitive in a different way. Most people do not turn into criminals from SSRI's. Case in point, my own trauma with Lexapro. Supposedly, it takes weeks to work, I however noticed it's effects within minutes and developed full blown mania after only a few weeks which over months turned into delusional thinking. However, it's quite possible that they have a more subtle effect on some people than once thought and that other factors that can't even be removed for the purposes of a trial, like the fact that someone is receiving a new "treatment" for their depression may be at work as well as a subtle effect of a drug. These drugs have other effects than just increasing serotonin. They also have the effect of causing cell growth in the hippocampus. A long-thought culprit of depression caused by PTSD and alcoholism is a shrunken hippocampus and this is actually supported by imaging of the brain. As far as alcoholism, and depression hundreds of years ago, I agree, people had different expectations for life. They weren't as spoiled as we are, easily frustrated, they knew they had to work hard and things may not always go like they planned. It's a known fact in countries where the gap between the rich and the poor is larger, the violent crime rate is higher. This has to do with expectations, they see the high class with a lifestyle that they can never attain, and thereby, the frustration of the impossible is born. If everyone is in the same boat, there is no need to take from my neighbor what I already have.

### **Fermented Food in Japan (2010-06-29 22:05)**

If you know anything about heart disease epidemiology, you know that Japan has the lowest rate of heart disease in the world. [1]The usual explanation is high fish consumption. But other countries, such as Norway, also eat a lot of fish but don't have low heart disease rates.

My visits to Japan suggest to me that Japanese eat far more fermented foods than people in other countries, including Norwegians. If heart disease is due to infection, then it's clear that the immune stimulation provided by fermented foods helps fight infection. My umami hypothesis – that we like umami, sour, and complex flavors to encourage bacteria consumption, which we need to be healthy – began with a trip to Japan in 2008, when I noticed, in a food court, many types of miso for sale. Back in Berkeley, I started making miso soup. I was stunned how well it worked. All you needed was miso. No other flavorings. It was so easy and good I ate it every day. It was my first bit of evidence that fermented foods are different and better than other foods.

Here are some fermented foods that are easy to get in Japan:

1. Miso soup. Most Japanese eat this daily. In a few countries, such as France, many people eat yogurt daily. Koreans eat kimchi daily. In most countries, as far as I know, it's hard to find a fermented food (apart from cheese and alcoholic drinks) that's eaten daily by most people. Miso is also used to flavor fish.
2. Japanese pickles. The best pickles in the world. Some are pickled as long as as two years, developing noticeable alcohol. Other countries have pickles, of course, but as far as I know the only pickle restaurants are in Japan. Moreover there are pickle shops in big Japanese cities. The only other pickle shops I've seen are in New York City.
3. Pickled apricots ([2]umeboshi). At a food court you have a choice of acidity, anywhere from 5 % (slightly sour) to 25 % (extremely sour).
4. Vinegar drinks. Tokyo 7-Elevens sell a black vinegar drink. Vinegar and water. In food courts you can buy special vinegars for this purpose. I've never seen vinegar drinks for sale anywhere else.
5. Natto.
6. Yogurt. The Japanese yogurts I've tried were sweetened but weren't as sweet as the yogurts sold in Beijing.
7. Yakult. The fermented milk drink. It's sold in [3]such small packages it's pretty clear it must appeal to people who think it improves their health. It doesn't boost energy, quench thirst, or taste especially good. The manufacturer says it is good for health and that one bottle per day is all you need.
8. Beer and wine.

Because soy sauce is used in small amounts, it doesn't count. At a Tokyo restaurant I met a nurse who said she thought you should eat fermented foods every day to be healthy. She said perhaps a third of Japanese believe this.

I've never seen high Japanese consumption of fermented foods noticed by epidemiologists. Individual fermented foods (such as miso), yes; the whole category, no. You can see how hard it would be to combine across foods: how much miso equals how much Yakult? Yet I'm sure fermented food consumption is extremely healthy.

Vic (2010-06-30 01:50:27)

I don't think sake or vinegar contain live bacteria, do they?

seth (2010-06-30 04:53:29)

Unless vinegar has been pasteurized (and as far as I know this is rare) it contains live bacteria. Sake, on the other hand, is usually pasteurized. I can't see why bacteria need to be alive to stimulate the immune system; bacterial fragments should have the same effect.

q (2010-06-30 07:57:26)

when i visited japan i found a lot of pickle shops and tofu shops in kyoto – a lot more than in tokyo or osaka. the pickle shops you've seen in nyc are places like gus's and pickle guys, right?

Caleb (2010-06-30 08:01:06)

I'm a big proponent of fermented foods and encourage my patients to get more of them, but it's worth keeping in mind there are likely trade offs. When over-consumed fermented foods probably irritating the lining of the digestive tract. East Asians have notably higher rates of stomach and intestinal cancer. My gut feeling is that this comes from having acidic vinegary food so frequently that the digestive tract doesn't get a chance to recover. I've had to go off vinegar when I found my body had an allergic inflammatory reaction to it. It would be very interesting to see if people only need fermented foods several times a week to get the immune stimulating benefits, while not being as hard on the lining of the digestive tract (though now that I've focused my thoughts, I suspect this may specifically be a vinegar thing; that stuff is strong, stronger than anything our tribal ancestors would have evolved to handle daily)

pam meier (2010-06-30 10:06:48)

In Gary Taube's book "Good Calories, Bad Calories" I remember that one possible explanation for the low rate of heart attacks is the fact Japanese doctors will rather diagnose a stroke, as it is believed to be a more honorable death.

mongolian (2010-06-30 10:54:34)

If fermented foods are critically important for health, wouldn't more societies have evolved to include it in their traditional diets? If the umami hypothesis is correct and humans are predisposed toward complex flavors due to the bacteria in them, then don't we see more fermented foods in diets around the world? Why is it concentrated only in Japan?

seth (2010-06-30 11:10:18)

Pam Meier, by a "strike" you mean a stroke? mongolian, traditional diets include plenty of fermented foods, in many different cultures. Fermented foods aren't only in Japan, they are just eaten there more than elsewhere. I can think of several possible reasons: 1. Modern foods, such as mcdonald's hamburgers and Coke, are less compatible with the Japanese diet than other diets. So they have been slower to displace the traditional diet. 2. Japanese food, being relatively mild, left a big desire for complex flavors that fermented foods fill. Other cuisines, with more complex flavors in their main foods, don't have that problem. 3. The Japanese are more food-conscious than other cultures, so they value complex flavors more. Certainly the French are relatively food conscious and also have a lot of fermented food.

thehova (2010-06-30 16:17:57)

"My gut feeling is that this comes from having acidic vinegary food so frequently that the digestive tract doesn't get a chance to recover." heh, I love the pun.

thehova (2010-06-30 16:21:50)

Seth is definitely correct when it comes to the Japanese and French passion for food. Most Americans take a much more pragmatic approach. I do think a lot of it comes from the fact that the French and Japanese generally eat less. When you eat less, your more selective about what you eat.

Tom Moertel (2010-06-30 18:21:14)

mongolian, I think we can safely assume that fermented foods were part of almost any primitive society's diet. Lacking refrigeration and modern chemical preservatives, most stored foods would have been subject to fermentation. And, back when food was scarce, almost any surplus would have been stored for later consumption. (Back in the day, discarding the leftovers wasn't a good survival strategy.)

pam meier (2010-07-01 12:55:30)

Seth, yes, I meant "stroke" ...

Nice "Diets" photos | Diets That Work With Easy Diet Plans (2010-07-08 16:06:16)

Huh? Are we talking about the fatty acids here? And what on earth is a morning face?

seth (2010-07-01 06:21:27)

Yes, omega-3 fatty acids. The beginning of my research on morning faces is described [1]here, see Example 2. Later not-yet-published research suggested that morning faces reduce anxiety disorders.

1. <http://escholarship.org/uc/item/2xc2h866%22>

lance (2010-07-01 07:31:06)

So do people with children and spouses or roommates they see every morning get anxiety disorders?

seth (2010-07-01 08:01:08)

lance, to get the benefits of morning faces you need to have a conversation, on the order of 30 minutes. Not everyone with a spouse or roommate or child talks to them that much in the morning.

Nansen (2010-07-01 13:07:16)

"... morning faces cure not only depression ..." I think "greatly reduce" would be more accurate than "cure", with all due respect.

seth (2010-07-01 18:28:56)

yes, by "cure" I meant greatly reduce. I have changed it.

Laura (2010-07-02 02:00:08)

I decided not to change my work schedule, since I start at 630 am, so I can continue to try this "morning faces" idea. I was going to change my schedule to work late nights, but these last posts convinced me not to do it. I also think behavior activation works, too!! And also being aware.

q (2010-07-03 05:55:56)

why not write a 'morning faces' app for the iPad?

## 5.7 July

### Homemade Yogurt Tip (2010-07-01 23:02)

[1]Mark Frauenfelder describes how he makes yogurt with a yogurt machine. [2]Made by Hand, his new book, has a chapter about fermented foods.

Let me add my two cents. After several years of making yogurt, I finally figured out there are two crucial steps: 1. Denaturing (expanding) the milk proteins. 2. Growing the bacteria. They require different temperatures. The milk proteins, as far as I can tell, denature at temperatures starting around 130 degrees F. You want the milk to be in that range for an hour or so. Below that temperature, the milk proteins curl up again unless bacteria get in the way. The best temperature for growing the bacteria is said to be around 110 degrees F., although I've found that incubation at 92 degrees F. also works.

So the ideal process for making yogurt is something like this: 1. Keep the milk at 140 degrees for a few hours. 2. Add the starter bacteria. 3. Keep the milk at 110 degrees for a long time, say 12 hours. I have a yogurt maker that approximates the initial higher-temperature phase by having you add boiling water around the container. The first time I tried it I was surprised how well it worked (how creamy the yogurt was) because it was much simpler than the usual recipes where you boil the milk, let it cool, and so on – and which after all that produced mediocre results. It took me a long time to realize I'd get even better results with my yogurt maker if the milk was warmer when I started.

1. <http://www.creditbloggers.com/2010/06/how-i-save-6750-a-month-by-making-my-own-yogurt.html>

2. <http://boingboing.net/2010/05/27/marks-new-book-made.html>

---

david (2010-07-02 06:58:32)

Even on a stovetop, I think it would be easier to raise the temp to 130 F and keep it there for an hour, then let it cool back to 110 F than it is to bring it up to 180 F and then let it cool back to 110. The problem with boiling is if you get distracted (say by attending to a child) the temp goes too high. Using low heat and a timer would be much easier and less risky IMO. Anyway, I'll give this a try for my next batch.

sadie (2010-07-02 12:08:55)

Just to clarify, you are saying that your yogurt maker heats the milk to 110, but you add boiling water to get it up around 140 for a few hours? I've never heard of keeping the milk at the higher temperature for a few hours to denature the proteins. I thought the initial heat was just to kill off competing bacteria. However, that explains why I get much creamier yogurt when making it in my crock-pot than on the stove. It takes much longer to heat and cool the milk when using the crock. It would be nice if slow cookers had more temperature settings. If I could get my crock to stay as low as 110, it would further simplify the process. As it is, I pour the milk into a jar and stick it in a cooler, wrapped in a blanket with a hot water bottle.

David (2010-07-02 12:19:02)

Just to clarify, you put the starter in while the milk is at 140F, cool to 110F and incubate for 12 hours or so? And adding the bacteria while the milk is above 130F results in a creamier texture to the final yogurt? Is 140F anywhere near the temperature that will kill the starter?

seth (2010-07-02 17:39:41)

Sadie, yes, your impression is correct, except that it reaches the higher temperature (around 130) for less than two hours. David, I put the starter in when the milk is about 130 F. What produces the creamier texture is more denaturing of the proteins simultaneous with bacteria growth. It's not the temperature at which I add the starter that causes the improvement, it's that there is a substantial length of time at the temperature that denatures the proteins. So the proteins become more denatured than if I heated the milk to boiling and let it quickly cool. This is what conventional yogurt recipes miss – the value of long denaturing. I don't know what temperature will kill the starter. Apparently 130 F. is safe.

SM (2010-07-10 13:52:37)

I thought yogurt makers were too expensive and too low capacity. I use a cooler ( \$25) and an aquarium heater ( \$30). First, I denature by bringing the milk to 180 on the stove at low heat (I set the stove's dial to 2). I cool it to 115 or 120 before adding starter. All this is easy with a digital kitchen thermometer ( \$15). The milk is above 130 for about two hours, and far above 130 for much of that time. If you try this and the milk burns just heat it more slowly. Put some warm water in the cooler. Use the heater and thermometer to maintain the water temperature at 110. The first time, it takes some a few tries to set the heater's power output knob correctly. After that it rarely needs adjusting or monitoring. Put the container(s) of the yogurt and starter mixture into the cooler. I use the handy half gallon glass jars that my kimchee comes in. I ferment it for 36 hours or so. Usually I make one gallon but the cooler has a 2.5 gallon capacity. This makes thick and tangy yogurt. I'll try adding the starter at a higher temperature to see if it's thicker, but really it's thick enough as is. The elapsed prep time is two or three hours but the total work time is certainly under 5 minutes.

TalkingRat (2010-07-12 14:12:45)

This was a great tip, I'd never seen anything about 'heat and hold' before. But when I googled, and ran into excerpts from a reference book, Development & Manufacture of Yogurt. The link is an authorized sample, and gives quite a bit of information about yogurt culture. The heat treatment section starts on page 73. [http://books.google.com/books?id=zMCDLlC-RaQkC&pg=PA92&dq=development+manufacture+yogurt&hl=en&ei=oXM7TleFNYfWtQOLqanaCg&sa=X&oi=book\\_result&ct=result&resnum=2&ved=0CDYQ6AEwAQ#v=onepage&q&f=false](http://books.google.com/books?id=zMCDLlC-RaQkC&pg=PA92&dq=development+manufacture+yogurt&hl=en&ei=oXM7TleFNYfWtQOLqanaCg&sa=X&oi=book_result&ct=result&resnum=2&ved=0CDYQ6AEwAQ#v=onepage&q&f=false) I found one other link that mentioned heat and hold. It suggests heating to 185F and holding for 10 minutes, or 20 minutes for thick yogurt. The commercial guideline (first link) was 30 minutes at that temperature. I tried 15 mins. and 30 mins., and both were thick. <http://www.uga.edu/nchfp/publications/nchfp/factsheets/yogurt.html> The recommended amount of culture has increased over the years, not necessarily a good thing. Sandor Katz (Wild Fermentation) uses 1T. fresh live culture per quart of milk, quoting Joy of Cooking (1964 edition) explanation why more culture is not better – Lebensraum. That 1T per quart was how I made yogurt for years. My 1976 Joy edition still has the Lebensraum explanation, but they quadrupled (!) the culture quantity. My hesitation about 130F inoculation is that I have 6 different cultures in my yogurt, and not all may be hardy at 130F. Nice to know, though, that culture can survive at higher temperatures than commonly thought. And it was especially nice to learn about denaturation.

diana henretty (2010-07-13 19:26:06)

This is the best I've tried. Bring your milk to 180. Let set till the temp goes down to 110, about an hour or so. Add your starter. (I use 1 cup of my latest batch of yogurt for 2 quarts of milk). Let set in machine till thick, about 3-4 hours. I make fresh yogurt every 3-4 days to keep the good bacteria live and fresh. I bought yogurt machines made in the '70's, they sell them at thrift stores and flea mrkts. very cheap. For thicker, creamier yogurt add 1 cup of powdered milk before heating.

sadie (2010-07-21 06:31:16)

I think maintaining a fairly warm temperature during culturation also helps make better yogurt. After reading this post I made a batch with a 3.5-hour preheat up to 180 degrees, a short cool-down to 110, and then I put three quart jars of yogurt into a cooler lined with a wool blanket. I also added two quart jars of boiling water to the cooler. I used whole milk and no powdered milk, which is my normal procedure. The culturation time was 8 hours, and it was still almost hot in the morning when I took it out. This produced the thickest, creamiest yogurt I've ever made, tangier than store-bought, but (to me) perfect. There was no visible whey separation at first, but after I took some out of the jar, whey appeared on top. I think this means the proteins were unwound enough to bind up most of the whey.

Shankar (2010-07-30 21:14:38)

Hey, Thanks for all the tips. Can someone say how much time it takes to bring the milk from boiling to 110F for say 2 Quarts. Is 45 mts the time (I dont have a thermometer).

wcw (2010-08-17 14:26:22)

Nice little discussion, especially the book link, thanks. My notes, going entirely for taste (health, schmealth: - yogurt makers are cheap. The Yogourmet is under \$50, includes a decent thermometer and makes half a gallon. It's less-than-no-frills, so test and fiddle (e.g., in a warmer kitchen I'd probably put it on a dimmer for bath temp). - starter matters. I use my favorite brand (Brown Cow), which is a pretty standard yogurt (*Bulgaricus/Thermophilus*)-and-probiotic (*acidophilus/bifidus*) mix. Experiment. - milk matters. Again, my favorite milk (whole from Clover) is also my favorite for yogurt. Use what you like best, not any stale old half gallon. - cleanliness matters. I killed one batch, maybe with phages (it didn't smell 'bad', but was watery and not right). Wash your hands. Transfer a starter-size amount to a clean, tightly capped container in the fridge. - culturing time affects live mix a lot. Too short or too long gives a one-note symphony where just one or two strains dominate. This naturally gets propagated into any subsequent run. In my case, 10 hours seems ideal. This probably varies a lot by temperature, strain mix and taste. Now if only I knew where my cheesecloth bag had gone..

Darlene (2010-10-08 15:56:54)

I'm so glad I found this blog. I think I made yogurt this way by accident yesterday and have been trying to figure out why it was so good. I brought the milk to 180+ and held it there for about 10 minutes. But, then I let it cool naturally in a small microwave that holds in heat for almost 2 hours. Had to heat it up a little before adding the starter. Then I let it sit in the microwave overnight, having zapped it a few times before I went to sleep. It was the best I've made. I used whole organic milk with 2 tblsp. of yogurt made from a bulgarian starter I ordered off the internet. When I took it out the next morning it had a custard texture which I love. I strained the whey for about an hour or so. I did not use my donvian yogurt maker because I didn't want to bother with the small containers. I made it this way because it was almost no work and I wasn't being that precise about anything. In fact, I was being lazy and took a chance that I didn't ruin anything. I believe that using at least two quarts of milk was important because it took the milk longer to cool down before I added the starter thus creating the "time at a high heat" which apparently made it thicker. Here's my only problem. I ate almost the whole thing myself. (with blueberry, all fruit, no sugar added preserves) Hopefully, when the newness wears off, I'll be more normal in how much I eat! LOL

Agnes (2012-02-15 09:47:14)

Thanks for this advice, I find it's true that holding at the higher initial temp produces thicker yoghurt (I do it for an hour, after experimenting with both shorter and longer times and finding that 1 hour is the sweet spot. 2-3 hours also works, but it doesn't make the yoghurt noticeably thicker). My question is this: does the effect of the denaturing get 'undone' if you add the bacteria in at 110 degrees or 120 degrees? That is, do the milk proteins curl back up if you let the milk cool? Also: is

heating to 140 and holding there any different/better/worse than heating to 180 and holding there? Finally: I usually incubate the yoghurt at 120 degrees, but I see a lot of people use lower temperatures (even as low as 92, you mention)-what are the advantages and disadvantages here? I am lucky enough to have an oven that can produce consistent low heat, so I am free to set my oven to whichever of these temps is best, for either the denaturing or the incubating-I'm just wondering about pros and cons.

Nick M (2012-03-05 07:21:11)

I use a crock pot modified into a sous vide machine. It allows controlling the crock pot at exact and constant temperatures. My next MOD is to use an air lock type contraption on the lip similar to a picklemeister.

### **Crazy Spicing Ice Cream (2010-07-02 22:55)**

Unfamiliar foods cause weight loss, says [1]the theory behind the Shangri-La Diet. If you add enough spices to a food, it will become unfamiliar. An ice cream store in San Francisco called [2]Humphrey Slocombe has some of the world's strangest flavors, likely to be unfamiliar until you eat them many times.

[3]Their flavors include Eight Ball Stout, Pink Grapefruit Tarragon, Carrot Mango, Russian Imperial Stout, White Chocolate Lavender. Here's [4]what happened when the owners ate a lot of them:

In the store's first few months, Godby and his business partner, Sean Vahey, scooped from noon to 9 each night, ate nothing but ice cream, traded the leftover brownies for cocktails at a dive bar called Dirty Thieves and still lost weight. Since then they've hired eight employees and "hazard of the job" each gained back the 10 pounds they'd lost.

Thanks to Alex Chernavsky.

---

q (2010-07-03 05:54:43)

that's great. now wouldn't it be nice if they had a weekly special - something new and completely unfamiliar every week?

Alexandra Carmichael (2010-07-03 09:21:32)

My favorite flavor there is Peanut Butter Curry. I find it incredible how they blend flavors so you get one predominant taste at the beginning and then it morphs into the other taste that you finish with. Genius!

Nancy Lebovitz (2010-07-04 08:05:36)

One of my friends found that adding ice cream (ordinary flavors) to his diet caused him to lose weight. His theory was that the extra calories convinced his body that the food supply was so secure that he didn't need to store fat. However, his cholesterol

went up so much that he stopped the extra ice cream.

Contemplationist (2010-07-06 20:14:14)

How exactly do we reconcile the shangri-la theory with Paleolithic nutrition? A head-scratcher that one

James A. Donald (2010-07-07 23:32:22)

"How exactly do we reconcile the shangri-la theory with Paleolithic nutrition?" I eat a fair bit of wild food, and it is far less uniform than farmed food, partly because you eat a wider variety of animals and plants, partly because the animals and plants are themselves less uniform.

seth (2010-07-08 05:05:39)

I agree with Donald. The theory behind the Shangri-La Diet says that obesity is due to eating foods whose flavor is too uniform. Too little variation from one instance to the next. Quality control is making us fat, in other words.

### **The Oncogene Theory of Cancer (2010-07-03 18:41)**

I am looking forward to reading *Wrong: Why Experts Keep Failing Us* and *How to Know When Not to Trust Them* by David Freedman because of this sentence in [1] an excerpt:

Cancer experts shake their heads today over the ways in which generations of predecessors wasted decades hunting down the mythical environmental or viral roots of most cancers, before pronouncing as a sure thing the more recent theory [that] cancer is caused by mutations in a small number of genes — a theory that, as we™ll see, has yielded almost no benefits to patients after two decades.

He's referring to the oncogene theory of cancer, for which Michael Bishop and Harold Varmus won a Nobel Prize in 1989. I made [2] a similar comment at a dinner:

Several years ago, at a big Thanksgiving dinner in an Oakland loft, I told the woman sitting next to me, a genetic counselor, what a travesty the Biology [Nobel] prizes were. The discovery that smoking causes lung cancer had improved the lives of millions of people, I said [yet the discoverers hadn't gotten a Nobel Prize]; the discovery of so-called oncogenes hadn't improved the life of even one person. She replied that she was the sister of [Harold Varmus]. The next day I learned she complained I had been rude!

I'm glad Freedman agrees with me. My low opinion of oncogene theory didn't prevent Varmus from becoming head of the National Institutes of Health, whose recent budget was about \$30 billion/year.

Thanks to Kathy Tucker.

1. <http://www.nytimes.com/2010/06/11/books/excerpt-wrong.html?pagewanted=3&r=1>

2. <http://www.blog.sethroberts.net/2007/10/25/should-mark-twain-have-won-a-nobel-prize/>

kevin denny (2010-07-03 20:39:51)

A number of people have questioned the link between lung cancer and smoking including R A Fisher, who knew a thing or two about statistics.

seth (2010-07-03 22:05:44)

Kevin, I blogged about smoking and cancer recently. <http://www.blog.sethroberts.net/2010/06/05/cigarettes-are-bad-right/> The results had certain puzzling aspects. I think the likely reason is that small amounts of smoking are protective against cancer because they activate the immune system. Because it's incredibly hard to determine the dose of tobacco smoke each person has gotten, the results get confusing.

Rashad (2010-07-03 22:23:05)

I wouldn't say that they haven't helped anyone. There are a few genes that we know do have a strong impact on cancer incidence, like the BRCA1 breast cancer gene. So my relatives that have it know they need extra mammograms and to keep an eye out for it. Is it as potent the smoking-cancer link? Obviously not, but still not nothing. Rashad

Mikael (2010-07-04 02:22:11)

Just a quibble - there is no Nobel prize for biology. You're thinking of the medicine one.

seth (2010-07-04 08:58:38)

Rashad, yeah, Freedman's summary ("almost no benefits") is more accurate than mine.

Alex Chernavsky (2010-07-04 09:11:06)

To see an analogous example in another field, read just about any paper published in the journal, [1]*Molecular Psychiatry*. We have not gained anything by attempting to understand mental illness at the molecular level. What we *did* get is a bunch of drugs that are [2]ineffective at best and [3]harmful at worst. We also wasted billions of research dollars that could have been better spent on other projects.

1. <http://www.nature.com/mp/journal/v15/n7/index.html>

2. <http://motherjones.com/politics/2003/11/it-prozac-or-placebo>

3. <http://www.thestreetspirit.org/August2005/interview.htm>

indah (2010-07-05 23:09:02)

I asked myself why cancer nowadays so often and very easy to come to us. What went wrong? Did our lifestyle? Do diet? Did descent? or What??. I read medical text book a lot, do searching, browsing.. according to u Mr.Seth what is the major cause? gene? or lifestyle?

Pancham (2011-06-04 10:20:25)

Here is one more idea about cancer, this time it is 'information homeostasis' but seems that this idea has the promise to combine various prevailing hypotheses and theories under one theme <http://theoryofcancer.blogspot.com/2011/05/information-homeostasis-based-theory-of.html>

## More Flight From Data (2010-07-04 12:11)

I've blogged [1]many times about the desire of professors to show off and how it interferes with being useful. It doesn't just make them bad teachers, it makes them bad scientists. Here's [2]an example from economics (via [3]Marginal Revolution):

“The mainstream of academic research in macroeconomics puts theoretical coherence and elegance

first, and investigating the data second," says Mr. Rogoff. For that reason, he says, much of the profession's celebrated work "was not terribly useful in either predicting the financial crisis, or in assessing how it would play out once it happened."

"[Academic economists] almost pride themselves on not paying attention to current events," he says.

Pure Veblen, who in *Theory of the Leisure Class* provided many examples of people, including professors, priding themselves on being useless. Men wear ties, he said, to show they don't do manual labor (which is clearly useful).

My research is closer to biology, where you can say the same thing: much of the profession's celebrated work has not been terribly useful. [4]Yesterday I gave an example (the oncogene theory of cancer).

[5]Modern Veblen: Flight From Data.

1. <http://www.blog.sethroberts.net/category/modern-veblen/>
2. <http://www.nytimes.com/2010/07/04/business/economy/04econ.html?partner=rss&emc=rss&pagewanted=all>

4. <http://www.blog.sethroberts.net/2010/07/03/the-oncogene-theory-of-cancer/>
5. <http://www.blog.sethroberts.net/2007/09/11/modern-veblen-flight-from-data/>

---

vic (2010-07-04 12:16:34)

The difference between useless economics (i.e., all economic research that comes out of academia) and useless biology is that useless biology is practically useless, but it at least reveals some underlying truth about biology; conversely useless economics is completely disconnected from anything to do with economics: it's pure mathematical games.

thehova (2010-07-04 14:51:56)

"conversely useless economics is completely disconnected from anything to do with economics: it's pure mathematical games." I don't know about that. Microeconomics is, IMHO, a very important subject that should be required in high school and college. It's ridiculous how little most Americans know about finance. I think part of that comes from not being taught microeconomics.

thehova (2010-07-04 14:54:48)

Just to add, the lessons behind most microeconomics is the type of stuff which Seth supports (decentralization is preferable to centralization, people act on their own self-interest, transparency is important, etc...). It's an important subject that doesn't get enough attention from educators.

vic (2010-07-04 15:06:30)

thehova, the type of microeconomics you refer to are ideas that have been around since at least Adam Smith. You clearly haven't been exposed to any academic research in microeconomics of the last 50+ odd years.

thehova (2010-07-04 15:30:56)

yep, there's no doubt that the law of diminishing returns applies to economics. Early economics was a lot more groundbreaking than the stuff now.

vic (2010-07-04 20:37:53)

If by diminishing returns, you mean zero (or negative) returns, then you might paint a fairly accurate picture of academic research in economics of the last 50+ years.

MT (2010-07-05 10:44:46)

I hope that Rogoff is as critical of the IMF during his tenure – at the time, to work there you needed to have a PhD in economics by the age of 32, plus related work experience. So basically, people who prioritized academics and also excelled at them. Did the resulting homogeneity in thinking produce good policy? Would it create rich debate and dialogue in the institution? Or did it allow delusion to persist indefinitely? I don't know what their hiring policies are like now, but fear massive, ossified bureaucracies like the IMF lack incentives to improve. The people in the institution who could make the decision to change hiring policy were hired for their supposed superiority based on their academic history. For them to change the hiring policy would be like admitting the emperor had no clothes – academic success is not equivalent to being able to provide real-world value.

dearieme (2010-07-05 11:29:04)

All economics is either (1) footnotes to Smith or Ricardo, or (2) wrong.

## **TV Recommendations (2010-07-04 21:39)**

TV is getting better and better.

1. [1] Temple Grandin (HBO). I'd read Oliver Sacks's story about her and seen a BBC documentary about her. This was far more moving.
2. [2] Work of Art: The Next Great Artist (Bravo). A competition. Each week the contestants are given a task (make a portrait, make art from junk). The person who does the worst job is eliminated. Bravo's great The It Factor followed actors in New York and Los Angeles and made you feel the constant rejection. This has the same vibe in the sense that much of what the contestants make is heavily criticized ("a middle-school art project").
3. [3] Undercover Boss (CBS). A head of a big company works at a low-level job in his company. Week after week, it has some of the most touching moments I've ever seen. When this or that employee learns that someone noticed their hard work or talent, they start crying. Because it relied on deception ("we're making a documentary about entry-level jobs"), I wonder if there will be another season.

1. <http://www.hbo.com/movies/temple-grandin/index.html>

2. <http://www.bravotv.com/work-of-art>

3. [http://www.cbs.com/primetime/undercover\\_boss/](http://www.cbs.com/primetime/undercover_boss/)

Robin Barooah (2010-07-04 22:53:21)

Hi Seth, I'm curious - have you ever done any experiments to see how TV watching affects your mood, sleep, or cognitive performance?

seth (2010-07-04 23:09:59)

ordinary TV watching, no. In the 1960s a survey suggested that Americans stay up an hour later than people in other countries because they watch TV an hour later. After I read that I stopped watching the late night news. It's an interesting question what effect it has on my mental performance but I don't know the answer. Mainly I watch TV to make exercise more bearable.

Robin Barooah (2010-07-04 23:18:31)

Interesting - I use audiobooks and music when I exercise. Anecdotally, I've found TV watching to make me feel less motivated, and I know others who find the same - and I'm talking about carefully selected advert-free TV - not just random channel surfing. I've personally considered experimenting, but don't yet have the tools - and now, I don't want to sacrifice my motivation to the experiment!

Alex Chernavsky (2010-07-05 07:12:19)

Psychologist Martin Seligman [1]claims, "The mood state that Americans are in, on average, when watching television is mildly depressed".

1. <http://books.google.com/books?id=3L0BCCoFMRgC&lpg=PP1&dq=authentic%20happiness&pg=PA176#v=onepage&q&f=false>

thehova (2010-07-08 00:24:16)

I saw a self-reported happiness study that showed that most people are very happy when they watch TV. And unlike the newspaper industry, the TV networks, cable companies, and satellite services are raking in the money. So watching TV must provide some sort of psychological benefit to a lot of people.

## Two Faces Better Than One? (2010-07-07 13:16)

[1]Here I describe my discovery that seeing faces on TV in the morning improved my mood the next day. The details of the effect suggested that the ideal stimulus is what you'd see during a conversation. For a long time I used the C-Span show [2]Booknotes as the main source of the faces. I watched it on a 25-inch TV. More recently I used my own face in a mirror. It was readily available and perfectly life-size. I listened to a podcast or book at the same time.

A few months ago, Caleb Cooper commented saying that he'd found that looking at two faces every morning seemed to work better than looking at one face. He found that [3]Bloggingheads.tv expanded to full screen on a 24-inch monitor (measured diagonally) produced close-to-life-size faces, which is what he wanted.

This interested me for several reasons: 1. It might make the effect stronger. 2. Bloggingheads.tv has a big selection, offering control over size. 3. I disliked looking at my face for long times. 4. It seems more naturalistic than looking at my own face.

I've been trying this with a 22-inch monitor (which I already had). Perhaps 24-inch would be better. The effect does seem stronger, as Caleb said.

I asked Caleb several questions about his experience.

How did you get started doing this?

I think it started when I read your posts about standing and sleeping.Â This led me to read your paper on self experimentation and sleep.Â Like you, I often suffered from early awakenings where I would wake up around 2-3 hours early, still feeling tired but having a hard time going back to sleep.

Based on what I learned from you and other sources, I tried out the following; got a pair of blue blocker clip-ons for my glasses which I put on about two hours before bed; ordered an Apollo goLite blue light emitter that I use for about an hour in the morning, I would sometimes take 1/3 mg of melatonin nine hours after waking up, and 3mg half hour before bed, and I started standing on a high difficulty Thera-Band balance pad on one leg while looking into a mirror for 30 minutes in the morning.

What made you think it was worth a try?

Well, why not:)Â Most self experimentation can be easily done for practically no cost, while the potential upside is significant.Â There's also satisfying curiosity, expanding self knowledge, gaining mastery over your mind and body...Â You had a plausible theory, had collected suggestive data, and I'd already found the appetite suppression effect of the Shagnri-La was very real, so you had a track record of introducing ideas worth paying attention to.

What happened at first?

It felt to me like my sleep modestly improved, sleeping through the night longer and having the energy to get up and go much sooner after waking.Â This was awhile ago though, I didn't keep any data, and I was adding and dropping different things, so my experience doesn't have a high enough confidence interval for drawing any general inferences.

When did you make those changes?

I'd guess around sixteen months ago.

After you made those changes ("got a pair of BlueBlocker glasses...") did your mood change?

It improved in as much as waking up feeling rested makes you feel a lot better than trying to get up while still tired.

Tell me something about yourself (job, age, etc.).

I got into medicine through Clinical Massage Therapy.Â Being a high school dropout I wanted something I could get into quickly, then sink or swim on my own.Â Massage is one of the few fields the university-accreditation complex hasn't sunk its tentacles deeply into (a mixed blessing; for an autodidact it lets you quickly start a great career, but the field really needs a bifurcated certification track to separate medical massage from relaxational spa massage). I live in the Pacific Northwest, near the site where they developed the atomic bomb dropped on Nagasaki.Â Despite all the lingering nuclear waste, it's a nice, mid sized metro area. I'm in my mid twenties.

Nansen (2010-07-10 16:13:07)

No comments? Jeez. Oh well. Could you please quantify a bit your statement, "The effect does seem stronger..."? Also, it would help to know whether the improvement holds up for more than 3 days, as opposed to it being some transient spike effect. Thank you.

Elizabeth Molin (2010-07-11 11:26:27)

I have discovered another way to get a good night's sleep. A while ago, I heard about a book called AUTOCONDITIONING: THE NEW WAY TO A SUCCESSFUL LIFE, by Hornell Hart. It is long out of print (over fifty years), but I managed to find a used copy on line and ordered it. If one can get past the very retro cover, typeface, illustrations, and design, and the very dated vocabulary and way of writing (â€œgrapple courageously?â€ oh, please), it's actually worth the trouble. It basically teaches what I would call self-hypnosis, or a way to get in touch with, â€œtalk to,â€ and program your unconscious, subconscious, idâ€the part of your brain you don't usually have access to. I'm still working on it, but I have learned to do what I call â€œtalking to the Monkeyâ€ and can sometimes get effective results. It's very good for those little chores that often take too much motivation and so never get done: writing a thank-you or condolence letter, cleaning out a drawer. It's good for remembering things: if you tend to think of all the things you have to do/buy or people you have to email just as you're falling asleep, you can give the Monkey a list and tell it to feed it back to you in the morning, when you have a pencil and paper. And I have found that it's very effective for getting a good night's sleep: I tell the Monkey it's time to go to sleep now, and that we are going to sleep right through the night and wake at X o'clock, feeling fine. And I no longer even get up to use the bathroomâ€if I wake up in the night, I remind the Monkey that this is not what we agreed on, and I generally go right back to sleep. I've also explained to the Monkey that my husband's snoring, or the funny noises the house makes when my husband is out of town, are simply â€œbackground musicâ€ that has no significance and will not disturb or wake me. And now my husband's snoring doesn't rouse me and I don't need earplugs anymore. It also works on minor painâ€I can tell the Monkey that the pain is peripheral and unimportant and doesn't affect me, and although I still feel it, it doesn't really seem painful. I haven't been confronted with any major pain, except migraines, which so far it isn't very effective against. It helps sometimes, a little bit, for appetite control. And it's pretty good for coping with worry and anxiety. As I said, I'm still working on it.

## Unlikely Data (2010-07-08 05:58)

Connoisseurs of scientific fraud may enjoy [1]David Grann's terrific article about an art authenticator in the current New Yorker and [2]this post about polling irregularities. What are the odds that two such articles would appear at almost the same time?

I suppose I'm an expert, having published several papers about data that was too unlikely. With Saul Sternberg and Kenneth Carpenter, I've written about [3]problems with Ranjit Chandra's work. I also wrote about [4]problems with some learning experiments.

Here's more about problems in higher education (from today's *New York Times*): [1]"Share of College Spending for Recreation Is Rising"

1. <http://www.nytimes.com/2010/07/10/education/10education.html>

Mark (2010-07-09 07:35:52)

You realize that The Secret Diary of Steve Jobs is a prank site, don't you? The suicide article is a satire, written as though by Steve Jobs. I crunched the suicide numbers myself (using the unerring Wikipedia article on national suicide rates), and

convinced myself that the Foxconn suicides were within normal range.

## **Does Lithium Slow ALS? (2010-07-09 23:57)**

In 2008, an article in Proceedings of the National Academy of Sciences (PNAS) reported that lithium had slowed the progression of amyotrophic lateral sclerosis (ALS), which is always fatal. [1]This article describes several attempts to confirm that effect of lithium. Three studies were launched by med school professors. In addition, patients at [2]PatientsLikeMe also organized a test.

One of Nassim Taleb's complaints about finance professors is their use of VAR (value at risk) to measure the riskiness of investments. It's still being taught at business schools, he says. VAR assumes that fluctuations have a certain distribution. The distributions actually assumed turned out to grossly underestimate risk. VAR has helped many finance professionals take risks they shouldn't have taken. It would have been wise for finance professors to wonder how well VAR does in practice, thereby to judge the plausibility of the assumed distribution. This might seem obvious. Likewise, the response to the PNAS paper revealed two problems that might seem obvious:

1. Unthinking focus on placebo controls. It would have been progress to find anything that slows ALS. Anything includes placebos. Placebos vary. From the standpoint of those with ALS, it would have been better to compare lithium to nothing than to some sort of placebo. As far as I can tell from the article, no med school professor realized this. No doubt someone has said that the world can be divided into people focused on process (on doing things a certain "right" way) and those focused on results (on outcomes). It should horrify all of us that med school professors appear focused on process.
2. Use of standard statistics (e.g., mean) to measure drug effects. I have not seen the ALS studies, but if they are like all other clinical trials I've seen, they tested for an effect by comparing means using a parametric test (e.g., a t test). However, effects of treatment are unlikely to have normal distributions nor are likely to be the same for each person. The usual tests are most sensitive when each member of the treatment group improves the same amount and the underlying variation is normally distributed. If 95 % of the treatment group is unaffected and 5 % show improvement, for example, the usual tests wouldn't do the best job of noticing this. If medicine A helps 5 % of patients, that's an important improvement over 0 %, especially with a fatal disease. And if you take it and it doesn't help, you stop taking it and look elsewhere. So it would be a good idea to find drugs that only help a fraction of patients, perhaps a small fraction. The usual analyses may have caused drugs that help a small fraction of patients to be considered worthless when they could have been detected.

All the tests of lithium, including the PatientsLikeMe test, turned out negative. The PatientsLikeMe trial didn't worry about placebo effects, so my point #1 isn't a problem. However, my point #2 probably applies to all four trials.

Thanks to JR Minkel and Melissa Francis.

Sonic Charmer (2010-07-10 05:56:10)

VaR doesn't assume fluctuations have a normal distribution. It is of course possible to set up a VaR calculation with that assumption, or any other, and maybe a certain laziness leads people to too often assume normality when other choices aren't obvious, but normality is not an intrinsic assumption of the model by any means. In practice normality is not how I see it being done (rather, the distribution is imputed from historical time-series - which is also a problematic approach, because until 2007 none of those time-series included a subprime/credit crisis, then suddenly in 2007 they did, then as we roll long enough past 2007 the subprime/credit crisis will drop back out of the time-series again...etc. Though there is an attempt to fix that by forcing time-series to include some really bad shocks whenever they occurred...). It is true of course that VaR is a misleading guide to risk and that this is partially because of the arbitrariness in how fluctuations are assumed to be distributed (normal or not) and the fact that whatever distribution they choose is likely to fail to capture whatever shock is coming. But it's also because VaR simply depends on too many variables and inputs to ever be able to calculate correctly. If VaR were as advertised the way it would work would be the risk/control group saying 'hey you're over your VaR limit', and this would genuinely mean the desk had too much risk, and the desk would then proceed to get back under their VaR limit by genuinely reducing their risk. In practice the way it often works is 1. 'hey you're over your VaR limit!', 2. the desk sifts through the VaR calculation and points out an error in it (there is always an error somewhere, and the desk is of course more likely to point out an error whose cure will reduce not increase their VaR), it turns out that if fixed they aren't over their limit after all, and 3. the risk group says 'oh yeah' and goes back to the drawing board. Or, the desk can actually attempt to identify nonsense/spurious trades they can put on (by essentially reverse-engineering VaR) which won't necessarily generate any profit but which will predictably reduce their "VaR" as calculated by the risk group simply because of whatever quirks in the model. In either case the method/approach of VaR is only tangentially related to genuine risk limits/controls, its more immediate effect is to divert the desk's resources from revenue generating activity and towards this sort of VaR deconstruction. So sorry to hijack from your main point. To try to get back to it: you are correct indeed that VaR is a good example of a mentality that focuses on process over results. The risk group is dependent on VaR being accepted as meaningful for their jobs, which are essentially nothing but following Correct process, which if they do, they're 'doing a good job' regardless of results. Upper management likes/uses VaR because they can throw it on charts/graphs showing that they reduced VaR or are keeping their VaR down, and this is meant to be equated with results. Nobody in his right mind who cared about results would actually managing their risk to VaR literally (and small comfort, in practice no one does)...

q (2010-07-10 06:02:41)

i don't know anything about ALS, but i know a bit about VaR. first, of course finance pros teach VaR, because businesses use VaR. it's a useful but flawed measure. (any single measure that applies to a portfolio is going to be flawed, but it's necessary to have some such measures when institutions have large portfolios. think of other economic measures like GDP and unemployment rate - they are heavily flawed but policymakers and economists use them all the time.) second, VaR does not assume any distribution. you can do VaR with any distribution you like, and people use all kinds of distributions with VaR. if there is an issue with this, it's that ALL the distributions are potentially wrong because, in finance, there is no guarantee that the past will resemble the future.

q (2010-07-10 06:04:47)

sorry, crossposted with Sonic Charmer

seth (2010-07-10 06:25:13)

q & sonic charmer, thank you for your comments. You are right, VAR doesn't assume any particular distribution. That is added by the practitioner. I should have said that VAR was used with distributions that turned out to vastly underestimate actual risks. I have changed the post to reflect this. q, I also think you make a reasonable point that finance pros taught VAR because it was used. I agree that is a good reason to teach something. But, also, finance professors are supposed to think for themselves.

vic (2010-07-10 09:43:13)

I don't think your point #2 is of much use unless it's possible to isolate the group that benefits. If 5 % of people with ALS benefit and 5 % are harmed (and 90 % unaffected), it wouldn't make sense to treat 100 % of that population.

seth (2010-07-10 12:22:01)

vic, little would change. Everyone would take the drug. After a reasonable length of time, those whom the drug doesn't help would stop taking it.

q (2010-07-10 19:18:03)

seth – finance teachers are supposed to think for themselves, yes, but there are a couple things to remember. finance programs are usually run by business schools even though they masquerade as mathematics, so intellectual rigor goes out the window. (if they were run by math departments, you would expect any connection to reality to be thrown out – and i suppose you have somewhat of a combination between the two.) in any case, saying that "finance teachers should think for themselves" would indicate that they should still teach VaR but talk about its many limitations and weaknesses. in the one class i took that covered VaR, the professor did this. if people go through these programs and don't know a lot about VaR they are not going to get jobs and if they do, they are not going to be effective in them.

q (2010-07-10 19:20:32)

oh, and while we are on the subject of taleb, the problem i have with him is that, mathematician he is, he criticizes the quants' mathematics much more than the sociology of the business. sure, the math has holes, but finance isn't engineering. the fact that people believe things they shouldn't believe isn't the fault of the math, and fighting the math with math is besides the point.

seth (2010-07-11 02:17:32)

q, your criticism of Taleb isn't clear to me. He's a philosopher more than a mathematician (in the sense that the issues he discusses are closer to what philosophers have cared about than what mathematicians have cared about) but to me that's beside the point. I would say that he's a realist and the people he criticizes have not just made unrealistic assumptions but also claimed their unrealistic assumptions were a big improvement.

Hal (2010-07-11 22:33:35)

I don't know anything about VaR, but I have learned a bit about ALS since I was diagnosed with it last year. As far as placebo trials, this is a sore point with the ALS community due to the small number of subjects. Diverting 1/2 or 1/3 of patients to the placebo arm of a trial reduces the number of trials that can be held. Partly for this reason I know some trials have been done without placebos. They either use a statistical technique called "futility" (don't know what that means), or they compare against placebo statistics from an earlier trial. I would think it would still be necessary to periodically perform a placebo-like measurement of disease progression, to have an up to date baseline to compare with. Still I would worry that bias could creep in. Even with a disease like ALS, with a well documented process of neural damage, a placebo effect can occur. It is difficult to objectively measure ALS progression due to the variable nature of the disease, so researchers often rely on patient reports of difficulty performing everyday tasks like eating or dressing. Desire to please researchers, among other effects, could lead patients to unconsciously color their reports. Different research setups and patient relationships could make this kind of placebo effect vary from trial to trial. You'd hate to put resources into an apparently successful treatment when the real effect was just that they had cute coeds doing patient interviews. Waiting for an objective end point like death can eliminate this problem but even with ALS that means waiting 3-5 years. There is a lot of pressure in the patient community to speed up trials. Nobody wants to wait that long for results.

## **Ancestral Health Symposium (2010-07-10 10:26)**

The dates of the [1]Ancestral Health Symposium have been set:ã€€August 5-6, 2011 at UCLA.

What an amazing event that will be. That said...I hope they have good security.

## **The Problem with Evidence-Based Medicine (2010-07-11 01:58)**

In [1]a recent post I said that med school professors cared about process (doing things a "correct" way) rather than result (doing things in a way that produces the best possible outcomes). Feynman called this sort of thing "[2]cargo-cult science". The problem is that there is little reason to think the med-school profs' "correct" way (evidence-based medicine) works better than the "wrong" way it replaced (reliance on clinical experience) and considerable reason to think it isn't obvious which way is better.

After I wrote the previous post, I came across an example of the thinking I criticized. On [bloggingheads.tv](#), during [3]a conversation between Peter Lipson (a practicing doctor) and Isis The Scientist (a "physiologist at a major research university" who [4]blogs at [ScienceBlogs](#)), Isis said this:

I had an experience a couple days ago with a clinician that was very valuable. He said to me, "In my experience this is the phenomenon that we see after this happens." And I said, "Really? I never thought of that as a possibility but that totally fits in the scheme of my model." On the one hand I've accepted his experience as evidence. On the other hand I've totally written it off as bullshit because there isn't a p value attached to it.

Isis doesn't understand that this "p value" she wants so much comes with a sensitivity filter attached. It is not neutral. To get it you do extensive calculations. The end result (the p value) is more sensitive to some treatment effects than others in the sense that some treatment effects will generate smaller (better) p values than other treatment effects of the same strength, just as our ears are more sensitive to some frequencies than others.

Our ears are most sensitive around the frequency of voices. They do a good job of detecting what we want to detect. What neither Isis nor any other evidence-based-medicine proponent knows is whether the particular filter they endorse is sensitive to the treatment effects that actually exist. It's entirely possible and even plausible that the filter that they believe in is insensitive to actual treatment effects. They may be listening at the wrong frequency, in other words. The useful information may be at a different frequency.

The usual statistics (mean, etc.) are most sensitive to treatment effects that change each person in the population by the same amount. They are much less sensitive to treatment effects that change only a small fraction of the population. In contrast, the "clinical judgment" that Isis and other evidence-based-medicine advocates deride is highly sensitive to treatments that change only a small fraction of the population – what some call anecdotal evidence. Evidence-based medicine is presented as science replacing nonsense but in fact it is one filter replacing another.

I suspect that actual treatment effects have a power-law distribution (a few helped a lot, a large fraction helped little or not at all) and that a filter resembling "clinical judgment" does a better job with such distributions. But that remains to be seen. My point here is just that it is an empirical question which filter works best. An empirical question that hasn't been answered.

---

kevin denny (2010-07-11 06:09:59)

I think this post is terrible. Firstly, you try to bring Feynman in on your side because Feynman was a genius & everyone cashing in on his name (like the "Feynman's Rainbow" book advertised on your blog. But the connection with cargo-cult science is far from clear. Secondly the statement about means being more sensitive when the treatment change each person by the same amount as opposed to a fraction of the population etc is hilariously wrong. Means DON'T CARE who is changed. Example: Pre-treatment distribution 1,2,3,4 Post-treatment (A): 101,2,3,4 Post-treatment (B): 26,27,28,29 In one case I added 100 to just one subject in the second I added 25 to all 4. So the mean changes by the same amount. D'oh. If you are talking about Medians, thats different but treatment effect models seldom look at this parameter. Or are you talking about heterogenous treatment effects? It seems to me that you are trying to provide some sort of veneer of respectability to anecdotal evidence relative to those who do things the correct i.e. the scientific way. Its not about using different "filters". I really doubt if Feynman would have derided those who followed proper scientific methods as you appear to suggest.

Stuart Buck (2010-07-11 07:28:58)

But you're skewing the point by pre-choosing an overall mean (100) and then dividing it up different ways. Then it's merely tautological that the overall mean is changed by the same amount. The real issue is if the treatment helps 10 % of people by X vs. helping 100 % of people by X. In the former situation, it won't change the overall mean nearly as much, even if it's a real effect for those 10 % of people.

seth (2010-07-11 10:14:20)

Kevin, Feynman was complaining about the same thing as me – a focus on process rather than results among people who claim to be scientists. To point out other people who had similar ideas is reviewing the literature. I'm talking about how best to detect heterogeneous treatment effects, yes. I am saying that what you call the "scientific" method is likely to be better at detecting certain treatment effects and worse at detecting others than the method it replaced. Of course it is better to base medicine on evidence than on no evidence. But there is more than one way of evaluating evidence and the current way has a certain disadvantage (greatest sensitivity to homogenous treatment effects) not shared by the method it replaced (reliance on clinical experience).

vic (2010-07-11 10:37:55)

Seth, off topic, but would be interesting to get your views on this: [http://www.mercurynews.com/bay-area-news/ci\\_15480908?source=rss](http://www.mercurynews.com/bay-area-news/ci_15480908?source=rss)

Maria Droujkova (2010-07-11 13:27:59)

Do you have a way to generate graphs to illustrate the distributions you are talking about? This is an excellent example of statistical literacy, and I want to send it around to math people (parents and educators). We just need pictures.

Alex Chernavsky (2010-07-11 13:37:16)

When I worked for a pharmaceutical company, I used to conduct interviews and focus groups with doctors. I have some reservations about the quality of their clinical judgment. Doctors are susceptible to the same sorts of [1]cognitive biases that afflict everyone else. (Example: If your first three patients on Prozac all did very well, you'll be a Prozac loyalist for years.) With doctors, though, the cognitive biases might be even worse than average, though, because doctors are typically overconfident in their own abilities.

1. [http://en.wikipedia.org/wiki/List\\_of\\_cognitive\\_biases](http://en.wikipedia.org/wiki/List_of_cognitive_biases)

Ragout (2010-07-12 15:37:43)

In Kevin Denny's example, post-treatment distribution A (with 100 added to 1 person) has a much larger variance than distribution B (with 25 added to 4 people). So, any statistical test is going to be more sensitive to B: they will be a smaller p-value and it will be more statistically significant. Just as Seth initially claimed.

seth (2010-07-12 16:49:59)

Maria, Thanks for your interest. The statistical point I am making here is pretty simple, yes, but the people who run clinical trials hire statisticians to analyze the data. To say those statisticians are not statistically literate is a little complicated. The point I make here has not appeared in the statistical literature (or biomedical literature) as far as I know.

Maria Droujkova (2010-07-13 12:39:13)

Seth, I did not mean to imply that clinical statisticians are illiterate, but only that, say, a beginner statistics course would do very well to include your example as a way to promote literacy in working with data. It is simple, but interesting because it's real. A pretty good combination for an educational topic. I will ask a couple of my math ed colleagues to look at the topic and see what comes of it. Also, I would like to thank you for a few very simple changes I made after reading your blog, which had unexpectedly large result/effort ratios.

Dennis (2010-07-15 09:00:13)

Seth, The key insight here is the following, and it answers a question I posed to you some time back: "I suspect that actual treatment effects have a power-law distribution.."

seth (2010-07-15 15:50:27)

Dennis, yes, that is the key insight. And, yes, it answers the question you asked me a while ago. The broader point is that it's possible to find out what the distribution of treatment effects has been (in similar experiments) and then tune the test to be most sensitive to that distribution. The current assumption that everyone changes the same amount is probably the least plausible assumption that could be made.

## **The Zamboni MS Procedure in Canada (2010-07-12 05:08)**

Because his wife had multiple sclerosis (MS), the Italian surgeon Paolo Zamboni discovered that a simple surgical procedure helped a large fraction of patients with MS. The Canadian MS society and some Canadian neurologists [1] have not reacted well to this discovery:

In November 2009, an elated Jamie Chalmers went to his neurologist and handed him a stack of print-outs on the new findings. Without so much as a glance, the neurologist tossed the papers in the garbage. He told Chalmers it was nothing but junk science.

In fact, cause and effect are utterly clear:

The vein-opening procedure involves snaking a balloon through the groin up to the neck and then inflating it where the veins are believed to be narrow. It didn't hurt, says Stock. "I could feel it . . . it was like plugging your nose and blowing."

Almost immediately afterward, says Stock, he felt a change: his compromised sense of balance had improved. By the time he touched down in Canada [the operation was in India], he was convinced he had

done the right thing. Before the procedure, he couldn't read a full paragraph. Now, he is reading whole chapters again. Before, he couldn't stand without support for long and was always hunched over his cane. Now, he can stand and walk for as long as an hour.

Doctors have believed that MS is an autoimmune disease. For example, the Mayo Clinic's website [2] says:

Multiple sclerosis (MS) is a potentially debilitating disease in which your body's immune system eats away at the protective sheath that covers your nerves.

Thanks to Anne Weiss.

1. <http://www.healthzone.ca/health/newsfeatures/article/834303--ms-patients-fight-for-access-to-new-zamboni-treatment>
2. <http://www.mayoclinic.com/health/multiple-sclerosis/DS00188>

---

Jeff (2010-07-12 08:11:17)

I got the impression that most people who undergo this procedure end up relapsing, so that it's not a permanent cure. (sorry, these points have probably been discussed to death... I haven't been following this story that much.) So I guess the idea is that this is a good starting point to work on better treatment, and a better understanding of the disease – i.e. not quite the panacea yet?

seth (2010-07-12 13:47:58)

Jeff, I have not gotten the impression that most people who undergo this procedure relapse. And I have been following the story. What has given you that impression?

Contemplationist (2010-07-12 14:57:38)

Wow such arrogance! Of course I see this as definitive evidence that we need to junk medical professional licensing and move to a certification regime. These organizational cartels have been wrecking havoc.

Lauren Rosenthal (2010-07-13 19:27:22)

This reminds of my dad. Back in the late 70's, before he was diagnosed with MS, we thought his difficulties with walking were due to a back injury. He had surgery to take pressure off some nerves in his neck. He experienced temporary relief of his symptoms but they returned within the year. If people are experiencing some relief from the Zamboni treatment it could be the procedure or it could be the sedatives or it could be placebo effect or it could be the body's response to an invasive procedure. Hard to say.....

Jeff (2010-07-14 11:23:22)

Hi Seth, I recall it was the NYTimes article published recently that mentioned some relapse cases. I also read a few cases from message boards reporting relapses (I apologize, it's unfair of me to not go re-find those links). Either way, I'm hopeful. My mom has MS.

seth (2010-07-14 13:25:53)

Lauren, you are leaving out of consideration that a large fraction of MS sufferers are found to have abnormal blood drainage from the brain. Which is a prediction of the theory that improving the drainage will reduce MS. It isn't a prediction of your other explanations of improvement (e.g., placebo).

Hal (2010-07-15 11:47:07)

This is certainly an exciting development to follow! And I agree it is an interesting case study on the way the scientific/medical establishment responds to a promising new treatment that flies in the face of conventional theories about the disease. If it does turn out to work, there have been speculations that similar effects could be at work in the spinal cords of ALS patients, making it of personal interest. Nevertheless my money is on science in this matter. That is, I suspect that venous insufficiency will not turn out to be a significant cause of MS. It's hard to believe that medical researchers could be so far wrong for so long. And I've seen claims that true venous insufficiency causes obvious symptoms in the brain, which are not seen in MS. Now I understand that the claim of high incidence of this vein problem among MS patients is significant - if true. That is what the first round of studies is for, to verify this claim. Maybe it's true, maybe not. We'll see. And it's also possible that a blood problem could cause blood cells to leak into brain tissue, triggering some kind of immune reaction. So perhaps this discovery could be reconciled with existing theories. But the patient stories remain anecdotal IMO. We have all the usual problems of selection effects where the patients who are helped the most are most vocal in demanding access to the procedure for others. And MS is often intermittent in its effects, making it peculiarly subject to placebo effects.

seth (2010-07-15 16:42:30)

Hal, I know of no evidence that placebos can produce the sort of improvement described in my post. Placebos have been studied extensively. "It's hard to believe that medical researchers could be so wrong for so long." Well, doctors used to dismiss the idea that smoking caused lung cancer. You can read 100 randomly selected nutrition books without finding one that recommends fermented foods. According to any weight control expert, sugar causes weight gain - but I lost weight drinking sugar water. I'll believe that medical researchers have a clue when they start finding safe practical solutions to common health problems.

jaygol (2010-07-17 11:50:22)

there is some promising research being done to study the effects of vein widening and stent placement for MS. what's interesting is how people seem to associate the risks endemic to surgery itself with this procedure as if it invalidates any of the recorded success stories. anytime people enter a hospital for a surgery there is always a chance of infection, or of a less than successful outcome. yet i read one scaremonger story after another questioning the efficacy of these procedures for MS on the basis of single person accounts like "one woman suffered a stroke in hospital, or one person had a severe reaction to the stent bringing to light questions of the safety of the procedure"... this type of procedure is done with such regularity for stroke/cardiac patients w/ all its risks, success and failure yet somehow anything less than %100 success for its use in MS seems to invalidate the theory. show me any sort of vascular surgical treatment that is close to %100 let alone %70, without relapse or side effects. the nature of any surgery that involves neurological functioning can be so tricky and a perfect cure elusive. back surgery, the severing of cranial nerves for neuralgia's, carpal tunnel release surgery, tenosynovitis treatments, deviated septum surgery, enlarging of the throat for relief of snoring, all of these procedures enjoy moderate success rates at best, come with a host of awful side effects or risks at times yet are routinely ordered and administered. thus far MS trials using the Zamboni conclusions are enjoying mixed but moderately good success. part of the reason this treatment approach has gone viral is precisely because the procedure itself is relatively non-invasive and safe and can be done in a host of clinics around the world. if it turns out to work only part of the time then it opens another chapter in MS research, one in which the dominant model of immune system malfunction is only a part of the picture. funny how few people mention the host of side effects, risks and fatal outcomes of the current host of MS treatment which is pharma-based and vaguely successful at best in slow progression of this disease. good luck to all who are investigating this new treatment option.

wcw (2010-07-20 06:29:36)

Mazmanian et al at Caltech find bacteria can induce MS in sterile lab mice. Viz [http://media.caltech.edu/press\\_releases/13362](http://media.caltech.edu/press_releases/13362)

johnson (2010-08-07 11:49:53)

Let's turn a phrase around : " I find it hard to believe that 'the doctors' could be RIGHT about the causes of MS and not have anything that looks like a promising solution. " I suspect the medical conservatives have put their eggs in a few favourite research baskets, which approach the disease from a wrong point of view.... so that every solution they produce is complicated, expensive and - in the end - not very successful. They will continue to do endless statistical studies to show a 5-cent improvement . Zamboni's research doesn't look like junk science; he was trying to cure someone, tried out a procedure, and it looks like he may have done something - at least in some cases/ MS patients should demand a chance to try the procedure and allow themselves to HOPE . They may be disappointed, but there's no point in playing 'neutral observer' when YOU are the patient . Leave that nonsense to the medical professionals, while you focus on getting better.

### **Kombucha Eliminated Heartburn (2010-07-13 11:35)**

In a comment on [1]an old post – in which I described how a friend's acid reflux was greatly alleviated by kombucha – Dave Schulz says he had a similar experience:

My heartburn occurs daily unless a) I stick to a strict diet with no carbs, dairy, or greasy/fatty food, like the Paleo Diet or b) I drink kombucha daily. It's not always possible to do a), so kombucha has literally been a life saver for me.

Daily kombucha eliminates his heartburn for long periods of time, not just for a few hours after drinking it. Due to the current ban he can no longer get it and his heartburn came back. He got the idea from a friend. Before kombucha, he'd tried many remedies that didn't work. The three doctors he saw were no help.

[2]On the Mayo Clinic website a doctor says that "until definitive studies quantify the risks and benefits of Kombucha tea, it's prudent to avoid it." This is what the Protestant Reformation was about: Speaking directly to God rather than waiting for "definitive studies" by experts that "quantify the risks and benefits".

1. <http://www.blog.sethroberts.net/2009/07/24/acid-reflux-cured-by-kombucha/>

2. <http://www.mayoclinic.com/health/kombucha-tea/AN01658>

---

MT (2010-07-13 15:07:42)

Where is the ban on kombucha? Might be worth a post! Sounds ridiculous.

Will Hunting (2010-07-14 06:50:21)

Well, in the case of the Protestant Reformation both parties were essentially speaking into the void, so it made no difference if the experts were right or the reformers. In medicine there is a quantifiable difference between the effects of various treatments. For example, I assume you would agree about the inefficacy of something like homeopathy, which is essentially a belief-based treatment.

Alex Chernavsky (2010-07-14 07:44:29)

About three years ago, my wife developed upper-GI problems, including GERD and sporadic nausea. I started brewing my own kombucha a few months ago because of information I read on this blog. My wife has found that drinking kombucha significantly alleviates (but doesn't quite eliminate) her GI disturbances. Tums, Prilosec, and other drugs had no effect. Eating soy yogurt

also had no effect. Sucking on candied ginger has a moderate effect on reducing nausea.

sadie (2010-07-14 08:09:06)

Alex, sporadic nausea and upper-GI symptoms are often related to gallbladder scarring. Kombucha appears to have some liver effects (from the small amount of alcohol and maybe other things we don't know about). Brewing kombucha is very simple if you can get a live scoby, requiring about the same amount of time as making sweet tea, and avoids the ban. I'm brewing some as part of self-experiment. I have autoimmune thyroid disease and I want to see if eating lots (lots!) of fermented foods offers any symptom relief.

Sir Francis Galton's Scientific Priesthood | Anthony Burgoyne (2010-07-14 13:20:14)

[...] Seth Roberts writes that: [...]

David (2010-07-14 15:33:52)

Can anyone speculate how kombucha might have this effect on heartburn?

steven black (2010-07-14 18:13:16)

I used to have acid reflux and it ended about a week after starting to drink kombucha. Can't find GT's any where in New York so I have started drinking BAO a local brew from the Westerly Market

Alex Chernavsky (2010-07-15 17:06:23)

Steven, you should brew your own. It's fun and allows you to experiment with various flavors and techniques.

G (2010-07-15 18:38:35)

I had a few months of extremely serious heartburn - the acid would migrate upward during the night, which induced throat-spasms that almost suffocated me to death a few times. A year and a half after curing it, I still cough more than I used to. The doctors didn't have a clue what to do about the spasms, but they prescribed omeprazole for the heartburn. This eventually stopped the spasms. I didn't want to take medication long-term, so I experimented with diet and discovered that wheat was primarily responsible, and stopped eating it. Once the problem was 90 % gone and I no longer needed medication, I tried eating wheat again and found that it's seemingly a lottery whether I suffer any acid and how severe the acid is. It doesn't depend on the amount of wheat consumed. Eating ice cream or drinking milk seems to reduce the symptoms a great deal, but it's not perfect. Other things trigger occasional heartburn but nothing so much as wheat. Oats come second. I will try to get my hands on some of this kombucha stuff and see whether it gives me a bit more dietary leeway. I grew up eating wheat every day... To get this problem just out of the blue - it's annoying, and I was disappointed to learn how little this sort of thing is understood or treatable.

G (2010-07-17 21:35:23)

Seth - something I don't understand is, how does promoting healthy bacteria in the intestine reduce acid-production prior to that stage, in the stomach?

Robbi (2010-08-08 12:11:57)

I have several members in my friends and family circle who have suffered from acid reflux/heartburn. They've collectively tried a few different brands and LOVE the BAO tea, hands down above the rest. Unfortunately it's only available in NYC right now. We buy it by the case to bring back to CT whenever we can make it down there.

## **The Journalistic Response to Climategate (2010-07-14 12:34)**

When the Climategate emails came out, people like Bill McKibben and Elizabeth Kolbert were in enormously difficult positions. McKibben, an extremely talented writer, had centered his entire professional life around stopping climate change. Kolbert, also a very talented writer, hadn't become an activist, like McKibben, but she had made the dangers

of climate change her journalistic specialty. She wrote a book about it, for example. For them to say that the Climategate emails revealed something important – namely, that the case for man-made climate change is much weaker than the public realizes – would have been like the Pope saying God might not exist. It wasn't going to happen. And it hasn't happened.

But other journalists are not so committed to one side. They are free to react honestly and intelligently. One sign of what an honest and intelligent reaction would be came during [1]a New Yorker podcast about Climategate. On one side was Colbert, on the other – saying that Climategate mattered – was Peter Boyer. Colbert came off as nervous and defensive; Boyer came off as reasonable.

Another sign of what an honest and intelligent reaction would be is [2]this column by Clive Crook, an Atlantic editor. Crook ridicules the inquiries that followed for reasoning such as this:

Had Dr. [Michael "Hockey Stick"] Mann's conduct of his research been outside the range of accepted practices, it would have been impossible for him to receive so many awards and recognitions . . .

Crook is right to ridicule this. [3]Ranjit Chandra, a nutrition professor, received the Order of Canada, an extremely prestigious award, yet some of his research appears fabricated.

1. <http://www.blog.sethroberts.net/2010/02/12/elizabeth-kolbert-confronts-climategate/>
2. <http://www.theatlantic.com/politics/archive/2010/07/climategate-and-the-big-green-lie/59709>
3. <http://www.sethroberts.net/chandra/index.html>

---

Nathan Myers (2010-07-15 03:50:36)

Yet it turns out "Climategate" really was all a lot of noise about nothing. The results were solid, the criticisms were hollow, the accused were [1]multiply vindicated. Everybody who took it to mean anything about the climate embarrassed themselves. The confusion lasted long enough to sabotage treaty negotiations, so its instigators achieved their aim. The only conduct questioned, in the end, was rudeness toward people ultimately working for Exxon, resulting in expensive-for-everyone overuse of freedom of information laws.

1. [http://scienceblogs.com/deltoid/2010/07/climate\\_scientists\\_vindicated.php](http://scienceblogs.com/deltoid/2010/07/climate_scientists_vindicated.php)

seth (2010-07-15 10:19:49)

[1]Stephen McIntyre and [2]Marc Morano will be sorry to hear that, Nathan.

1. <http://climateaudit.org/>
2. <http://www.climatedepot.com/>

Nathan Myers (2010-07-15 11:48:14)

If McIntyre and Morano are still clinging to that phony scandal, too bad for them. The Clinton impeachment is still the high point of Ken Starr's life too. In current news, the first half of 2010 was the [1]hottest ever recorded.

1. <http://www.thedailybeast.com/cheat-sheet/item/the-hottest-first-six-months-ever/climate-change/?cid=cs:headline4>

G (2010-07-15 18:53:14)

This narrow focus on CO2 is like a cosmic joke. We've got a runaway high-consumption culture that flies in the face of thermodynamics; no hi-tech energy solution guaranteed to be just around the corner; we can't countenance any measure that impacts economic 'growth' unless it's the growth of some other country; we aren't recycling or taking proper care with how we dispose of toxic waste - I mean, you have to mind how much fish you eat cos of the mercury for god's sake; we aren't about to go extract minerals from space anytime soon, etc, etc... All this, and we are stopping the presses for CO2. Which, I gather, was present in several times the concentration during the Jurassic era, when Earth supported lush rainforests and massive dinosaurs. Why don't we just take robust measures and leave a smaller footprint *in general* instead of prioritizing carbon to the near-exclusion of other environmental issues? I'll tell you why: because it requires bigger sacrifice, more thought, and it pisses off more powerful people with a big stake in how things are done just now. You can maybe convince China to make token reductions in CO2 but you can't convince them not to want to live in tower-blocks and drive everywhere in hummers. This CO2 stuff is a distraction *even if* it's good science. A distraction like, a fat person drinks Diet Coke with their Big Mac, invests heavily in Diet Coke, tells his friends to drink Diet Coke. (Also, carbon trading has 'racket' written all over it; to think that system won't be played to breaking-point requires... some naivety, I think.)

Nathan Myers (2010-07-15 21:31:37)

Please try to understand the distinction between absolute level of CO2 and the rate of change of CO2. Life can adapt to any level of CO2 if it gets there slowly enough. Too fast, and you get mass extinctions, ecological disruptions, agricultural crises, pervasive changes in rainfall patterns, famine, and world war (in that order). Previous large changes in CO2 level that did not result in mass extinctions happened over thousands of years. Those that happened fast show up as mass extinctions in the fossil record, and serve as boundaries between named geological periods.

Dennis Mangan (2010-07-16 06:08:44)

In other news, Los Angeles has had record low temperatures in July. <http://latimesblogs.latimes.com/lanow/2010/07/record-cold-at-lax-airport-as-july-gloom-continues-in-southern-california.html>

G (2010-07-16 11:21:42)

But Nathan, the changes we're looking at now are small changes over a short period of time - we don't have reliable enough data to know whether such changes happened hundreds or thousands of years ago, and if so, exactly what impact they had. The main measurements used all differ from each other hugely, so we can't comment on the impact of micro-changes in prehistory.

G (2010-07-16 11:29:35)

"The main measurements used all differ from each other hugely" - though they can be said to very broadly mirror each other as far as overall trends are concerned. Also: Yes, sudden changes can overwhelm a system; I see that - not that that relatively nuanced point is what generally comes across in the media (more carbon = bad). But still, even if this is right, why only focus on CO2? It's not a robust strategy. Way we're going, we avert one catastrophe and stumble into another. It's not good enough. We're like a dysfunctional family trying to solve our problems with a trip to Disneyland. It won't do any harm, but it's not going to address the root of the problem. The root of the problem is that we are idiots almost to a man. Our culture is selfish and venal. People don't want to leave a light footprint because they are greedy. They'd rather believe that somebody else can redesign hummers to run on clean fuels and go on driving to the recycling place to make a token gesture once a week. Things need re-thought from the ground up. Superficial measures help to defer that junkie's rock-bottom realisation. You need to know how wrong you are to get right. But the climate-change people think they have all the answers - they are so self-righteous. Even if they're right about the science, they're really wrong.

seth (2010-07-16 12:13:42)

"This narrow focus on CO2 is like a cosmic joke." I agree. Overdependence on a single resource has been a recipe for disaster for a long time. In the past, it's been manufacturers who've made that mistake - e.g., Manchester textile factories. Now thinkers have managed to make the same mistake, saying that we can solve overdependence on one thing (fossil fuels) by . . . doing

one thing (reducing CO2). It's like this: "Yur litter to me cantained meny mispillings".

Nathan Myers (2010-07-16 23:23:45)

G: You seem to be saying that because we have lots of potential sources of worldwide disaster (and I can list many of them: overfishing, over-fertilizing, oversubscription to fresh water sources, pollution, peak oil, peak phosphates, deforestation, antibiotic-resistant disease bacteria, mono-cropping... I could go on) we should ignore the biggest one. The same argument applies to each of the others, with the result being that we must ignore them all. This argument is appealing to people who are doing well now at the expense of those already affected, but it's ultimately both selfish and disastrous.

G (2010-07-17 07:21:59)

No Nathan, you've set up a straw man there. I wasn't saying anything like that.

Nathan Myers (2010-07-17 13:51:17)

When anyone writes "strawman" in place of a reasoned response, I know they're not interested in a serious discussion. Good day, sir.

G (2010-07-17 16:31:02)

This is laughable - you should bring a better class of debate around here. You made up a lot of crap that had nothing to do with my point - does that phrasing suit you better than 'straw man'? Cos either way, it's what you did buddy. If you disagree, make a real point and demonstrate it.

G (2010-07-17 16:41:55)

...I mean, did I *really* say "that because we have lots of potential sources of worldwide disaster we should ignore the biggest one." ? Did I? Go back and read what I wrote - did you really represent it fairly? Really? Ha ha.

## **Do Fermented Foods Improve Brain Function? (2010-07-16 11:12)**

I'm sure we need to ingest plenty of bacteria for our digestion and immune systems to work properly. What about the brain? When I started eating lots of fermented foods, I didn't notice any brain-related changes, such as changes in mood or sleep. Suggesting that fermented foods have little effect on the brain. But [1]a new study in the American Journal of Psychiatry suggests I reexamine the question. The researchers followed 160,000 high-school students in Taiwan for eleven years.

The incidence rate of suicide mortality in participants with current asthma at [the start of the study] was more than twice that of those without asthma (11.0 compared with 4.3 per 100,000 person-years), but there was no significant difference in the incidence of natural deaths.

Linking immune-system dysfunction (asthma) with brain dysfunction (suicide). I believe [2]fermented foods will substantially reduce asthma. This finding makes it more plausible they'd also improve brain function.

1. <http://ajp.psychiatryonline.org/cgi/content/abstract/appi.ajp.2010.09101455v1?roi=echo3-6602452087-4414127-d56cdc211e5951bf4e31d199e1f7166c&papetoc>

2. <http://www.blog.sethroberts.net/2009/04/29/eczema-nighttime-cough-antibiotics-and-fermented-food/>

## Learning From Mulan (2010-07-17 10:43)

You may have seen [1]the lovely Disney movie based on the story of Mulan, the girl who dresses as a boy to take her father's place in the army. Even better is [2]the original story, which is only 300-odd ancient Chinese characters. It begins like this:

Mulan was weaving. She was having trouble concentrating on her work. The previous night she had learned that her elderly father had been called to military service.

What a great beginning! Instantly you care. You could read every short story The New Yorker has published and not find a beginning as great as that. The essence of how a story should begin is so strong it reminds me of something that happened when I was a grad student. My roommates had cooked something with a lot of ginger. So that's what ginger tastes like, I thought. I understood for the first time why ginger ale was called ginger ale.

1. [http://en.wikipedia.org/wiki/Mulan\\_%281998\\_film%29](http://en.wikipedia.org/wiki/Mulan_%281998_film%29)

2. <http://www.yellowbridge.com/onlinelit/mulan.php>

---

Andrew Gelman (2010-07-17 13:16:26)

Seth: I think that by "you" you mean "I" (that is, "Seth").

vic (2010-07-17 13:28:00)

yeah, agree with Andrew, that opening grips me not at all.

Alex Chernavsky (2010-07-17 14:18:39)

I'm fond of this opening paragraph from *Fear and Loathing in Las Vegas*:

We were somewhere around Barstow on the edge of the desert when the drugs began to take hold. I remember saying something like "I feel a bit lightheaded; maybe you should drive...." And suddenly there was a terrible roar all around us and the sky was full of what looked like huge bats, all swooping and screeching and diving around the car, which was going about a hundred miles an hour with the top down to Las Vegas. And a voice was screaming: "Holy Jesus! What are these goddamn animals?"

seth (2010-07-17 17:41:16)

Andrew, I take it you don't like Pauline Kael.

Mike (2010-07-18 03:57:03)

Seth, the original story that you link to does not begin with "Mulan was weaving. She was having trouble concentrating on her work. The previous night she had learned that her elderly father had been called to military service." Where did you get that phrase? The poem that you link to begins "Ji-ji, again ji-ji, Mulan faces the door, weaving. You can't hear the sound of the loom's shuttle, You only hear Daughter's sighs. They ask Daughter who's in her thought, They ask Daughter who's on her memory. "No one is on Daughter's thought, No one is on Daughter's memory." Which beginning are describing as the fantastic beginning? Which beginning are the other responders reading or responding to ?

Mike (2010-07-18 03:58:00)

Which beginning are \*you describing as the fantastic beginning?

seth (2010-07-18 12:16:52)

Mike, I was summing up the beginning to emphasize the important elements. They don't depend on the exact words.

Andrew Gelman (2010-07-18 13:36:41)

Seth: As a statistician I prefer precision. I try to use "I" when I mean "I" and "you" when I mean "you." I don't always succeed, but I try. If you read your very own blog above, I think you might agree with me that the parts that are strongest are the "I" sentences and the parts that are the weakest are the "you" statements. The statement about "every short story The New Yorker has published" seems a bit silly to me too. I understand that you're engaging in hyperbole, but it still seems silly.

seth (2010-07-18 16:08:06)

Andrew, Pauline Kael wrote like this: using "you" to describe visceral reactions ("you can't look away"). She had a reason for writing this way, and so do I: because I am trying to say that I believe others will have similar reactions. To use "I" would not convey this. In other words I didn't mean exactly "I" so I didn't use "I". My comment about New Yorker stories was meant to say that among the several hundred New Yorker stories I've read, I can't think of even one whose opening had even close to the same effect. Maybe I should have put like that, you might be right.

Birdie (2010-07-18 14:06:58)

Isn't "blog" a diminutive of "web log?" At least, I always thought it was. (I think I'm missing the humor here, sorry!)

seth (2010-07-19 07:51:12)

Long ago "blog" replaced "web log". To say "web log" is like speaking Olde English.

Nansen (2010-07-21 13:39:26)

another technicality: your link for Nassim Taleb's "Immoderation in all things" will not be permanent, because his notebook entry "132 - Life's Barbells" will be pushed downward. Probably best to just copy the text.

## Fasting Blood Sugar Reduced by Walking (2010-07-18 17:07)

Richard Bernstein, an engineer with diabetes, invented home blood glucose monitoring. To learn more about this invention, about two years ago I started doing it myself. Mostly I measured my fasting blood sugar level – the level you measure in the morning before eating anything. My numbers were okay – averaging about 90 mg/dL. Optimal is 84, readings above 100 are considered pre-diabetic. I stopped for a while. Then I resumed, and was shocked to see that the numbers were considerably worse – the average was in the high 90s.

I tried to lower them. The obvious thing to do was to eat less carbs, but I already ate few carbs. I cut my carb intake still further but the problem didn't go away. The graph below shows a solution I found by accident: to walk 30-60 minutes/day (closer to 60 than 30).

[1]

After months of trying this and that, and nothing working, one morning the reading was good. I realized I'd done something unusual the previous evening: Taken a 30-minute walk home in the evening rather than ride my bike. After that I deliberately walked 50-60 minutes almost every day and found that my readings were much better, as the graph shows. It wasn't always walking steadily for 60 minutes – stopping now & then was okay. However, wandering through stores for 60 minutes (or any length of time) didn't seem to work. My walks were in the afternoon or evening.

I have not read elsewhere that non-diabetics should do this sort of monitoring, but it helped me. I have seen [2]"exercise" recommended as a way to improve blood sugar control but what I found is much more specific. [3]This article recommends walking about 3 miles/day, which is what I did. [4]This research found big effects of substantial aerobic exercise. My walking was just ordinary continuous walking. But the details of my exercise aren't the point: The point is you can find out for yourself what works.

This sort of thing looks even better when you learn that [5]GlaxoSmithKline, the giant drug company, hid evidence that its diabetes drug caused heart attacks. The drug has generated billions in revenue for the company.

---

Alex Chernavsky (2010-07-18 19:25:15)

Hiding evidence is business-as-usual for Glaxo (as well as Big Pharma in general). GlaxoSmithKline tried to bury evidence that their antidepressant Paxil (called Seroxat in the UK and in some other countries) was associated with suicidality. Investigative reporter Alison Bass wrote a book about this scandal. The book is called, [1]*Side Effects: A Prosecutor, a Whistleblower, and a Bestselling Antidepressant on Trial*. Glaxo deliberately suppressed studies which revealed the dangerous effects of their drug.

1. <http://www.amazon.com/Side-Effects-Alison-Bass/dp/1565125533?ie=UTF8&s=books&qid=1194099575&sr=8-1>

dearieme (2010-07-19 03:38:10)

My GP told me to get off my bike and walk a lot. I got plantar fasciitis, and the consequent limping caused further injuries to both knees and both feet. Beware!!

jim (2010-07-19 04:50:15)

I am just starting this to bring my glucose level down. I just got some walking poles (walkingpoles.com) to try to involve the upper body muscles. A half-hour does not have much effect so I am going to increase it to 1 hour. Sort of off topic. I am reading "Becoming a Successful Scientist" by Craig Loehle and he recommends long walks as an effective technique for deeper rumination and contemplation. Walking may be a toofer! Jim

Todd (2010-07-19 06:53:54)

I have found the same thing as you, Seth: that long walks not only bring down BG levels. I also found that walking causes BG levels to drop more rapidly than normal after eating. So the usual 2-3 hours that it takes to return to baseline is cut in half or shorter. Paradoxically, I found that intense exercise, like running or strenuous weight workouts actually cause a brief rise of 10-40 points in BG, but then a return to a level lower than starting. So I think the difference vs. walking is that strenuous exercise causes release of glucose from glycogen or stored fat & muscle (gluconeogenesis), followed by a drop to a lower baseline. I summarized these and a range of other findings (such as the BG-lowering effect of coconut oil) a few months ago and posted on your forum: <http://boards.sethroberts.net/index.php?topic=7511.0>

Aaron Blaisdell (2010-07-19 07:17:21)

I agree with Jim that walking seems to help a lot of people think, just as a lot of people think better on their feet. Stands to reason. Nassim Taleb has written about the benefits he's seen from incorporating lots of walking into his daily life.

seth (2010-07-19 08:14:26)

Aaron, yeah, [1]positive side effects. Whereas if I took a drug to control my blood sugar there would probably be negative side effects, as the GlaxoSmithKline story shows.

1. <http://www.blog.sethroberts.net/2010/05/04/positive-side-effects/>

Cracked, Angry Pundits and the 'AIDS Myth' Theory « The Daily G (2010-07-19 20:56:23)

[...] Today I read a new article about Nobel winners who were supposedly crazy. Actually, the wording was 'clearly insane'. Now, Cracked is a humour site; it's not supposed to be serious, okay – but it does have pretensions of being informative. And I have indeed learned many a thing there – it's actually one of the site's principal pleasures – the writers cobble their

articles together from research that most of us can't be bothered to do ourselves. So you sometimes gets this sugared pill of knowledge, usually about something 'awesome' or 'batshit insane'. [...]

jlonsdale (2010-07-20 14:40:59)

At UCSD in 2006, I attended a bioengineering seminar given by an old man (I think he was a famous old chemical engineering professor, but I could be wrong) who was a diabetic. He explained his self experimentation to control his blood sugar levels. He found that he only needed light exercise for about 15 minutes after each meal to keep his blood sugar levels at a reasonable level. Maybe the focus could be on stopping the blood sugar from rising in the first place?

Phil (2010-07-20 17:28:49)

This is a good example of self-experimentation leading to a successful intervention. But you could also have consulted a doctor, or a diabetes website, and probably found out about the benefits of walking for controlling blood glucose a lot sooner. And dearie me, your doctor should probably poke around online too. For instance, an [1]about.com entry says "Walking is one of the most popular and widely recommended forms of physical activity for people with diabetes", but warns "Foot health is particularly important for anyone with diabetes, so the input of a podiatrist may be especially useful if you're considering a walking program."

1. <http://diabetes.about.com/od/benefitsofexercise/a/walking.htm>

Don't miss these great links! (2010-08-19 06:18:32)

[...] Seth Roberts has found a study that shows the significant benefits of exercise to diabetics (and non-diabetics) for their blood-sugar levels.Â He also monitored his blood-sugar at home while exercising and while not exercising and found a significant impact. [...]

Great links for the weekend! (2010-08-27 13:04:19)

[...] Seth Roberts did an interesting experiment recently and found that he could significantly impact his fasting blood sugar levels (eg. blood sugar levels first thing in the morning) by taking a walk the evening before.Â Is there any coincidence that Chris has been getting us out doing a walk at the end of the day more often since we read this post? [...]

John W (2011-05-10 11:40:52)

Peter at the Hyperlipid blog describes why a low-carb diet may raise fasting blood sugar, and why it may not be a problem. Search for physiologic insulin resistance at the Hyperlipid blog and you will find it. Have you measured your A1C? This might be a better measure of your overall blood sugar control. What happens if you add a few carbs, say 100g/day for a few days?

Seth Roberts (2011-05-10 14:42:39)

Before I started this, my A1C was poor. Although I did plenty of aerobic exercise and had good aerobic fitness, it was also true that I mostly sat all day. So these results make sense from that point of view – the idea that we generally need plenty of walking for good blood glucose control.

## **Interview for a Press Release (2010-07-19 08:04)**

A writer for UC Berkeley media relations wanted to interview me for [1]this press release about the Tsinghua Psychology department. I said I'd blogged a lot about Tsinghua but she said she wanted "fresh quotes". So I wrote this:

Why did you decide to take this opportunity [become a professor at Tsinghua]?

Partly because I wanted to write more books – in addition to The Shangri-La Diet – and this job would let me, because I only teach one semester per year. Partly because I thought the undergraduates would be

brilliant. Partly because I thought living in Beijing would be fascinating.

What have you learned/discovered?

How talented the students are. To get into Tsinghua as an undergraduate, you have to score extremely well on a nationwide test. Oh, so they're bookish? Not quite. A month ago I went to a talent show put on by biomedical-engineering majors. One act was five girls dancing. After a few minutes someone told me that three of the girls were boys. I hadn't noticed. It was really hard to tell.

Influenced by [2]Mulan, perhaps.

1. [http://www.berkeley.edu/news/media/releases/2010/07/15\\_happiness.shtml](http://www.berkeley.edu/news/media/releases/2010/07/15_happiness.shtml)

### **Chinese View of Chinese Restaurant (2010-07-19 12:45)**

Some of my Tsinghua students are in Berkeley. I took three of them to Great China, the closest Chinese restaurant. They didn't like the Kung Pao Chicken. The sauce was wrong. It's supposed to be a little bit sour and a little bit sweet but wasn't. They liked an eggplant dish but complained the eggplant wasn't infused with the flavor of the sauce.

---

John S. (2010-07-19 15:29:56)

Once, in a country whose name I won't mention, I was taken to an "American" restaurant. One of the items on the menu was horse. That's what all us cowboys eat, right? I didn't try it.

### **Fasting Blood Sugar Reduced by Walking (cont.) (2010-07-20 18:14)**

In [1]an earlier post I described how I discovered that walking normalized my fasting blood sugar. In [2]a comment on that post, Phil wrote:

You could also have consulted a doctor, or a diabetes website, and probably found out about the benefits of walking for controlling blood glucose a lot sooner.

My initial reaction was that this was wrong—that a search on the web would find hundreds of suggestions for managing diabetes and walking would be just one of them. Diabetes, after all, is a huge problem. A doctor would probably prescribe something. But what if Phil were right?

What would I find if I looked? I didn't actually know. So I looked. Under "diabetes", the Mayo Clinic website has two sections about treatment. Under "[3]treatment and drugs" are six suggestions, such as "healthy eating". The suggestion called "physical exercise" recommends aerobic exercise. "Get your doctor's OK to exercise," it says. "Aim for at least 30 minutes of aerobic exercise most days of the week," it continues. My walking was not aerobic. Obviously one does not need a doctor's approval to walk at a normal pace. In a second section called "[4]lifestyle and home remedies" were ten suggestions, such as "make a commitment to manage your diabetes". No mention of walking.

What about the American Diabetes Association website? Their "[5]Treatment & Care" page says nothing about exercise. It mentions drugs and transplants (e.g., kidney transplants). There's also a "[6]Food & Fitness" page. There are dozens of comments about what foods to eat. The "Fitness" section begins like this:

Exercise is part of a healthy lifestyle for everyone, and it's especially important for people with diabetes. But exercise doesn't necessarily mean running a marathon orÂ bench-pressing 300 pounds.Â The goal isÂ to get active and stay active by doingÂ things you enjoy,Â from gardening to playing tennis to walking with friends.Â Here are someÂ ideas for getting moving and making exercise part of your daily life.

The fitness section goes on and on about such topics as "What is Exercise?" and "Top 10 Benefits of Being Active". Surely the ADA hired some hack to write it. It's useless.

I conclude that if you already know that walking helps you can find evidence to support this. But searching the web will not lead you to try walking any time soon. You will be too busy changing your diet and trying all possible aerobic exercises. (And I did aerobic exercise several times a week and still had too-high blood sugar.) My initial reaction was wrong, it turned out: I found a large number of suggestions and my actual activity (walking 30-60 min/day) wasn't one of them. No way could I "walk with friends" every day. (I've tried and failed miserably.) The next time I see my doctor I will find out what he would have recommended.

---

TalkingRat (2010-07-20 20:29:54)

Agreed, basic exercise information was buried and took too many clicks to find on the ADA site, but eventually they defined "brisk walking" as aerobic exercise. Then you had to go somewhere else to read how much you should walk. Not well done, although I'm sure they expected doctor involvement due to the health risks and potentially, insulin adjustment. When I had gestational diabetes, my nutritionist told me to walk briskly for at least 20 minutes, twice a day. That was over 20 years ago, so the glucose benefit was known, and quantified. My pedometer defines aerobic steps as 10 minutes of continuous walking. That seems to be a common definition for exercise – brisk walking counts, but only if you do it at least 10 minutes. Unless you walk really slowly, there should be a change in breathing by then. On a long walk, my heartrate is about the same as for

mowing the lawn, which isn't vigorous exercise, but it is aerobic. Aerobic (Sally Edwards) defines the aerobic zone as 70-80 % of maximum heartrate.

vee (2010-07-20 20:41:08)

There's one short (but not easy when done with proper form) T-Tapp move called Hoe Downs that lowers blood sugar. The move has been featured in books – Dr. Carolyn Dean (MD and ND) in "IBS for Dummies" and Dr. Nicholas Perricone's "The 7 Secrets to Beauty, Health and Longevity - The Miracle of Cellular Rejuvenation." From the article linked below, "Preliminary testing has also shown that Hoe Downs can effectively drop glucose levels quickly. Test results verified an average drop in glucose from 62 to 85 points upon completion and an average rate up to 100 points at 10 minutes post completion." <http://www.t-tapp.com/articles/hoedowns/default.html> [http://www.youtube.com/watch?v=IsURickB\\_G8](http://www.youtube.com/watch?v=IsURickB_G8)

seth (2010-07-20 21:17:41)

Talking Rat, I found that ordinary walking – not brisk – worked fine. No mental effort required. In other words, my solution can be found nowhere on the ADA site, as far as I can tell. Judging by my experience, the "aerobic" restriction is just wrong.

Jolly (2010-07-20 21:27:59)

Thats great! I'll have to try your walking solution and see where it gets me. I'm in a similar boat to you (non diabetic, I track my fasting bg, and it's been high lately (95+) even though I eat paleo/primal with a low carb emphasis. I'll report back later :)

Phil (2010-07-21 07:49:00)

But Seth, you don't have diabetes, you have symptoms that arguably match "pre-diabetes". When I look up "pre-diabetes treatment" on Google, the first website it recommends is WebMD, which has four recommendations. In order: (1) watch your weight, (2) make healthy food choices, (3) get active, (4) take medicine if you need to. They elaborate on "Get active" : "Try to do moderate activity at least 2½ hours a week. Or try to do vigorous activity at least 1¼ hours a week. It's fine to be active in blocks of 10 minutes or more throughout your day and week." The first item they suggest if you click on "moderate activity" is "brisk walking." You might say that you don't walk briskly, you just walk, but I think that's splitting hairs. You mentioned that ambling through stores while shopping doesn't seem to do it, after all. The second site Google lists is the American Diabetes Association. I found this site even worse than you suggest, it's really horrible. This association is, I suspect, essentially a front for the big drug companies. Absolutely appalling. Let's go to the third Google suggestion for "pre-diabetes treatment". It's something called "suite101.com", which I've never heard of. Immediately below the headline ("Pre-diabetes treatment helps prevent diabetes") is a photo of a couple strolling down a dirt road. The site lists diet, exercise, and medication as ways of controlling pre-diabetes, and says diet and exercise are most effective but some people need medication. As for exercise, the site says "Exercise plans do not need to be elaborate or expensive. Taking a walk for ten minutes each day can decrease your chances of developing diabetes, although experts advise being active for 30 minutes each day..." So...two out of the top 3 sites recommended by Google recommend "brisk walking" or "walking" among their top few strategies for controlling pre-diabetes. I also checked the Mayo Clinic site, since it's one that you mentioned and since it is such a trusted brand. They list four treatments under "treatment and drugs": (1) eat healthy foods, (2) get more physical activity, (3) lose excess pounds, (4) take medication as needed. (I'm guessing the webMD page borrowed from here, or vice versa). As for "get more physical activity", "take a brisk daily walk" is the first of their examples. So I think that although you have a valid point about walking not being adequately promoted by some sites, I think you are greatly exaggerating the difficulty of identifying moderate exercise in general, and walking in particular, as a treatment for pre-diabetes.

seth (2010-07-21 10:41:37)

Phil, thanks for looking into this further. The WebMD advice is an example of what I'm talking about. I did standard amounts of aerobic exercise (walking fast uphill on a treadmill) about 1.5 hrs/week. It didn't solve the problem. In China, I did lots of brief exercise, riding my bike here and there – maybe 5 min at a time. That didn't solve the problem. To say that distinguishing between "brisk walking" and "walking" is splitting hairs ignores the history of exercise physiology, where the term "aerobics" was invented to make just that distinction. Brisk walking is aerobic, non-brisk walking is not. The "aerobic exercise" concept was taken to explain a lot – to help distinguish helpful from unhelpful exercise. Years ago, to my dismay, I found that when

I simply walked several hours/day (non-aerobic) my resting heart rate and blood pressure got worse. They got better when I resumed aerobic exercise. This supported what the exercise experts had concluded. Aerobic exercise is also a lot more difficult than non-aerobic exercise. It is hard to do every day. Whereas non-aerobic walking is easy to do every day. This is another reason the suggestion of "brisk" (= aerobic) walking wouldn't have led me to try non-aerobic (= ordinary) walking. The solution I found requires it be done every day. I agree with you that the web advice is useful. It's obviously better than nothing. But it wouldn't have led me any time soon to the solution I found, which is a lot easier than "brisk walking". Brisk walking requires mental effort, walking doesn't.

Phil (2010-07-21 13:59:58)

Seth, I agree with some aspects of what you're saying, but not all of them. Many sites do recommend walking — either just "walking" or "brisk walking" — to treat pre-diabetes. The Mayo Clinic is one of them. What you seem to be saying is that that doesn't count, because being told that brisk walking will help you would not lead you to think that normal walking would help you. For one thing, I don't think that's true for most people. For another, some sites do just recommend "walking," without the "brisk." It's funny that you say you "simply walked several hours/day" in order to improve, so such an activity level should be recommended instead of "brisk walking" for a shorter period because brisk walking takes more effort. Yeah, but Seth, there's no way most people are going to walk "several hours per day!" I'm guessing you meant "several miles per day"? Even so, that takes a substantial amount of time, unless you walk briskly. More time than most people are willing to spend, I think. (And for what it's worth, like most people I would consider a 4mph walk to be "brisk", but I wouldn't consider it "aerobic", so to me a recommendation to walk briskly is not the same as a recommendation to get aerobic exercise). I believe you when you say that you had to discover the benefits of walking (vis-a-vis pre-diabetes) on your own. All I'm saying is that walking is in fact widely recommended for pre-diabetics, so self-experimentation isn't needed to come up with this. I also agree with you that self-experimentation is good in many contexts, including things like improving blood sugar.

Nathan Myers (2010-07-21 14:33:09)

I'm curious whether consuming small amounts of cinnamon makes any difference in your blood sugar level.

Jim Purdy (2010-07-22 01:38:07)

In 1998, I walked on a treadmill without shoes. As a result, I got blisters on the bottoms of my big toes. and they wouldn't heal. I went to my primary care doctor, and I was diagnosed with diabetes. I was told to protect my feet and to take oral pills for my diabetes. In 2005, I had my right big toe amputated because of a diabetic ulcer that got an infection in the bone. I was told to protect my feet by not walking, and to take more diabetic pills. IN 2009, I had my left big toe amputated because of another infected diabetic ulcer. Again, I was told to protect my feet by not walking, and to take more diabetic pills. In March 2010, I developed really bad diabetic ulcers on my right foot, and surgeons said my right leg had to be amputated. I refused amputation, and I went home. I was told to be completely sedentary, and to let my feet heal by staying in a recliner all day with my legs elevated. I was told to not walk or stand, and to put no weight on my feet. In June 2010, after years of being told to protect my feet by not walking, I was told that the blood vessels in my legs were badly blocked.. Even worse, I was told this month, July 2010, that my coronary arteries were severely blocked. I then was told that the blockages were too severe for stents, and later a planned quadruple bypass was cancelled because the surgeon didn't want to create bypasses with a vein from one of my legs, because I might then need a leg amputation. So, now, after years of being told to not walk, to stay off my feet, and after developing life-threatening heart disease, I have a new team of health care providers, including cardiologists, and I have some new and different advice, The new advice? Walk. Walk as much as a possible.

seth (2010-07-22 08:28:04)

Nathan, I haven't tried small amounts of cinnamon but I will look into it. Jim Purdy, did your doctors explain why the great change in their advice?

jallen (2010-07-22 10:51:56)

<http://www.ncbi.nlm.nih.gov/pubmed/20029518> Appl Physiol Nutr Metab. 2009 Dec;34(6):1087-92. Slow postmeal walking reduces postprandial glycemia in middle-aged women. Nygaard H, Tomten SE, HÅstmark AT. Lillehammer University College,

PB 952 2604 Lillehammer, Norway. havard.nygaard@hil.no

Seth Roberts (2010-07-22 12:03:28)

Jallen, thanks for bringing that paper to our attention. That sort of makes my point: the way the authors emphasize "slow" walking. Because it is so different than "brisk" walking. Given that a research paper has just been published about this, it is highly unlikely that this is something everybody in the field of diabetes knows and had I merely searched the web or asked my doctor it would have been obvious.

Jim Purdy (2010-07-22 13:26:03)

Seth, the doctors didn't change their advice. I changed doctors.

Seth's blog » Blog Archive » Fasting Blood Sugar Reduced by Walking (cont.) | Why Fasting, Detoxing and Cleansing for Health (2010-07-27 13:20:27)

[...] blog » Blog Archive » Fasting Blood Sugar Reduced by Walking (cont.) Posted on July 27, 2010 by shschrir Seth's blog » Blog Archive » Fasting Blood Sugar Reduced by Walking(cont.). [...]

Batencourt D.C., M.D. (2011-10-01 23:38:53)

I think you should ask your doctor about this and please let us all know what you find out. Walking does improve blood sugar levels because it is exercise. When a patient asks me what they should do to help their blood sugar I reply, "anything". Simply do anything you want three times per week: run, walk, swim, hike, ride a horse, play rugby anything. Just start making time to do something that is active and you will see your blood sugar come down. Then and only then we can talk about diet, nutrition and other alternative treatments that can help you deal with this disease. Take charge of your health as doctors we work for you!

Seth Roberts (2011-10-02 02:53:20)

My findings do not agree with your advice. "Do anything you want three times per week" - I found that I need to walk every day, which is seven times per week. 3 vs 7: big difference.

## **What's the "Natural" Pattern of Sleep? (2010-07-21 16:34)**

According to [1]this influential article by the historian [2]A. Roger Ekirch,

Until the close of the early modern era, Western Europeans on most evenings experienced two major intervals of sleep bridged by up to an hour or more of quiet wakefulness.

This is called [3]segmented sleep. Supposedly [4]this is "natural":

In a natural state, humans do not sleep a long consecutive bout throughout the night. The natural condition is bimodal - two bouts of sleep interrupted by a short episode of waking in the middle of the night.

And if you don't like sleeping this way [5]you are ignorant:

The modern assumption that consolidated sleep with no awakenings is the normal and correct way for human adults to sleep leads many to approach their doctors with complaints of maintenance [6]insomnia or other sleep disorders. Their concerns might best be addressed by assurance that their sleep conforms to historically natural sleep patterns.

[7]

An amusing therapeutic approach. Whatever the problem, simply say "your problem conforms to historically natural patterns".

I found that [8]if I ate more animal fat I slept better. It is entirely possible that if all those Western Europeans walking up in the middle of the night had eaten more animal fat – as their ancestors may have several hundred thousand years ago before big fat-laden game animals were hunted to extinction – they would have slept through the night.

I found several ways to improve my sleep. After my sleep got a lot better – in particular, I stopped waking up in the middle of the night – [9]I stopped getting colds, surely because my immune system was working better. The connection between sleep and immune function is obvious. Given a choice between (a) my immune system had returned to ancient levels of efficacy or (b) my immune system was working better than ever before in the history of the species, I'd bet on (a). Those Western Europeans with segmented sleep were in poor health, I'm sure. Perhaps their sleep was one sign of this.

---

Nathan Myers (2010-07-21 18:39:22)

When people went to bed at sundown and got up at sunrise, a winter's night was awfully long time to spend asleep the whole way through. Summer's, not so much.

David (2010-07-22 02:38:44)

Makes me think of how many "normal" states are taken as the measured average of the U.S. population, for example. If the population is messed up in the same way, the "normal" may be a long way from the optimal.

david (2010-07-22 03:58:38)

I'm willing to believe that segmented sleep with a period of quiet wakefulness is beneficial. Meditation (which could be described as quite wakefulness) has many documented benefits, so meditation could just be adding back in the period of quiet wakefulness we used to get and have evolved to take advantage of. Btw., Seth, I've never been persuaded that your metric of length and depth of sleep is the perfect measure for sleep quality, but then I've never had a problem with waking up too early :-). The crazy experiment I've been doing for the last year is sleeping on the floor. This has helped my lower back (I started doing it because of some lower back pain) and when it's time to get up, there's less temptation to keep hitting the snooze button for a few more minutes.

G (2010-07-22 05:45:11)

I'd want to be pretty sure of myself before I go and take such a dismissive attitude to another perspective. "An amusing therapeutic approach. Whatever the problem, simply say "your problem conforms to historically natural patterns". That seems unjustified. There are Mediterraneans who take a siesta every day. There's no reason to think this practice doesn't go

way back into distant ancestry. Why can't there be more than one 'right' way? Maybe the truth about sleep incorporates both your own findings and these other possibilities. *Contradiction at first sight* doesn't oblige you to disagree. Given the variation in diets all over the world, it seems wrong to counter Ekirch's essay with the solution 'eat more animal fat' - seems like pushing a favoured idea too far. Is the body so specialised and fragile that everything goes to hell unless we eat like Eskimos? I would like to say at this point that I have no foreknowledge of nor bias in favour of Ekirch, nor do I have strong views on sleep. :-) I would only like to reassert 'epistemic humility' where I perceive an academic being attacked unfairly just for having a view that does not *at first sight* fit with your paradigm.

seth (2010-07-22 08:24:24)

G, Ekirch didn't say segmented sleep was natural, at least in what I read; others did that, using his work as part of their argument. My point isn't that people should eat more animal fat; it's that taking what people did 500 years ago to support conclusions about what is "natural" is unwise. Perhaps malnourishment explains their behavior. I think this is a more productive line of thought than telling someone your problem isn't really a problem. Which goes nowhere.

Phil (2010-07-22 09:40:17)

Seth, I often wake up in the middle of the night, go to the bathroom, and lie in a sort of stupor for a while before falling asleep again. This has been normal for me for pretty much my whole life. Are you saying I have a problem? If I were to mention this to my doctor — I never have, because I've never considered it to be a problem — are you saying that he should tell me that there is a problem with my sleeping pattern and that I should try to correct it? Phil

Seth Roberts (2010-07-22 10:42:51)

Phil, to answer your questions, no I am not saying either of those things (you have a problem, your doctor should tell you you have a problem). I suspect you don't "lie in a stupor" for 2 hours before you fall back asleep. And I suspect that people who do complain to their doctor about waking up in the middle of the night lie awake for a few hours before being able to fall back asleep. That's why they complain. I am not saying either of those things but I am saying something related. The more useful question is not whether you have "a problem" but whether your sleep could be better – "better" in the sense of doing a better job of helping your immune system fight off infection. I don't know the answer but I think that considering that possibility is more likely to be helpful than not considering it.

Phil (2010-07-22 12:05:13)

I haven't read anything about this other than the three quotes that you selected so I really can't judge this issue on its merits at all. But based on what I know (which might be a lot less than you know) I don't think it is ridiculous to suggest that "segmented sleep" could be just fine. I'm not talking about situations in which I wake up and can't get back to sleep — I don't like that — but about what has always been normal for me, which is sleeping for several hours, then waking for perhaps half an hour or an hour, then sleeping for several more hours. You're sarcastic of the idea that that is OK, and you seem sure that my immune system is suffering for it. Like I said, you probably know a lot more about this stuff than I do, so it's obvious to you that "segmented sleep" is bad, but it's not obvious to me.

Seth Roberts (2010-07-22 12:28:42)

Phil, thanks for the clarification. I agree, segmented sleep may be just fine. That's why I said "perhaps" in "perhaps" the segmented sleep of those Western Europeans was a sign of poor health. Maybe I should have emphasized my uncertainty more. Likewise, I'm not "sure that [your] immune system is suffering for it." I just thought/think it's worth considering. Nor was I sarcastic anywhere, as far as I can tell. I don't know what led you to say that. When I said a therapy that consists of saying "it's ok" is "amusing" I meant just that – I find it amusing. Sarcasm would be to say that such therapy was brilliant and insightful.

G (2010-07-22 13:23:28)

Ah Seth, I see what you mean now about the trouble being more with the way Ekirch's ideas were appropriated by others - I missed that first time around... because I was badly underslept, ha ha ha... Brent made some recommendations here that I plan to follow as an experiment: <http://epistemocrat.blogspot.com/2010/07/circadian-rhythms-m1n1-thinkering.html> I have also

been trying the 'morning faces' thing; can't say yet whether I've had results yet but truthfully I've not been all that consistent.

Phil (2010-07-22 16:51:31)

"Sarcasm" means a sharp comment designed to indicate disdain or disagreement. I suppose you could say that your comment ("Whatever the problem, simply say "your problem conforms to historically natural patterns"), though disdainful, is not especially "sharp" and is there for not literally sarcastic. Fine, OK. As is often the case with your blog entries, I agree with some of your point but not all of it. In this case, I agree with your point that just because something is or was common, and some people call it 'natural', does not mean that it's good. After all, malaria is "natural" but we don't go around recommending it.

MT (2010-07-22 18:51:09)

The linguist Dan Everett lived with a hunter-gatherer tribe in the Amazon basin called the Piraha, and describes them as sleeping very intermittently throughout the night, waking and socializing for long periods, and then sleeping regularly through the day as well. Perhaps this is something closer to what our paleolithic ancestors would have experienced. The Piraha's sleep patterns are dictated by the dangers in the jungle, and their heightened vulnerability at night, and when asleep. This is so central to their lives that their version of "goodnight" translates as "Don't sleep, there are snakes" – also the title of the book, which tells many fascinating stories of their culture. Visiting psychologists speculated the Piraha may be the happiest culture they had ever seen based on the amount of time they spent smiling and laughing – characteristics not shared by other Amazonian tribes or Western civilisation.

tim (2010-07-23 01:24:37)

Remember that without electric light, the night is loooong in europe in the winter. Tired after a day of physical labor, the house dark, one goes to sleep. You don't have to get up and work again until its light again, too much time to sleep all the way through. Most people aren't sleeping in private bedrooms, so the break in the night is a social time. I like this theory of interrupted sleep, and see in it the prototype of performance arts, bars, night clubs, concerts, theatre, poetry; that is, the arts and amusements that are associated with the night and come from a shared dreamlike state.

Wayne (2010-07-23 05:27:21)

I'd echo what Nathan said about long winter nights being a bit too long to sleep entirely through – especially considering that you might have relatively activity during the day. Also, I've always interpreted Psalms that talk about "meditating on God in the watches of the night" to refer to awakening during the night. If so, "segmented sleep" may also have been common in the Middle East.

q (2010-07-24 19:00:25)

are people generally sleepier on rainy days? because i bet that neolithic humans slept a lot more when it rained.

Blog-watch: sleep (2010-09-02 13:03:16)

[...] Seth Roberts wrote up some fascinating stuff about historical sleep patterns " apparently some people were trying to persuade us all that it is natural to sleep in two batches with a period of quiet wakefulness in the middle, based on historical information about Western European humans. Seth reckons this is more to do with the poor diets of people in the last few hundred years than a sign of our true ancestral heritage (eg. looking back to our Paleolithic ancestors) since he's found that he sleeps better than ever since he increased his animal fat intake. My take-home point? If you're sleeping poorly, in addition to the usual "get some non-screen relaxation in before bedtime and get rid of the lights and noises in your sleeping room" also try eating more fatty meats. Sometimes it can be difficult to get comfortable of course [...]

## My Theory of Human Evolution (aniline dye) (2010-07-22 07:59)

From [1]The Story of Science, a great new BBC TV series, I learned that in 1856 William Perkin, a British chemist, while trying to synthesize quinine (to cure malaria), created the first aniline dye, called mauveine. It could be used to dye

cloth mauve.

Mauveine was [2]the first synthetic chemical dye. It led to the first chemical factories. Hundreds of tons were made. Other aniline dyes were developed and manufactured in large amounts.

Why does this shed light on human evolution? Because humans, unlike other animals, make art and decoration. We enjoy art and decoration, including color. To dye a dress mauve didn't make it last longer or smell better or fit better – it just made it prettier. Our enjoyment of decoration created demand for mauveine, which began the growth of the chemistry industry. Lessons learned from the manufacture of aniline dyes helped begin the manufacture non-decorative chemicals. These included ammonia, which led to chemical fertilizers. Mauveine wasn't useful in a simple-minded way but it was useful in a subtle way.

This is an example of art/decoration as stepping stone.Â Because we enjoy art and decoration, we pay for it (long ago we traded for it). The payment allows people to spend more time creating art and decoration. While doing this, they learn. What they learn later helps everyone make conventionally useful stuff. I believe this stepping-stone function is why art and decoration came to be.

[3]An alternative view: Art evolved because it gave us "the ability to shape and thereby exert some measure of control over the untidy material of everyday life."

G (2010-07-22 13:29:17)

There's a line in The Book of Five Rings that goes, "do nothing that is of no use." This line always confounded me more than any other.

Nathan Myers (2010-07-22 13:49:29)

I'm trying to understand this in natural-selection terms, where the vocabulary is restricted corresponding to the mechanisms available. You seem to be saying that an inclination to decoration and superfluous luxuries was selected for as a consequence of the incidental benefits that tended to come to people who so indulged. It's a subtle argument, and (therefore) hard to test. Just-so stories help to explain the idea, but don't constitute evidence. I wonder what could serve as evidence. Of course it's easiest to understand it in terms of Darwinian sexual selection; that is, the inclination to decoration could be reinforced simply by mating success, without its conferring any survival advantage. In that case any benefit really would be truly incidental, as would (mild) harm. I also wonder on what time scale this process would have operated. Of course during all of recorded history those in a position to record history had surpluses and didn't have to choose between luxuries and necessities, but by then the tendency must already have been well established. Almost everything in our evolution perforce happened before any referenceable history.

Seth Roberts (2010-07-22 17:28:13)

Nathan, I think decorative stuff first appears around 50,000 years ago, although I haven't looked into it. Humans do lots of signaling, especially of status, so decoration surely served that function as well. But signals can (and do) take many forms; to say something evolved because it served as a signal doesn't explain much.

G (2010-07-22 18:08:12)

I don't know what's so difficult about this. Art is an expression of subjectivity. Humans have a true, developed subjectivity. They have gone beyond the proto-self of the more complex social animals; humans are and know that they are. Knowing that one 'is' involves defining *what* one is, which includes things like 'purpose' and 'value'. This is the beginning of peculiarly human forms of suffering, but also of all ideation. There cannot be ideation without a subject who has the idea. The subject is as much construct as the object, but always in the background; object, obviously, is whatever's in the foreground of attention. As the self develops in complexity it produces more complex thoughts and can do more complex things with nature. Because nature is all of one piece, learning to manipulate it even for 'trivial' reasons will always lead to learning to manipulate it for 'serious' reasons. (Oscar Wilde might have a word or two to say about this distinction) I think it would be impossible for evolution to create self-aware creatures with genuine intelligence that were on a short mental leash of pragmatism. Doesn't the notion sound like an oxymoron? A self-aware being that merely labours for pure survival, like an ant, in total austerity, devoid of philosophy or spirituality? Something obvious is being overlooked through excessive abstraction and mechanistic approaches. I just read the Dissanayake article - she's definitely onto something with her ideas about special transitional moments, and the ability to shape and thereby exert some measure of control over the untidy material of everyday life. - yeah, that sounds good enough, but I think it would be reductive to say "this is the *point* of it and why it evolved." I just think it's innate to selfhood and will opportunistically serve whatever function it can as we go along. Now it's a major way to make money and attract mates. I say, think of art as something with the same roots as other forms of mentation, rather than some oddball phenomenon. I think it only stands out from, say, conversation because we don't display conversations in galleries. Except when they're in the letters of historical VIPs.

Alrenous (2010-07-23 08:14:15)

I'm shocked and impressed the Medical Hypotheses crew didn't just roll over. This is exactly what should always happen when their corporate overlords start letting pleasure get into their business - they should find all the affected employees just up and vanish.

### The Shangri-La-Diet Effect (2010-07-22 21:35)

A friend wrote:

Took 3 tbsp of flaxseed oil this morning and held my nose and drank the oil w/water. ^ It worked! ^ I had brought food for work, I didn't eat hardly any of it. ^ And I didn't think about losing weight all day, first time in all my life....

As far as I'm concerned, it never gets old.

[1]Alex Chernavsky: Eight months on the Shangri-La Diet.

1. <http://www.astrocyte-design.com/shangri-la-diet/>

---

Laura (2010-07-23 10:07:15)  
The Shangri-la Diet is AWESOME!!!!

q (2010-07-27 07:43:54)  
i've had good results too, not far from alex C. (6 months, adherence to the 'diet' is very easy, down from 205 to 186, goal 175, rate of change slowing, but so is my desire to reach my goal because i've got most of the benefits already.) what i've been wondering though is why it hasn't taken off more than it has.

### **Logarithmically Right (2010-07-23 12:53)**

In Kathryn Schulz's new book about being wrong (Being Wrong), she makes [1]an interesting mistake:

In the instant of uttering ["I told you so"], I become right squared, maybe even right factorial, logarithmically right "at any rate, really, extremely right.

Schulz doesn't know that the logarithm of a number 1 or more is much less than the number itself. For example,  $\log 100 = 4.6$ .

What's interesting is that logarithmically right is a good way of describing how one's beliefs should be transformed to be a fair approximation of the truth. When you think you are right, you probably are – but logarithmically. Much less than you think.

When faced with a scientific paper – the sort that press releases are written about, for example – the naive reader takes it at face value. The little-knowledge-is-a-dangerous-thing reader finds many shortcomings and dismisses it ("how did this get through peer review?"). The more likely interpretation, in my experience, is that the paper, in spite of its imperfection, moves us a little bit forward. Much less than appearances, but more than zero.

1. <http://www.nytimes.com/2010/07/25/books/review/Gilbert-t.html?nl=books&emc=booksupdateema3>

---

Aaron Blaisdell (2010-07-23 21:50:04)  
Hah! Seth, I think I'm logarithmically right 100 % of the time. But it feels good to think I'm right in an untransformed manner. If I knew the truth, I'd probably just shut up.

G (2010-07-24 07:29:32)

Advice works for me. But I'd change the wording: 'little-knowledge-is-a-dangerous-thing reader' - it seems unclear whether you mean someone who is hyper-skeptical of knowledge or someone who exemplifies what the aphorism warns against.

Jeremy (2010-07-28 12:28:32)

You don't suppose she simply meant "exponentially right"?

## **The Economics of Medical Hypotheses and Its Successor (part 1 of 2) (2010-07-23 16:15)**

A successor to Medical Hypotheses, titled Hypotheses in the Life Sciences, will soon be published. I asked Bruce Charlton and William Bains, the founder of the new journal, about the economics of the situation.

ROBERTS Did Medical Hypotheses make money for Elsevier? How much did it cost to run per year (leaving aside time contributed by you and the editorial board)? How much of that did Elsevier pay?

BRUCE CHARLTONÂ Medical Hypotheses did for sure make money for Elsevier - but I was never allowed to see the accounts.

I was told circa April 2009 that that the journal still made a profit even after page charges were abolished in early 2009 (income from things like subscriptions, sales of reprints including paid downloads, but mainly from its share of internet access 'bundles' via ScienceDirect - which is purchased mainly via library subscriptions from colleges etc).

Costs were my salary plus a share of the Elsevier editorial team - the journal secretary, the person who put together the issues and the manager - i.e., three main people at Elsevier each of whom worked on a group of journals.

Before 2009, when Medical Hypotheses still had page charges, the journal will have been very profitable since it had the above sources of income plus about page charges at about 60 dollars per thousand words, for a journal of between 160-240 pages, with about 500 words per page - that's roughly 50 thousand dollars extra income per issue - with 12 issues per year that is roughly half a million dollars p.a. in page charges alone. Over seven years as editor I must have generated a few million dollars income for Elsevier.

So - in my opinion Elsevier's behavior with Medical Hypotheses does not make business sense, since it lost them a lot of income and risked even more. Also hounding a successful editor, and sacking him before the contract was finished and with issues for 2010 un-compiled (and with nobody lined up to replace me) did not make business sense, nor did the mass of bad publicity all this generated for Elsevier.

My inference is that an individual or group in Elsevier senior management - perhaps Senior Vice President (USA) Glen P Campbell, who began the whole business and who has remained personally active in it (including the appointment of the new editor) - I guess that Campbell took a personal interest in Medical Hypotheses and in my editorship for reasons unknown to me - and drove the whole process.

The most sinister aspect of the whole thing for me is that senior Elsevier managers are now exerting personal influence on the content of the scientific literature and the conduct of science (overseeing appointment of editors, new restrictions on editorial conduct etc) - and they are doing this not for business reasons, but presumably to pursue

their own private agendas.

The strict legalistic definition of academic freedom

(for what it is worth – see [1]writings by Louis Menand)

is that academics be autonomous in the conduct of academic work (conduct, appointments, promotions, reviewing etc). The Medical Hypotheses Affair shows Elsevier very clearly in breach of academic freedom, and every competent editor will immediately recognize this fact.

In addition, in the later stages of the journal, Elsevier managers were also involved in covertly selecting (i.e. rejecting) what they considered 'controversial' Medical Hypotheses papers - the papers were intercepted after I had formally accepted them and held back, some were later rejected.

Elsevier also employed the Lancet (which they own) to choose 'peer reviewers' for the Duesberg and Ruggiero papers and arrange to have them rejected (using criteria quite different from those of Medical Hypotheses).

So that we know for sure that the Elsevier owned Lancet (one of the most prestigious medical journals in the world - perhaps the most prestigious?) is nowadays in the pocket of Elsevier management, and willing to do dirty jobs for them.

Yet there has been no outcry against Elsevier's breach of academic autonomy from senior journal editors (nothing from the editors of Nature, Science, Lancet (understandably, since they are Elsevier employees), NEJM, JAMA, BMJ etc.). This silence means, I take it, that these senior editors are not any longer autonomous journals, but are nowadays in the pocket of their own publishers and live in fear of their own jobs.

The Medical Hypotheses affair is therefore a straw in the wind: an indicator on a small scale of what is happening at the larger scale: i.e. the thoroughly dishonest and hypocritical state of modern science and academia, and the domination of the content and conduct of science by outside interests.

But the unusual point that is not well understood is that key aspects of these outside interests are not always operating in profit maximizing ways. My understanding is that senior managers (in the private and public sector) are 'using' - even exploiting - their organization's resources in pursuing personal goals - engaging in a kind of moral grandstanding, in making large gestures which show how 'ethical' they are in their views - at everyone else's expense.

This can be most clearly seen in the 'Green' 'ethical' behaviours linked to the Global Warming scam - senior managers have shown themselves willing to sacrifice efficiency in pursuit of large moralistic policy gestures of 'caring about the planet' with which they become personally associated (recycling schemes, fair trade, campaigns of 'save energy' or promote public transportation among staff etc - none of which are actually effective in terms of real world effects, but which are effective in expressing 'concern').

Such moral gestures are invariably designed to appeal to elite PC opinion - it is a major form of status competition among the elites. My guess is that something of this sort is behind what happened at Medical Hypotheses: a senior manager or group of managers at Elsevier probably wanted to show themselves and their peers that they were taking a strong 'moral' stance against people who published AIDS-denialist papers.

dearieme (2010-07-24 03:47:08)

The heart on the sleeve outweighs the brain in the skull.

G (2010-07-24 07:43:16)

"My understanding is that senior managers (in the private and public sector) are 'using' - even exploiting - their organization's resources in pursuing personal goals - engaging in a kind of moral grandstanding, in making large gestures which show how 'ethical' they are in their views - at everyone else's expense." I'm far from anti-union, but I do see this type of behaviour among militant union leaders (even low-level leaders) who just want to be seen to be championing a cause, usually at the expense of union members. It is another case of moral vanity trumping profit or even careerism. Happens that I posted recently about anger towards AIDS denialists. I read Kary Mullis's account and it seemed like there were questions to be asked, to say the least. It is funny/maddening to see 'liberal' people try to suppress debate, because these same people condemn censorship in virtually every other context. I suppose I say this because AIDS, like climate-change, is a perennial concern of educated liberals. You ever read cracked.com? They ran an article that listed Mullis as one of a number of 'clearly insane' Nobel winners, along with Brian Josephson, who studies ESP. I couldn't believe my eyes! You become a *household-name* nutcase for holding an unorthodox scientific opinion? It's not like he said AIDS was created by the Masons or anything...

Seth Roberts (2010-07-24 09:32:52)

I saw that cracked.com list. As one New Yorker editor would tell writers, "don't get it right, get it written."

Stephen M (Ethesis) (2010-07-25 15:01:25)

BRUCE CHARLTON ought to open up a competing journal, starting with the papers they excluded.

Stephen M (Ethesis) (2010-07-25 15:06:12)

What this reminds me of is a book I read in the late 70s about young millionaires. The profiles had a very large number of people who had been working on masters in business or economics and had stumbled on the fact that many business had parts there were worth more than the total value of the business itself. You could thus buy the business, break it up and sell the parts and make a substantial profit. All of this occurs because the people running the business and the owners (stockholders) have divergent interests. Most of them were flunked for writing thesis with this as the topic - their professors were certain that such a condition could never occur. What the profs missed was that these guys were the market forces that created a correction. Then, in the 90s, the trend began of people who sucked the revenue out of businesses, not in diversions (such as the ones evident here) but in excess CEO, etc. pay. Again, capture at work. In many of those cases you can make a business substantially more profitable by taking it over, firing the management team and replacing them with one that costs millions of dollars less. But capture, in all of its forms, is fascinating to watch. Sad in Charlton's case as well.

G (2010-07-25 17:45:27)

Stephen, what you wrote reminds me of Adam Curtis's excellent documentary series *The Mayfair Set*. I am forever trying to get people to watch his work; I think it's important. It happens that I pasted all of episode two into the following blog-post, but I would rather you watched it from the beginning; episode one is easy to find with a Google video-search. <http://thedailyg.wordpress.com/2010/05/26/some-painfully-pertinent-history-of-stock-market-speculation/>

Stephen M (Ethesis) (2010-07-25 18:39:21)

**And if Duesberg may be even partially correct, it is extremely dangerous that the proper scientific process has been so ruthlessly distorted and subverted simply to exclude his ideas from the official scientific literature.** <http://medicalhypotheses.blogspot.com/2010/05/medical-hypotheses-affair-times-higher.html> The real value in examining theories, especially ones that are wrong, is that refuting them is much more powerful than denying them. In addition, in refuting things, one learns. In denial, one avoids learning.

johannes borgstein (2010-07-30 06:33:26)

elseviers has now built a digital network that controls over 800 of the most important medical journals, both at the submission end and at the online access end. we should be asking ourselves who is elseviers? and what are their interests i suspect it is not a moral issue but a commercial issue curiously, the previous ceo of elseviers was also a paid director of GSK

lemmy caution (2010-07-30 18:15:18)

I am not sure. If "Medical Hypotheses" had the possibility of hurting the reputation of other Elsevier publications, it may make financial sense to drop "Medical Hypotheses" even if it is making money. Especially if they can find some less controversial magazine to put into its "bundles"™.

Laura Fisher (2010-10-04 14:52:59)

In response to the sacking of Dr. Charlton I have decided not to renew my subscription to Medical Hypotheses or its successor. I would hope others would do likewise. AIDS and its "cause" are not the only important medical topics to be willfully distorted for the sake of political gain. About 46 % of physicians in the US now are employees, rather than being self-employed. I believe this makes them bureaucrats and as such their first loyalty is to their employer, the bureau. Any loyalty or commitment they may have to their patient takes a second seat to their alliance with their employer. I have found Paul Berman, Shelby Steele and Thomas Sowell most helpful in my attempt to understand these very bad behaviors on the parts of intellectuals and bureaucrats. Insofar as one's best effort to sort out what is good science-based medical treatment clashes with that of the bureau, one tends to keep quiet lest one become its next target.

## **What's "Natural" Sleep? (more) (2010-07-24 09:29)**

This morning I woke up feeling very refreshed and in a good mood. I'd slept about six hours. I'd fallen asleep within seconds of turning off my bedside light. This is what usually happens. I almost always sleep this well. Yet I don't avoid caffeine during the day (I drink a lot of tea) nor artificial light at night (I do avoid fluorescent light at night). For a large chunk of my life my sleep was much worse. I never woke up feeling well-rested. I often woke up quite tired but unable to fall back asleep. A few hours later I'd fall back asleep and sleep a few more hours, much like the biphasic sleep called segmented sleep. Which is more natural – my current sleep or segmented sleep? [1]As I blogged, several scientists have said that segmented sleep is more natural.

I'm returning to this topic and sort of repeating myself because sleep is so important, "[2]almost everyone I [a NY Times writer] know complains about sleep," and the common cold so common. (When I improved my sleep I stopped getting colds.) Here, in chronological order of discovery, is [3]what I've learned improves my sleep:

1. Aerobic exercise. When I started swimming, I noticed that I fell asleep much faster – within a minute rather than within several minutes. Aerobic exercise didn't solve the bigger problem of waking up tired, however.
2. Skipping breakfast. This reduced early awakening. If you have any doubts about this, read about anticipatory activity in lab animals.

3. Seeing faces in the morning. Perhaps this deepens my sleep. It certainly makes it easier to go to bed in the evening (I stop wanting to do anything) and makes me wake up optimistic and looking forward to the day. The difference in how I feel when I wake up is like the difference between black and white and color. These days I watch about an hour of bloggingheads on a 22" monitor starting around 6 am.

4. Standing. I stand on one bent leg to exhaustion at least twice. Before that I got a similar effect by standing 8 hours or more, which was too hard to do every day.

5. Morning light. Every morning I go outside about 8 am. I try to stay outside at least 1 hour and ideally more.

6. Animal fat. I eat half a stick of butter (60 g) per day.

Maybe the 3 tablespoons of flaxseed oil I drink every day also helps.

Each one of these six factors probably reproduces Stone Age life, when people got a lot more exercise, didn't eat breakfast, chatted with their neighbors in the morning, etc. Were all six factors set at Stone Age levels for the Western Europeans that [4]Ekirch writes about or [5]Thomas Wehr's subjects (both of whom had segmented sleep)? Of course not. Had all six been at Stone Age levels, the segmented sleep seen by Ekirch and Wehr might have disappeared. As my segmented sleep disappeared.

My sleep still has room for improvement. When I stood for 9 or 10 hours I woke up astonishingly well-rested. I felt scrubbed free of tiredness. In the middle of the day, eight hours later, I would marvel how rested I felt. The problem with standing more now is that if I stand on one bent leg more than twice per day my legs get stronger and stronger and it starts to take a long time (e.g., 20 minutes) to reach exhaustion. I'm also unsure about the best amount of animal fat. More might be better.

Comments that [6]the night is long and sleep is short ignore that we can see by moonlight and starlight and that people chat after dark. In contrast to [7]this experiment with no artificial light, by J. D. Moyer, the things I do to improve my sleep produce no bad effects. And I sleep only six hours per night, which Moyer found isn't nearly enough.

Thanks to Heidi for the Moyer and NY Times links.

---

G (2010-07-24 10:37:49)

Did you try my suggestion of bending your leg more? I assure you, you can easily make this exercise more difficult and keep the time down without losing relevant verisimilitude in the kind of stimulus. At the extreme strength-level imaginable, you could do ten or twenty minutes of continuous pistol-squats. I'm not sure any human is capable of this. Indian pelwanhi

wrestlers do oodles of this particular type of squat every day: <http://www.youtube.com/watch?v=jPSVpo4mzNI> You're just doing a low-intensity one-legged squat, mate - you can optimize this without losing any of the effects you're after; I'd almost lay money on it. After all, you know that walking and standing does as well, so you can probably safely narrow the required type of stimulus down to 'long-duration lower-body exercise'. Who specifically doesn't want strong legs? If you do them with good form they won't necessitate your doing a load of other exercises to balance out - I guess you would end up resembling a cyclist rather than a typical bodybuilder.

Laura (2010-07-24 10:39:57)

I've been doing more of these things, over time. Because of the posts I've read here, I started standing 8 hours a day at work for two semesters. I also started skipping breakfast because of the shangri-la diet (i take the oil in the mornings). I am very active throughout the day and I go to the RSF gym at night, though. A coworker calls me a vampire, since I am up most of the night. I don't need to sleep a lot. I see faces in the mornings, since I work at about 6 am. I don't get much morning light, though, because I am indoors at a cafe, where I work. I started eating 1/4 stick of butter every night. It actually also makes food taste very good, too! This has helped me be more productive and sleep a lot less. Also, since I am taking 3 tbsp of flaxseed oil everyday, I don't have to worry about eating food. I could eat very little in a day, so this helps me put my energy into doing things that have value to me, instead of thinking of what I will eat when I get hungry. Incorporating these ideas into my life has allowed me to save my job, which I was about to lose due to anxiety, and to move out of my parent's house. Also, it has kept me out of the hospital. Thank you, Seth and all the people who contribute/comment on this blog!! I love all of your ideas!!!

Seth Roberts (2010-07-24 12:56:13)

"Did you try my suggestion of bending your leg more?" No. To make it more about how long one muscle can hold out is to make it more about stressing only one muscle. Which will produce less muscle-stress signal than stressing several muscles. But perhaps there are more rounded (involving many muscles) ways to make it more difficult, as you say.

MT (2010-07-24 13:24:23)

I previously mentioned pistol squats and variations as well and still think they make sense. They would enlist a similar, if not identical, number of muscles and it would be simple to test with little downside and a potentially large upside - if it worked you could perhaps get the total-refreshment feeling you got from longer periods of standing. If more challenge didn't work, it would be clear within a few nights. Consistent with the general principles of self-experimentation you outline Seth. I'd do it, but I tried the 9 hr standing experiment and it did not improve my sleep, nor did the one-leg to exhaustion technique.

Jeff (2010-07-24 13:48:01)

I've experienced a bizarre shift in sleep habits. For my whole life I was a 10-hour sleeper. If I didn't get 10 hours, I'd fall asleep in class. I could never stay awake in meetings or lectures. About 30 % of every movie I saw in a theater I accidentally slept through. Then came a slew of intense anxiety episodes, which were probably exacerbated by malnutrition. At some point I experienced a severe shift in how I slept. Since then, my body is never drowsy and I can only get 5 hours of sleep per night. I wake up in the middle of the night often, sometimes taking 1-2 hours to fall back asleep. I never feel rested. I mention this because I find it interesting that before this occurred, I broke every "rule" in the book of sleep (drank caffeine at night, kept inconsistent sleep schedules, lots of artificial light, etc). Now I follow every rule in the book, yet it has no effect. I suspect something permanently changed in my hypothalamus (which can be damaged from stress and malnutrition), or my HPA-axis at large - permanent in the same way a type 1 diabetic undergoes a permanent biological change. This has been going on for about 2 years. The only relief I get is from trazodone. I will start trying some of these ideas to see how they affect my sleep. Aerobic exercise is something that had no subjective impact on sleep quality prior to my change; after, however, it does have an impact - I do sleep better if I exercise during the day. I find this interesting.

Patrik (2010-07-24 18:05:50)

@Seth Excellent post. Riffing on your thoughts here: 1. *Aerobic exercise. When I started swimming, I noticed that I fell asleep much faster - within a minute rather than within several minutes. Aerobic exercise didn't solve the bigger problem of waking up tired, however.* I think the benefits you received from swimming have to do with being in water at some temperature

that was considerably less than your own body temperature. Reason I think this is that I used to sleep quite well after swimming practice, playing water polo, surfing or swimming in the ocean. Also, Tim Ferris talks about hacking his sleep with ice baths. <http://www.fourhourworkweek.com/blog/2008/01/27/relax-like-a-pro-5-steps-to-hacking-your-sleep/> Last thing, when I do CrossFit too late in the afternoon, say 5pm, I have a very hard time falling asleep.

Robin Barooah (2010-07-24 19:46:40)

I find it interesting that standing was so significant in your results. Apparently studies have shown that standing more is significant for one's general health: <http://www.kurzweilai.net/study-links-more-time-spent-sitting-to-higher-risk-of-death> Had you seen this?

Seth Roberts (2010-07-24 21:15:45)

Patrik, you might be right but I continued to fall asleep quickly when I switched from swimming to aerobic classes and then racketball. Robin, I hadn't seen that study, thanks.

andrew (2010-07-25 05:48:53)

According to a study from the John Hopkins Bloomberg School of Public Health: "skipping breakfast was associated with increased prevalence of obesity (odds ratio = 4.5, 95 % confidence interval: 1.57, 12.90)" <http://aje.oxfordjournals.org/cgi/content/full/158/1/85>. So, while skipping breakfast may help you sleep better, it will (statistically at least), make you more likely to become obese.

Tom Moertel (2010-07-25 15:52:56)

Even though some studies [1] [2] found that skipping breakfast is associated with weight gain, the association does not mean that the first causes the second. One plausible explanation for the association, for example, is that heavier people are more likely to skip breakfast, hoping to keep their weight down. [1] [1]Association between Eating Patterns and Obesity in a Free-living US Adult Population [2][2]Energy Intake at Breakfast and Weight Change: Prospective Study of 6,764 Middle-aged Men and Women

1. <http://aje.oxfordjournals.org/cgi/content/full/158/1/85?maxtoshow=&hits=10&RESULTFORMAT=1&andorexacttitle=&and&titleabstract=breakfast&andorexacttitleabs=&and&andorexactfulltext=&and&searchid=1&FIRSTINDEX=0&sortspec=relevance&resourcetype=HWCIT>

2. <http://aje.oxfordjournals.org/cgi/content/full/167/2/188?maxtoshow=&hits=10&RESULTFORMAT=1&andorexacttitle=&and&titleabstract=breakfast&andorexacttitleabs=&and&andorexactfulltext=&and&searchid=1&FIRSTINDEX=0&sortspec=relevance&resourcetype=HWCIT>

Tom Moertel (2010-07-25 16:08:55)

Quick clarification: I should have written "One plausible explanation for the association, for example, is that people prone to gaining weight are more likely to skip breakfast, hoping to keep their weight down." Cheers, Tom

Kirsten M (2010-07-26 09:52:55)

Seth, have you tried standing on a BOSU or wobble board? I have a inflatable blue pancake type thing called a J Fit that I got off of Amazon for about \$15. I first got it to sit on at work, on the theory that maybe strengthening my core would help my back problems. (At first I could use it for only 20 minutes at a time, but now I sit on it most of the day. As a bonus, I have excellent posture. Also, my back problems are gone, but I think some other things—such as switching to flat shoes—made more of a difference.) Anyway, you can also stand on the JFit, or do sit ups on it, and it's designed to put you a little bit off balance and make your muscles work harder. One legged standing would definitely be more difficult, even using the same exact stance.

Lisa Wilcox (2010-08-31 13:53:12)

I am trying to figure out my sleep problems too. I live in the northwest (rainy gray Washington). I made an observation. On a sunny day, I laid out in the sun, with maximum exposure on my body, for about an hour and I DID sleep better that night. We don't get many days that I can do that. I just recently came back from California where I got lots of sun exposure so I assume that my Vit D is up there (also take supplements and eat nutrient dense foods) but my sleep is still poor. Waking many times

throughout the night and feeling less rested in the morning. So, I really think that the "sun" exposure has more effects/affects than providing the Vitamin D for me. It might be the "light" itself. Wondering if I got one of the those lights for people with Seasonal Affective Syndrome would help my sleep? I would like to try the standing on one leg. I will let you know how that goes.

elise (2011-10-28 07:42:09)

I have insomnia where I can fall asleep very easily but awaken two hours later and cant fall back asleep until dawn, it which case its time to get up. I have done quite a few experiments on my self with food and have found that oils or foods high in omega 3 will wake me up early. Worst offenders are flax, fish oil, chia seed. I also discovered inadvertently that omega 3 oils in lotions and other topicals are absorbed and will wake me up early even in the tiniest amounts (Im talking a few drops of flax or fish oil!). I should note that my insomnia began about 8 months after starting a program for acne which included 1-3 tablespoons per day of fish oil. Im pretty sure I messed up my omega 3 to omega 6 balance. I had symptoms of omega 6 deficiency that went away after I quit taking fish oil, but the insomnia persists. Supplementing with omega 6 oils helps somewhat but is not a cure. I fall asleep very easily but awaken two hours later and cant fall back asleep until dawn, it which case its time to get up. Any ideas?

### **Learning From "Pseudoscience" (2010-07-25 10:39)**

The second episode of BBC's [1]The Story of Science is about chemistry. It shows unusual sophistication by emphasizing that early chemists built on the alchemists. The alchemists invented techniques and equipment later used by "real" chemists such as Joseph Priestly – the ones who reached conclusions we still believe. Not everyone understands that some "pseudoscience", such as alchemy, is valuable.

A few years after I became an assistant professor, I realized the key thing a scientist needs is an excuse. Not a prediction. Not a theory. Not a concept. Not a hunch. Not a method. Just an excuse – an excuse to do something, which in my case meant an excuse to do a rat experiment. If you do something, you are likely to learn something, even if your reason for action was silly. The alchemists wanted gold so they did something. Fine. Gold was their excuse. Their activities produced useful knowledge, even though those activities were motivated by beliefs we now think silly. I'd like to think none of my self-experimentation was based on silly ideas but, silly or not, it often paid off in unexpected ways. At one point I tested the idea that standing more would cause weight loss. Even as I was doing it I thought the premise highly unlikely. Yet this led me to discover that standing a lot improved my sleep.

Richard Feynman, in [2]his famous "cargo-cult science" speech, failed to understand that "real" science can build on "pseudoscience":

Another example is how to treat criminals. We obviously have made no progress–lots of theory, but no progress–in decreasing the amount of crime by the method that we use to handle criminals. Yet these things are said to be scientific. We study them. And I think ordinary people with commonsense ideas are intimidated by this pseudoscience.

Absence of obvious progress (such as no decrease in crime) doesn't mean something is worthless. Bizarre ideas or unsupported ideas ("lots of theory but no progress") doesn't mean something is worthless. What's worthless, in terms of science, is not paying attention to reality. Not caring about how the world actually is. The cargo cults Feynman mentioned weren't worthless. They tested their beliefs. They found out the planes didn't land. Fine. It wasn't pseudoscience, it was just early science, where the reasons for doing stuff now appear ridiculous. Of course the alchemists had beliefs we now think ridiculous. How could they not have?

Science is fundamentally on the side of the weak, since it offers hope of improvement. The powerful not only can afford to ignore reality they would like to, because it might be inconvenient. So they do so as much as possible. When

I've heard "the debate is over" (= it's now time to ignore reality) it's always turned out that the person saying this (e.g., Al Gore, mainstream journalists) was powerful or credulous.

It's not bad that some people ignore reality. We need people like that. I think of the body: parts of it (e.g., sensory systems) are very sensitive to reality, parts of it (e.g., bones) are not. We need both. When leaders ignore reality is when trouble begins.

1. <http://www.bbc.co.uk/programmes/b00s9mms>

2. <http://www.lhup.edu/~DSIMANEK/cargocul.htm>

---

G (2010-07-25 20:49:18)

Heh, I was totally with you until the last paragraph. I disagree on two counts: first, bones are very sensitive: they use a piezoelectric sense to continually redistribute mineral deposits according to the direction and magnitude of stresses. Second, you can't argue that some people 'should' be insensitive for the benefit of society - it's like saying we need a race of Morlocks toiling underground. We don't. Besides, folly doesn't help anywhere, at any level of society, whether you're a policy-maker or a fisherman. Blindness to reality is folly. The occasional accidental benefits of folly don't make it indispensable. Foolish people aren't so much like eyeless, insensitive people as people whose eyes can only see their own projections. When Al Gore looks at climate science data, he is projecting his own conclusions onto it. I can say this safely because to this day it is clear that we do not know what the truth is, so any overconfident conclusion - on either side - must be a case of projection. "The wish is father of the thought." Some people will always be more thoughtful or perceptive, but no one should be living in their own hall of mirrors, out of touch with reality. I love that you nailed that Feynman argument: I've heard that used so loosely all over the place, as an automatic trump-card, so it's good to see it downgraded from Scripture-status. You're right, if the Cargo-cultists gave up their method after seeing it didn't work, who can criticise them? Toddlers try out all sorts of things that seem stupid to adults just because they know more due to having already gone through the same experiments. If adults weren't so judgmental (and afraid of being judged) they would learn a lot more.

Nathan Myers (2010-07-26 14:52:13)

Congratulations, Seth, on discovering the value of research into the mechanisms of DNA replication, and sequencing genomes, and a million other things scientists do that don't seem to result directly in immediately useful therapies.

Seth Roberts (2010-07-26 16:52:09)

G, I didn't know that about bones. That's really interesting. I should have said that some parts of the body are much more sensitive to reality than other parts. Bones reflect reality more slowly than our eyes and ears reflect reality.

thehova (2010-07-26 22:23:16)

A bit off topic, but I wish that I could actually watch the BBC here in the USA. BBC America is pretty awful. I simply want a feed of BBC One.

Phil (2010-07-27 09:30:49)

You say "Whenever I've heard "the debate is over" (= it's now time to ignore reality) it's always turned out that the person saying this (e.g., Al Gore, mainstream journalists) was powerful or credulous." I don't think the claim that "the debate is over" is the same as saying it's now time to ignore reality. I also think that when the debate is over, it's OK to say the debate is over. Suppose someone asks me about, say, whether nicotine is addictive. That's not something I have any firsthand knowledge of — I've never done an experiment that would answer this, nor even read a paper about such an experiment. But

it's my impression that, well, the debate is over. If I say so, am I ignoring reality?

Seth Roberts (2010-07-27 10:35:29)

Someone asks you about nicotine. You say, "As far as I know, the debate is over." That's quite different than saying "The debate is over. Period." Which has, as far as I can tell, the underlying additional meaning that I (the speaker) know more about it than you (the listener) and can't be bothered to tell you why. But in any case I'm just describing my experience – cases where the speaker was uninterested in looking closely at the evidence behind the claim.

Nathan Myers (2010-07-27 14:26:18)

When we've seen case after case of "evidence" – the best that can be mustered – turn out to be cooked or outright fabricated, it becomes entirely reasonable to lose interest in the next one. I went along, following up denialism claims to see what might be there, for longer than I should have. Here's a time-saver: when you find somebody is trying to deceive you as part of making his case, you can stop looking at evidence, because you have already been notified that there is no case. Only an illegitimate claim stands to benefit from deception.

G (2010-07-27 16:40:28)

This book is available to download for free - somewhere, dammit - but I can't find it just now. Worth a read. Among many other very interesting things, it gives a great explanation of how bones work - they are surprisingly active. [http://en.wikipedia.org/wiki/The\\_Body\\_Electric](http://en.wikipedia.org/wiki/The_Body_Electric)

Phil (2010-07-28 14:13:08)

Seth, I still don't think that saying "the debate is over" is the same as saying "it's now time to ignore reality." Nathan, you can't stop looking at the evidence when you find that someone is trying to deceive you. Piltdown Man was a hoax, but that doesn't disprove the theory of evolution.

Nathan Myers (2010-07-31 18:01:57)

Phil: It means whoever cobbled up Piltdown Man has nothing to offer me. And it means that Seth's poster boys don't either; I will continue looking at evidence about global climate change, but not from them. Fortunately there are plenty of other people who have no desire to deceive. It happens that all the other evidence shows incipient disaster, at least for thousands of other species. It's just opinion that when thousands of other species go extinct, that's will be bad for humans too, but it is prudent to expect so until it's demonstrated otherwise.

## **The Economics of Medical Hypotheses and Its Successor (part 2 of 2) (2010-07-26 11:48)**

A successor to Medical Hypotheses, called Hypotheses in the Life Sciences, will be edited by William Bains and published by Buckingham University Press (BUP).

ROBERTS Does BUP hope to eventually make money from the successor journal? Or do they merely hope the subsidy required will decrease with time?

WILLIAM BAINS BUP is a small operation, and does not have the resources to subsidize Hypotheses in the Life Sciences beyond its start-up stage, so we hope to make enough money to break even fairly soon. Ultimately the aim is to be profitable. I for one am determined to put scientific quality first, and I have emphasized to BUP that I only want the journal to grow (and hence generate more revenue) when the quality of submissions allows it.

ROBERTS What led BUP to decide to publish the new journal?

BAINS I think a combination of similarity in philosophy and being in the right place at the right time. They thought it was an exciting project which would both raise their profile (in a good way) and make them money. Buckingham University is the UK's only private university, and as such takes a heterodox, even iconoclastic view towards what the academic establishment says is writ in stone. The Chancellor has a robust approach to academic and individual freedom. So a journal trying to do something rather new, enabling those with good ideas but little power to be heard, fitted with their approach. For me, an added advantage is that I deal directly with the man at the top. There are no intermediate layers of management to take decisions about the journal, and we discuss everything from philosophy to web page design. This is the sort of immediacy you do not get with a big publisher.

[1]Part 1 (Bruce Charlton). [2]Bioscience Hypotheses, a similar journal founded by Bains.

1. <http://www.blog.sethroberts.net/2010/07/23/the-economics-of-medical-hypotheses-and-its-successor-part-1-of-2/>
2. <http://www.biosciencehypotheses.co.uk/>

---

Robin Clarke (2010-07-28 03:17:34)

I applaud William Baines's initiative with this new journal. My main reservation about it is that it explicitly disowns "peer review". The problem with "peer review" is not the peer-review system per se, of referring to reviewers (actually PREviewers). It would work fine if employed in a positive mode rather than a nitpicking closedminded mode. But by saying "we don't use peer review", this unnecessarily opens a wide door of opportunity for the deceitful Forces of Darkness to pretend that the journal lacks legitimacy. Also I dislike the word "Hypotheses" in the title. All my own published theories are developed structures that are far beyond mere hypotheses and attachment of such a word would demean them. I myself put forward a new title of "Biomed Ideas" but was too ill to develop it. I fervently hope the new journal will change to that far superior name as soon as possible; please consider any copyright I have on it transferred to yourselves!

Robin Clarke (2010-07-28 03:28:25)

In the previous I should have mentioned the case of my own autism theory publication. It was accepted by editor HJ Eysenck (most cited scientist ever) via a process of peer-review. Just his use of peer-review was an honest, open-minded one rather than the hostile sloppy bigotry that I had encountered from other journals (as explained in my letter in Nature <http://www.ncbi.nlm.nih.gov/pubmed/9121540> ). There's a link to the paper at top of <http://www.autismcauses.info> , which also has some indications of the update review I'm preparing.

### **Omega-3 and Dental Health (revisited) (2010-07-27 17:49)**

A few years ago I learned that flaxseed oil improved [1]my gums and [2]other [3]people's – especially [4]Tyler Cowen's. A few months ago I went to Beijing for two months. Toward the end of the visit my gums would bleed when I'd use a toothpick. Yet I was drinking 3 tablespoons of flaxseed oil every day, just like in Berkeley.

Well, my Beijing flaxseed oil was old. Stored in a freezer, yes, but about 9 months old. When I returned to Berkeley, I bought fresh flaxseed oil. In a week, my gums were much better. The bleeding stopped.

Last week I went to the dentist. He measured my "pockets" – the distance a probe can be inserted between the gum and the tooth. The readings were almost all 2's (mm), with a few 3's and one 1. Years ago, before flaxseed oil, the rear teeth were 4s and 5s. Now I floss and brush my teeth less than back then. Because of living in China, I haven't had my teeth cleaned in more than a year (unprecedented) so I have the most plaque ever in my life. Yet my gums are the healthiest they've been, after just a few weeks of good flaxseed oil. ("Your gums are in good shape," said the dentist.) This suggests that plaque doesn't matter, the opposite of [5]what one dentist told me and [6]what Wikipedia appears to say ("The focus of treatment for gingivitis is removal of the [usual] etiologic (causative) agent, plaque."). Nothing is said about too-little omega-3.

All this suggests that gingivitis, a disease of inflammation, is due to too-little omega-3. This is even more plausible because omega-3 is a precursor of an anti-inflammation signaling molecule. Here's the sequence of events that led to this conclusion: 1. Several people wondered if they could do the Shangri-La Diet with flaxseed oil, so I tried some. It seemed to improve my balance. 2. Careful measurements of my balance confirmed this. 3. Further measurements showed that more flaxseed oil continued to improve my balance until I reached 3 tablespoons/day, which is far more than any recommended dose I've seen. 4. Readers of this blog and friends tried taking flaxseed oil in similar amounts. Everyone who did so, as far as I know, found their gums greatly improved. 5. [7]One person stopped taking the flaxseed oil. His gums got worse. He resumed. They got better again. 6. The story I tell here.

Notice how important blogs (this blog) are in this story. It's a kind of microscience – I learn something via self-experimentation, I post it, people write in with their experience – that has turned out to be surprisingly informative, given the many ways it differs from professional science (no long training, no lab, no grants, no peer review).

---

stefan (2010-07-27 19:41:52)

Hi Seth, Could you please let me know if your practice is to "mouth wash" with the flax seed oil and then swallow it, or is it simply to swallow the flax seed oil? Thanks, Stefan

Seth Roberts (2010-07-27 21:41:26)

I just gulp it down (very fast), with my nose clipped shut. I leave the noseclip on for a few minutes to let the smell disappear.

Mike (2010-07-27 21:46:14)

Hey Seth, Thanks for posting. Any idea why Flaxseed Oil in China was not helping your gums?

Nathan Myers (2010-07-27 22:16:58)

I buy the Barlean brand that comes in a squeeze bottle, and squirt it in directly. When my gums are tender, I slosh it about before swallowing, and the tenderness clears up in a day or two.

Robin Clarke (2010-07-28 03:41:11)

Any reason to believe that fish oil would not have the same effect? Could it be something else in the flaxseed oil? (And I wasn't aware it was particularly obnoxious anyway.)

Jen (2010-07-28 04:49:16)

Do you think fish oil would have the same benefits, given that it's high in Omega 3s?

john (2010-07-28 05:49:25)

Tom Levy MD in his book about heart disease recommended using an irrigator with some hydrogen peroxide in it. It's easier than flossing. And lots of vitamin c.

Brian (2010-07-28 07:25:11)

Seth, why the nose clip in conjunction with the flax seed oil? I don't remember clipping even mentioned in the SLD but I guess here you're trying to avoid weight gain from flax seed oil or perhaps you're trying to improve your gums (and brain) while also losing weight.

Annie (2010-07-28 07:30:38)

Seth - I've been following your experiments with flax, both for dental health and appetite suppression. Do you suppose hemp seed oil would produce the same benefits? I'm inclined to use hemp seed oil because it's supposed to be a better balance of omega 6s and 3s. In doing so, I wonder if I'd be foregoing a benefit that is exclusive to flax?

ChrisF (2010-07-28 08:51:26)

Speaking for myself, I find the taste of flaxseed oil quite noxious. I assume that's why Seth uses a noseclip. Best consumption method for me is two tablespoons in a glass, a blast of faucet water and a fast chug. My gums have not noticeably improved, despite morning and evening consumption. I ordered my oil from Amazon but have left it sitting on the counter. Should it be refrigerated? Is there noticeable quality variation across brands?

Seth Roberts (2010-07-28 09:22:59)

Mike, why was Chinese flaxseed oil not helping? Because it was poorly processed. Probably was at room temperature too long. ChrisF, flaxseed oil needs to be refrigerated to slow down deterioration. I wouldn't buy it from Amazon because it is mailed without refrigeration. I haven't noticed quality differences across brands. Annie, hemp seed oil has much less omega-3 per ml than flaxseed oil. So it won't work as well. Even with flaxseed oil, I had to drink a lot to get the best effect. I am unaware of a benefit specific to flax. Since we get lots of omega-6 in our diet, e.g., from nuts, I never try to get more in one particular food. You are more likely to be getting too much omega-6 than too little, in my opinion. Jen, yes, I think fish oil would have the same effect.

ab (2010-07-28 09:45:45)

I have talked to 'older' people, who say that when they were growing up they would have a teaspoon of cod liver oil every morning (and that it tasted terrible - I can confirm that part). So it seems like we had the implicit information in significant parts of our society that omega-3's (cod liver oil is high in omega-3's) were important.

bjk (2010-07-28 14:53:52)

I've found the fermented cod liver oil the best delivery vehicle for omega3s. It's also important to consume the paste (chocolate and FCLO) more than once a day. Once a day usually didn't do the trick. Using the FCLO, I've reduced the acne on my face by about 75 % (this is in conjunction with reducing my vegetable oil/omega6 consumption by about 90 %). Significantly, my face doesn't feel irritated to the touch anymore, and it has a nice soft feel . . . I can shave without wincing. The FCLO was better than ordinary CLO, flaxseed oil, and sardines, all of which I tried, in order of increasing effectiveness. The dermatologist I visited recently said he'd never heard the vegetable oil -> acne theory before. It makes sense, though.

Dustin Mattison (2010-07-28 15:05:22)

Clary sage is a unique omega 3 source that is the most stable! Clary sage is the world's most stable natural source of Omega-3. In comparison, flax oil is oxidized in 20 minutes at room temperature, while clary sage oil remains intact under similar conditions for 2 years. <http://ecochicagoland.com/2010/07/clary-sage-seeds-as-a-unique-omega3-source/>

Susie (2010-07-28 16:35:07)

It does make sense that, as an anti-inflammatory, omega-3s might help with gingivitis. Try consuming Gudernoobs made by WooHoo Foods. The walnuts and flax are what make it high in omega-3s. They are tasty treats - you'd never guess you are eating health food! No additives or preservatives either.

Nathan Myers (2010-07-28 20:29:37)

I can't tell if the last posting is a joke, and that by itself makes it funny. The copious "oo" sounds help too.

Kirsten (2010-07-29 08:01:50)

@bjk: I've found something similar just from regular cod liver oil. I started taking that, combined with Vitamin D, after reading on the Cooling Inflammation blog that flushing associated with rosacea is caused by inflammation similar to Alzheimers (he called it Alzheimers of the face) and can be treated with increased amounts of D. (Summary written quickly and maybe not totally accurate.) With chewable Carlson's D, and then D + Carlson's CL oil (which also has D) My flushing disappeared almost overnight. Also, while previous attention to gut bacteria (though diet and supplementation) had mostly taken care of my acne, the oil took it the rest of the way-and helped to get rid of that irritated feeling you mention. For a while, it felt like anything on my face-fingers, the ends of my hair, moisturizer-would irritate my skin and cause a breakout. Now, nothing seems to. And on the rare occasions when I do break out, it clears up right away. And Seth: My gums got pinker and pinker (as opposed to red) with this supplementation, which worried me (I thought maybe I was making myself anemic or something) until I read-I think on your blog-that red gums signal inflammation while pink gums are nice and cooled down.

TalkingRat (2010-07-30 16:30:21)

From The Omega Diet (Artemis Simopolous, M.D.) has a chapter on omega-3 and the immune system, including a paragraph on its use to reduce gingivitis. She cites a French study where half the subjects got 1.8g EPA plus DHA supplements or olive oil supplements, the other half got olive oil supplements. They were told to practice "intensive" oral hygiene for two weeks and then were told not to brush or floss for 3 weeks. The omega-3 showed less sign of gingivitis. The citation: Campan, P., P. O. Planchand, and D. Duran. Polyunsaturated omega-3 fatty acids in the treatment of experimental human gingivitis. Bull Group Int Rech Sci Stomatol Odontol, 1996; 29(1-2):25-31. Both this book and Dr. Andrew Stoll's (The Omega-3 Connection) mention that omega-3's benefits for the immune system came from a study of the Greenland Eskimos in the 1970s. The first book is mostly a food book, the second is more about fishoil in improving brain health, esp. depression (Stoll does research in Psychopharmacology). My note: high quality extra virgin olive oil has also been shown to have anti-inflammatory properties.

Sarah Schatz - Allergy-Free & GAPS Menu Planners (2010-07-31 17:56:44)

This is very interesting. Thanks for posting this. I take flax seed oil along with fish oils and cod liver oil, but didn't know it was helping my gums. However at my last dentist visit, it was much less painful for the dentist to probe my gums, so I think that says a lot right there.

Debra (2010-08-06 09:34:01)

I've just started looking into the SLD and the oil thing. Can't you take the flaxseed oil in capsule format?

Dentist in Los Angeles (2010-08-09 15:10:24)

I have been using borage oil, for omega3s, does it work the same as flaxseed oil improving you gums?

Terrence Tormey (2012-01-27 13:48:27)

This makes sense. About half of all Americans suffer from inflammatory gum disease. Omega-3s in sufficient dose have an anti-inflammatory response. But note a couple of points here, flax-seed oil is a poor source of omega-3, especially when compared to omega-3 from fish oil. Note too, most store bought fish oil capsules actually contain little omega-3! Only 25 -30 % of the contents of the fish oil capsule is actually omega-3. Most of the content is filler, like saturated fats, or omega-6, which is pro-inflammatory. There is also evidence that the ratio of EPA to DHA has an effect on the anti-inflammatory activity. I have seen research done at a major teaching hospital that shows that there is an optimal ratio of EPA to DHA that shows a true anti-inflammatory response. It is only found in a product called OMAX3.

Mrs Wagtails (2012-03-28 11:57:47)

I have read all your comments with interest. I have today started taking Golden Flaxseed Oil. Help! It's making me feel like I want to throw up. Any suggestions? I tried a grape straight after which helped a bit.

---

Zubon (2010-07-28 21:03:25)

Point of clarification: you had ONE intense racquetball session, followed by 6-8 pounds of weight loss, rather than taking up intense racquetball regularly?

Seth Roberts (2010-07-28 21:52:49)

Zubon, I played racquetball regularly. I didn't lose weight. Then I had ONE extremely intense session and did lose weight.

Wyman Brantley (2010-07-29 12:23:37)

From the second link: "Dr. Khoruts mixed a small sample of her husband's stool with saline solution and delivered it into her colon[...]Her Clostridium difficile infection disappeared[...]and has not returned since." ## **"No One's Going to Care About You Like You Do" (2010-07-28 09:12)**

At the end of [1]a BookTV interview of Harry Markopolos, the guy who discovered Madoff's Ponzi scheme, Markopolos says

No one's going to care about you like [= as much as] you do.

He meant this as financial advice: Make up your own mind about how to invest your money. Don't assume someone else has done the necessary thinking.

My self-experimentation led me to the same conclusion, [2]as I wrote here. My self-experimentation uncovered helpful treatments (e.g., how to sleep better) that the experts (in this case, sleep researchers) had missed. I theorized that this was partly because I cared more than they did about the quality of my sleep. I had "the motivation of a person with the problem"; they didn't.

Janet (2010-07-28 12:30:13)

Or, as Hillel said, "If I am not for myself, who is for me?"

Bob (2010-07-29 07:29:53)

Tell this to our ruling class who seem convinced that those of us in the great unwashed masses cannot be trusted to make our own choices. They will enact policies that nudge, and force, us in directions that are in our best interests.

## **Premier of Canadian Province Gets Involved in MS Research (2010-07-29 04:28)**

[1]How strange:

In a striking departure from his political counterparts across the country, Saskatchewan Premier Brad Wall says his government will finance clinical trials of liberation therapy, a contentious experimental procedure for multiple sclerosis patients.

Of course, the heads of provinces don't usually get involved in research at this level of detail. However, "Saskatchewan has the highest rate of MS in the country," says the article.

In Part 5 of The Story of Science (BBC), Michael Mosley, the presenter, said that for hundreds of years medical students were shown a human liver and told it had three lobes. They were told that because that's what Galen had said. However, human livers do not have three lobes. As the students could see. Mosely is a doctor. "When I was a medical student," said Mosley, "there was tremendous pressure to conform." MS researchers have said for a long time that MS is an autoimmune disease. Could this have been as misleading as Galen's description of the liver?

Thanks to Anne Weiss.

## A Month of Omega-6 (2010-07-30 03:57)

[1]Susan Allport, having written *The Queen of Fats*, unsurprisingly eats a diet high in omega-3 and low in omega-6. For one month, however, she ate a diet with more omega-6 and less omega-3 and wrote about it- like *Supersize Me*, except far more realistic.

O magazine commissioned a story about it but didn't run it. "My weight gain was only 0.5 pounds and they thought their readers wouldn't see the importance of that," says Allport. Her draft is [2]here. There were three striking changes over the month: the omega-6/omega-3 ratio in her blood doubled (implying that this ratio is controlled by diet rather than by stored fat); her belly fat noticeably increased; and the elasticity of her arteries decreased by 20 %. This supports Allport's belief (and mine) that omega-6 is dangerous when consumed in large amounts, as it is if you eat a lot of food cooked in vegetable oil.

The American Heart Association [3]recommends that Americans eat more omega-6. The justification of this recommendation says nothing about [4]the Israeli Paradox, which to me is the best reason to avoid a diet high in omega-6. Allport's experience is another reason.

Allport is also the author of [5]*Explorers of the Black Box*, about neuroscience research.

---

Annie (2010-07-30 06:12:27)

Seth - What are foods that are typically high in Omega 6? I'm a vegan and have a feeling that this diet naturally keeps Omega 6 levels low anyways. Put differently, what are foods that are high in Omega 3s, but not high in Omega 6s? Flax oil is one, I'm assuming.

q (2010-07-30 07:12:26)

interesting. how do they measure the the elasticity of arteries? (i can look that up myself, and i will.)

Melissa (2010-07-30 18:05:46)

Annie, you should read the article :P It appears Allport keeps her omegas balanced by using - flax, walnuts and canola and NOT

using - peanut butter, soy oil, corn oil There are other ways to balance, but for a vegan her approach is perfect...except it relies on ALA for omega-3. Now that they have vegan supplements of DHA, which is the form immediately usable by the human body...I suggest those.

M (2010-07-31 23:29:55)

Seth- How do you avoid lots of food cooked in vegetable oil in Beijing? It seems it's very hard to do here!

DamnDirtyApe (2010-08-01 00:57:49)

The "Israeli Paradox" is no paradox at all - it's simply more evidence that a low-fat diet high in vegetable derived PUFAs is unhealthy. To those of us who generally follow the opposite of the food pyramid and who consume plenty of natural saturated fat from grass-fed beef and fish with excellent O3-O6 ratios, recommendations from the American Heart Association or the USDA are irrelevant.

Seth Roberts (2010-08-01 09:41:21)

"How do you avoid lots of food cooked in vegetable oil in Beijing?" Because I eat lots of butter, flaxseed oil, and yogurt, I eat only one normal meal per day. Sometimes I cook that meal myself (using no vegetable oil). Sometimes I have grilled meat or boiled fish at that meal.

Tom (2010-08-01 21:35:16)

"Because I eat lots of butter, flaxseed oil, and yogurt, I eat only one normal meal per day." Interesting. I'm going to try amping up my butter + omega 3 oil consumption and similarly try 1 meal/day. (When I don't eat enough butter or fish/coconut oil, I get hungry for extra meals and/or get carb cravings.) Seth, one question...are you finding that taking that much oil is resulting in 'intestinal difficulties'? (If I take more than 1 T fish oil I am likely to need to race to the bathroom at some point the following day.)

carroll (2010-08-04 00:57:17)

Joel Kauffman only rated Susan Allport's book with 2 stars because it had so many errors of science (see amazon customer review forum for his main issues). For a list of 67 more errors email him at kauffman@bee.net

Great links for the weekend! (2010-08-27 13:04:34)

[...] I'm interested in the omega 3/6 ratio. If you still aren't convinced by all the fuss then it's interesting to read about Susan Allport's experiment, summarised and linked to on Seth Robert's blog. Shame on O magazine for not publishing the final article. If you want to learn more about omega 3 testing then Mike T Nelson interviewed Dr Doug Bibus about the subject: [...]

## **"Without Great Teachers, Nothing Else Matters" (2010-07-31 10:08)**

I could watch [1]these video clips (also [2]here) all day. You may have learned about Doug Lemov from [3]this NY Times Magazine article. The quote "without great teachers, nothing else matters" is from [4]the website of the organization (Uncommon Schools) that Lemov founded. The clips show techniques he has isolated that great teachers use in elementary school.

My research is fundamentally about deficiency diseases. I find things present in Stone Age life but absent now whose absence causes problems. Sometimes I work backwards (from present to past): why am I not sleeping well? This turned out to have a Stone-Age-related answer. Sometimes I work forwards: I study something present in Stone-Age life but not now and learn it makes things better: standing (better sleep), morning faces (better mood).

So I know a lot about deficiency diseases. One curious thing about them is the opportunity they present. Without scurvy, we wouldn't have discovered Vitamin C. Once we've discovered Vitamin C, we can figure out the optimal amount, possibly leaving us better off than before scurvy became a problem.

This is what I thought as I watched these clips. Formal education is unnatural. No wonder it's so hard. These clips, however, show that with considerable understanding of psychology you can solve the problems it presents. And perhaps leave us better off than before formal schooling began.

Maria Droujkova (2010-07-31 18:27:35)

While the techniques themselves are neutral, people often use them to manipulate students and rob them of choices. Consider views by Alfie Kohn about the techniques of praise and reward, for example.

MT (2010-07-31 21:46:32)

I think Lemov and Kohn are compatible – the danger Kohn and others identify with praise is related to its extrinsic focus, but Lemov's techniques are respectful and promote intrinsic sources of motivation. They focus on behaviours rather than on global characteristics of the child for instance. Alfie Kohn's work is fantastic. So is Lemov's. The more widely read they are the better the world will be.

### Is It Obvious to Walk to Control Blood Sugar? (2010-08-01 08:01)

[1]I discovered via self-tracking that I could get my fasting blood sugar much closer to optimal by walking an hour per day. This took me a year to figure out and I discovered it by accident. [2]Phil commented that I could have learned the same thing more quickly by searching websites or asking my doctor.

Whether I was rediscovering the fairly obvious [3]is important to me. [4]This website by [5]Janet Ruhl, who has diabetes, is named "How to get your blood sugar under control". Its advice says nothing about exercise, much less walking. Here's one reason why:

I [Ruhl] currently control my own diabetes using a fairly low carbohydrate diet and very low doses of fast acting insulin at meal time. . . . At one point I exercised daily for a year and got my body fat down to 24 %, which put me into the "Fitness" category for a woman my age. Despite what my doctors had told me, weight loss and intense fitness didn't do a thing for my blood sugars, which got worse.

Emphasis added. I too did recommended amounts of aerobic exercise. I too found my blood sugar was nevertheless unpleasantly high. The usual recommendation of aerobic exercise may make it less likely you will do the long low-intensity exercise (ordinary walking) that my results suggest works. You may think: I've already exercised. I'm tired.

[6]"Be very paranoid about any new drug."

---

Phil (2010-08-01 13:55:05)

I think we both agree that some people (and some websites) recommend moderate exercise, others don't. It's just a matter of degree. If I type [reduce blood sugar] into Google, the first site that comes up is [1]which says "An easy way to lower blood sugar levels is to stay fit and healthy....This exercise does not need to be a grueling workout. Thirty minutes of exercise a day, even walking, will help to lower blood sugar levels. Walking to the store instead of taking the car is all that may be necessary to provide you with some much needed exercise." Of course, that may not be bad advice for most people: just because you (Seth) seem to get more blood-sugar benefit more from moderate exercise than from vigorous exercise doesn't mean that's common. The second site I find is [2]wisebread.com, which gives a list of "8 cheap ways to lower your blood sugar." The very first one is "Exercise", where it says "...Now, the results of this can depend on the medication that you take, but many diabetics find that if they have high blood sugar, a brisk 20 minute walk can lower their sugar. I've lowered mine by up to 40 points with just a half hour of walking." The third site, though, squidoo.com, does only recommend "vigorous" exercise. And, as I mentioned in a comment a week or two ago, when I did a more specific search for "pre-diabetes," most of the top hits recommended either "walking" or "brisk walking." I'm not sure why it's so important to you, whether or not the advice to walk or get other moderate exercise in order to reduce blood sugar is already widely know. It clearly is widely know, but it is not universally known. Does it matter, really, whether this advice is given by 30 %, 50 %, or 70 % of the most popular websites, or the extent to which the number varies whether you search for [reduce blood sugar], [control blood sugar], [treat diabetes], [treat pre-diabetes], etc.? You discovered something that is useful to you, that is already widely known...that's great! What's the problem? If you think that moderate exercise is good but intense exercise isn't, that's a stronger claim — lots of these places say any exercise is good, including moderate exercise, but few of them say that only moderate exercise is beneficial. So if that claim is true, then you might be onto something more important. But I think you're doing an awful lot of generalizing from a very small sample if that is your claim.

1. <http://www.wisageek.com/how-can-i-lower-my-blood-sugar.htm>
2. <http://www.wisebread.com/8-cheap-ways-to-lower-your-blood-sugar>

Phil (2010-08-02 10:46:27)

Sorry about the mistake in the first link in my previous post, but I have no way to edit and fix it.

TalkingRat (2010-08-02 16:21:44)

It's possible that healthcare professionals know that ordinary walking improves glucose, but they advise patients to do aerobic exercise because of the secondary benefit of fitness. They may also assume that people will be reluctant to commit to a longer exercise time. But if they know, they really ought to give patients the choice of time vs. activity level. There seem to be a lot of people who find it painful to move vigorously, and it may be easier to get started with moderate exercise, even though they need to walk longer. The 10,000 steps pedometer campaign comes to mind as a recognized alternative to aerobic exercise.

Nathan Myers (2010-08-02 21:31:53)

I'm still curious to see whether small amounts of cinnamon make any difference in your blood sugar level. Every mention I find of the effects of cinnamon intake on type-2 diabetic blood sugar level carries on at length about the terrifying toxicity of certain components of cinnamon. We know from the way the effect was discovered – test subjects trying to raise their blood sugar by eating apple pie – that the useful dose is so small that any such toxicity is negligible. It must gall them that they can't outlaw cinnamon.

Gian (2010-08-04 02:16:17)

The normal fasting sugar of 84 is typical of healthy people not on low-carb diet. The healthy low-carb eater may have fasting sugar of 100 and still have HbA1c of 4.4 % since his sugars don't increase much after eating. See HyperLipid blog for details. The thing is whether walking improves the HbA1c or equivalently postprandial sugar level. Fasting level per se is not much indicative of subtle problems. People may have abnormal postprandial sugars but still have normal (even 84) fasting.

The 50 Best Health Blogs (2010-08-09 20:38:50)

Jenny's Diabetes Update blog is excellent, and she does a great job of exposing bad science.

Josh (2010-11-28 00:30:25)

In my experience with high blood sugar (some cases of blurry vision last winter), aerobic exercise like jogging and walking was the most effective way for me to lower my blood sugar, eating less sugar simply didn't do the trick. I imagine it was still swimming around my bloodstream, and blood sugar is such a sensitive thing that once you're used to high blood sugar you forget what feels right and what feels bad. I'd say stopping it before it gets to that point is the best way to prevent developing more severe form of diabetes. But I'm no doctor or anything and that's just my opinion

Johno (2011-04-02 07:16:07)

interesting.. I usually control my high blood sugar by avoiding white carbs and exercising regularly.

## **Quantity Versus Quality of Research (2010-08-02 06:51)**

In [1] this interviewer Craig Venter says that sequencing the human genome has had "close to zero" medical benefits so far. I thought this comment was even more interesting:

The human genome project was . . . supposed to be the biggest thing in the history of biological sciences. Billions in government funding for a single project – we had never seen anything like that before in biology. And then a single person comes along and beats scientists who have been working on it for years.

The government-funded people used inferior methods, said Venter:

Initially, Francis Collins and the other people on the Human Genome Project claimed that my methods would never work. When they started to realize that they were wrong, they began personal attacks against me.

The government-funded research was high in quantity ("billions") but low in quality.

A similar story emerged from the Netflix Prize competition. Netflix had in-house researchers who had tried to do the same thing as the competitors for the prize: predict ratings. The algorithm they'd developed took two weeks to run. According to my friend David Purdy, one of the competitors for the prize managed to compute the same thing

in an hour, the same sort of speed-up that Venter is talking about. The in-house research was high in quantity (it had been going on for years) but low in quality.

From my point of view, a similar story comes from my self-experimentation. Working alone, with no funding, I found several ways to improve my sleep – avoiding breakfast, standing a lot, standing on one foot, eating pork fat, etc. In contrast, professional sleep researchers have found nothing that has helped me improve my sleep. There are hundreds of sleep researchers and they've received hundreds of millions of dollars in funding.

Why such big differences in outcome? I think it has to do with the price of failure. When the government-funded genome researchers used inferior methods, nothing happened. They'd already gotten the grant. In contrast, Venter's group got nothing until they succeeded. In the case of the Netflix in-house researchers, use of inferior methods cost them nothing; they still got paid. Whereas the prize competitors didn't get paid unless they won. Use of inferior methods would cause them to lose. In the case of the sleep researchers, lack of practical results cost them nothing. They could still have a successful career. Whereas to me, without practical results I had nothing.

Thanks to Paul Sas.

---

q (2010-08-02 08:46:37)

as far as the netflix prize goes, i'm sure if you counted the quantity of research from the losing teams, you'd far, far exceed the amount that a single in-house group could produce.

bgc (2010-08-02 09:46:33)

'Medical' researchers aren't even \*trying\* to make people better; they are trying to get funding. Most know nothing about medicine, even from their personal experience (because they are young and healthy) - and, BS aside, couldn't care less about medicine, only 'models' of disease. They want to, need to, impress the big names in their field - the people who decide who gets published, gets grants, gets jobs, promotions and prizes; but why should they want to impress sick people, or make their lives better? Where's the career advancement in that? Indeed medical researchers typically have no involvement with sick people in any way (except, maybe, to use them as experimental animals).

G (2010-08-02 09:51:20)

Teams with a grant or contract may feel that there is a stinging price of failure out of sheer professionalism if nothing else, but most workplaces are demoralizing enough to dull those kind of ethics and sensitivities. Especially in large companies.

ab (2010-08-02 10:10:23)

Some other possible reasons for Venter's success might come from relatively unique attributes vis a vis other contemporary scientists (from his autobiography): "Of all my memories, the most vivid is my total and absolute freedom. [...] During my childhood in California, my parents simply told me to "go play." Given this heady license, I discovered that I loved taking risks and facing challenges - a side of me that I have not yet outgrown." (p.5) "Every day of my childhood was a day of play and exploration that had a bigger impact on my development than anything I was taught in school [...] I think that one reason I was able to become a successful scientist was that my natural curiosity was not driven out of me by the education system." (p.7 - Venter says he was not very engaged in schooling, and often received poor grades) "I can also recall only too well how my folks constantly rewarded my better-behaved older brother, a mathematical prodigy. I, on the other hand, was threatened with

visits to the juvenile detention home to scare me into better behavior.” (p.9) Venter likes taking risks and isn’t too interested in what other scientists think. He also had an unconventional education (when he graduated from high-school, he didn’t go to university, he went surfing, and so on).

Phil (2010-08-02 16:55:11)

q makes a good point. The quantity of work in the netflix contest was enormous.

Phil (2010-08-02 17:03:10)

I just read the Venter interview...everyone should read it, it’s terrifically entertaining. Venter is a piece of work.

Dennis Mangan (2010-08-03 06:11:19)

Ever notice how in the discussion section of most scientific papers, you almost always read ”further research is warranted”? If it weren’t, the scientists who wrote the paper would be out of work.

LemmusLemmus (2010-08-03 07:06:38)

That’s right, Dennis. The usual paper published in a scientific journal answers all the questions in its field of study, but its authors routinely denigrate their own work by dishonestly suggesting that the field needs further study. They do that because suggesting your work is lower quality than it actually is happens to be a brilliant career strategy.

bjk (2010-08-03 07:18:51)

Does a dermatologist/oncologist/etc. who does research at a university ever see patients? It would seem like an easy side business. Just an outsider wondering aloud.

Aaron Blaisdell (2010-08-03 09:43:02)

The ”further research is needed” phrase irks me, too. I try to avoid it in my scientific publications, though sometimes a statement like it is needed to convey how preliminary a conclusion may be given a limited data set. It is probably more accurate and genuine to point out when an important, perhaps fundamental issue has so far received scant (inappropriately insufficient) attention. Seth and I have said something to this effect in our publications on behavioral variability.

Aaron Blaisdell (2010-08-03 09:45:02)

@bjk. I believe clinical faculty for the most part do see clients in a professional applied manner. I know the clinical psychology faculty in the psychology department at UCLA do have clients in addition to their own research programs. I think the faculty in the medical school do as well, though I don’t know if this is the case for all clinical faculty or only some.

Nathan Myers (2010-08-03 19:35:10)

bjk: Sorry, what planet are you writing from? Read Atul Gawande’s ”The Checklist Manifesto” to get a real sense of many of the systemic problems in American medicine, and the challenges real physicians face. The problems are not that physicians don’t know or care much, it’s that knowing and caring way more than you do are nowhere near enough to overcome the problems, which are many, varied, deep and, frankly, terrifying.

## **The FBI Gets It Backwards (2010-08-03 04:24)**

The FBI [1]recently sent a letter to the Wikipedia Foundation saying it should take down an image of the FBI shield – that is, a picture of an FBI badge – and threatened legal action. Supposedly the Wikipedia Foundation was breaking a law by posting it.

The Wikipedia Foundation responded that

[2]The law cited in the F.B.I.'s letter is largely about keeping people from flashing fake badges or profiting from the use of the seal

If nobody knows what an authentic badge looks like it becomes easier to fool people with a fake badge.

1. [http://www.nytimes.com/2010/08/03/us/03fbi.html?\\_r=1&hpw](http://www.nytimes.com/2010/08/03/us/03fbi.html?_r=1&hpw)

2. <http://www.law.cornell.edu/uscode/18/701.shtml>

---

laurie (2010-08-03 09:26:15)

Generally love your posts, but..... If counterfeiters learn how to make more authentic badges, even more people will be fooled..... IJS

Seth Roberts (2010-08-03 12:07:48)

IJS, the sensible way to deter counterfeits is to make the design hard to copy.

Vic (2010-08-04 01:41:06)

federal bureaucracy of investigation

### **High-End Kombucha (2010-08-03 11:44)**

I'm in Vancouver for the Joint Statistical Meetings. The local Whole Foods sells a small bottle of kombucha for \$22. It's in a refrigerator in the health section, next to flaxseed oil. I asked an employee how this kombucha was different than the kombucha sold in the drinks section. More potent, she said. The next time I give someone homemade kombucha I'll say that it sells for \$22 in Canada.

Kombucha, let me repeat, is extremely easy to make. Tea + sugar + store-bought kombucha + three weeks.

---

Aaron Blaisdell (2010-08-03 12:14:27)

Thanks for the reminder that I've got to get my next batch of kombucha going.

Alex Chernavsky (2010-08-03 14:17:30)

Making kombucha is fun, because you get to experiment with various permutations. I've made kombucha with raspberry leaf tea and with yerba mate tea. I've done second-fermentations with fruit juice (this makes it more carbonated, if you seal it in air-tight bottles). Not all experiments turn out well - the version with brown sugar didn't taste so good.

David (2010-08-03 17:25:22)

I'm really glad I make my own. You can't find it in the stores now (around Austin TX anyway). Apparently the alcohol content can go above .5 % when it ferments in the bottle.

q (2010-08-04 09:02:24)

Night guards don't prevent grinding, and they only barely protect your teeth. In addition, my experience says that wearing a night guard encourages stronger grinding (because it's less uncomfortable to grind), which would be even more true of the drug store variety (which are softer). For a lot more information on the frustratingly bad state of understanding of bruxism, see here: <http://www.is.wayne.edu/mnissani/bruxnet/advice.htm> Unfortunately, there's not a good community now for people with the problem, and that page is old, so nobody (at least, nobody I know of) is pushing forward our understanding.

dearieme (2010-08-05 01:37:18)

American life expectancy is notably lower than British: I've often wondered if Americans are paying for their obsession with dentistry.

Dean (2010-08-05 19:40:15)

The NTI device is a type of night guard that is worn on the front teeth only. It was approved by the FDA in 2001 for migraine prevention. I never had migraines but I purchased it because I wanted a hard plastic night guard that would leach less toxins. I have used it every night for over three years and don't even notice it. [www.headacheprevention.com](http://www.headacheprevention.com)

## "Give Us Our Dammed Data" (2010-08-05 09:57)

[1]A large painting by Regina Holliday called "Give Us Our Dammed Data" shows 17 book authors, each holding the book they'd written about struggle with the health care system. For example, Lisa Lindell, who wrote [2]108 Days, which describes

her successful campaign to keep her husband alive. She was astounded when she read her husband's medical record. The nurse's notes specified that she had an "unreasonable" belief that her husband should live.

1. <http://e-patients.net/archives/2010/08/give-us-our-dammed-data-regina-holliday.html>
2. <http://www.108days.com/home.html>

---

Regina Holliday (2010-08-18 05:56:05)

Thank you Seth for re-posting the piece "Give Us Our Dammed Data." Especially, thank you for high-lighting Lisa Lindell. She is a wonderful woman who has had a very hard journey.

Don't miss these great links! (2010-08-26 06:08:21)

[...] Seth Roberts reports on the troubles that the developed world is still having with its purportedly advanced and sophisticated health system. I won't get into detail as I find it too depressing. [...]

### **The Potti Scandal (2010-08-05 12:54)**

A Duke University associate professor named [1]Anil Potti who does cancer research turns out to have fabricated numerous details on applications for research money. The first fabrication to be noticed was that he had received a Rhodes Fellowship.

[2]This is interesting because Duke had previously investigated him:

Late last year [2009], there was a crescendo that caused Duke to stop clinical trials on three of his research programs, two involving lung cancer and one involving breast cancer. In each program, Potti was giving patients chemotherapy – determining what drugs might work best and in what dosage – based upon his genome research.

In January Duke let these programs resume after an internal review. [emphasis added] And these are the precise programs where Duke – for the second time – has now suspended new [emphasis added] enrollments. . . . In an official statement on the winter review, Duke said it had determined Potti's approaches were "viable and likely to succeed."â€?

Someone who appears to be a total fraud is called to Duke's attention – and [3]they find him innocent! This is what happened with the SEC and Madoff and [4]Memorial University and Ranjit Chandra. Chandra's research assistant, a nurse, told Memorial something was wrong and Memorial did nothing, or very little. Chandra then sued the nurse. He went on to write the paper that Saul Sternberg and I investigated.

Someone lies on his resume – it happens. That a prestigious institution like Duke let him continue to get away with it, possibly endangering patients and surely wasting vast resources, after it's brought to their attention – not so well-known. So far, [5]the New York Times has only covered the false-resume side of the story. You may recall [6]how poorly Duke responded to charges against its lacrosse team.

As this unfolded, [7]Duke had the following headline on its website: "Crisis management 101: What can BP CEO Hayward's mistakes teach us". From a CNN story in which a Duke expert was quoted.

[8]Duke.Fact.Checker notes that Potti's papers have at least 26 co-authors! Many with M.D.'s, who have or will tell thousands of trusting patients "you should take Drug X". The patient endangerment is not trivial.

[9]The Cancer Letter on Potti. [10]Another issue of The Cancer Letter about it.

---

Tom in TX (2010-08-05 16:44:54)

I read this one years ago: [http://www.amazon.com/BETRAYERS-TRUTH-FRAUD-DECEIT-SCIENCE/dp/0712602437/ref=sr\\_1\\_2?ie=UTF8&s=books&qid=1281051671&s=8-2](http://www.amazon.com/BETRAYERS-TRUTH-FRAUD-DECEIT-SCIENCE/dp/0712602437/ref=sr_1_2?ie=UTF8&s=books&qid=1281051671&s=8-2) It told how some scientists had faked credentials and research to advance their careers and earn \$ \$ \$ \$.

G (2010-08-05 17:57:02)

â€œCrisis management 101: What can BP CEO Haywardâ€™s mistakes teach us...â€? ...About Covering Our own Butts more Effectively? Step 1: don't admit any failure unless it's absolutely unavoidable. Seems like primate social behaviour to me...

Jack (2010-08-21 15:20:36)

Duke's response to its lacrosse case was just the opposite. The craven administration fell to radical faculty pressure and essentially judged the entire team, guilty until proven innocent.

### **The Joan Evans Scandal (2010-08-05 18:40)**

I came across [1]the Potti scandal while trying to find out about the trouble faced by a woman named Joan Evans because a statistical analysis couldn't be reproduced. Robert Gentleman had mentioned this in a talk at the Joint Statistical Meetings in Vancouver. Look for The Cancer Letter, Gentleman said.

I now realize that Joan Evans is Joe Nevins, who co-authored a major paper with Potti.

Speaking of Potti, members of the Duke administration [2]are said to "have warned people not to even Google the name â€˜Anil Potti,â€™â€?

1. <http://www.blog.sethroberts.net/2010/08/05/the-potti-scandal/>
2. [http://cancerletter.com/tcl-blog/copy150\\_of\\_whats-going-on-with-nih/CL36-28.pdf](http://cancerletter.com/tcl-blog/copy150_of_whats-going-on-with-nih/CL36-28.pdf)

---

### Unnoticed Conflicts of Interest (2010-08-06 11:52)

Gary Taubes pointed to [1]this PNAS paper about climate change and noted that one of the authors, Stephen Schneider, had a big non-financial conflict of interest: If it turns out the whole argument is wrong, he looks like a fool. The accompanying statement ("The authors declare no conflict of interest") is, if taken to mean the authors have no conflict of interest, wildly inaccurate. Readers unaware of Schneider's history wouldn't know this.

I came across a similar example today. A reader of this blog wrote extensive criticisms ([2]here and [3]here) of the idea that [4]prenatal ultrasound may cause autism. He believed Caroline Rodgers, my source for that idea, misrepresented the evidence. In particular, Rodgers pointed to a study that found ultrasound disturbed neuronal migration in mouse fetuses. She said it supported her idea. The reader disagreed, saying,

The bottom line for me is that Dr. Rakic (from the mouse study) clarified, "Our study in mice does not mean that use of ultrasound on human fetuses for appropriate diagnostic and medical purposes should be abandoned. Instead, our study warns against its non-medical use." Yes. Okay. No more boutique, keepsake ultrasounds. Great. But for Rodgers to skew this data (along with the FDA's and others') into claiming that ultrasounds under the care of an Obstetrics professional (and for medical use) are causing autism is disingenuous at best, unethical propaganda for the Midwifery Way at worst.

The reader is a professor who teaches composition. Maybe an English professor. He or she takes Rakic seriously, where I completely ignore his statement because of a conflict of interest. If Rakic questions "appropriate" ultrasound, he will be attacked in many ways, making his life unpleasant. I have no idea whether this swayed Rakic, but he would be only human if it did.

Of course developing neurons are unable to distinguish appropriate and inappropriate ultrasound. Rakic's statement is ridiculous as Rakic and all insiders (neuroscientists) know, I believe. All insiders know that there are dozens of examples where findings from mouse brains have turned out to be true for human brains, in spite of the many differences between them, and that there are thousands of grant proposals in which mouse brains are claimed to be a worthwhile model for human brains. All insiders know this, realize the pressure on Rakic to say what he said, and, like me, just ignore it. As far as I can tell, Rakic pays no price for misleading outsiders because the outsiders don't know they are being misled. (Just as with political lobbying: the public doesn't understand what's happening.) The composition professor doesn't know this, as far as I can tell.

Rodgers is not claiming that ultrasounds "are causing autism". She is saying they might cause autism, that there are several reasons to think so, and therefore (a) the ultrasound-autism idea deserves further scrutiny and (b) ultrasounds should be avoided as much as possible until more is known.

4. <http://www.blog.sethroberts.net/2010/05/24/autism-and-prenatal-ultrasound-more/>

---

Alex Chernavsky (2010-08-06 12:33:17)

Is Gary Taubes's analysis available on-line somewhere? I couldn't find it through Google.

Stephen M (Ethesis) (2010-08-06 21:00:09)

What is interesting is the paper I saw comparing ultrasounds and the loss of diagnosis quality with them vs. patients who were not receiving them. At present ultrasounds are performed for entertainment value, not diagnostic value, and as a revenue source. Interesting discussion, all in all, especially in context.

David (2010-08-06 23:27:04)

Perhaps Rakic changed the wording based on a referee's request. I'm not sure why some people think the only possible effect of ultrasound is thermal. It is well known that ultrasound can produce light (sonoluminescence), which is surprising in the same way it would be if a light breeze would occasionally ignite a fire. In controlled studies of this phenomena, the spectra of the light generated in a single ultrasonically driven collapsing bubble was measured, and the spectra appeared to be the tail of a black body spectra suggesting a transient temperature in the tens of thousands of degrees K. In any case, if the sound waves can produce light it isn't unreasonable to expect chemical changes too, and in fact books (Cavitation Reaction Engineering) have been written about its use chemical processes. Why anyone should think it is 100 % safe for a fetus and no further study is needed is mystery to me. This 1988 paper considers the safety issue of ultrasound induced cavitation: <http://iopscience.iop.org/0031-9155/33/11/003/pdf/pbv33i11p1249.pdf>

Seth Roberts (2010-08-07 15:36:19)

Alex, Taubes conveyed this to me by email. David, that's a good point about transient temperature. Rather than produce uniform heating, ultrasound may produce a power-law distribution of heating with a tiny fraction of places getting very hot. Only if one of those very hot places is important is any damage done. So a given dose of ultrasound might do no harm at all for 99 usages (with 99 fetuses) but then badly damage the 100th fetus. Conventional statistics are bad at picking up such effects; they are more sensitive to treatments that change each individual the same amount.

David (2010-08-08 12:00:31)

I suspected the imaging ultrasound was probably done at power levels significantly lower than the levels mentioned in that 1988 paper where light was generated during tests, but I was curious to check. It appears to be the case, at least 10 to 20 times less than the .5 to 1 W/cm<sup>2</sup> threshold for sonoluminescence mentioned: "At the opposite end of the ultrasound-intensity spectrum, much lower magnitudes of 1 to 50 mW/cm<sup>2</sup> are used to drive diagnostic devices that noninvasively image vital organs, fetal development, peripheral blood flow, and metabolic bone diseases such as osteoporosis<sup>7</sup> and, coincidentally, to evaluate fracture callus during healing<sup>8,9</sup>. The intensity level used for imaging, which is five orders of magnitude below that used for surgery, is regarded as nonthermal and nondestructive<sup>10</sup>. Nevertheless, low-intensity ultrasound is still a mechanical force, and it therefore holds the potential to influence bone mass and morphology through bone tissue's strong sensitivity to physical stimuli."

Hal (2010-08-09 17:30:02)

Every time a scientist publishes, if the argument turns out to be all wrong, he risks looking like a fool; but we don't consider that a conflict of interest. So I'm sure Taubes means something more. This paper claimed that the most actively publishing researchers in the field believe in anthropogenic climate change; also true of the most respected. I guess the criticism is that Schneider believes in ACC, hence if the paper is all wrong then that would mean he doesn't publish very much and is not respected in his field. But those propositions are objectively false. What is Taubes' angle that makes Schneider a fool if wrong?

Seth Roberts (2010-08-09 17:43:30)

Hal, by "wrong" Taubes meant wrong about global warming, not wrong about the thesis of the paper.

Patrik (2010-08-11 20:49:55)

Great post, Seth. My wife and I just had our first child and I brought up the question of ultrasounds with our obstetrician. Our obstetrician's response: "They are just sound waves. How could that hurt?" I was stunned by her obvious ignorance, obtuseness and lack of any introspection – as I discussed this with my wife afterwards, I too noticed an "Unnoticed Conflict of Interest" – namely, this obstetrician will never even consider the hypothesis that ultrasounds could be damaging or injurious because if she were to and recommend against ultrasounds in case where they are not medically needed, she might open herself up to litigation as hitherto she has been doing just that. She is simply stuck in this intellectual trajectory - where she is aware of it or not. We passed on all ultrasound that were not medically indicated, as well as the keep sake-y 4D type, which I would have loved to have seen, but wasn't worth the unknown uncertainty.

Mark (2010-08-23 16:20:11)

How can you advocate avoiding ultrasounds "as much as possible until more is known" without any data on what the harm caused by that alternative might be? Are ultrasounds never used for a legitimate diagnostic/harm-preventing purpose? By "as much as possible" do you mean in any case where the harm of giving the ultrasound is less than the harm of not giving it? But the very thesis of this post is that the former is unknown. I am very confused by your recommendation; it's vague, and to the extent it can be quantified doesn't appear to be very reasonable.

Paul liberti PhD (2010-11-21 21:06:46)

I was searching rates of autism increase and use of ultrasound in pregnancy. I did that because I have been working with a Chinese women who was pregnant and I was surprised to learn no use of ultrasound. (she is economically upper class). Based on that (plus my interest - grand son with autism) it occurred to do some searching i see there is a body on literature on concept. If they are not using ultrasound in China or other countries has anyone looked for correlations?

## **Too Much Murder in The New Yorker (2010-08-06 13:00)**

The title of [1]Nicholson Baker's chat about his New Yorker video-game article is "My Son is Killing Me". Which is a far better title than the print title of the article: "Painkiller Deathstreak". Why not give the article the much better title? Because another article in the same issue, a profile of Gil Scott-Heron, is called "New York is Killing Me." Too late.

1. [http://www.newyorker.com/online/2010/08/09/100809on\\_audio\\_baker](http://www.newyorker.com/online/2010/08/09/100809on_audio_baker)

---

Mark (2010-08-08 21:06:36)

Both those titles are terrible. A decent title would be "Violent video games can help parents bond with their children." The title of anything on the web should be completely, utterly, boringly descriptive of the content, using the most ordinary language possible ("children," not "kids," for instance). On the web nobody wants to have cleverness or mystery meat up front. There's no time for that. If the title of the Google result or Google News result is not crystal clear and accurate, then bye-bye. It doesn't matter how clever you are if nobody reads you. With video and audio it's even more important, because you cannot skim the content. If you have your own blog and it's not a money-making venture, you can do whatever you want, I suppose. But if you're being paid for content, then the editor needs to see to it that interested readers can find your piece and recognize that

it would be of interest to them.

Seth Roberts (2010-08-08 23:40:39)

Mark, I don't think Nicholson Baker is worried about attracting readers via Google.

### **Vitamin K2 and Fermented Foods (2010-08-07 15:29)**

We evolved to like sour foods, foods with complex flavors, and umami foods, I believe, so that we would eat more bacteria-laden food. Why do we need to eat such food? Perhaps to get enough Vitamin K2. Vitamin K1 and Vitamin K2 are quite different. [1]A brief introduction:

The term vitamin K refers to a group of compounds that have a 2-methyl-1,4-naphthoquinone ring in common but differ in the length and structure of their isoprenoid side chain at the 3-position. The 2 forms of vitamin K that occur naturally in foods are phyloquinone (vitamin K<sub>1</sub>) and the group of menaquinones (vitamin K<sub>2</sub>, MK-n), which vary in the number of prenyl units. Whereas phyloquinone is abundant in green leafy vegetables and some vegetable oils, menaquinones are synthesized by bacteria; therefore, they mainly occur in fermented products such as cheese.

[2]A 2004 study found a huge protective effect of K2:

The scientists at Osaka City University gave 21 women with viral liver cirrhosis [which greatly increases your chances of liver cancer] a daily supplement of 45mg vitamin K2 (menaquinone) for a period of two years. A group of 19 women with the disease received a placebo for the same time. Liver cancer was detected in only two of the 21 women given vitamin K2 but nine of the 19 women in the control group, reports the team in today's issue of [3]JAMA (292:358-361). After adjustment for age, severity of disease and treatment, the researchers found the women receiving vitamin K supplementation were nearly 90 per cent less likely to develop liver cancer.

A huge effect, suggesting that K2 is necessary for a repair system to work properly. [4]This recent article is more support for the idea that K2 protects against cancer. The effect is weaker, perhaps because there was less damage needing repair.

1. <http://www.ajcn.org/cgi/content/full/87/4/985>

2. <http://www.nutraingredients.com/Research/Vitamin-K-found-to-protect-against-liver-cancer>

3. <http://jama.ama-assn.org/cgi/content/full/292/3/358>

4. <http://www.ajcn.org/cgi/content/full/91/5/1348>

---

vic (2010-08-07 18:19:06)

you should include the caveat that spurious huge effects are easy to get with small samples

Seth Roberts (2010-08-08 06:23:42)

Vic, the one-tailed p value for the liver-cancer result is 0.02. From which I conclude that the reduction is unlikely to be bogus (it's unlikely that the two groups were the same) but could easily be a lot less than 90 %.

allan (2010-08-08 17:34:38)

Seth, You realize that bacteria fermented K2 (natto, sauerkraut, cheese) is generally of the MK-7 variety, while K2 found in animal products such as liver and butter is of the MK-4 variety. <http://www.westonaprice.org/abcs-of-nutrition/175-x-factor-is-vitamin-k2.html> #fig4 The effects are probably similar, but studies done on MK-4 don't necessarily provide evidence for consumption of fermented food.

Seth Roberts (2010-08-08 18:01:11)

I didn't know that. Thanks for pointing that out. I found the following in the article you linked to:

Future research will have to clarify whether the vitamin K2 synthesized by animal tissues and by bacteria are interchangeable, whether one is superior to the other, or whether each presents its own unique value to our health."

The Japanese liver-cancer study I describe doesn't make clear what sort of K2 they used. The article says: "The treatment group received 45 mg/d of vitamin K<sub>2</sub> (Glakay, Eisai Co, Tokyo, Japan)."

allan (2010-08-09 10:32:20)

Seth, I couldn't figure out what sort of K2 the Japanese study used either. I assume that it is MK-4.

Jen (2010-08-09 11:09:35)

The vitamin K2 used in the Japanese liver cancer study was Glakay. This product sheet [http://www.eisai.jp/medical/products/di/-EPI/GLA\\_SC\\_EPI.pdf](http://www.eisai.jp/medical/products/di/-EPI/GLA_SC_EPI.pdf) says that Glakay contains menatetrenone, which is the same thing as menaquinone-4, ie, the form of K2 used was MK-4.

Seth Roberts (2010-08-09 11:42:28)

thanks, Jen, that's very helpful.

Don't miss these great links! (2010-09-02 06:06:45)

[...] Seth Roberts notes that "we evolved to like sour foods, foods with complex flavors, and umami foods" so that we would eat more bacteria-laden food. Seth asks "why do we need to eat such food?" And he answers "perhaps to get enough Vitamin K2." Find out more here. [...]

John (2010-09-19 11:21:01)

<http://www.technologyreview.com/biomedicine/26178/page1/> Thought this article on transplanting gut flora might be interesting ;-)

## Journal of Participatory Medicine (2010-08-08 08:06)

The Journal of Participatory Medicine has released two issues ([1]first, [2]second). They help explain what participatory medicine means. The best article I have found among them is called [3]"What It Will Take to Embrace Participatory Medicine: One Patient's View" by Kate Lorig. Here is one bit:

In one of my regular clinics, I am met with a sign that tells me that if I am a half hour late, my appointment will have to be rescheduled. I once asked what would happen if I were not seen in a half hour and was

told to sit down and wait. Last year while waiting for scheduled appointments I read five full-length books (five hours each).

But overall the articles, even this one, are long on generalizations and short on specifics.

### **The Power of Hobbyists and the Impotence of Professionals (2010-08-08 23:58)**

One theme of this blog (I hope) is that [1]it's insider/outside – people with the knowledge of insiders but the freedom of outsiders – who can produce real progress. Ordinary insiders have the necessary knowledge but not the necessary freedom; ordinary outsiders have the freedom but not the knowledge. [2]This article of mine makes this point in detail.

A similar point was made in a comment on [3]a blog post by George Packer, the New Yorker writer. Packer had written an article about the U.S. Senate and his post was about how he'd written it. Someone commented:

I think Packer covered Washington with the refreshing take of a short-timer, one who didn't have to make his living or sustain his career there. The disservice inherent in careerism connects with the Senate's paralysis à la Tom Harkin's quote about senators spending more than half their time fund-raising, one of the most troubling realities of the story. (Years ago, Bill Clinton said the House was ineffective because the members were "sleep deprived" from having to attend fundraisers every night. If a six-year term requires half-time fund-raising, imagine what a two-year term requires.)

I think the subtext is that journalistic long-timers, unlike short-timers like Packer, must spend a lot of time nurturing relationships, and this makes it harder to write unpleasant and unflattering truths.

Professional scientists spend a lot of time fund-raising, which in their case means applying for grants. A typical grant lasts three years. During those three years, because they need another grant when the current one runs out, they must publish several papers, recruit several grad students or post-docs (to do the heavy lifting), and avoid pissing off anyone in their field (because they might review your papers or grant proposals). Just as members of the House of Representatives never ever want to talk about how the constant need for money cripples them – it would make their job seem irrelevant and them appear impotent – neither do professional scientists.

1. <http://www.blog.sethroberts.net/2009/01/24/not-the-same-study-section-how-the-truth-comes-out/>

2. <http://www.sethroberts.net/articles/2010%20The%20unreasonable%20effectiveness%20of%20my%20self-experimentation.pdf>

3. <http://www.newyorker.com/online/blogs/georgepacker/2010/08/reporting-the-senate.html>

---

disgruntledphd (2010-08-09 02:59:55)

Hey man, like the blog and the major theme of your post. However, scientists complain constantly about the grant treadmill, read any blog over at science blogs or scientopia and you'll find at least three per day. That being said, its normally people who are new to a field who come up with the revolutionary theories, so i do see where you are coming from there. Keep up the good work.

Seth Roberts (2010-08-09 06:34:58)

thanks, disgruntledphd. I've heard lots of complaints from scientists about the need for constant grant writing – as you say, three per day on ScienceBlogs – but I've never heard any of the complainants say how much it had inhibited their work. Maybe I'm not reading ScienceBlogs carefully enough. If you know of any examples, I'd be grateful if you'd point me to one because it's highly relevant to my work.

Elizabeth Molin (2010-08-09 06:56:09)

This <http://www.boingboing.net/2010/08/08/nope-high-fructose-c.html> #more is only peripherally related to your theme, but I have been wondering whether you were familiar with boingboing and wanting to bring it to your attention if you're not.

### **Vitamin Absorption With and Without Accompanying Meal (2010-08-09 11:56)**

[1]This pharmaceutical-company handout (thanks, Jen!) about their Vitamin K2 includes a description of an experiment where subjects took the tablets on an empty stomach or with a meal. The variation in stomach contents made a huge difference: absorption, measured by blood concentration, was 7 times higher when the K2 was taken with a meal.

This is going to change how I take supplements, such as selenium, for the rest of my life. I've often taken them on empty stomach. I never realized the effect of doing so could be so large.

1. [http://www.eisai.jp/medical/products/di/EPI/GLA\\_SC\\_EPI.pdf](http://www.eisai.jp/medical/products/di/EPI/GLA_SC_EPI.pdf)

---

Alex Chernavsky (2010-08-09 14:03:44)

Yes, but perhaps the effect is reversed for other nutrients besides K2.

Jen (2010-08-09 20:34:23)

Fat-soluble micronutrients such as vitamin K are absorbed to a much greater extent when they are consumed with fat. Most meals contain some fat. This may explain the result. Nature conveniently packages its K2 MK-4 along with plenty of fat. Foods rich in MK-4 include grass-fed butter, egg yolks, liver, other organ meats, etc.

Christina (2010-08-10 03:15:57)

Do you routinely take Vitamin K2, or any vitamin supplements? I agree with Jen - vitamins naturally come packaged with necessary things to absorb them (ie fat). Seems to me the focus should be on eating whole foods that contain the vitamins we need, rather than isolating vitamins individually (an unnatural state) and trying to find ways for the body to absorb them.

tom (2010-08-13 11:07:54)

So would it work as well to take fat-soluble vitamins with fish oil etc..?

The Listless Lawyer » Closing Tabs: Weight Loss Edition (2011-06-18 04:48:27)

[...] Vitamins should always be taken with a meal. [...]

### **A Smug Professor (2010-08-09 19:35)**

The Chronicle of Higher Education website has a blog about "ideas, culture, and the arts [that] features some of the best minds in academic and policy circles". One of the bloggers - Gina Barreca, a professor of English and Feminist Theory at the University of Connecticut and [1]a humorist - [2]wrote about being older than her students:

I think about the fact that my students and I no longer listen to same music or revere the same actors; I wonder about the implications of the fact that even some of the smart ones like I Hope They Serve Beer in Hell.

I pointed this out to Tucker Max (author of I Hope . . . ). He replied:

I like how she implies that some of her students are stupid. Great prof.

I thought that was a great point. I asked if I could use it on this blog. He agreed, and added:

The other thing about her statement is that she implicitly scoffs at the notion that someone smart could-gasp-DISAGREE with her. It doesn't even occur to her that she might be wrong, that her worldview might be the one that needs examining. To her, nothing legitimate can exist outside of her prejudices and opinions. Even the idea that it could is rejected out of hand.

I replied:

Yeah, she hasn't read your book but it must be ridiculous. Of course. I praised the film Gladiator (pre-Oscar) to someone I knew and she said, to a friend, that this made me an inferior person. Because Gladiator was popular, it must be bad. If I liked it, there was something wrong with me.

Tucker replied:

Exactly-the idea that THEY might be wrong doesn't even occur to them. Like it's not even in the realm of possibility.

These are the same people that Nassim Taleb rails against, and the same people who read Socrates, and completely miss the point, but still praise it because they think they're supposed to. And these are the people that the internet/the age of connectivity is destroying. Because you can't hide behind status anymore. Results are measurable, and everyone is on the playing field now.

I agree.

1. <http://www.ginabarreca.com/>

2. <http://chronicle.com/blogPost/Why-College-Professors-Dont/8765/>

---

Paul (2010-08-09 20:57:10)

Wait, did I read that correctly- Seth Roberts corresponds with Tucker Max? Seth, if that is true, you really need to let more people know. It could drive a whole new demographic to your site, one that is ready to hear about the virtues and possibilities opened up by self experimenting. I mean, any one who is a fan of Tucker Max, being suspicious of the received wisdom concerning men, women, sex, romance, and love, would also be likely to be suspicious of the received wisdom in other areas. Some of those, having already been conducting experiments of sorts in the Venusian arts, might readily take to self experimentation in other areas as well. You should correspond with Roissy.

Tom (2010-08-09 23:08:29)

Um...huh? In any event, Seth, your point is perfectly illustrated at <http://rawfoodsos.com> where a web designer named Denise Minger has completely destroyed T. Colin Campbell (of *China Study* fame.) Seriously...after just a few blog posts, there is nothing left of him but a smoking crater.

MT (2010-08-09 23:18:51)

You two read like bitter old ladies – taking an essay intended to humorously lampoon the generation gap, labelling it smug, then invoking Socrates as a defense. It's like an awkward satire. What are the measurable results Tucker is referring to that prevent this prof from "hiding behind status" while he has been liberated by internet connectivity (assuming, ridiculously, that we take her humorous essay as seriously as you have)? If there are measurable results why don't you cite them instead of posting yourselves agreeing with each other? This post is like two people in a political party griping about how the people in another political party can't consider the possibility they are wrong – while not discussing that they themselves might be wrong, or providing anything other than subjective statements of opinion to support their view. Why not supply some sort of substantive insight into how it is that Tucker's book is "right" (whatever that would mean), or how it represents progress, or whatever else you think it does that would back up the perspective you are supposedly defending as "right" in contrast to this humourist's "wrong."

LemmusLemmus (2010-08-09 23:42:49)

Seconding MT.

Mark (2010-08-10 02:31:10)

At least one thing she's definitely "wrong" about: her website is truly hideous and does not make me want to spend any time at all learning anything about her. But maybe that's a side effect of her ageism, purposely having a website that looks ten years younger than it is.

Nancy Lebovitz (2010-08-10 03:34:09)

Your blog has mysteriously turned medium green with an olive green stripe at the top– this makes the main page harder to read. The comments are still at the pleasant old format of white with a green border– the main page seems to have lost the

white overlay, since I note that it's got an olive green stripe at the top which doesn't interfere with the text.

john (2010-08-10 06:04:17)

Is there a theory about why white men are magic and white women pedestrian - along with the rest of mankind. What's going on there? Why such an incalculable distance between what white men do and have done and white women. Some people expect women and others to do something useful - but it's just not happening, is it?

B Riley (2010-08-10 06:25:07)

You two jump to conclusions as quickly as the prof you criticize! She clearly has an initial dislike of Max's book, but there are multiple implications of her students liking it even though she doesn't. These range from her students being stupid, her students being unexposed to better material though smart, or that she is passing up something good because of a knee-jerk reaction. If that sentence can plausibly be read as her pondering whether she is wrong, you can't say that thought isn't "even in the realm of possibility".

Seth Roberts (2010-08-10 08:12:33)

MT, one measurable result is book sales. Another is name recognition. Nancy, thanks for pointing that out. B Riley, yes, that is a fair criticism. She does muse about the popularity rather than take it as an example of the world going to hell. As you say, one of several possible explanations is that she is considering the possibility that she is wrong. I think it's far more likely that she has made up her mind about the book (which she hasn't read) and now is deciding what it means that "even" "smart" students like it. It is a harsh judgment on X to wonder why "even some smart people" like X. And if X is a book you haven't read, there is a lot of "I must be right" involved, even if it doesn't rise to absolute certainty.

G (2010-08-10 08:29:26)

I think I agree with this except... what was good about *Gladiator*? I thought it was boring; like a long episode of Xena Warrior Princess.

Seth Roberts (2010-08-10 08:42:09)

G, I liked the raw emotion Crowe displayed in many scenes. An attractive gloominess permeated the picture.

LemmusLemmus (2010-08-10 10:34:26)

Seth, criticizing A for criticizing B when A has not read B's books seems self-defeating when "A has not read B's books" is a mere assumption.

Seth Roberts (2010-08-10 11:44:24)

LemmusLemmus, if she's read more than 1 % of the book I am happy to apologize.

Phil (2010-08-10 15:08:16)

I agree with MT on this. Did you not understand that Barecca was joking? Hey, and you know what? I didn't like the movie Dumb and Dumber...I guess that makes me a bad person, right? Obviously I'm a snob, only an elitist snob would dislike Dumb and Dumber; after all, it was a very popular movie. Any time a well-educated person expresses dislike or disdain for something popular, it's because they're a snob. What other reason could there possibly be?

Seth Roberts (2010-08-10 17:51:07)

Phil, joking about what?

John (2010-08-11 00:02:25)

Have you asked Barreca if she has actually read 1 %+ of Tucker's book? Have you asked for a comment or clarification? Publicly labelling her as obstinate and stubborn in her worldview without finding out her point-of-view seems like quite a jump and one hell of an assumption. Given that she is a 'humourist', there's also the chance that she was making light of the age gap with a facetious remarkâ€”exactly how I did yesterday when I said that I cannot possibly be a mentor to someone who reads and

enjoys Dan Brown novels.

Phil (2010-08-11 09:11:46)

By the way, I'm not entirely sure Bareca was referring to the book, rather than the movie, for which you can watch the trailer [1]here.

1. <http://www.youtube.com/watch?v=FXTmNApNrxM>

Phil (2010-08-11 09:12:33)

Seth, joking about judging her students' intelligence by the fact that they like the book or movie "I hope they serve beer in hell." That was a joke.

Seth Roberts (2010-08-11 09:37:38)

Phil, thanks for explaining that. I read it differently: she really does wonder what it means that even the smart ones like a book she considers stupid. It vaguely resembles a Polish joke, I suppose, with I Hope They . . . in the place of the Polish people. John, to say "I cannot possibly be a mentor to someone who reads and enjoys Dan Brown novels" strikes me as humorous. You seem to be making fun of your dislike of Dan Brown. Whereas to say "I'm amazed that even some of our smart employees like Dan Brown" doesn't strike me as humorous at all. If she had used a smiley face after her sentence I would agree you, however. For example, "I'm amazed that even some of our smart employees like Dan Brown :)" comes across much differently than the sentence with no smiley face.

MT (2010-08-11 23:12:28)

Book sales and name recognition tell us nothing about the relative merits of the positions taken by the prof and Tucker. They tell us something about the relative popularity. Which is about as meaningless as it is possible to get. Or should we assume The China Study is right and Denise Minger's criticisms are inaccurate because she isn't as well known as Campbell? And Gary Taubes should shut up because Dean Ornish has sold more books? Perhaps you could add that Tucker has a law degree as a measurable result – and he went to Duke too. All of which is beside the real point – the author was making casual fun of the generation gap, and the critique is misplaced.

Alex Chernavsky (2010-08-12 03:48:26)

And speaking of Denise Minger, I'd be interested hearing in Seth's professional opinion about Denises's re-evaluation of Campbell's China data. <http://rawfoodsos.com/2010/08/06/final-china-study-response-html/> It seems impressive to me, but I don't know correlations from coriander.

Seth Roberts (2010-08-12 07:30:43)

Alex, I haven't looked closely at Minger's analyses. So I can't give an informed opinion.

Alex Chernavsky (2010-08-12 10:58:49)

Seth, I didn't assume that you had read her analysis – I was suggesting that you might be interested in it, given your past posts about Gary Taubes and about non-professionals doing significant work.

## **Animal Cognition Paper Retracted (2010-08-10 09:08)**

A paper in Cognition by Harvard professor Marc Hauser and others [1]has been retracted:

The paper tested cotton-top tamarin monkeys'™ ability to learn generalized patterns, an ability that human infants had been found to have, and that may be critical for learning language. The paper found

that the monkeys were able to learn patterns, suggesting that this was not the critical cognitive building block that explains humans'™ ability to learn language.

The note to be published about the retraction says almost nothing about why: "An internal examination at Harvard University . . . found that the data do not support the reported findings."

Several other papers from Hauser's lab have also been questioned.

The usual explanation would be that someone in Hauser's lab made the results better than they actually were. A co-author of the paper said Hauser had told him "there were problems with the videotape record of the study".Â That's consistent with the usual explanation: Someone edited the tapes (via deletions) to make the results appear better than they were. But it's also possible that many tapes are missing, which might be an accident. When The New Yorker archives were moved from Building A to Building B several years ago, much of the archives was lost.

Thanks to Aaron Blaisdell.

VS (2010-08-11 09:24:45)

This is an interesting article. A PhD student, studying the effects of microwaves on human health, improved his sleep by moving his computer router away from his bed: <http://www.thestar.com/news/gta/article/841732-fiorito-our-heads-in-a-microwave-oven>

G (2010-08-11 12:57:06)

That little Taleb article - that's one of those utterly obvious things that are widely overlooked. There was a documentary in the UK about how all the outgoing Labour Party MPs are all cleaning up as lobbyists, circumventing the very democracy, the checks and balances that they helped shape.

Radek Pilich (2010-08-12 11:36:29)

Who is this Dave Lull guy? Why is everybody referencing him and why I am not able to find anything about him?

G (2010-08-14 11:27:30)

@Radek: [http://petrona.typepad.com/petrona/2008/11/happy-birthday-to-our-favourite-li brarian.html](http://petrona.typepad.com/petrona/2008/11/happy-birthday-to-our-favourite-li-brarian.html)

### **Jane Jacobs and Traffic (2010-08-11 08:42)**

This [1]excellent post by Alex Tabarrok about the effect of removing traffic lights – traffic improves – reminds me of how I discovered the work of Jane Jacobs. Browsing in the Transportation Library at UC Berkeley, I came across The Economy of Cities.

That order arising from below (from individual drivers and pedestrians) can be much better than order imposed from above (by traffic engineers) was a point Jacobs made often. The details in Alex's post and the video he embeds don't just suggest that traffic lights in thousands of places could be profitably removed, they also support more radical thinking:

- Traffic engineers were completely wrong in all these cases. Trying to improve something, they made it worse. How did we get to a world where this is possible? Surely it isn't just traffic engineers.
- What would happen if students were given more power to control their own education? Perhaps we would need far few professors. [2]I gave my students much more control and found (a) my job got easier and (b) my students learned much more.
- What would happen if all of us were given more power to control our own health, rather than rely on gatekeepers, such as doctors? Perhaps we would need far fewer doctors.

The essence of my self-experimentation is that I took control of my health. Rather than seeing a doctor about my early awakening, or waiting for sleep researchers to find a solution, I found a solution.

### **The 50 Best Health Blogs (2010-08-11 12:00:51)**

If law and order would follow spontaneously from less regulation, how would that work in a community of Bernie Madoffs? And regarding our society's experts on law and order – attorneys – how many law students could be trusted to take the LSAT exams or the bar exams on an honor system, without proctors watching them? There is a good reason for regulations and enforcement.

Alex Chernavsky (2010-08-11 12:20:52)

I particularly don't like the fact that doctors are the gatekeepers for prescription drugs. When I get a cat bite, I ought to be able to go to the drugstore and buy some Augmentin myself, without first jumping through hoops (and possibly waiting for a few days while I can get an appointment).

G (2010-08-11 13:07:48)

Ever read the Tao Te Ching?

Seth Roberts (2010-08-11 15:18:36)

Re Bernie Madoff: perhaps the existence of the SEC made investors less careful. G, no I haven't read the Tao Te Ching. Why do you ask?

Links: Leher mentions Jacobs, Economics for the layman. « Riley Jones (2010-08-12 00:54:01)

[...] Nice little interview with ultra-hip neuro-journalist Jonah Leher. Besides talking about consciousness, his career, and the process of science, it's interesting that he mentions the late Jane Jacobs, a skeptic of urban planning, and her view of sidewalks. Seth Roberts also seems to love Jacobs and so it's interesting how her ideas have seemed to gathered steam posthumously. [...]

G (2010-08-12 18:47:40)

@ Seth: From chapter 60: "Ruling the country is like cooking a small fish." i.e. you ruin it with too much prodding. I think the Gia-fu Feng translation is the best one; you can read it all here: <http://thedailyg.wordpress.com/2010/05/24/tao-te-ching-complete-text/> A lot of these ideas floating around just now about self-organisation, not trusting experts on faith, and doubting models of reality, etc have been around for thousands of years. The problem is that the writings are in an ancient language and nothing like the kind of scientific exposition that nonhistorical scholars can take seriously as a source of good method or theory. But they dig much deeper than the faddy meme-mongers we tend to esteem these days, I think. I like a lot of what Nassim Taleb and Richard Dawkins have to say, but I take Lao Tzu or Chuang Tzu over them any day. They didn't stop once they were onto something powerful that could sell books - they wanted a complete philosophy of life. They were sort of reticent and doubted whether anything of worth could be transmitted as easily as just reading a book. It's like that James lyric, "I saw the crescent, you saw the whole of the moon." Ancient philosophers were aiming for some kind of ideal life; I get this general sense that thinking has left that behind for the time being; we think that's romantic and that life is sterner stuff. But the weird thing is, those ancient idealists were living in much sterner circumstances than us. We think they were prescientific crackpots with some good ideas, but in many cases they had a more urgent eye on empirical reality than most intelligent modern people. Yeah, maybe they went on pilgrimages to go hallucinate in a cave, but they had to survive bandits, nature and who knows what trials along the way. This is why Buddhist monasteries emphasise physical work so much - as well as preventing physical torpor, it stops the monks from becoming the classic absentminded professor.

G (2010-08-12 20:12:28)

James Carse is a contemporary thinker who might be more like the kind of *deeply* aspirational philosopher I'm waxing on here.

Alex Chernavsky (2010-08-13 04:24:06)

G, have you read [1]*The Happiness Hypothesis: Finding Modern Truth in Ancient Wisdom*, by Jonathan Haidt? It's a truly excellent book, and Haidt covers some of the same topics that you mentioned in your comments above.

G (2010-08-13 07:36:32)

Alex, thank you for the reference, but it looks to me like a 'positive psychology' scholar mining ancient wisdom for nuggets that will improve mood as evidenced statistically. The ancients had something different in mind, and so do I. Not that I think people

should blunder into misery and high blood-pressure! :-) I am not like those Scientologists who think psychology is evil because it conflicts with some religious paradigm. My beef with PS's 'mining' of ancient wisdom is that they are trying to achieve mundane goals by using sacred materials\*. That is not a dogmatic distinction - it has substance. The spiritual geniuses were aiming at a core of life and value. They were prepared to weather misery and high blood-pressure if necessary. Everyone knows that the various saints of note often practiced austerities or had misery thrust upon them. They weren't looking for hacks to improve mood. It just happens that a deep understanding of life bestows a deep joy, serenity and fortitude. But when you look at portraits of Bodhidharma when focused on his quest for enlightenment, he is not pictured as an optimistic sensualist enjoying the good life with good friends - he is pictured as someone who sat grimly facing a wall for nine years, like he was having a staring-contest with the universe. When you read the biographies of saints and sages, what you find is never some sanguine tinkerer looking for the path of least resistance: you find people who were very conscious of their own egotism and limitation, yet intuitively aware of their half-obscured divinity, and desperate to destroy or tame all that is base in them. \* In case this needs made clear, I aim for mundane goals every day, like trying to get a ketchup-stain out of a t-shirt - this is obviously fine in its time and place. :-)

Stephen M (Ethesis) (2010-08-14 18:48:44)

<http://the50besthealthblogs.blogspot.com/> came up as not found. Hmm. Actually, it depends on the kind of regulation. In traffic, the whole thing models well in fluid dynamics and some things create more turbulence than others.

anonymous (2010-08-14 21:51:40)

In the case of Bernie Madoff, the SEC had been notified of his malfeasance. Several times. They did nothing. Not such a resounding success for regulation. P.S. The economic double speak is "regulatory capture."

### **"A World Suppressing the Uniqueness Inside Each of Us" (2010-08-12 08:37)**

I liked [1]Erica Goldson's graduation speech very much partly because she says the same things I say here. To me, the core of her message is that her high school was

a world suppressing the uniqueness that lies inside each of us

That's what I tried to say [2]here. Goldson summed it up better than I did. One of the things that pushed me toward that conclusion happened in an undergraduate seminar about depression that I taught at Berkeley. For a final project, the students could do almost anything related to depression, so long as it was off campus and did not involve library research. One student chose to give a talk to a high school class. Not a rare choice - several other students did the same thing. But her final paper blew me away. She wrote about how hard it had been. She had/has severe stage fright. Every step of the project was very hard for her. But she did it. "I learned I can conquer my fears," she wrote.

Her performance on the week-to-week assignments (writing comments on the reading) had been mediocre. But now I saw another side of her: She was courageous. My assignments, like practically all college assignments, required no courage. So I never noticed how courageous any of my students were. I remember sitting at my desk after reading her paper and thinking how badly I had undervalued her. I had noticed this only because I'd given a highly unusual assignment. I could see that there was a gigantic amount of undervaluing going on. And undervaluation leads to suppression. Students have unique or unusual strengths that fail to develop because their high school or college teachers don't value them.

Thanks to Tucker Max.

Alex Chernavsky (2010-08-12 12:41:17)

Erica's speech is interesting, but I think she considerably overstates her case. There has to be some kind of middle ground between the strict regimentation that happens now and the more free-wheeling system that Erica seems to favor.

G (2010-08-12 18:24:55)

In way Cormack McCarthy's *The Road* is one of the best statements on learning: the two protagonists are shown constantly learning; constantly attuned to each other and to their environment. With no room for anything redundant, no directives from outside, and an ever-present real-world survival context that naturally brings about full engagement, there's not really the same kind of division between what one ought to do and what one wants to do - one wants to survive and the reasons for learning are never abstract or received on faith. The way we can move towards this 'natural engagement' in civilised life is to encourage intellectual curiosity (inherently rewarding when things cohere and work) and to reward origination, intellectual integrity, virtue in general. This could all be done culturally, without any government flagship programme, though things being as they are the government would probably have to play some kind of part, even if only to clear the way for such developments, i.e. alternative schools.

G (2010-08-12 18:26:43)

Oops: "e.g. alternative schools"

G (2010-08-12 18:53:46)

Also, we keep forgetting that many if not most famous achievers were/are weirdos in one way or another - to become even a minor talent/knowledge outlier probably involves some form of eccentricity? School life does *not* generally have much tolerance for eccentricity. Even athletes - and I think many of them are quite boring, hyperfocused people - there's a certain Olympic gold-winning British athlete; I got talking to a psychologist one time who told me that she had treated her for OCD and that her training was a productive 'outlet'.

latte island (2010-08-12 23:15:34)

She made a few good points, but after I'd been reading for a while, I realized they weren't her own ideas. She's obviously the pet of the charismatic, leftist teacher she mentioned. Too bad the teacher shamed an accomplished student into denigrating her own accomplishments in order to further the teacher's agenda of preferring creativity to academics. Maybe the valedictorian wanted to do exactly what she did. Maybe she's good at learning academic subjects, instead of changing the world or whatever Teacher wanted her to do. Again, I partly agree with her speech, but it's obvious that there's some personal stuff going on here. It's not clean. Hopefully, when Erica goes to college, she'll find other teachers who appreciate what she's good at-academics-and forget the creepy teacher she's trying to impress.

Bryan (2010-08-14 14:21:40)

My brother just sent me a video of the speech: <http://www.youtube.com/watch?v=qwRTTp19Xnk> &playnext=1 &videos=x0ZSkIPazRo &feature=sub

Stephen M (Ethesis) (2010-08-15 04:11:49)

Alex Chernavsky and latte island - I very much agree. However, I really liked where Seth took the observation and the starting point. Sometimes it is very much a mix. The ironic thing is that the "secretive government agencies" actually value critical

thinking a great deal.

A Post-Ride Paleo Meal, a Workout, and a Couple of Thoughts « Theory to Practice (2010-08-17 06:53:33)

[...] Seth Roberts recently posted this piece, “A World Suppressing the Uniqueness Inside Each of Us” in which he references this fabulous Valedictorian address purportedly given by Erica Goldson during the graduation ceremony at Cocksackie-Athens High School, on June 25, 2010. Now whether this was truly a Valedictorian address or not, I can’t be sure of. What I am sure of, though, is that the message is “spot-friggin’-on”. And not only is this the case in “education”, writ large, but the same can be said of diet, health, and fitness writ large — the totality of what I term “Physical Culture”. Take an n=1 approach toward achieving your own ultimate phenotypical expression. Keep both eyes on the path; the destination will take care of itself. [...]

Gunnar (2010-08-17 13:28:29)

Isn’t that what schools are for? Demoralizing kids and filling them with “knowledge” of the suppressor’s liking? That’s how I understand public school as of today. Be well.

Zach (2010-08-20 05:35:56)

When someone in the same speech speaks out against compulsory government mandated education AND quotes Mencken to then assume that person is the pet of a charismatic, leftist teacher? With all due respect, I think it would be worth the time to read up on just who is Mencken, how incredible it is that this 18-year-old is quoting him!, and examine just who among the left and/or right supports compulsory education and who does not. It is possible in the same speech to string ideas from various people’s philosophies with whom you don’t 100 % agree on everything. I simply don’t find any political ideological dogma in this student’s speech for the left or right... I think the whole point of the talk both regarding schooling and thought is to not standardize and pigeonhole other people. If she is a leftist, it’s strange that someone from the “right” is speaking out against her because she’s speaking out against compulsory standardized education? What an interesting non-traditional position for someone from the right to take! And she uses the word “Corporatism”! Holy moly! No leftist I know (and very few “rightests”) even knows what that word means. Kudos to her again for using it. To be against corporatism by the way is not to be against capitalism... unless you approve of the government bailouts carried out by both the current and previous administrations... that’s not capitalism folks, that’s corporatism and that’s going down the road further and further away from a free market and toward socialism. We may thank both the left and right politicians for that.

## **How Well Do Authors of Scientific Papers Respond to Criticism? (2010-08-12 21:59)**

[1]This BMJ research asked how well authors responded to criticism in emailed letters to the editor. A highly original subject, but the researchers, one of whom (Fiona Godlee) is the top BMJ editor, appear lost. They summarize the results but appear to have no idea what to learn from them, ending their paper with this:

Editors should ensure that authors take relevant criticism seriously and respond adequately to it.

Which was perfectly reasonable before any data was collected. So that’s not a good conclusion.

The real conclusion is this: The letters to the editor were far better than nothing because authors responded to their criticisms about half the time.

1. [http://www.bmj.com/cgi/content/short/341/aug10\\_2/c3926?etoc](http://www.bmj.com/cgi/content/short/341/aug10_2/c3926?etoc)

---

G (2010-08-13 13:32:02)

One time the editor of *The Guardian* came to my university to give a talk on the unhealthy relationship/symbiosis between politicians and the press. At the end he concluded that the press shouldn't suck up to politicians just so they get the stories first, and that politicians shouldn't manipulate the press so cynically; then the floor was opened for questions. I asked him what *systemic* changes would he recommend, rather than just telling people to 'be good' at the end of a long cause-effect explanation of exactly why people aren't being good. He irritably restated his conclusion then tried to turn the question around, asking what I would do (though I was able to give an opinion, *he* was the expert, not me). Yes, the letters to the editor are better than nothing, just like the faltering professional-ethics-culture of journalists and politicians is better than nothing, but a better conclusion would have been: we should create a culture of *expectation* that every convincing-sounding criticism should be answered satisfactorily. Doesn't have to be 100 % - people have lives to live; fall and break their ankle, feel to hungover to answer letters, etc - but there should be some stigma attached to ducking hard questions.

Seth Roberts (2010-08-14 07:52:53)

G, that's a great story. As if the editor had had brain surgery that kept him from thinking useful thoughts. Since he ran an important paper, that's not trivial. Perhaps some criticisms were not answered satisfactorily because there was no satisfactory answer. Or because the criticisms were unclear. To have a sensible idea on how to improve things I'd want to look closely at what the problems were.

Stephen M (Ethesis) (2010-08-15 04:13:20)

It is interesting how often people think in terms of conclusions they want to see result instead of methods to get to the conclusion. Dieting and weight loss is generally like that.

## **Arithmetic and Butter (2010-08-13 20:35)**

On Tuesday I gave a talk called "Arithmetic and Butter" at the Quantified Self meeting in Sunnyvale. I had about 10 slides but this one mattered most:

[1]

It shows how fast I did simple arithmetic problems (e.g.,  $2 \times 0$ ,  $9 - 6$ ,  $7 \times 9$ ) before and after I started eating 1/2 stick (60 g) of butter every day. The x axis covers about a year. The butter produced a long-lasting improvement of about 30 msec.

I think the hill shape of the butter function is due to running out of omega-3 in Beijing – my several-months-old flaxseed oil had gone bad, even though it had been frozen. When I returned to Berkeley and got fresh flaxseed oil, my scores improved.

This isn't animal fat versus no animal fat. Before I was eating lots of butter, I was eating lots of pork fat. It's one type of animal fat versus another type. Nor is it another example of modern processing = unhealthy. Compared to pork fat, butter is recent.

Most scientists think philosophy of science is irrelevant. Yet this line of research (measuring my arithmetic speed day after day, in hopes of accidental discovery) derived from a philosophy of science, which has two parts. First, scientific progress has a power-law distribution. Each time we collect data, we sample from a power-law-like distribution. Almost all samples produce tiny progress; a very tiny fraction produce great progress. Each time you collect data, in other words, it's like buying a lottery ticket. I realized that a short easy brain-function test allowed me to buy a large number of lottery tickets at low cost. Second, we underestimate the likelihood of extreme events. Nassim Taleb has argued this about the likelihood of extreme negative events (which presumably have a power-law distribution); I'm assuming the same thing about extreme positive events (with a power-law distribution). We undervalue these lottery tickets, in other words. Perhaps all scientists hope for accidental discoveries. I seem to be the first to use a research strategy that relies on accidental discoveries.

In the graph, note that one point (actually, two) is down at 560 msec. This suggests there's room for improvement.

1. <http://blog.sethroberts.net/wp-content/uploads/2010/08/2010-08-12-butter-effect.jpeg>

---

Caleb (2010-08-13 22:55:28)

What type of butter is it? My first guess would be that you were vitamin K2(MK4) deficient, and the butter's correcting it.

Tom (2010-08-14 01:58:39)

Seth, have you considered alternating between pastured and grain-fed butter? (I'm not sure what the cows in China might be fed, though.)

Riz Din (2010-08-14 03:24:58)

An ideas for taking this experiment to the next stage could include switching back to no butter and seeing if the improvements are not just due to a learning effect. Have you already looked at this Seth?

Seth Roberts (2010-08-14 08:12:12)

Caleb, it's Straus Creamery unsalted butter. That's an interesting idea about K2. I did not notice an improvement when I started eating natto, which is very high in K2. But I wasn't looking for one. Tom, so far I've only tried one brand of butter other than Straus. I didn't notice any big difference. However, it was a small test. Riz Din, I haven't yet gone back to no butter, no. I'm sure it's not a learning effect. I've seen thousands of learning curves. Not one showed a sudden improvement like this.

John (2010-08-14 08:52:07)

Supposedly, butter from grass-fed cows has more vitamins, like K2, in it. Maybe you can try with Kerry Gold Irish Butter. That stuff is pretty good. :-)

G (2010-08-14 11:19:52)

Placebo?

Seth's blog » Blog Archive » Arithmetic and Butter « Beware of Roaming (2010-08-14 12:59:12)

[...] Seth's blog » Blog Archive » Arithmetic and Butter It shows how fast I did simple arithmetic problems (e.g.,  $2^{*}0$ ,  $9-6$ ,  $7^{*}9$ ) before and after I started eating 1/2 stick (60 g) of butter every day. allan (2010-08-14 14:26:09)

I heard that in Chinese medicine, if you have a problem with one organ, to eat that same organ from animals. So, the obvious food for better brain function is animal brains. Cow brains provide DHA at 851 mg/ 100g and EPA at 374 mg/ 100g. <http://nutritiondata.self.com/facts/beef-products/3461/2> (btw, Vitamin K2 is found in rat brains, and will likely be also found in cow brains if someone looks for it) The problem with eating cow brains is that the FDA prohibits it because of the belief that it can transmit mad cow disease. (There is a secondary problem in harvesting cow brains because the most humane method of slaughter is to shoot cows in the head, thus destroying the brain). Mark Purdey, an example of an insider-outsider, believed that mad cow disease resulted from the UK's decide to order pesticides to be sprayed on cattle. [http://en.wikipedia.org/wiki/Mark\\_Purdey](http://en.wikipedia.org/wiki/Mark_Purdey) So, if Purdey is correct, then the consumption of a healthy source of long chain omega 3 is prohibited by a false scientific theory. One hypothesis why butter might be helpful is that short chain saturated fats might be the cause. Not many foods have butyric acid (4 carbon saturated fat) or valeric (6 carbon saturated fat) acid. Wikipedia says valeric acid has a similar structure to neurotransmitter GABA. You can test coconut oil to see if the cause is 8 to 12 carbon saturated fats because coconut oil and butter have them, while lard does not. If coconut oil is unhelpful, then look at the 4 or 6 carbon fatty acids. <http://nutritiondata.self.com/facts/fats-and-oils/508/2> <http://nutritiondata.self.com/facts/fats-and-oils/483/2> <http://nutritiondata.self.com/facts/dairy-and-egg-products/133/2>

[...] Arithmetic and Butter Perhaps all scientists hope for accidental discoveries. I seem to be the first to use a research strategy that relies on accidental discoveries. (tags: science research methodology philosophy) [...]

Seth Roberts (2010-08-14 16:22:05)

G, placebos cannot generate surprising results. My exploration of the drop in RT began when 4 things were unusual. Things 1-3, when tested separately, had little effect. Thing 4 (butter) seemed to have an effect.

vic (2010-08-14 22:17:17)

have you considered that butter isn't helping, but that pork fat was harming your performance?

Stephen M (Ethesis) (2010-08-15 04:31:45)

G, if it was placebo, Seth would be rocketing off the charts :) – he routinely tries things which should trigger the placebo effect. If it was kicking in, given the number of times he tries things, if everything gave him a jolt ...

Seth Roberts (2010-08-15 05:59:38)

vic, pork fat made me sleep better. that's the short answer.

peter (2010-08-15 08:27:22)

mad cow disease arose when sh\*t kicking stupid cheap farmers fed cows to cows; the carcass of one diseased animal spread the disease to all the cows that ate it and so on. it had nothing to do with pesticides.

CTB (2010-08-15 08:44:44)

Any chance you have fasting blood glucose levels for this period? You posted recently about having levels in the prediabetic range that came down after starting daily walks...where does that experiment fit within this time frame? The brain uses glucose rather exclusively for energy needs (unless you're starving then I think it can also use ketone bodies)...and glucose use goes up when the brain is working on problems. So if more glucose was available, it would seem logical that your brain would think better. And if your fasting glucose levels were up, your post-meal levels might have been alot higher as well...lots of potential computing power for the old noggin. It would be interesting to see your math times for 4 conditions: pork fat and old exercise regime; pork fat and walking; butter and old exercise regime; butter and walking. And have glucose levels for the whole thing. I'm very insulin sensitive, and can run glucose levels in the low 40's. I don't even try to do my taxes or balance my checkbook unless I've eaten something. I also participated in a diet study once where we had to decrease our daily total fat intake to 20 % per day. I couldn't do it. I couldn't sleep; felt miserable and wired...plus ended up binging like crazy. Then went to the weekly meeting and found out there were several others who had the same experiences. Yet some people did it with no problem at all.

Caleb (2010-08-15 09:57:25)

The version of K2 in natto is M7. M4 is the type animals produce when converting K1 to K2, meaning it's the type we seem to have evolved to optimally run on. M7 in natto probably isn't equivalent to animal sourced M4. That said, Allan's idea that it's the Valeric acid (6 carbon sat fat) sounds like a more promising theory.

Seth Roberts (2010-08-15 12:42:30)

CTB, that's an interesting idea. However, my fasting blood sugar levels dropped substantially, as I described in an earlier post, long before the drop in arithmetic speed. There was no obvious change in arithmetic speed at the time of the blood sugar drop. And there was no obvious change in the blood sugar levels at the time of the arithmetic drop.

G (2010-08-15 16:55:08)

Yeah, I see what you mean Seth. @ Alan: Braaains are delicious curried, though not so much on their own; too fatty; sop it up with bread, something like that; mix it with rice maybe. Can have a metallic background taste that you might find offputting. They could probably use the bolt-headshot method while preserving most of the brain if they made sure to aim for the brain-stem - that's the quickest and surest kill anyway.

Kit (2010-09-03 07:34:10)

Excuse the tangent, but I have a question that seems simple, but finding an answer is not. I bought refrigerated flax oil about a year ago, and have kept it refrigerated since then. I've been lax about consuming it, but have lately started to eat it everyday. I can understand how old oil would be less effective, but is it a total waste or harmful?

Seth Roberts (2010-09-03 12:56:40)

Kit, I kept flaxseed oil frozen for a year. When I used it it wasn't very effective. Not harmful, except that I didn't realize its low effectiveness so it kept me from drinking better flaxseed oil

Great links for the weekend! (2010-09-03 13:01:52)

[...] Butter. I love it, but don't tend to have it often anymore since it doesn't work so well with broccoli and curry. Or beef stews. However, for all the butter fans out there, Mark Sisson did a great summary of the different types of butter you can get and the pros of each. Taking this a step further, Seth Roberts (who seems to spend his life self-experimenting) did an arithmetic-related butter consumption experiment. Fascinating how much better his arithmetic results got when he started eating butter, though eating 60g of butter a day sounds like it could be both expensive and a little sickening over time... [...]

Don't miss these great links! (2010-09-09 06:08:50)

[...] And following straight on from Mike's self-experimentation is some self-experimentation that Seth Roberts has been doing. Seth tested how quickly he performed simple arithmetic tests before and after he started eating 60g of butter each day. Post butter consumption, he performed statistically, significantly better. Why? Who knows. [...]

Butter and Arithmetic: How Much Butter? | Quantified Self (2011-12-02 08:15:52)

[...] Two years ago I discovered that butter — more precisely, substitution of butter for pork fat — made me faster. This raised the question: how much is best? For a long time I ate 60 g of butter (= 4 tablespoons = half a stick) per day. Was that optimal? I couldn't easily eat more but I could easily eat less. [...]

## Arithmetic and Butter (continued) (2010-08-15 08:52)

At [1]my Quantified Self talk I described data that suggested butter improved my mental function. During the question period, a cardiologist in the audience said something about me killing myself – butter is unhealthy. The usual view.

I said I thought the evidence for the usual view was weak. He said, "The Framingham studies." That was epidemiology, I said. It is notoriously hard to understand. My data was from something like an experiment. Much easier to understand. (And the Framingham study is a terrible example of the supposed evidence. To [2]quote from it: "In the period between the taking of the diet interviews and the end of the 16-year follow-up, 47 cases of de novo CHD developed in the Diet Study group. The means for all the diet variables measured were practically the same for these cases as for the original cohort at risk.") He replied that the reduction in heart disease in recent years was more support for the usual view. I said the recent decline in heart disease could have many explanations other than a reduction in animal fat intake. Many things have changed over the last 20 years.

There is epidemiological evidence that saturated fat is bad, yes, but it is not the Framingham study nor the recent decline in heart disease. And it really is difficult to interpret. The butter-is-bad interpretation could easily be wrong. The obvious problem is that, after people are told butter is bad, people who try hard to be healthy avoid butter. And they do a lot of other things, too, to be healthy. So butter consumption ends up confounded with a dozen other variables believed to affect your health. When I was growing up, my parents avoided butter because margarine was much cheaper. So butter consumption is confounded with income, another problem.

My tiny experiment, whatever its problems, was much easier to interpret.

---

Kudzu Bob (2010-08-15 12:29:18)

If doctors ate more butter, then maybe they'd be smart enough to know what the hell they're talking about.

G (2010-08-15 16:49:16)

Aren't stomach-contents broken down into little molecular lego-bricks anyway? It's like, cholesterol is something your body *makes* when it thinks it needs more; it doesn't pass directly from the stomach into the blood. I think many people imagine butter clogging up their arteries like it just flows right in there, from sandwich to heart, directly.

Darrin Thompson (2010-08-16 05:46:47)

I wonder if this is part of the reason Weston Price was ignored. Not only was he an outsider, a dentist, his evidence was clear enough for anyone to understand.

CTB (2010-08-16 07:01:33)

It may be relevant to note again that lard-type fat and butter both come from animal sources, but lard is the fat storage depot of the animal, while butterfat is custom made by the mammary gland for the nourishment of infants. And the brains of infants are developing like crazy during those early months. Older cultures nursed for years. The composition of depot fat directly reflects the kind of fat you eat, and can vary a lot between individuals eating different diets. Butter fat in milk is pretty consistent in composition...and it has a lot of short-chained fatty acids which aren't found elsewhere in the diet in such quantity. Obviously evolution has selected for the best possible composition for infant development, because those were the infants who survived and went on to continue the race. Quick and dirty: When fat goes through the digestive system, the components get disassembled, absorbed and reassembled in the gut cells (but not metabolized)...then dumped into the lymph...which is then dumped into the veins. It then circulates in the blood and cells/organs take what they need, while excess is taken up by the fat stores. The idea is to clear the blood of excess and maintain homeostasis. When you're healthy and active, you can handle a high-fat meal. The problems come when the body can no longer quickly clear out the excess...whether because of age, illness, genetics, lack of exercise that would utilize it...whatever. I worked in a hospital lab years ago. Tubes of coagulated blood have red cells on the bottom, and a clear yellow layer of serum on top. Occasionally there would be tubes with milky white gunky serum due to the high lipid content. Either these people had their blood drawn shortly after a high fat meal...or they had lipid metabolism problems. You don't forget this image...and I'm sure the cardiologists have seen it. The thought of this gunk flowing through your veins is scary. Half a stick of butter is 4 tablespoons or eight pats; roughly 400 calories. Not really that much for a male who is walking at least an hour a day. It would depend on whatever else you are eating along with it. Just make sure to cover your butt and get regular blood tests as you age. Maybe don't eat it all at one time.

Aaron Blaisdell (2010-08-16 08:23:04)

@ CTB, At what temperature was the drawn blood in the tubes kept? Saturated fat does not congeal or thicken until it drops to at or below about 74 degrees F. The human body is typically around 98.6 F so saturated fat would be completely liquid (and not sticky or gunky). Also, a high carbohydrate meal becomes a high fat meal from the point of view of vasculature. Most of the carbs cannot be burned off at the time of ingestion, so most of them are repackaged by the liver as palmitic acid (i.e., a saturated fat). So looking at the fat content of cooled blood will not differentiate a recent high-fat meal from a recent or chronic high-carbohydrate meal/eater.

G (2010-08-16 08:29:01)

An arresting image CTB, thanks for the explanation.

CTB (2010-08-17 08:41:53)

The lab was room temp. I did not mean to imply that the milky serum was solid like butter. These sera had visible fatty films which would cling to the side of the tubes, and when you poured the milky serum off the clot, it was more viscous. The fat from a meal is released into the lymph in chylomicrons...along with proteins to make it more soluble as it travels in the blood. Same for the saturated fats you mentioned that are released from the liver...they're packaged with lipoproteins and are more soluble. Most of those tubes had clear serum, but some people, for whatever reason, had such overwhelming amounts of lipid in their blood that it was visibly present in their serum. How do you know if you have a problem like this? And if you're healthy now, how do you know if you're developing a problem? All I'm saying is that this is the world that cardiologists live in...and it's easy for me to see why some of them quickly say 'fat is bad.' BTW, all of us in the lab tried eating cheeseburgers and fries and donuts (probably at least a decade before Morgan Spurlock was born)...then practiced taking blood from each other to see if our serum looked like this. It didn't. We were young and apparently not showing any problems yet. My family's ethnic background is Polish...lots of butter and pork fatback in our cooking. No cardiac problems...no diabetes...folks live into their 90's...but everyone stores fat in their thighs and butts and have relatively small waistlines. That's our genetics. Other folks are not so lucky.

Aaron Blaisdell (2010-08-17 09:39:24)

Yes, that sounds like a fat metabolism dysregulation. Still, I think the notion that eating a high-fat meal will "clog the arteries" is a misconception based on how saturated fats are observed to congeal or thicken at room temperature (and thus clog a sink pipe, for example). I cook with coconut oil that I let sit out on my countertop near the stove. For most of the year it is a solid, but during the hot days of summer it becomes a liquid. My kitchen has never been close to 98.6 deg. F (more like a high in the low 80s) and so I am not worried about consuming high amounts of saturated fat. In fact, I take a couple of tablespoons of coconut oil, which is close to 90 % saturated, every day.

Alex Chernavsky (2010-08-17 12:53:21)

Aaron, I'm curious if you noticed any positive effects from the daily coconut oil.

Aaron Blaisdell (2010-08-17 13:01:53)

Alex, I think so, but a caveat is that I started taking coconut oil after making many dietary changes, such as following a primal lifestyle (as detailed on Mark's Daily Apple). The spoonfuls of coconut oil have, I think, reduced my overall appetite (and I don't take it following the SLD protocol). Also, my skin looks and feels like that of a younger person (I'm 41). Very supple and smooth. My gums are in the best condition ever in my life, too, but I have been taking high-vitamin fermented cod liver oil and high-vitamin butter oil (both from Green Pastures) almost daily for the past two years.

CTB (2010-08-18 05:46:20)

OMG Aaron, you sound like an Adonis! Not to beat this horse to death, but coconut oil in a jar...or a stick of butter in the refrigerator are relatively pure fat...whereas once in the bloodstream, these fats need to travel in an aqueous environment. So they're packaged with lipoproteins to aid in transportation to the tissues, just like the steroid hormones (nonwater soluble) all have protein carriers, etc. Liquid oil agitated with water forms a mushy emulsion. If your body is not clearing fats from the blood fast enough, and the levels build up, what's going to happen...especially when the blood needs to travel through arteries which have constricted openings due to plaque buildup. In this condition, if you eat a high-fat meal, you're just adding to the mess. the problem is how do you know when you pass the point where your body is no longer clearing the fats out because you're less active or whatever.

Aaron Blaisdell (2010-08-18 07:37:44)

CTB, I've heard that if one eats a high-fat, moderate protein, low carbohydrate diet, their body shifts to a ketogenic mode of fuel use in which they burn fat as the main fuel source rather than glucose. (I got this information from sources like Robb Wolf's blog, Hyperlipid blog, Mark's Daily Apple, Protein Power by Drs. Mike and Mary Dan Eades, etc.) I've been eating a ketogenic diet for over a year now (closer to two on or off). So, isn't it probable that after a high fat meal my body is clearing

the protein-packaged lipids out of the blood relatively quickly to burn for fuel? I haven't come across evidence in the literature or on blogs that heart attacks or strokes are more likely following a single high-fat meal (or repeated ones, for that matter). Do you have references to suggest otherwise? I would love to get at the truth. I'm not wedded to the theory that the ancestral human (especially before the agricultural revolution) was generally running in ketosis (with some exceptions, e.g., the Kitavans), but it is a very compelling theory with a lot of supporting evidence. I would value very much any evidence that fails to support this theory. Thanks, Adonis

### **Power Makes You More Dismissive (2010-08-15 09:38)**

[1]An excellent essay by Jonah Lehrer describes a pair of studies I didn't know about:

In a recent study led by Richard Petty, a psychologist at Ohio State, undergraduates role-played a scenario between a boss and an underling. Then the students were exposed to a fake advertisement for a mobile phone. Some of the ads featured strong arguments for buying the phone, such as its long-lasting battery, while other ads featured weak or nonsensical arguments. Interestingly, students that pretended to be the boss were far less sensitive to the quality of the argument. It's as if it didn't even matter what the ad said—their minds had already been made up.

. . . Instead of analyzing the strength of the argument, those with authority focus on whether or not the argument confirms what they already believe. If it doesn't, then the facts are conveniently ignored.

Deborah Gruenfeld, a psychologist at the Stanford Business School, demonstrated a similar principle by analyzing more than 1,000 decisions handed down by the United States Supreme Court between 1953 and 1993. She found that, as justices gained power on the court, or became part of a majority coalition, their written opinions tended to become less complex and nuanced. They considered fewer perspectives and possible outcomes.

Scary. Thomas Paine [2]wrote about this: "The state of a king shuts him from the world, yet the business of a king requires him to know it thoroughly."

1. <http://online.wsj.com/article/SB10001424052748704407804575425561952689390.html>

2. <http://www.earlyamerica.com/earlyamerica/milestones/commonsense/text.html>

---

Robin Barooah (2010-08-15 14:34:28)

I wonder whether this is the very definition of what 'power' is - rather than being a consequence. People generally seek power because they think it will make their lives easier - i.e. because its very nature is that they won't have to deal with as much complexity in order to get results. They don't seek it in order to make their lives more challenging or difficult. I also think this is generally understood. My guess is that if you ask 1000 people the question: "Which of these statements more accurately reflects the effect of power on people:" a) Power Corrupts b) Power Enlightens I think you'd see significantly more people choosing answer a. My suspicion is that the reasons you don't hear people expressing outrage about it unless they are actually threatened is the sense that it's an immutable fact of life and that most people have to pay respect to someone in power over them. I personally question the immutability, but have little doubt about the second issue.

Allen K. (2010-08-15 15:39:04)

Another reason to end lifetime Supreme Court appointments.

Seth Roberts (2010-08-15 21:05:47)

Robin, I think more accurate than Power Corrupts is Power Isolates. That's what Paine was saying.

dearieme (2010-08-16 03:20:03)

Acton said that power tends to corrupt.

Darrin Thompson (2010-08-16 05:50:54)

Historically, industry improvements have happened in times of crisis. I wonder if the threat of losing power due to a crisis event tempers this dismissive attitude. The Lean quality people are quick to point out that most of their poster quality success stories happened at companies that were near death.

G (2010-08-16 09:08:42)

People tend to get power because (among other factors) they consistently and intensely desire power. People who work in large companies or bureaucracies know that there is work you do to do a good job, and 'work' you do to become a candidate for promotion. I don't know whose saying this is but, 'power transforms a person into a thing; love transforms a thing into a person'. I think it's D.T. Suzuki's.

Robin Barooah (2010-08-16 11:45:58)

Seth: I agree - isolate is a much less loaded term - in practice I'm not sure there's a difference since what we're really talking about is quality of decision making. It would certainly be more interesting to use the word 'isolate' when questioning people about their beliefs though.

## **Drug Company Corruption (2010-08-16 05:43)**

This [1]Al Jazeera documentary, called "Drug Money", emphasizes three things.

1. Doctors get vast amounts of money from drug companies, which influences which drugs they prescribe. One influential doctor, Tom Stossel of Harvard, who has received "millions" from drug companies, [2]sees no problem with that!
2. Drug companies encourage the prescription of drugs for unapproved uses. For this and other crimes, more than half of the major drug companies have been found guilty and fined billions of dollars. Several of the not-yet-guilty ones are under investigation. The problem is industry-wide, not due to a "bad apple".
3. The harm done by deceptive practices isn't trivial. One example is Risperdal. It isn't approved to treat ADHD in children, but it is prescribed for that. Given to boys, it can cause them to grow breasts, which is extremely embarrassing. When the boys were given the drugs, their parents were unaware of this possibility. Joseph Biederman, another Harvard professor who has received millions from drug companies and an advocate of giving Risperdal to children, told a Congressional committee he had no idea that a large fraction of all Risperdal is given to children ("I have no idea how much Risperdal is used in children").

Thanks to Anne Weiss.

1. <http://www.wimp.com/pharmaceuticalindustry>

2. <http://brodyhooked.blogspot.com/2010/04/encounters-with-dr-tom-stossel.html>

---

PeterW (2010-08-16 07:24:48)

The sheer amount of money on the upper end is troubling. But I'm surprised at your disapproval of off-label uses. Isn't one of your bugaboos the fact that large institutions like the FDA are too slow at recognizing new data, and have outdated recommendations that clever researchers should question? To be consistent, you should approve of the study and employment of off-label uses for drugs as a good innovative thing.

G (2010-08-16 09:19:39)

Imagine the anger and harsh penalties if a non-professional individual were to directly cause just one boy to grow breasts. Whether motivated by greed or neglect, it would be a mass media horror-story and there'd be an expectation of a prison-sentence. A doctor who was irrefutably found to do this for knowingly dishonest motives would be struck off; drug-companies have no analogous punishment: they are never dissolved, taken over by the state; the bosses are not personally punished - they are not prevented from doing similar things again.

bill (2010-08-16 12:33:59)

Should a law require doctors to inform patients of conflicts of interest?

vic (2010-08-16 12:49:11)

that tom stossel is the brother of the reporter jon stossel, kind of ironic

Seth Roberts (2010-08-16 18:20:19)

"Isn't one of your bugaboos the fact that large institutions like the FDA are too slow at recognizing new data"? I'm afraid I'm unable to figure out why you say that. Giving thousands of children dangerous untested drugs in order to boost profits is obscene - that's what I think.

Tom in TX (2010-08-16 20:25:33)

Using a drug for an unapproved use is not always a bad thing.

Alex Chernavsky (2010-08-17 04:57:08)

For an excellent (if infuriating) treatment of corruption and pseudoscience in the field of psychiatric drugs, see [1]*Anatomy of an Epidemic: Magic Bullets, Psychiatric Drugs, and the Astonishing Rise of Mental Illness in America*, by Robert Whitaker. See also Whitaker's recent op-ed piece, [2]"It's time to end this grand experiment with psychiatric drugs". (And no, I'm not a Scientologist.)

1. <http://www.amazon.com/Anatomy-Epidemic-Bullets-Psychiatric-Astonishing/dp/0307452417>

2. <http://www.registerguard.com/csp/cms/sites/web/opinion/25126557-47/bipolar-illness-medical-medications-mental.csp>

Jim Ellison (2010-08-25 20:16:00)

I have been in practice for 27 years but I have never received any payment to prescribe a drug.

Seth Roberts (2010-08-26 03:55:21)

Jim Ellison, money flows from drug companies to doctors in a dozen ways. Conferences, speakers fees, meals, samples, and so on. I don't think it's ever as crass as "you prescribe X, I'll give you \$ \$ \$". If you have never received anything valuable from a

drug company, I would like to hear about it.

### Pork Belly News (2010-08-16 18:04)

I am [1]a big fan of pork belly. Whenever I see it on a menu I order it. The mayor of Chongqing (population 32 million) recently made headlines with [2]a speech whose main point was

æ"¹ă-,æ°'ç"Yä,ä?ä?ä?-jd?σf?ä?dž×!8%oc©;æ¼,ä°\*è;£æœä?

Which means: Better living standards is not just eating hong shao rou wearing beautiful clothes. [3]Hong shao rou is pork belly braised in a red sauce. Maybe my favorite Chinese dish. Supposedly Chairman Mao's favorite dish. I'm glad he said "not just" rather than "not".

1. <http://www.blog.sethroberts.net/2009/10/31/effect-of-animal-fat-on-sleep-more/>

2. <http://www.blog.sethroberts.net/%20%E6%94%B9%E5%96%84%E6%B0%91%E7%94%9F%E4%B8%8D%E5%8F%AA%E6%98%AF%E5%90%83%E7%BA%A2%E7%83%A7%E8%82%89%E7%A9%BF%E6%BC%82%E4%BA%AE%E8%A1%A3%E6%9C%8D>

3. <http://www.saveur.com/article/Recipes/Red-Cooked-Pork-Belly-Hong-Shao-Rou>

---

G (2010-08-16 21:09:28)

Char siu = candidate for 'best and easiest meal ever'.

vic (2010-08-16 22:28:12)

Seth, you've often said pork belly fat improved your sleep. Does it also affect your dreaming? In general, do you find your quality of sleep is related to dreaming? just curious...

dearieme (2010-08-17 02:07:54)

Roast pork and crackling is a British favourite - do you eat it in the USA?

Pieter (2010-08-25 19:35:33)

Population Chongqing more than twice the population of Shanghai? Sure. That said, hong shao rou is sooo good, albeit a heart attack waiting to happen.

Seth Roberts (2010-08-26 03:51:09)

dearieme, roast pork, yes, crackling, no. I suppose the popular american food with the most animal fat is hamburger. Or spareribs. vic, I haven't noticed an effect on dreaming, no.

j (2010-08-28 20:07:45)

Chongqing, while a "city", is the size of South Carolina.

### "That's Why You're So Easy to Hate" (2010-08-17 05:42)

This is what [1]one bloggingheads commentator said to the other. Was the speaker-listener combo (a) man to man, (b) man to woman, (c) woman to man, or (d) woman to woman?

As you can guess, woman to woman. After I wrote this post, I listened to the rest of the dialog. The phrase was repeated several times.

It's a standard compliment, yes. Sure, women compliment each other like this and men don't. But I think it is an example of another underlying rule that I can't figure out.

More I hadn't noticed that the title of the conversation is "We're All So Easy to Hate".

1. <http://bloggingheads.tv/diavlogs/29445>

---

sadie (2010-08-17 06:13:18)

If the context is "you're so easy to hate because you are so wonderful," I think I can take a stab at explaining this. I'm a strongly introverted woman in a culture that expects women to be strongly extroverted, so figuring this kind of thing out has been the work of a lifetime for me. Women learn (and some people say are hardwired, although this doesn't seem to apply to me) that belonging to a group is the most important function they fulfill. We are supposed to fear separation from the group and love unity of purpose with the group. If you want to do something that the group doesn't want, you can bring it up, but you should apologize and feel bad for that. If you excel at something, you probably worry that this alienates you from the group, and so you will have to do a lot of sucking up and making amends for being so great. The group, in turn, behaves like a group and enforces consensus, conformity (to varying degrees. When put in terms like these, it often sounds more malicious than it is), and so "hating" a group member who is doing something different (but better) is a group-bonding activity. Basically, this is competitive behavior, but with a strong set of social-bonding rules guiding how you can compete. An easy example of this is weight loss. If you're a woman who loses weight, your friends will be happy for you, but if you go too far outside their norm, they will "hate" you for it. BUT- by telling you playfully, "I hate you," they are reinforcing your mutual bond while still pointing out that you have violated the group rule. If you are very apologetic about it, you can still pull off this kind of group rule-violation (and change group norms), but do too much and the group will resist and you will lose status. I feel like the Jane Goodall of human female behavior after writing this.

vimal (2010-08-17 09:24:25)

Can you provide the link of the blogginghead post?

Seth Roberts (2010-08-17 09:51:52)

<http://bloggingheads.tv/diavlogs/29445>

Nathan Myers (2010-08-17 17:05:28)

Thank you, Sadie, I have learned more from your few short paragraphs than from decades of outside observation. Any further explication of your insights will be most welcome.

Aaron Blaisdell (2010-08-17 19:28:53)

I'm in the middle of watching "Snow White and the Seven Dwarfs" with the kids and it suddenly dawned on me how appropriate this blog post is to the movie. But the Queen went to great lengths to show how much she hated Snow White for surpassing her in beauty.

yoginprogress (2010-09-02 15:44:05)

Though I agree with some of what you say, Sadie, there are some chemical explanations for social bonding that aren't necessarily societal. That is, it's not always a nurture situation - "damn those cultural standards" - but a nature, biological

situation. Women social-bond because historically the children of the pack are less likely to be killed by the saber tooth tiger if more adults are around. Over time, women have evolved to release chemicals like oxytocin and serotonin from early adolescence but especially when pregnant, which reinforce both pair-bonding and a desire for community. And, frankly, as a woman who is considered by the world to be extroverted, I would disagree that that's what our culture expects us to be - even in New York City I've often found both men and women uncomfortable and/or intimidated by my level of extroversion. I think it's proof that ultimately what our culture is, is confused. I think the biggest problem in regards to the "you're so easy to hate," comment is a general disregard for sympathetic joy in our culture. We are not taught to celebrate one another's achievements or differences, but fear them - as if joy and success are in constant quantities and the success of one means the failure of another.

### **The Irony of What Works (2010-08-18 05:40)**

After [1]posting about Doug Lemov, I ordered [2]Teach Like a Champion. It arrived yesterday. Leafing through it, I came across a section titled "The Irony of What Works," which begins:

One of the biggest ironies I hope you will take away from reading this book is that many of the tools likely to yield the strongest classroom results remain essentially beneath the notice of our theories and theorists of education.

Lemov continues with an example: Teaching students how to distribute classroom materials, such as handouts. This can save a lot of time. Then he adds:

Unfortunately this dizzyingly efficient technique - so efficient it is all but a moral imperative for teachers to use it - remains beneath the notice of our avatars of educational theory. There isn't a school of education that would stoop to teach its aspiring teachers how to train their students to pass out papers.

The last chapter of Veblen'sÂ Theory of the Leisure Class is about just this - the importance that professors (like everyone else) place on status display and how this interferes with their effectiveness. The connection with self-experimentation is that no matter how effective it is, no psychology department would stoop to teach it. Or, at least, that's the current state of affairs.

The book's index doesn't include Veblen, although it does include Richard Thaler.

1. <http://www.blog.sethroberts.net/2010/07/31/without-great-teachers-nothing-else-matters/>

Mary O'Keeffe (2010-08-18 10:23:28)

That's not true. I recall reading Susan Ohanian (a great teacher and writer) writing in one of her wonderful books that the only thing of actual usefulness that she learned in the teacher-ed classes she was required to take for certification was a technique for handing out papers efficiently! <http://www.susanohanian.org/index.php>

Maria Droujkova (2010-08-18 12:18:36)

There are a lot of classes on "how to pass papers around." They are called Classroom Management and taught by Curriculum and Instruction departments. People who study education theory are in Education departments. The two departments (or, in smaller institutions, parts of the same department by whatever name) typically don't talk to one another much, nor do they communicate with the corresponding Subject Area departments. So, for example, a future math teacher may learn classroom management from one professor, education theory from another, and math from the third - with the three professors belonging to three different departments. This makes little practical sense, because in real classroom, these "parts" aren't separable at all.

Eric Meltzer (2010-08-18 21:54:54)

I love specific and concrete (low status?) advice like what is in this book. I am considering ordering it even though I don't do any in-classroom teaching just because I love reading about techniques like this. I find it is MUCH easier for me to think up or understand general principles when given a set of great concrete tips than it is for me to generate great concrete tips from a set of abstract principles. I suspect this is the same for everyone, which makes me think that concrete tips should be valued MUCH higher than anything abstract!

Seth Roberts (2010-08-19 07:21:26)

Eric, yeah, I agree. Maybe knowing it is low-status protects you from the derogatory effects of that. So you are better able to take advantage of it. So people who understand Veblen are more free than people who don't.

disgruntledphd (2010-08-20 07:53:19)

I am a psychologist who teaches, and I have encouraged almost all my students to experiment on themselves, given that its the easiest way to get data. That being said, i dont know if its part of the formal curriculum anywhere.

Stephen M (Ethesis) (2010-08-21 07:04:21)

Seth, thanks for the pointer. There is a real issue in many disciplines that emphasize that teaching really is not as important as other things - even though, in theory, the teachers/professors are being hired to teach (from the public perspective) ;)

## **Beijing Students at Berkeley (2010-08-18 21:33)**

In downtown Berkeley I met a group of Chinese students from Beijing. They were entering freshmen at UC Berkeley.

They said there were 40 students like them - from Beijing, entering UC Berkeley. (At Tsinghua, there will be 400 entering freshmen from Beijing.) In all of China, 13 students were admitted to Harvard, about the same number to Yale and Princeton. One of them said she'd wanted to go to Northwestern but hadn't gotten in. Had she gone to college in China, she might have gone to Renmin University, perhaps the #3 university in China.

Surely their parents were wealthy, yes. But they preferred an American college to a Chinese one for two main reasons: 1. They can choose whatever major they want. At Chinese universities students are often forced into a major they don't want if their scores are high enough to get into a prestigious university but not high enough to get into the major they want at that university. 2. They believe that if they graduate from an American university they will have more opportunities. Where did they get the idea of coming to Berkeley? I asked. Online, they said. Their English was really good.

The "more opportunities" may not be as simple as they think. In Beijing I know a Chinese businesswoman who hired a recent college graduate. She'd gone to college in England, indicating that her parents were wealthy. The new worker turned out to be irresponsible and had to be fired. Perhaps her parents had spoiled her. In this businesswoman's eyes, an overseas education may now be a negative.

---

thehova (2010-08-19 04:13:01)

But I bet on the whole, it works the other way around. Well, at least in America I think that's true. Lots of parents send their kids to top private high schools to signal to colleges, "we've spent a lot of money and energy on our kid" (same might be true why people go to more expensive private colleges).

dearieme (2010-08-19 06:05:35)

It's also possible that in the west they learn not always to do as they are bloody well told.

### **Assorted Links (2010-08-19 21:54)**

- [1]A new paper debunks Michael Mann's Hockey Stick global temperature graph. "Climate scientists have greatly underestimated the uncertainty of proxy-based reconstructions and hence have been overconfident in their models." Very well written.
- "Obscure, contemporary ethics books . . . were actually about 50 % more likely to be missing than non-ethics books." [2]Paper. The study was done entirely online and covered 32 large university libraries.
- [3]Gladys Reid, Australian discoverer of benefits of feeding zinc to farm animals. "Reid was reluctant to make direct dose recommendations after claiming the Director General of Agriculture had told her she would be taken to court for misleading practices if she did. However she won followers from farming wives in particular. Many would call asking for zinc advice after tiring of seeing suffering livestock and husbands on the brink of suicide from crippling stock and production losses."

bob (2010-08-20 08:30:32)

Yes, it seems well written. However, I would not describe it as "debunking". From the paper: "Natural climate variability is not well understood and is probably quite large. It is not clear that the proxies currently used to predict temperature are even predictive of it at the scale of several decades let alone over many centuries. Nonetheless, paleoclimatological reconstructions constitute only one source of evidence in the AGW debate. Our work stands entirely on the shoulders of those environmental scientists who labored untold years to assemble the vast network of natural proxies. Although we assume the reliability of their data for our purposes here, there still remains a considerable number of outstanding questions that can only be answered with a free and open inquiry and a great deal of replication."

G (2010-08-21 08:40:31)

Have always liked to pace up and down when thinking - I think this is a more natural, varied way to body-think (sometimes, when no one is looking, I sort of dance), but I suppose an office environment has to be more controlled and one has to be near one's working materials, keyboard etc. In 'The Grapes of Wrath' the farmers always squat down together and doodle in the dust with sticks when having a confab. I think if you are forced to think while stock still and suppressing the body you might get more rigid and dumb over time.

### **The Marc Hauser Case (2010-08-21 07:43)**

It would have been harsh to title this post "Marc Hauser, RIP". However, unless [1]the following is shown to be in error, I'll never believe anything he writes or has written:

According to the document that was provided to The Chronicle, the experiment in question was coded by Mr. Hauser and a research assistant in his laboratory. A second research assistant was asked by Mr. Hauser to analyze the results. When the second research assistant analyzed the first research assistant's codes, he found that the monkeys didn't seem to notice the change in pattern. In fact, they looked at the speaker more often when the pattern was the same. In other words, the experiment was a bust.

But Mr. Hauser's coding showed something else entirely: He found that the monkeys did notice the change in pattern—and, according to his numbers, the results were statistically significant. If his coding was right, the experiment was a big success.

The second research assistant was bothered by the discrepancy. How could two researchers watching the same videotapes arrive at such different conclusions? He suggested to Mr. Hauser that a third researcher should code the results. In an e-mail message to Mr. Hauser, a copy of which was provided to The Chronicle, the research assistant who analyzed the numbers explained his concern. "I don't feel comfortable analyzing results/publishing data with that kind of skew until we can verify that with a third coder," he wrote.

A graduate student agreed with the research assistant and joined him in pressing Mr. Hauser to allow the results to be checked, the document given to The Chronicle indicates. But Mr. Hauser resisted, repeatedly arguing against having a third researcher code the videotapes and writing that they should simply go with the data as he had already coded it. After several back-and-forths, it became plain that the professor was annoyed.

"i am getting a bit pissed here," Mr. Hauser wrote in an e-mail to one research assistant. "there were no inconsistencies! let me repeat what happened. i coded everything. then [a research assistant] coded all the trials highlighted in yellow. we only had one trial that didn't agree. i then mistakenly told [another

research assistant] to look at column B when he should have looked at column D. ... we need to resolve this because i am not sure why we are going in circles."

The research assistant who analyzed the data and the graduate student decided to review the tapes themselves, without Mr. Hauser's permission, the document says. They each coded the results independently. Their findings concurred with the conclusion that the experiment had failed: The monkeys didn't appear to react to the change in patterns.

They then reviewed Mr. Hauser's coding and, according to the research assistant's statement, discovered that what he had written down bore little relation to what they had actually observed on the videotapes. He would, for instance, mark that a monkey had turned its head when the monkey didn't so much as flinch. It wasn't simply a case of differing interpretations, they believed: His data were just completely wrong.

As word of the problem with the experiment spread, several other lab members revealed they had had similar run-ins with Mr. Hauser, the former research assistant says. This wasn't the first time something like this had happened. There was, several researchers in the lab believed, a pattern in which Mr. Hauser reported false data and then insisted that it be used.

If taken literally, this description seems to imply that Hauser was making up data – writing down results much more favorable to his career than the actual results – and not realizing it! As if someone else was marking the data sheet. Since the videotapes are being coded by more than one person the fabrication/delusion/whatever would come to light, you might think, but he does it anyway! And then gets "a bit pissed" when things don't work out perfectly.

I would love to hear Hauser's side of this story, and see the videotapes being coded. So far Hauser has said nothing to make me doubt the straightforward interpretation: He made up data. After Saul Sternberg and I published a paper implying that [2]Ranjit Chandra had made up data, Chandra retired.

[3]Derek Bickerton says Hauser "fell victim to a soon-to-be-outdated view of evolution". I am more interested in what this says about Harvard and Hauser's co-authors. In particular, I wonder what Noam Chomsky, one of Hauser's co-authors, will say. The incident makes Chomsky look bad. Hauser appears to be a person who pushes aside the truth of things. That Chomsky wrote a major paper with him suggests that Chomsky failed to notice this.

Thanks to Dave Lull and [4]Language Log.

dearieme (2010-08-21 10:08:09)

"Scientific dogma, not Hauser is to blame for misconduct": geeze, we need to ignore Godwin here. "Anti-semitism, not Hitler, is to blame for Holocaust." Never blame a crook when you can hold an abstraction responsible.

CF (2010-08-21 14:49:01)

"The incident makes Chomsky look bad. Hauser appears to be a person who pushes aside the truth of things. That Chomsky wrote a major paper with him suggests that Chomsky failed to notice this." It's this kind of guilt-by-association that worries me the most, given that I have friends and colleagues who either passed through Hauser's lab at some point or were associated with him loosely, as co-authors. Please recognize that a lot of the work with his name on it was conducted entirely out of his hands, and thus the integrity of that research rests on those authors. Unfortunately, it's difficult to sort out which papers he had his fingers on the data collection/coding/analysis, and which he was a passive participant in or only helped in designing experiments and/or writing the results up. Note that he was apparently exposed BY HIS STUDENTS, which to me says a lot for those who took those measures, since they placed themselves at risk both personally and professionally. You want to roll them up in the guilt-by-association mess, also? Finally, wasn't the Chomsky paper purely theory? So how would Chomsky "notice" Hauser's tendency to distort or outright fake data? If it's just an ideas paper, then I don't see what it has to do with all of this. I'm not defending that paper, which I personally found opaque and muddled, I'm just saying I don't see Chomsky as having any guilt-by-association whatsoever, and I think it is extremely unfair to characterize him that way. I'm not defending Hauser one iota, he deserves to be fired in my frank opinion. For the sake of avoiding a witch-hunt that punishes the innocent, Harvard should be transparent on this matter, and also force Hauser and his colleagues to clarify their respective roles in the authorship of each paper to the extent possible, regardless of whether their authenticity has been formally called into question.

Seth Roberts (2010-08-21 17:05:42)

CF, it doesn't matter because Chomsky wrote a "theory" paper with Hauser? I don't follow this argument. Theories are supposed to be based on facts – on evidence. That evidence should be fairly described, not slanted (e.g., by omission, by overstatement) toward a favored point of view. Which is exactly what Hauser seems to have done – grossly slant stuff to help his career. If Chomsky writes theory papers unrelated to, unconcerned about, or unaffected by available evidence, that REALLY makes him look bad. The students who exposed Hauser did not co-author papers based on faked data, we can be sure. They are cases of esteem-by-lack-of-association. In [1]this article, Michael Ruse, a philosopher further from Hauser than Chomsky is, is angry. "I feel a bit as though I have got egg all over my face," he writes.

1. <http://chronicle.com/blogPost/HauserHarvard/26308/>

SJ (2010-08-21 19:24:33)

If Hauser walked around with a badge that said "FAKER" and his coauthors ignored this, you might have reason to blame them. But it wasn't like that. Hauser is an outstanding experimentalist, a sharp thinker, astonishingly erudite, and on top of about six different fields. That stuff doesn't become false just because it turns out he was also faking his data. OK, say you're Chomsky, and Hauser has a bunch of cool ideas that sync with what you're doing and you sit down to write a paper together (and with Fitch). What now? you're supposed to ask to see the lab notebooks and inspect his hard drives for the data from his already published papers before trusting him enough to write a paper together? Don't be silly. Or maybe you think if you're any good at all you're just supposed to see directly into Hauser's soul and know you're dealing with a criminal mastermind? And you're just a loser if you don't have those particular superpowers? I don't think so. Is that what you really think? Remember, Hauser and Chomsky didn't do any experiments together. They thought some thoughts together, which is a very different thing.

John (2010-08-21 19:27:44)

You can't seriously expect Chomsky to review this sort of data. He's obviously a theory guy, and wouldn't have the lab training anyway. Hauser claimed to have discovered that tamarins can grasp the rules of a regular grammar while failing to grasp analogous rules in a phrase-structure grammar. Since these concepts come straight from the Chomsky hierarchy, it is only natural that Chomsky would have been interested. Hauser claimed to have evidence that made it look like differences in monkey-vs.-human competence could be mapped onto part of the Chomsky hierarchy. Very cool, if true. But if tamarins can't even pick up the rules of a regular grammar, then it just shows that Hauser failed to establish a connection. I don't see how Chomsky's syntax is discredited or his speculations on language evolution.

G (2010-08-21 19:31:43)

Uh, I dunno Seth, it's not like Chomsky married and lived with a serial-killer for ten years without twigging, and you don't know that this kind of seediness has blighted everything Hauser's ever done. It seems like innuendo to try to tar him with this. Do

you have something else against him? I have always found his ideas about politics interesting; I think he is useful. I like that he stresses the relationship between thought and language, though I vaguely recall feeling unconvinced by his ideas about animals. Humans probably do have unique hard-wiring for language, but if apes can use sign-language, there's no point in denying that that is language-aquisition - that strikes me as goalpost-shifting.

CF (2010-08-21 21:28:04)

Seth, it's pretty difficult to detect that someone is faking this sort of data unless you see the raw data - i.e., the tapes. How the heck is Chomsky (and similarly placed individuals) supposed to guess Hauser is up to no good on papers he has NOTHING to do with except as a reader, can't replicate on his own, and that no one has publicly challenged the integrity of? Of course I'm sure Chomsky is disappointed and feels like he has "egg on his face" to some degree as well, but it's hardly surprising that a human was successfully able to deceive other humans. I don't think we should think less of the deceived unless they personally saw two sets of tape codings (or Hauser's coding plus the tape), noticed the fact that they disagreed, and thought or said nothing. We have evolved with a lot of social machinery, and deception is one technology that often succeeds. Unless you've developed some foolproof B.S. detector you'd like to sell us? I'd love to have one of those...

Seth Roberts (2010-08-22 00:14:14)

CF, I agree. I didn't mean my comment as a judgment, I was just predicting the future. I should have made that clear. I don't think less of Chomsky because of this. It's like predicting that X will win the election even though you didn't vote for him.

dearieme (2010-08-22 03:36:06)

The first case of crookedness that I was told about involved a distinguished researcher who invented some data to supplement real measurements. His postdoc co-author later realised what had happened and opined, in private, that the invented data were probably pretty good - the so-and-so had had a fine intuition for the problem in question. Later in his career the wrongdoer was eased out from his post in an ancient university, the charge sheet including bullying, blackmail and theft, in addition to mere academic crimes like plagiarism. Experience teaches that once someone decides that he's too grand for the rules to apply to him, and once he gets off with it, problems get worse.

Alex Chernavsky (2010-08-22 07:52:35)

Reminds me of the story of Samuel Waksal, former CEO of ImClone and friend of Martha Stewart. (He spent seven years in federal prison for insider trading and related crimes.) Before he became a businessman, he spent time in academia, doing biology research. He resigned from (or was forced out of) four different institutions - all under highly suspicious circumstances. [http://online.wsj.com/article/NA\\_WSJ\\_PUB:SB1033076483640238993.html](http://online.wsj.com/article/NA_WSJ_PUB:SB1033076483640238993.html)

John (2010-11-15 18:51:23)

"The incident makes Chomsky look bad" - especially because Chomsky has been Hauser's mentor for more than 15 years: <http://www.thecrimson.com/article/2010/9/14/hauser-lab-research-professor/>

### **Open-Access Publication Fees at the BMJ (2010-08-21 14:11)**

Open-access is why you're reading this. Because [1]my long self-experimentation paper was in an open-access journal, many people could easily read it. I'm sure this is why I managed to get a contract to write The Shangri-La Diet.

The BMJ is experimenting with [2]a way to support open access: Ask for publication fees from authors with grants that include the appropriate support.

We are introducing this policy as the next step in our efforts to ensure the sustainability of open access publication of research in the BMJ, and we are doing so in the spirit of experimentation. Many research

funding organisations, sponsors, and universities now provide grants that cover journals' fees for open access publication.

Wise. While I was writing The Shangri-La Diet, I visited Alice Water's [3]Edible Schoolyard. I learned that it cost hundreds of thousands of dollars a year, provided by foundations. As far as I could tell, the people in charge were doing nothing to reduce the subsidy required. Yet they wanted the idea to spread.

### More Saturated Fat, Less Stroke (2010-08-23 07:59)

[1]This recent study from Japan found that middle-aged men and women who ate more saturated fat had a lower risk of stroke. The rate of strokes was 30 % lower in the highest intake quintile compared to the lowest quintile. There was a non-significant reduction in heart disease.

Other big differences were correlated with saturated fat intake. For example, those in the highest quintile had more college education than those in the lowest quintile and were more likely to do sports >1 hr/week. These data by themselves won't convince anyone that saturated fats are beneficial. But they should push you in that direction. Contrary to what you've heard a million times.

As far as I can tell, eating lots of butter has lowered my blood pressure. High blood pressure is associated with greater risk of stroke.

Although pig fat certainly helped me (I slept better), I've found butter is even better. [2]Butter has considerably more saturated fat than pig fat. The fat in butter is 60 % saturated fat, whereas pig fat is 40 % saturated fat. My consumption of 60 g/day of butter gives me 36 g/day saturated fat. In this study, persons in the highest quintile of intake averaged 20 g/day. The highest intake in the whole study (60,000 people) was 40 g/day. In addition to butter, I eat cheese, whole-fat yogurt, and meat, so I'm surely higher than that.

Via [3]Whole Health Source.

JM (2010-08-23 10:00:21)

I had a pretty severe health disaster recently. Malnutrition + anxiety -> negative feedback loop that ended up causing serious

damage. Overnight I went from being a lifelong near-narcoleptic to an insomniac. At one point I thought I was developing schizophrenia due to mild hallucinations (there's a correlation between malnutrition and the onset of psychopathology). It's been several months and I feel like my brain is slowly improving. I can't sleep as well as I used to, but I can't complain either. One thing I'm consciously doing is eating massive amounts of butter and high fat dairy products. Based on my day-to-day experience (e.g. some days of eating no butter, and having somewhat worse sleep the following night) I can't help but believe that saturated fat is playing a key role in short-term and long-term brain function.

CTB (2010-08-23 11:42:56)

A couple of things. The USDA recommends limiting sat fat to 10 % of calories. If you eat 2000 total calories per day, that would be 200 calories of sat fat. there's 9 calories per gram of fat, so that would be  $200/9 = 22$  grams of sat fat. So on average, the highest quintile was eating the USDA recommendation for sat fat. Which then makes you wonder how little fat the lowest quintile was eating. Usually, foods with high saturated fat come from animal sources...which means they also contain significant cholesterol. So the people in the lowest quintile were possibly eating no animal fat...maybe traditional lowfat Japanese food? with highly salted (preserved) fish? and low amounts of cholesterol? When Japanese switch from traditional diets to more Westernized food (in moderation), a lower risk of stroke has been noted in the past. This has been attributed to the protective effect of adding a little more cholesterol to the diet and reducing salt. Cholesterol is crucial to the membrane stability of every cell in your body. Increased salt intake is associated with increased blood pressure. Increased pressure against weakened membranes on vascular cells can lead to rupture. There's also concern that reducing cholesterol too low with statins can lead to increased stroke risk. So perhaps the take home message from this study is that if you're eating a traditional Japanese diet, you can go ahead and add a cheeseburger every day for lunch.

John (2010-08-23 11:43:03)

Seth, why don't you try culturing your butter, if you haven't already. Take some heavy cream, throw a dollop of yogurt in it and stir, wait overnight. Then whisk the cream until it butters up. Drain off the buttermilk (and drink!), then wash the butter in water to get rid of the excess buttermilk (or the butter will apparently go sour in a less than tasty way, but who knows). It is very buttery, more so than uncultured sweet cream butter, and gives you saturated fat and more delicious lactobacilli.

q (2010-08-23 11:46:16)

do you eat the butter so that you taste it? is it possible that some effects have to do with tasting it? i've been alternating between butter and canola and flax oil for a couple weeks for my SLD routine and find that butter is pretty effective and easier on my stomach than canola or flax. but i haven't noticed any mood or intelligence effects, and my sleep is so variable (and has remained so) that i'd have to chart it to be sure of anything. flax oil has the problem that i can kinda sorta taste it even half an hour later, so i'll have to figure out how to do it right.

Hap (2010-08-23 13:15:56)

All I can say is that the butter sold by Spring Hill at the Berkeley Farmers' Markets is from pasture-fed cows in Petaluma – and it is VERY TASTY. Spring Hill claims it does contain Weston Price's "X-Factor," i.e. Vitamin K2. I get myself in trouble (?) by leaving it on the kitchen counter to soften, right next to a container of crackers. No knife needed. Talk about instant gratification!

Seth Roberts (2010-08-23 14:07:08)

q, I started by tasting it. Lost 10 pounds. Then started gaining it back. Then switched to eating it noseclipped. Then started losing again. You won't notice the intelligence effects unless you carefully measure it, as I did. I wasn't terribly good at predicting how well I'd do on the arithmetic test. CTB, that's very interesting. The very low rate of Japanese heart disease has usually been attributed to lots of fish and low saturated fat. This study makes that explanation unlikely – and therefore makes more likely an alternative explanation I like: the low rate of heart disease is due to all the fermented foods they eat (e.g., miso). The high rate of Japanese stroke has usually been attributed to a salty diet. This study suggests it's due to too-little saturated fat.

vic (2010-08-24 00:33:20)

I'll up my consumption of saturated fat after you report an improvement in your follow-up heart scan

Alex Chernavsky (2010-08-24 04:32:51)

Seth, there are a lot of little nuggets of nutrition-related information scattered throughout your blog posts and comments. I think it would be useful for your readers if you could organize and condense them into some kind of longer document.

G (2010-08-24 08:02:56)

I tend to stay away from cheap sausages knowing that they are mostly fat, skin and unappealing low-value cuts. But sometimes I wonder whether any of this is truly unhealthy in moderation. People often joke that haggis is junk-food, but it's not in the least.

Seth Roberts (2010-08-24 16:10:10)

Alex, thanks for the suggestion. But there are not enough hours in the day.

Nansen (2010-08-26 13:18:17)

"As far as I can tell, eating lots of butter has lowered my blood pressure." At what time(s) of day do you take your blood pressure?

Seth Roberts (2010-08-26 18:17:42)

I take my blood pressure early in the morning. Such as 6 am.

## **Asthma and Probiotics (2010-08-24 05:46)**

In [1]a long comment on [2]an earlier post, JohnG tells how he failed and succeeded to get rid of disabling exercise-induced asthma. Lots of things didn't work:

I tried Vitamin D; it didn't work, but it did help my nasal allergies somewhat. I tried low carb dieting, and just like Dr. Lutz of "Life Without Bread" said, it made asthma worse while it practically cured my nasal allergies. I also tried the Dr. Sears approach of taking as much as 7.5g of EPA/DHA a day; no change at all in the exercise induced asthma.

The idea that asthma is due to lack of microbes made sense to him and he started trying fermented foods and probiotics. At first, nothing:

I re-reviewed the probiotic slant and found the Helminth story and all the trials that were going on in PubMed for them. With that logic in hand, I set about to find a probiotic that worked. I tried yogurt, kefir, fermented cabbage, and buttermilk to no avail. I then tried store bought probiotics one by one. I tried The Maker's Diet probiotic and it didn't help; but I do think it helped make a 20 year long wart go away. I also tried all forms of probiotics on the market; even LGG. Nothing.

Finally, success:

I bought this super high dose probiotic and took it along with a L. Sporogenes/[3]bacillus coagulans. Voila, three days later I could really feel the difference during exercise. I continued that for 10 days. By the 10th day, I didn't have to hit my inhaler at all during exercise. Wow!

First, I had to decide which probiotic did the trick. I didn't want to spend a ton on that high dose probiotic, so I stuck with the Bacillus Coagulans and it continued working normally. So, I found my probiotic. Now, I needed to verify it wasn't placebo. A close cousin to exercise induced asthma is the

phenomenon of waking up sneezing and then promptly getting an asthma attack/or closure after that.

I went off my bacillus coagulans that I had been on for 14 days. By the second day, I noticed a little difference. By the third day, I had to hit my inhaler during the workout. By the 10th day (bacillus coagulans supposedly lives in your intestines 7 days), I was full-blown back to having to use 4 inhaler puffs and it wasn't doing the trick. This was test phase one.

I then went back on the bacillus coagulans for 10 days. The same process repeated itself. The nightly asthma attacks abated after about 4 days and the same no-puff needed during exercise continued as well.

I then went back off the bacillus coagulans for 10 days. I got the asthma back at day 3.

I've now been back on 5 billion CFU's of bacillus coagulans (duraflora) for 18 days. I don't have to use my inhaler for exercise. I can feel the asthma come on very slightly and then go away.

Very impressive. Shows what can happen if (a) you think for yourself, (b) persist, and (c) have access to a lot of helpful information. I think he needed all three.

Aaron Blaisdell (2010-08-24 07:47:51)

Very well done self experimentation! The ABABA design really strengthens conclusion about the causal relationship between probiotics (of a particular type) and his asthma.

Aaron (2010-08-24 11:03:55)

This is probably the wrong forum for this, but I wonder why he had to keep supplementing with the bacteria. Don't they continue to feed and multiply once implanted? If I were him, I would start to look at factors of my diet and lifestyle that were killing this helpful bacteria in my gut.

JohnG (2010-08-25 09:16:43)

Good point Aaron. I've considered the same thing. I'm hoping that, over time, on a paleo-like diet while taking the bacillus coagulans my body will heal itself, but I'm just not sure that's how it works. Here's two points that oppose that thought which I've considered thus far. One, because of my diet, other environmental exposures, or just something genetically fouled up in my system, I may never get better and need a probiotic of some kind for the rest of my life; ala prescription medicines. Two, perhaps we were meant to have some level of exposure (load) to these agents (soil organisms, etc), and maybe some people require more because of genetics. I'm currently leaning to believe it is some combination of the two. As a side note, I also had mild colitis for about 15 years which has not returned since I've begun the treatment.

John (2010-08-25 22:10:14)

Well, it appears from the probiotics books that I have read that you will need supplementation in the long term if you want a particular, commercial probiotic as non-native bacteria don't permanently colonize the gut. You get the mix early in life from

family and early environmental exposure. Another point is that in a more bacteria-rich environment, you wouldn't need to seek out commercial bacteria to ingest—they would be present in larger numbers in your food.

Alex Chernavsky (2010-08-26 11:22:28)

My wife had various gastrointestinal problems that all went away (or at least improved a lot) after she started drinking kombucha. However, she has to drink it about three times a day to maintain the beneficial effect. She's been doing this for about three or four months, I think, with no cumulative effect. If she misses a dose, the symptoms return.

David (2010-08-26 13:19:03)

The detailed ecology of the gastrointestinal tract is poorly known, to say the least. Maybe 1 % of the intestinal organisms have even been identified. Seeing results where a single probiotic addition improves a symptom in an obvious way may give the false idea the system is simpler than it actually is. It should not be surprising that the positive effect does not last without continuing intake because of the unlimited complexity of the internal ecology and unknown players involved.

Tom (2010-08-27 07:59:57)

There's a lot of great information on the 'cooling information' blog. He recommends eating apples and onions (for pectin & inulin, I believe?) a form of fiber that supports intestinal bacterial growth. He also recommends eating a broad array of vegetables that have *not* been cleaned too well.

JohnG (2010-08-27 08:29:49)

I've tried the apples, jicama root, fennel, etc to no success. I do juice carrots twice a week and don't wash them. We have a garden and don't wash the vegetables well either for the same reason. I agree with David's complexity idea. The bacillus coagulans is clearly a band aid of sorts; performing a needed function somehow missing in me currently. What really throws a wrench in the works is the fact that my Dad and one of my sons both have the same problem; and my other son has atopic dermatitis. So, clearly, there's a genetic component. Now, is that a genetic component that manifests itself via an incorrect diet or just a different environment than we were adapted for. Or, what if the genetic problem is just that; a malfunction which persists with the aid of antibiotics to keep us alive long enough each generation to pass it along. Lots of variables to bewilder the mind. That's why I really get excited when something works like this.

Seth Roberts (2010-08-27 10:07:16)

JohnG, it's a genetic problem that only becomes visible in a bad environment. Like Aaron Blaisdell's sun sensitivity. We were designed to live in an environment where we ate lots of bacteria-laden food. Lack of such food makes us sick. Some of us get more sick than others, partly for genetic reasons.

Aleksandar Totic (2010-08-30 16:14:58)

Seth, I stumbled upon your blog earlier this year. It held my interest, I've always been attracted to alternatives. This is the first post where I'd like to try out your suggestion, but I could not find "bacillus coagulans" at Whole Foods. Any suggestions on where can I order it from?

JohnG (2010-08-31 08:22:53)

Aleksandar, I'm currently using Source Naturals Dura Flora. Thorne Research's Lacto bacillus Sporogenes (the old name for this probiotic which is now called Bacillus Coagulans) also has it. And, there are a few others which have Bacillus Coagulans/Lactobacillus Sporogenes as well. Seth, yeah, that's what I figured. I'm excited that this probiotic has done so much for me, but I'll be even more excited if my body can heal to the point where I don't need as much of it. I'm currently taking 10 Billion CFU's of the Bacillus Coagulans because the Autumn is my worst time of year. So far, I only have to hit the rescue inhaler about one out of every three workouts (and only one time). I'm still on my nightly steroid inhaler which I used to take twice a day. I did go off the steroid inhaler for one of my three 14 day tests, and I did notice some difference being completely off of it. I'll see how I progress this Fall. I might go off it before the Fall ends depending on how this treatment progresses.

Anon (2010-10-26 21:12:16)

>Thereâ€™s a lot of great information on the â€˜cooling informationâ€™ blog. That's cooling *inflammation*, not information  
And yes it is a great resource

Richard Friedel (2010-12-20 06:31:33)

A relevant but strangely ignored or not generally known fact about asthma and breathing troubles is that the change between weak (asthmatic) and strong (healthy) breathing is dependent on abdominal muscle tension. Slackening the muscles here causes abysmally weak and asthmatic breathing. Training the muscles, for example by â€œabdominal hollowingâ€ (see Web articles) produces an antiasthmatic effect. Abdominal muscle tension plays a prominent part in Asian martial arts. I tend to breathe asthmatically after an evening meal or in pollen-laden air. So it is fair to assume that there is a natural breathing spectrum with an asthmatic tendency at one end and Ku Fu or Karate breathing at the other end. For a few words on the Japanese version of Asian breathing see <http://www.lrz.de/~s3e0101/webserver/webdata/OBT.pdf> Breathing powerfully into my lower abdomen with tensed muscles provides an effective cure for me. But then Iâ€™ve always been sceptical about medical wisdom on asthma: such a paradoxical and doctor-baffling increase in the last 40 years with modern, merely symptomatic inhalers. Respectfully, Richard Friedel

JohnG (2011-01-27 09:47:18)

Richard, That's interesting, but definitely does not apply to me. I have some allergic asthma along with exercise induced asthma. I can crank out 50 sit ups or 15 toe to bars without breaking a sweat. My abdominal muscles are strong yet I still have asthma. I do have some success damping down asthma if I try to keep my lungs empty until I have to breath. At that point, I breath in from the bottom of my lungs up (i.e. using the abdomen to pull the air in). This helps when sitting idle, but is of no help during Crossfit-type strenuous activity. John

Sinisa Janicijevic (2011-05-19 12:52:41)

Great information. It's always good to know that there is some new alternative remedy for asthma. Is there any web site where we can purchase "bacillus coagulans". I would also suggest you to try Buteyko Breathing Technique. The approach takes its name from the past Ukrainian doctor Konstantin Pavlovich Buteyko. Many of the studies showed patients who used the Buteyko method experienced a reduction in the symptoms of their asthma and many of the patients also were able to reduce their use of inhalers by two uses a day after using the method for six months.

## Web Alternative to Peer Review (2010-08-24 22:22)

Mixing traditional and new methods, the journal ["the prestigious Shakespeare Quarterly"] posted online four essays not yet accepted for publication, and a core group of experts . . . were invited to post their signed comments on the Web site MediaCommons, a scholarly digital network. Others could add their thoughts as well, after registering with their own names. In the end 41 people made more than 350 comments, many of which elicited responses from the authors. The revised essays were then reviewed by the quarterlyâ€™s editors, who made the final decision to include them in the printed journal, due out Sept. 17.

[1]The NY Times article never says how many of the four posted essays were published. If all of them made the cut, then perhaps the web stuff was just for show. And if any of them didn't make the cut, the public embarrassment would be great. Perhaps too great. I suspect that all of them made the cut and the whole thing was closer to a publicity stunt than something that you could plausibly do again and again. If the probability of acceptance given that your essay is posted is 100 %, what matters is getting posted. Peer review wasn't replaced by web review; it was replaced by behind-closed-doors review.

Another instance of academics outwitting this particular journalist:

To Mr. Cohen, the most pressing intellectual issue in the next decade is this tension between the insular, specialized world of expert scholarship and the open and free-wheeling exchange of information on the Web. “And academia,” he said, “is caught in the middle.”

Haha! Poor poor professors! Caught in the middle! I was under the impression that professors = expert scholarship. Anything to distract attention from the real change: The more education you can get from the Web, the less you need to get from professors. The more evaluation you can get from the Web (e.g., by reading someone's blog), the less you need to get from professors. The less professors are needed, the fewer of them there will be.

Thanks to Dave Lull.

---

LemmusLemmus (2010-08-24 23:18:39)

"The revised essays were then reviewed by the quarterly's editors, who made the final decision to include them in the printed journal" Doesn't that mean ". . . to include all of them?"

Seth Roberts (2010-08-25 08:31:21)

Maybe. It might also mean the editors were the ones who made the final decision.

Gunnar (2010-08-26 19:23:40)

The web alternative requires that people think for themselves and not just accept what's on the menu. That's good imho ;-)  
And a reason why I like this blog. So Thank you Seth for your blog! Gunnar

Eric Meltzer (2010-08-29 08:43:37)

Wouldn't posting them anonymously solve the embarrassment problem?

Caleb (2010-08-25 20:43:01)

Great, now I'm slaving for some prosciutto, and I don't think it's even available out here in the boondocks

Caleb (2010-09-10 09:34:30)

Wai! Thanks for sharing about prosciutto! I finally found some and it was even more delicious than I imagined

### **New Heart Scan Results: Good News (2010-08-28 06:04)**

One and a half years ago, in February 2009, I got a [1]heart scan. It's an X-ray measurement of how calcified your arteries are. Persons with high scores are much more likely to have a heart attack than persons with low scores. Scores in the hundreds are dangerous. Tim Russert, who died at age 58 of a heart attack, [2]had a score of about 200 ten years before his death. Above age 40, the scores typically increase about 25 % per year. That puts Russert's score when he died at around 2000.

A few weeks ago I got another scan, at the same place with the same machine. Here are my scores. February 2009: 38 (about 50th percentile for my age). August 2010: 29 (between 25th & 50th percentile). In other words: 47 % lower than expected. The earlier scan detected 3 "lesions"; the recent scan detected 2. The woman who runs the scanning center - [3]HeartScan, in Walnut Creek, California - told me that decreases in this score are very rare. About 1 in 100, she said.

The only big lifestyle change I made between the two scans is to eat much more animal fat. After I found that pork fat improved my sleep, I started to eat a large serving of pork belly (with 80-100 g of fat) almost every day. Later I switched to 60 g of butter every day. The usual view, of course, is that to eat so much animal fat is v v bad and will "clog" my arteries. In fact, the reverse happened. Judging from this, the change was v v good.

1. <http://www.mayoclinic.com/health/heart-scan/MY00327>

2. <http://heartscanblog.blogspot.com/2008/06/tim-russert-had-heart-scan.html>

3. <http://www.heartscan.com/>

---

q (2010-08-28 06:38:02)

great news! where do you get the 47 % from?

Chris Sturdy (2010-08-28 06:41:11)

Excellent news! I'll have eggs fried in lots of butter to toast your success!

Allen K. (2010-08-28 07:45:10)

I'm selfishly very glad - I want to keep reading you for a long time! (And eating animal fat.)

John (2010-08-28 08:41:08)

Keep on driving a steak thru the heart of conventional wisdom!

Seth Roberts (2010-08-28 08:46:20)

how I got 47 %: At 25 % increase/year, 1.5 years should produce a 40 % increase. With a 40 % increase, 39 becomes 54. My actual score, 29, is 53 % of 54.  $100 - 53 = 47$ .

Gaspard (2010-08-28 10:50:49)

Did you simply add this fat to your diet or eat less of something else? An extra 60g fat would be 540 extra calories a day, no?

K (2010-08-28 11:08:17)

Good for you! I am unsurprised by your result. If you hang out in the paleo/low carb forums, you see this kind of thing a lot. And let's not forget that the greatest (and most vilified) proponent of animal fat, the late Dr. Atkins, was a cardiologist. By the way, I am curious. Do you eat low(ish) carb?

Alex Chernavsky (2010-08-28 12:28:16)

Seth, have you ever heard of the brachial artery tourniquet test? It's supposed to test the health of your arteries. I once heard a lecture by [1]Dr. Caldwell Esselstyn, a cardiologist who advocates an extremely low-fat diet as a means to prevent or treat heart disease. Esselstyn uses the results of the tourniquet test as evidence that ingesting even modest amounts of lipids can make your arteries "stiffer" (i.e., less able to dilate after being constricted). I remember that Esselstyn made a big deal out of it during his lecture.

1. <http://www.heartattackproof.com/>

Timothy Beneke (2010-08-28 14:26:31)

Question: Had you lost weight between the 2 scans? And is that a relevant variables in bringing down your numbers? And what is the retest validity if you take the test twice in a row after waiting a week or so?

Vic (2010-08-28 15:38:14)

Good news Seth! Besides the animal fat, what's the rest of your diet like? and how often do you eat? Besides your walking and biking, do you do any other exercise? Do you think your improved sleep helped to improve your score?

Seth Roberts (2010-08-28 17:14:50)

Did I simply add the fat to my diet or eat less of something else? I ate less of everything else. Butter is not all fat; 60 g of butter is about 500 calories. I already ate low-carb. The rest of my diet is meat, vegetables, and fermented foods, such as kombucha and yogurt. I eat one normal meal per day. I walk hard uphill on a treadmill a few times/week. Perhaps I lost 7 pounds between the two scans. I'm not sure, but weight loss alone can't produce such a change, in the sense that I can't imagine a plausible connection. I don't know the test-retest correlation but the fact that a decrease is so rare shows that this cannot be due to chance. My sleep has been good for a long time. I doubt sleep changes had anything to do with it. I haven't heard of the brachial artery tourniquet test. Butter seems to have reduced my blood pressure, which argues against increasing stiffness. K, can you point me to an example of this in the paleo forums? My impression is that people sometimes improve, but inevitably they have made many changes. To make just one change as I did is very rare, as far as I can tell.

Hans S (2010-08-29 04:45:02)

A frequented blog in the paleo sphere is the <http://heartscanblog.blogspot.com/> from cardiologist Dr. William Davis. Infact, you'll both be presenting at the upcoming Ancestral Health Symposium. He advocates, as so many in the paleo crowd, the total avoidance of the 'three horsemen of the apocalyps' : sugar (fructose), wheat (gluten) and industrial plantoils (broken/excess omega6). Ask him yourself but Dr. William Davis is used to seeing his type of heartscan improvements.

Vic (2010-08-29 11:09:11)

he doesn't advocate much against omega 6, he advocates for eating plenty of nuts, which have fair amounts of omega 6

Hans S (2010-08-29 12:20:01)

Nuts are not broken industrial plantoils (also, nuts are difficult to fully digest so overloading yourself with excess omega6 is nearly impossible). Better examples of broken industrial plantoils are margarine, mayonaise, any hydrolized oil filling, ...

JohnN (2010-08-30 12:33:37)

Seth, Congrats on your calcium score improvements. There's good reason to expect more than just the correlation between animal fats and lower calcification of the artery. They have one thing in common - vitamin K.

Ed M. (2010-08-31 08:56:39)

Seth, What is commonly tested as LDL is not the whole story. Have a look at "cholesterol subfractions" Not all LDL is the same. There is small and dense, and large and fluffy. One "good" one "bad"... Admittedly I have a layman's (caveman's?) understanding of all this but you might be able to better digest it... There are enough studies out there to seriously doubt the medical establishment's fascination with Statins... Just to put my biases out there, I have been following a LowCarb-> Paleo-> EvFit lifestyle for over two years now and have lost weight (320->240 lbs) as well as improving my overall fitness... PaNu Blog is excellent on this: <http://www.paleonu.com/panu-weblog/2010/7/21/statins-and-the-cholesterol-hypo-thesis-part-i.html> -Ed

Willy (2010-09-06 15:49:28)

Have you read this? "Our hypothesis is that fats themselves play a role in regulating sleep," Shaw said. They are, after all, signaling molecules, he said, and it's possible "that lipids themselves are somehow signaling to the brain that you should be sleepy or are initiating cascades that either result in impairment or can protect you from impairment." <http://www.the-scientist.com/blog/display/57664/>

Perfect Health Diet » How to Raise HDL (2011-04-20 16:28:54)

[...] Roberts cut his coronary artery calcification score by 24 % by eating a half-stick of butter per day; perhaps butter's HDL-raising property deserves the credit. High dairy fat consumption is [...]

CH Parker (2012-01-24 13:37:40)

I hope you do not equate one diagnostic with predictability for heart attacks, strokes, embolisms, stenosis, etc...! The Mayo Clinic suggests caution with regard to walk-in "clinical/diagnostic analyses"

## **New Heart Scan Results: Good News (context) (2010-08-29 04:19)**

I [1]posted yesterday that a recent heart scan found my arteries about 50 % less calcified than a previous scan predicted. Apparently the improvement was due to eating much more animal fat (pork fat and butter).

In 2004, [2]an American Journal of Clinical Nutrition article found something similar: heart disease progressed less in women who ate more saturated fat. "In postmenopausal women with relatively low total fat intake, a greater saturated fat intake is associated with less progression of coronary atherosclerosis," the authors wrote. Here's how they saw this finding:

The inverse association between saturated fat intake and atherosclerotic progression was unexpected. However, this finding should perhaps be less surprising. Ecologic and animal experimental studies showed positive relations between saturated fat intake and CHD risk (8). However, cohort studies and clinical trials in humans have been far less consistent (9 –12). Furthermore, most studies of dietary fat and

CHD risk have been performed in men (15, 16). The relations in women“particularly postmenopausal women”are much less well-established, and evidence from dietary intervention trials suggests that diets low in saturated fat may have different effects on CHD risk factors in women (15, 17“22).

In their study, women with the highest intake of saturated fat did not get worse during the study period, whereas women with lower intakes did get worse.

An editorial about this study described some of the evidence that supports the “article of faith” that “saturated fat . . . accelerates coronary artery disease”:

One of the earliest and most convincing studies of the better efficacy of unsaturated than of saturated fat in reducing cholesterol and heart disease is the Finnish Mental Hospital Study conducted in the 12 y between 1959 and 1971. In this study, the usual high-saturated-fat institutional diet was compared with an equally high-fat diet in which the saturated fat in dairy products was replaced with soybean oil and soft margarine and polyunsaturated fats were used in cooking. Each diet was provided for 6 y and then the alternate diet was provided for the next 6 y. After a comparison of the effects of the 2 diets in both men and women, the incidence of coronary artery disease was lower by 50 % and 65 % after the consumption of polyunsaturated fat in the 2 hospitals.

My results make the results of that earlier study exceedingly puzzling. I found a large change in one direction; the Finnish study found a large effect in the opposite direction. Given the huge effect (50 % or 65 % reduction) observed in the Finnish study, it is hard to understand why “cohort studies and clinical trials in humans have been far less consistent”.

1. <http://www.blog.sethroberts.net/2010/08/28/new-heart-scan-results-good-news/>

SB (2010-08-29 05:10:15)

Stephan on the Finnish trial: <http://wholehealthsource.blogspot.com/2009/07/finnish-mental-hospital-trial.html>

Steve\_P (2010-08-29 07:33:26)

Here's a critical view of the finnish trial that points out some serious flaws: <http://wholehealthsource.blogspot.com/2009/07/finnish-mental-hospital-trial.html>

Jake (2010-08-29 09:13:00)

Stephan has blown Finnish Mental Hospital Study out of the water. The study was poorly designed, variable controls were none existent and compliance was low. Any information from this study should be ignored.

Seth Roberts (2010-08-29 10:06:05)

After I read Stephan's critique, I still found the Finnish results puzzling. For example, “compliance was low”. This will make the observed differences underestimate (not overestimate) the beneficial effects of lowering saturated fat. Stephan believes the study overestimated them.

Vic (2010-08-29 11:12:16)

Lots of epidemiological trials also show highly significant benefits of polyunsaturated fat consumption on heart disease. Seth, curious what your cholesterol (ldl/hdl) is like?

Aaron (2010-08-29 17:33:33)

Wouldn't low compliance mean that you could not tell what diet the participants were actually eating, and so no be able to tell what was causing the changes in CHD levels?

Seth Roberts (2010-08-30 00:17:37)

No, low compliance means the treatment difference between the two groups is less than what it would be if there were high compliance.

Aaron Blaisdell (2010-08-30 06:44:01)

If the finish study was low compliance, but they yielded large results in favor of polyunsaturated fats, then perhaps the data had been "hausered."

### **New Heart Scan Results: Good News (explanation) (2010-08-30 07:21)**

My recent heart scan score was [1]about 50 % less than you'd expect from an earlier score. Why the improvement?

During the year between the two tests, I'd made one big change: eat much more animal fat. That's the obvious explanation. Three things support it:

1. Mozaffarian et al., [2]as I blogged, found a similar result.
2. The animal fat (pork fat and butter) had both produced large immediate improvements when I began to eat them. The pork fat had improved my sleep; the butter, my arithmetic scores. This sort of large immediate effect we associate with the supply of a missing necessary nutrient – giving Vitamin C to someone with scurvy, for example. My brain, at least, needed much more animal fat than I'd been eating. Different parts of the body need different nutrients, sure, but they all must work well with the same set of nutrients. If Nutrient X helps one part of the body, it is more likely to help another part.
3. My initial score put me at the 50th percentile for my age. I'd had an unusual diet for a long time. I stopped eating bread, potatoes, rice, pasta, and dessert 13 years ago. I'd started consuming lots of omega-3 and fermented foods a few years earlier. It was possible that those other changes produced improvement but if so it was a strange coincidence that, as my score got better and better over the years, I happened to measure it for the first time just when it crossed the 50th percentile.

This explanation makes a prediction: If you greatly increase your animal-fat intake, your heart scan score should improve. [3]A commenter said what he'd read on paleo-diet forums supported this prediction: "If you hang out in the paleo/low carb forums, you see this kind of thing a lot."

Nathan Myers (2010-08-30 14:19:49)

I'm finding this 25 % per year figure increasingly implausible. By the magic of compound interest, if this had any validity, we would expect a patient measured with 100 at age 40 to reach 8673 at age 60, and 80779 by age 70.

DALE MCNULTY (2010-08-31 00:22:21)

Most expensive study of diet ever conducted. <http://www.hsph.harvard.edu/nutritionsource/nutrition-news/low-fat/>

Kris Cannon (2010-08-31 16:18:35)

I have tripped over your blog while researching flaxseed. At the expense of sounding COMPLETELY stupid... I admit, I have no idea what I am reading, as the science is all greek to me. BUT, I am seeing key words that resonate with the path I am on. I am seeing a Dr. in Mesquite, TX who did some pretty unorthodox testing but was able to get to the bottom of my symptoms. Too many to go into, and too many diagnosis to list here as well, but I originally saw him for RA symptoms and reflux like symptoms. He requested blood work. The results you are so painfully stumbling upon seem to jive with what he rambled in scientific terms. I have only seen him once and I am on heavy duty regimen of vitamins and plan on talking to him more specifically as I slowly digest what my body is experiencing. I am writing because I wanted to recommend 2 books, Nourishing Traditions and The Maker's Diet. Both have VERY controversial and interesting information about our food sources and the testimony in Maker's Diet was amazing. Dr.'s CLEARLY are only in the business of masking symptoms. The doctor I am seeing was able to give me REAL answers. While he is an MD and a PhD, all his schooling was done out of the country and he has received amnesty to treat in the states (not clear about that process), but I know he is highly controversial as the last person he tried to train in his methods was shot in the back of the head. How's that for modern medicine!!! One thing I do see is that every "new theory" is touted as the end all be all, and for real, we are all individuals with very complex bodies and very different combining systems. Just because something is a "natural" supplement, doesn't mean it is good for you and certainly not in mega doses! I am getting quite an education and I am just beginning. I may start a blog of my own, people need to feel that there is hope amidst the wolves of medicine. Basics, raw, raw, raw as often as you can from a reputable source/dairy. No white flour or sugar. Some may not even be able to tolerate honey etc. or wheat. Pork fat and butter, brilliant!! Nourishing Traditions does a whole thing on fats and you are SPOT on. I've written so much, but I just wanted to put it out there to the stratosphere that what you are doing is commendable and I encourage you to cross reference your sources with other sources and don't ever believe everything you read from a medical journal, find out who is funding them, it just may be a corn oil manufacturer!!!

### **Funny Coincidence (2010-08-30 19:05)**

In The New Yorker (25 January 2010), David Owen wrote about his father's mother:

Gaga lived to be ninety-two, despite never having had much conventional health care. . . . She made foul-smelling yogurt . . .

---

Alex Chernavsky (2010-08-31 04:09:06)

See also this vintage commercial for Dannon yogurt: [http://www.youtube.com/watch?v=HYng\\_oCaL3w](http://www.youtube.com/watch?v=HYng_oCaL3w) I remember when this series of commercials ran in the 1970s. I can't believe I was able to find this one on YouTube. I love the Internet.

G (2010-09-02 11:31:34)

Seth, I tried to make cultured butter and it turned out really pale and buttermilky even though I whisked and rinsed like crazy and did manage to extract some. I wanted it to be deep yellow and very buttery. Do you know what I might be doing wrong?

### **New Heart Scan Results: Good News (lipid scores) (2010-08-31 07:11)**

[1]My recent heart scan results were 50 % lower (= better) than predicted. Apparently I am doing something right. You might think that my lipid values would reflect that. Not quite. They were measured twice in the last two weeks, first with a Cholestech LDX machine (instant results); second, ordinary lab tests.

Here are the scores (first test, second test). Total Cholesterol: 210, 214, which is "borderline high" (borderline bad) according to the Cholestech LDX quick reference sheet. HDL = 17, 36, which is "low" (bad). TRG = 62, 75, which is "normal". LDL = 180, 163, which is "high" (bad).

There is no hint in these numbers that I am doing the right thing! If anything, they imply the opposite, that I'm doing the wrong thing. This supports all those people, such as [2]Uffe Ravnskov, who say the connection between cholesterol and heart disease is badly overstated.

1. <http://www.blog.sethroberts.net/2010/08/28/new-heart-scan-results-good-news/>

2. <http://www.ravnskov.nu/cholesterol.htm>

---

Chris (2010-08-31 08:40:06)

Your results are interesting because while animal fat will raise LDL it will (typically) raise HDL to protective levels. Ever think about getting your Omega-3s from fish oil as opposed to flaxseed or maybe try a combination of both to see if that might have the effect of raising your HDL?

speno (2010-08-31 09:07:01)

Yes, and you didn't get the LDL sub particle type measured. You'll probably find that the majority of LDL particles are the larger ones (the "good" "bad" cholesterol - ha!) And the formula used for calculating LDL doesn't work well when TRG is that low. How's it look with the Iranian formula? [http://homepages.slingshot.co.nz/geoff36/LDL\\_mg.htm](http://homepages.slingshot.co.nz/geoff36/LDL_mg.htm)

vic (2010-08-31 09:50:15)

wow, your HDL is incredibly low for someone on a high animal fat diet. There are some people with low HDL though that are particularly protected from coronary disease: [http://en.wikipedia.org/wiki/ApoA-1\\_Milano](http://en.wikipedia.org/wiki/ApoA-1_Milano) A question also is did your lipids change appreciable in the time since your last heart scan?

David (2010-08-31 11:08:26)

Might there be a problem due to the unnaturally high omega-3 consumption, because it is an easily oxidized fat?

Charles (2010-08-31 16:04:58)

You might want to get a test to determine the makeup of the LDL. You'll find out if it is the large, fluffy kind (good), or the small, dense kind (bad). I would guess that with your diet, you would have a higher percentage of the large fluffy LDL. And that would be fine. The number itself, without knowing the different fractions, is meaningless if not misleading.

Seth Roberts (2010-08-31 19:46:42)

My lipids didn't change appreciably from what would have been predicted from previous years, except that the low HDL (18) is an aberration.

### In Tokyo - Wanna Meet? (2010-08-31 08:29)

From Thursday Sept 2 through Sunday Sept 6 I will be in Tokyo. If you'd like to meet, let me know.

[1]One Tokyo restaurant:

Please enjoy the dinner of the chef recommendation adhering to a "place of production", "freshness", a "season", "health", and "beauty" as a menu of a season.

Exactly. Words such as freshness, season, and so on in restaurant descriptions are indeed quotations but usually the quotation marks are missing.

1. [http://www.t-i-forum.co.jp/english/shop/shop\\_21.html](http://www.t-i-forum.co.jp/english/shop/shop_21.html)

---

Laura (2010-08-31 20:16:36)

Interesting! I was given a new idea today that tied in to this post. Strange how life is. I'm gonna try to get a second job at SFO or OAK, since I live so close to them. Maybe I can get good benefits for discounts on flights someday!! EXCITING!!!

### New Heart Scan Results: Good News (raw data) (2010-08-31 20:46)

Here are the details of my two heart scan scores, one recent, the other one and a half years ago.

February 2009:

[1]

Coronary Artery	Number of Lesions	[Agatston] Calcium Score	Calcium Volume Score
Left Main	2	32.95	25.02
LAD	0	0.00	0.00
LCX	0	0.00	0.00
RCA	1	4.81	5.86
(Other)	0	0.00	0.00
Total [plaque burden]	3	37.76	30.88

August 2010:

[2]

Coronary Artery	Number of Lesions	[Agatston] Calcium Score	Calcium Volume Score
Left Main	1	27.46	19.29
LAD	0	0.00	0.00
LCX	0	0.00	0.00
RCA	1	1.72	1.29
(Other)	0	0.00	0.01
Total [plaque burden]	2	29.18	20.59

To give some context, [3]this group of patients given a whole bunch of treatments ("statin therapy, niacin, the American Heart Association Therapeutic Lifestyle Changes (TLC) diet, omega-3 fatty acids and vitamin D-3 supplementation") meant to improve these scores managed, on average, about a 0 % change in scores after 1-2 years of the treatments. Which is better than the usual 25 %/year increase, but not as good as what happened to me.

---

Ed (2010-09-05 12:43:35)

I recently had a second CT scan for calcium scoring. The results were inconclusive but the research I performed indicated that the measurement error is significant enough to make serial CT useless unless there is a large difference in measurement, especially with scores as low as yours.

bill (2010-09-05 14:37:28)

Another possible explanation for the reduced calcium in arteries is vitamin K2. An article in the September issue of Life Extension Magazine vitamin K2 keeps calcium out of arteries. Some vitamin K2 is created in the gut by fermentation of vitamin K1 in green vegetables. Some fermented foods such as cheese and a Japanese dish called natto are high in K2. The fermented foods you eat may explain the calcium reduction. bill

Seth Roberts (2010-09-05 17:07:23)

Ed, what is "the research [you] performed that indicated that the measurement error is significant enough to make serial CT useless"? The head of the center where I got my scans said she almost never sees decreases ("1 in 100"). This implies that measurement error is small compared to whatever is increasing the scores. If measurement error was large you'd see decreases half the time or even more (due to people with high scores being more likely to get a second measurement than people with low scores). Bill, I ate a lot of fermented foods before my first score. It is possible that they lowered it to an average score – that my calcium score was on a downward trajectory that merely continued – but then it would be a coincidence that my first calcium score was so average. Still, I agree with you that that's another good reason to eat fermented foods.

## 5.9 September

### My Theory of Human Evolution (baseball park collector) (2010-09-02 05:07)

Waiting in line at Tokyo immigration control, I met a woman from North Carolina who'd come to Japan for an organized tour of Japanese baseball parks (17 of them). She learned about the tour from a friend. In America, she's visited 117.

I told her I was a psychology professor and had [1]a theory of evolution in which connoisseurship played a big role. She was a baseball-park connoisseur, I said.

The evolutionary role of connoisseurs and collectors was to provide demand for finely-made stuff – things made by state-of-the-art artisans. Connoisseurs and collectors would pay more for features that had no clear value otherwise. By trading for these things, the connoisseurs and collectors helped the artisans make a living and thereby push their technology further.

1. <http://www.blog.sethroberts.net/category/human-evolution/my-theory-of-human-evolution-directory/>

---

D (2010-09-02 08:15:04)

It would be helpful if the following quote, or part of it, was linked to your theory for new readers like me: "...had a theory of evolution in which connoisseurship played a big role." Wonderful blog.

Gaspard (2010-09-02 09:33:57)

I was thinking of this theory today reading the Classical Heritage and its Beneficiaries by RR Bolgar today. He provides a complementary (and certainly similar) description of how a certain kind of connoisseurship developed: [http://books.google.com/books?id=5HtUx2D1VYgC&lpg=PP1&ots=UmisyoMeDG&dq=classical %20heritage %20beneficiaries&pg=PA137#v=onepage&q=burgher %20class&f=false](http://books.google.com/books?id=5HtUx2D1VYgC&lpg=PP1&ots=UmisyoMeDG&dq=classical%20heritage%20beneficiaries&pg=PA137#v=onepage&q=burgher%20class&f=false)

Gaspard (2010-09-02 09:35:36)

sorry, link didn't quite work, it's the passage on 137 I mean.

Nathan Myers (2010-09-02 20:37:51)

Any theory of human evolution that depends on specialization can only apply to the last few thousand years – perhaps as few as four thousand, perhaps as many as twenty. Certainly some evolutionary adaptation has occurred in that time, such as Tibetans' and Peruvians' to high altitude, or Europeans' to dairy in the diet, and perhaps widespread increased tolerance for crowding. Nothing fundamental can have had anything to do with connoisseurship or specialization, because they began far too recently. You could make a much better case that agriculture is fundamental to who we are. A related argument, that extravagance is selected for in mating competition, applies throughout the animal kingdom, so there's enough time to develop endless variations, but there's nothing uniquely human about it.

G (2010-09-03 02:37:43)

Nathan - From the caveman has a thing about rocks. He stares at them, weighs them in his hands, and bangs them together. Others think this is merely eccentric until he develops a new cutting-tool. The impact of the new technology influences evolution. If I am right about Seth's idea, it's not connoisseurship just in the culturally fully-formed sense of joining a club and discussing it on the Internet - I think he means just the mental predisposition to focus on a favourite thing or a few favourite things. Many people who grow up to be excellent at something can trace this back to early childhood - they were honing

the skill or thinking about the topic just for the thing itself rather than to make a career or survive. It's specialisation by temperament and talent, not specialisation in the Marxist sense of 'division of labour'. Do I have this right?

Seth Roberts (2010-09-05 05:07:02)

By connoisseurs I mean people who get more pleasure from X than the rest of us and are more sensitive to differences between X1 and X2 (different versions of X) than the rest of us. For example, wine connoisseurs. It's not "being excellent at something".

G (2010-09-06 13:56:59)

Yeah Seth, but you just expressed a similar thing really but with algebra - Crom is fascinated by rocks and obsesses over small differences that interest no one else, hence they find him odd. I didn't say it is being excellent at something, just that it can lead to that, even if the 'excellence' is just in perception and not in any bold outward action. The baseball park connoisseur had some, possibly a bit inscrutable, excellence at looking at parks, but did not go on to be a park designer, for whatever reason.

### **A University President Defends Research Universities (2010-09-03 15:05)**

Steven Knapp is president of George Washington University in Washington, D. C. It was inevitable he wouldn't like a book attacking the current structure of higher education but it wasn't inevitable that [1]he would write this:

A similar point could be made about the educational value of working at the frontier of discovery in one of the research centers that Mr. Hacker and Ms. Dreifus [the book authors] decry. Have they spoken with undergraduates who have enjoyed the privilege of assisting a top investigator in an active, federally financed laboratory? In my own anecdotal experience, the best of those students, far from shutting themselves away in a narrow specialization, are very likely spending their time outside the lab in life-expanding service activities that, again, were quite beyond the ken of undergraduates in earlier generations.

At UC Berkeley, I spoke to many undergraduates like that. Most of them, perhaps 90 %, were working in a lab because they thought it would help them get into medical school. Almost none were interested in a research career. All of them were being supervised by graduate students and had little or no contact with the "top investigator".Â Because of the mismatch between what working in the lab could teach (what research was actually like) and what the students wanted to do (which wasn't research) the "educational value" was slight. Knapp fails to understand this basic point about education: It matters what the student wants. Almost none of them, even at UC Berkeley, want to be scientists.

Yes, outside the lab they did do "life-expanding service activities" – volunteer for the Red Cross, work on a suicide hotline, and so on. By making them take lots of classes in which they were assigned lots of homework, the university made such outside activities more difficult.

Before he became university president, Knapp was an English professor – where he no doubt claimed he taught his students how to think. His thinking, in this review, consists of banalities that don't bear examination. At least this is merely an unwittingly revealing book review instead of [2]an entire delusional book.

Is the second link supposed to lead to the same book?

### Self-Experimentation and Infomercials (2010-09-04 16:31)

When I was a grad student I was inspired to self-experiment by something I read about teaching math: The best way to learn is to do, said Paul Halmos, a math professor. A more recent version is fail early fail often fail cheap.

A maker of infomercials [1] put it like this:

We were fortunate at American Telecast, in that most of our learning days were in our first 12 years, when we were in the 2-minute business. Learning was a lot cheaper. Failure was a lot cheaper than what failure is today in a 30-minute commercial. When you fail with a 30-minute commercial you can lose half a million or a million or a million and a half dollars. When we failed with a 2-minute commercial back then, we were failing with \$15 or \$20 thousand.

Self-experimentation made failure so cheap, so much cheaper than conventional research, that I was able to learn much more.

All this seems so obvious – yet self-experimentation by professional scientists is very rare. Psychology and nutrition professors, for example, could easily do self-experimentation, but don't. And the infomercial maker describes himself as "fortunate" rather than as deliberately creating the situation.

1. [http://www.itreallyworks.tv/book\\_ad.html](http://www.itreallyworks.tv/book_ad.html)

---

q (2010-09-04 20:39:04)

halmos had at least half the right idea. sure, you can learn by doing, but you also have to have objective evaluation. that's hard to do in teaching as it's hard to get good information about what people are learning.

Gunnar (2010-09-05 06:31:16)

Such a way requires to leave the trodden paths. Once you do that, all hell or heaven can break loose. So most people stay in the herd. I found out the herd is victim to plenty false dogma, so I left it regarding information consumption and thinking. Maybe you are interested in today's Disclosure Day: <http://sbeckow.wordpress.com> Be well.

## Plastic Fantastic by E. S. Reich (2010-09-05 11:44)

Plastic Fantastic: How the Biggest Fraud in Physics Shook the Scientific World by Eugenie Samuel Reich, a science writer, tells how a young physicist named Jan Hendrik Schoen, working at Bell Labs on making electronic devices from organic materials, managed to fool the physics community for several years, publishing many papers with made-up data in Science and Nature. [1]This podcast summarizes the story, with the new detail that after his disgrace – even his Ph.D. was revoked – Schoen managed to get a job as an air-conditioning engineer in Germany.

I enjoyed the book, partly for the drama, partly for the physics, and partly for the light it sheds on the culture of physics and Bell Labs. When anyone says "science is self-correcting" I'm amused because, as the speaker must know, the amount of fraud that goes uncorrected is unknown. It may be far larger than the amount that is detected.

[2]The author's website.

1. <http://setiradio.blogspot.com/2010/05/are-we-alone-fraudcast-news-eugenie.html>

2. <http://www.nasw.org/users/essreich/>

---

Brian (2010-09-05 16:12:12)

So Seth, the basic point is that scientific peer review is the same as in the liberal arts: garbage in, garbage out. Scientific peer review consists of reviewers performing a reasonableness check: assume the underlying data and data collection methods are correct and the paper will be good if the scientific method is applied appropriately? Since we know that science is largely about signaling, why wouldn't up and coming institutions invest heavily in institutionally mandated internal controls on research and data collection methods? Hire young, promising researchers, wait a few years for everything to ferment, and then climb the rankings.

vic (2010-09-06 00:29:41)

so is the conclusion that individual scientists are immoral and corrupt or is the system corrupt?

dearieme (2010-09-06 01:00:14)

Bell Labs is famous for inventing the transistor. But according to Wikipedia, it wasn't invented there at all. It was developed there, building on publications and a patent by an earlier worker, all reference to his achievements being suppressed from the Bell Lab publications and patent applications. I first read this fairly recently and confess to being Shocked about Shockley. And the buggers bagged a Nobel for it!

Duncan (2010-09-06 06:23:18)

OT, I see your pal Leonard Mlodinow has collaborated with Stephen Hawking on his new book, out this week. <http://www.amazon.com/Grand-Design-Stephen-Hawking/dp/0553805371>

How reliable is science? (2010-09-06 11:18:42)

[...] Source: Seth Roberts. [...]

Nathan Myers (2010-09-07 13:46:59)

vic: Couldn't it be both? But scientific crooks are made, not born. Nobody becomes a scientist intending a career based on deception; deceptiveness is much more richly rewarded in other fields. The institution defines an environment in which deception is rewarded more than it should be, and where scruples are valued less than they should be. Each person responds to this differently. Some thrive despite it, some thrive because of it, others languish or move on.

Matthew Cornell (2010-09-08 18:14:55)

Just a random thought: This reminds me of the notion of always including a professional magician as part of any scientific team investigating claims, esp. those that are fringe. The thought is not only will they notice intentional misdirection, they also >think tricky

### Assorted Links (2010-09-06 08:07)

- [1]"When you are good [at your work], you must apologize." Italian academia.
- [2]no effect of omega-3
- [3]clinical trials of new MS therapy go ahead in spite of MS society disapproval. Canadian MS society leaders have managed to convince themselves it could be bad to learn more about a plausible and possibly revolutionary therapy for MS. "A true clinical trial must be conducted at more than one institution and in more than one province" with "well over 1000 participants," said Yves Savoie, the president of the Canadian MS society. If a study had only 999 participants, he would disapprove of it!

Caleb (2010-09-06 12:07:04)

The study used \_margarine \_ with a little added omega-3. Considering how unhealthy and full of omega-6 most margarines are, this sounds like trying to put out a fire by dumping oil with a little added water on it.

Sean Estey (2010-09-06 13:01:01)

Yes this seems like a poorly designed study. Only 4 teaspoons a day of omega-3? If there were no other dietary changes, that little O-3 would seem to have little effect on the patients overall O-3/O-6 ratios. It doesn't even seem that this ratio was measured in this study.

Alex Chernavsky (2010-09-06 17:47:26)

Here's another interesting article, from today's *New York Times*: "[1]Forget What You Know About Good Study Habits" Here's a sample:

Take the notion that children have specific learning styles, that some are "visual learners" and others are auditory; some are "left-brain" students, others "right-brain." In a recent review of the relevant research, published in the journal *Psychological Science in the Public Interest*, a team of psychologists found almost

zero support for such ideas. “The contrast between the enormous popularity of the learning-styles approach within education and the lack of credible evidence for its utility is, in our opinion, striking and disturbing,” the researchers concluded. Ditto for teaching styles, researchers say. Some excellent instructors caper in front of the blackboard like summer-theater Falstaffs; others are reserved to the point of shyness. “We have yet to identify the common threads between teachers who create a constructive learning atmosphere,” said Daniel T. Willingham, a psychologist at the University of Virginia and author of the book “Why Don’t Students Like School?”

1. <http://www.nytimes.com/2010/09/07/health/views/07mind.html>

Å...se (2010-09-07 03:57:09)

The L-world paper reminded me of a paper that came out this year in JPSP: The desire to expel unselfish members from the group, by Cragi Parks and Asako Stone. They set out to study how one tolerates freeriders, and discovered to their surprise that group members were also willing to punish someone that gave more and took less. from what they can see people either thought that the unselfish people set too high standards, or, alternatively that they broke the rules. Also reminds me of the discussions I have with my 7 year old son, when he wants to give his friends the really big and wonderful lego boxes as a birthday present, and I say no. The consideration that it costs too much is fairly easy to explain, but the half implicit, not quite pronounced idea that it would be wrong to come with a very expensive birthday gift (especially in the eyes of parents that may feel a pressure to reciprocate) is just not that easy to convey.

Nathan Myers (2010-09-08 13:04:47)

That LL-world paper by Gambetta and Origgi is outstanding. It explains so much, including just about the whole blogging world. The omega3-in-the-margarine study is an excellent example of how to cook a trial.

### Is Science Self-Correcting? (2010-09-06 15:53)

Lots of scientists say science is self-correcting. In a way this is surely true: a non-scientist wouldn’t understand the issues. If anyone corrects scientific fraud, it will be a scientist. In another way, this is [1]preventive stupidity: it reassures and reduces the intelligence of those who say it, helping them ignore the fact that they have no idea how much fraud goes undetected. If only 1 % of fraud is corrected, it is misleading to say science is self-correcting. A realistic view of scientific self-correction is that there is no reward for discovering fraud and plenty of grief involved: the possibility of retaliation, the loss of time (it won’t help you get another grant), and the dislike of bearing bad news. So whenever fraud is uncovered it’s a bit surprising and bears examination.

What I notice is that science is often corrected by [2]insider/outside – people with enough (insider) knowledge and (outsider) freedom to correct things. As I’ve said before, Saul Sternberg and I were free [3]to severely criticize Ranjit Chandra. Because we were psychologists and he was a nutritionist, he couldn’t retaliate against us. Leon Kamin, an outsider to personality psychology, was free [4]to point out that Cyril Burt faked data. (To his credit, Arthur Jensen, an insider, also pointed in this direction, although not as clearly.) The Marc Hauser case provides another example: Undergraduates in Hauser’s lab uncovered the deception. They knew a lot about the research yet had nothing invested in it and little to lose from loss of Hauser’s support. This is another reason insider/outside are important.

---

LemmusLemmus (2010-09-06 23:46:49)

As far as I can see, when people say that science is self-correcting, they typically don't mean that specific instances of fraud are detected, but that additional research will not confirm incorrect findings.

Seth Roberts (2010-09-07 02:35:36)

True, they mean that a broad range of wrong answers are corrected, not just fraud. When a published result turns out to be wrong, it doesn't mean it was fraudulent, of course. People who say science is self-correcting have a mental image of science wherein important experiments are repeated by others in attempts to extend the initial results. In these attempts, the veracity of the initial results is confirmed (or not). This view of science isn't terribly accurate – in some areas of science experiments are so difficult or expensive or diffuse (it's unclear what's central and what isn't) that replication is rare. Anyone who seriously believes science is self-correcting should study the career of Ranjit Chandra.

Nancy Lebovitz (2010-09-07 05:13:00)

Still, a lot of useful work comes out of science– maybe the takeaway is that science is more self-correcting than most human institutions. Scary, isn't it?

Seth Roberts (2010-09-07 06:05:31)

Perhaps the takeaway is that science is self-correcting when it matters. For example, med students were told, following Aristotle, that the human liver has a certain shape. Actually it had a different shape. That error took more than a thousand years to correct. But it didn't matter.

milieu (2010-09-07 06:05:37)

It is scary indeed. Also, for a young scientist starting out, he/she would definitely want to become an insider rather than an outsider. The incentive to ignore rather than correct the mistakes of an established insider is very great. And I guess most of the real science is done by those trying to make a name are quite young.

Dennis Mangan (2010-09-07 06:40:03)

The example of Cyril Burt is an unfortunate one, as he was almost certainly framed. Arthur Jensen and W.D. Hamilton came to his support. Leon Kamin is an IQ demagogue staunchly opposed to the idea of the heritability of IQ.

Kris (2010-09-07 08:45:47)

Maybe this explains why you can not see many journal articles w/o a subscription. The outsiders who have nothing to lose would be more apt to shred their arguments.

Robbo (2010-09-07 09:34:28)

"Perhaps the takeaway is that science is self-correcting when it matters." Yes. I think you have to take into account your 'modern Veblen' thesis that most of what passes for science in universities has neither value nor importance. Errors in those areas will stand for a long time without correction. Errors in the valuable/useful fields will tend to be corrected because there are reputations to be made doing so. However, it still may require the old-generation gatekeepers to retire before it is career-positive to correct their errors.

Seth Roberts (2010-09-07 12:27:25)

Dennis, Jensen wrote a paper saying that Burt's data was unreliable. Kamin was the first to point out that some of Burt's correlations stayed the same to 3 decimal places (e.g., 0.771) as the sample size went from 20 to 50. See <http://www.hum.utah.edu/~bhenham/Phil%207570%20Website/csSir%20Cyril%20Burt.pdf>

Hal (2010-09-07 12:35:49)

Gary Taubes accuses nutrition science of clinging to the false notion that fat is bad for you for over 50 years! He claims that evidence disconfirming that hypothesis has been plainly available for many decades, yet generations of scientists go along with obviously false beliefs because... well, he doesn't really say why. Apparently nutrition scientists are so dishonest and mendacious that they would rather propagate obvious falsehoods than upset the apple cart that is delivering them their grants. Could science really be this bad?

Alex Chernavsky (2010-09-07 18:41:00)

Hal, I think that science really *can* be that bad. I'll give you another example. [1]Robert Whitaker is sort-of the "Gary Taubes" of psychiatry. Whitaker recently wrote a book called, [2]*Anatomy of an Epidemic: Magic Bullets, Psychiatric Drugs, and the Astonishing Rise of Mental Illness in America*. The book details the devastating effects of psychiatric drugs (antidepressants, antipsychotics, antianxiety agents, etc.). The book is meticulously documented and is quite an impressive piece of scholarship. The psychiatric establishment has had a love affair with psychotropic drugs since 1952, when chlorpromazine was introduced. So we're going on 60 years here. It's interesting to note that Whitaker used to be an insider, of sorts. He worked as director of publications at Harvard Medical School. He also founded a publishing company that covered pharmaceutical clinical trials. He also worked as a science journalist for the *Boston Globe*. Because of his insider/outsider status, he was able to publish a scathing and cogent critique of psychopharmacology.

1. <http://www.madinamerica.com/madinamerica.com/Home/Home.html>

2. <http://www.amazon.com/Anatomy-Epidemic-Bullets-Psychiatric-Astonishing/dp/0307452417>

Marc Maxson (2010-09-10 13:29:56)

I think you're right that "science is self correcting when it matters." All your examples are from social science. I'm a molecular neuroscientist who works in international development now, and I have seen both extremes. Frauds thrive in a non-peer reviewed "foreign aid" world, and succumb to their schemes in neuroscience much faster than do social scientists. Maybe it's because people do repeat their experiments, because it at least matters in order to publish the next result.

## **A Unified Theory of Japanese Food (2010-09-07 12:54)**

I used to like Japanese food because it was less fattening than other foods – I lost weight eating sushi. Now I like it because the Japanese eat so much fermented food: miso, pickles, yogurt, Yakult, [1]umeboshi (pickled plums), natto, vinegar drinks, and alcoholic beverages. A Tokyo food court might have 20 types of pickles, 15 types of miso, and 10 types of umeboshi.

Abundance of fermented food isn't the only way Japanese food is unusual. I see Japanese food as an outlier on three dimensions:

- Use of fish. More fish-centered than any other major cuisine.
- Beauty. More beautiful than any other cuisine.
- Fermented food. More fermented food than any other cuisine.

[2]As I've said, lightning doesn't strike twice in one place for different reasons. If two rare events could have a common explanation, they probably do. I've discussed before [3]why a fish-centered cuisine could lead to better visual design: Because cooks can't use complex flavorings to show how much they care (it would make all fish taste the same), they take pains with appearance to convey this.

What about fermented foods? Here's an idea: In the development of Japanese cooking, lack of complex flavoring

of main dishes increased desire that other parts of the meal provide complexity, which is what fermented foods do so well. For example, Japanese meals often include pickles. We want a certain amount of complexity in our food, in other words. Most cuisines provide complexity via complex spice mixtures (mole sauce, harissa, curry powder); Japanese cuisine provides it with fermented foods. (I love Japanese curry, but it isn't common.)

This explanation predicts that desire for complexity is like thirst: It grows over time and can be satisfied. Prediction 1: Eating one complex food will make a second one will taste less pleasant, just as drinking one bottle of water will make a second bottle of water taste less pleasant. Prediction 2: Over time, the pleasure provided by complexity grows. The same complex-flavored food will taste better at Time 2 than Time 1 if you haven't eaten anything with a complex flavor between the two times.

1. <http://en.wikipedia.org/wiki/Umeboshi>

2. <http://www.sethroberts.net/articles/2010%20The%20unreasonable%20effectiveness%20of%20my%20self-experimentation.pdf>

3. <http://www.blog.sethroberts.net/2009/12/07/my-theory-of-japanese-aesthetics/>

---

G (2010-09-08 09:20:36)

An ex-girlfirend always used to prefer the simple things I made over the complex. It was nothing to do with competence; even the complex things I did particularly well were not appreciated as much as what many would call 'comfort-food'. I am the opposite. I always wondered what this was about. Now I think of it, the TV chef Jamie Oliver made the same complaint about his wife. Japanese curry comes via the British - it's somewhat like the curry we used to eat in the 1970s before we began to discover more authentically Indian/Pakistani curry. That sort of breaded pork and carrot curry is the bee's knees.

Jeff (2010-09-11 04:49:25)

Prediction 2 makes sense from my experience. Salt and vinegar potato chips(which I ate pre-Paleo...) and Indian food were good examples. Very complex and I didn't like it the first time. I week later I wanted it again. Strange but true.

Elizabeth Molin (2010-09-13 13:35:51)

For mention of a book called "Wild Fermentation" (which you may already be familiar with), see <http://www.boingboing.net/2010/09/13/exploding-sauerkraut.html>

## **Dry Eye and Fish Consumption (2010-09-08 12:37)**

Let's say that dry eye is caused by lack of omega-3. If you eat enough omega-3, you'll never get it. [1]Here is a recently-discovered association with tuna consumption:

Tuna consumption [1 serving was 113 g (4 oz)] was inversely associated with DES [Dry Eye Syndrome] (OR: 0.81; 95 % CI: 0.66, 0.99 for 2â€“4 servings/wk; OR: 0.32; 95 % CI: 0.13, 0.79 for 5â€“6 servings/wk versus  $\leq 1$ /wk P for trend = 0.005).

If tuna were a good source of omega-3, eating 5-6 servings per week would completely prevent dry eye. But it doesn't. Which supports what I have come to believe for other reasons: oily fish, in the quantities most people eat it, is a mediocre source of omega-3. Even if you eat tuna almost once/day, you don't get enough. To get enough omega-3,

look elsewhere.

Thanks to Brent Pottenger.

---

Brian (2010-09-08 13:59:57)

Seth, just to make it clearer for me, please, the italicized text under the indented quotation are your words. Correct?

Caleb (2010-09-08 14:40:08)

Omega-3 and Omega-6 compete for the same receptors in the body and thus displace each other. So your Omega-3 needs are related to how much Omega-6 you need to offset, a rather confounding variable.

John (2010-09-08 16:57:35)

Yeah, what Caleb says.

Aaron Blaisdell (2010-09-08 21:04:47)

I've never been a big tuna fish fan. But I love sardines. I eat a few cans of them per week, interspersed with cans of smoked oysters in olive oil.

Caleb (2010-09-08 22:57:48)

It might be more meaningful to compare the fish that is always recommended; salmon. There's a reason it's so popular; a 154g serving of chinook has 3301 mg of omega-3 to only 433 mg for an equivalent serving of tuna. So a person eating one serving of salmon would be getting more omega-3 from fish than the highest six servings of tuna a week.

Seth Roberts (2010-09-09 06:44:13)

Caleb, I agree. But they didn't report results for salmon specifically. Other categories of fish were not correlated with DES.

G (2010-09-09 11:38:26)

If this is an evolved human dietary need we're talking about and not a cross-species universal elixir of life, what the hell way of life did cavemen have where they could eat all this salmon every week? Are humans actually river-fishing/shellfish-harvesting specialists rather than the generalists we're usually assumed to be? I do usually keep a tub of cod liver oil around, but I still have doubts. I mean, cows live on grass - they are large complex mammals like us. There was a guy in the UK, Dave Nunley, who had an extreme food-phobia and could only eat mild cheddar cheese. That was all he ate until the age of 29. He led an active life and seemed healthy. I've heard tantalising study results about this and that food-item over the years, but from the wide-angle view it doesn't make sense to me that we have such finicky, specific needs. Hunter-gatherers eat special items once in a blue moon, 'medicinally'; they don't on a weekly basis consume kilos of what we now think of as 'superfoods'. I'm generalising but you get my drift.

Hal (2010-09-09 15:08:29)

G, cows unfortunately do not eat grass. They are fed corn, which has little omega-3. Grass fed beef has much more omega-3.

G (2010-09-09 16:52:56)

Hal, my point about cows eating nothing but grass was more general than the question of how much omega-3 they get. Dogs live on low-grade meat and here we are saying that tuna doesn't have enough omega-3 for our purposes. Why do we need so much? I am suggesting that maybe we are making insignificant tweaks to a system that is normally broadly robust. I suppose I would like to believe that I would live an extra ten or twenty years in good health by eating berries and salmon more than

normal, but I'm not sure it's an efficient cause. I don't believe or disbelieve. I feel like an absurd picture builds up once someone delves further and further into a narrow interest - they come to think their specialism is all-important - the people who think ascorbate is the Elixir of Life say we should eat oranges every day and the omega-3 people worry about where their yellowfin tuna comes from and whether their beef is grass-fed. It seems like fussy micromanagement in a broadly uncertain world, to me. Either humans have evolved with this crazy dietary requirement (that, by the way, if you're at all concerned, is not ecologically sustainable at current population-levels) or omega-3 really is some kind of cross-species universal elixir.

James A. Donald (2010-09-09 19:10:31)

Flax oil is the best source of omega three. Unfortunately, like fish, it deteriorates rapidly. All sources of omega three deteriorate rapidly, and the better they are, the faster they deteriorate. So fish oil tablets are not necessarily doing you any good. So the solution is to take flax seeds, since seeds will preserve their oil as long as the seed remains alive - but does anyone have any satisfactory method of preparing flax seeds into something edible and digestible?

James A. Donald (2010-09-09 19:14:14)

If this is an evolved human dietary need we're talking about and not a cross-species universal elixir of life, what the hell way of life did cavemen have where they could eat all this salmon every week?

Cavemen lived largely on deer and suchlike - which have a lot more omega three than cows and suchlike.

G (2010-09-10 05:22:26)

@James: same as I said to Hal.

Hal (2010-09-10 12:34:58)

G, as I understand the theory, if you eat animals that graze on grass (as humans did in the past), you get a rough balance of omega-3 and 6. However corn is almost all omega-6 (as far as poly fats). I'm not sure if this is specific to corn or if it's because corn is all seeds. Anyway, our diet today is very much biased towards omega-6, we eat 10 or even 20 times as much 6 as 3. Now omega-6 is pro-inflammatory and omega-3 is anti. Many of the modern diseases are associated with excess inflammation, such as atherosclerosis. Again the theory is that this may be linked to excess consumption of pro-inflammatory omega-6 and not enough omega-3. It's not that omega-3 is an elixir, it's that we evolved with a certain balance in our diet, and with factory farming, this balance has changed very drastically. Theoretically, if you switched your diet to eat 10 times as much omega-3 as omega-6, that would be just as unhealthy, because you'd have too little inflammatory response and might be vulnerable to infection or other failures of the body to repair itself. The point of omega-3 supplementation (and reducing omega-6 consumption) is to get back to the historical balance and hopefully help the body achieve a healthy level of inflammatory response. However I doubt you would extend lifespan by 20 years because most of these diseases hit late in life, and we have medical treatments for them anyway. Still I'd think you could hope for a few years more of health.

G (2010-09-10 21:33:10)

So Hal, how definitive is the proof for this? I haven't a clue. It just sounds too simple and elegant - the whole 3/6 fat-balance balance thing. Maybe it is!

Willy (2010-09-11 21:45:30)

Last time I went to the supermarket I compared the Omega 3 content of a can of tuna and sardines. I was surprised to see tuna contains much less than sardines (in % to weight). I bought sardines.

John (2010-09-11 22:41:28)

Although flawed (as in imperfect, not unacceptable), read The Queen of Fats for a rather well-researched account of the discovery of n-3 fats (by Susan Allport). If someone knows of a better account (in one place, not in scattered articles), please post it. I wonder if one issue with self-experimentation is when people don't try enough. I have greatly reduced my allergies

through high probiotic/bacteria intake (yogurt, kimchi, doenjang), but one of my friends who wanted to try it balked at eating 2c of yogurt/day and making these changes. Adding one dollop of yogurt likely would not be enough to see changes. Likewise, eating small amounts of fish and thinking you have changed your n-3 consumption (or the overall n-3/n-6 balance) may not be enough, but may be all some people are willing to try.

Sanjeev Sabhlok (2011-05-23 06:17:55)

Just for info. After eight months of great suffering I've experienced very significant relief from computer-related eye strain and dry eyes by using - guess what! honey! Please check out details at: <http://sabhlokcite.com/2011/05/announcing-a-candidate-solution-to-eye-strain-and-dry-eye/> should you be interested.

### **Jane Jacobs and Food Trucks (2010-09-09 15:50)**

In [1]this article about food trucks, Ed Glaeser doesn't mention their educational value: They allow people with a new idea to test it relatively cheaply. If it works they can expand. I saw this happen in Berkeley. A food truck that sold stuffed potatoes eventually became a store that sold the same thing. Food trucks don't merely create jobs, they can create the best kind of jobs: Those that provide new goods and services. Unlike jobs created by building dams or highways.

Any advanced economy needs a constant stream of new goods and services to replace the ones that are inevitably lost. It goes against the survival instincts of people in power (government officials) to help those at the bottom (e.g., potential food truck owners) because they seem so much less powerful than those at the top (e.g., restaurant owners) who are threatened by those at the bottom.

All this should be utterly obvious - as it is to anyone who has read Jane Jacobs on economics. But it isn't. In science, too, every field needs a constant stream of new empirical effects (in experimental psychology, new cause-effect relationships) to replace the ones that have been studied to death. So every field needs a cheap way of searching for those effects, but no field, as far as I know, has such a way. In science, editors and reviewers are like government officials. They can discourage new ideas (food trucks) by enforcing "high standards" (regulations) whose costs they fail to understand.

Via [2]Marginal Revolution. [3]"[David] Westin's biggest weakness [as head of ABC News] was that he lacked the entrepreneurial spirit to launch innovative and creative ventures."

2. <http://www.marginalrevolution.com/marginalrevolution/2010/09/assorted-links-6.html>

3. <http://www.humanevents.com/article.php?id=38915&page=1#c1>

---

Cliff Styles (2010-09-09 16:52:07)

There's more economic wisdom (and other wisdom,too) in those two paragraphs than many economics students get in a year of study. Perhaps If more economists would try to make working food trucks, or some equivalent, they might learn this, and then be able to teach it? By the way, here's another economist commenting on economic education: <http://aidwatchers.com/2010/09/welcome-to-economics-all-you-students-and-aid-workers/> That link came via Marginal

Revolution, too...

G (2010-09-09 17:01:08)

Similar thing happens with patents - it costs money to take out a patent so the ideas of the poor are squandered and powerful companies can take out patents in their thousands just to prevent others from actually using the ideas. This obviously causes technological, social and economic stagnation.

Ryan Holiday (2010-09-09 17:09:03)

I'd actually disagree. In many ways, food trucks are the anti-thesis of Jacobs ideas about what makes a good cities. Food trucks pay no rent, don't renovate spaces, operate mostly cash businesses, and have no vested interest in the neighborhood. In fact, in many cases they operate on incentives as big box retailers which is to identify lively, robust communities, and siphon out money from it. For instance, you're a restaurant who has worked hard to draw people/attention/other businesses to your surrounding area and navigated through the various regulations that the government forces business owners to jump over. Then a food truck - which is subject to none of those rules - parks outside your attractive location and takes away customers. (meanwhile, adding none of the benefits that you do - taxes, employees, etc) How would that be something Jacobs would support? Food truckers aren't less powerful, they are less meaningful and valuable to communities. Rarely is this true, but I think governments are mostly correct in their reactions against them.

Ryan Holiday (2010-09-09 17:10:22)

Btw, I'd make a distinct difference between taco trucks and ice cream trucks which have always existed and benefited underserved communities and the new generation of gourmet food trucks which nerds can't seem to stop blowing.

Seth Roberts (2010-09-09 19:16:30)

Ryan, in her later books on economics, such as *The Economy of Cities*, Jacobs tacitly recognized that her first book (about city planning) was actually a small part of a bigger picture. You can have all the old buildings, infill and short blocks you want but still do badly if other things are unfavorable. Food trucks are a way of helping small things (e.g., one person who wants to enter the food business) become bigger - become someone who can afford to open a restaurant and has the necessary business skills.

Ryan Holiday (2010-09-09 22:45:46)

I think your generalizing from a relatively rare occurrence. Most food truck owners don't go from truck to brick and mortar. They go from truck to more trucks because the economics are better - they don't have any of those pesky commitments to anyone but themselves. We, as a people, decided the regulations we enforce on restaurant owners are important. Things like health standards, minimum wages, zoning ordinances and so on. It's misguided to hold up food truck owners as examples of innovation or whatever, because the reality is they flout the very constraints we decided were necessary in the food industry and punish the real community builders by pocketing the better margins and stealing their business.

M (2010-09-10 02:00:29)

"Food trucks don't merely create jobs, they can create the best kind of jobs: Those that provide new goods and services. Unlike jobs created by building dams or highways." Why do you say that dams and highways don't provide goods and services? They may not provide buttered potatoes, but they provide electricity and transportation.

Seth Roberts (2010-09-11 05:38:27)

Dams and highways are unlikely to provide NEW goods and services. Too much is at stake for innovation.

Tom (2010-09-11 08:20:58)

*We, as a people, decided the regulations we enforce on restaurant owners are important. Things like health standards, minimum wages, zoning ordinances and so on. It's misguided to hold up food truck owners as examples of innovation or whatever, because the reality is they flout the very constraints we decided were necessary in the food industry and punish the real community builders by pocketing the better margins and stealing their business.* Some sloppy thinking here. Who's

"we"? What's "flouting the constraints 'we' decided were necessary"? Do you know for a fact that they are violating "health standards, minimum wages, zoning ordinances"? You don't, because the trucks are not breaking the law; they're offending your sensibilities. There are windfall profits to the first-mover, and the fact that one business takes traffic from another is just life. Two years ago, I was one of the thousands checking Twitter and racing off at 1am to check out a nearby Koji fusion Korean truck. But once I got there, the food was no biggie, and standing on a sidewalk in an industrial area with meat juice running down my arms wasn't exactly magical. I never went again. It was not quite as silly as the Tamagotchi craze – sometimes you get hungry, but you never really *need* a Tamagotchi – but it was still a little lame. And now there's a stampede into the niche. Eventually there will be more regulations as the bricks and mortar businesses complain. I think the alternative food truck thing is already overplayed, at least in LA (where it seems to have started.) A clear signal is the fact that Sizzler is right now building a fleet of them. Once people start to equate food trucks with Sizzler, they will no longer think of food trucks as interesting and kinky....they will be right back to the "roach coach" perception, and there will be a crapload of money lost on now-useless trucks. And most of the new trucks are being built by companies with bricks and mortar outlets. IE, Border Grill, an expensive downtown LA restaurant, has at least one truck. But I wonder if people will be willing to pay the premium at the restaurant for something the truck dishes out for cheap, without even needing to schlep downtown? (Koji's trucks can't damage their B & M outlets; they don't have any physical outlets.) I would be pretty fricking furious if I were a bricks & mortar Sizzler franchisee, though.

Harry (2011-04-12 14:02:21)

I'm way late to the party. I think (Ryan) you're taking the point and running away with it. What we're working with here is the idea that food trucks provide an avenue for innovation for culinary workers. They can enter the marketplace with a new idea – a new baked potato – and test it out with the relative ease of food trucks. Roberts is arguing that any economy that hopes to thrive shouldn't constrain these measures, you're saying the government should regulate food trucks heavily because they're a burden to employers and taxpayers. But that goes a little too far. After all, it's just a food truck – in most every case, it hits a pretty low ceiling. If the demand for their menu grows high, this food truck won't satisfy that demand with more food trucks. Nor is he likely to satisfy that demand by parking outside the premium real estate of other restaurants, eschewing property taxes and proper health codes. If the consumer is left to decide, most people usually prefer eating inside, on a table, in the confines of a restaurant. That's why restaurants are more profitable, and why they're taxed more heavily. All we're dealing with here is giving good ideas a chance to reach the marketplace. You can do that with food trucks, but if the consumer is left to decide what he wants, the food truck will only survive so long before it gets passed over for a restaurant.

## reCAPTCHA and Self-Experimentation (2010-09-10 18:39)

reCAPTCHA is the use of CAPTCHA security to read words that optical character recognition has failed to read. You see two words rather than one. The second word is the hard one. [1]This 2008 article by its inventors (computer-science professors) says reCAPTCHA is a way that

"wasted" human processing power can be used to solve problems that computers cannot yet solve.

Self-experimentation like mine is similar. I did it in my spare ("wasted") time. I was going to sleep anyway, I just recorded my sleep. And I found new answers to old questions, such as how to sleep better, that professional scientists had not yet found. You could say I solved problems that professional scientists aren't yet capable of solving.

I believe that reCAPTCHA and self-experimentation like mine are two ends of what will be a power-law distribution of the use of "spare" human processing power. reCAPTCHA: many people, tiny amount of time per contribution. Self-experimentation like mine: Tiny number of people, large amount of time per contribution. Halfway (in log units) between reCAPTCHA and self-experimentation like mine is Wikipedia: middling number of people, middling time per contribution. Writing open-source software, to the extent that it's unpaid, lies somewhere between Wikipedia and

my self-experimentation.

Volunteer work is nothing new. Intellectual volunteer work is nothing new – most books are written essentially for free. What is new is cheap distribution of intellectual volunteer work. Which greatly increases the diversity of what can be done and the extent to which it can be cooperative.

---

Bil Herron (2010-09-10 19:15:39)

Clay Shirky just wrote a book about this phenomenon, which he calls cognitive surplus (also the title of the book). Might be worth checking out.

Kerry (2010-09-12 09:20:43)

All that wonderful wasted intellectual property made ReCaptcha's inventor a millionaire 20 times over. It's not a public benefit project, it's a for-profit enterprise.

Seth Roberts (2010-09-12 11:32:24)

Kerry, you have a point. I think degree of public benefit and how much money someone makes are two separate dimensions; an enterprise can be high on both or low on both. However you are right that I was too narrow in my thinking about this. The product reviews left on amazon.com surely help Jeff Bozos and are examples of the use of spare time – maybe they lie between reCAPTCHA and Wikipedia.

### Assorted Links (2010-09-11 13:12)

Alex Chernavsky (2010-09-11 14:32:49)

Here's another article that's skeptical about the value of college: "[1]The Great College Hoax", from *Forbes* magazine, January 14, 2009. The same argument can be made about graduate school. I'll be paying-off my grad school loans for a total of 25 years

(I refinanced my original loan five years ago). I doubt that I'll get a positive return on investment.

1. <http://www.forbes.com/forbes/2009/0202/060.html>

q (2010-09-12 07:12:12)

you could ask the same thing about any investment and the answer will be "sometimes". individual circumstances matter a lot, and so does luck after the draw.

Laura (2010-09-12 07:33:42)

Thank you for the links! I especially liked the idea of putting college money in a Treasury bill. I learned that it is possible doctors won't be making as much anymore. The health care reform will affect them. <http://www.studentdoctor.net/2009/07/healthcare-reform-what-can-we-really-expect/> [http://www.huffingtonpost.com/jan-herman/a-doctor-speaks-outbremenhe\\_b\\_269406.html?show\\_comment\\_id=29771719](http://www.huffingtonpost.com/jan-herman/a-doctor-speaks-outbremenhe_b_269406.html?show_comment_id=29771719)

## Unschooling (2010-09-11 21:30)

Home schooling has a new name, or at least a new variety: [1]unschooling, notable for the absence of textbooks.

When the conference [about unschooling] is over, Ms. Laricchia will return to collaborating on building an online business with her son, Michael, 13. Her daughter, Lissy, 16, is a photographer who was recently invited to participate in a show in New York. The oldest child, Joseph, has turned 18 and is no longer being actively unschooled. His mom happily admits that the change has had almost no effect on his day-to-day life.

Thanks to Anne Weiss.

1. <http://www.theglobeandmail.com/life/family-and-relationships/back-to-school/more-families-are-deciding-that-schools-out-forever/article1703185/>

---

aretae (2010-09-11 22:38:57)

It started with John Holt, Summerhill, and the Sudbury schools. I've been in the unschooling community for near 20 years now, and my 14yo has been unschooled his whole life. It's not news...and it's good....and there's quite a bit of room to do it badly.

Gunnar (2010-09-12 03:48:38)

This sounds great to me. I wish I had been deschooled. I'm still working on getting rid of school's effects on me ;-)

Mary (2010-09-12 11:33:24)

I agree with aretae. The "unschooling" movement is older than the modern "homeschooling" movement. I first heard about "unschooling" in the mid-1980s, when the hugely influential leader of the unschooling movement, John Holt, was still living and publishing the magazine he founded, "Growing without schooling." The Colfax family that put "homeschooling" on the national radar screen when three of their sons were admitted to Harvard in the mid 1980s were actually "unschoolers" and followers of John Holt.

aretae (2010-09-12 17:49:37)

To elaborate a bit on the doing things badly portion... Unschooling, as originally conceived, relies on the natural curiosity of kids along with relatively supportive parents, in order to allow kids to learn what/when/how they want, rather than being force-fed mounds and mounds of junk that they will use precisely never, while being taught that learning is a chore, obedience is good, and whatever propaganda is in season this year. Advantages for time available to live: HUGE. Advantages for avoiding horrid school social world: HUGE. Advantages for learning to be self-directed: HUGE. However, there's also a trap hidden in there. Unschooling success relies on an environment wherein the social group finds learning interesting, useful, and common. I'm increasingly (Never 20 years ago, sometimes now) seeing folks who are "unschoolers" but not active in giving their kids opportunities to learn. Our unschooled kids know every museum in the city of Chicago...every animal at the zoo, and most of the trees in the arboretum. They do photography, read regularly, and count butterflies for the botanical society. They cook, they enter robotics competitions and learn to program them, and they play sports. They play online games (Shidonna, this week for the young ones, WoW and Modern Warfare 2 for the older one), they garden, they do puzzles. They visit the other unschoolers in the area frequently. They have, in short, been exposed to A LOT of options, and then largely left to pursue them. If you're an unschooler, this is your job...especially while the kids are young. Make stuff available to them...so they can choose things they like. While it might not be the thing you like, it will almost certainly be something that they are into. On the other hand, I've also seen families who call themselves "radical unschoolers" (not all radical unschoolers fit this model, but some clearly do) who don't aggressively pursue additional opportunities for the kids. Their kids don't sign up for classes...the parents don't spend an hour a day looking for interesting/new things for the kids to do...they operate in what they conceive of as the "natural" state of being. Parents work, kids play however they like. But it doesn't match natural mostly. Mostly, natural is that kids see how the parents work, not that parents leave to work and come back at night. Kids can participate when they're ready, and the social unit and the work unit are highly interrelated. Might it work? It might. In my experience, most of the time I see kids who have never found something they REALLY wanted to learn to do, and so they are highly angsty, unhappy kids who grow up not really knowing how to start learning something new...kids who want entertainment...and are almost as low on self-directed activity as the schooled kids are. They've had too much time alone (or with JUST family) and not enough with other kids...they've had too much time with TV and video games...systems designed to play on your brain-addictions. And they've not DONE enough. Is it worse than schooling? Perhaps they haven't learned the bad things school teach...but they haven't learned the self-reliance and self-directedness that most unschooling teaches either. Unschooling takes lots of work on the parents' part to prime the kids to learn. Without that recognition, there's a lot of room for failure.

Alexandra Carmichael (2010-09-13 08:48:29)

Hey Seth, We've been unschooling for the past 8 years now. John Holt was a great inspiration to us, as well as Sandra Dodd and John Taylor Gatto (read "The Underground History of American Education"). It works well most of the time. Happy to chat more about it sometime :) Alex

Heather Madrone (2010-09-13 10:04:00)

Unschooling is way more than an absence of textbooks. To Holt, unschooling was synonymous with homeschooling (and predated it and the Christian homeschooling movement by at least 10 years). People who apply certain of Holt's educational principles - like the importance of child-led learning and direct experience - have attempted to narrow unschooling to all child-led learning all the time, but unschooling is a lot more than that. I've unschooled my four kids (22, 18, 15, and 11) all their lives. Sometimes they use textbooks and take classes. Other times, they take a more direct, hands-on approach. My two daughters are in college; the eldest works as a math and physics tutor in the learning centers at the college she attends.

Alex Chernavsky (2010-09-14 05:18:11)

I'm the product of a conventional education - public schools from kindergarten through my BS degree (and private schools thereafter for graduate work). Yeah, it was regimented, and some of the classes/teachers weren't very good. But, overall, I liked it, and I don't share the disdain that some people have towards conventional education. I don't think that I would have done better in an unschooling program.

Maria Droujkova (2010-09-14 12:57:01)

I agree with Aretae's analysis. In the original unschooling literature there is too much stress on "innate" curiosity and not nearly enough emphasis on experience-rich environment and learning communities. People who doubt the importance of the social environment should re-read the (real) story of Mowgli kids. A fellow unschooler and I recently wrote an essay about family educator commons: <http://blog.p2pfoundation.net/family-educator-commons/2010/08/09> Unschooling does take a village! Off to help my unschooling 12yo to prepare her SparkCon presentation on children's right to work...

JohnG (2010-09-20 08:32:57)

We've been home schooling for 8 years. But, we do not believe unschooling is particularly beneficial for the child nor our nation. In fact, we believe too many home schoolers put too much emphasis on the arts and not enough on math and science. For us, math comes first, English second, science third, and the rest a distant fourth.

Stephen Bronstein (2010-10-10 23:16:50)

I highly recommend watching (or at least listening to) Jesse Schell's Long Now talk from July. [http://fora.tv/2010/07/27/Jesse\\_Schell\\_Visions\\_of\\_the\\_Gamepocalypse](http://fora.tv/2010/07/27/Jesse_Schell_Visions_of_the_Gamepocalypse) One of his points is that the future will belong to the curious and he suggests there will be a 'curiosity gap' between those who are curious and those who are not. But he says the problem is that we really have very little idea how to foster curiosity. Which isn't totally true as things like unschooling are obviously all about it.

### **The Treatment Trap by Rosemary Gibson (2010-09-12 11:27)**

[1]The Treatment Trap, a new book by Rosemary Gibson, is about the overuse of medical care – too much medicine. In [2]this talk, Gibson tells how a woman getting a heart check-up overheard a conversation: "We're only doing 9 bypasses a day, we need 14 a day to keep this place running." The result of her check-up: She needed a bypass!

[3]My encounter with too much surgery (and [4]here). [5]The Safe Patient Project is gathering stories of overtreatment, although it is unclear what they will do with them.

---

Kim Å~yhus (2010-09-13 00:57:23)

I actually ran away from my hand surgery while sedated, as I did not trust the doctor. Turned out I was right, and got a competent doctor later. This experience is not exactly overtreatment, as I barely avoided it, but it is similar, and shows that running away can help.

Alex Chernavsky (2010-09-13 07:38:54)

See also this excellent editorial from the *New York Times*: "[1]Is Newer Better? Not Always" (Sept. 12, 2010).

1. <http://www.nytimes.com/2010/09/12/opinion/12sun1.html>

John (2010-09-14 06:56:11)

I'm fairly sure I was forced to get a root canal while being treated at a dental school clinic in Boston. My student dentist needed to do one, so her supervisor came over and banged -hard- on my tooth until, lo and behold, I needed a root canal. Since it was for her exam, she paid for it, but still....

### **First Day of Class (2010-09-13 05:06)**

Today was my first day of class at Tsinghua. I am teaching a seminar called Frontiers of Psychology. There was only time for about half of the 40-odd students to identify themselves, which included saying their favorite book. Three girls said their favorite book is Pride and Prejudice. Two said The Little Prince. One said Harry Potter. One said Rebecca by Daphne Du Marier (published 1938). One boy said he didn't have a favorite book - reading books was a waste of time. One boy said his favorite book is Ulysses.

Most of them, perhaps 80 %, chose a non-Chinese book as their favorite. One French, two German, the rest English (which they may have read in Chinese translation). At first I was surprised but then I realized it made sense. Chinese civilization was more advanced than European civilization for a long time but when Gutenberg invented the Western version of the printing press everything changed. In Europe, unlike China, books became cheap and literacy spread. With literacy came a book industry. A large number of Europeans have been reading books for 500 years. In contrast, the Chinese language, with thousands of characters (in contrast to 26 lower-case and 26 upper-case letters) made printing difficult. With reading material rare, so was literacy.

---

Chris Sturdy (2010-09-13 08:46:00)

I considered having students identify themselves on the first day of class but with a class range from 60-180 I thought it would be too cumbersome. Do you do this each time you start a new term? What's the reaction? I do think that it is a great idea, and would (hopefully) get them involved and more invested in the course, or at least, in learning in general.

Alex Chernavsky (2010-09-13 09:17:14)

This seems like a lot of information to absorb in real-time, as students introduce themselves verbally in class. I wonder if it might be more efficient to set up something like a Facebook site, where each student can post their name, photograph, interests, favorite book, etc.

Chris Sturdy (2010-09-13 15:37:25)

I have a facebook site for my class. It doesn't get as much use as I would like.

Laura (2010-09-13 22:26:33)

I wish I could have been in your class! I would have said my favorite book of all time is: The Shangri-La Diet!

milieu (2010-09-14 05:35:52)

Hi Seth, I just came across this wonderful pedagogical approach and thought i should share it with you. I didnt know where to put it so i put it in the comments. Feel free to delete this comment later. <http://www.inference.phy.cam.ac.uk/mackay/exams.pdf> Milieu

Thu (2010-09-19 01:56:44)

Dear Professor Roberts, When and where does your class meet at Tsinghua?’

Seth Roberts (2010-09-19 23:27:18)

This class meets Monday 3:20 pm in Teaching Building 6, room 6B108.

### **The Thick-Fingered Surgeon (2010-09-14 05:25)**

Kim Å~yhus, who has [1]a proof that correlation is evidence of causation, told me this story of [2]medical overtreatment:

At 16 I got glass splinters and sand inside my hand when a test tube broke because it was handled too hard. The small local clinic sewed the wound shut without close examination, so a glass splinter and sand remained deep inside. About 5 years later the glass splinter cut itself loose because of bowling, and for about 10 years made the hand problematic to use. It became swollen and partly numb each time I used it with force.

So, 5 years into this I decided to do something about it. My mother contacted the local clinic again. "Come back tomorrow, and we will look at it," the doctor said to me at the first examination. The next day I arrived to a ready operation table of the simplest kind, and just the doctor.

"I thought we should look at it today, not operate it," I said.

"You know perfectly well that that means operating," he said.

I took that answer as a hint that he might not be an honest person.

In addition he had nervous tics in his shoulders and arms, as well as big thick sausage fingers, as if he plowed hard soil every day.

So, there I lay on the hard mattress, arm outstretched while he plunged the local anesthetic needle hither and dither inside my hand, while my unease continued to grow. So when he took the scalpel and pointed it at my hand, I said "No. There is not going to be an operation today." and rose from the guernsey.

"You can't just leave like that!" he said.

"It is my hand, so I decide what is to be done with it," I answered, and left the room with my mother.

Having seen the entire ordeal silently, which is very atypical of her, she was visibly relieved, and agreed entirely with my decision. She thought he was extremely nervous.

As we drove away, I saw the doctor sitting smoking on some wooden stacks outside, looking somewhat forlorn. I waved, and he waved back.

Fortunately, the needle had moved the glass splinter to a better place, so the hand was useful again for a few years after that.

When it started getting really bad again, I asked other doctors how stuff like that could be fixed, and they told me that hand operations are exceedingly difficult due to the delicate nature and lots of nerves, tendons, muscles, and so on everywhere tight together, so it requires a surgical team with a very good and experienced surgeon, long operating time, and often unconscious anesthesia. And so it was. They found sand inside nerves. I can tell you that is uncomfortable to have. The glass splinter I knew was there because I could feel it by poking hard with my fingers before the hand got swollen, was nowhere to be found.

The recovery took many years. It's OK now. And eating omega-3s and dropping carbohydrates this last year significantly improved it. It became softer, more bendable, and more sensitive, less numb, even though it is decades old now.

1. <http://kim.oyhus.no/CorrelationAndCausation.html>

2. <http://www.blog.sethroberts.net/2010/09/12/the-treatment-trap-by-rosemary-gibson/>

---

G (2010-09-14 11:03:33)

Had a very similar experience when I had an ingrown toenail out. Sat through the operation; was very painful and ineffective. I kept wondering what was wrong with him; he seemed like he'd just been divorced or worse.

john (2010-09-16 05:43:40)

Smart guy, there are other correlations that could be used, as shown by news reports about alien doctors in the U.K.

Stephen M (Ethesis) (2010-09-19 15:18:46)

You might find this interesting: <http://erinoconnor.org/2010/09/so-what-happens-now/>

### **Academic Horror Story (Duke University) (2010-09-15 05:20)**

Duke University officials have known since 2009 that there were [1]serious problems with Anil Potti's research – serious enough to believe it is fraudulent. Here is how [2]one researcher put it:

The Duke investigators said their data showed that expression of a particular gene, ERCC1, correlated with response to some agents. However, the commercial microarray chip the Duke investigators said they used in their experiments does not include that gene. "I admit this is one for which I do not have a simple, charitable explanation," [said] Dr. Baggerly.

Potti, you may remember, lied about having a Rhodes Fellowship. Duke's first investigation found him innocent.

Later events caused Duke officials to reconsider. They are [3]still making up their minds. This is a horror story because a clinical trial based on Potti's research is in progress. A hundred cancer patients are getting treated according to Potti's research – that is, according to research that is probably fraudulent. Duke has done nothing to warn the patients or stop the trial.

The whole thing reminds me of [4]UC Berkeley researchers taking weeks to tell a woman she had a large lump in her brain. As if their legal liability were more important than her life.

1. <http://www.blog.sethroberts.net/2010/08/05/the-potti-scandal/>

dearieme (2010-09-16 08:41:53)

The Bank of Sweden's nonNobel Prize is just a fiat currency among prizes.

Matt Weber (2010-09-16 11:41:27)

This post looked very different in Google Reader: <http://www.sas.upenn.edu/~mweb/img/cialis.jpg>

Sam (2010-09-16 12:02:42)

In my feedreader (google reader) your posts has a lot of cialis keywords and spam links inside it. Either your feed has been hacked, or google reader (or someone in between). You might want to check your site for intrusion.

Gunnar (2010-09-16 12:16:16)

On topic of the financial services industry: <http://csper.wordpress.com/> It's dogma in the disguise of a science.

Phil (2010-09-16 13:05:45)

Seth, your RSS feed appears to be hijacked somehow. When I subscribe to it either with Google Reader or as a Google widget, all the article titles are changed to "Cialis" or "Viagra", with links to Viagra added at the bottom of each article.

John S. (2010-09-16 15:26:53)

Have you been hacked somehow, or have I? I read your blog through Google Reader, and the title of this post (on Google Reader at least) has been replaced with the name of a certain drug used to treat erectile disfunction. The name of said drug is also scattered four times in bold throughout the text. In fact, looking at your feed I now see that the titles of the last ten posts or so have been replaced with the names of different erectile disfunction drugs.

Jo (2010-09-16 16:34:48)

Yes, I've noticed what John S. is talking about too, for a few days now. I used a firefox add-on to create a fake email address for this comment because I don't trust that my real email wouldn't wind up in the hands of spammers. Yesterday I searched for an older post on different yogurt incubation times and your Google search results are full of the same words too.

Seth Roberts (2010-09-16 17:36:47)

Sorry about the problem with the RSS feed. I'll look into it.

G (2010-09-17 06:37:13)

On the toad article, I can see that Karl's suggestion about inducing earthquakes is stupid but I don't see what's stupid or 'clueless' about Friedemann Freund's comment - can you clue me in?

## **Yale President Defends Liberal Education (2010-09-17 07:10)**

The President of Yale, Richard C. Levin, spoke in support of a Singapore branch of Yale College [1]like this:

There has never been a greater need for undergraduate education that cultivates critical inquiry. In a world that is increasingly interconnected, the qualities of mind developed through liberal education are perhaps more indispensable than ever in preparing students to understand and appreciate differences across cultures and boundaries, and to address problems for which there are no easy solutions.

I suppose President Levin uses a speechwriter but still . . . It reads like something a college student would write in answer to an essay question when they hadn't done the reading. What does "critical inquiry" have to do with understanding cultural differences? The first and second sentences could have been written by two different people. What

possessed Levin to imply that people without a liberal education – such as MIT and Caltech graduates – can only solve problems for which there are easy answers? Or did he fail to understand what he was reading?

Couldn't he, like, hire a better speechwriter? Or is "liberal education" [2]so hard to defend that no one can coherently defend it?

1. <http://www.nytimes.com/2010/09/14/education/14yale.html?hpw>

2. <http://www.blog.sethroberts.net/2007/03/31/for-whom-do-colleges-exist/>

---

Gunnar (2010-09-17 10:51:13)

He's the product of the education he proposes ;-)

NE1 (2010-09-17 11:10:23)

I have been insanely horny all week, so I admit when I read your post in my feed, I had to blink a lot before I clicked through to see what the hell was happening. Basically, your last 10 posts seem to have been hijacked by internet pharmaceutical vendors emphasizing male enhancement products. Are you using a different posting software, or just doing something crazy to stop blog scrapers?

waltzingmonkey (2010-09-17 11:26:24)

Looks like your server has been infected. Your posts are not affected when viewed from a browser, but when the Googlebot comes visiting, this virus alters what gets passed to it, so those who read your posts in Google Reader get the impression that you have suddenly become obsessed with medicines for male enhancement.

Thomas Seay (2010-09-17 12:51:46)

I agree that his statement about cross-cultural understanding doesn't make a lot of sense. However, I don't understand your criticism of "liberal education". By "liberal education" I understand an education that includes a broad range of disciplines. Now, I live and work (as a Computer Programmer) in Silicon Valley. A great number of "technical types" become very confused when the subject of conversation strays from their field of specialization (say, Computer Science) to politics, philosophy or any other subject (save, maybe the stock market). The same could be said of "business types". Given the power such people exercise in our society, don't you think it might be beneficial for them to have a wider perspective on the world? And yes, I do believe they might benefit from a "liberal education".

Seth Roberts (2010-09-17 15:21:32)

Thomas, now there's a coherent argument (I mean yours). I agree with your assumption – it would be a good if technical types had a wider perspective on the world. But I don't think it's obvious that such a wider perspective can be force-fed – that is, by making them take Class X and Class Y to fulfill a breadth requirement. Nor can I easily see why teaching "critical inquiry" (whatever that is) would make anyone more interested in new subjects, such as politics or philosophy. Perhaps MIT & Caltech's approach is better: Have speaker series that explore non-technical topics.

Bill (2010-09-17 19:24:31)

Your criticism seems strange to me. Surely what's bizarre about Levin's speech is the claim that Yale delivers a liberal education. Are undergraduates required to develop an even slightly deep understanding of (or even a superficial exposure to) Latin? Logic? Calculus? Classical history? Rhetoric? Theology? the Western Cannon? Any thing at all which might be recognizable

as a liberal education? He is like a zombie, shambling along, clutching at his briefcase though he has long ago passed into a shadow state of existence where the briefcase and its contents are entirely meaningless.

john (2010-09-18 03:54:41)

Didn't Alan Bloom state, and I agree with him, that there can be no cross cultural communication, the most there can be is inter cultural negotiation. U.S.A. has been quite good at high level negotiations for the past fifty years. Maybe that's what Levin means.

Ronald Pottol (2010-09-19 11:57:16)

I'm seeing it too, your rss feed (via google reader) is full of viagra spam, links inserted all over the posts.

ice hole (2010-09-21 07:15:24)

If, at Yale or any other major university, "differences across cultures and boundaries" were truly examined in a spirit of "critical inquiry," President Levin's worst administrative nightmare would be realized.

Mike Schwab (2010-09-21 10:53:29)

I think Levin's point is both coherent and important. As I understood it, what he is saying is that these days many people refer to things they read online as an authority that doesn't particularly need to be questioned. The same goes for articles in journals, books, lectures, what have you. Often the language is obscure enough that people don't have the tools to pick it apart; other times there is a tacit assumption that if it got edited and published it is probably correct. Yet, the reality is that we are still capable of making mistakes, and the climate of unscrupulous attribution only means that they will go further and potentially inhibit more people. A liberal education, where you learn about some various ancient shit before getting down to business, helps you get into the habit of embedding considerations of context and perspective into your answer for "what does this really mean?" Another facet of Levin's statement is the ability to comprehend the differences between cultures. It almost goes without saying that most of us oversimplify the thought processes that take place in foreign lands that we don't know that well. This has always been a tremendous problem for humans, and now that we have such a connected world, we have even more of a reason to learn how to respect each other. I doubt that Levin uses a speechwriter, although perhaps someone helps him out after he has drafted his remarks. He's an excellent speaker, besides being a fantastic president, and he is just as eloquent when he's responding to questions and other spontaneous stimuli.

Seth Roberts (2010-09-21 23:15:15)

President Levin's understanding of diversity appears to be roughly the same as the understanding of UC Berkeley administrators – to whom diversity meant the percentage of under-represented minority groups! The notion that people vary in other ways – such as how they think and what they are good at – didn't cross their minds, judging by the fact that efforts to increase "diversity" never involved that. By promoting a college environment that tends to reward one sort of thinking – the kind of thinking that does well in liberal education classes – more than others, Levin is discouraging diversity of thought.

MH (2010-09-23 13:59:21)

"What does 'critical inquiry' have to do with understanding cultural differences?" There is a long literature in the scholarship of teaching and learning which links critical inquiry and multiculturalism. In short, critical inquiry serves as a method of discovering and analyzing cultural assumptions that contribute to conflict, misunderstanding, and bias. President Levin may have been speaking in a way that was too specialized for a broad audience (and can surely be faulted for that if he was speaking to such an audience). However, you and your commenters are wrong to say he's intellectually incoherent—you are merely unfamiliar with this area of scholarship. (I wouldn't talk trash about psych theory before studying up on it.) Also, the quote clearly does not imply that MIT students can only solve easy problems. That's ridiculous. "By promoting a college environment that tends to reward one sort of thinking – the kind of thinking that does well in liberal education classes – more than others, Levin is discouraging diversity of thought." It seems you have a personal beef with this guy, which is justified for all I know. I can say, however, that liberal education opens up a lot space for diversity of thought—that is why many accuse it (with some justification) of promoting pure cultural relativism.

Seth Roberts (2010-09-23 20:10:19)

MH, you wrote: "You have a personal beef with this guy." Not true. I'd never heard of him until now. You also wrote: "The quote clearly does not imply that MIT students can only solve easy problems." Here's what Levin said: "the qualities of mind developed through liberal education are perhaps more indispensable than ever . . . to address problems for which there are no easy solutions." You seem to have a different interpretation of "indispensable" than I do. MIT students do not get a liberal education.

### **How Things Begin (Time Out) (2010-09-19 23:21)**

Time Out magazine was started in 1968 in London by Tony Elliot, who was 22 at the time. The original title was Where It's At. There were all sorts of new cultural stuff, such as a concert by the Who, that the mainstream media didn't notice. The fringe-y alternative media weren't interested in the attention to detail required to put out a list of events. That was the gap Time Out filled. Elliot borrowed a small amount of money (70 pounds) to start it. He and his co-workers worked without pay for the first three or four months. It was hard to get distribution, so they went around to parks passing it out. At a Beijing talk, Elliot said he didn't remember the first paid advertiser (maybe a music store) but he did remember when he got an unsolicited advertising order from the prestigious [1]London Film Museum. They understand what we're trying to do, he thought.

I asked what some of his biggest mistakes had been. Both involved not saying no when he should have said no.

1. <http://www.londonfilmmuseum.com/>

---

Aaron Blaisdell (2010-09-20 07:53:48)

Did he elaborate on the specific examples of not saying no when he should have?

### **Avocado Raises Blood Sugar (2010-09-21 07:39)**

Tim Lundeen writes:

We [Tim and his partner, Alexandra] first noticed that eating avocados raised our blood glucose when we were on a low-protein/low-fat/high-fruit nutrition plan. After 1/4 avocado each, we would both have fasting glucose of 95-99 instead of 80-85, with the effect lasting for about 4 days. It was quite repeatable, so we stopped eating avocados. We speculated at the time that it was due to the omega-6 content of the avocado fat.

We just tried avocado again with more typical nutrition, with about 25 % protein, 25 % fat, 50 % carbohydrate with very low fructose, thinking that because we were eating more fat the effect might not be so pronounced, but saw the same elevated fasting blood glucose as before.

After some more research, we found out it is because avocados contain a sugar called mannoheptulose, which causes temporary dysregulation of blood sugar.

Mannoheptulose was first isolated in 1917. Mannoheptulose has been proven to be present in many foods, but is found most abundantly in the avocado (La Forge 1916-1917). In 1957, the first research was published in the Archives of Biochemistry and Biophysics (Volume 69, page 592), suggesting that avocado extract blocked normal insulin secretion. In 1963, it was demonstrated that avocado extract blocks glucose-stimulated release of insulin (Nature, Volume 197, page 1264). By 1967, low doses of avocado extract were found to inhibit both pancreatic secretion and synthesis of insulin without eliciting measurable hyperglycemia (high blood sugar) (Nature, Volume 214, page 276). This finding was significant because it demonstrated that a controlled dose of avocado extract could suppress pancreatic production of insulin without inducing a diabetic state. [[1]<http://www.health-marketplace.com/p-Obesity-3.htm>]

The problem with this is that your cells don't absorb nutrition because insulin is reduced, so we have strong cravings for food, feel extra hungry all the time, and have been eating about 50 % more calories to feel full. The net effect is not a good feeling...

This makes sense. And it is methodologically interesting. Spending zero research dollars, Tim and Alexandra learned something important about blood sugar control that the rest of the world seems not to know. (Except perhaps the researchers who did the avocado extract research.) None of the research articles they mention make clear the practical significance of the effect. To say that avocado extract does X doesn't tell you how much avocado you need to get the effect.

When I google "avocado" and "blood sugar" (together), the first page of links all claim, at least at first glance, that avocado lowers blood sugar. But that's just the internet. (Although Google is supposed to put the most reliable links at the top.) Then I went to the most authoritative possible source on what we should eat: the American Journal of Clinical Nutrition. I found only three articles that mention avocados in their title or abstract. None was about this effect. I also looked in Eat Drink and Be Healthy by Walter Willett and the Harvard School of Public Health. Nothing about this effect of avocado.

1. <http://www.health-marketplace.com/p-Obesity-3.htm>

---

Mike (2010-09-21 08:15:20)

While the implications of mannoheptulose are interesting, the results from this n=2 trial are fairly worthless, seeing as how the couple utilized high carb diets both times. "The problem with this is that your cells don't absorb nutrition because insulin is reduced, so we have strong cravings for food, feel extra hungry all the time, and have been eating about 50 % more calories to feel full. The net effect is not a good feeling" this statement reflects the results of their diet, and subsequent chronically elevated insulin, not the avocado, accurately. I regularly consume up to two whole avocados daily in conjunction with a high fat, moderate protein, low carb diet; fasting triglycerides are extremely low, and when I've tested my BGL, it has always been within normal range (5.0mmol/L). Satiety is extremely high with no strong cravings, ever. Perhaps Tim & co. need to analyze the whole picture, and not just a piece.

Alex Chernavsky (2010-09-21 08:16:54)

So, if Gary Taubes is right that insulin is the primary regulator of fat storage, and if avocados lower insulin levels, then it makes sense to eat avocados if you're trying to lose weight? (Or would doing so make you more hungry than normal, which

might make you eat something that would then counteract the insulin-suppressing effect)? I'm trying to parse the practical significance here, in terms of weight loss.

Vic (2010-09-21 09:14:05)

Interesting, from wikipedia: Roth and his team (from P &G Pet Care, Wayne State University, Southern Illinois University and the Pennington Biomedical Research Institute) have been mining avocados for an alternative "MH (for mannoheptulose). It's a fairly simple sugar with a 7-carbon backbone. When fed to mice in fairly concentrated doses (roughly 300 milligrams per kilogram of an animal's body weight), it improved insulin sensitivity and the clearance of glucose from the blood. Meaning it helped overcome diabetes-like impairments to blood-sugar control. MH supplementation also improved the ability of insulin, a hormone, to get cells throughout the body to do its bidding (and that's a good thing). MH revved up the burning of fats in muscle. That's the opposite of fat deposition and something that these scientists note "would be an expected effect of a calorie restriction mimetic." Treated mice also lived longer "some 30 percent longer than untreated animals. And they were happier, I'm guessing, because they didn't have to give up most of their chow to achieve this life extension. Indeed, their food intake and weight matched that of untreated mice. Roth, G., et al. 2009. Mannoheptulose Glycolytic Inhibitor and Novel Caloric Restriction Mimetic (Abst. 553.1). Experimental Biology 2009, New Orleans (April 19).

peter (2010-09-21 09:59:20)

i started eating avocado (1/4) in a salad and found that it satisfied my hunger to the extent that eat less over all; also, the effect seems to last a long time, i.e., i can postpone when i next eat. i haven't measured by glucose, but i'll try. I think this points out the problem of trying to extrapolate from the experience on one person. the body is complex and reactions to food etc.. will likely vary; it is unlikely that any underpowered "study" (in this case really an anecdote) is very meaningful.

Caleb (2010-09-21 22:28:26)

So, they ate an evolutionary excessive amount of carbs, and then found that down-regulating the hormone that absorbs carbs caused problems. That's... not surprising. Learning that avocado down-regulates insulin is very useful though. i'll be sure to eat it more often, as producing less insulin is very healthy as long as you aren't consuming a ridiculous excess of sugars that need to be mopped up (i'd say anything in excess of 25 % carbs is suboptimal, let alone twice that)

Seth Roberts (2010-09-21 23:04:59)

Mike, perhaps your fasting blood sugar would be lower – closer to 84 – if you ate fewer avocados. Closer to 84 is better. I eat the same diet as you (high fat, med protein, low carb) and agree with you about its benefits. I agree that if you eat such a diet avocados should make less difference. Caleb, that's a good point. But a large fraction of the world eats an evolutionary excessive amount of carbs. So this has practical value.

Nancy Lebovitz (2010-09-22 01:59:35)

Also, just having information that avocados raise the blood sugar for some people is worth knowing. It isn't that hard to check, and it's better than thinking avocados must be good for everyone.

Aaron Blaisdell (2010-09-22 09:32:43)

So an emerging consensus appears to be that if you are asked "Is Food X good to eat?" (X=avocados in this case), a proper response would be "That depends. What else do you eat?"

Tim Lundeen (2010-09-22 09:50:25)

If you eat avocados on a regular basis, your body will adjust to the reduced levels of insulin: your cells will increase the number of insulin receptors they express, and you'll stop being hungry. When we noticed this effect, our elevated blood sugar went away after 4 days, which is exactly how long it takes your cells to rebuild these receptors and calibrate their needs to changes in their environment. However, it seems likely that reducing insulin levels this way is not healthy. If our bodies are designed to produce a certain level of insulin in response to a particular glucose/protein load, then reducing it is likely to have side effects even though the overt hunger and elevated blood glucose goes away in 4 days. With regard to the level of carbohydrates

in the diet, the pancreas has sensors for both glucose and glutamine, so produces insulin in response to both carbohydrate and protein intake until both are back to baseline. If the effect of mannoheptulose was only on glucose sensing, then it is possible that you wouldn't see a blood sugar increase resulting from combined protein/carb intake. My prediction is that mannoheptulose acts directly on insulin output, not just on pancreatic glucose sensing, because we do see glucose increase with combined intake. Very hard to say what the balance is without doing the experiment and measuring insulin levels with all protein vs all carb intakes, but would be interesting to try it. Also, re the "correct" level of carbohydrates in paleolithic diets, there is a lot of debate and these numbers are constantly revised. There is a good paper in the European Journal of Clinical Nutrition by Eaton et al, "Paleolithic nutrition revisited: A twelve-year retrospective on its nature and implications". They retrodict paleolithic macronutrient intake as 37 % protein, 22 % fat, 41 % carbohydrate, which is consistent with studies of modern-day hunter-gatherers. Further, there are cultures today that eat very high carbs (the Okinawans traditionally ate 10 % protein, 10 % fat, 80 % carbs) who have excellent blood sugar control and live long healthy lives (the Okinawans have one of the highest percentages of centenarians of any culture). Our own requirements for any nutrition plan we adopt is that we have fasting blood sugar of 83 and peak blood sugar after meals of no more than 120, ideally less. Our current diet does this, except for 4 days after we eat avocado :-)

Paul (2010-09-22 12:16:03)

I both want to criticize and defend Mr. Roberts here. The criticism is this; the sample size is too small to take it as Gospel. The results must be replicated. On the other hand, new hypothesis/avenues of research must come from somewhere. In regards to diet/exercise/sleep or any other endeavor where it is easy for people to play around with marginal changes and record data, amateur self-experimentation is likely to prove very fertile ground for new ideas. The proper response of a scientifically inclined skeptic would be to ask if the results are repeatable, not to discount them because the bearers don't wear the priestly vestments of a white lab coat. Also, Seth, one of the values of a liberal education, if it is an education that includes an emphasis on the history of math, science, literature, and philosophy, is to free the mind from prejudices and dogma and to recognize dogma and prejudice when one sees it. A liberal education, unlike some other forms of education, attempts to inculcate the habit of using reason as the ultimate arbiter of truth, as opposed to authority, mysticism, or emotions.

Vic (2010-09-22 22:40:40)

Hi Tim, Thanks for sharing... so what do you eat to achieve those levels? and how often? where does exercise come in? Vic

Caleb (2010-09-23 10:45:56)

Tim, thanks for your data rich and nuanced response. We both agree that there is a wide variety of macro nutrient consumption that can be healthy. It's more the type of carbs and fats that are important at the proximal level. I'm a little skeptical of using modern hunter gathers to extrapolate the evolutionary environment, as those who have survived usually have done so because they live on marginal land that others didn't feel was worth driving them off of, so the type of food such land supports may not be representative of the past. I do consider these diets great baselines, though once again, I'm not convinced they're optimal. My personal philosophy is to only get enough carbs to fuel the brain and muscles with glycogen (i.e. avoiding ketosis most of the time), only get enough protein for body maintenance, and use fats to meet all other energy needs. The main reason is that protein and insulin restriction seem to be the key mechanism in all the longevity studies. Insulin seems to activate the pathways that result in aging, and most of the interventions that increase lifespan, such as curcumin, avocado, rapamycin, all seem to share the common factor of down regulating insulin pathways. I don't agree with the second paragraph, as hunter gather diets vary through the seasons and food availability, and I believe we're well evolved to handle such variations. Hormesis suggests it's even good for the body to have to respond to such intermittent stressors.

peter (2010-09-23 15:30:20)

i just got my glucose reading back; it's 83 (taken at 3:00 pm, probably 3 hours after eating); my reading before this (when i wasn't eating avocado every day) was 100 (it was fasting). i guess i'm going to continue eating avocado (altho i also take cinnamon in the a.m.).

Nansen (2010-09-23 16:44:20)

@ Aaron Blaisdell: and perhaps also, "what is your exercise regimen"? I wonder about this when I read that Seth eats 60 grams of butter a day.

Seth Roberts (2010-09-24 02:02:57)

Nansen, I usually take a one-hour walk every day. Sometimes more. The butter greatly reduces my appetite, I find. Paul, I think all education tends to "free the mind from dogma" in the sense that the more you know, the more beliefs you have to choose between. I don't understand how the history of math is relevant here. Sure, learning the history of science shows how cherished beliefs (such as the earth is the center of the cosmos) have been wrong. But science isn't the focus of liberal education. I suspect MIT students know more about the history of science than Harvard students. Liberal education, in practice, means a large dose of humanities. How studying this or that novel or listening to an art-history professor's obscurities tends to free one from dogma I fail to see. I think Veblen was right about higher education: Professors try to show off their uselessness. In all areas they try hard but in the humanities it's easier.

SB (2010-10-02 06:48:14)

From this site: [http://www.newhope.com/nutritionsciencenews/NSN\\_backs/Apr\\_00/cancer.cfm](http://www.newhope.com/nutritionsciencenews/NSN_backs/Apr_00/cancer.cfm) "... avocado extract to inhibit glucose uptake in cancer cells; ..."

Paul (2012-04-08 10:43:49)

Is it possible for avocado to temporarily give you symptoms of diabetes? I have frequent hunger and urination regularly but it seems after a couple of days of eating avocado both are exacerbated, especially the urination. I went to the doctor and had a fasting blood glucose of 99. I am very fit and eat a super clean diet yet it appears I am knocking on the door of diabetes. I should also mention I have chronic insomnia and that might play a part.

### **Shamelessness in Chinese Academia (2010-09-22 06:20)**

Professor Wang Hui, a Tsinghua faculty member in the Chinese Language Department, was accused of plagiarism several months ago. You can read about it [1]here. Professor Wang is no stranger to controversy:

Wang Hui was involved in controversy following the results of the Cheung Kong Dushu Prize in 2000. The prize was set up by Sir Li Ka-shing, which awards one million RMB in total to be shared by the winners. The 3 recipients of the prize in 2000 were Wang Hui, who served as the coordinator of the academic selection committee of the prize, Fei Xiaotong, the Honorary Chairman of the committee, and Qian Liquan, another committee member. Wang Hui was then the editor-in-chief of Dushu magazine, which was the administrative body of the prize.

He awarded the prize to himself! And his fellow committee members. Wang was editor in chief of Dushu for ten years. During that time, he published many hard-to-understand articles by his friends. The influence of the magazine shrank considerably.

1. [http://en.wikipedia.org/wiki/Wang\\_Hui\\_%28intellectual%29](http://en.wikipedia.org/wiki/Wang_Hui_%28intellectual%29)

Gunnar (2010-09-22 07:07:14)

Because he was worth it ;-) His "friends" think so, too!

Timothy Beneke (2010-09-22 09:04:11)

I wonder how social reality is so constructed for these people so that they can give themselves prizes worth lots of money with a straight face. Or are they smirking? In the West there is some recognition that one is not in a position to objectively evaluate one's own work compared with others; that biases intrude. Is it cynicism? As Gunnar suggests, do they in good conscience believe that they were deserving of the award? I'm curious as to how they would rationalize it... It is said that corruption is widespread in China... Wow...

Thomas Seay (2010-09-22 09:09:18)

Let's face it. Bribery and corruption are built into the Chinese system. Sure, there is bribery and corruption in the West, too. However, I dare say that even those who engage in it here, know deep down it's wrong. I am not certain that is the case in China. It just seems part of life that teachers, for example, are given "gifts" in order to boost a child's grade. Money is given to judges in order to ensure that a prisoner either doesn't go to jail or his sentence is reduced. Managers in charge of money for a corporation "borrow" some in order to start a business of their own on the side. The list could go on and on. Wang Hui was just doing what anybody (in China) would do. Remember the Chinese attitude of disbelief at the downfall of Nixon. How could Americans have got rid of their President over such a simple infraction?!

Alex Chernavsky (2010-09-22 10:45:42)

Shamelessness in the town of Bell, California: [http://news.yahoo.com/s/ap/us\\_bell\\_salaries](http://news.yahoo.com/s/ap/us_bell_salaries)

**8 Bell officials to face judge in corruption case** LOS ANGELES — The mayor, the ex-city manager and six current and former officials of Bell were headed from jail to court Wednesday as residents of the modest, working-class suburb celebrated their arrest on charges of bilking taxpayers out of \$5.5 million. As former City Manager Robert Rizzo, Mayor Oscar Hernandez and the others were rounded up during Tuesday morning raids on their homes, residents across the city honked their car horns, burst into cheers and staged impromptu celebrations. The eight were scheduled to be arraigned in court Wednesday on charges of misappropriating more than \$5.5 million in public funds. "They used the tax dollars collected from the hardworking citizens of Bell as their own piggy bank, which they then looted at will," District Attorney Steve Cooley told a news conference in Los Angeles soon after all eight were taken from their homes in handcuffs.

Darius Bacon (2010-09-22 11:37:18)

Reminds me of Dick Cheney heading Bush's vice-president search. <http://www.harpers.org/archive/2008/09/hbc-90003554>

Seth Roberts (2010-09-22 15:29:43)

"Wang Hui was just doing what anyone (in China) would do." The overseers of Dushu didn't agree, apparently. This seems to be why he was removed from his post as editor-in-chief of Dushu.

Thomas Seay (2010-09-28 12:49:50)

“Wang Hui was just doing what anyone (in China) would do.” The overseers of Dushu didn't agree, apparently. This seems to be why he was removed from his post as editor-in-chief of Dushu.” Yes, if you get caught you MAY suffer the consequences; however, that doesn't diminish my point. Bribery, etc. is, relatively speaking, socially accepted in China. If an American mother were to advise another mother to give a teacher \$50 as a gift to enhance a child's grade, more likely than not, the American mother would be outraged. If you were to do that in China, it would just be considered smart, sound advice.

## Why Psychologists Don't Imitate Economists (2010-09-23 07:43)

Justin Wolfers, an economist, via [1]Marginal Revolution:

When I watch and speak with my friends in psychology, very little of their work is about analyzing observational data. It's about experiments, real experiments, with very interesting interventions. So they have a different method of trying to isolate causation. I am certain that we have an enormous amount to learn from them. But I am curious why we have not been able to convince them of the importance of careful analysis of observational data.

By "careful analysis of observational data" I think Wolfers means the way economists search within observational data for comparisons in which the factor of interest is the only thing that changes (which is why he says "isolate" rather than "infer"). He's right – it really is a methodological innovation that psychologists are unfamiliar with. It lies between ordinary survey data and experiments.

Here's why I think this innovation has had (and will have) little effect on psychology:

1. Most psychology professors are bad at math. They still use SPSS! Which is terrible but they think R is too difficult. Economics papers are full of math. That is part of the problem. Math difficulty also means they have trouble with basic statistical ideas. When analyzing data, they're afraid they'll do the wrong thing. For example, most psychology professors don't transform their data. It wasn't in some crummy textbook so they are afraid of it. Lack of confidence about math makes them resistant to new methods of analysis. Experimental data is much easier to analyze than observational data. You don't need to be good at math to do a good job. So they not only cling to SPSS, they cling to experimental data.
2. Psychology studies smaller entities than economics. Study of the parts often influences study of the whole; the influence rarely goes the other way. This is why, when it comes to theory, physics will always have a much bigger effect on chemistry than vice-versa, chemistry a much bigger effect on biology than vice-versa. Method is different than theory but if you aren't reading the papers – and physicists don't read a lot of chemistry – you won't pick up the methods.
3. There is a long history of longitudinal research in psychology. Studying one or more groups of children year after year into adulthood. The Terman Genius project is the most famous example. I find these studies unimpressive. They haven't found anything I would teach in an introductory psychology class. I think most psychologists would agree. This makes observational data less attractive by association.
4. Like everyone else, psychologists have been brainwashed with "correlation does not equal causation". I have heard many psychology professors repeat this; I have never heard one say how misleading it is. To the extent they believe it, it pushes them away from observational data.
5. Psychologists rarely use observational data at all. To get them to appreciate sophisticated analysis of observational data is like getting someone who has never drunk any wine to appreciate the difference between a \$20 wine and a \$40 wine.

1. <http://www.marginalrevolution.com/marginalrevolution/2010/09/justin-wolfers-on-trade-across-the-disciplines.html>

---

Matt Weber (2010-09-23 10:20:03)

Working from nearly zero information, I wonder if it's not harder to get good observational data that's of interest to psychologists. I gather economists do a lot of work with big, publicly available datasets collected by agencies whose job it is to collect

them. If I knew about a large dataset that included variables of psychological interest, I'd be interested. There are exceptions – my ex-officemate Gary Lupyan has a recent PLoS ONE paper analyzing how morphology relates to number of speakers in a big database of languages. And it's obviously possible that many of these datasets exist, and I'm unaware of them because of this very methodological bias. (Unrelated, I have a bachelor's in computer science and don't touch SPSS if I can avoid it – but R is gross in its own way, and I'm getting more and more frustrated with how much effort it takes to do simple things. I'm starting to think that Python with numpy and matplotlib may be the open source data analysis and visualization solution, not that I've tested this hypothesis.)

UhhhNo (2010-09-23 12:00:42)

I know quite a few psychologists who absolutely love SAS. I work with SAS exclusively, both for my psychological and economic analyses.

Alex Chernavsky (2010-09-23 14:28:53)

Seth, I'm curious why you think longitudinal studies haven't produced any really interesting results. What about the Harvard Study of Adult Development, which has been running for about 73 years? I don't actually know much about it, aside from what I read in this article: <http://www.theatlantic.com/magazine/archive/2009/06/what-makes-us-happy/7439/> The article wasn't very well written, but the study itself seems interesting.

Seth Roberts (2010-09-23 15:11:59)

Alex, I read the article but didn't find any impressive results in it. Maybe you noticed how no small number of results were emphasized. Instead, 20-odd conclusions were described briefly. Matt, the big databases you refer to often measure things that depend on behavior, which psychologists study. For example, income reflects behavior. Sometimes these big databases include something very close to behavior, such as highest degree achieved. But a psychologist would think that income and highest degree achieved are poor measures of behavior because they are likely to depend on dozens of things, including many a psychologist wouldn't care about (e.g., where you live). When you can't measure all the things that might affect your dependent variable, and it's observational (non-experimental) data, you get very nervous about concluding cause and effect.

Sam Gershman (2010-09-23 21:15:57)

There is a long history of working with observational data in personality psychology, as well as intelligence research. For example, researchers have been interested in understanding the relationship between working memory capacity and IQ: [http://www.interactivemetronome.com/IMPublic/Research/Temporal %20Processing/Intelligence/Research \\_Intelligence \\_Engle1999.pdf](http://www.interactivemetronome.com/IMPublic/Research/Temporal%20Processing/Intelligence/Research_Intelligence_Engle1999.pdf) More generally, studies of "individual differences" are widespread throughout psychology. In any case, I completely agree that software and mathematical knowledge is a major limiting factor. I remember having a conversation with social psychologists where they wanted to use graphical models to analyze their data; they kept asking me, "Can your model do this? Can your model do that?" I told them that we can build a graphical model encoding any type of assumptions they want, which completely amazed them. Psychologists have put themselves in a very constraining analytical box, and I hope that we can revise the statistics curriculum (and force them to learn programming) in the future to enable more flexible thinking.

Seth Roberts (2010-09-24 01:37:49)

Sam, yeah, you're right. And some of the personality work does impress me – Frank Sulloway's, for example. That would be one way that these economic methods could begin to influence psychology.

jeanlouisefinch (2010-09-25 12:09:14)

6. Psychologists who do this sort of analysis get re-branded as economists.

Marcus (2010-09-25 12:29:30)

This fixation of economists doing comparative analysis of their discipline with others invariably proves the superiority of economics over all things. "We're the awesome realists" they say. And yet the gulf ignored is analysis of what is past with useful observations for the future. And the disciplines ignored ethics and philosophy.

Alan Gunn (2010-09-25 12:35:54)

Practicing psychologists are people who work with one (or sometimes a few, as in group therapy) person at a time. This is so much taken for granted that the idea that one ought to look at large numbers of people seems foreign to them. I suppose this outlook tends to infect academics as well, especially as many of them do therapy too. I do some work with abused children. I constantly run across therapists who are willing to offer firm opinions about someone's character or intentions based solely on discussions with that one person. Whenever I point out that several other people tell very different stories from what they've heard, they mostly just look at me funny. It's sort of the same thing as if one were to conduct a trial by asking questions only of the defendant. This mindset doesn't encourage the sort of thinking that economists do. It also doesn't tend to lead to accurate predictions: studies of how accurate therapists are at prediction things like dangerousness show them about on a par with coin flips.

Tom Leahey (2010-09-25 12:43:17)

What's going here is that by and large economists and psychologists have different objectives. When psychology began as a science in the 19th century it defined itself as the science that studied – experimentally – conscious experience. It asked questions such as "How many simple ideas can be held in consciousness at the same time?" (answer 3-4 clearly and distinctly). Observational data sets aren't useful here. Even though psychology is now the science of behavior, we're still interested in elucidating internal mechanisms that cause behavior, whether conscious, nonconscious, or physiological. As an example, let me take Friedman's famous billiards player. He was happy to explain the player's behavior from the outside as if the player were a master of physics. A psychologist would want to look inside: What thoughts does he have as he lines up a shot? What sensory cues does he need to integrate to make an effective shot: light reflectance off the billiard balls? kinesthetic cues from the position of his body and hand as he holds the pool cue? kinesthetic feedback from the movement of his hand as he strikes the ball? sensory integration of the visually perceived movement of the ball with the feedback from striking the ball? Also: How does one move from being a novice billiard ball player to an expert one? Is there explicit instruction? Does one learn by observation? If the latter, how does the learner figure out what aspects of an expert's movements are relevant and which are not? What's happening at the neural level as the player contemplates and executes a shot? Because these are questions about internal mechanisms, observational data sets are not helpful. One needs careful experimental studies in which one might vary things such as light reflectance off the balls. In this connection, let me note that one can find very sophisticated mathematical work in psychology, it will just be in areas that economists are unlikely to encounter, such as psychophysics (Fechner's law looks a lot like a utility curve, by the way) or in work in neural network theory or dynamical systems. Finally, I'd like to mention that the very first work I know of in behavioral economics never seems to come up in economists' discussions of it, which tend to start with Simon and Kahnemann/Tversky. It was work back in the 1970s by Skinnerian radical behaviorists on choice behavior in animals, pioneered by Richard Herrnstein (of the Bell Curve). Skinnerians don't care about internal mechanisms, either. If we were all social scientists from Mars studying the movements of "automobiles" on Earth's highways, you would collect large observational data sets about traffic flows. Psychologists would want to capture several vehicles and look inside to see how they work.

buzz (2010-09-25 15:02:40)

Why Psychologists Don't Imitate Economists ... ..

Michael Bishop (2010-09-25 15:15:51)

Psychology studies smaller entities than economics. Study of the parts often influences study of the whole; the influence rarely goes the other way. This is why, when it comes to theory, physics will always have a much bigger effect on chemistry than vice-versa, chemistry a much bigger effect on biology than vice-versa. Method is different than theory but if you aren't reading the papers – and physicists don't read a lot of chemistry – you won't pick up the methods.

I share the intuition... has anybody fleshed out the implications?

Mario Rizzo (2010-09-25 15:32:55)

I wonder if there are studies that have been redone using the more sophisticated data techniques of economists. My question is: Does it make a difference, not for one of two studies, but for the thrust of the basic conclusions in an area? This would be an excellent opportunity to examine the various ways smart researchers can overcome the limitations of their respective empirical methods. It won't be done, of course – so economists can continue to feel superior.

blink (2010-09-25 15:40:06)

I think we have nearly reached a point where the difference between psychology and economics is the methodology, particularly since the content often overlaps. That is, if you are using sophisticated statistics on observational data, you are doing economics; if you are running experiments, you are doing psychology. A fair bit of training is required to do either well – witness the number of graduate-level courses devoted to econometrics or psychological methods – so specialization according to comparative advantage makes sense.

John Bullock (2010-09-25 16:11:55)

Psychologists rarely use observational data at all.

Social psychologists use observational data – of a particular sort – all the time. They do it when they analyze mediation (or "causal mechanisms") in the style of Baron and Kenny (1986). Their data on mediators are almost always observational: the mediators are measured but not manipulated. The analyses of mediation in these cases should be thought of as observational studies, with all of the difficulties that observational studies entail.

Andy (2010-09-25 16:35:55)

Hmmmm. What bits of psychology were you looking at? Plenty of psychologists use R. Plenty of psychologists use observational data.

John Bullock (2010-09-26 12:47:55)

I wonder if there are studies that have been redone using the more sophisticated data techniques of economists. My question is: Does it make a difference, not for one of two studies, but for the thrust of the basic conclusions in an area?

Sometimes it does: [1]How Choice Affects and Reflects Preferences: Revisiting the Free-Choice Paradigm M. Keith Chen and Jane L. Risen JPSP 2010 Excerpts from the abstract:

After making a choice between two objects, people evaluate their chosen item higher and their rejected item lower (i.e., they "spread" the alternatives). Since Brehm's (1956) initial free-choice experiment, psychologists have interpreted the spreading of alternatives as evidence for choice-induced attitude change. It is widely assumed to occur because choosing creates cognitive dissonance [... but] the free-choice paradigm (FCP) will produce spreading, even if people's attitudes remain unchanged [...] We show this, first, by proving a mathematical theorem that identifies a set of conditions under which the FCP will measure spreading, even absent attitude change. We then experimentally demonstrate that these conditions appear to hold [...] The results suggest a reassessment of the free-choice paradigm, and perhaps, the conclusions that have been drawn from it.

1. <http://www.som.yale.edu/faculty/keith.chen/papers/CogDisPaper.pdf>

Phil (2010-09-26 16:48:19)

Seth, out of curiosity, can you list a few important points that have come to be generally accepted as a result of the "innovation" you extol in the beginning, which psychologists have foolishly ignored. I'm in neither field, but it strikes me that there are papers showing "evidence from this" and "evidence from that" supporting various hypotheses, but on how many important

questions has a general consensus been reached as a result of these studies? Many? More than longitudinal studies employed by psychologists?

Keivn H (2010-09-26 17:51:16)

I think you have it a bit backwards. Psychologists won't start using large amounts of observational data because experiments are fundamentally better at answering questions. Imagine trying to do observational chemistry or observational physics! While economics has historically had to rely on imperfect observational data, I think more and more economists will start embracing experimental approaches. I think some of your own points actually are pretty good arguments for this line of thinking. "Experimental data is much easier to analyze than observational data." This is pretty much the point. For any given effect, you will have more power to detect the effect in a well controlled experiment than in observation data with uncontrolled variables. Sometimes you can correct for those uncontrolled variables, but almost always it is an approximation. "Study of the parts often influences study of the whole; the influence rarely goes the other way." With experiments, it is much easier to get at multiple levels of analysis, with observational data, there is a lower limit on how small you can go (usually related to privacy laws and the inability to record all decisions/environments). Some of the really large scale stuff will probably have to remain observational for similar technical limits, but experiments of groups of up to a few hundred people are feasible. Also, correlation isn't causation. I agree it can sometimes be used dismissively, but it comes back to a basic point. In order to determine the direction of relationship unambiguously, you need to externally perturb one of the variables and measure the influence on the other variable. That is an experiment. There are sometimes natural experiments, but they can never be as well controlled as a deliberate experiment. I will agree on one point however. Psychologists are chronically bad at math, and this holds the field back. Economists can add a lot to psychology if they bring mathematical rigor to the field, and learn how to design good experiments. I think the biggest road block for most economists in designing good experiments is know what tools they have at their disposal. Psychological methods have a long history and there is a lot of great paradigms to use in there. One field that jumps out to me is the study of working memory. There are a lot of interesting findings there that economists could use to start predicting individual and maybe even group behavior. Other topic to learn about would probably be cognitive control/executive function (which desperately needs some better models and rigor), and attention, which relates to literally everything humans do.

Kevin H (2010-09-26 17:54:02)

Oh, and an interesting set of longitudinal data related to psych? I'd say there's lot in child development. Probably most likely to make it into a psych 101 course would be maternal diet and it's effect upon psychological outcome of the child.

## **The Corruption of Drug Trials (2010-09-25 22:51)**

In [1] a clinical trial of a new antipsychotic drug done at the University of Minnesota, a man named Dan Weiss was given a choice: be hospitalized in a psych ward or, shockingly, "take part in an industry-funded study of antipsychotic drugs". The usual choice is between hospitalization or conventional treatment. Weiss chose to be in the clinical trial. During the trial he killed himself.

An FDA investigator named Sharon Matson decided that Weiss had not been coerced into participating! During a trial, Moira Keane, the head of the University of Minnesota Institutional Review Board, which of course is meant to protect human subjects, claimed the purpose of the board was not to protect human subjects. The purpose of the board, Keane said, was "to make sure that Olson and the trial sponsor had a plan to protect subjects." This is false. IRBs sometimes measure compliance, not just plans.

After Weiss's mom sued the University of Minnesota and lost,

The university filed a legal action against Mary, demanding that she pay the university \$57,000 to cover its legal expenses. Gale Pearson, one of Mary's attorneys, says that while such suits are technically permissible, she had never seen one filed in her previous 14 years of legal practice. The university agreed to drop the lawsuit against Mary only when she agreed not to appeal the judge's decision.

[2] The article by Carl Elliott about this case also contains excellent discussion of how drug companies shape clinical trials to get the results they want – and when that fails, hide the results. The effect is that new drugs are approved that are worse than the drugs they replace.

Thanks to James Andrewartha.

2. <http://motherjones.com/environment/2010/09/dan-markingson-drug-trial-astrazeneca>

---

Gunnar (2010-09-26 05:09:54)

If the drugs are worse or better depends on the goal. Some people have opposite goals to common folks. I'm a rather common guy, and I want to be healthy. That's not in the interest of drug companies and the FDA, as I understand it today. Better not be a (human) subject or resource!

David (2010-09-27 12:59:44)

Very sad to see where things are going, if the U of M feels it can do this without a massive public outcry.

### **The Stupidity of Crowds (2010-09-27 07:33)**

At Tsinghua I am teaching a class called Frontiers of Psychology. The students are reading [1]The Man Who Would Be Queen by Michael Bailey. At one point Bailey mentions what is sometimes called [2]the older brother effect: If a man has one older brother, he is more likely to be gay than if he has no older brothers, controlling for several things. This has been seen many times. In 1962 it was reported that gay men have more older siblings than other men but not until 1996 was it determined that this was due to more older brothers.

Bailey doesn't mention the strength of the effect. [3]The Wisdom of Crowds by James Surowiecki is about research that found that non-experts can do an excellent job of estimating this or that number (such as the weight of a particular cow) even when they know little about it. Their answers are excellent in the sense that the average of their answers is very accurate. Perhaps my students, who had read two-thirds of Bailey's book, could accurately estimate the strength of the effect.

I posed the question like this. Suppose that when a man has no older brothers, his chance of being gay is 2.0 %. What is his chance of being gay if he has one older brother? I gathered an estimate from every student. The median of their estimates was 8 %. The correct answer is 2.7 %.

2. [http://en.wikipedia.org/wiki/Fraternal\\_birth\\_order\\_and\\_male\\_sexual\\_orientation](http://en.wikipedia.org/wiki/Fraternal_birth_order_and_male_sexual_orientation)
3. [http://en.wikipedia.org/wiki/The\\_Wisdom\\_of\\_Crowds](http://en.wikipedia.org/wiki/The_Wisdom_of_Crowds)

---

Caleb (2010-09-27 08:38:35)

Did the studies control for the mother's age at time of conception? I suspect there is a small social specialization effect, but if they didn't control for the mother's age, they might just be picking up that by definition of having an older brother, a younger

brother is conceived later. The older an egg is the more degraded its DNA, leading to a greater chance of a tuning error in sexual targeting.

Darrin Thompson (2010-09-27 09:05:13)

Or if they aren't stupid, you've managed to quantify a crowd response to narrative, which is kinda cool. Maybe PR companies beat us you to that research though...

JRF (2010-09-27 10:16:21)

It's not clear to me that this is a bad estimate, given the knowledge of the individual students.

Robin Barooah (2010-09-27 11:47:31)

What was the mean value of their estimates?

dearieme (2010-09-27 15:25:33)

In the land of the One Child policy, questions about brothers must be hard to cope with.

Anthony (2010-09-27 15:48:12)

So countries with larger families should have more male homosexuals per capita?

Seth Roberts (2010-09-27 22:12:40)

I didn't compute the mean, but it was probably more than 8. yes, countries with larger families will have more male homosexuals per capita. yes, at least one of the analyses controlled for both mom's age and dad's age.

Michael Bishop (2010-09-28 06:21:39)

Fascinating. That said, i bet their answers would have been far closer if the question had been framed differently. Imagine asking: "How much more likely, in percentage terms (i.e. 100 % equals twice as likely), is it that a boy will become a gay man if he has older brothers?"

Jlonsdale (2010-10-01 10:07:33)

It isn't clear that this is a bad estimate if you asked them in this manner - giving them 2 % instead of X %. Given the number of 2 %, the number of gay men in the other population needs to be at least 8 % in order to meet the intuition that at least 1/20 people are gay (I've heard numbers ranging from 1/20 to 1/10). They may have accidentally used this heuristic of trying to get the overall number correct while trying to answer your question.

Wyman Brantley (2010-10-04 15:07:45)

This does not seem to be a very telling result. Surowiecki does not claim that crowds are good at baseless, or nearly baseless guesses, does he? On what basis would these students have been expected to have any idea that the actual number would turn out to be 2.7 %? That example seems less like Surowiecki's go-to cases where you estimate the number of something like gumballs in a big glass jar, and more like asking a crowd for the exact sequence of cards in a deck of playing cards. This isn't "The ESP of Crowds."

Seth Roberts (2010-10-04 15:27:53)

Wyman, there are examples in Surowiecki's book where you'd think it would be impossible for the crowd to do well. But it does. I haven't seen anything where someone correctly predicts where this sort of crowd-sourcing will do well and where it won't do well. It was more informative to find out what the answer was - how well the students would do - than be sure I knew what would happen.

Tomasz (2011-02-18 09:55:21)

I wonder whether the measurement was validated. But it is interesting that someone can write an entire book about a phenomenon without an adequate measurement. Its like measuring the speed of a high-tech train with a thermometer.

## Malcolm Gladwell on Twitter (2010-09-28 04:06)

In the latest New Yorker [1]Malcolm Gladwell says Twitter and the like are less revolutionary than claimed.

A month ago a friend and I discussed Gladwell. The friend said that after [2]Steven Pinker's review of What the Dog Saw, he couldn't look at Gladwell the same way.

I said that was a silly review. Sure, Gladwell has faults, but he also has strengths. He chooses interesting research to write about and writes about it in an accessible attractive way. An example is the Korean Airlines chapter in Outliers. It had little to do with the rest of the book but it was excellent journalism. Pinker barely mentioned these strengths but did point out spelling mistakes. It is silly to judge something by dwelling on what's wrong with it. (Exhibit A: correlation does not equal causation.)

Gladwell's latest piece is one of his best. It makes four points:

1. The strong-tie/weak-tie distinction in social networks. An old idea, but worth being reminded of.
2. Strong ties were behind the civil-rights lunch counter sit-ins. The movement they helped start was long and dangerous. Strong ties helped.
3. Twitter and other social media create weak ties. It isn't clear they create strong ties. Donations based on weak ties were in several cases a few cents/person. Much less than the cost of participation in the civil-rights movement.
4. If you're going to claim something is "revolutionary", as Clay Shirky did about Twitter and the like, you should start your book with a better example than a rich guy getting his Sidekick back.

Perfectly good points, especially the last.

[3]Tyler Cowen's reaction.

---

thehova (2010-09-28 09:31:35)

Gladwell claimed on a popular sports show that he strongly believed that football would end in the future due to the fear of concussion related injuries. It's a major issue. But to say the sport will end is beyond ridiculous. There are other better

examples of how Gladwell doesn't take empirical evidence very seriously. It hurts his credibility. I find it difficult to take him seriously (I think that's a growing trend. His popularity is diminishing).

Seth Roberts (2010-09-28 12:39:29)

thehova, popular sports have ended. See [http://www.cracked.com/article/180\\_6-ancient-sports-too-awesome-modern-world](http://www.cracked.com/article/180_6-ancient-sports-too-awesome-modern-world) for examples. Do you have a better example?

thehova (2010-09-28 17:01:51)

That's a really interesting article. Gladwell cites boxing as a sport which witnessed a dramatic decline in popularity due to serious head injuries. He sees it as a precursor to football. But I don't think that's right. Boxing has been horribly managed. MMA, which is in many ways more violent, is better managed and extremely popular despite serious concerns about safety (indeed, it's illegal for MMA events to be held in many states). I'm sure many parents refuse to allow their kids to play football due to injury concerns. The number of parents who do that will probably increase. But when there is such a large demand for the sport, there will be players. Football teams might have to compensate players more for the risks they endure. But I find it highly unlikely the sport will disappear. Part of me really doubts that Gladwell fully believes that claim. It often seems like he tries to be more interesting than accurate.

Nathan Myers (2010-09-28 20:06:17)

Your choice of the KAL chapter is interesting. My brother, a professional pilot, says he got the story entirely wrong, and that the important change to flight deck procedures was to hire American pilots. The supposedly all-important English lessons for existing crew were just so they could talk to the new pilots.

Adam (2010-09-28 21:41:17)

I have to agree with @thehova. Gladwell has been called out too many times. Many sports, but particularly football, are also rites of passage. As such, risk of injury is a necessary component and likely adds to the allure. On the other hand, although I agree that boxing has been mismanaged, I disagree with @thehova on MMA being more violent. MMA is more bloody. Because of the different types of strikes allowed (e.g. elbows), cuts are more frequent. Also cuts to the head tend to bleed a lot, as does damage to the nose. The big difference is that an MMA fighter can close the distance and clinch (nullifying much of the force that can be generated with a strike) and the referee will not force a break to maintain striking distance. In boxing, striking distance must be maintained and striking must continue. Repeated strikes to the head by a professional fighter are going to do permanent damage and can lead to death (not unheard of in boxing, but so far not a factor in MMA w/ only 2 deaths resulting from sanctioned bouts...I suspect these numbers could get worse as MMA gains popularity). @Nathan I fly in and out of Korea. More often than not, when the Captain addresses the cabin, he has an American accent. Less frequently, I hear an Australian accent. Only once have I heard what appeared to be a Korean captain address the cabin. @Seth My problem with Gladwell's article was that it left me with the impression that he was elevating the importance of long and violent struggle and discounting the possibility that less dramatic means, that take advantage of weak bonds, could facilitate change, perhaps without so much violence.

James (2010-09-29 01:44:53)

[1]The revolution will not be published in the New Yorker points out some things he missed.

## **The Nobel Prize: Not Helping (2010-09-28 22:20)**

Nassim Taleb [1]recently criticized the Nobel Prize in Economics:

According to Taleb, there are a number of mistaken ideas about forecasting and measuring risk, which

all contribute to events like the 2008 global crisis. The Nobel prize, he says, has given them a stamp of approval, allowing them to propagate.

It isn't just economics. As I've said before, the Nobel Prize in medicine was not given for the discovery that smoking causes lung cancer. It was not given for the discovery that lack of folate causes birth defects. Both enormously useful. It has been given for several discoveries, such as the connection between telomeres and aging, with (so far) little or no practical value.

This is no mystery. The Nobel Prize must be prestigious, therefore must honor high-prestige research. Veblen argued long ago that in academia high prestige correlates with low practical value. Just today I told a friend Veblen's idea that professors use jargon for the same reason men wear ties – to show off how useless they are. The economics research ("Harry Markowitz, William Sharpe, Robert Merton, Myron Scholes, Robert Engle, Franco Modigliani and Merton Miller") that Taleb is criticizing was high prestige. The so-far-useless biology that has received a Nobel Prize was high prestige; the highly-useful epidemiology that didn't receive the prize was low prestige.

Thanks to Dave Lull.

---

Vic (2010-09-29 00:55:50)

There's a difference between work that provides insight into processes of no practical relevance (perhaps the biological research that you cite) and total nonsense (the work taleb cites)

dearieme (2010-09-29 01:09:45)

Epidemiology has produced so little of value that it's a shame that the smoking result wasn't honoured. It would have meant honouring Third Reich men, though. So be it, say I.

Seth Roberts (2010-09-29 04:38:24)

"Epidemiology has produced so little of value" – compared to what? Vic, yeah, there's a difference. But are Nobel Prizes in Economics ("total nonsense") actually more harmful than the Nobel Prizes in Biology ("no practical relevance")? I don't know. The Nobel Prizes in Biology, with their emphasis on studies of mechanism, have in certain ways validated the drug-company assumption that the way to solve health problems is to give people a powerful drug. I think that's been very damaging compared to an alternative research strategy that studied lifestyle changes.

CTB (2010-09-29 07:44:35)

Warren and Marshall got the Nobel for discovering that bacteria cause ulcers...leading to a cure and not just endless treatment of symptoms...that was a good one, no?

Gunnar (2010-09-29 08:54:37)

Money is numbers on paper and in computers. The national deficit exists because the money printers (the Federal Reserve Banking system) are private entities that lend the money they printed to the USA (which is also a corporation). Just look up "debt based money creation". The whole system exists to deceive people. Did the winners tell that? No, because then the system would stop to work. Anyways, it's just days until it hits the wall, so I'm relaxed and joyfully excited :-)

James (2010-09-29 09:05:47)

The financial economists that Taleb criticizes did the most practical work of the econ Nobelists; it translated directly into new financial strategies and companies, which many would say is exactly the problem. So your criticism contradicts Taleb's.

vic (2010-09-29 12:54:40)

Fair point Seth, I agree

Seth Roberts (2010-09-30 01:15:14)

CTB, I suspect ulcers are a sign of a poorly-functioning immune system, perhaps compounded with poor nutrition. Almost everyone who has the bug that Marshall and Warren say "causes" ulcers doesn't have ulcers. So, no, that wasn't a good one. It is another example of using drugs to treat a problem caused by lifestyle.

CTB (2010-09-30 08:03:52)

I agree with you that ulcers probably have multiple factors contributing to their severity. And having a well-functioning immunesystem and good nutrition, whatever that is, is an ideal to strive for. But the reality is that if I'm acutely ill with an ulcer attack and I have those bugs, I'd go for the antibiotics in a heartbeat and be very glad that those guys made the connection. Especially if it lets me get back to work so I can pay the mortgage and put food on the table.

Seth Roberts (2010-09-30 14:01:28)

CTB, yes, antibiotics have helped people with ulcers just as you describe. But it's plausible the Nobel-Prize-winning work by Marshall and Warren has discouraged research into lifestyle causes of ulcers. A poorly-functioning immune system does more than cause ulcers. It probably increases heart disease, for example. You could say that Marshall and Warren did duct-tape science - science that failed to study fundamental causes.

CTB (2010-09-30 18:08:26)

By shining a light on the bacteria, Marshall and Warren put an end to duct-tape treatment of ulcer symptoms (with everything from acid-controllers to stomach resection surgery). They also stimulated a wave of research to figure out how this bacteria evades the immune system and causes stomach pathology. Check out this review from 2006: <http://www.ncbi.nlm.nih.gov/pmc/articles/PMC1592695/?tool=pubmed> It has over 250 references describing the known factors by which this bacteria escapes detection and is able to colonize half the world's population. It's freaking complicated. But I doubt most of this work would have been done without M & W's discovery. That's why they got and deserved the prize, (not to mention that they really bucked the system along the way, bless 'em). Lifestyle research is tricky since the human population is so genetically diverse, and multiple genetic factors play a part in immune response. But let's say there is just one immune factor which is primarily responsible for keeping the bacteria in check...and that eating butter promotes optimal levels of this factor. It might also turn out that 30 % of the population carries a mutation in which butter promotes still another factor which actually makes the bacteria more virulent...but no one knows about this second factor yet. So you do your study (butter and ulcers) and get a result. And another group does a similar study and gets different result because the genetic makeup of their group relative to the second factor is different. It's just not known yet. We're still in the dark ages, in a way. Meanwhile, the best we can do is keep on doing the experiments and generating the molecular data, waiting for someone to make the next connection.

Seth Roberts (2010-09-30 18:48:08)

"We're still in the dark ages . . . the best we can do is keep . . . generating the molecular data," you write. I disagree. I don't think more molecular data will show us what lifestyle factors make a big difference. Why does half the world have h. pylori in their stomachs but only a tiny fraction have ulcers? I am sure that the tiny fraction with ulcers will have a higher than average risk of many other problems. If we figure out the lifestyle causes of ulcers, we may be able to not only lower risk of ulcers; I think the associated elevated risks (e.g., heart disease) will also come down. If you take antibiotics those other elevated risks won't come down, I'm also sure. And I wonder how likely it is if you take antibiotics to get rid of h. pylori that you will become reinfected within a year after you stop the antibiotics? It really is a duct-tape solution. Not the only one, to be sure. I don't

agree about people being so different ("the genetic makeup of their group . . . is different"). There are plenty of broad truths about how to be healthy. See any nutrition textbook. For another example, I'm quite sure everyone needs regular ingestion of bacteria to be healthy (to have a well-functioning immune system). Maybe you've heard that chimps and humans share 96 % of their genes. This implies that two randomly chosen humans must share much more than 96 % of their genes. Because two randomly-chosen humans diverged genetically much more recently than chimps and humans.

Wayne (2010-10-01 06:49:45)

First, I agree that we are rewarding the wrong research in many cases: "sexy" or "prestigious" and not necessarily fundamental. (Though in the case of *H. pylori*, I am happy because of how hard they had to fight the voodoo consensus that had preceded their research.) But the fact that humans share more than 96 % of their DNA doesn't impress me. There are how many inherited diseases that I don't have, even though I only differ from millions of sufferers by less than 4 %? (Not to mention the two other alternatives: inherited benefits, and inherited "doesn't make enough difference in function that anybody has bothered to look into it".) And what about the tens of thousands of people who suffer severe side effects from the dozens of medications I've taken in my lifetime, from which I've never suffered any of those side effects? My suspicion would be that the DNA argument is like saying that, in the grand scheme of machines, automobiles share 96 % of their designs. And sure, they share a lot of common characteristics, like they don't do well if submerged in salt water. But even though they all have fuse boxes, I wouldn't assume that the fuse box is in the same location, nor that I could replace the third fuse from the top in all cars and get the same results. I am allergic to milk, my wife is not. But she is lactose intolerant, while I am not. I've learned over the years that chemicals (including medicines) affect me much more rapidly than most people. Obviously, my neurons work like yours, but my brain is wired differently than yours, both in the sense of wiring due to learning and I would suspect how it was originally laid out. And my immune system has also learned differently from yours, and we haven't even gotten into mental attitude and health. (I've heard, and believe, that many people in mental institutions are there because of the effects of bitterness, for example.) So I would agree with CTB that there are a lot of meaningful differences within the overall human population. And I think that current medicine is in an awkward gap: lured away from general healthy principles, but not yet able to be specific enough (in terms of both the mechanisms by which medicines work and in terms of a particular person's needs/reactions) to be well-targeted. I agree with some of your observations about things like butter, but when you then justify them as being sensible in light of historical human life, I am skeptical that your vision of historic human life is accurate. And perhaps the real explanation is that it works for a subset of people who share a particular gene or two, a particular environment, etc. That's a major point of self-experimentation, isn't it: what works for others may not work for you? I'm an avid reader of your blog - learned about it from Andrew Gelman's site, I believe - and I hope that this doesn't come across as harsh.

CTB (2010-10-01 09:12:47)

"I don't think more molecular data will show us what lifestyle factors make a big difference." Transcription factors are small pieces of DNA which bind to gene promoters and can regulate the activity of multiple genes. PPAR is a group of these factors, some of which can promote insulin sensitivity by increasing uptake of glucose and fatty acids by adipose tissue (thus lowering blood sugar and bettering lipid profiles). The glitazone drugs which were developed to treat diabetes, work, in part, by activating PPAR. When this factor was discovered, investigators looked for 'natural' ligands and found that polyunsaturated fatty acids also stimulated PPAR. Saturated and monounsaturated fatty acids do not. "I don't agree about people being so different" The cytochrome P450 oxidases are a huge family of enzymes which metabolize 'foreign' compounds to make them more soluble so that they can be eliminated by the body. These enzymes are the bane of pharmaceutical companies because multiple variations of each enzyme occurs in the population, so that the population runs the gamut from slow- to fast-oxidizers in each category. Still others carry mutations that result in no oxidation. Most medicines are metabolized by these enzymes, which helps explain in part why some people need a much larger dose of drug than the next person, or why some have side-effects that others do not. In other cases the medicines will only work if the patient has the needed oxidizing enzyme to actually activate the drug, so patients are genotyped before treatment. For example, I've read that tamoxifen will not work in women who are negative for CYP2D6 activity. I agree with Wayne that the reason for self-experimentation is to find out what works for you. At the clinical level, this is what 'personalized medicine' is all about. We're just not there yet. Yes, there are broad truths...e.g., eating more fruits and vegetables seems to help...but look what happens when they give people supplements of known nutrients. Sometimes there are good results...sometimes the results are contradictory. Other times

you get things like beta-carotene actually being harmful in smokers with lung cancer, or calcium supplements without vitamin D causing increased heart attacks in women. But these harmful effects are not in all the subjects...just some...and we don't know why yet. But the effect will be because of some interaction at the molecular level...and we need to keep plugging at the research which illuminates it.

John (2010-09-29 16:37:04)

Butter tea? I prefer a butter spoon myself.

Jake (2010-09-29 20:22:15)

I have been in Tibet and they use fermented yak butter in their tea. It is the worst smelling substance known to man. The only thing worse is the taste. However, I do put a tablespoon of coconut oil in my tea and coffee instead of eating a snack. Coconut oil kills your appetite dead.

Thomas Seay (2010-09-30 10:57:34)

That's an EASY way to consume butter? I am still trying to figure out the recipe. Here's an easier way: put thick slabs of butter on a piece of bread and eat it. If you don't eat bread, put lots of butter on your veggies. Of course, not all butter is created equally. I have found most commercial American butters to be insipid, if eaten alone. However, I could eat grass-fed raw butter with a spoon, like ice-cream. Unfortunately, it's very expensive. Butters like KerryWood, imported from Ireland are good enough and not too expensive. Anybody else here have a fav butter?

CTB (2010-10-01 14:17:59)

The Nutrition & Metabolism Society, which advocates lowcarb diets for control of diabetes, has just published an open-access article in the journal Nutrition. They claim that the article is a rebuttal of the USDA dietary guidelines. Their website has the press release and links to the article: <http://www.nmsociety.org/>

### **New Idea About Learning Chinese (2010-09-30 19:44)**

[1]

I never considered taking a class to learn Chinese. Too boring, too time-consuming. I've tried hiring tutors and going through a textbook. Better but too close to taking a class. That didn't last.

For maybe half a year I've used [2]Anki (a flashcard program) to learn characters. This is better – at least it's lasted half a year – but I don't study it often enough.

A friend suggested labeling things in my apartment – put a card with the character for chair on a chair, for example. Another friend pointed out that there are children's books with big characters (one per page). That suggested my latest idea: Put these pages on the walls of my apartment. So whenever I look at the wall it will be a kind of test. If I don't remember the character, I can look on the underside of the card for the answer.

I'm excited about this: it might actually work, I now think. It doesn't require being still, [3]which I think reduces learning. It spaces learning (you learn in little bits throughout the day), which is surely better than massing it. It allows great amounts of repetition. And it takes advantage of natural curiosity (whenever I see Chinese – in a sign, for example – I wonder what it means) rather than requiring discipline. As far as I can tell it requires no discipline at all. If it doesn't work I'll learn something about education.

Matt Goff (2010-09-30 21:45:27)

This is only tangentially related, but there's a language game called "Where are your Keys?" with the goal of gaining fluency in a fun/quick way. [1]Where are your keys? website. The people behind it are focused on helping to revive endangered languages, but it seems to be adaptable towards a lot of different things (they've done a workshop or two about agile programming, for example).

1. <http://whereareyourkeys.org/>

Aaron Blaisdell (2010-09-30 21:58:41)

I hope it works for you. Taking a year-long class worked extremely well for me.

Seth Roberts (2010-09-30 22:44:44)

Aaron, that's good to know. Matt, I tried the where are your keys? ideas. They didn't work. It was too hard to learn the hand signs, for one thing. Maybe it works better in a group than when you are trying to learn with a tutor. It surely works better with experienced instructors.

G (2010-10-01 04:56:23)

Man, I tried to learn out of a book-CD but it was torture. I enjoyed parroting phrases; I found the tonality an absolute hoot, but once I got into vocab it was like eating a crate of crackers. Have you already covered speaking and speech comprehension? That would be easier surrounded by Chinese people. I don't see how I can accomplish this at home by myself. I read the previous article you linked to - the one on thinking while walking. I've always been a pacer and like you I want to get up a lot during TV programmes, even movies - I'll pause them and go on some invented errand like making a cup of tea even if I like the movie. An interesting exception is video-games. I don't know if you're a gamer at all but I've noticed that I will sit quite still until some natural break in the action; in fact, I may only think to move when I get stiff and sore. So simulated movement does as well?

elizabeth molin (2010-10-01 07:13:03)

I think I would tend to learn the meaning by the location of the card on the wall, rather than by the character shown on the card.

David (2010-10-01 07:18:30)

Have you tried the Rosetta Stone software? I've been impressed with it for other languages (I've never tried Chinese but it uses the same approach for all languages). I've also been interested in what you said about exercising while learning. There's a game-like aspect to Rosetta Stone. I'd like to try a tablet computer + Rosetta Stone + walking on a treadmill someday. David

Thomas Seay (2010-10-01 10:27:29)

I've been studying Chinese for a number of years. Your idea MIGHT work for passive recognition, but you aren't going to learn how to write the characters this way. One recommendation I would make would be to find a subject that REALLY interests you, find a simple text on the subject (in this case, in Chinese) then read short passages from it, learning the characters. I am not

sure if you already know Chinese and know pinyin. Another way to learn is to take a book that you really know extremely well and read the same book in Chinese. It used to be that people who had read the Bible all their life and knew it by heart would assist their language learning by reading the Bible in their target language. I believe Thomas Jefferson was a big proponent of this method. I am not suggesting the Bible in your case. I have a friend who speaks 10 languages well (I speak 4 by the way). He is a big fan of the Indian spiritual teacher Yogananda and know some of this latter's writings almost by heart. Whenever he studies a language, he reads a Yogananda book he knows by heart in the target language. Of course the best way to learn a language (though this lends itself better to verbal language than written) is to find a lover who is a native speaker. I have an entertaining anecdote in this regard. I knew a girl in college (let's call her Jane) who liked to learn various languages. She learned them well. Jane's secret was that she always had a boyfriend who was a native speaker of the language she was studying. One semester Jane announced that she was going to begin study of Italian. I knew then and there that her French boyfriend would soon be getting his "Pink Slip" from Jane. Sure enough, two weeks later, Olivier was out, soon to be replaced by Roberto, an Italian :)

Kurt (2010-10-01 14:45:13)

I encountered some browser extension a couple weeks ago that you configure to replace certain types/frequency of words on the web sites you're visiting with words in another language (colored, so you know, and mouse-over for translation.) I thought this was a brilliant way to at least slowly absorb new vocabulary. It was both fun and fascinating for a little while, but became a bit frustrating for me after a while (probably because I'm not trying to learn a new language right now :).) But the idea is cool. I've been thinking about how this might be paralleled 'off the grid' too, in everyday life, and your idea about the signs on the walls reminded me of it. Sounds like a good approach... just slowly surrounding yourself with these mini-tests that you can absorb. Good stuff...

stefan (2010-10-01 16:04:22)

I am an extremely obtuse language-learner. To learn a little bit requires a major - a huge - effort on my part, and my retention and understanding is minimal. I have friends who can learn languages and accents very quickly, and the difference between us is remarkable - i.e., this is not just me being 'critical' of myself. I'm interested in learning a language of course, but am daunted right at the beginning. So, I had a couple thoughts: - Focus on accent first, not words or grammar. I had a friend (able to learn languages quickly), who could fake a German accent so well - not knowing a word of German - that her German friends would say "Slow down! We can't understand you!" She would simply babble nonsense, and they thought she was speaking their language. My thought is that by learning some key elements of the accent (like, how the French 'r' is nothing like what Americans think it is), and practice \*sounding\* French (for example). Don't worry about words or syntax - just get the lilt and pace and \*feel\* of the language. My theory is that, to a certain degree, 'babbling' in an accent IS the language... I think this would be invaluable in providing a 'bucket' in the brain for the rules and words to fall in to, like it does with babies. - Speak in English but use the target languages syntax. In German the verbs are often at the end of the sentence. So practice stuff like "would you with me to the zoo and the animals feed go?" Practice the target sentence structure but ignore the vocabulary. My ear makes it \*very\* difficult to 'babble' in anything but English, and I've had a difficult time finding useful syntax rules for other languages. But perhaps there might find something useful here...

curious (2010-10-01 20:22:06)

when you say you want "to learn Chinese", what exactly do you mean by that? Do you want to be able to talk? Read (and write)? For the spoken language, the only hurdle is the tone, and you can use pinyin for your notes. Reading (and writing)... do you really want to invest that much effort? Ask yourself how much you are ready to invest.

k (2010-10-01 21:43:18)

A quick and rough estimate of the things that have helped me learn Mandarin (and by 'learn,' I mean able to speak very well, read a little, and not really write at all, though I can type pretty well using pinyin input): 1. lived in Taiwan for a few years 2. married a native speaker (and actually speak Chinese at home) 3. took classes in Taiwan for a few months to get me started, then continued learning on my own. Like you I don't like classes, but I found that they provided a boost at key moments. 4. studied full time for a year in Taiwan (about 1.5 years into learning Chinese). The classes were pretty lame, so maybe it was just

the time investment? But I clearly made a big improvement from basic ability to something like advanced intermediate. 5. (I would rate this higher, but I was already speaking fluently by this time) Supermemo for palm. I now prefer Anki. Having it on a mobile device makes it much more enjoyable and likely that you'll keep up. If you're bored with learning characters, maybe try downloading the shared deck of HSK sentences. I read an article online somewhere about sentence mining, the idea being to read materials that are mostly within your grasp and enter the individual sentences in your spaced repetition software for practice. I don't know how effective it is, but I do find it more enjoyable than most other methods of study for Chinese. 6. Reading children's books, novels, studying textbooks on my own, etc. I also enjoyed Chinesepod when it was free, but stopped using it when they made it a subscription service.

Seth Roberts (2010-10-01 22:57:46)

Kurt, that is a brilliant idea. I once heard that a thirteen year old learns a dozen words per day. Not by looking them up, by context. Which is what that browser extension supplies. I think he's referring to the Firefox extension [1]ming-a-ling. what do I want to learn? in this case, to read the Chinese I'm surrounded by. Signs, posters, and so on.

1. <https://addons.mozilla.org/en-US/firefox/addon/9635/>

## 5.10 October

### Punishment of Difference (2010-10-01 14:13)

When I was a boy, my family didn't have a TV. (Which I now make up for by watching a lot of TV.) The strangeness of this was made clear one day at school. It was second grade. The teacher wanted to talk about something on TV. "Who doesn't have a TV?" she asked the class. I raised my hand and a girl raised her hand. She didn't have a TV because it was being fixed.

So I was especially disturbed by [1]this video in which a few schoolchildren who differ from the rest of their class are blown up. Their fatal mistake is not cutting carbon emissions. The organization that made it took it down and issued [2]a lukewarm apology ("live and learn") that said nothing about ridiculing minorities. If I were teaching 10-year-olds, I think I'd show them the video, tell them how disturbing I found it, and ask them about times in their lives that they felt different from everyone else. It is a curiously teachable moment.

1. <http://motls.blogspot.com/2010/10/1010-movement-all-skeptical-kids-and.html>

2. <http://www.1010global.org/no-pressure>

---

PeterW (2010-10-01 15:08:37)

They would not recognize it as discrimination. We never seem to outgrow our tendency towards discrimination; we merely recognize old forms of discrimination as outdated. Thus we move on to discriminating against new types of minorities, while congratulating ourselves for being so much more open minded than our fathers.

John S. (2010-10-01 17:40:25)

This video marks a turning point in the global warming debate. The fascists have let the mask slip.

G (2010-10-02 02:49:31)

Seth, I watched that video preparing to tell you you're overreacting but I didn't expect it to be so blatantly judgmental and coercive. I was expecting a metaphor that we will be 'blown up' by climate-change if we don't act, not summary capital punishment for unbelievers. The campaign makes it seem like there is no such thing as a good skeptic - they're all just selfish and apathetic. But I am a skeptic (as in, undecided) and I consider the ecological effects of my everyday actions out of a genuine sense of moral duty. And my main - and anytime I have an audience, loudly prosecuted - objection to consumerism, even above its shallowness, is that it is unsustainable. But because I don't believe in this particular theory I am just a slack-jawed zombie unworthy of tolerance and life!? I don't want to go to Hell - save me, Jeeesus! Give me a sign, haha. I agree with John S. - when they can put this ad out without picking up on the Holocaust-style brutal extremism, that's a watershed moment. Richard Curtis is a big-name director (whose work I happen to despise; 'Love, Actually' is like being force-fed one's bodyweight in aspartame). If he is promoting this Final Solution mentality it reflects the general mindset in some powerful circles.

Nancy Lebovitz (2010-10-02 17:02:07)

G, that ad wasn't about belief, it was about compliance.

G (2010-10-02 19:15:38)

Nancy, you're right - the ads make no attempt to persuade nor do they clearly define the antagonists as skeptics. I assumed that they were targeted against skeptics but they probably do have multiple targets in mind; I think they were deliberately painting with broad strokes. Watching the ads I just saw myself, the well-meaning skeptic, and not the uncritically indifferent whom they were also condemning.

Seth Roberts (2010-10-03 03:34:44)

I too agree with Nancy. It is about compliance. Even blind compliance, since how are schoolchildren supposed to seriously consider both sides? It makes the brainwashing described in 1984 look crude.

Nathan Myers (2010-10-03 15:24:51)

It might have shown the Bangladeshi and Pacific Islanders being flooded out of their homes by the rising sea. Of course, that will happen regardless of what children do, because we would have had to start acting on what we knew ten years ago. It might have shown one animal after another that will be extinct in thirty years because we aren't acting on it now. Or it might have shown some of the millions of people who will starve as the monsoons fail. Ten years ago one could still honestly object that the data didn't conclusively demonstrate that we were heading for disaster. Not any more.

Glen Raphael (2010-10-03 22:21:07)

Nathan, even the IPCC models project that agricultural productivity and forest growth will increase on net for the next 50 years or so due to climate change. Some places will need to shift from growing crops to growing trees, but other places will have a longer growing season. The short-to-medium-term effect is that food is going to be cheaper in the world; fewer people will starve than might otherwise had we "started acting on what we knew ten years ago" and that's not even including the cost of raising taxes or whatever you would have had us do. The simple cost of \*not warming so much\* would have been: more people die of hunger. According to satellite analysis, Bangladesh has been [1]gaining land for the last few decades, about 20 square km/year. The anecdotes about islands disappearing weren't really islands at all, they were sandbars. People who live in floodplains and marshes will still (always) have problems, but helping them is a relatively straightforward engineering problem; in the areas that \*have\* lost land they've lost it as much due to erosion and subsidence as sea level changes. The country is already building dams and other engineering projects designed to do what the Dutch do about having chosen to live near or below sea level. The data \*still\* doesn't conclusively demonstrate that we are heading for disaster. A significant subset of the data says even if warming continues, the next few degrees of warming (IPCC says 1-3 degrees; I'm rounding up) is on-net good for human life and plant life and tree life and more warming is better than less for much of the foreseeable future. 50 years of things getting better is a heck of a long time for us to improve the models, figure out whether it really is a problem at all, improve our mitigation tech, and eventually start doing something about whatever problems actually crop up in practice when and as we so choose.

## Science Journalism Cliches (2010-10-01 17:49)

I enjoyed this [1]funny article about science-journalism cliches. Via [2]Andrew Gelman. At the moment it has 643 comments. The five posts that preceded it (none of which Andrew linked to) have 19, 7, 6, 11, and 20 comments. Correlation or causation?

Last night someone asked me if it was hard to write scientific articles. I said no. As a friend said to me about her copy-editing job at The New Yorker, a trained monkey could do it. My articles are just as formulaic as everyone else's. I hope the content isn't formulaic, but the structure is.

1. <http://www.guardian.co.uk/science/the-lay-scientist/2010/sep/24/1>

2. [http://feedproxy.google.com/~r/StatisticalModelingCausalInferenceAndSocialScience/~3/DzTzSP51DPg/this\\_is\\_a\\_link.html](http://feedproxy.google.com/~r/StatisticalModelingCausalInferenceAndSocialScience/~3/DzTzSP51DPg/this_is_a_link.html)

---

G (2010-10-02 09:39:41)

How about TV science doucheumentaries? Scientist-as-sleuth, like it's *The Da Vinci Code*. So pompous, blegh. I watched a Stephen Hawking documentary a few days ago; it was an utter waste of time - full of pointless whizz-bang graphics and patronising exposition that could have been condensed into a single simple diagram. And cliché-a-go-go: "is AMAZING possibility X really possible? [30 mins of ponderous, self-important investigations] No. It is not. But this other much less amazing possibility is possible." And you know they knew this from the bloody get-go and did not have to fly over the pyramids in a helicopter to find out.

G (2010-10-02 11:46:03)

## Gelatin and Sleep (2010-10-02 22:18)

I found that [1]pork belly improved my sleep. Pork belly is mainly fat, but is it as simple as that (pork fat improves sleep)? Thomas Seay brought to my attention [2]claims about gelatin by Ray Peat. One was that it improved his sleep:

For years I hadn't slept through a whole night without waking, and I was in the habit of having some juice or a little thyroid to help me go back to sleep. The first time I had several grams of [commercial] gelatin just before bedtime, I slept without interruption for about 9 hours.

Seay tried gelatin himself and found it improved his sleep. I asked him about this.

What do you do?

I take Great Lakes Unflavored Gelatin. I take about 5 or 6 tablespoons a day (2 tablespoons per meal) usually in hot water. So, that amounts to about 35-42 grams/day. You can also put it in juice or make an aspic with it. Another person I know who takes it only needs to take two tablespoons a day, just prior to sleep.

What effect has it had?

It helps me to sleep more hours uninterrupted. This did not require a build-up over weeks. It happened the first time I took it.

You sound like you've stopped taking it. How long did you take it? Why did you stop?

I have taken it off and on. (Usually I would take it one week on, one week off). I have noticed that after a few days it causes constipation FOR ME.Â Another person I know who has tried it has not noticed this effect. Presently I am experimenting with segmented sleep (getting up for an hour or two in the night and then returning to sleep), so I have stopped taking any sort of supplement, including the gelatin.Â Prior to this, I had done the gelatin for about 4 months.

---

Aaron Blaisdell (2010-10-03 10:09:33)

When I make bone stocks, I always add extra articular joints (e.g., chicken feet for chicken stock, beef knuckle for beef stock, etc.). Adding these dramatically increases the gelatin content of the resulting stock, which I think greatly improves its quality. Along with cod-liver oil and vitamin D3, bone stock is my go-to food when my kids have colds, though I use it all the time in my cooking.

q (2010-10-03 15:24:21)

i was thinking that cow-foot soup was probably common in china as it is in many parts of the world. i can't stand the stuff, but i see it in various places.

### **Out-of-Control Drug Companies and Their Consorts (2010-10-03 02:47)**

The increase in pediatric bipolar diagnosis, [Dr. Joseph Biederman's] lawyer said, "cannot be attributed solely to Dr. Biederman's work."

[1]This article is a long list of drug-company abuses, such as

Lilly produced a video called "The Myth of Diabetes" to sell Zyprexa, which became its all-time best-selling drug, even though evidence showed that Zyprexa could cause diabetes.

And

Pfizer paid more than 250 child psychiatrists to promote its antipsychotic, Geodon, at a time when it was approved only for adults, according to a government filing with the Pfizer settlement last year. High-prescribing doctors pocketed extra money in the form of research payments, speaking fees, gifts, meals and junkets.

[2]Pharma Gossip. Thanks to Ken Feinstein.

2. <http://pharmagossip.blogspot.com/>

---

Alex Chernavsky (2010-10-03 11:11:21)

The pharmaceutical industry is the second-most corrupt industry in America. And *within* pharmaceuticals, psychiatric drugs are by far the most problematic category. I'm glad that the article mentions Robert Whitaker, who has been like a lone voice in the wilderness. His recent book is a brilliant, well-researched, well-documented exposé of corruption and pseudoscience in psychopharmacology. The book is called, [1]*Anatomy of an Epidemic: Magic Bullets, Psychiatric Drugs, and the Astonishing Rise of Mental Illness in America*. See also his earlier book, [2]*Mad in America: Bad Science, Bad Medicine, and the Enduring Mistreatment of the Mentally Ill*. Whitaker's website is <http://www.madinamerica.com/>.

1. <http://www.amazon.com/Anatomy-Epidemic-Bullets-Psychiatric-Astonishing/dp/0307452417>
2. <http://www.amazon.com/Mad-America-Medicine-Enduring-Mistreatment/dp/0465020143/>

CTB (2010-10-03 17:51:07)

I have a friend with schizophrenia who took prolixin (injection) for many years with no problems. He'd get a shot once a month or so...we'd know when he was due. Then all of a sudden prolixin became unavailable and he had to switch to Zyprexa. He's had problems ever since, including three hospitalizations. And it's so much more expensive. That's another thing these companies do: they phase out the older drugs so you can't get them even if they're working fine.

### The Seminar Rule (2010-10-03 06:23)

"The first third is for everyone, the second third is for experts, and the final third is for the lecturer." Haha! From the excellent BBC documentary [1]The Story of Maths.

1. <http://www.open2.net/storyofmaths/>

---

q (2010-10-03 15:23:01)

that's an in-joke. i heard it when i was a math grad student. a variant was to split the time in fourths and have the fourth one be for no one, not even the lecturer.

### Quantified Self in National Post (2010-10-04 01:11)

The National Post, a large Canadian newspaper, has [1]a long article about quantitative self-tracking. Overall I like it. It looks at the subject in five or six ways, it focuses on examples of self-tracking rather than people generalizing about it, and, best of all, it [2]includes actual data.

I wasn't so pleased with the treatment of my work. First, the graph showing my butter data was wrongly labeled and the dividing line between before butter and during butter put in the wrong place. (These mistakes have been fixed.)Â Second, the description of my acne experiments – my dermatologist prescribed Medicines A and B, I found that only B worked – misses the point. True, I found that B worked better than A but far more interesting is that Medicine A (an antibiotic) didn't work at all. Contrary to what I believed. Antibiotics are dangerous. How many people are taking dangerous drugs with no benefit? Third, the written description of my butter research doesn't say the main point: butter improved my brain function in the sense that I did arithmetic faster. Instead it says I found butter was better than "standing on something painful". A billion people would like better-functioning brains. None of them care whether butter is better than standing on something painful.

I pointed out the last two problems to Kathryn Carlson, the author of the article. She replied that in the future she would call me to go over the accuracy of the relevant parts of the article. I had considered asking the people who made the graph to show it to me but had thought because they had [3]my graph of the same data in front of them, they couldn't go wrong.

A good lesson for me.

1. <http://curetogether.com/blog/about/what-people-are-saying/national-post/>
2. <http://news.nationalpost.com/2010/10/02/the-quantified-self-supplemental-data/>

Joseph Dantes (2010-10-04 01:50:33)

Those Canadians are none too clever, eh? Butter luck next time.

Joseph Dantes (2010-10-04 01:51:24)

By the way, ads by Google is showing: Gonorrhea Treatment Today 20min Test, result, Treat all Today Take home Treatment to your partner CaliforniaSTD.com

Aaron Blaisdell (2010-10-04 08:55:26)

This reaffirms my decision not to trust any secondary or tertiary source. Even textbooks often get things wrong, or at least not quite right.

Alex Chernavsky (2010-10-04 12:45:53)

"Everything you read in the newspapers is absolutely true, except for that rare story of which you happen to have first-hand knowledge." – Erwin Knoll (journalist)

Seth Roberts (2010-10-04 14:30:12)

Alex, yeah, that's certainly true and why it is NOT a big deal when a journalist makes errors like this. Because other journalists would have made similar errors.

Deborah Boyer (2010-10-05 07:50:40)

I find it odd, that we all expect news articles to be wrong, as indeed every article about me or anyone I am close to has been - yet newspapers and politcos claim that we must make sure that newspapers continue since we know we can't trust bloggers to vet news!

Nathan Myers (2010-10-05 10:44:45)

A reporter who doesn't mess up the story feels like the job has been left without any personal stamp.

### **This Year's Nobel Prize in Medicine (2010-10-04 19:40)**

I applaud it. [1]The winner developed in vitro fertilization, which has helped millions of parents. In contrast to last year's prize for telomere research, which has helped no one. Notice what in vitro fertilization is not: It is not taking a powerful poorly-tested drug for the rest of your life – the drug industry's preferred answer to all problems. It is not expensive (given the benefits). Unlike health care in general. It is not dangerous, unlike many drugs and surgeries. It is not molecular biology. It is barely science (uncovering cause and effect). If the prize were given for research like this year after year, many biologists who now dream of winning a Nobel Prize would stop dreaming. It is not a typical Nobel Prize. They waited so long to award it that the winner became demented. Above all, the prize-winning work was not mainstream medical research. The winner and his collaborator endured "an unremitting barrage of criticism", unlike almost any other medical researcher.

The award is unflattering to medical ethicists, who did a lot to try to prevent the prize-winning work.

1. <http://www.nytimes.com/2010/10/05/health/research/05nobel.html?hp>

---

John (2010-10-05 16:02:29)

There's no better sign that a technological advance has been useful than the fact that it was opposed for decades by those who dedicated their lives to telling others how they ought to feel.

Vic (2010-10-05 16:18:26)

Sounds like your complaints about the past winners were heard in Stockholm

Seth Roberts (2010-10-05 23:29:42)

John, that's a good point. And it raises an interesting question: how did those medical ethicists manage to convince other people to pay them – to give them a full-time job! – to tell the rest of us how to feel? In particular, when to feel bad. Quite an achievement. Other academic jobs have at least a vague connection with improving people's lives.

milieu (2010-10-06 08:31:03)

I don't think the Noble prize should be held in such reverence any longer. It results in stupid competition amongst scientists. Nassim Taleb has rightly criticized the "Nobel" prize in economics. It is perhaps time to evaluate whether the Nobel prize should be held in such high regards due to it is clearly a subjective and flawed way of selecting. Though it does bring attention to science amongst the general public.

CTB (2010-10-06 10:14:32)

Can't say it isn't dangerous. In vitro paves the way for: Octomoms, 70-year old moms who die from cancer after being exposed to all the hormones needed to maintain pregnancy, ...eugenics. There's pluses and minuses with everything.

## How to Eat a Lot of Butter (2010-10-05 23:22)

Since I discovered that [1]butter makes my brain work better, I have been eating half a stick (60 g) per day. Usually half in the morning and half in the evening. It is hard to eat by itself but easy to eat with other foods. I've tried a dozen ways of doing this. My top three additions:

1. Pu'er tea. The most convenient. As convenient as drinking tea. Put the butter in hot tea, wait till it melts. I can eat at least 20 g of butter in one cup of tea. [2]Butter tea is common in Tibet. Thanks again to Robin Barooah.
2. Cherry tomatoes. The healthiest and fastest. Slice the tomatoes in half lengthwise, eat each half with a similar-sized piece of butter. It is like that classic Italian combination, mozzarella and tomatoes.
3. Thin-sliced roast beef. The most delicious. Wrap a piece of butter with the roast beef. However, I already eat plenty of meat, it is hard to get thin-sliced roast beef in Beijing, and it is so delicious I end up buying a lot of thin-sliced roast beef.

None of these additions affects brain function (measured by arithmetic score), as far as I can tell, although I suppose the tea wakes me up.

1. <http://www.kk.org/quantifiedself/2010/09/seth-roberts-on-arithmetic-and.php>

2. [http://en.wikipedia.org/wiki/Butter\\_tea](http://en.wikipedia.org/wiki/Butter_tea)

---

Gunnar (2010-10-06 04:41:15)

I eat plenty butter, too. Only what's called "organic" in America, from cows living as free/natural as possible. The dentist that traveled the world, to find out why actually his patients had bad teeth - turned out because of wrong food: <http://www.westonaprice.org/>

Tom Moertel (2010-10-06 07:03:38)

Seth, have you tried eating more (or less) butter each day? Have you learned anything interesting about the dose response? Cheers, Tom

Cliff Styles (2010-10-06 07:57:37)

I tried the butter in tea, and did not like it, but I tried butter in coffee and loved it (I love heavy cream in coffee anyway, the butter just intensifies that). I also love a thin slice of sharp cheddar matched with a slice of cold butter. And this may amuse you: when I was a boy, I loved cold butter wrapped around a pickle...umami and butter. Haven't tried that in years.

Seth Roberts (2010-10-06 08:35:42)

Tom, not yet. Eventually.

G (2010-10-06 09:26:59)

Butter is very pleasant to eat by itself if you take miniscule bites and let it melt a little - it's not all that pleasant to eat fast in big mouthfuls. I recommend eating very buttery scrambled eggs in the morning. There's hardly such a thing as 'too' buttery scrambled eggs.

G (2010-10-06 09:28:49)

Oh yeah, I also meant to point out that Indians use butter to cook with; a practice I adopted a few years ago. Many things like butter better than veg, sunflower or olive oil. I would be interested to know whether Indians show a traceable tendency to get heart-attacks due to all the butter/ghee - somehow I doubt it.

Aaron Blaisdell (2010-10-06 09:47:35)

@G, I agree with how delicious letting a small pat of grass-fed butter melt in the mouth! Very sensual. And I've been cooking with Ghee and coconut oil exclusively for the past year or so. It's as if these fats were meant to be used for cooking.

CTB (2010-10-06 10:31:14)

Some people can't handle high lipid meals without going through a period where their blood becomes overloaded with fat, as illustrated at this web site from a clinical lab: <http://www.cdha.nshealth.ca/default.aspx?page=SubPage &centerContent.Id.0=21654 &category.Categories.1=411> Just to play it safe, no matter how you eat your fat, it might be wise to have someone draw your blood after a meal to see if your body can handle the load....but especially those who eat butter with lots of carbs.

Jolly (2010-10-06 12:35:02)

Seth: Have you tried experimenting with Ghee vs butter? Aaron: My cooking fat list is lard, tallow, coconut oil, ghee, and butter :)

sydney jane (2010-10-06 15:26:10)

I had a cholesterol problem a while ago. So, I started eating oatmeal. Only thing is I can't eat it without gobs of butter. People used to tell me I was defeating the purpose by putting butter on the oatmeal. Still, after a month or so, my cholesterol went down to about 149, the bad cholesterol went down and the good went up. I agree about not eating a lot of carbs, though, because they tend to be loaded with the bad fats. My grandparents ate lots of butter and they both lived to their 80s, with no heart problems.

Seth Roberts (2010-10-06 21:23:44)

I haven't tried Ghee. I have barely tried other brands.

Aaron Blaisdell (2010-10-07 08:11:20)

Ghee isn't a brand, per se. It is the Indian term for the type of clarified butter made and used in India.

Aaron Blaisdell (2010-10-07 08:14:18)

@CTB, I checked out the website to which you linked. Here's what it had to say: "What is lipemia? Lipemia is defined as excess lipids or fats in the blood. Lipemic serum will appear turbid or milky. What causes lipemia? Lipemia is caused by a rise in chylomicrons following a meal containing fat. How does lipemia interfere? The large particles causing lipemia will interfere with instrument methods that are based on light detection or scatter. Again, it is the responsibility of the Medical Laboratory Technologist to report any findings of lipemia so that results can be interpreted with this in mind. How can lipemia be avoided? In some cases Lipemia can be avoided simply by having the patient fast for 8 hours prior to the sample being drawn. In disease processes where the liver is unable to remove the chylomicrons from the blood, the appearance of lipemic serum may be unavoidable." So it looks to me that this is not a health problem but a measurement problem that the site is discussing. I've not come across any medical literature showing adverse health outcomes with consuming a high-fat meal. Can you provide any such references if you know of them? Thanks, Aaron

CTB (2010-10-07 08:59:50)

Aaron, I purposely used the lab website because it showed the difference between normal and fatty (lipemic) sera while remaining 'neutral.' The lab is only interested in getting samples that can be accurately tested; i.e., there is no one trying to convert you to eat a particular diet (as for instance at this site): <http://www.newveg.av.org/optimum.htm> where the doctor is trying to find converts for vegetarianism. I was trying to avoid sensationalism, while providing a verbal illustration of what

happens physiologically after a fatty meal, as well as a picture. Heart attacks happen for many reasons. Sometimes arterial plaques rupture and pieces travel in the blood until they reach an area of the heart vasculature with a smaller diameter that they can then block. Many times heart attacks occur in people without known risk factors. In many of these cases a blood clot formed somewhere in the body and then traveled to one of the coronary arteries and blocked it. It's known that high blood fat triggers increases in clotting factors. In this study, people (normals and heart patients) were fed high fat meals...and then were studied in the hours afterward: <http://www.ncbi.nlm.nih.gov/pubmed/16730815> The conclusion: "Fat-rich meals may cause procoagulant episodes, which may promote vascular complications such as myocardial infarction, transient ischemia attacks in susceptible persons." My concern is whether or not I'm a susceptible person. Studies like this one were prompted by stories of when and where cardiac events occurred. Heart attacks often occur in the hours after a large meal...ditto for attacks of angina/ischemia (chest pain). If fatty meals can raise pro-coagulant levels, maybe it's best to spread it out over the day rather than eating large amounts in one sitting. Perhaps it's like those old math problems with the bath tubs...water going in at a certain rate...water draining out at another rate. If your ability to drain the tub is compromised by age, illness, whatever, then adjust the rate by which you're filling the tub.

G (2010-10-07 10:55:28)

Ghee is what results when you melt butter and skim the surface. It is more neutral-tasting than butter so better for things that don't like to be buttery. And I think it may have a higher smoke-point. I would cook certain curries in ghee rather than butter; I would not cook an omelette in ghee rather than butter. I haven't tried ghee on nontypical things like stir-fries because I easily use up any ghee I buy on curries - I tend to the principle that there are oils best suited to different dishes and I wouldn't avoid sunflower oil where it's the best culinary option; I would just avoid eating sunflower oil meals on a daily basis. Maybe once a week, I don't expect to die of that.

Aaron Blaisdell (2010-10-07 16:47:45)

@CTB, I read the meal they fed their participants in that study to which you linked, and while it does indeed seem to contain a lot of fat, it also contains a lot of sugar (mousse au chocolate) and starch (potato dumplings, rye bread, for example). Thus, the meal was confounding multiple macronutrients and so there is no way to disentangle the effects of dietary lipids per se from the other macronutrients. I'd really like to see the diet/health medical or scientific studies move away from lumping fat and sugar in their "fast food" or "fatty food" meals experiments/epidemiologies. You should read some of the posts at hyperlipid blog (<http://high-fat-nutrition.blogspot.com/>). He presents a lot of good evidence against the notion that fat, even saturated fat contributes to atherosclerosis or MIs/strokes.

CTB (2010-10-08 08:23:19)

Aaron, Thanks for the high-fat blog link. I agree with you about the diet in the study...but most people eat a mix of fat/sugar/starch/protein, so that's where they're focused for now. Even so, that diet might be OK if the total energy consumed equals the daily energy output. For example, people/animals who are hyperthyroid convert increased amounts of sugar to fat in the liver (and dump it into the blood)...but they have reduced body stores of fat because their metabolism is causing the tissues to suck up the fat and burn it for fuel instead of storing it (and their cholesterol stays quite low). Digested protein and starch/sugar goes from the intestine to the liver after a meal, but fat goes from the intestine to lymph vessels and directly into the large veins leading to the heart...then to the lungs...then back to the heart for circulation to the whole body (including the liver). The tissues suck up what they need for storage or fuel. If there's insulin around from eating sugars, fat burning is decreased and more is stored. And in addition, sugars are converted to fats and dumped into the blood as well. But in either case, what's at issue here, for me, is how fast can you clear your blood of the fat that gets dumped into it after a meal? Here's an analogy: Near where I live, there's a flood-prone area that took a big hit two years in a row (two 'storms of the century'). Then last week, the area got hit with two back-to-back tropical storms...8-12+ inches in 48 hours. Usually the rivers rise...then crest 1-2 days later as the runoff continues to feed them. But this time, the rivers immediately receded when the rain stopped and major flooding didn't occur. It was because we've had a drought all summer, the water tables were low, and rain that fell on the dry ground was absorbed instead of running off. If you're clearing your blood of the fat load after a meal quickly enough, no problem. As you age, metabolism slows as muscle mass declines; demand for fuel is less, blah, blah. Other people have genetic factors which might subject them to added stress after a fatty meal. For example, the Framingham study showed

increased cardiac events in men with above normal hemoglobin. This usually means they have increased red blood cell counts, so their blood is more viscous (they are encouraged to donate blood often). Adding a big fat dump to already 'thickened' blood could interfere with oxygen gas diffusion from the lungs to the red cells and from the red cells to the tissues. Decreased oxygen tension...ischemia...can trigger cardiac events. In a way, it's like 'no sex' vs. 'safe sex.' One of the biggest mistakes this country ever made, IMHO, was promoting the use of margarine over butter...the other mistake was the low fat diet fad which spawned the low-fat/high carb food industry. But that doesn't mean we can go to the other extreme and eat the old no-no foods as if there were no precautions needed.

Anthony (2010-10-08 08:42:29)

"In a way, it's like 'no sex' vs. 'safe sex.'" IMAO, this isn't the best analogy. The "safe sex" idea has led to an epidemic of sexually transmitted disease, abortions, and out-of-wedlock births.

Rhonda (2010-10-08 18:57:55)

Seth - Does the butter need to be any particular kind? Will margarine work?

Seth Roberts (2010-10-08 20:45:38)

I have only used Straus Creamery Unsalted Butter. I doubt very much that margarine will work.

Gunnar (2010-10-09 03:09:37)

Margarine is something completely different and not related to butter in its essence. If you are interested in your health, avoid margarine at all cost. <http://en.wikipedia.org/wiki/Margarine>

Aaron Blaisdell (2010-10-09 09:46:26)

@CTB, I see. It seems you are suggestion that a high-fat meal can be a problem in the context of eating a SAD (Standard American Diet) which is heavily skewed towards grains (especially refined), sugar, and industrially-processed oils. I don't doubt that this type of diet may increase the problem of eating a meal with a large amount of even healthy fats as the person's system will likely already be compromised by metabolic syndrome. For those of us who follow a more ancestral diet (e.g., paleo, primal, even Weston Price) do not seem to be negatively affected by high-fat meals.

Ashish (2010-10-10 00:12:09)

> I would be interested to know whether Indians show a traceable tendency to > get heart-attacks due to all the butter/ghee - somehow I doubt it. Far be it from me to talk anyone here out of your daily butter-stick, but let me assure you that heart disease is widespread among middle-class Indians. In fact, it's pretty much the rule. A quick google search tells me that India, with a fifth of the world's population, accounts for more than half of the world's heart disease. Pretty impressive for a poor country where many people don't get enough to eat (let alone "excess" fat) and have a hundred other life threatening diseases to worry about.

autilicious (2010-10-13 14:52:24)

Why are we all trying to eat sticks of butter?

Jody W (2011-10-05 17:35:10)

Heated butter provides the same benefit as chilled butter, I assume?

## Research Fraud in China (2010-10-06 20:38)

[1]From the New York Times:

Last December, a British journal that specializes in crystal formations announced that it was withdrawing

more than 70 papers by Chinese authors whose research was of questionable originality or rigor. . . .  
“Even fake papers count because nobody actually reads them,” said Mr. Fang, who is more widely known by his pen name, Fang Zhouzi, and whose Web site, [2]New Threads, has exposed more than 900 instances of fakery, some involving university presidents and nationally lionized researchers.

Recently a Tsinghua colleague asked me to fix the English in his paper. Most paragraphs required a few changes every sentence but here and there were whole paragraphs with no mistakes. Presumably he copied them from somewhere else. The material in them was boring – it was like copying from the phone book – so it was hard to care (he wasn’t taking credit for anyone else’s ideas) but I wonder if he realized how obvious it was. I don’t mean this is typical. I have looked at several other papers by Chinese authors and found no patches of perfect English.

The article begins with a false claim by a Chinese doctor – and of course these are truly damaging. In my experience, false claims by American doctors are common. An example is my surgeon recommending an operation that, she said, evidence showed would benefit me. [3]There was no such evidence. One value of self-experimentation is that you can find out if a medicine works, rather than take your doctor’s word for it. I became impressed with self-experimentation when it showed me that an acne medicine (tetracycline, an antibiotic) my dermatologist had prescribed didn’t work. Not at all. He didn’t express any doubts when he prescribed it. Call it forensic DNA testing (e.g., [4]The Innocence Project) for the rest of us.

Perhaps the Chinese people, faced with even more false claims than Americans, can benefit even more from self-experimentation.

Thanks to Tim Beneke.

---

Gunnar (2010-10-07 04:38:36)

Since people in the west are mostly fed lies, too, I doubt the Chinese can be faced with more false claims. It’s just that you are probably not yet aware of how bad it really is. Even though you are more aware than regular people. Here is just one resource to show how bad it is, don’t fall off your chair: <http://www.wanttoknow.info/> Don’t despair. It’s getting better already.

Anonymous (2010-10-07 05:42:35)

I’m embarrassed to say it, but in the Computer Science field, I’ve started skipping papers I find in online searches if all of the authors have Chinese names. It’s sad, but so many papers that come out of China seem to simply restate the obvious, or combine two techniques in an unoriginal manner, without any real purpose or benefit. It’s as if every undergraduate had to be published four times before they graduated.

Elizabeth Molin (2010-10-07 09:22:30)

Tangentially related: <http://www.boingboing.net/2010/10/07/most-autism-treatmen.html>

Thomas Seay (2010-10-07 09:49:05)

Shouldn't we distinguish between false claims that are intentionally perpetrated and ones that are not? A doctor may pass on a meme or act on it, because that is what he was taught and he is too busy, too lazy or lacks the aptitude to research the issue in question. Of course, nowadays that meme would issue directly or indirectly from pharmaceutical companies or maybe received dogma from med school. Then there are people who knowingly perpetrate lies for personal gain. Perhaps you will argue that no matter the intention or reason, the consequences are the same. That may be true. In any case, it leaves us with the distressing realization that there is very little information, even from so-called scientific sources, that we can count on as true. We are truly on our own, in many respects.

nile (2010-10-07 10:25:54)

Sorry Gunner, any website that promotes 911 "truthers" has no credibility.

Thomas Seay (2010-10-07 10:49:44)

Nile, I started to write something like that, but that's not right. Even if 90 percent of the web site is "wrong" (and I'm not saying that's the case here), it doesn't mean that we should conclude that it is entirely wrong. If you follow the link given for the BBC story about the US military using the Internet as a propaganda tool, then I think you will agree that that is something to be concerned with. Also, I must admit that until I read some of the posts up here, I put anybody who challenged Global Warming in the same boat as you (and for that matter, me) put 9/11 truthers. That is to say that I thought they were Right-Wing Nuts with the IQ and sophistication of Sarah Palin. Now I am very skeptical of the 9/11 stuff, but the truth is I haven't really carried out any in-depth investigation of it. Have you? (Maybe you have)

John (2010-10-07 20:15:30)

Does anyone have any information about what happens to these researchers once they're caught further humiliating China's already disreputable academic system? I mean, it seems the State is in the habit of severely punishing and even executing Party members whose actions vis-a-vis, say, tainted milk or toxic childrens' toys. While clearly there is state impetus to up China's academic output in foreign journals, what happens when it comes out that these guys are making China look bad? Anybody know?

Seth Roberts (2010-10-08 06:05:51)

John, my impression is that little happens to them. I haven't looked into it. After a Tsinghua professor was accused of plagiarizing his doctoral dissertation, so far Tsinghua has done nothing.

Gunnar (2010-10-08 15:07:21)

Well, this year I have investigated plenty topics I had formerly believed to be absurd. And I found out that we are constantly lied to. I also found out that most people don't think for themselves, they mostly use what people they believe to be trustworthy tell them and build that into their mind structure. If you take the 9/11 topic alone and watch pictures and original TV footage with an open mind, you can see for yourself that what the government said cannot be true. Well, OK, not everybody can. The stuff on wanttoknow.info is real, but it's too overwhelming for most so they falsely conclude it to be wrong. The insanity is the reality and that's tough! But don't despair, as I said, it's getting better already. Here's a usable primer on the UFO deception: <http://www.thedaybeforedisclosure.com> Just part 3 of it is unsound. Be well.

## **Dairy Consumption and Health (2010-10-08 05:54)**

Two studies of the effect of dairy consumption on health have recently appeared. Both suggest it is healthy. [1]One of them- a prospective study where about 1500 people were followed for 16 years - found no association of dairy

intake with overall mortality but did find a protective effect of full-fat dairy against heart disease. The study considered lots of possibilities and the authors write " it is important to take into account the large number of comparisons considered in this study and thus we cannot rule out the possibility that the protective association between full-fat dairy intake and cardiovascular mortality was due to chance."

I mentioned this study [2]earlier. It gains more credence because of the [3]other study, which is a meta-analysis. The second study found protective effects of dairy products on several outcomes, including overall mortality:

Meta-analyses suggest a reduction in risk in the subjects with the highest dairy consumption relative to those with the lowest intake: 0.87 (0.77, 0.98) for all-cause deaths, 0.92 (0.80, 0.99) for ischaemic heart disease, 0.79 (0.68, 0.91) for stroke and 0.85 (0.75, 0.96) for incident diabetes.

This is good news for me since I eat yogurt and butter every day.

Thanks to Peter Spero.

---

Thomas Seay (2010-10-08 11:14:14)

Strangely enough, butter and cream are the only two dairy items that don't cause me some discomfort. It must be the higher fat content. Even yogurt/kefir, if I eat more than just a very small portion (and I mean a couple of tablespoons) has this effect on me. Those touting raw dairy products claim that these don't cause similar lactose intolerance as pasteurized products. That \*MAY\* be true for some people but not for me. Anyway, like I said, I am able to digest butter just fine and have plenty of other sources of good saturated fats. Ditto for probiotics. In general I eat mostly saturated fats. I do sometimes use olive oil and macadamia nut oil for cooking, as these are primarily monounsaturated fats.

Alex Chernavsky (2010-10-08 13:52:19)

I once went to a lecture by a nutritionist who extolled the virtues of this book: [1]*The No-Dairy Breast Cancer Prevention Program: How One Scientist's Discovery Helped Her Defeat Her Cancer*. The author, who is a prominent geologist in Britain, claims that dairy products contain growth factors that stimulate cancer growth. I never read the book, but it sounded interesting at the time I attended the lecture a few years ago.

1. <http://www.amazon.com/No-Dairy-Breast-Cancer-Prevention-Program/dp/0312291671>

Hap (2010-10-08 13:59:23)

Andronico's on Shattuck Ave. in No. Berkeley now carries raw milk and raw cream.

Sifter (2010-10-09 19:14:01)

Richard Cohen takes a dramatically different position, [www.no-milk.com](http://www.no-milk.com) He cites study after study implicating dairy in cancer, heart disease, degenerative diseases, etc. The 'milk letter' by a physician at the top of his site is a bit long, but proposes that dairy can be the cause of everything from bovine leukemia in humans to arthritis, allergies and aneurisms. I'd be curious to see how the info and references with these two studies lines up above with the referenced material on [www.nomilk.com](http://www.nomilk.com)

Hal (2010-10-10 16:39:53)

For every nutritional belief on the net there is an equal and opposite belief to be found - The Third Law of Nutrition

G (2010-10-12 06:51:47)

There was a guy in the UK who ate nothing but mild cheddar cheese and had no major complications, just bouts of tiredness. He started this diet (due to food-phobia) as a toddler and ended it aged 29, a strapping physically active guy. <http://thedailyg.wordpress.com/2010/08/27/are-nutritionists-phonies/>

### **Chinese Text-Message Censorship (2010-10-09 04:06)**

An American friend wondered about Chinese reaction to Liu Xiaobo winning the Nobel Peace Prize. So I sent a text message to four Chinese friends: "Did u know chinese dissident won nobel peace prize?"

Six hours later I hadn't received any replies. I phoned one of them. She hadn't received my message. I saw it hadn't gone through: "Unable to send message". I tried again. Failed again. Then I tried to send "did u know chinese dissident won prize?" Success. I tried the earlier message, with "nobel peace prize". Fail. Tried the shorter message. Success.

Messages almost never fail, so it was clearly censorship. One of my friends said the same about messages in Chinese: "We can't send email or text messages" about it. She had heard about the prize from her classmates. She didn't know how they had learned about it. Another Chinese friend read it on a website. Later it was gone.

I thought of the boy who cried wolf. One day there was a wolf. But no one believed him.

---

thehova (2010-10-09 04:32:31)

I've always wondered about the relationship of your blog with censorship (do you have trouble accessing your site, do you go through a 3rd party, do you feel hesitant about blogging on certain subjects in fear of obstruction, is it all overblown).

Seth Roberts (2010-10-09 06:31:36)

No I don't have trouble accessing this site, although I would if it were hosted by blogspot. I use a VPN to get to other people's blogs in some cases. I use a VPN if I want to use Flickr or YouTube. I don't worry about being censored. I can get any site, but it is hard to watch videos. They come through so slowly.

thehova (2010-10-11 23:50:23)

Thanks for the response. Although I'm for open, transparent societies, I certainly have sympathy for Chinese government officials who feel cautious about enacting such liberalizations too quickly. It's too easy for Americans to criticize such policies thousands of miles away without being fully knowledgeable about the situation.

Willy (2010-10-12 06:51:49)

Have you tried sending the message in an image if both phones are capable? or using simple scrambling like writing backwards? Just curious. Anyway, I don't think it is good to draw attention.

### **Strong Light and Cancer (2010-10-10 07:58)**

From an excellent article about light pollution (not online) by David Owen in the 20 Aug 2007 issue of The New Yorker:

Richard Stevens, a cancer epidemiologist at the University of Connecticut Health Center, in Farmington, has suggested a link between cancer and the "circadian disruption" of hormones caused by artificial lighting. Early in his career, Stevens was one of many researchers struck by the markedly high incidence of breast cancer among women in the industrial world, in comparison with those in developing countries, and he at first supported the most common early hypothesis, which was that the cause must be dietary. Yet repeated studies found no clear link to food. In the early eighties, Stevens told me recently, "I literally woke up in the middle of the night – there was a street lamp outside the window, and it was so bright that I could almost read in my bedroom – and I thought, Could it be that? A few years later, he persuaded the [directors] of the Nurses' Health Study . . . to add questions about nighttime employment, and [1]the study subsequently revealed a strong association between working the night shift and an increased risk of breast cancer. [The researchers] wrote, "We hypothesize that the potential primary culprit for this observed association is the lack of melatonin, a cancer-protective agent whose production is severely diminished in people exposed to light at night."

Exposure to strong light at night reduces the amplitude of your circadian rhythms. That causes a thousand changes. To decide that one of them ("lack of melatonin") is the one that matters is highly premature. If reducing circadian amplitude increases cancer, it follows that getting more light during the day – which surely increases circadian amplitude – will reduce cancer.

The article also says:

Growing numbers of us pass most of our waking hours "in a box, looking at a box," as Dave Crawford put it . . . Fewer and fewer of us spend much time outside at all, except in automobiles.

I have measured the light inside cars (front seats) several times and found it is quite strong (you are close to a big window). If the article is arguing that night light is bad and causes cancer, I am unconvinced. Night light exposure and daylight exposure are confounded – people who work night shifts get more night light and less daylight.

The Nurses Study paper: E Schernhammer, K Schulmeister. Light at night and cancer risk. Photochemistry and Photobiology, 2004, Vol 79, Iss 4, pp 316-318.

1. <http://www.ncbi.nlm.nih.gov/pubmed/15137506>

Nate Rosenberg (2010-10-10 12:43:46)

Seth, The article can be found online here: [http://www.newyorker.com/reporting/2007/08/20/070820fa\\_fact\\_owen?currentPage=all](http://www.newyorker.com/reporting/2007/08/20/070820fa_fact_owen?currentPage=all)

Eric Arias (2010-10-10 17:40:04)

People who work night shift are less likely to get much Vitamin D from sun exposure during the day as well.

pond (2010-10-11 04:47:14)

Studying night workers is looking at people who get light during the night and presumably sleep, presumably in darkened rooms, during the day. The study also is only looking at one kind of cancer. The conclusions and tentative hypotheses of any study need to be restricted and as narrow as the study itself.

Nansen (2010-10-13 14:29:01)

for what it's worth, this study (full-text online) seems to show that simulated chronic jet lag increases liver cancer in rats: "Circadian disruption accelerates liver carcinogenesis in mice", Mutation Research/Genetic Toxicology and Environmental Mutagenesis, Volume 680, Issues 1-2, November-December 2009, Pages 95-105

Andrew Durham (2012-02-18 21:29:27)

Hi, Seth, This is my first post. Thanks for your lively discussions. You wrote: "If reducing circadian amplitude increases cancer, it follows that getting more light during the day — which surely increases circadian amplitude — will reduce cancer." I disagree. Getting more light during the day cannot solve a problem caused by too much light at night, or even significantly mitigate it. From the New Yorker article: "...melatonin...production is severely diminished in people exposed to light at night." "Severely" is right. We are diurnal creatures. Even a tiny amount of light at night interrupts the pineal gland's secretion of melatonin. Melatonin is the main hormonal cause of sleep, dreams, loss of appetite loss during sleep, etc. It is a huge factor in circadian amplitude: restoring the waking half of it by a couple percentage points does not compare to continuing to lose tens of points on the sleeping half. The study of melatonin and its primary role in sleep and rest goes back decades. There is nothing premature about it. Here is the website of a long-time self-experimenter whose rigorous elimination of nightlight helped him with his particular illness, Ehlers-Danlos Syndrome, a collagen disorder: [http://photoperiodeffect.com/diabetes\\_hypertension\\_and\\_other\\_chronic\\_illnesses/ehlers\\_danlos\\_syndrome\\_chronobiology\\_and\\_the\\_photoperiod.html](http://photoperiodeffect.com/diabetes_hypertension_and_other_chronic_illnesses/ehlers_danlos_syndrome_chronobiology_and_the_photoperiod.html)

## Where Does Oil Come From? (2010-10-10 14:10)

This [1]fascinating article describes two ideas about oil production that were new to me: 1. It is made by microbes a long way down inside the Earth. 2. It is made by nuclear reactions going on in the middle of the earth.

The first idea came from a Cornell geologist named Thomas Gold. According to the article, "some geologists were so incensed by Gold's ideas they petitioned to have the government remove all mention of it from the nation's libraries." That is so strange (and no source cited) you might think the whole article is made-up but Gold explained his ideas [2]here (short) and [3]here (long).

Thanks to Carl Willat.

1. [http://www.americanthinker.com/2010/10/sustainable\\_oil\\_production.html](http://www.americanthinker.com/2010/10/sustainable_oil_production.html)

2. <http://www.ncbi.nlm.nih.gov/pmc/articles/instance/49434/>

3. [http://books.google.com/books?id=PEyYSU06hgYC&dq=gold+deep+hot+biosphere&printsec=frontcover&source=bn&hl=en&ei=VbSjTIfIFojSsAPvyej6Bg&sa=X&oi=book\\_result&ct=result&resnum=4&ved=0CCKQ6AEwAw#v=onepage&q&f=false](http://books.google.com/books?id=PEyYSU06hgYC&dq=gold+deep+hot+biosphere&printsec=frontcover&source=bn&hl=en&ei=VbSjTIfIFojSsAPvyej6Bg&sa=X&oi=book_result&ct=result&resnum=4&ved=0CCKQ6AEwAw#v=onepage&q&f=false)

---

Alrenous (2010-10-10 15:17:18)

See something wrong. Present the arguments that show it's wrong, or get angry and censorious? All true scientists know which to pick. More seriously, even if oil is generated continuously, by geology or biology, there's still a limited supply. We'll still effectively run out if it is generated slower than some threshold - say 10 % of demand at current prices, just for the sake of argument. Above that the economy can adjust with higher prices, below that cars, loud lawnmowers and so on effectively disappear.

marmolillo (2010-10-11 02:24:16)

There are a few theories about oil treated like heretic science. Most famous: [http://en.wikipedia.org/wiki/Abiogenic\\_petroleum\\_origin](http://en.wikipedia.org/wiki/Abiogenic_petroleum_origin) Communist science is a fascinating study area, most of their discoveries are not accepted by mainstream science unless they have clear and practical applications. It is crazy a theory about oil is quite reasonable in Russia's eyes and completely dismissed by USA & Europe scientific society. I have a friend who studied in psychology in communist Romania and told me their studies are not accepted in western Europe because they learn "the Russian psychology" who is somehow not accepted as valid.

pond (2010-10-11 04:45:08)

Abiotic oil is fairly well documented. However, it is not the primary source of oil – the vast majority of oil discovered and extracted comes from shallow basins that were filled in, sunk, and pressurized. Your post title assumes that oil has one unique source of origin. This is beginning from unproven premises. Oil can have more than one source. It does not seem so far that abiotic oil is going to help us go on heating up the planet, either – not enough of it.

Robbo (2010-10-11 12:48:55)

There is also the "Russian-Ukrainian theory of deep, abiotic petroleum origins" - I wonder if Gold was aware of that ? I would have thought it relatively easy to test the fossil-origin hypothesis, by measuring the levels of life elements such as K, P, N in crude oil, and comparing with levels in vegetation, and between oil samples from different locations. It is also worth remembering that when astronomers find evidence of methane on Titan, for example, they don't conclude that Titan used to be covered with forests. So why could not methane deposits on Earth have the same origin as those on Titan ?

G (2010-10-12 06:46:36)

Why would the geologists be so angry about it?

Alex Chernavsky (2010-10-12 11:30:23)

I imagine that geologists get angry for much the same reason that psychiatrists get [1]livid if you start to question the usefulness of psychiatric drugs – it challenges their worldview and throws doubt on many of the important decisions they've made in their professional life.

1. <http://www.psychologytoday.com/blog/mad-in-america/201010/samhsa-the-alternatives-conference-and-the-story-opportunity-lost>

## How to Lie with Meta-Analysis (2010-10-11 17:35)

Michael Constans drew my attention to [1]a Consumer Reports article about spinal surgery. According to the article, a popular type of spinal surgery called vertebroplasty (involving cementing vertebrae together) doesn't work and should be stopped:

Despite the popularity of the procedure, the [2]American Academy of Orthopedic Surgeons has just released a [3]guideline [actually a meta-analysis of available data] saying it doesn't work, and shouldn't be

used.

They reviewed all the literature about the procedure, and found two good-quality studies (randomized controlled trials) that show vertebroplasty works no better than a fake (placebo) procedure. There were no clinically significant differences in pain or disability, they say.

No significant difference means it "doesn't work"? At best, it's absence of evidence. And it's not even that because we don't know what the rest of the research suggests. The meta-analysis might have ignored thirty studies; it doesn't say how many studies were ignored. Nor does it say what "placebo" means. Patients are interested in pain relief. Whether the pain relief is "all in their head" or whatever hardly matters. From a patient's view, and a clinician's view, a better comparison is a group that gets another plausible treatment or no treatment. The meta-analysis reports one study that compared vertebroplasty to "conservative" treatment, which makes more sense.

So how come vertebroplasty has been used so often? Other experts have recommended the treatment in the past, including the United Kingdom's [4]National Institute for Health and Clinical Excellence, which said most people got some pain relief from the procedure.

This suggests that ignoring of evidence and poor choice of comparison group made a difference.

In this case, it probably comes down to what you mean by significant pain relief. The US surgeons set a strict definition – they said a difference in pain relief of less than 2 points on a 10-point scale was not meaningful for patients. Smaller differences in pain relief were recorded in the studies, but, say the surgeons, they were not big enough to make a real difference.

I think patients would prefer to decide for themselves what degree of pain relief is meaningful.

The surgeons say the evidence against vertebroplasty is strong, and they don't expect future studies to overturn their recommendations.

Haha! Two studies with inferior comparison groups that failed to find a difference – and ignoring an unknown number of studies and arbitrarily raising the bar – adds up "strong evidence against"!

Still the Guideline and Evidence Report is useful. It reviews a range of treatments, provides citations (so you can look much further), and isn't wedded to the placebo-comparison group. It includes studies with other comparison groups; the article just doesn't mention them.

And I completely agree with the article's conclusion:

If you're considering any type of surgery, ask your surgeon to show you data about how likely it is to solve your problem.

And [5]don't take your surgeon's word for it that such data exists.

1. <http://blogs.consumerreports.org/health/2010/10/vertebroplasty-popular-spinal-surgery-doesnt-work-say-surgeons-treating-compression-fractures.html>

---

Jake (2010-10-12 03:56:08)

Here are the results of my survey of people I know that have had the vertebrae fusion surgery. It has not relieved pain for anyone but did mean 6 months of additional suffering recovering from the surgery. I will never have such surgery. I will go the back muscle strengthening route instead.

Alex Chernavsky (2010-10-12 04:30:55)

When a medical trade group issues guidelines that run contrary to their own financial interests, my inclination is to take them seriously.

Jim Breed (2010-10-12 08:42:07)

I had back pain so bad I could barely walk. I got Healing Back Pain by Dr. Robert Sarno. I read it. Pain went away. I gave it to my Brother. He was going to have surgery. After he read it, he feels so good, he is not having surgery. I was at a motorcycle rally in 2009. I met a guy from Texas who was miserable with back pain. I told him about Dr. Sarno. I ran into him again in 2010. He was raving about how the book worked. Look, it may not be for you, but I know how my back feels and I know how it helped people who were going to get surgery and then felt good enough that it was no longer an option.

Gunnar (2010-10-12 10:23:06)

Don't ask a surgeon if or why you would need surgery.

Bruce G Charlton (2010-10-14 11:06:03)

Often, perhaps usually, a treatment will make some people better, do nothing for others, and make some people worse. When a treatment makes about as many people worse as it makes better, then meta-analysts say it doesn't work. But often it *\*does\** work - for *\*some\** people. Indeed, it might work very well indeed for them. The other people - for whom it makes no difference, or makes work - just need to stop using it - then everyone benefits. (It is just a matter of using patient response as a feedback loop.) Is that really so difficult to understand? - yet I can never get this point across to bio-statisticians/ epidemiologists, meta-analysts and the like...

TOM ATKINS (2011-07-14 03:04:51)

MY WIFE, CLARA, HAD UPPER AND LOWER BACK PAIN THAT WAS UNBEARABLE EVEN WITH STRONG PAIN MEDICATION.....SHE HAD SURGERY FOR A VERTEBROPLASTY PROCEDURE IN 4 PLACES AND HER PAIN VANISHED OVERNIGHT.....SHE UNDERSTANDS THAT HER SPINE WILL NEVER BE AS GOOD AS IT WAS BEFORE HER SPINAL FRACTURE AND SURGERY BUT SHE IS WITHOUT THAT UNBEARABLE PAIN.....IN HER CASE WE AGREE THAT THE PROCEDURE WORKED FOR HER.....

## Chinese Reaction to Liu Xiaobo's Nobel Prize (2010-10-12 05:45)

I asked several Tsinghua students what they thought about Liu Xiaobo, the imprisoned Chinese dissident, winning the Nobel Peace Prize. There was a wide range of answers:

1. "It's a sensitive subject," said one student. And said no more.

2. "The Nobel Prize always seems to involve China," said another student. Maybe she meant the Peace Prize in 1989 to the Dalai Lama and the more recent Literature prize to Gao Xingjian, but I'm not sure. Politely changing the subject.
3. "I don't know much about what he stands for," said another student (a freshman).
4. "Now is not the right time for his ideas. They would interfere with economic progress," said a student who is a member of the Communist Party.
5. "Many people say because the European economy is bad, they gave the prize to someone who will never collect the money [because he's imprisoned]," said another student. She added that receiving the prize will be bad for Liu. Because it was "a great shame for China" (meaning the government), they will increase his prison sentence.

---

G (2010-10-12 06:42:59)

If they want to stick to a centrally-planned authoritarian system they might try letting people discuss, critique and have some input into decision-making without introducing democratic elections. Most workplaces are dictatorships but the good ones have a light touch and consult staff at all levels. It doesn't lead to disorder and revolution; it increases productivity and job-satisfaction. But people who are authoritarian, I guess, prefer to objectify and control others. It's not necessarily rational or self-serving.

Genius (2010-10-12 14:10:37)

Thanks for posting this. I know, living in Israel, that the word on the street / local reality is often so different from what's reported abroad / foreign perceptions as to be unrecognizable, and that people just don't have a clear conception at all of what Israelis think about anything. So it's pretty interesting to see a sampling/snapshot of Chinese opinions.

NNM (2010-10-12 15:49:32)

Seth, did you ask each of them privately for their opinions, or in front of a group?

Alrenous (2010-10-12 16:57:28)

"It's not necessarily rational or self-serving. " It's very rational if they value control more than wealth-from-productivity. Less rational in that it looks fear-dominated to me. It's not, "Wow, telling people what to do is fun! Dance, minions, dance!" It's more, "Oh crap if they don't do what I tell them WE'RE ALL GOING TO DIE." Or; the Chinese don't come down hard on dissidents because they're cruel jackasses. They come down hard on dissidents because they're terrified of what will happen if they don't. (Rightly or mistakenly.) The holders of fear-dominated values tend to spend all their time warding off fearful situations, at the expense of looking for actual positive situations, and thus get stuck at suck no matter how skilled or powerful they are. But it's still the rational decision if the holder doesn't know any better.

Gunnar (2010-10-13 06:05:20)

To add to Alrenous' post - instead of "anti war" one acts "pro peace" for example for positive outcome. Even if it does not seem important at first sight, it makes a world of a difference, or better yet, a different world.

ali (2010-10-19 11:40:11)

## The Contribution of John Ioannidis (2010-10-13 05:08)

From [1]an excellent Atlantic article about John Ioannidis, who has published several papers saying that medical research is far less reliable than you might think:

A different oak tree at the site provides visitors with a chance to try their own hands at extracting a prophecy. "I [bring] all the researchers who visit me here, and almost every single one of them asks the tree the same question," Ioannidis tells me . . . "Will my research grant be approved?"

A good point. I'd say his main contribution, based on this article, is pointing out the low rate of repeatability of major medical findings. Until someone actually calculated that rate, it was hard to know what it was, unless you had inside experience. The rate turned out to be lower than a naive person might think. It was not lower than an insider might think, which explains lack of disagreement:

David Gorski . . . noted in his prominent medical blog that when he presented Ioannidis's paper on [lack of repeatability of] highly cited research at a professional meeting, "not a single one of my surgical colleagues was the least bit surprised or disturbed by its findings."

I also like the way Ioannidis has emphasized the funding pressure that researchers face, as in that story about the oak tree. Obviously it translates into pressure to get positive results, which translates into overstatement.

I also think his critique of medical research has room for improvement:

1. Black/white thinking. He talks in terms of right and wrong. ("We could solve much of the wrongness problem, Ioannidis says, if the world simply stopped expecting scientists to be right. That's because being wrong in science is fine.") This is misleading. There is signal in all that medical research he criticizes; it's just not as strong a signal as the researchers claimed. In other words the research he says is "wrong" has value. He's doing the same thing as all those meta-analyses that ignore all research that isn't of "high quality".

2. Nihilism (which is a type of black/white thinking). For example,

How should we choose among these dueling, high-profile nutritional findings? Ioannidis suggests a simple approach: ignore them all.

I've paid a lot of attention to health-related research and benefited greatly. Many of the treatments I've studied through self-experimentation were based on health-related research. An example is omega-3. There is plenty of research suggesting its value and this encouraged me to try it. Likewise, there is plenty of evidence supporting the value of fermented foods. That evidence and many other studies (e.g., of hormesis) paint a large consistent picture.

3. Bias isn't the only problem, but, in this article, he talks as if it is. Bias is a relatively minor problem: you can allow for it. Other problems you can't allow for. One is the Veblenian tendency to show off. Thus big labs are better

than small ones, regardless of which would make more progress. Big studies better than small, expensive equipment better than cheap, etc. And, above all, useless is better than useful. The other is a fundamental misunderstanding about what causes disease and how to fix it. A large fraction of health research money goes to researchers who think that studying this or that biochemical pathway or genetic mechanism will make a difference – for a disease that has an environmental cause. They are simply looking in the wrong place. I think the reason is at least partly Veblenian: To study genes is more "scientific" (= high-tech = expensive) than studying environments.

Thanks to Gary Wolf.

---

Alex Chernavsky (2010-10-14 07:15:45)

I haven't read the article about Ionnidis, but your blog post reminds me of this excellent paper on the placebo effect: Roberts, Alan H., Kewman, Donald G., Mercier, Lisa, Hovell, Mel (1993). "[1]The power of nonspecific effects in healing: Implications for psychosocial and biological treatments." *Clinical Psychology Review* 13(5): 375-391. **Abstract:**

We evaluate the hypothesis that the power of nonspecific effects may account for as much as two thirds of successful treatment outcomes when both the healer and the patient believe in the efficacy of a treatment. Five medical and surgical treatments, once considered to be efficacious by their proponents but no longer considered effective based upon later controlled trials, were selected according to strict inclusion criteria. A search of the English literature was conducted for all studies published for each treatment area. The results of these studies were categorized, where possible, into excellent, good, and poor outcomes. For these five treatments combined, 40 % excellent, 30 % good, and 30 % poor results were reported by proponents. We conclude that, under conditions of heightened expectations, the power of nonspecific effects far exceeds that commonly reported in the literature. The implications of these results in evaluating the relative efficacy of biological and psychosocial treatments is discussed.

1. <http://deepblue.lib.umich.edu/bitstream/2027.42/31080/1/0000757.pdf>

G (2010-10-14 10:33:58)

You can allow for bias!? Allowing for bias is non-bias. I think it is a huge problem. You might have your own (right or wrong) sense that you can surf the nutritional data and get your best result but I think that 'ignore it all' might be good advice for most people. The stuff you say people should eat (butter, pork fat...) has been shunned for years by people who paid attention to studies. They would have been better served by tradition and *instinct* than by attempting to grapple with masses of data and conflicting opinion *even if* they had the time and educational means.

Seth Roberts (2010-10-14 23:17:06)

"They would have been better served by tradition and instinct." I agree, if the right tradition is chosen. There are plenty of harmful traditions. The Chinese have a tradition of eating rice. Bad idea. They eat little animal fat (can't afford it). Bad idea. And instinct, too, is a good guide to something but it isn't always clear what. Why do we like sweet things? So we will eat more candy? No. perhaps bias is a "huge" problem. I meant it strikes me as a smaller problem than the two others I name.

G (2010-10-22 11:49:09)

Seth, instincts can be clouded by habit. There's a signal that tells you 'enough chocolate, time to eat some lettuce', but people binge on chocolate for dysfunctional reasons and dietary advice has very, very limited power to override these compulsions. I know someone who eats an incredible amount of sugar and is slim and healthy-looking. She is also a vegetarian. For all we know, she's suited to that.

Margaret Wilde (2010-11-05 03:59:18)

I think there's a common reluctance to find environmental cause for degenerative conditions because drug companies fund so much research. You can't 'cure' environmental causes by selling a pharmaceutical drug for the environment to take. Better to blame the victim/patient for the ill-health and then treat them with profitable drugs or other profitable procedures.

fredafal (2010-12-09 13:24:23)

Another important contribution to bias not mentioned is the fact the once there is an accepted hypothesis, people look for confirmation, rather than refutation, which is required for truly critical scientific method. One huge institutional impediment to a healthy balance of refutation is the peer review process employed by almost all journals. If there is not even any place to publish, and in turn debate, negative results and possible alternate hypotheses, how can our existing hypotheses be anything but biased? One of the last places unbiased debate was fostered was Medical Hypotheses, which did not practice standard peer review. However Elsevier, the huge publishing house that publishes Medical Hypotheses, sacked the editor-in-chief and installed peer review, because of the publication of a controversial scientific hypothesis about AIDS. Rather than let a scientific debate of the merits, or lack thereof, of the hypothesis proceed, this important forum for unbiased scientific debate was stifled for good.

### **How She Adjusted to Living in China (2010-10-13 23:13)**

I asked an American friend who's been in China for a year how the year had changed her. She told a story:

I was in a restaurant in Inner Mongolia. This guy was going around smashing things, throwing glasses. He was drunk. I was shocked. I expected a strong reaction: Get out of my restaurant! That's not what happened. There was no strong reaction. The guy finally left and the staff cleaned up the mess he made. I've learned not to react strongly to unusual behavior.

I love this story. That travel changes your assumptions is hardly a new idea but this says it vividly and briefly.

---

Gunnar (2010-10-14 04:04:47)

Gene Sterling allegedly said: "You are not responsible for the stimulus, only how you respond to the stimulus." So if you want peace, be peaceful. A la Gandhi - be the change you want to see in the world. Btw, what do people around there think about incarnation, Seth? Westerners are taught they are a body, die, and that's it for their existence, as you probably know ;-)

Alex Chernavsky (2010-10-14 06:12:13)

I find this story surprising. Are Inner Mongolians typically very tolerant of out-of-control drunks? If so, why?

Seth Roberts (2010-10-14 06:14:35)

Alex, I don't know the answer to your question.

Bruce G Charlton (2010-10-14 11:08:34)

It shows this must be a society in which violence is rare and a temporary aberration. And also where drunken-ness is rare. In a high violence/ frequent intoxication society - such as the British Isles - the restaurant would not last a week.

Alex Chernavsky (2010-10-15 06:35:10)

Bruce, apparently drunkenness is a huge problem in Mongolia: "[1]Mongolia's drinking epidemic"

Heavy drinking in Mongolia is nothing new. Genghis Khan was reputed to have consumed huge quantities of alcohol after vanquishing his enemies. But today, alcoholism is reaching epidemic proportions, driven by cheap liquor and wrenching social and economic change. I visited a young man lying on an old iron bedstead in a bare white room inside an Ulan Bator hospital. The man was an alcoholic and this desolate room was his last resort. [...] This young man's story is far from unique. Mongolia is today in the midst of an epidemic of alcoholism. On the streets of Ulan Bator you do not have to go far to see its effects. Ulan Bator railway station, even at 10am in the morning, was already crawling with drunks, many of them already so intoxicated they could hardly stand.

1. <http://news.bbc.co.uk/2/hi/asia-pacific/3138806.stm>

Nancy Lebovitz (2010-10-15 11:43:44)

Another possible factor is trust that a drunk who's breaking glasses won't escalate to attacking people.

Ragout (2010-10-15 17:19:44)

Maybe the drunk was the Mayor (or some other important person).

### **Will Eating Half a Stick of Butter a Day Make You Smarter? (2010-10-14 22:19)**

To my pleasant surprise, Mark Frauenfelder posted [1]this call for volunteers. Will eating half a stick of butter per day or a similar amount of coconut fat improve your performance on arithmetic problems? Eri Gentry is organizing a simple trial to find out. The trial is inspired by [2]my recent Quantified Self talk. [3]Study details.

During the question period of my talk, I responded to a question about a trial with 100 volunteers by saying I would suggest starting with 2 volunteers. A reader has written to ask why.

What's your reasoning behind suggesting only 2 volunteers to test the eating more butter results? You seem highly convinced earlier in the video, but if you were so convinced why not have a larger trial?

Because the trial will be harder than the people running it expect. If you're going to make mistakes, make small ones.

This is my first rule of science: Do less. A grad student in English once told me that a little Derrida goes a long way and a lot of Derrida goes a little way. Same with data collection. A little goes a long way and a lot goes a little way. A tiny amount of data collection will teach you more than you expect. A large amount will teach you less.

My entire history of self-experimentation started with a small amount of data collection: An experiment about the effectiveness of an acne medicine. It was far more informative than I expected. My doctor was wrong, I was wrong – and it had been so easy to find out.

This may sound like I am criticizing Eri's study. I'm not. What's important is to do something, however flawed, that can tell you something you didn't know. Maybe that should be the first rule, or the zeroth rule. It has the pleasant and unusual property of being easier than you might think.

Thanks to Carl Willat.

---

Eric (2010-10-15 05:33:05)

I like rule zero :-) Thanks for replying to my email. Your comment makes great sense in context. Making the mistakes up front with less effort gets results more quickly and may illuminate ways of improving future studies. There will always be the possibility of doing more rigorous studies later.

Gunnar (2010-10-15 07:02:31)

Seth, how do you rule out the so called placebo effect? Human attitude/intention influences the outcome. IMHO such trials tell the one human that observes himself if his approach worked or if he should try different. And different can start with different attitude. Btw antibiotics reduced acne for me; at that time I believed doctors and in medicine ;- ) I will probably never use anything like that again, though, now that I am less clueless. I haven't thought this through, it just came into my mind while reading your blog post. Be well.

Mike Kenny (2010-10-15 08:30:35)

Venkat from [rinnonfarm.com](http://rinnonfarm.com) had an interesting post apropos a little data versus a lot of data: <http://www.ribbonfarm.com/2010/09/28/learning-from-one-data-point/> The gist IIRC is that when you collect a lot of data, you may stop thinking deeply about a problem, whereas one piece of data tends to force you to think deeply, I think mainly about how cause and effect might act in this particular case.

Eri (2010-10-16 21:38:30)

Do less. I love it. Really, I do. But, at least this once, I want to have the experience of running a study with as many participants as are willing. It's going to be a data mess at first. But I hope that, soon enough, online platforms will be capable of automating this type of study. However, I'll probalby still spend the majority of my test time on myself. :) Thanks so much for your curiosity and testing, Seth. It is quite the inspiration. Eri

Seth Roberts (2010-10-17 03:40:48)

Eri, thanks! Yes, better software could certainly help. R is not designed for data collection but I use it anyway.

Forrest (2010-10-22 16:33:22)

Does anyone have any data, arguments, or guesses about what it is in the butter that has this effect, and what the mechanism might be? (Really enjoyed the talk btw.)

Gunnar (2010-10-23 05:30:18)

Forrester, here is general information: <http://www.westonaprice.org/> And here is one great blog out of many about how the conventional lipid theory is total bullshit: <http://high-fat-nutrition.blogspot.com/> It's proven!

majamin (2010-11-04 20:39:59)

"This is my first rule of science: Do less." "Same with data collection. A little goes a long way and a lot goes a little way." "A tiny amount of data collection will teach you more than you expect." "A large amount will teach you less." No. Absolutely

not. Science hinges on good sampling methods, and the more data, the better. You will eventually exhaust resources in order to obtain this data, this data may be difficult to collect, but a good statistician / scientist would never say "no" to more data. Especially if it is collected in a manner that sheds light on interesting relationships and phenomena, and especially if we want meaningful outcomes. A small amount of data can suggest further study, but these can never be relied upon to make confident and accurate decisions.

Seth Roberts (2010-11-04 20:48:26)

majamin, where do these beliefs of yours come from? Science requires a lot more than "good sampling methods". Every experiment requires assumptions and the bigger the experiment the more assumptions – which have a higher chance of being wrong than you appreciate. A single wrong assumption may cause the whole project to fail. If you're a scientist and haven't managed to learn this, I'm surprised.

majamin (2010-11-04 21:55:40)

Hi Seth, Of course assumptions are counter-productive, and can render any data collection to be fruitless. There are many other things that need to be considered (bias, blinding, etc.). With these in place, you have the beginning of a robust study. "the bigger the experiment the more assumptions" No. Every data point that is collected does not mean one more assumption. Bias in sampling can creep in, of course, but that does not mean that less data should be used. It just means that the data if you are collecting data, you need to ensure that it is collected with a good dose of randomness. The claim made above was "less data is better". Let's focus on that. That's like saying that, in sampling a product line for an estimated number of defected products, the less amount of data you collect, the better. Like I said in my first post, at one point the collection of data would become difficult (i.e. the resources required to test for defects), but how could less data teach you more? Why would you chose to sample less number of products? Can you give a good reason why doing this would result in a better understanding of the situation? The same with any other observation of our world ... how would less observation give us the ability to understand it better? Please point me to a (mathematical, if possible,) analysis that would show that less data you have, the better. Sincerely, majamin

Seth Roberts (2010-11-05 04:20:11)

majamin, I'm still curious: where do your beliefs come from? They strike me as highly incomplete. Your puzzlement ("how would less observation give us the ability to understand it better?") is why I wrote what I did: because it wasn't obvious. You're just describing the conventional point of view. I'm well aware of that view. But why do you believe it? To be even a little bit convincing you have to explain that.

Alex Chernavsky (2010-11-05 07:21:40)

Jay Cohen of UCSD Medical School has written a [1]whole book about the idiosyncratic ways in which different patients can react to the same medication. (This is a problem that drug companies would rather sweep under the rug.) With regard to the butter/reaction-time experiments, for example – is it not possible that your (Seth's) results are an outlier? In order to generalize the results to the population-at-large, would we not need to replicate the experiment with a larger group of people? Not sure if that's what Majamin is getting at here, but it's something that occurred to me.

1. <http://www.amazon.com/Over-Dose-Jay-S-Cohen/dp/158542370X>

majamin (2010-11-05 09:11:08)

Seth: I can see how my response may seem rhetorical, since I am actually echoing the established viewpoint. The reason why I adopt it, is given by the above example of a product line, where one is checking for defects. Logically, I cannot see how one can learn more from a smaller sample. This example illustrates why we should not opt out of collecting more data points. In fact, it can be shown that no useful information can be gained from doing so. We will not be able to tell whether the items in the sample are a fluke, or not, etc. So, I've explained my position. It's time to back up your claim by applying it to the situation that I posed. Your argument to "less is more", is that we are susceptible to making more mistakes. What mistakes? Bias? We have techniques to lessen the amount of bias attributed to every sampling method. Do you disagree with these methods? If so, why?

Seth Roberts (2010-11-05 14:12:21)

"What mistakes?" Here's an example. A professor at a famous university got a large grant to do a big study of how cleaning your apartment affects your chances of asthma. Most of the grant money was wasted because his research group couldn't get enough people to volunteer for the experiment. Alex, you ask if my results "could be an outlier". The history of nutrition is a good guide. There are no examples in the history of nutrition where one person, apparently normal, needed a nutrient that no one else needed. There are countless examples where the results from one person turned out to generalize to everyone else.

majamin (2010-11-05 19:26:58)

Seth: You still haven't spoken to the example I gave, and how a smaller sample ("less data") would be more beneficial. Again, product line defects: how would checking a smaller amount lead to less mistakes?

majamin (2010-11-05 19:35:57)

Seth: In the large grant case, all this shows is that the study's funds were used ineffectively, it says nothing about the efficacy of having smaller sample sizes. All we can say is that (1) a bunch of money was wasted, and (2) there wasn't enough data to perform a meaningful analysis. If you are arguing this particular university did not issue funding in an efficient manner, I wholeheartedly agree with you. But, what does this have to do with the efficacy of small sample sizes?

Seth Roberts (2010-11-06 05:29:07)

If they had tried to do less – smaller sample size – they would have wasted far less money learning that one of their assumptions was wrong.

majamin (2010-11-06 09:56:28)

Seth: I'm not sure if you keep missing the question I posed above, or are ignoring it. There's no point in this conversation if you won't even bother to apply your approach to that scenario.

Seth Roberts (2010-11-06 15:30:18)

I am ignoring it. I'm not interested in hypothetical examples. I was trying to find out if you had real-world experience that contradicted what I wrote. The answer seems to be no.

majamin (2010-11-06 22:19:10)

Seth: That's fine. I'm not interested in hypothetical theories.

## Assorted Links (2010-10-14 23:51)

- [1]meaning-based computing
- [2]academic plagiarism. "One of my own students turned in a paper on "Great Expectations" which was an exact copy of Dorothy Van Ghent's essay - an essay so celebrated that I recognized it right off and, at the first opportunity, raised the issue with my student. "Shit!" she said. "I paid seventy-five dollars for that." "
- [3]The dark side of fermentation. I am very pleased to see that Edward Jay Epstein is writing a book about the 9-11 Commission.

1. <http://www.computing.co.uk/itweek/analysis/2162661/interview-meaning-computing>

2. <http://www.tnellen.com/cybereng/ethics/purloined.html>

---

vic (2010-10-15 01:50:11)

It's clear you love conspiracy theories, but this guy has devoted his life to following the anthrax case, and makes a pretty compelling case that Ivins WAS the anthrax mailer: <http://anthraxinvestigation.com/>

Aaron Blossom (2010-10-24 17:44:14)

You might look at Ellen Langer's work. It seems to correspond to yours. I did a search for Langer on this site, no results found.

Seth Roberts (2010-10-24 19:18:21)

How does Langer's work correspond to mine? I'm afraid I don't see the connection. Nor do I see any connection with this post.

### **Fermentation Not Sexy (2010-10-16 06:31)**

From an [1]NY Times article about the high price of kimchi (in Korea):

Michel Troisgros, the renowned French chef from Roanne, listened to a Korean official hold forth on the wonders of fermentation and an ambitious project to export Korean foods like kimchi.

“I think you have to stop talking about fermentation,” Mr. Troisgros told the man. “It’s not sexy.”

Via [2]Marginal Revolution. I love that remark (“not sexy”). Good epigraph for book or article about fermented foods.

I considered making kimchi until I was in a Korean market buying some. The Korean woman next to me thought it was too hard.

1. <http://www.nytimes.com/2010/10/15/world/asia/15kimchi.html?hp>

2. <http://www.marginalrevolution.com/marginalrevolution/2010/10/assorted-links-12.html>

---

Caleb (2010-10-16 08:23:41)

“Aged” seems to work over here as the distinguished sounding euphemism for “deliberately cultivated bacterial growth”

David (2010-10-16 08:53:14)

Ah, but not sexy is the new sexy...

Alex Chernavsky (2010-10-16 10:43:56)

Seth, I tried making kim chee a couple of months ago. It didn't taste nearly as good as the stuff I can buy at the store, though I think I might know why my attempt didn't work. I made it during the heat of summer, in a non-air-conditioned space. An acquaintance later told me that kim chee does best when it ferments at a cooler temperature. I will try again. In the meantime, I buy kim chee made by Hawthorne Valley Farm. It's made without fish or shrimp.

John (2010-10-16 17:30:59)

Kimchee is not too hard to make on your own. If you have Sandor Katz's book Wild Fermentation, there is a simple, authentic and easy recipe and it takes about a week to ferment. I did it last winter (made a quart) and it was good. There's also a fruit kimchee recipe that I'm hankering to try soon.

Russ (2010-10-19 12:03:40)

I made sauerkraut this Spring - it was actually quite easy, and the results were much better than store-bought.

Oli M (2010-10-22 19:44:04)

As opposed to Alex, I like my Kimchi stinky. The stuff from the store is just not stinky or flavorful enough. Kimchi's not as easy to make as kombucha, but it's still pretty easy. It is easier than most traditional asian dishes; perhaps the woman meant it is hard if you consume a lot of it. (e.g are feeding a family.) I can make it much more regularly than kombucha, since a little cabbage goes a long way. [1]Here is the recipe I use. (Also first hit on a Google search "how to make kimchi", I believe.) It's turned out great for me. I've experimented with vegetables other than nappa and also using various fruits as sugar sources. My two month old (non-spicy) watermelon yu-choy kimchi was the best one so far.

### **Breakfast Not All Bad (2010-10-17 03:53)**

I stopped eating breakfast when I discovered it made me wake up too early. My Tsinghua students are reading [1]the paper in which I describe my breakfast research. One of them, a freshman, wrote:

When we [entered] Tsinghua University, the first task we should finish was the military training. [New students have a few weeks of military training.] We were asked to be gathered at 8 o'clock, and then we would do a lot of trainings. As the training was hard and tiring, we all had to eat breakfast in the morning. And I remembered in those days, we all slept well and were early-awakening. When the trainings were over, we began our classes. The time was also 8 o'clock, but many times we didn't have breakfast in order to save time. Gradually, our awakening time become later and later. Even we set an alarm clock, we felt really reluctant to get up. For a long time, we wondered about that but no idea appeared. Now I got the answer, it has something to do with the breakfast. When I told my roommates, they were indeed surprise. Everyone was curious about why, and I was also interested in that. Maybe if the last day you had breakfast, the next morning your body will still have the motivation to call you up to eat breakfast.

Yes, if you eat at a certain time of day, you will tend to be awake that time of day. The effect has been heavily studied in animals, where it is called anticipatory activity.

1. <http://escholarship.org/uc/item/2xc2h866>

---

Eric Vlemmix (2010-10-19 07:09:29)

I really don't like to eat (breakfast) in the morning. I'm not hungry at all, and usually I take have, or take, the time to make breakfast. What will trigger the effect of waking up in the morning? The intake of fat, the intake of protein, the intake of carbs, a combination, or any of the before mentioned? I have troubles getting up in the morning and would like to get a kickstart. Let's see the responses, and if no clear answer: I'll start another n=1 experiment!

Gunnar (2010-10-19 08:59:15)

Eric, imho the best way to get up, is to sleep as long as you need to, not until a clock alarms you to get up. I do it that way as of now, and it works great for me ;-)

Stan (2010-10-20 01:29:49)

I stopped eating breakfast 5 years ago (some fruit from time to time) and feel lively and full of energy the whole morning. I wake up at the time I am used to wake up for work the last 14 years. So it is matter of getting used for me. And I am never really hungry until noon.

How the Other Person Sleeps: Seth Roberts on Christine Peterson's Zeo Research (2011-06-21 08:36:11)

[...] eat breakfast until at least three hours after you wake [...]

19Grumpah42 (2011-06-21 17:23:26)

According to my Zeo data I am a poor sleeper, and I'm sure that is a correct assessment. I always eat a significant vegetarian breakfast within an hour of arising. For the last two months, Zeo says: ZQ=48, TotalZ=5.2 hours, REM= 108 min, Wake= 92 min, Times woken=8, Deep Sleep=28min. I have great difficulty getting off to sleep, it may take 45 to 190 minutes. I sleep very restlessly, motion IR camera recordings indicate 80-200 limb movements per session. [limb movements often occur during periods flagged by Zeo as REM !]. I am not very good at the Zeo subjective estimates, but I reckon my "sleep stealer" score must be pretty low because I do not do anything obviously wrong. I am fascinated by the "no breakfast for 3 hours after waking" recommendation. How is that thought to work? -Grahame

Seth Roberts (2011-06-21 21:10:59)

Breakfast causes what's called "anticipatory activity" - which includes waking up. If you eat breakfast at a certain time you will tend to wake up 3 hours earlier. Anticipatory activity is easy to see in pets, which become active about 3 hours before the time of day they are fed.

19Grumpah42 (2011-06-22 09:08:35)

Thanks for the explanation! I wonder if this underlies the German tradition of the "zweiter Fruehstueck" whereby you have an almost nothing breakfast when you arise, then a full-blown 'breakfast' with lots of animal protein around 10.00 am? -G

## Health Care As Seen by a Psychiatrist (2010-10-20 21:17)

A reader of this blog named Laura Fisher left a comment about "doctors as bureaucrats" - meaning they care more what their employer thinks of them than what their patients do. A scary and plausible idea. I asked for details. She replied:

I live [and practice psychiatry] in a small [Utah] college town that is 80 % Mormon. Almost all the docs in town are employed by an outfit called Intermountain Healthcare which owns most of the hospital beds in this and a few surrounding states. Once you get the doctors on the payroll, they really must take instruction from the employer-and they sure as hell do. The doctors who refuse to take instruction that is ethically or morally conflicted or repugnant are typically subjected to "peer review" as a means of punishment, either by hospital medical staffs or by state licensing boards. If you want details on the abuses of "peer review", you should find plenty of information on [1]the website of the Association of American Physicians and Surgeons.

The typical patient I see has been jollied along for years [by IHC doctors], sometimes decades, without any of his physicians taking the time to review his/her medications effectively. There isn't a billing code

for actually taking the time required to deliver good care, so the patients do not get good care. Some of them get good surgeries. Some get bad surgeries. Often a patient has had a surgery or procedure that he or she did not need. Often the surgery creates new needs for expensive pharmaceuticals. Most often he or she is on a pharmaceutical which is causing psychiatric effects. Either no one has thought of this, including psychiatrists, or no one other than the patient has thought of this and the patient is afraid to discontinue medications for fear of alienating the doctors he needs to stay on good terms with and for fear of unanticipated withdrawal syndromes. The docs who are seeing these salt of the earth working-class patients are young physicians who are not familiar with the old-fashioned notion of the doctor-patient alliance as being somewhat sacred, private and full to the brim of ethical obligations on the part of the physician. These docs check out at quitting time. I have seen them fail to save a sick person at risk of death when one of their colleagues is responsible for putting the patient in that predicament. They refuse to answer questions from patients about whether or not a given treatment change would help that patient, apparently because that doctors employers' treatment guidelines don't include answering such questions or choosing different treatment and because that doctor's professional society leaders are reading from the same page where treatment is conveniently canned such that even nurses can dole it out pretty successfully.

I have seen depressed patients whose depression completely resolved when he or she stopped taking the statin they were on. I have also been interested in the statin users apparently having a higher risk for infections and therefore cancers. Duayne Graveline wrote a very short book (Lipitor, Thief of Memory) on his personal experience with transient global amnesia. This short book is great introduction into the statin subject. The best book I have found on the statins is [2]Fat and Cholesterol are Good For You by Uffe Ravnskov. There is [3]an International Network of Cholesterol Skeptics and their website is marvelous. If you look at this material you are going to learn that it is a poor idea to interfere with cholesterol because we have to have it for brain function.

Don't forget to read *The Trouble With Medical Journals* by Richard Smith and *The Emperor's New Drugs* by Irving Kirsch.

[4]Statins and memory loss. Thanks to JR Minkel.

---

Alex Chernavsky (2010-10-21 04:40:10)

I have not read *The Emperor's New Drugs* (yet), but I'm familiar with Kirsch's other published work. The trouble with Kirsch is that he doesn't go nearly far enough. His hypothesis is that antidepressant drugs are essentially glorified placebos. That view is correct, as far as it goes, but Kirsch doesn't realize (or, at least, doesn't emphasize) the harmful effects of antidepressants, particularly when they are taken over the long term. For a more-comprehensive look at antidepressants (and other psychiatric drugs), see, [1]*Anatomy of an Epidemic: Magic Bullets, Psychiatric Drugs, and the Astonishing Rise of Mental Illness in America*, by Robert Whitaker.

1. <http://www.amazon.com/Anatomy-Epidemic-Bullets-Psychiatric-Astonishing/dp/0307452417>

Seth Roberts (2010-10-21 08:22:08)

Alex, I am happy that Kirsch has taken the time to compare antidepressants with placebos and non-treated controls. I would say the main problem with his work is that the studies he examines do a poor job of matching clinical practice, where non-working antidepressants are stopped and a new one tried. A comparison of placebo and the usual clinical practice hasn't been done. Such a trial is likely to show a larger effect of anti-depressants.

Laura Fisher (2010-10-21 09:24:37)

For those interested in the adverse effects of the SSRI drugs, see Joseph Glenmullen's Prozac Backlash (especially focused on involuntary tics caused by these drugs and the importance of withholding such drugs from patients with Parkinson's) and Let Them Eat Prozac by David Healy (all about suicide and bizarre homicides in people who became suicidal or homicidal only on an SSRI drugs, and of course this comes to mind whenever a normal person shoots up a shopping mall or a classroom or an induction center. Healy is not exactly easy to read by has written extensively on the history of psychiatric drug development. As to "long-term" use, the suicides and homicides happen quite early on. I find Whitaker very helpful in sorting out what is actually involved in assigning drug efficacy or lack of such. Physician critics of non-discriminant anti-psychotic and anti-depressant use, such as Peter Breggin, M.D., emphasize that the anti-psychotic drugs offer no efficacy advantage over simple sedatives but as associated with a myriad of adverse effects not caused by sedatives. Perhaps Dr. Roberts is familiar with the STAR-D trials.

David (2010-10-21 09:31:09)

I find it interesting that Ms. Fisher is specifically calling out Intermountain Healthcare—they are the poster child for health care reform. The New York Times did a big article on them almost a year ago: [http://www.nytimes.com/2009/11/08/magazine/08Healthcare-t.html?\\_r=1&pagewanted=all](http://www.nytimes.com/2009/11/08/magazine/08Healthcare-t.html?_r=1&pagewanted=all) Atul Gawande is also a big fan of theirs. He likes to hold them up as a counter example to wasteful medical practice. He mentions them in passing in this New Yorker article: [http://www.newyorker.com/reporting/2009/06/01/090601fa\\_fact\\_gawande?currentPage=all&](http://www.newyorker.com/reporting/2009/06/01/090601fa_fact_gawande?currentPage=all&) David

Duncan (2010-10-21 10:37:47)

Gary Greenberg did a podcast with Russ Roberts a few weeks ago. He made the same point about Kirsch as Alex, but went further. (From the transcript): "Basic point: efficacy of these pharmaceutical treatments of depression is that they are very unclear on depression, help some people but so do placebos; but they have this powerful effect that has nothing to do with depression that makes people like taking them. People [specifically, Kirsch] claim the studies showing the drugs don't really work means that the drugs don't do anything. The drugs do plenty, but there's no financial interest in figuring out what it actually is. In fact, there may be an anti-interest. If it only makes you feel more powerful then it's like Scotch; can't get your Medicare to cover it, or your employer. Argument for making Prozac over the counter, or making it illegal and let there be a black market for them." He didn't address your point, though, Seth. [http://www.econtalk.org/archives/2010/09/greenberg\\_on\\_de.html](http://www.econtalk.org/archives/2010/09/greenberg_on_de.html) (The section starting at 47:58).

Seth Roberts (2010-10-21 13:25:10)

Thanks for mentioning the STAR-D Trials, which I knew only a little about. They tried to resemble clinical practice and measured the effect of switching treatments if the first treatment (antidepressant) doesn't work. Here is an overview: <http://www.nimh.nih.gov/trials/practical/stard/allmedicationlevels.shtml> Here is a critique: <http://ebmh.bmj.com/content/11/4/97.full> (which fails to make clear what was learned, unfortunately)

Alex Chernavsky (2010-10-21 14:02:08)

Seth, here is a more-recent critique of STAR\*D: "[1]The STAR\*D Scandal: A New Paper Sums It All Up"

Allan Leventhal and David Antonuccio were able to make sense of that mysterious graphic on page 1319, and they reported that only 108 patients – out of the initial cohort of 3,671 – had a "sustained remission." In other words, only 3 % of the patients who entered the trial remitted, and then stayed well and in the trial during the year-long followup. But, as Pigott and his collaborators explain, even this number may be a bit high.

1. <http://www.psychologytoday.com/blog/mad-in-america/201008/the-stard-scandal-new-paper-sums-it-all>

Thomas Seay (2010-10-22 09:48:37)

Does anybody know of a good book that deals with the sociological prejudices regarding diagnosis? Perhaps that unclear, so I will give examples. A woman with whom I worked has a son who was diagnosed with ADHD. The boy did indeed have a hard time studying in the usual sense of the word. He just couldn't sit down and read books. However, here's the thing. The kid was a mechanical genius of sorts. He's now 19 (and apparently having a brilliant career in the Navy as an airplane mechanic), however, even as a child, the neighbors would ask him to their house whenever they needed something put together. You see where I am going with this. Different strokes for different folks. We have one model of how people are supposed to be nowadays and, if you don't fit that model, well, you are labelled as "faulty". How many of these people on psychiatric drugs are just people who have been prodded out of their proper niche or haven't found it yet? How much of this is chemical and how much of it is sociological?

Nansen (2010-10-22 15:59:43)

Kirsch's view of the STAR\*D trial is described by Louis Menand in The New Yorker:

One objection to Kirsch's argument is that response to antidepressants is extremely variable. It can take several different prescriptions to find a medication that works. Measuring a single antidepressant against a placebo is not a test of the effectiveness of antidepressants as a category. And there is a well-known study, called the Sequenced Treatment Alternatives to Relieve Depression, or STAR\*D trial, in which patients were given a series of different antidepressants. Though only thirty-seven per cent recovered on the first drug, another nineteen per cent recovered on the second drug, six per cent on the third, and five per cent after the fourth – a sixty-seven-per-cent effectiveness rate for antidepressant medication, far better than the rate achieved by a placebo. Kirsch suggests that the result in STAR\*D may be one big placebo effect. He cites a 1957 study at the University of Oklahoma in which subjects were given a drug that induced nausea and vomiting, and then another drug, which they were told prevents nausea and vomiting. After the first anti-nausea drug, the subjects were switched to a different anti-nausea drug, then a third, and so on. By the sixth switch, a hundred per cent of the subjects reported that they no longer felt nauseous – even though every one of the anti-nausea drugs was a placebo.

Source: [http://www.newyorker.com/arts/critics/atlarge/2010/03/01/100301crat\\_atlarge\\_menand?currentPage=2](http://www.newyorker.com/arts/critics/atlarge/2010/03/01/100301crat_atlarge_menand?currentPage=2) Note: Menand has been criticized for his sobriety and lack of extreme opinions; this article is no exception. However, it does contain several cogent observations, and at least a hint of a coming "train wreck":

So the antidepressant business looks like a demolition derby – a collision of negative research results, questionable research and regulatory practices, and popular disenchantment with the whole pharmacological regime. And it may soon turn into something bigger, something more like a train wreck. If it does, it's worth remembering that we have seen this movie before.

Daron (2010-10-25 16:14:13)

Several aspects of Laura Fisher's comments are factually incorrect in regards to Intermountain Healthcare. First, Intermountain Healthcare does not own most of the hospital beds in Utah in surrounding states. Intermountain owns 21 of Utah's 59 hospitals and operates only about 40 percent the 6,258 hospital beds in the state. Intermountain owns only one hospital outside of Utah, a small 25-bed hospital in Idaho. Intermountain does not have any facilities in other states besides Utah and Idaho (as noted, a minor presence in Idaho). Lastly, only about 900 physicians in Utah are employed by Intermountain, out of nearly 5,000 licensed doctors in the state. The University of Utah Medical Center is actually the largest employer of doctors in Utah. I think those 900 physicians employed by Intermountain would likely have an opinion different than Ms. Fisher. Given the way she plays loose with the facts I have to wonder about her objectivity and motivations.

## Learning Chinese Characters (2010-10-21 01:38)

I have 80 Chinese characters (flashcards for children) taped to a wall of my Beijing apartment. I add about five per day. [1]I wrote about this earlier, before starting. So far it's working. With almost no effort, no discipline, I know what almost all of them mean. I test myself a little whenever I'm in that room. This is a vast improvement over several previous attempts to learn the characters, such as studying flashcards the usual way or using [2]Anki, a flashcard

program.

I ruefully realize this is an application of something I thought of many years ago: the forces we can turn on and off are much weaker than pre-existing forces we can only take advantage of. Burning coal is a force we can turn on and off. Solar power is a pre-existing force we can take advantage of (and which almost everyone in Beijing uses to dry clothes). The sun shines no matter what we do. Deliberate studying we can turn on and off. We can study or not. In contrast, I am inevitably going to be in that room. Taping characters to the wall takes advantage of that.

1. <http://www.blog.sethroberts.net/2010/09/30/new-idea-about-learning-chinese/>

2. <http://ichi2.net/anki/>

---

Mikael (2010-10-21 05:15:58)

My strategy used to be to carry a pocket dictionary with me at all times in Beijing and to look up as many characters as possible from those that I encountered on street signs, in shops etc. It worked pretty well.

Seth Roberts (2010-10-21 07:20:13)

Mikael, yes, that's a standard thing to do – have some way of identifying the characters I see in public. Such as an electronic dictionary. The problem is that I know so few characters there's little payoff to being able to decipher one character in a 10-character message. And to do all 10 characters would take too long. After I learn a lot of characters, your strategy will make more sense, I think.

Mary (2010-10-21 12:28:12)

This sounds like a good idea. This reminds me of a family story. When my great-grandmother died, my grandmother and her siblings were still very young, ranging in age from 4 to 9, I think. The oldest of the three, my great-aunt, had to stop attending school in order to do all the housework and farmwork her mother had previously done. My great-grandfather felt very bad about that, because he valued education, but he couldn't see how to else to meke out an existence without his daughter's help. To mitigate the problem, he used to cut out newspaper articles that he thought were interesting and post them up on the wall inside the outhouse! My great-aunt grew up to be a voracious reader, one of the best read and well-informed adults I knew.

Laura (2010-11-03 18:49:50)

It's fun to read about your experience with learning Chinese. One psychology professor at my school told me: Learning Chinese is like learning Klingon!! A helpful way for me to learn a new language is to be with people who are supportive. A lot of people at my workplace speak a second language and they always support me in my learning. They encourage me and they correct me when I am wrong and talk to me in the foreign language I am learning. Also, another thing that helps me is to speak to people who know that language and to discuss with them my questions and thoughts on learning it. Berkeley students know different languages and they help me a lot. They're very nice to me, even when I make mistakes. I enjoy using language books and I like to teach myself things, but I also ask other people for help at the same time. Perhaps there is something in the App Store, as well. Apps are fun!!! Some apps are free.

mamacita (2010-12-01 16:26:51)

What I've been thinking about lately – and possibly someone else has thought it, too – is that obesity rates in the United States are much higher in the flatlands than the highlands (Gulf Coast vs. Rockies, let's say). I assume it's because you can't help but get more exercise when you live among rolling hills, but you burn far fewer calories getting around town when you don't.

## Why Small Change = Big Deal (2010-10-22 11:05)

Eating a half-stick of butter (60 g) every day [1]apparently improved how fast I can do simple arithmetic problems (e.g., 7-5, 3+1). I improved about 5 % – from 630 to 600 msec per problem. My scores had been at 630 msec for months. They suddenly dropped.

A reporter said to me that a 5 % improvement isn't much. You couldn't notice it. Why did this matter?

I did not reply "[2]what good is a newborn baby?" I said it mattered for three reasons:

1. You cannot easily produce such an improvement. I was already doing very well. For example, I had already lowered my scores a lot via omega-3. Imagine the world record for the 100 meter dash suddenly dropping 5 % due to eating something you can find in a supermarket.
2. A 5 % improvement is just the beginning. There is room for optimization – better dosage, better timing of taking the butter, and so on.
3. The brain is a mirror of the rest of the body. Learning the best diet for the brain, at least in terms of fat, will help us learn the best diet for the rest of the body, just as learning what house current is best for one electrical appliance is a guide to what other electrical appliances are designed for. They're all designed to work with the same house current.

Alas, this is not just a poor answer, it's what I actually said. I give myself a C+. Reason 1 is almost gibberish. Reason 2 is technocratic. A good answer is more emotional. Reason 3 is okay, if not very clear.

At Berkeley I knew a student who had transferred from a junior college. He is/was black. He had probably gotten into Berkeley because Berkeley administrators wanted to admit more black students. He complained one day that he got C's on his essays even though "all the words were spelled correctly." It was frustrating, he said. I am in a similar situation here. My answer is poor but I cannot easily do better.

G (2010-10-22 11:37:25)

An alternative: It will come to matter to the degree it reveals more about the wider workings and maintenance of the human body. Whether it will indeed help to usher in a new and useful dietary paradigm of 'lipidity' etc remains to be seen.

jimrandomh (2010-10-22 12:44:52)

Your thinking speed is actually increasing by significantly more than 5 %, when you consider that some fraction of those 630ms represent irrelevant things like the time the signal takes to travel from your brain to your hand and for your fingers to move. Possibly a large fraction, though I don't know how much exactly. Though, come to think of it - could the butter affecting your muscle twitch speed, rather than your thinking speed? If so, the benefit might be illusory. You could find out with a simple reaction speed test, where you react to a stimulus without any mental calculation first. Perhaps this should be added to that study Mark Frauenfelder is doing.

David (2010-10-22 14:43:20)

One only needs to look at the state of things in the US to realize as a whole we don't eat enough butter. What is more important than having your brain function well?

David Gilman (2010-10-22 15:55:27)

Mr Roberts - I'm a big fan of your writings and your work. However, I do find it mildly disturbing that your anecdote about your student pointed out that he is black and you thought he got in via affirmative action. I'm sure, regardless of how rigorous the standards are at UCB, that often times there are students there that are not top notch. Making your story about a black student who you assumed (perhaps incorrectly) was an affirmative action pick helps perpetuate stereotypes and places an unfortunate burden on all minority students. Just my point of view. David

Willy (2010-10-22 16:08:43)

It seems butter is not so good: > And minimize or avoid butter use, if we are to believe the data that suggest that it contains the highest exogenous AGE content of any known food. <http://heartscanblog.blogspot.com/2010/10/anti-ageing-diet.html>

Seth Roberts (2010-10-22 17:08:53)

David, thank you for your comment. I think diversity among college students – among Berkeley students, for example – benefits students. They can learn from those who are different. But lack of diversity also benefits students, as my story implies. They can be taught at an appropriate (non-frustrating) level. I think it is important to weigh both costs and benefits. The benefits are mentioned often, the costs practically never. It's worth emphasizing the costs because administrators benefit from diversity ("look how diverse we are!") but pay none of the costs. The costs, which can be great, are paid only by the students, such as the student I mentioned. Eventually he dropped out. Willy, it isn't clear what happened in the study that produced the result you describe (high AGEs in butter). I can't tell if the butter was heated (e.g., broiled, boiled) after purchase. I am trying to find out. The butter I eat is not heated after purchase.

Zach (2010-10-22 18:45:12)

Have you considered that marginal returns on common actions often induce massive gains? For example, a small improvement in the computation speed of basic arithmetic operations in computing would yield a significant reduction in algorithm run times. This could also open up opportunities to new algorithms which were previously too slow. One could infer that if these quicker arithmetic operations generalize to other thought processes, you ought to be compounding your gains which would lead to a larger than 5 % improvement in overall capacity. Also, I agree with jimrandomh's suggestions as additional things to consider when interpreting your 5 % figure.

Seth Roberts (2010-10-22 20:50:17)

Zach, what's an example of "marginal [improvements in] return on common actions [causing] massive gains"? I'm not saying they don't exist, I just can't think of any. Arthur Jensen found a correlation between IQ and reaction time. In his measurements, I'd guess that a 30-msec decrease in reaction time corresponds to 10-15 IQ points. (I haven't looked at his data recently.)

jeff borsato (2010-10-23 07:55:06)

regarding the post noted about the AGE content of butter: <http://heartscanblog.blogspot.com/2010/10/anti-ageing-diet.html> consider the comments section in that blog post to find out details of the study and the lack of consideration for how AGE's pass through the digestive tract, most are altered or fail to make their way far enough to cause damage. the effects of AGE's were determined by feeding mass amounts extracted from foods to see their effects, there is no indication that consumption of butter sets off a chain reaction of damage in the body, a good grass fed cow's milk and pastured butter is healthy. i wonder how much of an effect removing vegetable oils and excess omega 6 fats from your diet affects your brain rates, was it the addition of butter or the exchange of omega 6 fats for better saturated fats that was key. i guess if you added butter on top of your usual meals then we could conclusively state that butter affects brain function in that way.

Chris (2010-10-23 09:37:43)

Seth, I'm not sure reason 1 is gibberish. With your test, I would measure the improvement as a % of the difference between your previous best and the limits of human performance. If an optimally functioning person can do the test in, say, 530 msec, your butter intervention brought you 30 % closer to optimal. Personally, I have been eating 1/2 stick of butter per day for the past several months. If you include the heavy whipping cream in my coffee, which I believe has a similar fatty acid profile, I'm close to the equivalent of 3/4 stick per day. My energy level is much higher during the day, and I'm quicker mentally. No afternoon lulls either. Part of the reason may be an improvement in sleep. It's actually a little bizarre. I'll be wide awake one moment, then out cold the next minute. I'll sleep 9 hours without waking, then open my eyes in the morning wide awake and ready to go. A couple weeks ago, I had my best report ever at the dentist, by a long shot. I could go on all day.

Seth Roberts (2010-10-23 23:04:39)

Chris, I'm glad to hear about those change. Perhaps I should try 3/4 stick of butter. Jeff, you ask whether it was the increase in butter or the decrease in bad fats that caused the improvement. When I started eating a lot of butter I stopped eating a lot of pork fat. There isn't much omega-6 or vegetable fats in pork fat.

P. Winter (2010-10-24 18:05:32)

"there isn't much omega-6 or vegetable fats in pork fat.' It depends whether you your lard is factory or pasture raised, if it's factory ( 99 % ) then it's grains feed, is your butter pastured? Also see the current practice of feeding NZ dairy cows palm :- <http://paleozonenutrition.wordpress.com/2010/10/02/new-zealand-cows-fed-palm-kernel-expeller-producing-a-new-type-of-trans-fat-is-it-safe/>

jeff borsato (2010-10-25 11:54:09)

Seth, thx for the comment, your lard consumption decreased while butter increased. both fats have a great lipid profile, i would be suspect of any attempts to implicate pork fat in cognitive decline, perhaps butter helps while lard is neutral and omega 6 laden veg oils are negative. in addition to this i would want to consider if your total fat intake increased, especially if we are considering amounts as small as %5, i eat a fat heavy diet and can attest to the ways 200 extra calories a day can slip in from a few extra spoons of heavy cream in my coffee, which likely doesnt produce an equivalent drop in consumption the rest of the day. so many factors, so little time!

Jimmy (2010-11-02 09:29:41)

jimrandomh, I think this is not the case. Butter improves my ability to play guitar, but it does it by speeding up the rate at which I can play songs that I'm not comfortable with while leaving my maximum speed the same. 'racetams speed up both. Guitar is actually a pretty good test, because performance is sensitive to brain performance in a few different ways, and since its something I do for reasons other than brain testing, there's less placebo effect to worry about. Don't do it with a test on your mind, just play until you start doing surprisingly well, then think back and see what you could have changed.

### **30 Rock: East versus West Live Shows (2010-10-22 21:56)**

I suppose I'm one of the few people who know there are many differences between the audiobook version of On Beauty and the printed version. Maybe two per page. The audiobook version was prepared before the printed version was finalized. The printed version is better, of course. Long before that comparison, I was fond of comparing books drawn from New Yorker articles with the articles themselves. The New Yorker versions were better-written (= better-edited). It was a painless way to learn how to write.

Last week the TV show 30 Rock did two live shows: one for the East Coast, one for the West. I noticed many differences. The writing was better in the West version (jokes were improved) but the acting was better in the East version (the comic timing was better, for example). New York magazine has [1]listed the biggest differences. For example:

East Coast: In a flashback, Julia Louis-Dreyfus calls to Jonathan, "Yeah, Chai Boy, get in here. You'll never be a millionaire" – Slumdog Millionaire ref. Blammo!"

West Coast: Instead, Louis-Dreyfus says, "Hurry up, Aladdin, before Jasmine is forced to marry Jafar! Similarities – Lemon out." It gets way more applause.

East Coast: In the final scene, Liz is happy with how her birthday went. After all, she even "got to eat the cake off the floor."

West Coast: This time, she "ate the Fonz's face."

I wish there was a whole website about this: Differences between Things that are Supposed to Be The Same. I wrote [2] a Spy article about Similarities Between Things that are Supposed to Be Different. I noticed similar jokes in Jay Leno's and David Letterman's monologues.

Alex Chernavsky (2010-10-23 06:51:28)

I speak Russian. In certain movies (example: [1] *White Nights*), English subtitles appear on the screen when some of the characters are speaking Russian. I've noticed an odd tendency for the subtitles to be different from what's actually being said. The differences are not critical to the plot, but still... I wonder why that happens? It's been a while since I saw *White Nights*, but as I recall, there is one scene where a Soviet KGB agent – speaking Russian – says something like, "I've seen enough. Let's go back to headquarters". The subtitles said something like, "Turn the car around. We're not needed here."

1. <http://www.imdb.com/title/tt0090319/>

Allen K. (2010-10-25 10:36:14)

The book, record, radio show, TV show, computer game, and presumably the play, of the Hitchhiker's Guide to the Galaxy are all substantially different. (The play exists; I haven't seen it. Time was I could have expounded on the deep dissimilarities of the others.)

Errata-sleuthing for fun and knowledge (2011-03-24 21:20:14)

[...] By studying these diffs, you can learn something about the way their creators think. Similarly, Seth Roberts wrote on his blog that he learned something about writing and editing by comparing New Yorker articles to the slightly different versions published elsewhere; the New Yorker versions were better, and the differences between the versions explained why they were better: free writing lessons. [...]

Regarding computer generated music, watch this... <http://www.youtube.com/watch?v=u8mi8SjGKMY> Payoff at 30 seconds. Best part is the straight face. They want \$300 bucks, which I'm hoping pay next year.

## A Chinese Physicist Resigns (2010-10-24 04:23)

A Chinese physicist recently resigned from his job (pure research) at a Beijing research institute. His salary was too low. The base salary is something like \$200/month, with something like \$1200 for each paper you publish. He explained his decision in a letter to his bosses, which he posted on the Internet. From Google Translate:

Dear leaders:

Hello!

August 2006, I single-handedly carried the mat, one hand holding the quilt to the school to report to work. Slept on the floor in the office 3 nights later, Frank and others XX XXX Street, shares a house, 800 yuan per month. Themselves feel better. However, when my wife came to see me when to Shanghai, but a cry. She did not expect this to write beautiful prose, in English is superb, the monthly salary of ten years ago, men who have three thousand

dollars so come down: the room to work without a decent table, there is no place to sit, could only sit bed; office also can take place without her. Yes, until now, my office is a chair, a common HP laser printer or the wife gave me a birthday present. His wife's insistence, in March 2007, after six months sharing with others, I moved to Village X XX X, X round room (Reference: College on XXXX XXX), monthly rent of 1,600 yuan.

I come to school only task is to do research. Not in class, not with the students. I do specialty is theoretical physics. In my opinion, the current basic problems of theoretical physics can be divided into three areas, but also three levels: the top and most shallow, which is the quality of particle physics, neutrino problem, particle state mixing problem ; Secondly, the harder is self-consistent description of the gravitational field and unify quantum field; final, most difficult, is the true cosmology, the concept of the universe all things are included, the true cosmological should a TOE (Theory of Everything). Cosmology is now called, should be called observational cosmology, from a theoretical point of view, can only be called up to fit the observational cosmology. Three aspects of the course, or interrelated, each is at stake.

Second half of 2006, I understand the unified description of the main energy to the gravitational field and quantum field theory and mathematical tools needed which, in an arbitrary manifold reflects the quantum characteristics of the mathematical tools may be harmonic analysis. But I do not master any of harmonic analysis on manifolds.

Time to flash the first half of 2007, the annual meeting of gravity, I consider the possible use of Finsler geometry to try to do quantum gravity, began to self-Finsler geometry, the same year by the end of September, I made use of Finsler geometry re-expressed in general relativity. However, re-expressed with the Finsler geometry of general relativity does not make me to the direction of quantum gravity there is any progress, Finsler geometry is very strict rigid mathematical structure, the introduction of any features of the quantum structure itself will be incompatible with the geometry. Of course, you can put Finsler space-time structure of dark energy as an inevitable result, however, computability theory, the ability to compare theory and observations are not good.

July 2007, I bought a house in Shanghai, the total price of 96 million, 30-year loans to 66 million. After that, our economic pressure to the limit: my wife rented a house in Beijing, XXX XX Garden Park Unit X X X Building, Room (Reference: Beijing XXX Company XX), monthly rent of 2,500 yuan; my house in Shanghai, monthly rent of 1,600 yuan; also close to 6,000 yuan per month mortgage. All of my salary: two accounts, one CCB, more than 2,000 points (up once already, I am now in January 2669.27 yuan (March 2010)); another investment line, 1,800 yuan per month. Do not say that I run in Beijing and Shanghai both transport costs, my salary to feed my already running out. So we got married in 2005 had never to children.

Under the pressure of the huge costs climb in 2007, first half of 2008, I intend to do some simple problems, the observation of neutrino cosmology application, or vice versa, according to some astronomical observations to discuss the micro- Mass of sub-limits. However, read the literature, in-depth period of time to do that: this work is not a person with a PC machine can be done, at least a group of some value to make it possible to do the work. So, do I still have to go back I am a person with a PC, will be able to do mathematical physics. At this time, there have been two things: First, my wife is pregnant, should be joyous, married 4 years, she has XX years of age. Second, in June 2008, my body feels discomfort, severe cough began after the end of August, the end of September to do CT, in the chest, heart on top, between the lungs lymphatic tumor, a copy of the specific report, see CT.

08 expiration of the contract work my wife returned to Shanghai from Beijing. August 30, we arrived in Shanghai, after living for a month in a hotel (of course, is my wife's company out of accommodation), I X, X, Room XXX Village renters (references, XXX), 3,300 yuan monthly rent. Our own new home in the June 30 submitted to, because my physical problems, and his wife was pregnant, there is no way to decoration. Only in November 2008 leased to our

new home workers rough (references XXXX), monthly rent of 1,800 yuan.

My CT report came out, there are three doctors that the disease: sarcoidosis best results, followed by lymphoma or lung cancer. Six City Hospital, Zhongshan Hospital and the City Chest Hospital's doctors agree that: To do mediastinal thoracic endoscopy to confirm the diagnosis. However, my child is born in November 2, and before that in October, I can not do chest examination. October 21, 2008, in my guarantee, Chest Hospital, XXXX decided in accordance with sarcoidosis, I began to hormone (prednisone) therapy. In fact, I know, if it is worse than the result of sarcoidosis, I have only the choice of suicide: I can not let my white mother in the cold begging to others: "Save my son... "; or my wife holding an infant child:" save my husband... "

Thank bliss, I am still alive and well. But, my friends were not so lucky: Mao XXXX, 2005 in High Energy suicide; von XXX, one of my best friends, in January 2007 committed suicide at Tokyo University. Their death, and they chose Theoretical Physics, chose to do research are closely related. Von XXX, 28 years old when he died less, 8 years old his father died, take pains to support his mother and younger siblings. In the Babaoshan, watching Von XXX's mother, that Ganchangcunduan, piercing woman, I was deeply sad but misery. To von XXX, I think I should continue to do theoretical physics.

2009, I went back to quality issues, problems and mixed particle state mixing matrix. An elegant theory that all the observed phenomena should be explained with the natural, but the existing weak unified theory, have failed. After several months of effort, I think, rest mass operator should be introduced to the rest mass of the quantum field operator as is the rest mass of the intrinsic value, so that uniform interpretation of quantum states can be mixed and mixed matrix. Done in July, found the problem difficult to overcome, and because of physical reasons, was closed. After the October, and XXX, XXX discussions and continue to do for some time. I found a little forward, but there are fundamental problems from a distance, need to be more profound thoughts.

In 2009, my body slowly getting better. Done 4 CT, 4 after March, the condition improved slowly. And then to Shanghai Pulmonary Hospital treatment is the same method. September 2, to Nantong XXXX hospital medicine treatment, medication in January, costs over 3,500 yuan (can not be reimbursed, easy to find the invoice.) To October 2009, my medical insurance card, no money already. At this time, CT showed that half of the tumor has disappeared, the results see the copy. Since then I have to give up treatment, on the one hand do not want to spend more money on the one hand I believe I can beat the rest of the half.

2008 year-end assessment, I did not write. Do write to me to do research, but failed; or I was sick; or I just add a small baby at home? Write my difficulties, I do not want to let others sympathetic to buckle my money? For a limb still, physical and mental health of man, which is a shame.

Thus, starting from March 2009, my investment line of Cary, 900 yuan less per month, only 900 yuan.

Finally, I deeply know that I am the circle around me, most people are not doing scientific research. Doing scientific research is false, is an issue, published an article to change some money, to live. (Above paragraph, is not directed against any person or thing, I seriously do research and those who pay tribute to the depths of his heart. Even if someone is writing papers for money, as long as there is no plagiarism, is beyond reproach, and now the rule is like that. I can not do, but my poor ability to adapt.) von XXX, XXXX Mao may also, like me, are the idealists, does not fit in this circle there to do, so they died.

Yes, I suddenly realized: I do not fit inside the circle to do the research now. Otherwise, I will and Feng XX, XXX Mao same fate. In the November 25, 2009 made a report terms of rest mass operator, I decided to leave. November 30, in the center of the meeting, I proposed to my research was no longer suitable.

All see, I know, the year-end 2009, has not filled out the necessary assessment: whether what I was made or

not made anything, I knew.

So, I Merchants Bank of Cary, from the beginning in January 2010, a month is 0. I can start another kind of living law.

Determined from the high school to study physics to me, from the self to the Thermodynamics of Newtonian mechanics, to quantum mechanics; from the self-study calculus to linear algebra; learn from differential geometry, group theory, and then learn topology. Into his own youth, twenty years into his effort, and now had to give up, is a frustration.

Dreamed last night: spring, towards the sea, I lingered under the weeping willow, think about the physics, think of the beauty of the universe!

I know, only to leave, I can live. When people have forgotten that the earth is the soul of the physical sacrifice, I still worried about soul.

Must live with dignity, I can only leave. In the vast universe, the short life of individuals, such as fireworks, energy and all the leaders met, life is fate. Besides, I also get more help and the central leadership to take care, keep in mind when I hope to have the opportunity to return.

---

Gunnar (2010-10-24 07:02:01)

Thou shalt trust the human heart to be the divine representative of the soul. Or as Albert Einstein allegedly said: The intuitive mind is a sacred gift and the rational mind is a faithful servant. We have created a society that honours the servant and has forgotten the gift. I'm rather clueless regarding physics, but I found Nassim Hameiri's ideas interesting. <http://theresonanceproject.org/>

02 (2010-10-24 12:03:28)

Could you post the original source please? I'd like to read the Chinese.

### **Walnuts: Brain Food? (2010-10-25 06:56)**

At a Mr. Lee's restaurant (a Chinese chain), I started chatting with a girl sitting near me. I told her I was a psychology professor. "You know what people are thinking," she said. I lamely said, no, I study what foods make the brain work best.

"I don't know the English word for it," she said. She drew a walnut.Â Good for your brain, her parents had told her. I was astonished. When I got to China, my arithmetic scores mysteriously improved. I had expected them to get worse, if anything. I tried to duplicate my American diet in Beijing but it is hard to duplicate the flaxseed oil. (Chinese flaxseed oil is worthless. I can bring it from America but not easily, and it's impossible to keep it cold the whole way.) I had tested various explanations of the improvement but none held up.

I was starting to believe the reason for the improvement was walnuts. I have two servings/day of yogurt, each time with walnuts. I ate a lot of yogurt with walnuts in Berkeley, too; this was not a dramatic change. But maybe I eat more

walnuts in China, and maybe the walnuts have more omega-3.Â Maybe the walnuts are fresher. In Berkeley I put ground flaxseed in my yogurt (in addition to walnuts), without obvious improvement. Walnuts are lower in omega-3 than flaxseeds.

A Chinese friend of mine had told me the same thing – that her parents had said that walnuts are good for the brain. This is a common Chinese belief, mingled with the curious idea that they are good for the brain because they look like a brain. [1]The Wikipedia entry for walnut, which includes its use in Chinese medicine, says nothing about improving brain function. [2]This long article about the benefits of walnuts doesn't connect them directly with better brain function. It does say they are considered "brain food" because of high omega-3 content and links to [3]a page that says 1/4 cup of walnuts (25 g) has 2.3 g of omega-3. I am now consuming 2 tablespoons/day of flaxseed oil, which contains 14 g of omega-3. I have sometimes consumed 3 or 4 tablespoons/day (with 21 or 28 g omega-3). You can see why 2 g doesn't impress me, especially when added to 14 g. I thought I was getting the optimal amount of omega-3 from flaxseed oil. Adding a small amount to the optimal amount shouldn't have a noticeable effect. [4]This article says walnuts are brain food because of their lecithin content. Lecithin is used to make acetylcholine, a neurotransmitter.

Miraculously I can gather better evidence by myself, in a month, than all the evidence I've found. I simply vary how much walnuts I eat and see what happens to my arithmetic score. The experiment is worth doing because of the common Chinese belief and my puzzlingly good scores. Maybe walnuts help a brain that is already getting plenty of omega-3. Maybe not.

SB (2010-10-25 07:24:21)

Indians believe walnut is good for the brain, because it looks like a brain.

Aaron Blaisdell (2010-10-25 07:42:25)

Many culture, such as the Chinese and Indian (see SB's comment above) view form and function as connected in terms of their effects on human health and well being. In some cases this makes sense. If you have a problem with fertility, take tiger penis (or some reproductive organ) and it should help you. The reproductive organs of other animals likely have many of the same compounds that our endocrine system uses and so you're basically taking a drug. In other cases, like walnuts, the link between form and function is likely just coincidental. Are there other things that look like brains (brain coral?) that won't help with brain function when consumed? Are there other things that don't look like brains (sardines) that will? It would be fascinating to see how systematically these principles are applied in the societies that practice them.

Thomas Seay (2010-10-25 09:44:04)

Here is an interesting anecdote that my Indian colleague related. It turns out that people used to sprinkle turmeric on the threshold of the front door of their house in India. As it turns out, due to the anti-bacterial action of the turmeric, this may have produced some benefits, as the bacteria on the bottom of people's feet would have been destroyed/diminished as they entered the house. However, at some point, this turned into a superstition. People thought it was THE COLOR that was

beneficial and so they started painting the house entrance with the color of turmeric.

Gunnar (2010-10-25 10:43:49)

Maybe they don't put fluoride into the tap water, like they do in some US cities. You can check that with the water supplier. They say they add it because it allegedly reduces suicide and criminal rates. And maybe you leave out artificial sweetener and other excitotoxins, possibly unknowingly. <http://web.me.com/rblaylock/> And maybe they don't have the chemtrails there that you may have been victim to in the past. [http://en.wikipedia.org/wiki/Chemtrail\\_conspiracy\\_theory](http://en.wikipedia.org/wiki/Chemtrail_conspiracy_theory) People with a still usable brain can see that some of the trails slowly descend and widen. Well, I can. You get the idea ;-)

Alex Chernavsky (2010-10-25 12:09:36)

Since the putative brain-enhancing effect of the walnuts is probably subtle, can we reasonably expect the Chinese to have discovered it in the absence of careful, quantitative testing? I've experimented with making a type of walnut butter by using a blender to combine shelled walnuts and coconut oil. It tastes better than coconut oil alone, though it's still not exactly tasty. I've been eating it in addition to flaxseed oil. Now that I think about it, though, I wonder if grinding-up the walnuts makes the omega-3 degrade any faster.

Willy (2010-10-25 12:41:17)

Could it be the L-arginine (a precursor to nitric oxide) content in walnuts? The use of similarities can be seen also in herbal remedies (maybe first they use the plant because a similarity in shape with the organ and then discard if useless) and Bach Flower Remedies (e.g. the flower that opens early is good to be more alert). Sorry for the oversimplification.

q (2010-10-25 17:05:18)

interesting that she would have been able to draw a walnut. most americans couldn't. is realistic drawing something that many or most chinese learn as part of their education?

Seth Roberts (2010-10-25 17:19:13)

q, she couldn't really draw a walnut but since I had an idea I was able to figure it out. Alex, yes, that is what I find most interesting: if it turns out the Chinese belief is right, how did they notice? Gunnar, you are right the water is different. In America I drink filtered tap water. In China, I drink bottled water with minerals added. In both countries I eat a lot of Splenda.

Stephen M (Ethesis) (2010-10-25 19:33:09)

[http://books.google.com/books?id=yuaSjvZr3ikC&pg=PA71&lpg=PA71&dq=walnut+oil+Lecithin&source=bl&ots=qf2uWLAJWJZ&sig=nRpesXgE4PyCwo8xJ2vDOdAJtO8&hl=en&ei=Yj3GTKGaNcO78gaS260p&sa=X&oi=book\\_result&ct=result&resnum=9&sqi=2&ved=0CEkQ6AEwCA#v=onepage&q=walnut%20oil%20Lecithin&f=false](http://books.google.com/books?id=yuaSjvZr3ikC&pg=PA71&lpg=PA71&dq=walnut+oil+Lecithin&source=bl&ots=qf2uWLAJWJZ&sig=nRpesXgE4PyCwo8xJ2vDOdAJtO8&hl=en&ei=Yj3GTKGaNcO78gaS260p&sa=X&oi=book_result&ct=result&resnum=9&sqi=2&ved=0CEkQ6AEwCA#v=onepage&q=walnut%20oil%20Lecithin&f=false) I was hoping that walnut oil had Lecithin, but it appears it doesn't.

Stephen M (Ethesis) (2010-10-25 19:37:43)

Also: <http://www.bbaby.us/that-kind-of-walnut-oil-product-effect-good-child-clever-walnut-oil-soft-capsule.html>

Alex Chernavsky (2010-10-25 19:42:50)

Seth, I'm surprised that you eat a lot of Splenda. I used to eat it, but I gave it up after reading your blog post titled, "Splenda Reduces Gut Bacteria in Rats" (from Nov. 22, 2009). Do you now have reason to believe that Splenda is less harmful than other sweeteners?

Seth Roberts (2010-10-25 21:45:57)

Alex, no I don't have reason to believe it is less harmful. You make a good point, I should try giving it up and see what happens. Stephen, thanks for the references. The book makes a good point, that walnuts have far more omega-6 than omega-3. They have more omega-3 than other nuts but, if omega-6 is bad, you could easily argue that walnuts should have a bad effect on brain function.

Kirk (2010-10-26 04:44:23)

I replaced Splenda with Now Stevia Balance, which contains 900 mg inulin per packet. Inulin is a prebiotic; as you are probably aware, prebiotics stimulate the growth of helpful gut bacteria. I have migrated to the belief that prebiotics are as important as probiotics. Now that I ingest more prebiotics daily, I have fewer issues with dairy foods. As for walnuts, I wonder if a Traditional Chinese Medicine practitioner would recommend walnuts for brain function? There may be a difference between folklore and what TCM recommends. Another thing about walnuts . . . the Omega 6 to 3 ratio of English walnuts is 4:1 (or 5:1, depending on source), which is a decent ratio for a food which is typically added to a meal. If one's meal consists of rice, soy sauce, vegetables, fish, and a few walnuts, the overall ratio probably calculates close to a desirable Omega 6:3 ratio.

Thomas Seay (2010-10-26 09:31:57)

I think you are going to be hard pressed to find any chemical component to support the walnut-brain theory. It is based on a sort of doctrine of correspondence and it will defy any rational investigation. Let's take another example of this. According to the Chinese, beans will help the kidneys (because most beans look something like a kidney). I dare you to find a chemical component of beans that are particularly good for the kidneys. What we are dealing with here is human projection. The same logic that gave the planet Mars its name and said that it ruled anger, aggression and war on Earth (most certainly in part because of its red color). Now, if you want to consider whether or not such a thing is true, you may want to look at statistics (as Gauqelin did with Mars), but I don't think if you went up and took a soil sample (or measured any other physical parameters) of Mars that you would find anything that would suggest that it could influence aggression on Earth. Same goes for walnuts, beans, or tiger testicles, etc, vis a vis human health.

G (2010-10-26 10:09:13)

Seth, Alex - people have instincts for what is good for them. Babies self-select a balanced diet when given a variety of foods to choose from freely. This implies that there is a nutrition 'sense'. This sense may be strong enough to communicate with the conscious mind. If only a few 'sensitives' develop the idea that walnuts enhance the brain, they may disseminate the idea into their culture even if most people are not nutritionally sensitive.

I Trust My Body (2010-10-26 16:32:41)

Some facts about walnuts and cleverness: 1. FACT: There are lots of articles in scientific and medical journals about studies supposedly showing the health benefits of walnuts. 2. FACT: Many of those studies were funded by the California Walnut Commission. 3. CONCLUSION: Walnut lobbyists are very clever people.

Seth Roberts (2010-10-26 23:23:56)

They are especially clever in their ability to influence Chinese folklore.

Z (2010-10-26 23:44:00)

[1]Paleo Diet Basics: Why I Eat Walnuts.Contains a number of links to possible benefits of eating walnuts: Cancer Prevention Cardiovascular Health Cognitive Health

Chris Sturdy (2010-10-25 21:13:56)

Hi Seth, I was at the CSBBCS conference in Montreal and attended Doreen's acceptance speech for the Hebb award that is the basis for the text on the web pages. It was very cool to see just how much she contributed. Cheers, Chris

John (2010-10-26 15:24:07)

The youtube video on cooking is labeled "private."

Vic (2010-10-26 23:39:19)

Has something happened to Nathan Meyers? He has yet to retort to Seth's post on the hockey stick... very atypical and somewhat worrying.

## Periodontitis and Omega-3 (2010-10-27 06:15)

A few years ago, [1]after I started taking about 3 tablespoons/day of flaxseed oil, my dentist told me my gums were much healthier. They were less red, more pink. Friends and blog readers who took flaxseed oil in similar amounts [2]noticed the same thing. Tyler Cowen's gums improved so much [3]he no longer needed gum surgery.

[4]An epidemiological study in the November Journal of the American Dietetic Association reports correlations between omega-3 intake and periodontitis (an extreme form of inflamed gums). The more omega-3, the less periodontitis. I'm sure that sufficient omega-3 intake cures periodontitis so this study has methodological interest for me. One interesting point is that the study reached a correct conclusion – contrary to [5]the nihilism of John Ioannidis. Another is that the correlations were weak. The risk of periodontitis was only 20 % lower in the group (quintile?) with the highest omega-3 intake. Although there were 9000 subjects, there was no significant correlation with linolenic acid, the form of omega-3 found in flaxseed oil.

Thanks to Sean Curley.

5. <http://www.blog.sethroberts.net/2010/10/13/the-contribution-of-john-ioannidis/>

---

Alex Chernavsky (2010-10-27 06:26:42)

Seth, do you have a theory as to why the correlations were weak, and why no effect from linoleic acid?

jeff borsato (2010-10-27 13:04:10)

this issue has been brought up before, its difficult to refer to fish oil or any sort of "omega 3" oil in general terms. general label "fish oil" cod liver oil fermented cod liver oil cod liver with K2 wild salmon oil flax flax/fish blends all could react differently in tests and could deliver different results depending more on the existing diet (ie: noticeable effects when omega 6 ratio is brought back to balance vs. none if diet remains) we would really need to see a differnt approach to these omega 3 studies.

Robert (2010-10-27 13:12:17)

Seth, I would be interested to know what you eat over the course of the day to put this in context. Still one meal plus 2 fruits and oil? What does your meal consist of usually?

Seth Roberts (2010-10-28 05:55:40)

Alex, the correlations were weak and no effect was found for linolenic acid because (a) there are many sources of error (such as dietary recall, measurement of omega-3 in foods, etc.) and (b) the range was small. People in the highest group didn't consume that much, compared to what I consumed. Robert, I eat one ordinary low-carb meal (no rice, no potatoes, no bread, no noodles) plus 2 servings of yogurt with walnuts plus 1/2 stick of butter plus 2 tablespoons flaxseed oil. Jeff, my finding that flaxseed oil quickly improved how well my brain worked can be a bioassay for omega-3: a way to compare different sources by seeing how effective they are inside the body. I intend to compare flaxseed oil with ground flaxseed, for example.

Erik (2010-10-28 19:09:31)

I had a similar experience. I had badly bleeding gums - even just brushing (not flossing) would cause bleeding. It would be red when I spit out, not just pink. I started taking cod liver oil (Carlson's) - 1 teaspoon per day. Originally I started taking it for general health, not thinking there would be any relation to the health of my gums. What I subsequently noticed was that the bleeding gums almost completely disappeared. That plus flossing regularly (every other day) seems to have eliminated the problem completely for me.

Brendan (2010-11-02 12:08:36)

Seth, why do you take flaxseed instead of cod liver oil. Just a pointer to a previous post or short answer if you have time. Thanks for the great blog. BC

## **The C.I.A. and Self-Experimentation (2010-10-28 06:04)**

I learned of [1]The Human Factor: Inside the CIA's Dysfunctional Intelligence Culture by [2]Ishmael Jones (a pseudonym) from [3]an interview on the New Yorker website. This comment by the author interested me:

Once the C.I.A. became a place to get rich, effective operations ended. Today, more than ninety per cent of C.I.A. employees live and work entirely within the United States, in violation of the C.I.A.'s founding charter [to supply only foreign intelligence].

I could say much the same about science: Once it became a place to get rich (or at least get large grants), effective science became a lot less common. A great deal of science is done by drug companies. They pay a lot. Some of their scientists are surely brilliant but their talents are wasted by the need to find solutions that will be highly profitable. My self-experimentation found solutions that cost nothing and make far more intellectual sense. I was able to do something that didn't produce a lot of publications because it wasn't my job.

Many skills make good full-time jobs. Science doesn't. There is too much pressure for short-term results. Without short-term results, you may lose your job or your grant. (Or, in China, most of your income.) Nor is science a good source of status. If you want your science to provide your status, you will be under great pressure to conform. Yet for practically all scientists, it's their full-time job and their main source of status. This may not make it impossible for them to do good work but I suspect it comes close to doing so. My self-experimentation was effective not only because it was fast and cheap (per experiment) but also because I could be slow (per publication) and do something low-status.

---

Gunnar (2010-10-28 16:18:04)

Officially there are 16 "Intelligence" Agencies established for the USA [http://en.wikipedia.org/wiki/United\\_States\\_Intelligence\\_Community](http://en.wikipedia.org/wiki/United_States_Intelligence_Community) Does that seem excessive to anyone besides me? I find it odd there's need for one at all, but actually 16? I read somewhere that the CIA is permitted to keep its profit, which goes in line with the "get rich" part. And I concur with your science statements, Seth. Simplicity rules, especially with so much disinformation around; self verifiably insight is needed. And self experimentation actually gives results that are relevant to you, the one experimenting ;-) I'm at a point where I'm sure science is heavily used to dumb society down.

### **Madame Bovary and Self-Experimentation (2010-10-28 14:16)**

Someone asked Lydia Davis: Why another translation of Madame Bovary? [1]She replied:

In the case of a book that appeared more than 150 years ago, like Madame Bovary, and that is an important landmark in the history of the novel, there is room for plenty of different English versions. For example, 1) the first editions of the original text may have been faulty, and over the years one or more corrected editions have been published, so that the earliest English translations no longer match the most accurate original; 2) the earliest translators (as was the case with the Muirs rendering Kafka) may have felt they needed to inflict subtle or not so subtle alterations on the style and even the content of the original so as to make it more acceptable to the Anglophone audience; with the passing of time, we come to deem this something of a betrayal and ask for a more faithful version. 3) Earlier versions may simply not be as good in other respects as they could be—let another translator have a try.

This reminds me of [2]my three-part answer to the question a journalist asked me: why it mattered that butter improved my arithmetic speed by 5 %.

Just as I disliked my answer, I disliked Davis's answer. It's hypothetical ("may have been faulty", "may have felt", "may not be as good as they could be"). It's flat and obvious (earlier versions may have room for improvement). It's irrelevant (bad translation of Kafka does not justify new translation of Flaubert).

I had trouble figuring out a better answer to what I was asked, but I could instantly say what Davis should have written: The story of how she decided to do a new translation. ("I began to think about doing a new translation when . . . ") That would have been a lot more emotion-laden and not hypothetical, obvious, or irrelevant.

As soon as I thought what Davis should have said, I could see what I should have said. I should have answered the journalist's question like this: Why does 5 % matter? Let me tell you why I was so excited by this. . . .

Via [3]Marginal Revolution.

---

Steve G. (2010-10-29 07:06:05)

Seth, You have discovered the power of narrative. Ms. Davis answered like a (typical) lawyer, listing reasons and couching her answer with qualifications. You're suggesting that she (and you) should have answered like a smart trial lawyer, with narrative to bring the issues to life.

Seth Roberts (2010-10-30 00:10:02)

Steve, yeah, that's good advice.

Alex Chernavsky (2010-10-30 13:51:41)

Seth wrote, "Why does 5 % matter? Let me tell you why I was so excited by this..." How would a continuation of this explanation differ from what you [Seth] actually told the journalist?

Seth Roberts (2010-10-31 08:01:44)

It would be more emotional and less list-like. More focus on one reason.

## **Placebo Non-Disclosure (2010-10-30 16:14)**

[1]A new study in the Annals of Internal Medicine asked how often placebo-controlled medical studies made clear what the placebo was. [2]The abstract says:

Most studies did not disclose the composition of the study placebo.

Which may give the wrong impression. About 90 % of the studies they looked at did not say what the placebo was.

The paper illustrates the problem with an example:

In one of these studies [where the placebo was not described], the authors commented that “The lack of any overall effect in patients with myocardial infarction might be related to the unexpectedly low mortality rate in the placebo group.” The possibility that the placebo composition may have influenced this “unexpectedly low mortality” was apparently not considered.

Thanks to Gunnar Schr der.

### **My Experience of Sickness (2010-10-30 18:28)**

I am at a hotel. Yesterday I decided to take a walk. A short distance from the hotel I started to walk uphill. It was surprisingly hard. I realized I was sick.

I think this is what happens when your immune system is working properly: Sickness stops being obvious. I think my immune system is working well [1] because I sleep well and eat plenty of fermented foods.

I have never heard sickness described like this by anyone else. I have heard it described in terms of obvious suffering thousands of times. Which suggests a lot of room for improvement.

1. <http://escholarship.org/uc/item/2xc2h866>

---

tim perkis (2010-10-30 21:58:55)

I remember thinking the exact opposite of this. When I was younger, getting sick was obvious: an intense experience of coughing, running nose, etc., which passes in a day or two. Now, in my 50's, it seems there is some doubt, a general feeling of malaise that may last a week or two. Aren't the symptoms we identify as sickness mostly the reactions of the immune system? Might not their clear-cut appearance the sign of an immune system that is working well, and the absence of clear-cut symptoms a sign of a weaker immune system?

JBB (2010-10-31 04:27:41)

No, it's not unheard of. When I was spending a goodly amount of time cycling, I was measuring my basal heart rate every morning. It was a good way to tell if my system had recovered from the extra strain I had put it through after a day of training – if the basal heart rate was still elevated, I knew to take it easy to let my system settle down a little more. An unexpectedly high basal heart rate, such as the morning after a non-training day, had to mean something else. It usually turned out to mean I was coming down with a cold or some similar illness. Other than that I was symptom-free for at least another day before I started getting snuffly.

Nancy Lebovitz (2010-10-31 07:35:12)

I think malaise and obvious symptoms are different things– it's possible to have either or both. The only explanation of malaise I've heard is that it's the liver sequestering iron to keep it away from bacteria, but I don't know if it's sound.

jeff borsato (2010-10-31 08:52:49)

I view the immune system like a muscle that can be trained and strengthened, the longer one goes without getting sick doesn't mean your immune system is resting, it simply means it's busy doing its job and doing it well. I wonder if the longer you go without getting sick the stronger your immune system becomes, hence why the image of those 70 year old men who have never been sick in their entire lives are the product of a sort of self-propagating cycle of progressively stronger immune systems.

Aaron Blaisdell (2010-10-31 09:26:44)

Seth, that's an astute observation, but it does have precedent. Tom Minor, a psychologist at UCLA is involved in research on the role of sickness-induced depression. He says the cytokines play a role in regulating this behavior and that its function is to make sure you don't exert yourself so that you can recover. He also said the neural circuit responsible for sickness-induced depression develops rather late in childhood which is why when little kids are obviously sick (fever, runny nose, respiratory symptoms, etc.) they still try to run around and play and act like they aren't sick. They actually don't have this neural mechanism yet and so they don't feel "run down" like adults do when they have a cold/flu etc.

Seth Roberts (2010-10-31 14:32:53)

JBB, I made similar observations with doing the treadmill. If I could come close to my previous best I must be sick. In my case it didn't progress to obvious sickness, it was the only clear sign. Tim, you write "Might not [the] clear-cut appearance [of the symptoms we identify as sickness] be the sign of an immune system that is working well, and the absence of clear-cut symptoms a sign of a weaker immune system?" I read this idea in the New York Times a month or so ago. In my case, the shift from clear-cut symptoms to nearly-invisible symptoms coincided with much improved sleep. I think everyone would agree that better sleep should make your immune system work better (if anything) rather than worse. I believe the easily-visible signs of illness show that your immune system was slow to react or reacted too weakly at first. Because it was slow to react/weak at first, it had to ultimately do more. With a fast/strong initial reaction, it doesn't have to do as much.

G (2010-10-31 19:28:59)

I haven't had any obvious sickness in the last two years and your observations are the same as my own: brief, barely-there sickness; rare colds with hardly any nasal wetness but a sense of slight depletion, etc.

Nancy Lebovitz (2010-10-31 19:37:24)

I think some of it is a matter of which diseases you happen to get. A couple or three times, I've had bad malaise going on for weeks with barely perceptible cold symptoms– and iirc, other people in my social circle had the same combination. Other times, I get noticeable symptoms without much malaise, and there's no obvious correlation with my general state of health.

thehova (2010-11-01 10:32:23)

This NYTimes article sort of concurs with you: <http://www.nytimes.com/2010/10/05/opinion/05ackerman.html>

Seth Roberts (2010-11-02 00:29:21)

thehova, you write: "This NYtimes article sort of concurs with you". I wonder who you mean by "you". I disagree with the main point of that article, which is that having a stronger immune system causes more cold symptoms. As I said, I believe if your immune system is working better it will jump on the invading viruses before they replicate a lot and suppress them with little fuss and few visible symptoms. It's when the immune system is weak (= slow to respond) that you end up with massive symptoms. Because by then you need a massive response to get rid of the virus.

thehova (2010-11-03 21:32:12)

ok, yeah. But you both agree that symptoms from a cold stem from the immune system and not the cold itself.....right? I'm guess most people don't understand that.

Seth Roberts (2010-11-04 02:31:26)

Well, as a result of evolution, virus fragments in our blood make us tired. So if we get sick and then feel tired (because our immune system has destroyed some of the viruses), is that from "the cold itself" or "the immune system"? But yeah, our immune system is big and well-connected with the rest of the body. The viruses are tiny and unconnected. It follows that visible changes are much more likely to be due to the huge thing (the immune system) than the very tiny thing (the viruses).

## 5.11 November

### Dangers of Supplements (2010-11-02 00:58)

Via [1]Robin Hanson I found [2]this study of the effects of antioxidant supplements. It studied five (e.g., Vitamins A and C). Overall they were slightly harmful, except selenium.

This isn't intuitive – why should they differ? – but fits well with previous work:

1. Evidence for benefits of selenium is overwhelming. You can look at a county-by-county map of US cancer rates and see a sharp drop along a certain line in the northeast. The line separates different geology. There is much more selenium in the soil on the low-cancer side of the line. Yet another case where correlation is powerful evidence for causation. An experiment with selenium supplementation found a reduction in cancer.
2. Several years ago, [3]two experiments found Vitamin A supplements increased lung cancer. ([4]Another study.) [5]Later experiments cast doubt on Vitamins C and E. As one of Robin's readers put it: "two of which were previously well known to be bad for you."

Given this previous research, which is far more persuasive than the current study, the interesting contribution of the new study is methodological: will a meta-analysis of epidemiological studies reach the right conclusions? Will the signal outweigh the many sources of bias and error? In fact, it did. [6]Again suggesting that severe critics of epidemiology, [7]such as John Ioannidis, go too far.

1. <http://www.overcomingbias.com/2010/10/supplements-kill.html>

2. <http://jama.ama-assn.org/cgi/content/abstract/297/8/842>

---

jimrandomh (2010-11-02 04:59:17)

Serious questions have been raised about the methodology of this meta-study. See [http://lesswrong.com/lw/20i/even\\_if\\_you\\_have\\_a\\_nail\\_not\\_all\\_hammers\\_are\\_the/](http://lesswrong.com/lw/20i/even_if_you_have_a_nail_not_all_hammers_are_the/) for the details. While Robin Hanson brushed them off, he did so because of motivated cognition, and he has not actually looked at the data.

G (2010-11-02 09:37:05)

If someone ate nothing but cheese, do you think that a multivitamin supplement would do them more harm or good?

### **Shallows Net (2010-11-02 03:59)**

When I told my Chinese friend I read The New Yorker, she said she knew it was a very good magazine. A famous writer she knew of had written for it for 50 years. He was dead now. She didn't remember his name. One of his books was Shallows Net.

She meant Charlotte's Web by E. B. White.

A well-read and influential writer, she said.

Well-read, yes, influential, no, I said.

The Elements of Style might have been influential had its advice been good. Alas, it wasn't. "Omit needless words." "Be clear." How to form the possessive. Please. I once took a short-story-writing class. When typing your story, the teacher said, put two spaces after a period.

Criticism of The Elements of Style [1]here, [2]here, and [3]here.

1. <http://chronicle.com/article/50-Years-of-Stupid-Grammar/25497>

---

G (2010-11-02 09:39:47)

These days I keep reading people who think that Hemmingway is the benchmark - not just economical, but self-consciously minimalist. Still like Cormac McCarthy though.

pond (2010-11-03 05:03:59)

Not influential? A book that has been required reading for just about every single college student for 50 years, and a lot of high-school students too. A book that is top of the sales charts on 'Writers' Toolkit' must-have shelves. A book that darn near

every writer in English in North America has read. I guess what you're saying is, 'nobody ever followed its advice.' I wonder though if even that supposition, assuming it could possibly be true, might not be evidence of 'influence' since saying that every working writer has read the book and done the opposite, has actively rejected its 'bad' counsel, would be influential in a negative sense. Even the controversy over the book indicates how influential it has been. You don't go out of your way to take time and effort to write a 'this book is garbage' tract unless you have read the book in question, felt oppressed by it somehow, feel that it somehow represents the Official Voice of the Establishment that crushes your creative free spirits, and felt the utter need to speak out against it. Saying 'it can't be influential because its advice is bad' is like saying 'Hitler was insignificant in German history because his policies were wacky.' Stick to eating butter and telling us all how, contrary to scientific studies, you KNOW that it makes people smarter...

Seth Roberts (2010-11-03 08:14:42)

pond, a book that tells people to put two spaces after a period is not influential, no matter how many people read it. That was my point. A book that tells people how to form the possessive of a noun (and similar anodyne stuff) is not and can never be influential, no matter how many people read it. That such a book is "required reading for almost every college student" tells you something about the professors who assign it. I really did have a writing teacher who told us to put two spaces after a period, which shows how divorced from reality some writing teachers are. you say my claim about butter is "contrary to scientific studies" – such as?

Alex Chernavsky (2010-11-03 10:15:58)

Seth – do you have suggestions for style guides that are better than Strunk & White? @pond – for what it's worth, the book was never assigned to me in either high school or college.

Seth Roberts (2010-11-03 15:50:57)

From Tim Harford I learned of Style: Towards Clarity and Grace by Joseph Williams: <http://www.amazon.co.uk/Style-Clarity-Chicago-Writing-Publishing/dp/0226899152> Which does have good advice.

Laura (2010-11-03 18:16:01)

I just had an interesting conversation with someone at my school, too. Me: Are you teaching "Hormones and Behavior" next semester? I was going to take that class, but I can't because it conflicts with my work schedule. Psychology professor: I'm sorry, what did you say?...Oh, I thought you said "abnormal behavior." I was going to say that I teach that everyday!

thehova (2010-11-03 21:40:45)

I guess it might not technically be "influential", but the book is definitely a success. I think the key to the book's success lies in how short it is. Other style and grammar books are often hundreds of pages long.

thehova (2010-11-03 21:43:03)

I really like economist Greg Mankiw's recommendations: <http://gregmankiw.blogspot.com/2006/10/how-to-write-well.html>

Nathan Myers (2010-11-04 01:41:33)

A better assessment of EoS would be "unfortunately influential". But E. B. White wrote way more than EoS, and while his other writings (aside from CW) are not individually as well known, in aggregate they were read by millions of people over many decades. Most people could only wish to be so influential.

Seth Roberts (2010-11-04 02:40:34)

Mankiw makes some good points. "Don't use very" is something I learned pretty late.

## In-Flight Fermented Foods? (2010-11-02 23:42)

I've tried taking fermented foods on airplane flights. Here's what I've learned:

1. The rules speak of "medicinal" exceptions to the no-liquid policy. In practice, this means: (a) You need a doctor's note and (b) you must need the medicine during the flight .
2. The rules say no gels. It turns out that yogurt is a gel.
3. What about Japanese pickles in sake dregs? When they were in a glass jar, with a lot of dregs (50 % dregs, 50 % pickle), the answer was no: Dregs are like gels. When they were in a plastic package (98 % pickle, 2 % dregs), they were okay.

---

CD (2010-11-03 09:06:49)

A couple years ago, I found out peanut butter was also a gel.

Mike G (2010-11-03 18:09:34)

I have always been able to get hummus on the plan. Possibly because the agents do not know what hummus is.

Aaron Blaisdell (2010-11-04 17:14:59)

If the food "gel" would survive being frozen, try freezing the food into a solid to take with you on the plane. You just have to find some way to quickly bring it to a comfortable temperature for consumption.

G (2010-11-04 20:31:22)

Now printer cartridges will be banned. Because of course terrorists take about a year to conceive of packaging explosives in a new object... When they start disguising bombs *as* planes we're screwed.

## Art Majors & UC Berkeley (2010-11-03 08:36)

In [1]a fascinating bit of intellectual history, Andrew Gelman says he started off in math but came to doubt he was good enough at pure math. This reminds me of something one of my Tsinghua students told me a few days ago. An art major at his high school (the top high school in Beijing) was accepted at UC Berkeley with a big scholarship on the condition that the art student compete for Berkeley in a college math competition.

i think professor gelman has cool comments on this blog. he is visiting ucb now

## Why Small Change = Big Deal (revised) (2010-11-04 02:33)

Last week a journalist asked me why the 5 % improvement in arithmetic speed produced by butter was important. In [1]an earlier post I said I'd given a poor answer.[2]A few days later I figured out what I should have said. The article was delayed, it turned out, so there was time to use my new strategy. I answered the question like this:

I was excited by this discovery because it was so big and unexpected. Someone once found a correlation between IQ and reaction time. The higher your IQ, the faster your reaction time. I don't know what the exact function was but a decrease of 30 milliseconds might correspond to 10 more IQ points. I felt a little bit smarter. It was so unexpected because hardly anyone was going around saying butter is good for you – and thousands of people were saying it is bad for you. The only ones saying butter is good for you were the followers of Weston Price, and they had almost no evidence for what they were saying. Compared to their evidence, my evidence was crystal clear. Among mainstream nutritionists, butter is universally scorned. Yet my data suggested exactly the opposite – that it had a large amount of an important nutrient I wasn't getting enough of. If mainstream nutrition advice could be so wrong, it would have big implications for what we eat. Maybe other things we are constantly told about what to eat are also wrong.

I discovered this big effect of butter by substituting butter for pork fat. So the reason butter was so helpful wasn't anything as simple as animal fat is food for us. I ate plenty of animal fat before I started eating lots of butter. The reason was something more specific.

1. <http://www.blog.sethroberts.net/2010/10/22/why-small-improvement-big-deal/>

2. <http://www.blog.sethroberts.net/2010/10/28/madame-bovary-and-self-experimentation/>

---

peter (2010-11-04 04:47:15)

did you ever get an answer to the AGE issue? (i.e., hi Advanced Glycation End-products generated by consuming butter)

weightmaven (2010-11-04 06:20:25)

Curious that you didn't think to mention that the WAPF folks believe that this important nutrient in butter is vitamin K2 (see <http://www.westonaprice.org/abcs-of-nutrition/175-x-factor-is-vitamin-k2.html> ). In terms of your testing, have you considered trying high vitamin butter oil instead of the copious amounts of butter?

Seth Roberts (2010-11-04 06:35:00)

yes, I think the answer is that ordinary butter – not heated after purchase – is high in AGEs.

jeff borsato (2010-11-04 06:47:35)

Butter is high in Vitamin K (K2) which is being studied in greater detail as of late and could be involved in a host of processes that contribute to greater health overall. Stephan's blog has some of the soundest Vitamin K related posts around, if it can reverse arterial calcification and improve the pathways for absorption of other critical nutrients, perhaps it can results in a slightly sharper and better functioning brain: <http://wholehealthsource.blogspot.com/2009/03/latest-study-on-vitamin-k-and-c> oronary.html

Seth Roberts (2010-11-04 07:01:03)

The effect of butter is so large and fast I find it hard to believe it is due to a micronutrient, such as Vitamin K2. But time will tell. Have I considered high vitamin butter oil? thanks for the suggestion. to answer your question: not explicitly. So far I haven't

tried even one variation. I'm trying to figure out why my reaction time became much lower soon after I returned to China.

G (2010-11-04 08:39:12)

Mistake? - "the reason butter was so helpful wasn't anything as simple as animal fat is food for us" You meant "good for us"?

Charles (2010-11-04 12:56:51)

Just FYI, I have a very high IQ (not bragging-high IQ and \$2.00 gets you a latte), but very mediocre reaction time. In that respect, I guess I'm an outlier.

G (2010-11-04 20:28:38)

Heh, maybe Advanced Glycation End-products *are* what's speeding the brain in this case. Maybe it's a reaction to damage.

tom (2010-11-05 08:01:46)

One reason it matters so much: passing a threshold for all-or-nothing activities. If I could jump 5 % higher, I might be able to dunk a basketball (ok, this is not true of me but it is of somebody). Dunking is an activity that is yes/no. If my kid had 5 % quicker reaction times, he might be a striker instead of a defender. I bet there are things like this in non-sports life all the time. If I could think 5 % more quickly, that might make me comfortable enough with my speaking that I would be willing to challenge someone smart in a group with me who says something I disagree with.

Dustin Andrews (2010-11-05 16:56:07)

After reading both answers, I am not convinced the quality of the answers is that striking. I sort of prefer the three part answer. I am partial to lists.

## **GRE = God Read English (2010-11-04 06:56)**

Chinese students say GRE stands for God Read English. The reading passages in GRE prep books are so difficult only God could read them.

More Maybe God will comment on your blog, said a Chinese friend. "I haven't passed the GRE."

---

Mark Mo (2010-11-06 02:14:50)

Some people study a second language for the fun of it, but for many Chinese students, they have to study English in order to pass exams. As there are so many Chinese students, the competition is very fierce. In order to select the "best" student, the exams are usually very difficult but not practically. Sometimes Chinese students complain that they will never have chance to use some GRE words when they study in US because the words are seldom used by US local people. There is no doubt that there are some problems in the Chinese education system, but sometimes we have no choice because of the population, limited educational resources and so on. But I think things will get better as China moves forward.

Thomas Seay (2010-11-05 09:11:50)

With the mania for sun-block and sun avoidance, I guess we can expect an increase of schizophrenia, if, indeed, diminished levels of Vitamin D is a culprit.

Alex Chernavsky (2010-11-22 21:26:54)

I made the fermented salsa. It's pretty good, though not quite as good as the fresh salsa that you might get at a decent Mexican restaurant.

## **Plagiarism by British Drug Tsar (2010-11-06 15:18)**

[1]Leslie Iversen, a retired Oxford professor of pharmacology, is Chair of the British government's Advisory Council on the Misuse of Drugs. He is also a Fellow of the Royal Society, a foreign associate of the National Academy of Sciences, and chairman of the board and director of Acadia Pharmaceuticals, San Diego.

In 2008, Oxford University Press published a book by Iversen called [2]Speed, Ecstasy, Ritalin: The Science of Amphetamines. Four passages in it are very close to [3]a website about MDMA (Ecstasy). The duplicated material was on the website [4]in 2002.

Iversen (p. 151): MDMA was profiled by the San Francisco Chronicle as 'The Yuppie Psychedelic' (10 June 1984). In Newsweek, J Adler ('High on "Ecstasy"', 15 April 1985) likened his MDMA experience to 'a year of therapy in two hours'. Harpers Bazaar described MDMA as 'the hottest thing in the continuing search for happiness through chemistry'. Unsurprisingly, MDMA use soon spread beyond the couch and clinic to the wider world. MDMA's now universal brand-name, "ecstasy", was coined in 1981 by a member of a Los Angeles distribution network. The unnamed distributor apparently chose the name "ecstasy" because 'it would sell better than calling it "Empathy". "Empathy" would be more appropriate, but how many people know what it means?' (Eisner 1989). Condemned by purists as a cynical marketing ploy, the brand-name 'ecstasy' isn't wholly misleading (ecstasy: "an overpowering emotion or exaltation;

a state of sudden intense feeling. Rapturous delight. The frenzy of poetic inspiration. Mental transport or rapture from the contemplation of divine things' (Oxford English Dictionary)). Many first-time MDMA users do indeed become ecstatic. Some people report feeling truly well for the first time in their lives.

Website: MDMA was profiled by the San Francisco Chronicle as "The Yuppie Psychedelic" (10 June 1984). In Newsweek, J Adler ["High on 'Ecstasy", April 15 1985] likened his MDMA experience to "a year of therapy in two hours". Harpers Bazaar described MDMA as "the hottest thing in the continuing search for happiness through chemistry". Unsurprisingly, MDMA use soon spread beyond the couch and clinic to the wider world. MDMA's now universal brand-name, "Ecstasy", was coined in 1981 by a member of a Los Angeles distribution network. The unnamed distributor, quoted in Bruce Eisner's Ecstasy: The MDMA Story (1989), apparently chose the name "Ecstasy" because "it would sell better than calling it 'Empathy'. 'Empathy' would be more appropriate, but how many people know what it means?" Condemned by purists as a cynical marketing ploy, the brand-name "Ecstasy" isn't wholly misleading [ecstasy: "an overpowering emotion or exaltation; a state of sudden intense feeling. Rapturous delight. The frenzy of poetic inspiration. Mental transport or rapture from the contemplation of divine things"]. Many first-time MDMA users do indeed become ecstatic. Some people report feeling truly well for the first time in their lives.

Iversen (p. 157-158): Pure MDMA salt is a white crystalline solid. It looks white and tastes bitter. The optimal adult dose of racemic MDMA is about 120-130 mg (around 2 mg/kg body weight). Pills sold in clubs often contain less. There are gender differences in response; proportionately to body weight, women are more sensitive than men to the effects of MDMA and so their optimal dosage may be lower. The preferentially metabolised (+)-enantiomer ('mirror image') of MDMA is more active, more stimulating, and more neurotoxic than the (-)-enantiomer. MDMA is usually taken orally as a tablet, capsule, or powder.

Website: Pure MDMA salt is a white crystalline solid. It looks white and tastes bitter. The compound is chemically stable. MDMA does not readily decompose in heat, air or light. The optimal adult dose of racemic MDMA is probably around 120-130 mg [around 2 mg/kg of body weight i.e. about 125mg] but optimal dose ranges from perhaps 75mg to as much as 250mg. Pills sold in clubs often contain less. There are gender differences in response; proportionately to body-weight, women are normally more sensitive than men to the sub-acute and longer-term effects of MDMA, so their optimal dosage may be lower. The preferentially metabolised (+)-enantiomer ("mirror image") of MDMA is more active, more stimulating, more dopaminergic, more subjectively rewarding, and more neurotoxic than the (-)-enantiomer. MDMA is usually taken orally as a tablet, a capsule, or a powder.

Iversen (p. 158): ... can promote an extraordinary clarity of introspective self-insight, together with a deep love of self and a no less emotionally intense empathetic love of others. MDMA also acts as a euphoriant. The euphoria is usually gentle and subtle; but is sometimes profound.

Website: ... can promote an extraordinary clarity of introspective self-insight, together with a deep love of self and a no less emotionally intense empathetic love of others. MDMA also acts as a euphoriant. The euphoria is usually gentle and subtle; but sometimes profound.

Iversen (p. 159): MDMA is sensuous in its effects without being distinctively pro-sexual; it is more of a hug-drug than a love-drug. However, MDMA's capacity to dissolve a lifetime's social inhibitions, prudery, and sexual hang-ups means that lovemaking while under its spell is not uncommon. In men, orgasm is more intense than normal but is delayed: MDMA retains a residual sympathomimetic activity, triggering a detumescence of the male organ. To ease MDMA-induced performance difficulties, flagging Romeos increasingly combine Ecstasy with Viagra.

Website: MDMA is sensuous and sensual in its effects without being distinctively pro-sexual. Although once dubbed "lover's speed", MDMA is proverbially more of a hugdrug than a lovedrug: "I kissed someone I was in love with and

almost felt as if I was going to pass out from the intensity”, recalls one American clubber. However, MDMA’s capacity to dissolve a lifetime’s social inhibitions, prudery and sexual hang-ups means that lovemaking while under its spell is not uncommon. Superfluous clothes tend to get shed. In men, orgasm is more intense than normal but delayed: MDMA retains a residual sympathomimetic activity, triggering a detumescence of the male organ. To ease MDMA-induced performance difficulties, flagging Romeos increasingly combine Ecstasy with Viagra.

Bold type indicates differences between the book and the website. [5]University of Oxford policy on plagiarism. [6]Plagiarism by Harvard professors.

1. <http://www.daronet.com/campaign/campaign.asp>

dcgent (2010-11-07 12:44:20)

Anyone check whether the website stole from Iversen? He has a 2001 book *Drugs: a short introduction*, also published by OUP, which might contain this same material in theory.

CTB (2010-11-07 14:15:47)

Just curious, anyone know who authored the 2002 MDMA website? McGraw Hill has a text called Taking Sides which offers a pro/con analysis of several drug topics, and in it, Iversen argues that Ecstasy isn't as bad as some people make it out to be. That 2002 MDMA website had to have been written by someone very very knowledgeable in pharma, as well as sympathetic to the cause...could it have been Iversen? He's been around since the 60's, at least.... <http://www.mcgrawhill.ca/highereducation-/product/9780078127564/taking+sides:+clashing+views+in+drugs+and+society/> "Issue 4. Are the Dangers of Ecstasy (MDMA) Overstated? YES: Leslie Iversen, from Speed, ecstasy, Ritalin: The Science of Amphetamines (Oxford University Press, 2006) NO: National Institute on Drug Abuse, from "MDMA (ecstasy) Abuse," National Institute on Drug Abuse Research Report (March 2006) Author Leslie Iversen contends that ecstasy can result in adverse effects but that the drug has been unfairly demonized. Moreover, Iversen states that its negative consequences on the brain have not been proven conclusively. Iversen acknowledges that ecstasy may produce profound effects, although those effects are subject to an individual's perception. Club drugs such as ecstasy allow partygoers to dance and remain active for long periods of time according to the National Institute on Drug Abuse (NIDA). However, ecstasy may produce a number of adverse effects such as high blood pressure, panic attacks, loss of consciousness, seizures, and death. Moreover, ecstasy can produce negative effects on the brain, resulting in confusion, depression, memory impairment, and attention difficulties."

Gunnar (2010-11-07 16:35:12)

Quite an accumulation of titles and positions over the range of education, policy making and actual drug commercialisation. I sure hope he did it in the interest of humanity.

Seth Roberts (2010-11-08 03:24:54)

David Pearce is author of the website. His name is at the bottom of the current version.

amsale (2011-05-06 23:51:30)

i also think its Good catch. How did you notice this? Someone at Google could probably write a script to ferret-out many instances of this kind of stuff.

2all (2011-08-03 06:44:34)

i think its Good catch. How did you notice this??

## **The Size of Restaurant Tips (2010-11-07 19:10)**

The size of tips left in restaurants has been the focus of considerable study. [1]An early study found that brief contact increases tips. [2]This study reviews the literature. [3]Here is a study in a French bar.

## **A Theory of Human Evolution and Application to Education (2010-11-08 04:29)**

A week ago I went to a cognitive science conference in Chongqing, where I gave a talk called "A Theory of Human Evolution and Application to Education" (a theme of the conference was education). A sponsor of the conference, a

magazine called Scientific Chinese, will publish short versions of the talks. Here is the short version of my talk, only a little different than [1] what I've said before but far more compact.

Humans specialize. We make a living thousands of ways. A dentist makes a living one way, a carpenter another, and so on. No other species does this. In every other species, all members of the species make a living in one or two ways. All sparrows search for and eat the same food, for example. I propose that human nature changed in several ways to make possible our extreme within-species specialization.

It started with hobbies. Hands, evolved to swing through trees, could also make tools. Tools saved time. They made it easier to hunt and prepare food. Hobbies were a good use of the spare time. It was better to do one thing repeatedly during your spare time (and become skilled at it) rather than do many different things. Because of this advantage, an across-day tendency to repeat (to do today what you did yesterday) evolved. This tendency not only caused hobbies, it also caused diversity of hobbies. It was hard to change hobbies, so choice of hobby became less sensitive to feedback (the payoff from doing the hobby). Today, this tendency to repeat across days causes procrastination. It is hard to start a job-like activity. Procrastination is so common and hard to avoid because the underlying tendency was so important.

Diverse hobbies led to trade. I give you what I make, you give me what you make.

Language began because it increased trade. It helped the two sides of a trade find each other. It started with single words. Single words made it easier to convey what you wanted: You said the word for it. They also made it easier to indicate what you made: You said the word for it. Someone else could say the word for what you made and point at you. The first conversation: Person 1: X? Person 2: X (pointing). English family names reflect this usage; many come from occupations. For example, smith means metal worker.

A healthy economy has three features: 1. Many goods and services. Diverse hobbies provided this. 2. Easy trade. Language provided this. 3. Innovation. A healthy economy creates new goods and services. This was encouraged by the evolution of desires for (a) current tools made better than necessary and (b) useless "tools".

Demand for current tools made better than necessary came from the evolution of several tendencies. These tendencies produced behavior that is still common. First, gift-giving. Gifts are better-made versions of ordinary things. The "improvements" – the differences between the gift version and the ordinary version, such as a nicer package – are useless in the sense that neither giver nor recipient would buy the gift version for themselves. Second, holidays, festivals, and ceremonies. Holidays, festivals, and ceremonies create demand for fancy versions of ordinary things, such as special clothes, tools, and foods. For example, Japanese tea ceremonies use special tools and require special clothes. Third, connoisseurs, collectors, and souvenirs. Connoisseurs notice small improvements that most people don't notice and pay for them. Collectors buy things that non-collectors would not buy or at least pay more for them. A collector of frog-related things might buy an eraser in the shape of a frog. Making an eraser look like a frog does not make it erase better. Souvenirs are usually ordinary objects (ashtray, pen, key chain) made more desirable. Souvenirs make anyone a collector.

The existence of gift-giving, holidays, and so on increased demand for finely-made things – better versions of ordinary things. Finely-made things were harder to make than ordinary things, so this demand pushed artisans to become more skilled. The more skilled an artisan, the more easily he could innovate. A skilled baker is more likely to invent a useful new bread than an unskilled baker.

The useless "tools" that promoted innovation are art, decoration, and music. Desire for art and decoration supported the development of new techniques and materials – new paints, for example. Music encouraged technical advances because better control of materials allowed you to make better-sounding musical instruments. The

tendency behind fashion (year-to-year changes in preferences, and a desire for novelty) pushed artists and artisans to continue to innovate, to continue to develop new techniques and materials. They could benefit from innovating, but only for a limited time.

Art, decoration, and music allowed the development of revolutionary technologies – technologies that weren't refined versions of old technologies. Can you invent metal by refining stone tools? No, you can't. Endless trial-and-error while making stone tools will teach you how to make stone tools that are suitable for gifts, but it will never lead to metals. To produce something as different from its predecessors as a metal tool, you need to reward small steps on the way to getting there. This is what art does. Metal looks good. Long before our ancestors could make useful tools with metal (tools that could outperform existing tools), they could make art with metal.

The application to education is that this tendency to specialize in terms of job must be strong within us. The members of a group lived in the same place and had similar genes, yet there must have been powerful forces pushing them toward different jobs. Today these forces push students in different directions. The closer they get to being old enough to work, the more powerful these forces probably become, the more diversity they create. One reason I developed this theory is the diversity I saw in my own students. Within one undergraduate class, all psychology majors, I realized there were big differences between students. After graduation, they would choose different jobs.

Most teachers ignore these differences. They treat all students alike. It is like trying to put shoes of different shapes and sizes into identical boxes. Most shoes won't fit, no matter what box you use. Teachers who treat all students alike are fighting human nature. I learned to take advantage of the diversity of my students by giving them great choice. When I gave them enough choice, they found activities they really wanted to do. They did them enthusiastically and learned a lot. With human nature on my side, teaching became much easier.

1. <http://www.blog.sethroberts.net/category/human-evolution/my-theory-of-human-evolution-directory/>

---

tom (2010-11-08 09:57:51)

Interesting to use shoes fitting into boxes instead of shoes fitting on feet. But aren't shoes too great an example of your thesis to throw them in at the end as something that comes in different shapes and sizes for putting into containers?

Seth Roberts (2010-11-08 11:25:46)

Tom, at the Shoe Museum in Toronto I took pictures of the shoes as examples of my thesis – so I agree about them being good examples. Because the word limit of this article was low, I had room for very few examples.

Pip (2010-11-08 16:03:26)

Interesting theory. One question - you reference a desire for novelty as an incentive to innovate, but did not talk about where the desire for novelty came from. Is it possible that the desire for novelty also had a hand in the development of hobbies and is was not just the practical considerations that drove the beginning of hobbies? My theory is that the desire for novelty (and risk taking) in at least part of a population helped survival because it drove migration into new environments. The need to adapt quickly to new environments plus the desire for novelty led to tool-making and hobbies. Those of us who inherited the strongest desire for novelty and have the hardest time staying in one place are now diagnosed as ADHD. :-)

Seth Roberts (2010-11-08 18:11:58)

Pip, as someone who incessantly plays with his tableware, I have to say you may have something there. Animals have plenty of desire for novelty – they need to explore to find new food sources. That by itself doesn't lead to tool making or else the entire

animal kingdom would make tools. Whether people added some sort of desire to manipulate stuff to that I don't know.

Alexandra Carmichael (2010-11-09 09:28:48)

"When I gave them enough choice, they found activities they really wanted to do." This sounds exactly like how we homeschool. I remember learning in a Taoist philosophy class in university that people are stripped down into finely honed copies of productive human tools through education/training - and the decision for which tool to become is often made earlier in life than perhaps necessary. My partner and I try to expose our kids to as diverse a range of possible human activities as we can, and it's very interesting to see their different preferences, given the same external input. Great post!

Evolutionary Diet (2010-11-16 00:41:35)

QUOTE: "Language began because it increased trade." Since many animal species have very sophisticated languages, then what goods are being traded when birds sing, lions roar, fireflies flash, and insects click? Isn't it more likely that language evolved because it had a direct role in survival and reproduction?

Seth Roberts (2010-11-16 14:06:15)

The languages used when birds sing, lions roar, and so on are far less complex than human language.

Alex (2010-11-28 08:40:59)

Being as the division of human labour (excluding male/female differences) only really becomes prominent with sedentism in the neolithic around 10,000 years ago, and 10,000 years would generally be considered far too short a time for significant evolutionary change, it would be unlikely that division of labour would have had any effect on "human nature". Do we really need this whole "theory" just to tell us that people have different personalities?

## **How to Choose A Research Topic (2010-11-10 08:17)**

A few weeks ago, a female biology professor from Berkeley gave a talk at Tsinghua as part of a women-in-science series. During the question period, a student asked how to choose a research topic. You have a choice of labs; which should you choose? You have a choice of research questions; which should you choose? An excellent question: Every young scientist wonders about this.

The speaker's answer: Believe in yourself. Huh? This came from her personal history. When she was a grad student (at Berkeley) she proposed a certain line of research to her advisor. Her advisor said it was a bad idea. She switched to Harvard and pursued her idea there. It paid off. A sign of her success is that her lab gets \$1 million/year in grants.

I wasn't there. The friend who told me the professor's unhelpful answer asked how I would answer the same question. During graduate school, I thought a lot about it - about how to do research that anyone will care about in fifty years. I can answer it only for experimental psychology.

First, invent a new method or study a large puzzling experimental effect. With either one you can generate a steady stream of publications. Inventing a new method means inventing a better way - usually, a faster way - of measuring something important. You can then apply your new method all over the place. With a large experimental effect you can vary all sorts of things and narrow in on an explanation. As a grad student, I took the first route: I used a new way of studying animal time discrimination. I didn't invent it but its inventor hadn't seen its value. An example of the second route is the career of John Garcia. In graduate school, he discovered that making rats sick after eating a new flavor caused them to dislike the flavor. The sickness could come hours after the flavor. Garcia made a whole career out of doing variations on this.

Second, take advantage of whatever is unusual about you. If you are unusually interested in X, study X. I differed in two ways from most experimental psychologists: I was better at math, and I cared more about writing. Taking advantage of this, I spent a lot of time on data analysis and writing. Both paid off. I suppose my paper were better written than necessary but the time spent on writing paid off because I got good ideas while writing.

Third, collect a rich data set. New experimental effects are enormously important – if you manage to find one you can spend the rest of your career studying it – but are also very difficult to find. You can't do experiments whose main purpose is to look for them. The chances of success are too low. To find them, you set up your research so that a conventional experiment has the possibility of finding them. For that you need a rich data set – a data set with many factors and many levels of each factor, ideally. The new way of studying timing that I used provided a rich data set. Quite soon this led to discovering a new effect when some of the data changed in a surprising way.

---

dearieme (2010-11-10 13:04:17)

"Read a bit of Medawar" would have been more helpful than "Believe in yourself".

Bruce G Charlton (2010-11-11 04:36:38)

I'm afraid that my first response would be to try to dissuade them from a \*career\* in science (which hardly exists now, and will be even rarer by the time that they are advanced in their research program) - and instead to do real science as an amateur hobby, instead of becoming a manager or technician merely pretending to do science as a paid job.

Alex Chernavsky (2010-11-11 05:25:34)

I agree with Bruce. But if someone *insists* on going into science anyway, my advice would be to find a mentor who has a reputation of being good to his or her graduate students (i.e., paying attention to them and ensuring that they finish their PhDs in a reasonable amount of time). Finding an interesting research topic is all very well and good, but if you can't get out of grad school, the point becomes moot.

## Why I Am A Biological Psychologist (2010-11-11 00:37)

Sheena Iyengar, a professor at Columbia Business School, is best-known for a study she did in graduate school. When shoppers in a Menlo Park food store were offered much more choice of jams (24 rather than 6), they were less likely to buy one. In [1]The Art of Choosing (2010), Iyengar wrote (p. 190):

Since publication of the jam study, I and other researchers have conducted more experiments on the effect of assortment size. These studies, many of which were designed to replicate real-world choosing contexts, have found fairly consistently that when people are given a moderate number of options (4 to 6) rather than a large number (20 to 30), they are more likely to make a choice, are more confident in their decisions, and are happier in what they choose.

In contrast, [2]Benjamin Scheibehenne, a research scientist at the University of Basel, and two co-authors, who surveyed the literature, [3]found the effect was hard to replicate:

The choice overload hypothesis states that an increase in the number of options to choose from may lead to adverse consequences such as a decrease in the motivation to choose or the satisfaction with the finally chosen option. A number of studies found strong instances of choice overload in the lab and in the field, but others found no such effects or found that more choices may instead facilitate choice and increase satisfaction. In a meta-analysis of 63 conditions from 50 published and unpublished experiments (N = 5,036), we found a mean effect size of virtually zero but considerable variance between studies

This reminds me of the learned-helplessness effect. When Martin Seligman, a psychology professor at Penn and recent president of the American Psychological Association, was a graduate student, he and his advisor reported that when you give dogs inescapable shock, they stop trying to escape or avoid the shock: learned helplessness. The effect turned out to be extremely hard to replicate, but this did not stop Seligman from having a brilliant career.

1. <http://www.amazon.com/Art-Choosing-Sheena-Iyengar/dp/0446504106>
2. <http://www.scheibehenne.de/>
3. <http://www.scheibehenne.de/ScheibehenneGreifenederTodd2010.pdf>

---

Bruce G Charlton (2010-11-11 04:26:14)

This reminds me of a friend who wasted several years of a PhD meticulously trying and failing to replicate an effect upon which a famous Professor had built their reputation - he concluded that the whole thing was probably due to a small but significant sloppiness or dishonesty in the conduct of the experiments - a matter of recording observations about a second later than was supposed to be the case according to the stated methodology - and this delay meant that a different (old-hat, mundane, obvious, uninteresting) psychological mechanism would explain everything without recourse to the new reputation-building theory. Examples of this are still happening - I have seen with my own eyes a rapid build-up of an international research program and hasty public policy implementation based upon a really simple error in matching control with stimulus.

Nancy Lebovitz (2010-11-11 04:42:48)

I don't know about choice overload in general, but I've found it harder to make choices at the Strand (a humongous used bookstore in New York) than in smaller bookstores. Has learned helplessness been replicated at all?

Alex Chernavsky (2010-11-11 05:20:14)

I feel sorry for all those dogs that Martin Seligman tortured. And speaking of torture, Seligman has been criticized for his role in the US government's interrogation programs: " [1]'War on terror' psychologist gets giant no-bid contract " Having said that, I do admire Seligman for his role in promoting [2]positive psychology. Regarding the choice studies: I find Iyengar's results to be plausible. When I eat in a restaurant that has a huge menu, I find myself overwhelmed with the number of choices and start to worry that I won't order the optimal dish. With regard to prominent authorities being wrong, I'm about two-thirds of the way through an excellent and entertaining book called, [3]*Wrong: Why Experts Keep Failing Us* " And How to Know When Not to Trust Them, by David H. Freedman. The book reiterates what I more or less knew already, but I enjoy learning about the many examples that Freedman uses to back up his points.

3. <http://www.amazon.com/Wrong-us-Scientists-relationship-consultants/dp/0316023787>

vic (2010-11-11 11:18:27)

and a response to that meta-analysis: [http://www.chernev.com/research/articles /ChoiceOverload \\_JCR \\_2010.pdf](http://www.chernev.com/research/articles /ChoiceOverload _JCR _2010.pdf)

Timothy Beneke (2010-11-11 12:21:48)

Wow! I'd assumed that both the Seligman and Iyengar were robust findings. I think one reason they have become "important" apparently despite replicability is that they have the feel of "insight" that we can relate to. I find it easy to feel overwhelmed by too many options and to thus lose any subjective sense that I am making a choice. And it's easy to relate to the idea that after being in situations where one is objectively helpless, one can carry over the assumption of helplessness to contexts where one is no longer helpless, and get depressed. It's all very accessible. We can have an "aha!" experience when we learn about the findings. I wonder if when something feels intuitive and has resonance in one's experience, it is likely to have staying power in psychology, even when there is little scientific basis for it. Someone should study this more systematically. You've got me wondering what other famous findings in psychology are weakly founded....

Seth Roberts (2010-11-11 14:37:13)

I'll be surprised if anyone figures out why Iyengar's finding is hard to repeat. It's hard enough to repeat the stuff that is repeatable. After it turned out that learned helplessness was difficult to repeat, the subject was dropped. Learned helplessness was not important for central ideas about learning; nobody would build a theory upon it.

Justin (2010-11-11 14:44:52)

Sorry if I am missing something obvious, but why is it that are you a biological psychologist? I am not seeing it from the post. Maybe the problem is that I don't know what it means to be a biological psychologist.

vic (2010-11-11 20:12:15)

I've heard stereotype threat also fails to replicate, same with locus of control studies (including versions of the famous one conducted by Judith Rodin, who then became president of Penn).

Seth Roberts (2010-11-11 21:10:43)

Justin, by the title (Why I am a Biological Psychologist) I meant that this sort of failure to replicate is a nightmare but is not easily avoidable outside biological psychology. (At least, I don't know how to avoid it. The cost of doing widely-varying replications before you publish is too high.) Apparently the choice overload effect depends on details of the experimental procedure that researchers in that field have no idea about. Whereas if I study the effect of omega-3 and other nutrients on brain function (an example of biological psychology) the results are more likely to be easy to replicate. For example, when I found that breakfast caused me to wake up too early I was repeating an effect that had been found in several other species, where it was called anticipatory activity. Another example is that my ideas about weight control are supported by rat research. If they are true for some humans and some rats, they are likely to be true for all humans.

Lisa (2010-11-13 16:18:31)

What studies tried to replicate learned helplessness and failed? And, from my understanding, Seligman's work into learned helplessness fueled his subsequent research into optimism as a cure/prevention to learned helplessness (effectively a proxy for depression...)

Seth Roberts (2010-11-13 20:38:50)

Lisa, the experiments that failed to replicate learned helplessness weren't published. Steve Maier published a paper showing how hard it was to repeat in rats.

MT (2010-11-20 23:53:11)

I thought the model built off LH related to depression was significant (as opposed to using the findings in learning) - and wouldn't Harry Harlow's prior work with helplessness in monkeys (the notorious "pit of despair") be supportive of the model?

## **The Climate Change Bubble Has Burst? (2010-11-11 13:55)**

How many climate change scientists does it take to change a light bulb? None. They all agree it will change.

Judging by [1]these nine comments, a large fraction of Mother Jones readers think they've been had.

1. [http://motherjones.com/blue-marble/2010/11/kate-sheppard-podcast-need-to-know#disqus\\_thread](http://motherjones.com/blue-marble/2010/11/kate-sheppard-podcast-need-to-know#disqus_thread)

---

## **Dangerous Acne Medicine (2010-11-11 21:12)**

Treatment of acne with isotretinoin is associated with suicide attempts, according to [1]a new study. A puzzle is that suicide attempts started to rise before the treatment started. They sharply declined to baseline after treatment stopped.

Acne is an good target for self-experimentation because it is easy to measure and [2]is surely related to diet. My discovery of the value of self-experimentation happened with acne: I discovered that of the two drugs my dermatologist had prescribed, one (benzoyl peroxide) worked, the other (tetracycline) didn't. I had believed the opposite, that tetracycline worked and benzoyl peroxide didn't work.

1. <http://www.bmj.com/content/341/bmj.c5812.full.pdf+html>

2. <http://www.blog.sethroberts.net/2009/06/24/acne-self-experimentation-why-its-promising/>

---

Michael (2010-11-12 07:33:27)

Why are drugs still prescribed for acne? Loren Cordain has already nailed the cure with the paleo diet. This is like the guy in Australia discovering that bacteria cause ulcers and the drug companies continuing to invest billions in making medicine to treat the symptoms of ulcers.

Gunnar (2010-11-12 15:19:31)

Seth, thanks for stating what you had believed/anticipated to work prior to your experiment. Michael, how about you think about that some longer. I could tell you what I found out, but it's better to find out for oneself. Cheers!

CTB (2010-11-12 16:14:16)

There's garden variety acne (zits and whiteheads)...and then there's cystic acne where the lesions look like someone put peas under your skin. A friend of mine had cystic acne. She was miserable both because the lesions hurt and because of the social effects of having your face look deformed. She took Accutane when it first came out in the 80's. The doctors were very cautious back then and would only prescribe it for serious acne. I can understand why someone with cystic acne might consider suicide...and maybe that might then convince the doctors that they needed the stronger treatment. I think if I looked the way she did at 25, and felt so depressed that I wanted to kill myself, I just might do it if my dermatologist told me to go home and experiment with my diet.

Mark (2010-12-22 10:00:51)

I have an aunt whose face would become acne ridden whenever she ate sunflower seeds. May it has to do with the fact that sunflower oil is almost devoid of omega-3s.

robert (2011-03-18 21:56:35)

what a load of irresponsible crap. food is responsible for a vanishing minority of acne, and people looking for an acne fix by adjusting their diet are in for a long wait-as in, until the process burns out. accutane (13 cis retinoic acid, or 13cra) does not cause depression, rather, severe acne is associated with a near doubling of suicide risk. this is clear from the medical literature. it is great to self-experiment, but only a fool would ignore what has been already learned by previous investigators. furthermore, generalizing from your experience and presuming it applies to others is foolish.

Seth Roberts (2011-03-18 22:40:28)

"Food is responsible for a vanishing minority of acne" – what is this conclusion based on? I know of no evidence that supports that idea. "Generalizing from your experience and presuming it applies to others is foolish." Years after I discovered that tetracycline did not help my acne, articles started appearing in dermatology journals saying the same thing. In this case, at least, generalizing from my experience would have been a good idea.

Mr F (2011-04-16 03:03:10)

> Why are drugs still prescribed for acne? Loren Cordain has already nailed the cure with the paleo diet. AHAHAHAHHHAHA... oh, you were being serious :/

Marina Witsky (2011-08-12 08:30:57)

It never fails to amaze me how the cosmetics & pharmaceutical industries continue to rip acne sufferers off providing them with useless products in order to fuel cyclical consumption. Think how many billions are made from selling rubbish like Benzoyl Peroxide or using Tetracycline antibiotics. They can never cure the acne just provide temporary relief if it can even be called that. Moderate/ Severe acne needs to be treated seriously with Accutane which has been used to treat 13 million people worldwide for over 25 years.

Seth Roberts (2011-08-12 10:07:12)

Marina, I have removed the spammy links in your comment. You cannot be serious. First, benzoyl peroxide actually works. I tested it. Second, Accutane is dangerous. It has bad side effects. It is expensive. It doesn't "cure" the acne nor provide more than "temporary relief". It's just another drug. Using Accutane is a distraction from figuring out what has caused the acne. Probably something about the diet. Not lack of Accutane. I suppose the problem with Accutane is partly revealed by comments such as yours. If Accutane were so great, it wouldn't need to be marketed in misleading ways.

## **Two Gmail Features I Want (2010-11-12 01:46)**

Now that Gmail is out of beta, here are two suggestions for improvement:

1. Oldest first. I want to be able to sort my email so that the oldest is first on the list. That will make it harder to ignore or forget about. I can use the reward of seeing my latest email as inducement to deal with the oldest email. (I often bundle unpleasant and pleasant tasks: taking vitamins and drinking kombucha, doing pushups and listening to music, standing on one foot and watching Survivor.)

2. Delayed send (also called second thoughts). I want to be able to send email after a delay – say, one day. This has two advantages: it slows down the correspondence, and it gives me a chance to reconsider. An earlier email program

I used had something like this and I was often glad I could revise what I'd written before it was sent.

More The Gmail Undo Send feature (available in Labs) gives you about 20 seconds to change your mind. Better than nothing but not nearly long enough.

---

Mike Carey (2010-11-12 02:23:06)

Seth Try Boomerang for Gmail. <http://www.baydin.com/boomerang4gmail/> It's a Gmail plugin that lets you schedule when you send emails. Somewhat bizarrely, it also lets you schedule when to receive emails, or at least when to have them reappear having been already received.

Mike Carey (2010-11-12 02:50:24)

Thinking about it, a (less than optimal) solution to your first problem is to also pick up your Gmail in an actual email client, e.g. Thunderbird, using Gmail's POP download facility. That way, when you need to view your emails in chronological order, you could do it in Thunderbird. Not great but better than nothing.

Alex Chernavsky (2010-11-12 05:39:00)

Mike, Gmail also supports IMAP, which has advantages over POP. For a discussion, see: <http://mail.google.com/support/bin/answer.py?hl=en&answer=75725>

Andy (2010-11-12 13:44:30)

I used to use a 10-minute delay on all outgoing emails. Not as long as the day you suggest, but long enough to realise if I've made a major boo-boo and retrieve it. The closest GMail has is the "Undo Send" lab, which gives you up to 30s to reconsider. I still often un-send and edit emails within that time. Unfortunately as soon as you navigate anywhere else you lose the undo option, but it's better than nothing.

Nansen (2010-11-12 14:34:00)

In case you missed it, here's a funny piece about email: [http://www.newyorker.com/humor/2010/10/25/101025sh\\_shouts\\_marks](http://www.newyorker.com/humor/2010/10/25/101025sh_shouts_marks)

Matthew Cornell (2010-11-12 14:38:42)

I agree, Seth re: delay. When I'm in a bad mood I sometimes later regret some messages. Right now the 10 second delay is pretty useless. It's usually after some pondering that I realize I should have edited. A programmable time is good, as is a day. You'd need a list of "pending" messages. All in all, Gmail's pretty good, esp. for free.

Ed M. (2010-11-12 20:50:33)

Seth, Gmail already has these features, almost. Look into the Labs add-on called "Undo Send", it it will allow you to delay an outbound message up to 30 seconds. Unfortunately no longer than that. Also, you can sort by oldest but the option is only available after a certain number of messages. Go to All Mail then look at the top right. You should see: "1 - 100 of 49833 Older &° Oldest &»". -Ed

dee (2010-11-14 22:47:50)

You can change the settings for the undo send in gmail. You can have up to 30 seconds to undo the send. Just look in the settings portion and change the option. 30 seconds is not much, but it is better than 10.

### Stroke and Saturated Fat (2010-11-13 01:38)

A [1]1997 epidemiological study, which I just learned about, found that increases in saturated fat intake were associated with a lower risk of stroke. Sampling from among the papers that cited it, [2]this study found a non-significant change in the same direction. [3]This study found a significant change in the same direction in Japanese, who eat a low amount of saturated fat. This is especially interesting because many people assumed that the high rate of stroke among Japanese was due to high salt intake. This finding suggests it is due to low saturated fat intake.

As I said in [4]a recent post, this sort of consistency across studies on a question of enormous interest argues against the severest critics of epidemiology, such as [5]John Ioannidis.

4. [http://www.mcgill.ca/newsroom/news/item/?item\\_id=169419](http://www.mcgill.ca/newsroom/news/item/?item_id=169419)

Tom (2010-11-13 16:04:10)

It's interesting how disappointed the researcher was that the meat images didn't make people aggressive. So he's off to craft another study where he can try to cure the defect. What a pathetic excuse for a 'scientist.' Confirmation bias, anyone?

Seth Roberts (2010-11-13 20:43:01)

If there was confirmation bias, it makes the results – which were opposite to the direction in which confirmation bias would push them – more impressive. "what a pathetic excuse for a scientist": well, I'm impressed that an undergraduate did such interesting research. I don't care if he had preexisting ideas about what the results would be. That's the usual state of affairs.

anonymous (2010-11-14 15:34:53)

Seeing boobies also calms men down. Can I get a grant?

anonymous (2010-11-15 14:02:56)

Should you be searching out or talking about pasture butter, which is high in omega-3 fatty acids? Or cultured butter, which is normal in Europe but unusual in the US, which is filled with living cultures? Culture butter is easy to make – take cream, add a dollop of yogurt and leave on the counter for a day or two or three, then churn. Then you get real buttermilk, too, a lovely thing.

Seth Roberts (2010-11-15 16:46:17)

thanks for the suggestion about pasture butter, which is a good one. I am currently in Beijing where it is hard to get any butter. when I get back to the US I will try different kinds of butter.

G (2010-11-16 19:33:19)

Might there be an obvious error in the meat study? It is supposed to find an innate effect of meat on mood, but meat – especially cooked meat as in the study – has acquired, positive associations.

## **For Whom Do English Departments Exist? (2010-11-14 11:32)**

In [1]an account of ghostwriting for students (i.e., term-paper factory) the following story stood out:

Although my university experience did not live up to its vaunted reputation, it did lead me to where I am today. . . . I was determined to write for a living, and, moreover, to spend these extremely expensive years learning how to do so. When I completed my first novel, in the summer between sophomore and junior years, I contacted the English department about creating an independent study around editing and publishing it. I was received like a mental patient. I was told, "There's nothing like that here." I was told that I could go back to my classes, sit in my lectures, and fill out Scantron tests until I graduated.

Inconvenient human nature. He wanted to learn something the school didn't formally teach. The school controlled something precious that he needed – time. The rest of his life was at stake, but it wouldn't give it to him.

His college was like a diet without necessary nutrients. It stunted growth.

[2]For whom do colleges exist?

1. <http://chronicle.com/article/article-content/125329/>

2. <http://www.blog.sethroberts.net/2007/03/31/for-whom-do-colleges-exist/>

---

David (2010-11-14 14:34:03)

For whom do ponzi schemes exist?

John (2010-11-14 14:50:11)

Seth, there are lots of questions here—not all English departments are alike, not all professors would have treated him “like a mental patient,” and some institutions are more flexible in response to students’ requests. At my alma mater, a small liberal arts college, I had student directed tutorials with professors from the first year, including both theoretical and practical projects (designing and implementing a social survey, ethnography, communication theory). Most universities now offer various kinds of classes—one of my former students is now screenwriting and wants to incorporate ideas he developed in my class into his screenplays and filmmaking (this at the University of Michigan).

q (2010-11-14 20:00:39)

at the school i went to (huge midwest state school) i’m sure he would have got either answer depending on who he asked, how he asked, and what mood (or how busy) the person he asked was in. i asked a lot of profs for independent study (including in the english dept, and i wasn’t a major) and got both kinds of answers depending on differing factors. and unsurprisingly, it’s been the same story after university – sometimes people say yes, sometimes people say no.

Alex Chernavsky (2010-11-14 21:01:01)

”I contacted the English department about creating an independent study...” Well there’s your mistake, right there. You need to contact a professor (preferably someone who already knows & likes you) to get tentative approval. Only *then* do you approach the bureaucrats.

Aaron Blaisdell (2010-11-14 22:20:30)

Yep, as Edward Thorndike said, the problem with anecdotes is that you don’t know the back story leading up to the observation. I concur with q and Alex on this one. It’s very bad form to draw general statements from an anecdote. Anecdotes can be incredibly helpful in suggesting what to look for but not for confirming what you found.

Seth Roberts (2010-11-14 23:46:09)

Alex, I don’t know who the writer contacted. The article is unclear. Perhaps by “the English department” he or she meant a professor in the English department. Perhaps he or she contacted the chairman of the department. Who knows? Sure, it would be better to contact a professor than a bureaucrat. But to complain the writer didn’t know the best possible procedures is like Malcolm Gladwell in *Outliers* blaming the guy who got kicked out of Reed because his mom didn’t return a form. Someone else would have known what to do, said Gladwell.

Lauriejane (2010-11-17 09:40:37)

I graduated from PSU in June of 1976, so maybe my anecdote is way out of date. But I remember being repeatedly laughed at by my English professors when I said I wanted to write for a living. They said it was simply impossible and I should give up the idea. (I got the idea from my father who was a professional writer). They told me I would have to be a teacher because that was the only profession open to young women who were literate + college grads. The pressure was so great that even when I went to the CA State employment office, they said they would only send me to teacher interviews even though I had experience as an executive secretary to a TV star and had worked on a newspaper. Under pressure to support my elderly parents, I caved in and became a teacher, hated it, then became an adult education instructor which I like better, but not much. Now I am planning to retire. I have written a book for college students telling about all of the things that neither parents nor colleges like to tell them about college. I am saving my money to self-publish it. It is called: *College Crazy And How Not To Be*. It includes a chapter on how to drop out. And another chapter called, “They’ll Call It Credit; You’ll Call It Debt.”

## **My Theory of Human Evolution (letterpress printing) (2010-11-15 16:51)**

According to [1]my theory of human evolution, a liking for ceremonies evolved because ceremonies increased innovation. Ceremonies increase demand for hard-to-make stuff, which helps the most skilled artisans make a living.

[2]Stephanie Laursen, a letterpress printer, is an example. Letterpress printing is difficult. Larsen is a skilled artisan. She makes a living from wedding invitations. Without wedding ceremonies, she would probably be doing something else.

1. <http://www.blog.sethroberts.net/2010/11/08/a-theory-of-human-evolution-and-application-to-education/>
2. <http://www.boingboing.net/2010/11/12/the-modern-face-of-l.html>

---

Ben (2010-11-23 21:31:48)

She could be making high-quality posters or other printed material for marketing campaigns. I don't think marketing campaigns are ceremonies.

## **Secrets of Chinese Retail (2010-11-16 06:25)**

In Chinese supermarkets now and then you see a large and a small version of something taped together – for the price of the large version! For example, a quart of milk and a pint of milk taped together, sold at the price of one quart. Wow, you think, for the same price I get 50 % more.

Today I looked closely at one of these deals. The milk was several days older than the rest of the milk for sale. I realized it was the Chinese equivalent of putting a day-old sticker on something and selling it at half-price. Day-old stickers have negative connotations ("stale") but the taped packages have positive ones ("your lucky day").

---

David (2010-11-16 08:21:42)

Sounds like a bad deal. Twice as much of a perishable item and less time in which to consume it.

humble reader (2010-11-22 11:32:58)

Well at least you get the extra melamine and that won't degrade as fast as those other pesky milk proteins.

## **Guan Er Dai (2010-11-16 20:51)**

A few years ago the Chinese people invented a new noun: guan er dai (官二代), meaning the children of government officials. There was already fu er dai, meaning the children of rich people.

The reason for the new term is that guan er dai act badly. A few weeks ago at Hebei University, a guan er dai, driving

a car on campus, hit and killed a girl. Angry bystanders gathered around the car. "My father is Li Gang!" shouted the guan er dai. Li Gang is a mid-level police official. Not especially powerful, but powerful enough. Hubei University covered up the incident.

Government officials have always been very powerful, said the friend who told me this. But only recently have people become aware of this. This is why guan er dai is a new term.

A few years ago a Tsinghua sociology professor and a graduate student wrote a book about the hierarchy within Chinese society. Government officials on top, below them business people, and so on. Perhaps farmers at the bottom. The government did not allow this book to be published – "we are not on top of society, we are the servants!" said a government official. All that work, down the drain.

More The reckless driver was sentenced to three years in prison. The New York Times has [1]a long article about this.

### **DHA Did Not Slow Alzheimer's (2010-11-17 23:43)**

[1]A large just-published study found that giving people who already have Alzheimer's 2 g/day of DHA (present in fish oil) did not reduce their cognitive decline compared to placebo (corn or soy oil). Fish consumption had been found many times to be associated with a reduced risk of Alzheimer's.

Thanks to Saul Sternberg.

1. <http://jama.ama-assn.org/cgi/content/abstract/304/17/1903>

Jeremy (2010-11-18 12:56:04)

There is a difference between slowing the course of existing Alzheimer's disease (the subject of this study) and reducing the risk of the disease for the currently unaffected - a question not addressed in this research.

Seth Roberts (2010-11-18 14:49:36)

Jeremy, there are lots of nutritional disorders where something that prevents the problem also slows or reverses its course. For example, Vitamin C prevents and cures scurvy. [1]Here is another example (thanks to Anne Weiss). I can't think of any cases where something that prevents a disease does NOT slow down the disease once it starts.

1. [http://www.sciencedaily.com/releases/2010/11/101117184457.htm?sms\\_ss=email&at\\_xt=4ce5e3ce762af480,0](http://www.sciencedaily.com/releases/2010/11/101117184457.htm?sms_ss=email&at_xt=4ce5e3ce762af480,0)

## Effect of Flaxseed Oil on Arithmetic (2010-11-19 01:01)

After I moved to China in September, I was surprised that my arithmetic speed went down. (That is, I got faster.) I had lowered it from about 630 msec/problem to 600 msec/problem [1]by eating lots of butter. I had no idea how to lower it further. I didn't deliberately change my diet in China but it was quite different. I kept some things the same: the amount and brand of butter/day, the amount and brand of flaxseed oil/day.

I failed to figure out why I had gotten faster. I reduced the amount of flaxseed oil from 3 T (tablespoons) per day to 2 T per day. It made no difference. (In the beginning of my interest in flaxseed oil, change from 2 T/day to 3 T/day had made a difference.) Perhaps because of the butter.

Surprised that the change from 3 T/day to 2 T/day hadn't made a difference, I went down to 1 T/day for two weeks, then back to 2 T/day. Both changes made a difference:

[2]

Each point is a separate test. Each test had 32 arithmetic problems (e.g., 3+4, 11-3). In the beginning of the data shown in the figure I tested myself once per day. After 12 days I started doing two tests/day, one right after the other. I was curious about the repeatability of the numbers; it wasn't hard; it was a way to get better measurements. Averaging over the tests for each day to get one value per day, combining the 19 2-T/day (before) days and the 11 2-T/day (after) days, and comparing the combination to the final 7 1-T/day days,  $t(38) = 6.5$ . If you're not familiar with t values,

t = 2 is a barely reliable difference, t = 4 is a very clear difference.

This is [3]more evidence that flaxseed oil improves brain function. It interests me because it implies the optimum dose is close to 2 T/day. It cost about \$20 and took 1 person-month. In contrast, [4]the DHA-Alzheimer's study I mentioned two days ago cost about \$1 million and took about 7000 person-months. And used (a) a cruder something-versus-nothing comparison, b) a less-sensitive between-subjects comparison, and (c) a more ethically-problematic placebo-controlled design.

G (2010-11-19 14:18:10)

I would be super-cautious about drawing wide conclusions from this kind of research because you're not performing the task for its own sake: in your brain there are connections between the task and the experimental context. Maybe you produce the link because you want there to be a link, even though you may think you're making the same degree of effort each time.

Seth Roberts (2010-11-19 19:22:52)

G, I wasn't clear. I did this research to find the best dose of flaxseed oil. That flaxseed oil improved my brain function I had established to my satisfaction long ago. I would have preferred the opposite result (no difference) because it would have meant I needed less flaxseed oil. I live in Beijing, where good flaxseed oil is hard to get. Almost no human psychological research has been done using tasks done for their own sake. Subjects are paid or doing it to satisfy a course requirement.

G (2010-11-20 09:18:52)

Of course, but the subject should not have a vested interest in a particular outcome. If you give subjects either a real drug or a placebo they cannot jinx the result by *wanting* the effect to arise because if the sample-size is large enough then that corrupting motive will be equally represented in both the drug and placebo samples. I think it also helps if the subjects aren't the experimenters. But in blazingly clear-cut cases, like that guy who uncovered the true cause of ulcers, the results are too compelling to write off as bias and are easily repeatable/falsifiable. How did you eliminate the problem of bias in your original studies?

Seth Roberts (2010-11-20 13:25:03)

You can learn more about my original studies, and whether to trust them, by reading these entries: <http://www.blog.sethroberts.net/category/nutrition/omega-3/omega-3-directory/> If you think that stomach ulcer case is "blazingly clear" and Barry Marshall found "the true cause of ulcers" you should read this: <http://www.blog.sethroberts.net/2009/04/03/nobel-prize-cluelessness-stomach-ulcers/> Marshall did not get an ulcer from his ingestion of the bacteria he says cause ulcers. And almost everyone who is infected with those bacteria doesn't get an ulcer.

G (2010-11-20 16:16:59)

Bloody hell, I did not know that! Do you think the Nobel Committee could do better than this? They don't seem to have a great hit-rate overall; it would be interesting to look into just how many awards look dubious in hindsight.

Jazi yechezkel zilber (2011-06-19 04:11:06)

Possibly there are omega 3 reseviors in the body, making the 2/3 T difference less marked. (as opposite tk wen starting).  
Reseviors can also work by different routes (like improvements in stability of other systems etc.)

### **The New Yorker Stories by Ann Beattie (2010-11-19 16:15)**

Ann Beattie, a great writer, has a new book out called [1]The New Yorker Stories. I loved her early stories. Her first story in The New Yorker (1974) was "[2]A Platonic Relationship". I still remember this:

When he did have a beer he would take one bottle from the case and put it in the refrigerator and wait for it to get cold, and then drink it. . . . One night Sam asked her if she would like a beer. . . . He went to his room and took out a bottle and put it in the refrigerator. "It will be cold in a while," he said quietly.

Last night I put a Diet Coke in the freezer. It will be cold in a while, I thought, remembering this passage.

Alas, I haven't liked her work over the last 20 years as much, although I am looking forward to reading Walks With Men, her latest novel.

### **Potti: The Final Act (2010-11-19 22:53)**

Dr. Amil Potti has [1]resigned from Duke. The clinical trials based on his (faked) research have been stopped. Duke has not exactly covered itself with glory. [2]The two statisticians who first noticed a problem:

In November 2009, we identified and reported the exact problems now cited for retracting the paper....  
Given that Duke knew of these problems, why were (Potti's) clinical trials reopened in January 2010?"

[3]And:

Experts say that Nevins ["who supported his collaborator Potti through four years of controversy over reliability of their findings"] has admitted that the clinical trials that followed the laboratory research – more accurately described as experiments with human beings – harmed patients. Up until this moment, Duke has steadfastly denied this; and in a Halloween statement, Duke affirmed "we do not believe that patients were endangered."

Recall that the case against Potti attracted notice only when it was discovered he wrongly said he had won a Rhodes Fellowship. Giving new meaning to the devil is in the details.Â

1. <http://dukefactchecker.blogspot.com/2010/11/potti-resigns-continued.html>
2. <http://www.stanford.edu/~vcs/Press/CL36-39.pdf>
3. <http://dukefactchecker.blogspot.com/2010/11/potti-mess-update-medical-journal.html>

---

dearieme (2010-11-20 09:15:48)

Think of all the economists who wrongly claim to have won a Nobel Prize.

### **Flaxseed Oil vs. Fish Oil (2010-11-21 15:52)**

You can find statements like the following in a hundred places:

Both fish and flax are good sources of omega-3. Flaxseed oil is less expensive, which can be an important consideration. The main difference is that flaxseed oil contains only alpha-linoleic acid (ALA), which is the parent compound from which other omega-3 fatty acids are derived. This leaves it to your body to do the conversion to the other forms it needs, eicosapentaenoic acid (EPA) and docosahexaenoic acid (DHA). The problem is that the conversion is not always that efficient, and the body often uses the ALA for extra energy, leaving less for conversion to the other types. The body uses various enzymes to convert ALA to other omega-3s, and the process is not very efficient, especially as one gets older. Estimates of the rate of conversion range from 5 % to 25 %. In order to make sufficient amounts of EPA and DHA, one needs to consume 5-6 times more ALA than if one relies on fish oil alone. Fish oil, on the other hand, contains the other forms and delivers them directly to your body with no conversion necessary.

It isn't that simple. Here are three things I rarely see mentioned:

1. The conversion rate is not fixed. It depends on the amount of the conversion enzyme, which increases with ALA exposure. The body makes the enzymes it needs and doesn't make the enzymes it doesn't need. You don't have enzymes to digest food you don't eat – but if you start to eat them you will build up the enzymes. The measurements of ALA conversion rate I have seen measured the conversion rate without giving the subjects extensive exposure to ALA before the test. (Measurements of glycemic index have the same problem.) They should be considered lower bounds of what would happen with long exposure.

2. Time release is good not bad. When you take a dose of flax oil, its ALA is converted to DHA and EPA, which takes time, thus smoothing out the supply versus time function. If you take a dose of fish oil, the brain receives a sudden burst of DHA and EPA. It is likely that a smoother supply is better.

3. ALA (omega-3) conversion blocks AA (omega-6) conversion. Omega-3 fatty acids and omega-6 fatty acids are almost identical. The enzyme that converts short-chain omega-3 to long-chain omega-3 also converts short-chain omega-6 to long-chain omega-6. Long-chain omega-6 probably has bad effects in your brain, at least in large amounts, because it displaces long-chain omega-3. For industrial reasons, our diets are high in short-chain omega-6. Having ALA in your

system, which flax oil provides but fish oil does not, slows down the conversion of short-chain omega-6 to long-chain omega-6 by occupying the conversion enzymes.

Thanks to Gary Skaleski.

---

Jake (2010-11-21 17:39:29)

No reason to debate this. Take a omega 6/omega 3 ratio blood test and you will know what works for you. I take such a test every six months. My last test was 2.85 to 1. 2 to 1 is ideal so I am close enough. I take fish oil and I eat omega 3 eggs. Omega 3 eggs are made by feeding chickens flax seed. A chicken body is better at converting ALA than mine is. Your experience may differ.

Seth Roberts (2010-11-21 19:10:36)

Jake, that's very interesting. I don't understand, however, how this test shows that you are getting the right amount of omega-3. You could be low in both.

Jon (2010-11-21 21:12:12)

Two tablespoons of flaxseed oil a day has completely eliminated my dandruff. Two tablespoons of cod liver oil did not (nor did two tablespoons of olive oil or of butter). I have no idea why this might be the case, but for me, at least, flaxseed oil provides something the others do not.

Darrin Thompson (2010-11-22 09:18:27)

Interesting. Conventional wisdom out here in fix-autism-with-nutrition-land is to go with fish oil and evaluate based on DHA count and processing method. (Yay Kirkman!) The story behind it is roughly the same except that kids with Autism are bad at converting ALA to DHA/EPA. I'd like to know where the notion came from that you "build up" enzymes by requiring them over time. I hadn't that before. Is it common knowledge?

CTB (2010-11-22 15:21:49)

@Darrin Enzymes are proteins...(DNA makes RNA makes protein). Some enzymes are constitutive (made all the time in fairly stable amounts because they are needed for routine, house-keeping functions), while others are inducible (the amount that is made depends on how much is needed for special functions). If all the proteins a cell could make were made all the time, the cell would run out of space and/or not be very efficient. This is pretty easy to demonstrate in bacteria. They prefer to use glucose, but when there is no glucose left in their medium, but there's some lactose, they will turn on the genes that make the enzyme that breaks down lactose. If you add glucose back to their diet, they turn off the lactose-digesting genes and return to glucose fermentation. We do this too. If you feed a diet high in protein, there is an increase in enzymes that degrade amino acids in the liver, as long as the influx of amino acids continues.

Indrek (2010-11-23 07:49:29)

Considering that the enzyme for ALA conversion would be upregulated with continuous intake, it could explain why your optimal dose went from 4 T to 2 T, Seth, don't you think?

Eugene (2010-11-30 22:55:26)

Professor Roberts: After reading your blog for some time, last year I started flaxseed oil (2TBSP). After one year, my total blood cholesterol went down (206 to 194), HDL increased and triglycerides decreased (110 to 55). Exercise and diet remained

constant year over year, except that 6 months ago I began large amounts of butter and one Greek yogurt a day. Thanks.

g (2011-01-15 20:20:28)

Hi My name is Gonçalo and I'm from Portugal. I really like your blog so that's why I thought about asking you a question. I have struggled with strong chronic anxiety and some depression for a long time. I'm 23. I would like to ask you if you have any suggestion about what I can do to try to understand if these symptoms have roots in nutritional deficiencies, infections, inflammation, etc. I have some history of trauma but maybe some of this is aggravating the problem? Are there some probable causes? Any tests I should do? cost-effective Solutions? Thanks so much Warmest wishes Gonçalo

Seth Roberts (2011-01-16 17:00:07)

Gonçalo, I believe that a common cause of depression and anxiety is a messed-up mood rhythm This rhythm is generated by an internal oscillator with a 24-hour cycle that controls our mood. To work properly this oscillator needs: 1. exposure to sunlight in the early morning 2. no fluorescent light late at night. 3. exposure to faces in the early morning, 4. no exposure to faces late at night. If any of the four is missing it doesn't work. And when it doesn't work you are at greater risk of depression. You can read more about this in Example 2 of my long self-experimentation paper: <http://escholarship.org/uc/item/2xc2h866>

### How Wonderful is Lipitor? (2010-11-22 06:53)

John Cassidy, a staff writer at The New Yorker, understands clearly the poor judgment of economics professors. In How Markets Fail he said the Nobel Prize in Economics has made things worse, because it has often been given for worthless work. Outside of economics, however, he can write [1]this:

during a period in which American companies have created iPhones, Home Depot, and Lipitor, the best place to work has been in an industry [the financial industry] that doesn't design, build, or sell a single tangible thing.

That such a smart well-informed non-party-liner can believe Lipitor is wonderful shows Orwell was right: with enough repetition, people can be convinced war = peace. [2]Here is the truth about Lipitor:

Statin therapy is extremely efficient in lowering cholesterol numbers, but unfortunately not without adverse effects on the body. To prevent a first heart attack, for every life that is saved - 1 % over 10 years of use - statins cause an equal number of adverse deaths due to accidents, infection, suicide and cancer - 1 % over 10 years' use and significantly greater levels of serious side effects and suffering. . . . In a study to see the effects of raising the Lipitor levels from 10 to 80 mg (more sales) on patients, those taking 80 mg had increased liver problems, that is the rate of raised liver enzymes was six times higher than those given 10 mg of Lipitor. Even though the total deaths due to CVD in the 80 mg group was fewer (126) than in the 10 mg group (155), the total deaths due to other causes was higher in the 80 mg (158) than the 10 mg (127) group. There was no difference in the overall mortality rate.

Lipitor, the miracle drug. Taken by millions at a cost of billions. This is what happens when you - such as those in charge of health care - have little understanding of a problem: You aren't good at solving it.

Cardiologists believe that high cholesterol causes heart attacks. Their depth of understanding was illustrated by the cardiologist at [3]my Quantified Self talk about butter who said that the Framingham study showed that diet caused heart attacks (no,[4] it found new correlations between heart disease and "risk factors" such as cholesterol - see also

[5]this) and that the recent reduction in heart attacks is evidence of our improved understanding (e.g., the science behind Lipitor). That a thousand other things changed over the same time period he apparently hadn't considered. He simply couldn't defend – at least then – his core belief that butter was bad. A cardiologist! How many thousands of people has he told to eat less butter?

Cassidy's article about the harm done by the financial industry, from which that quote was taken, is excellent.

Brian (2010-11-22 11:16:07)

Seth- I recently stopped taking Zocor [a statin, like Lipitor]. I started taking it at the same time I started using a CPAP machine to treat sleep apnea. While my sleep was more restful, I remained fatigued. After a year of Zocor, I was diagnosed with ADHD. Following this diagnosis, I tried a string of medications - adderall, stratera, and ritalin. I even became depressed and was put on an SSRI. My memory and mental prowess faded and became extremely spotty at best. I would use IQ apps on my iPhone to measure my mental prowess – and usually scored in the 75-100 range! (Prior to Zocor, similar, computerized IQ tests would yield answers from the 130s to the 170s.) Even moderate exercise would wipe me out for days - unless I was taking the maximum dosage of adderall. So I quit taking Zocor. (Initially, I tried using COQ10 to moderate the effects, but it proved ineffective.) Even though I am obese, I can now exercise in moderation with no ill effects. My mind is back, as are my computerized IQ scores. I no longer arbitrarily stop talking in the middle of sentences after losing my train of thought.

Wayne (2010-11-22 18:38:50)

I'm not sure I buy either side of the statin argument (am currently on statins myself). An interesting article which is vaguely related: <http://www.washingtonpost.com/wp-dyn/content/article/2010/11/22/AR2010112203503.html>

Seth Roberts (2010-11-22 19:45:53)

Wayne, do you know if the statins you take are lowering your IQ? See the previous comment. Cholesterol lowering has been associated with more death from suicide and accidents. If this association is due to cause and effect, it implies that cholesterol lowering makes your brain function worse. Suicide rate and accidental death rate are very insensitive measures of brain function, more sensitive measures of brain function might show a strong association.

Stephen M (Ethesis) (2010-11-27 19:05:05)

Hmm. On a related topic, <http://www.thejuliagroup.com/blog/?m=201010> is about failures of statistics (among other things).

Robin Hanson (2010-11-27 21:55:44)

I didn't think the finance article was excellent. It raised a bunch of standard well-known issues, but offered no insight into how to weigh those factors.

Seth Roberts (2010-11-28 03:56:06)

I thought it was excellent because it was a well-written description of those well-known issues. I agree it did no more than neatly package them.

## How Wonderful is Lipitor? (continued) (2010-11-23 07:08)

In response to [1]my previous post about Lipitor, someone named Brian commented:

I recently stopped taking Zocor [a statin, like Lipitor, and the most prescribed anti-cholesterol drug]. I started taking it at the same time I started using a CPAP machine to treat sleep apnea. While my sleep was more restful, I remained fatigued. After a year of Zocor, I was diagnosed with ADHD. Following this diagnosis, I tried a string of medications – adderall, stratera, and ritalin. I even became depressed and was put on an SSRI. My memory and mental prowess faded and became extremely spotty at best. I would use IQ apps on my iPhone to measure my mental prowess “ and usually scored in the 75-100 range! (Prior to Zocor, similar computerized IQ tests would yield answers from the 130s to the 170s.) . . .

So I quit taking Zocor. (Initially, I tried using COQ10 to moderate the effects, but it proved ineffective.) . . . My mind is back, as are my computerized IQ scores. I no longer arbitrarily stop talking in the middle of sentences after losing my train of thought.

Apparently Zocor caused serious mental problems. Is this rare or common? Common. [2]Here is an article about it. The idea that statins have bad mental effects is old. At first it was dismissed. [3]Here is one dismissal:

The issue of low serum cholesterol and depression was directly examined in three randomized, placebo controlled trials of statins in which indices of depression were measured in all the participants“a total of 7400 people taking active treatment and 2400 taking placebo. Depression was no more common among those taking active treatment.

Apparently these three large randomized placebo-controlled trials got the wrong answer. Curious.

Perhaps statins cause mental impairment in everyone. Everyone’s brain uses cholesterol. If you are going to start or stop taking a statin (such as Zocor or Lipitor) and would like to learn how the drug affects/affected your mental function, please contact me. I am interested in helping you do that.

In [4]the top 15 most prescribed drugs, Lipitor ( #7) was the only non-generic. The profits are large, the benefits small and plausibly outweighed by the costs. There is great room for improvement in determination of how much Lipitor and other statins impair mental function.

1. <http://shadesong.livejournal.com/4214956.html?nc=18>

G (2010-11-24 04:46:31)

My mum was prescribed statins as a precautionary measure due to cholesterol levels only slightly above the official acceptable threshold. She was hesitant to take the medication and asked me to look up the side-effects online. She did this because she knew two people who had specifically warned her off ever taking statins because of the major side-effects they had endured; among other things, hair-loss. One of them, a woman who had had a full head of hair and no history of alopecia, now had barely a wisp left. This is not a medication that should be given out on the basis of statistics because there are too many unknowns and danger-signs. It should be given out like ECT: when there is short-term danger to the patient and other methods have failed.

Arlene (2010-11-24 16:10:32)

Apparently these three large randomized placebo-controlled trials got the wrong answer. Curious. I don't know if it's curious or predictable. I'm currently reading "White Coats and Black Hats" an expose of pharmaceutical company marketing practices. It's very common to publish studies supporting their product while ignoring or denying any ill effects. These companies manage to publish in many "respected" journals as well as their own, in house, journals and hide the conflict of interest

Brian (2010-11-27 11:24:07)

My problems were exacerbated by the psychiatric drugs. But I was on a statin for a year-and-a-half before taking any of the other drugs. All of the mental problems showed up prior to taking any of the psychiatric drugs. None of the problems went away until after discontinuing the statin, even though I had discontinued taking the psychiatric drugs weeks, months, or years earlier. If I have time, I'll blog my experiences in a linear fashion.

## **Epilepsy's Big, Fat Miracle ... (2010-11-26 20:49)**

... is the title of [1]a New York Times Magazine article about the ketogenic diet, a treatment for childhood epilepsy, which I've blogged about several times ([2]here, [3]here, [4]here, [5]here, [6]here). It's a very-high-fat diet. It interests me for two reasons: (a) It connects a high-fat diet with proper brain function, as my self-experiments have done. A curious feature of the ketogenic diet is that it isn't permanent. After several years the child can go off it. My self-experimentation suggests that Americans eat far too little of certain fats. Perhaps eating enough of these fats would prevent childhood epilepsy. (b) It shows how someone who cares enough – in this case, Jim Abrahams, whose son had epilepsy – can be more effective than professional researchers and doctors. Abrahams rediscovered the diet. He saw its value, the professionals didn't. I've argued that this is part of why my self-experimentation found new solutions to common problems: because I had those problems. I cared more about finding a workable solution than researchers in those areas, who had several other concerns (publication, funding, acceptance, etc.).

The details of the article reminded me of something I learned in the BBC series The Story of Science. For hundreds of years, medical students were told, following Aristotle, that the liver has three lobes. It doesn't. You might think that examination of thousands of actual livers would have dispelled the wrong idea, but it didn't. The article contains many examples of doctors ignoring perfectly good evidence in favor of nonsense they read in a book or heard in a

lecture. Epilepsy is easy to measure. If a child has 100 seizures per day, and has been having them at this rate for years, and this goes down to 5 shortly after he starts the ketogenic diet, and goes up again when the child goes off the diet, there is no doubt the diet works. As early as the 1930s, this had been observed hundreds of times. This was overwhelming evidence of effectiveness. Doctors ignored it, probably based on the modern equivalent of the three-lobed liver. They complained, according to the article, that there was "no evidence it worked" or that the evidence wasn't "controlled" or "scientific" (whatever that means). A study published in 2008 "answered doubts about keto's clinical effectiveness" – as if doctors needed the equivalent of a very-large-type book to be able to read what most of us can read with normal-sized type.

According to the article, "by 2000, more people were asking about keto, but most pediatric neurologists still would not prescribe it" – as if the parents needed the approval of their doctor to try it. You don't need a prescription to buy food.

Thanks to Tim Beneke, Michael Bowerman, Alex Chernavsky, David Cramer, and Peter Couvares.

---

Dennis Mangan (2010-11-27 07:17:47)

The ketogenic diet for epilepsy was known to the ancients: Hippocrates prescribed fasting as treatment for epilepsy. If doctors wanted to use a text, they could have gone to the original.

Caleb (2010-11-27 09:19:48)

Occasional fasting can be good medicine for adults, but I'd hesitate to recommend it for kids who are still growing.

Seth Roberts (2010-11-27 14:34:32)

Dennis, that's a good point. First doctors rely too much on the ancients (three-lobed liver); later, not enough.

### **Examples of MS Liberation Therapy (2010-11-27 02:33)**

[1]This story from the Globe and Mail describes what happened to ten Canadians who left the country to get liberation therapy for their multiple sclerosis (MS). The therapy consists of widening veins that drain blood from the brain. The therapy does not always work, but it usually does. The improvement is so fast and large – comparable to giving someone with scurvy Vitamin C – that the thing being changed must be the source of the problem.

Mainstream MS researchers missed this completely. The mainstream view is that MS is an auto-immune disease (e.g., [2]according to Mayo Clinic staff). This view would never lead you to the liberation surgery. Doctors not only have the wrong idea, they are unwilling to defend it. A woman in the Globe and Mail story tried to get the anti-liberation argument from neurologists. She couldn't:

Unfortunately the neurologists are all hysterical. You can't talk to them.

Remember this the next time someone tells you that ulcers are not caused by stress but are actually caused by bacteria – as several contributors to [3]this EDGE symposium claim.

The vast improvement in understanding of MS came about because someone with the necessary expertise (a professor of surgery) cared more than most MS researchers because his wife had MS. I think this is why my self-experimentation found such different solutions than mainstream science: because (a) I cared more than the professional researchers who studied the subject (e.g., sleep) and (b) I had the necessary expertise to do research. I discuss this [4]here.

Thanks to Anne Weiss.

---

vic (2010-11-27 16:42:48)

Wow, Seth, you and I interpret things really differently. I am completely convinced, like you, that most of the time doctors don't know what they are talking about and that most pharmacological interventions are useless or worse - still, the results of these MS patients are not remotely in the same ballpark as results from Vitamin C in scurvy patients. Many symptoms of MS are both subjective and influenced by mental states, and their are natural improvements and deteriorations in the patient's MS without treatment. When I read about the improvements these patients describe they seem well within the normal bounds of MS, without any evidence for an effect of treatment beyond the psychological/placebo.

Seth Roberts (2010-11-28 06:31:04)

vic, to take just the first story:

Before the procedure, Mr. Garvie used a wheelchair, had no control over his bladder and his left side was completely numb. . . Seven months after the surgery, he stopped taking his bladder pills and the colour had returned to his left foot. He now walks with a cane,

Why do you think such improvement could be normal variation or a placebo effect? I don't know of any studies of MS – or any studies of anything – that have found placebo effects like these.

James (2010-11-28 08:09:05)

Another important aspect is how the improvements go away if clots develop in the veins.

Seth Roberts (2010-11-28 15:32:16)

That's a good point.

vic (2010-11-28 15:33:40)

Seth, I think you grossly underestimate the power of the mind over the body. The boundary between needing a wheelchair and a cane is often very fuzzy, and certainly depends on one's mental state. I've seen people walk out of wheelchairs on

televangelist shows. I've often encountered medical case reports that seem similarly 'remarkable,' such as a woman confining herself to bed for over 30 years because of unremittant pain, whose pain suddenly went away completely after a placebo. There is work by Ramachandran showing that unbearable phantom limb pain can be made to go away using a mirror. When people are told that a device drives an electric current through their brain they develop a headache. Lots of studies have documented little connection between chronic pain (back, neck, shoulder, head, knee) and physical abnormalities (except in arthritis or extreme cases). If you showed me a placebo controlled study and the liberation group did much better than the placebo group then I might believe something is happening. If you don't have a placebo group, which I am aware you are not a fan of, then the evidence needs to be much stronger - show me that 7 out of 10 people go from needing a wheelchair to being almost fully functional for a period of a year or more and it \*starts\* approaching the level of evidence that shows that vitamin C cures scurvy.

Michael M (2010-11-28 20:49:04)

You do know that MS often occurs in a relapsing/remitting form? Changes like this don't have to be attributed to either interventions or placebo effects: they can be an inherent feature of the natural history of the disease. MS can't be viewed as a typical degenerative disease, with a continuous decline in functioning for all patients. So no, a single case report like this in MS cannot be convincing evidence.

Seth Roberts (2010-11-29 15:50:28)

Michael, I am unaware of remissions in MS as large and long-lasting as the one described in my quote from the first case ("Before the procedure..."). Are you? If so is there a description you could point me to? All diseases go up and down, just as all measurements do. It's the size and duration of the up/down variation that's interesting, not its existence. Vic, I'd be very surprised if liberation therapy was the first treatment these patients had tried. A placebo explanation of these results doesn't explain why the previous treatments these patients tried didn't work. Nor does a placebo explanation explain why blockage in the opened vein is associated with the improvement disappearing. And I am unaware of any placebo that produces MS results as good as those described in the article. They've been tested and don't work this well. For example, [1]this study.

1. <http://www.thelancet.com/journals/lancet/article/PIIS0140-6736%2896%2909377-4/abstract>

vic (2010-11-30 21:16:30)

Finding a miraculous 'cure,' being disappointed, and then repeating the cycle is the norm for most chronic medical conditions. And this treatment is no ordinary placebo - these patients spent many thousands of dollars, left the country, and had invasive surgery on their neck veins \*against\* the advice of their doctors and neurologists. Talk about cognitive dissonance effects!

SB (2011-05-08 16:19:26)

An article on Liberation Therapy that you might find interesting <http://www.significancemagazine.org/details/magazine/1036499/Multiple-sclerosis-is-a-cure-or-a-contradiction-.html>

Seth Roberts (2011-05-08 18:34:23)

thanks, very interesting article.

## **Cold Showers Raise Mood (2010-11-27 22:32)**

[1]Todd Becker pointed me to [2]this post which is negative about the notion that cold showers raise mood ("empty science") but you can ignore the negativity and go to the comment that gives a long list of studies that support the idea. Todd has blogged about [3]his use of cold showers.

Todd calls this hormesis. About the mood-raising aspect of cold showers, I'm not so sure. There is a broad correlation between being sleepy and being in a bad mood. So anything that wakes us up is likely to improve our mood. But if cold showers improve one's response to stress of all sorts - which is less clear - it does seem like hormesis in other contexts. When I think of hormesis I think of two sorts: intra-cellular (e.g., x-ray-like radiation breaks stuff, activating

repair systems – [4]radiation hormesis) and extra-cellular (microbes in fermented food activate the immune system). But there are other examples of similar stuff: exercise breaks muscle fibers (which is why you shouldn't exercise the same muscles two days in a row) and longer-term increases them; bones when broken grow back stronger. If we need a certain amount of thermal or other stress to properly respond to stress that would be another example.

1. <http://gettingstronger.org/>
2. <http://experimentalchimp.wordpress.com/2008/04/14/how-empty-science-becomes-wisdom/>
3. <http://gettingstronger.org/2010/03/cold-showers/>
4. <http://www.angelfire.com/mo/radioadaptive/inthorm.html>

---

Greg (2010-11-28 05:15:46)

Interesting. I started having only cold showers a couple of weeks ago to see if I would still get the hives I usually got from hot showers. I no longer got the hives and I also noticed an improved mood. I don't know if the heat caused the hives, or if it was prolonged exposure to fluoridated water. Cold showers are usually of short duration, so I might try some short hot showers.

Jonathan (2010-11-29 11:35:39)

I'm a big fan of cold water swimming, and I surf without a wetsuit. I'm out there as many mornings as I can fit in. I never get a cold or flu, and I'm usually pretty upbeat. I never put 2 and 2 together, but it very well could be a result of all that time in the cold surf. I take lukewarm showers, but I'll try going without any hot water to see if it kicks things up a notch.

Gary Wolf (2010-11-29 16:19:03)

The mood elevating effect of cold immersion is a common topic among cold water swimmers. I was first exposed to this idea in 2007 by Piotr Wozniak, a sleep and memory researcher. My first experience produced an elevated mood that lasted for about 2 days; but I associated this elation with the rush of doing something that I felt to be risky and coming through it unharmed. (January; Baltic Sea) However, once I'd broken the ice, I started swimming in cold water regularly, and it always elevated my mood. Swimming is fun in general, but swimming in warm water, or swimming in cold water with a wet suit on, does not produce the same after effect of elation. I have never experienced as extended a period of elation as after my first swim; normally, the most noticeable effect lasts about 4 hours, with a lingering effect for the rest of the day.

d-day (2010-11-29 16:53:16)

I have always loved the feeling of absolute refreshment from cold showers and cold-water swimming ever since I was a little kid. Glad to know I'm not a freak.

Alex Chernavsky (2010-11-29 21:05:37)

This is intriguing. What are some other non-obvious ways to improve your mood? Is there a summary somewhere?

Nansen (2010-12-01 15:01:57)

In her book "Treating Bipolar Disorder: A Clinician's Guide to Interpersonal and Social Rhythm Therapy", Ellen Frank makes the interesting point that behavioral activation alone (i.e. just doing something) was equally efficacious to a complete cognitive therapy treatment in bringing about a resolution of unipolar depression. (page 102). Perhaps a cold shower is a good way to get someone to just do something.

cap (2011-03-03 11:34:55)

Hi Seth, sorry this is a little off topic, I'm commenting here since it's the most recent entry about self-experimentation and mood disorders. My question is, in your self-experimentation, have you found any tricks that help to get over a broken heart? Thanks.

Seth Roberts (2011-03-04 02:43:46)

cap, yes I found that seeing faces in the morning (Example 2 of my 2004 self-experimentation paper) was a huge help in getting over bad news.

## Feeling the Future: Room For Improvement (2010-11-29 21:56)

My Frontiers of Psychology class read Daryl Bem's new paper [1]Feeling the Future that reports nine experiments that show an effect of the future on the present. I have a different take than anything I've read: I think there are several good reasons to take it seriously. But in this post let's start with how it could have been better:

1. Lack of background. There have been lots of experiments along these lines. What did they show? This question is not clearly answered. The prior probability of these claims is enormously important. As I told my students, if seeing the future was common and easy for even a small fraction of people, we wouldn't have businesses, such as casinos, making money on gambling. But the existence of such businesses doesn't rule out weak effects.
2. Lack of exact repetition. An obvious criticism is that Bem slanted the data analysis to favor the results he wanted. In any data analysis of unfamiliar data, you must choose – how to transform the data, what test to use, and so on. You must also choose how many subjects to run and how many trials to give them. There are rules for these choices (Bem doesn't seem to know how to choose a transformation) but nevertheless they allow favoritism to creep in. Drug trials have big problems along these lines – severe slanting of the analysis to make the results more favorable – which is why when you register a clinical trial you must specify the endpoints. The answer to the criticism that your data-analysis choices made your favored result more likely is to do a data analysis with no choices at all. This cannot be done from scratch. You need to do the experiment once, make all the necessary choices, and then do the same experiment again (same everything as much as possible) and analyze the data exactly the way you analyzed the data from the first experiment. Bem never does this. Instead each experiment is different from all the rest. This is what experimental psychologists traditionally do but here it is a bad idea. Better to have taken the two simplest and clearest effects (priming and word learning) and repeated them several times exactly.
3. Were experiments left out? Let's say you observe a weakly-significant result,  $p = 0.03$ . Now you do the same experiment eight more times. How likely is it that each of the eight replications will also find a significant difference? Quite low. Yet Bem finds a weakly significant difference in each of his nine experiments. This is highly unlikely. Bem appears unaware of the problem. Mendel had the same problem (data too good to be true). Ultimately Mendel was proved right. But again it stresses that Bem should do exact repetitions and report the results no matter what if he wants to be more persuasive.

1. <http://dbem.ws/FeelingFuture.pdf>

Bruce G Charlton (2010-11-30 07:25:14)

As I tried to argue in the related case of Alternative/ Complementary healing - <http://qjmed.oxfordjournals.org/content/95/10/643.full> - I believe that the problem for this kind of study, of a phenomenon whose nature is unknown, is that 'controlled trials' are strictly impossible/ nonsensical. In this instance, since the nature of hypothetical psi is unknown, and the features that influence it, it is not possible to 'control' the trial. When a causal phenomenon is understood, then a trial can be controlled - and the better controlled the experiment, the clearer will be the result. The level of significance in frequentist statistical testing is merely a distraction - a mere arbitrary convention applied to a no-causal hypotheses (the 'null hypothesis' has nothing to do with causation). And significance testing has nothing to do with (is orthogonal to) causality: <http://charltonteaching.blogspot.com/2010/10/scope-and-nature-of-epidemiology.html>.

Alex Chernavsky (2010-11-30 21:43:29)

I used to subscribe to the *Skeptical Inquirer*, and I read a lot of stuff by James Randi and Martin Gardner. There's usually some plausible, mundane explanation for these types of PSI effects. Extraordinary claims require extraordinary evidence.

Anthony (2010-12-01 00:26:15)

@Alex, Is an 'extraordinary claim' relative to a given agent's belief system? (for example, telepathy might be extraordinary for person a, but not for b)

Interesting because something like Ku Gua (Bitter Melon), besides being part of Chinese Cuisine, is actually recommended by Chinese medicine for numerous pulmonary afflictions, including asthma.

## 5.12 December

### Food For Thought (2010-12-01 07:08)

A perfectly good [1]Economist article about food and brain function includes the following:

Many studies suggest that diets which are rich in trans- and saturated fatty acids, such as those containing a lot of deep-fried foods and butter, have bad effects on cognition. Rodents put on such diets show declines in cognitive performance within weeks.

Whereas I found butter improved my cognitive performance within a day. And pork fat improved my sleep within a day. On the other hand, I wouldn't be surprised if foods deep-fried in plant oils, such as corn oil, are bad for the brain.

1. <http://www.economist.com/node/11745528>

---

John (2010-12-01 07:37:58)

clearly they aren't differentiating between kinds of oils, at least in that part of the report-the category "bad oil" is enough for them.

john (2010-12-01 08:13:22)

Ahh, the typical great control of variables...I did an experiment where I fed butter and mercury to rats, and they died. So now I avoid both.

jeff borsato (2010-12-01 08:25:39)

feeding rats diets high in substances they normally don't eat (saturated fats and industrial vegetable oils) surely is a poor predictor of their effects on humans, even more so when "fat" is far too general of a term, testing "fats" effect on any animal is like testing "liquids" effects, the variance between natural saturated fats and omega-6 rich vegetable oils or even coconut oil demand separate streams of data. which likely would yield vastly different results.

Jake (2010-12-01 09:18:05)

American nutrition researchers were stupid enough in the old days to think that trans fats and saturated fats were the same thing. Thus when they wanted to test the effects of saturated fats they substituted trans fats as they were cheaper. Then they reported that saturated fats will kill you. The difference is that trans fats will kill you, saturated fats are necessary for life. Most American nutrition researchers remain just as stupid today. Journalists come from the same dead brain pool as nutrition researchers. Thus you saw the report that you did. However, you did arrive at a rule that will serve mankind forever. That is: Never, ever believe any nutrition information that you read in the mainstream media.

Glen Raphael (2010-12-01 14:01:08)

Did you follow the butter-mind study? If so, do you have any comments about the findings? <http://genomera.com/studies/butter-mind> (charts here <https://sites.google.com/site/buttermind/>) The genomera blog says their study "came to a conclusion" but doesn't say what the conclusion \*was\* and the charts are a little ambiguous on their own.

PJ (2010-12-02 16:30:52)

They do that on purpose, you know. It's so common at this point it's eye-rolling. "We fed rats bacon and twinkies and they were less healthy. So don't eat meat!" Much research is little more than an attempt to 'buy' free advertising – mass media, worldwide, with the heft of authority – by deliberately designing things to make your friend (or enemy) substance look good (or bad) and then sending out press releases about the paper. If the study doesn't support that, you can mess with numbers until you find \*something\* the study can say. If you still can't, you can just write an abstract that appears to say nearly the opposite so it still looks like what you want it to say. The more I appreciate science, the less I appreciate most of what I read.

## **Feeling the Future: More Likely Than You Think (2010-12-01 20:37)**

A few posts ago [1]I pointed out how Daryl Bem's [2]Feeling the Future paper (experiments that seem to show the future changing the present) could have been more persuasive. This post is the other side of my critique. I'll explain why the results are more persuasive than Bem and commentators have said.

If this research is correct, I told my students, you can study for a test not only before but also after you take it. Studying after isÂ better than studying before because you would only need to study what was on the test. And there are reasons to believe the research that Bem didn't mention:

First, the history of electricity. Electricity, now incredibly important, was once nearly invisible. Remember [3]Galvani? During a frog dissection, an assistant touched an exposed leg-muscle nerve with a static-electricity-charged scalpel. The leg twitched. This tiny accident made all the difference. Galvani studied what had happened. He soon discovered that two different metals in contact generated electricity. This led to the first batteries. With a steady source of electricity, we could learn about it.

The methodological lesson is that the nervous system is (a) unusually sensitive to the environment and (b) easy to "read". You could touch a static-charged knife to many things: a plant, cloth, a piece of metal, a piece of wood. No doubt this had happened countless times before Galvani. The static electricity changed all of them (plant, etc.) but these changes led nowhere because they were too small to see. In contrast, the effect of static electricity on the nervous system was easy to see. It was amplified by the neuro-muscular junction and the muscle. Measuring the effect of electricity on nerves turned out to be the best way to study it, at first.

My self-experimentation takes advantage of the sensitivity of the brain to the environment. Mostly I study stuff controlled by the brain, such as sleep, weight, and arithmetic speed. Because the brain changes quickly and the changes are easy to detect (via behavior), I can do short convincing experiments. People who study health in other ways have to do much slower and more difficult experiments. For example, bones change slowly in response to dietary changes. Other parts of our body, such as the liver, are much harder to measure than behavior.

The story of how electricity began to be understood suggests that if the future does affect the present, there will be a period when the best way to study this is by studying behavior. This is what Bem did. We don't normally think of the brain as good for physics experiments but Galvani showed the truth of this. The brain acts as an enormously sensitive amplifier. For example, Barbara Sakitt did [4]an experiment suggesting that the eye can detect single photons. Bem's experiments cost essentially nothing. He needed no grant. For a physicist to build a detector that detects future effects on the present without involving the brain will surely be more expensive and more difficult, just as it was so much easier for Galvani to use frog legs than build a electricity detector not involving the nervous system.

Second, the history of psi research. Unfortunately Bem omitted even a brief summary from his article. Experiments similar to Bem's have been going on for decades. In the 1980s, I visited a lab near Princeton doing such

experiments. I haven't studied this research but as far as I know they have repeatedly reported small effects. This is what has kept them going – or at least I cannot rule out this explanation for why it has lasted so long. The alchemists pursued fruitless research a long time but I am unaware they reported small successes. Bem used his knowledge of mainstream psychology (e.g., priming) to design much more sensitive experiments. So it makes sense that these weak effects would become more detectable.

Third, gravity/time symmetry. Bem says we see no signs of the future affecting the present in everyday life. I am less sure. The effects of gravity and time reversal (time going backwards) are remarkably similar. If you watch the same video played forwards and backwards you can tell which is forward (correct) and which is time-reversed: In the time-reversed version, impossible things happen. A man slowly drinks coffee. Correct version: the level of coffee in his cup slowly gets lower, as the coffee goes into his mouth. Time-reversed version: the level of coffee in his cup slowly gets higher, as the coffee comes out of his mouth into the cup. That's impossible! You can spit again and again into a cup, sure, but you can't spit pure coffee into a cup. You can't unmix the coffee from the rest of the liquid in your mouth.

Imagine two billiard balls on a frictionless perfectly flat pool table. They are together in the center. Touching, but not held together. A video of the balls would show them slowly moving apart in response to random disturbances. They move down a probability gradient: Further apart is more likely than close together. This is why a sodium pump is needed to keep enough sodium in cells: because the difference in concentration (more sodium within a cell) makes diffusion out of the cell more likely than diffusion into the cell.

Now we do something different: we randomly and independently place both balls on the table. The placement of one has no effect on the placement of the other. Almost surely they will not be touching. Then we start filming. And a funny thing happens: the balls move closer and closer together! The opposite of the first film, where they slowly drifted apart. They are drifting closer and closer together because they are so heavy that the gravitational attraction is larger than the random forces (e.g., air molecules) in the situation. The second film run backwards looks exactly like the first film run forward! In this way the force of gravity causes time to go backwards. It causes seemingly less-probable events to be more probable than seemingly more-probable events. Rather than have two concepts (force of gravity, passage of time) perhaps we only need one.

I will write more about this later. The simple point is that the effects of gravity are very similar, perhaps identical, to time moving backwards. The force of gravity is obvious and the similarity to backwards time unexplained. Given this failure to explain something easy to see, we shouldn't be sure we know if the future can visibly affect the present. If time goes backwards to some extent (measured by the force of gravity) then to some extent the future has happened and we know something about it. The more we know about it, the better we can choose to study for a test by studying just the items that will appear on it.

Anon (2010-12-02 04:13:11)

I always say that love at first sight is a result of memories of the future. That line has got me laid a few times!

PeterW (2010-12-02 06:26:55)

The Princeton lab shut down a few years ago.

Henrico Otto (2010-12-02 12:27:45)

If you start with a random distribution of particles, running the laws of physics forward or backwards will both look "normal". It is only after the simulation has run for a period that reversing the time direction makes it look funny. But that effect holds for both (i) starting with +t, and reversing so the equations use -t, and (ii) the opposite, starting with -t, and reversing so the equations use +t. In both cases, the reversed simulation starts to look normal again when you pass the point of the initial distribution. This is due to the fact that running the simulation (with +t or -t) creates information that is not random (but reflecting physical law). The issue is not time direction, but information. The separation of balls due to random fluctuations is not the mirror image of gravity, and so I'm not following what you are saying, but look forward to your posts on this.

Seth Roberts (2010-12-02 15:26:05)

Henrico, that's a nice way of looking at it. Suppose there are just two particles in an enclosed space and the only important force is the force of gravity. When you run time forward, the two particles move closer, due to attraction. When you run time backward, they move further apart, due to repulsion (gravity in reverse). In the second case, however, the increase in information (predictability of location) is very slight because the particles are already far apart and are at random locations. Those locations become only slightly less random if the enclosure is large enough. More concretely if you have a bunch of randomly-placed particles in an enclosed space and you run time backwards with just gravity as a repulsive force they will appear to be moving randomly, as far as I can tell. The build up of information is far clearer when time goes forward. Then gravity will cause them to clump together. Their locations will become perfectly correlated. In other words, I am not so sure the operation of gravity causes information (predictability of location) to increase when time runs backward. If information is defined as correlation of location, then with two particles, yes, they become negatively correlated due to repulsion. But as the number of particles increases the effect – increase in negative correlation due to repulsion – becomes weaker and weaker.

CTB (2010-12-02 15:30:18)

Entropy is the tendency for a system to move from order to disorder due to the random disturbances you mentioned in the ball example. The force of gravity can counteract entropy...otherwise, for example, the planets in our solar system would not be orbiting around the sun, they'd be moving off into the cosmos. If the balls were heavy enough to exert gravitational pull on each other and move together, they would be using the force of gravity to overcome the force of entropy. If you filmed this happening, then played it in reverse, it would look like 'time in reverse' but the reverse film would be an impossibility in reality unless you put in some sort of energy to make it happen. I.e., only one of the directions happens spontaneously (depending on which force is bigger), and that is the direction which corresponds with time moving forward. Also looking forward to the point of all this....

Joe (2010-12-02 15:41:10)

I tend to agree with Henrico on the gravity/time symmetry... The example of the billiard balls is not actually one case being run back and forth in time; it's two non-equivalent cases. Case 1 involved the air molecules being more powerful than gravity, and pushing the balls apart as time moves forward. Case 2 involved gravity being more powerful than air molecules and pulling the balls together as time moves forward. If you run Case 1 "backward" (start the balls apart and run time backwards) the air molecules will not push the balls together, they will continue to move the balls around randomly. If you run Case 2 backward (start the balls together and run time backwards) gravity will hold the balls together. In Case 1 gravity is explicitly weaker than the air molecules, in Case 2 gravity is explicitly stronger. In either case there is no gravity/time symmetry, only the special situation where you have "Case 1 rules" (gravity weaker than air) as time moves forward and "Case 2 rules" (gravity stronger than air) as time moves backward. I think it's more helpful to think of time as a dimension (length, width, depth, time) and gravity as a force (gravity, electromagnetism, lift, drag). Events are caused by forces and measured relative to dimensions. Some events are conservative in time and space, tossing a ball in the air for example, and there is force-force symmetry IN time with those events (gravity is symmetrical, in time, with the projectile force sending the ball into the air). Some events are non-conservative in time, like the "drinking coffee" example, and so in those instances there is

no force-force symmetry in time. This is a very interesting line of thought and I'm looking forward to the rest of the posts, but I think there is a lot more work to do to establish the validity of a time/gravity symmetry. Or maybe I'm missing a subtler point that someone can point outâ€¦!

Seth Roberts (2010-12-02 15:43:29)

"The point of all this" . . . just non-obvious reasons to believe the Bem results, which are basically well-done creative experimental psychology. Not the beginning of coverage of psi experiments.

CTB (2010-12-03 08:04:18)

Sorry...by 'the point of all this' I meant I don't see the connection between the billiard ball thought experiment (requires untrue assumption that the balls exert enough gravitational force on each other to pull them together, overcoming the opposing air movements) and the Bem experiments which produced real effects without any untrue assumptions being made. But I think you're trying to say: the Bem experiments produced real effects, and these results might be demonstrating that precognition is possible...so, let's think about some other reasons to believe that precognition is possible. While my way of looking at it is: the Bem experiments produced real effects, what real conditions caused these effects to happen.

Seth Roberts (2010-12-04 20:19:42)

CTB, yes, that's true. I'm trying to say why Bem's experiments should not be quickly dismissed. Galvani's experiments showed how psychology (or at least study of the nervous system) could be helpful to physics. If the future can affect the present that is new physics. Before Galvani, people knew about static electricity. They just couldn't study it well. It was just a strange thing. I think everyone knows that gravity has an ordering effect (things in different places are drawn to the same place) and the passage of time has a disordering effect, but what to make of that opposition, if anything, hasn't been clear. It is just a strange thing. Perhaps there is some relation to Bem's results, just as static electricity and other easily-noticed phenomena (such as lightning) turned out to be related to Galvani's results. Joe and Henrico, thank you for your comments. You make good points. I hope to discuss this with a physicist....

## **Cold Shower Report (2010-12-03 16:05)**

Blogging about [1]the effect of cold showers on mood made me want to try them. I've taken cold showers before. They had no obvious effect beyond mild invigoration. But I learned that the showers need to last at least 5 minutes to get the mood benefits. My earlier showers were much shorter than that.

So far I've taken 4 cold showers, one per day, each 5-7 minutes long. Water temperature 56-60 degrees F. The first was unpleasant for maybe a minute. For hours afterward I felt warm inside – that was obvious. Maybe a slight rise in mood, but not an obvious one. With subsequent showers the unpleasant part at the start grew shorter. Now it's maybe 20 seconds. The warm feeling inside is less obvious but maybe that's because it's constant. My apartment started to feel too warm. I opened windows to cool it off. Outside I was more comfortable (it's close to freezing here

in Beijing). I wear fewer layers of clothing.

I like the warming effect and will continue. Maybe colder water would produce more of an effect. I live on the sixth floor. Even if outside a minute ago it has traveled through warm pipes. Perhaps I can get greater effects walking outside loosely clothed.

1. <http://www.blog.sethroberts.net/2010/11/27/cold-showers-raise-mood/>

---

jimrandomh (2010-12-03 18:09:24)

There's one more option to try, besides hot and cold showers, and that's a hot shower with about 5 seconds of cold water at the end - just enough to undo the increase in body temperature from the hot water. I've found this leaves me feeling more energetic than regular hot showers, at least for the 30 minutes or so immediately after.

Sam Schulman (2010-12-03 19:03:08)

Seth, there must be thousands of middle-aged men who were, like me, seventh-graders when Ian Fleming's Bond novels came out in paperback in 1962, driven by President Kennedy's enthusiasm for them. Since we could neither shake nor stir Martinis, nor even touch girls, or drive Aston Martins, the only thing Bond did that we could do, we did; take a cold shower every day. There were no discernible effects. Yet.

Josh M (2010-12-04 11:54:01)

A monk at a temple in Japan told me they do a cold water meditation. They douse themselves in cold water then sit for hours. He said the experienced monks knew to get the bucket of water ice cold if possible because the body would warm strongly and dry out their robes. The novices tried to use warmer water and ended up shivering in wet robes. This was 20 years ago so I don't remember the details. Google says I might have heard of shinto misogi or been at the Kamakura temple.

Evelyn (2010-12-04 19:17:11)

Tummo meditation <http://www.cognitionandculture.net/Brian-s-blog/g-tum-mo-heat-meditation.html> That blog entry has a couple of references to papers. The blog looks interesting.

Maria Droujkova (2010-12-05 07:47:12)

Submerging in snow is a part of the traditional Russian steam bath routine. First, you gradually raise the temperature and humidity inside (this part is somewhat similar to Native American ceremonies) while drinking kvass or beer to sustain electrolytes. You use specially aged and soaked birch branches with leaves to gently beat yourself all over - this opens up pores and does some complex things to circulation. When you are VERY hot, you go out and roll in the snow, or just splash yourself with a tub of cold water in the next room. Amazingly, the sensation is extremely pleasant. The cooling is welcome and it does not feel like a shock. Then you can go back to the steam room for more, repeating the cycle a few times. Needless to say, every step can go pretty wrong if you don't know what you are doing. For example, raising the temperature or humidity too abruptly will most definitely cause cardiovascular problems. Applying too much strength with branches will not feel painful, but you will get scars. I would strongly advise learning from someone experienced before trying any of this.

Tom (2010-12-05 19:22:24)

I wonder if the increased thermogenesis would be conducive to weight loss. I also wonder if doing this repeatedly would cause you to grow (metabolically active brown fat. <http://www.time.com/time/health/article/0,8599,1890175,00.html>  
[http://www.vivo.colostate.edu/hbooks/pathphys/misc\\_topics/brownfat.html](http://www.vivo.colostate.edu/hbooks/pathphys/misc_topics/brownfat.html)

## Leslie Iversen Plagiarism Update (2010-12-04 04:16)

I contacted Julie Maxton, the Registrar of Oxford University, about the plagiarism of Professor Leslie Iversen that [1] pointed out in a previous post. (Four passages in [2]Speed, Ecstasy, Ritalin: The Science of Amphetamines, a book by Iversen, were copied without attribution from a website.) Maxton's first reply was this:

This matter was drawn to the attention of the Oxford University Press in 2009, when the OUP and Professor Iversen agreed with the author of the online text that a reference would be included in any reprint or future editions of the publication.

I thought it strange that Oxford University governance was outsourced to Oxford University Press. Maxton then told me that she had made up her own mind:

Having looked at the texts and discussed the matter with Professor Iversen and with Oxford University Press, both of whom had previously been alerted to your complaint, I was satisfied that the error related to a small section of text of the book in question, that it was an honest error rather than a deliberate attempt to plagiarise the results of research, and that appropriate remedial action had been taken as far as the author of the text was concerned. I therefore concluded that no further investigation was required, and I regard the matter as closed.

Maxton did not respond to three emails asking why she concluded the plagiarism was "honest error".

[3]Oxford University's plagiarism policy says "You have come to university to learn to know and speak your own mind, not merely to parrot the opinions of others. Still less to do so deceitfully, without attribution." Apparently undergraduate plagiarism is a big problem at Oxford. [4]According to an Oxford professor (not Iversen),

Hard though it may be to believe, students type word-for-word and increasingly copy and paste from the internet, and submit essays containing whole pages of this verbatim material.

dearieme (2010-12-04 17:47:23)

Dr Maxton's appointment was rather controversial. She is on her way out, leaving at the end of January to take a post at what I think of as The Disgraced Royal Society.

q (2010-12-04 21:04:56)

students type word-for-word and increasingly copy and paste from the internet, and submit essays containing whole pages of this verbatim material?

Maria Droujkova (2010-12-05 07:36:42)

Here is one honest mistake scenario I am afraid will sometime happen to me. When I research for longer works, I usually paste longish quotes (with references or links next to them) right into the draft. When it's a Google Document being edited together by many people, or simply a long and complex document, things get moved around a lot. I can easily see how a piece may land somewhere separate from its reference. What I don't understand is the lack of communication and transparency. If an honest mistake is made, why not tell the world what it was, why it happened, and what you are doing to prevent it?

Nathan Myers (2010-12-05 13:47:56)

There's an interesting discussion of the ethics of plagiarism and ghostwriting over at Language Log: <http://languagelog.ldc.upenn.edu/nll/?p=2829>

Neuroskeptic (2010-12-07 08:16:00)

Mmm. This is concerning. Someone ought to start googling sentences from other parts of the book, to see if this really is an isolated incident.

William Bains (2011-10-24 22:57:03)

This could reasonably be an honest mistake, although if so it points to carelessness. But the claim that "Apparently undergraduate plagiarism is a big problem at Oxford" implies that plagiarism is a bigger problem in Oxford than elsewhere. This I doubt. One lecturer at another university has said to me that she routinely gets essays blatantly copied from internet sources, complete with embedded HTML codes clearly identifying the source - students do not even bother to paste-as-text. This is because we ask students to produce, not think. In my own teaching I ask for short essays on non-standard topics, and have yet to detect any evidence of plagiarism. The students seem to prefer those tasks as well.

Seth Roberts (2011-10-25 12:46:45)

William, I think people who regard plagiarism as a big problem at Oxford are comparing present to past.

## **Sanity in Education (2010-12-04 15:19)**

The head of the Baltimore school system, Andres Alonso, [1] is fond of saying this:

Kids come as is and it's our job to engage them.

I couldn't agree more. In [2] Totto-Chan, Tetsuko Kuroyanagi described meeting the headmaster of her new school. They had a conversation lasting hours. She remembered it as the most anyone had ever listened to her. The full English title of Totto-Chan is Totto-Chan: The Little Girl at the Window. "At the window" is a Japanese term for failure - businessmen judged incompetent were seated near the window. At her previous school, Kuroyanagi had been a misfit and expelled - for, among other things, opening and closing her desk too often.

1. <http://www.nytimes.com/2010/12/02/education/02baltimore.html?pagewanted=1&hp>

2. [http://en.wikipedia.org/wiki/Totto-Chan:\\_The\\_Little\\_Girl\\_at\\_the\\_Window](http://en.wikipedia.org/wiki/Totto-Chan:_The_Little_Girl_at_the_Window)

Alex Chernavsky (2010-12-05 08:54:32)

I agree that, to the extent that it's possible, schools should try to engage their students. However, kids vary in which subjects they find inherently engaging, and they also vary with regard to the degree that they can find ANYTHING engaging. I've taken many classes that were less-than-enthraling at the time, but which ended up being valuable to me anyway.

### WikiLeaks (2010-12-05 22:11)

I have liked [1]the New Yorker coverage of Wikileaks but my favorite bit was [2]this comment:

The world is divided in many "twos" and I would add another one. Those who are for and those who are against Wikileaks. I will try to describe each group. AGAINST: If a part or the full of your daily life deals with corruption, war crimes, extortion, blackmailing, malfeasance, bribery cover-up, then Assange is definitely a nightmare for you. You surely would like to get rid of him so that you can carry on with your evil. FOR: If you are an honest person, with high principles and impeccable conduct, a person who believes in true justice for each and every single one of the citizens, a person who supports education of the masses so that they can take informed decisions instead of being daily brainwashed and lied to by the Mainstream Media, then you are not afraid of the truth, you love the truth and you want to protect the innocent.

This is the modern version of The Emperor Has No Clothes in which it took a child to point out the obvious. No serious journalist could say this. As far as I can tell, no serious journalist has. It is too simple. Too disrespectful. Too sentimental. But it is surely true.

2. <http://www.newyorker.com/online/blogs/newsdesk/2010/12/wikileaks-evolves.html>

---

Dennis Mangan (2010-12-06 06:36:20)

Or consider: "If you are an honest person, with high principles and impeccable conduct, a person who believes in true justice for each and every single one of the citizens," etc., then you won't mind if we search your house. You've got nothing to hide, right?

Olga (2010-12-06 06:51:25)

Well, and if you such an honest person, you would not mind if your emails would be published... but not all of it! Not! Just a selection. And neither you nor you reader will ever know whether this partial and selected release is biased in any way. Come on! Partial truth is worse than lie.

Shane (2010-12-06 09:28:36)

@Dennis: agreed, wholeheartedly. Or how about: "You won't mind if all of your phone conversations are made available as podcasts." Or: "You won't mind IP video cameras in your bedroom." Is it so mad to maintain that WikiLeaks, like everything else, offers some good things and some bad things? Outing corruption is good in most cases I can think of. Outing the news of the US's discovery of Bin Laden's secret lair before they get there to seize him is pretty clearly bad. Most everything else is somewhere in between. That this non-digital attitude seems to be the minority view, with most people rushing to line up against one wall and start hollering at the guys lining up against the other, is just another thing to be depressed about.

Sean Estey (2010-12-06 14:15:30)

I disagree with the first comment. I don't think the metaphor fits at all. What you do in the privacy of your home is your business and yours alone. You are not accountable to disclose or report your private behavior to government. Government, however is accountable to the citizens, and the failure to live up to this basic duty is the gap that Wikileaks bridges.

Seth Roberts (2010-12-06 15:53:38)

I think that the comment I quoted is stating something resembling a fact: An extremely tiny fraction of people in the world – who happen to be very powerful – have something to fear from the continued existence of WikiLeaks. An extremely large fraction of people in the world, such as 99.999 % or even higher, have nothing to fear. I would argue the opposite of what Dennis says: the more powerful the government, the more likely that ordinary citizens (part of the 99.999 %) will have their houses searched. WikiLeaks is a force against powerful government. It makes it more difficult for governments to become extremely powerful.

Vince (2010-12-06 17:21:19)

There are some cases where it is good for a government to be able to keep secrets; for instance, [1]during peace talks.

1. <http://www.samefacts.com/2010/11/secrecy-in-government/how-secret-diplomatic-communication-laid-the-groundwork-for-peace-in-ireland/>

Seth Roberts (2010-12-06 18:04:11)

"During peace talks." That's a curious example because governments benefit from wars. During a war, the citizens need their government more (for protection) than during peace. They pay for this protection – resources flow from all citizens to everyone in government. This creates incentive for governments to start wars.

CF (2010-12-06 18:31:04)

This whole affair has caused me to wonder about whether it is ever clearly good or bad to have backroom discussions in politics. Take your average politician who makes strong public pronouncements on an issue, but who cannot possibly believe all of the absurd crap that he or she says, but makes their most extreme statements in order to play to their base constituency.

Indeed, they will (behind closed doors, to other politicians), admit that they are doing as much, and even show willingness to act against their more egregious stances in legislation (perhaps in trade for something more important to them). There is some merit to this – at least they can be convinced to govern by trading. Now, what happens if you take away the backroom in these cases? Does the politician moderate himself, or is he forced to become even more extreme or otherwise lose out to someone who plays to base in both word and deed? If the electorate sees that issue X is just a trading card, can effective governance actually take place in the environment we've created? Obviously, the analogy is – can effective diplomacy (in the world as-it-is, not as we'd like-it-to-be) take place without private interactions? Will the leaders of the Arab world ever admit that they are afraid of Iran if you don't give them a private forum to do so in? Honestly I don't know, I'm curious what you think. I don't find the issue as clear cut as implied here, but I might be wrong.

G (2010-12-06 20:52:06)

Hahaha, couldn't agree more! Governments are just another class of powerful fools who think that good ends can come via evil means. The character of the means determine the character of the ends.

Seth Roberts (2010-12-06 23:32:00)

"Will the leaders of the Arab world ever admit that they are afraid of Iran if you don't give them a private forum to do so in?" Leaking documents, such as diplomatic cables, doesn't mean people can't talk privately. I don't think the various branches of the State Department are going to stop sending emails or cables to each other. They are just going to be a lot more careful what they say in them. In particular, they will stop proposing this or that repulsive-to-the-public Action X (such as collecting the credit-card numbers of UN delegates). Which means it will become a lot harder to do Action X.

Nik (2010-12-07 05:05:28)

During peace talks. That's a curious example because governments benefit from wars. This is insane logic, based on the idea that governments are monolithic entities with a single interest and a single will determining their actions. In fact, governments are made up of individuals, the vast majority of whom do not benefit from wars - resources spent on defence are taken from the budgets of other departments, including money that would otherwise have been spent on diplomacy and international development. Furthermore, those individuals participating in peace talks pretty clearly do benefit if those talks are successful, because they can put this success on their resume. But even at a governmental level, in what sense, exactly, did the British or Irish governments benefit from the war in Northern Ireland continuing? And if that is the case, why did they expend so much political capital on getting it resolved, successfully? This automatic mistrust of governments is just ridiculous. Even if you think that freedom of information is in principle a good thing, there are clear cases where some information should remain secret. In general, I would rather the democratic process work out where those boundaries are than an organisation like Wikileaks (although the extra-judicial persecution of them since the revelations is a disgrace).

Nik (2010-12-07 05:11:10)

"I don't think the various branches of the State Department are going to stop sending emails or cables to each other. They are just going to be a lot more careful what they say in them. In particular, they will stop proposing this or that repulsive-to-the-public Action X (such as collecting the credit-card numbers of UN delegates). Which means it will become a lot harder to do Action X." If they are forced to be careful what they say in internal communications, then this is the same as not being able to talk privately. There are many discussions that need to be had that might even involve options that are repulsive to public opinion. For example, bailing out banks, pardoning someone on death row, nationalising health care... particularly in a polarised political environment, any number of issues can become politically sensitive, even if they are not downright evil. Again, the question is which organisation do we want drawing the line? Wikileaks is not the answer, because they do not believe in a line at all. Discussing options freely and frankly should be possible, even if that sometimes means that officials say stuff in private that they would not in public. If you are constantly editing yourself, you become a less effective operator, to everyone's detriment.

Alex Chernavsky (2010-12-07 09:27:41)

Seth's comment about governments profiting from wars reminded me of a wonderful book called, *Travels with Lizbeth*, by Lars

Eighner (for an insightful review, see [1]here). Eighner spent a few years being homeless, and then wrote a book about his experiences. Here's an excerpt:

"The purpose of welfare systems is not to help poor people. If the object were to help poor people, then that would be most surely done by giving money to poor people. But that is not the idea, as our tax code proves. If you give twenty dollars to someone on the street, there is not a way in the world you can deduct that donation from your taxes. To claim a deduction you must give the money to an organization that employs clerks and administrators and social workers and that, more than likely, puts nothing material into the hands of the poor... When the agency makes an accounting of the good it has done the poor, it will count the money it spent on paying social workers to hold the hands of the poor the same as money, if any, spent on bread. The purpose of welfare systems is to provide jobs for social workers and bureaucrats. I told Billy he should be grateful to have a job in the poverty industry, but to ask that such a job be meaningful is to ask too much."

1. <http://photo.net/travel/travels-with-lizbeth>

Gunnar (2010-12-07 12:35:48)  
I'm pro WikiLeaks :-)

"War is the health of the state." – Randolph Bourne

vic (2010-12-07 21:34:12)  
Seth, in a way I envy your naive idealism... i'm glad you're not involved in foreign policy or national security though...

Sean Estey (2010-12-07 23:15:08)  
I find the problem with this debate is that both sides are arguing philosophy rather than facts. It is like politics vs economics in that sense. One side argues intention, the other actually looks at matters empirically. Why don't we put aside the philosophy and hypotheticals for one second and actually look at this empirically: how many people have been harmed or killed as a result of any information Wikileaks has released up to this point? Simple question. If these leaks are as dangerous and damaging as people claim, let's see the evidence. Otherwise, this debate simply becomes clouded with empty rhetoric.

Mark (2010-12-09 02:32:42)  
I'm withholding judgment until I see if they really release every single cable for a 3-year period. Somehow I doubt that all of them deal with "corruption, war crimes, extortion, blackmailing, malfeasance, and bribery cover-up." If they release everything, it does seem like rape (metaphorical rape, sort of like the kind Assange is accused of in Sweden).

G (2010-12-09 07:39:59)  
I don't think the 'pragmatism' arguments stand up. The Cold War was conjured up by 'pragmatism' and was nearly the end of us. These politicians who believe themselves pragmatists have a reductive, simplified view of human nature (Game Theory), and the only people who really conform to it are economists and psychopaths. Idealism is not necessarily naive - it's our only real weapon against self-destruction. [See: Rome]

## **Slate Covers Self-Tracking (2010-12-06 16:43)**

Slate has recently published several articles on self-tracking. [1]"How should we use data to improve our lives?" is a nice way to frame it. By data, the author, Michael Egger, means data we collect ourselves – leaving the traditional

collectors of data, such as government and scientists, out of the loop (act → collect data → act). The first person to close the loop like that was Richard Bernstein, who measured his own blood sugar levels several times/day – omitting his doctor, who had measured Bernstein's blood sugar level once/month, out of the feedback loop. The consequences were huge. Bernstein's health got much better. And the treatment of diabetes changed forever when what Bernstein did became common. Hanna Rosin wrote about tracking her blood sugar levels in [2]an article with a completely misleading subtitle ("Diabetes has forced me to become a self-tracker, and I can't stand it").

[3]Another article – titled "Living the Quantified Life: Some of the most inspiring self-tracking projects" but promoted as "The guy who eats a half-stick of butter a day and other strange 'self-trackers' " – is about three examples of self-tracking: [4]my butter research, [5]the benefits of categorizing one's possessions, and Jon Cousins's discovery that [6]telling other people his mood greatly improved it.

Slate is running [7]a contest about this:

We are looking for great ways that we can collect and analyze data to improve our lives. You can submit your idea by clicking the button below. The deadline for submitting ideas has been extended until Wednesday, Dec. 8. We'll be tracking your most interesting ideas throughout the month. And don't forget to vote on the proposals you like best. We'll take a closer look at the three top-vote-getting ideas and write about them.

## The Decline Effect (2010-12-09 20:01)

[1]A new article in The New Yorker by Jonah Lehrer is about declines in the size of experimental or quasi-experimental effects over time. For example, Jonathan Schooler, an experimental psychologist, found that if subjects are asked to describe a face soon after seeing it their later memory for the face is worse. As Schooler continued to study the effect, it appeared to get weaker. The article also describes examples from drug trials (a anti-psychotic drug appeared to become weaker over 15 years) and ecology (the effect of male symmetry on mating success got weaker over years).

It's nice to see an ambitious unconventional article. I blogged a few weeks ago about [2]difficulties replicating the too-many-choices effect. Difficulty of replication and the decline effect are the same thing. I could do what Jared Diamond does in Collapse: give a list of five or six reasons why this happens. (Judging by [3]this paper, the effect, although real, is much weaker than you'd guess from Lehrer's article.) For example, the initial report has much more flexibility of data analysis than later reports. Flexibility of analysis allows researchers to increase the size of effects.

A long list of reasons would miss a larger point ([4]as Diamond does). A larger point is this: Science (search for truth) and profession (making a living) are not a good fit. In a dozen ways, the demands of a scientist's job get in the way of

finding and reporting truth. You need to publish, get a grant, please your colleagues, and so on. Nobody pays you for finding the truth. If that is a goal, it is several goals from the top of the list. Most jobs have customers. If a wheelwright made a bad wheel, it broke. Perhaps he had to replace it or got a bad reputation. There was fast powerful feedback. In science, feedback is long-delayed or absent. Only long after you have been promoted may it become clear anything was wrong with the papers behind your promotion. The main customers for science are other scientists. The pressure to have low standards – and thus appear better to promotion committees and non-scientists – is irresistible. Whereas if Wheelwright Y makes better wheels than Wheelwright X, customers may notice and Wheelwright Y may benefit.

There are things about making science a job that push scientists toward the truth as well, such as more money and time. When science is a job, a lot more research gets done. Fine. But how strong are the forces against finding truth? I was never surprised by the replication difficulties Lehrer writes about. I had heard plenty of examples, knew there were many reasons it happened. But I was stunned by the results of my self-experimentation. I kept finding stuff (e.g., breakfast disturbs sleep, butter improves brain function) that contradicted the official line (breakfast is the most important meal of the day, butter is dangerous). Obviously I had a better tool (self-experimentation) for finding things out. The shock was how many things that had supposedly been found out were wrong. Slowly I realized how much pressure career demands place on scientists. It is no coincidence that the person most responsible for debunking man-made global warming, Stephen McIntyre, is not a professional climatologist (or a professional scientist in any other area). Unlike them, he can say whatever he wants.

Thanks to Peter Couvares.

More In his blog, failing to see the forest for the trees, [5]Lehrer says we must still believe in climate change (presumably man-made): climate change and evolution by natural selection "have been verified in thousands of different ways by thousands of different scientists working in many different fields." Charles Darwin, like McIntyre, was an amateur, and therefore could say whatever he wanted.

PeterW (2010-12-09 21:04:08)

Would there be a way to structure a research organization to produce extremely transparent and truth-oriented research? If so, would the quality of their aggregate conclusions be novel and high-quality enough to demonstrate the superiority of this way of doing science?

Alex Chernavsky (2010-12-09 21:35:34)

There's also this article on a somewhat related topic: "[1]Placebos Are Getting More Effective. Drugmakers Are Desperate to Know Why."

1. [http://www.wired.com/medtech/drugs/magazine/17-09/ff\\_placebo\\_effect?currentPage=all](http://www.wired.com/medtech/drugs/magazine/17-09/ff_placebo_effect?currentPage=all)

M (2010-12-10 01:45:07)

You write about the incentives faced by scientists and the ways in which you believe that distorts research on various subjects, such as climate change. You make good points. However, when you talk about climate change I'm a bit surprised that you

neglect to talk about the incentives faced by the climate change "skeptics" – namely, the large amounts of money that special interests (energy companies, etc) have pumped into the debate in the interest of calling into question anthropogenic climate change and thus heading off policy changes. This is a distortion that I would guess to be at least as large as the ones that you identify.

dearieme (2010-12-10 03:07:36)

A colleague once explained a second colleague's professional success by saying "He's careful not to be familiar with the literature, and never to scrutinise his own data critically".

Seth Roberts (2010-12-10 03:24:58)

M, I don't believe that Stephen McIntyre is a tool of the energy companies. His skepticism about the hockey stick graph, it has turned out, was fully justified. It is unsurprising that it took an amateur to do what for a professional would have been career suicide – make numerous Freedom of Information Act requests from someone who might review your next grant.

LemmusLemmus (2010-12-10 09:01:18)

More specifically, in many cases there is what I call "the car mechanic problem". The people most qualified to judge how big a problem X is are also the people who benefit most from describing X as a huge problem, whether X is your motor, climate change, youth crime or passive smoking.

Seth Roberts (2010-12-10 12:35:19)

LemmusLemmus, "the car mechanic effect" is a nice name for it. In practice it describes only half of the problem – assessments of how bad something is. The other half of the problem is assessments of how good something is – professors of engineering judging the work of professors of engineering, professors of English judging the work of professors of English, and so on. It's curious there is no name for this.

vic (2010-12-10 15:46:23)

Seth, as much as I enjoy reading about your self-experimentation research and think it has real value for generating hypotheses, I doubt much of it is replicable in well-controlled studies (I've tried a few of the interventions and they haven't done anything for me as far as I can tell). Unless your work is replicated more robustly than the research you disparage, it seems premature to conclude that it is in any way better.

Alrenous (2010-12-10 15:58:42)

Misunderstanding of placebo continues. "The main objections to more widespread placebo use in clinical practice are ethical" The placebo works by the belief that it works. Therefore, just teach the patient that they can get much better due to a chemically inert placebo. Then, give them the placebo. The barrier to this is that you can't patent the sugar pill - and placebos don't have to be pills, but basically any ritual. Fully generalized, if you believe that you can activate the placebo effect at will, you can, because of that very belief. (Though it's nice to have things to reinforce the belief.)

M (2010-12-10 20:12:44)

Seth, I don't know much about McIntyre so I can't comment on him specifically. I like your point about how amateurs (or insider/outside, as I think you sometimes say) can question in areas where "professionals" blind themselves to the truth. When it comes to climate change, yes, professionals would have to be brave to question their peers. Call this the first set of incentives. But there is another set of incentives, operating in the other direction: a climate skeptic wouldn't have to be as fearful as skeptics in other more obscure scientific areas. This is because special interests (energy companies, etc) provide plenty of financing to media (that heap praise on skeptics), jobs at "think tanks", contracts through publishing houses, etc. In other words, to be a climate skeptic can have substantial financial, social, and political rewards. I'm surprised that, when it comes to climate change, you focus on the first set of incentives, but not the second.

Seth Roberts (2010-12-11 04:38:02)

M, you write "to be a climate skeptic can have substantial financial, social, and political rewards." I am talking about academia. Professors of climatology, professional scientists. I cannot think of a single professor who has reaped those rewards. Whereas the grant money given to Michael Mann, for example, is in the millions. vic, what "interventions" do you doubt are replicable?

vic (2010-12-11 11:21:53)

Seth, I don't know if they are replicable or not, the point is I'd remain skeptical till I saw the effects replicated in some sort of systematic study in more than one person – or at least until they worked for me. A few of the ones I tried: standing on one leg and eating more animal fat didn't seem to improve my sleep; faces in the morning didn't seem to improve my mood; on the other hand, morning light did seem to improve my sleep.

Seth Roberts (2010-12-12 17:14:12)

Vic, the morning faces effect depends on several things you may not have realized. For example, fluorescent light exposure at night may cause the effect to go away. With animal fat, you may have not used a large enough dose. Other people have observed both effects. I don't know anyone who has repeated the standing on one leg effect but I have observed and tested it in several ways. Perhaps it didn't work for you because something else is causing you sleep trouble. For example you have too much X or too little Y – and standing on one leg affects neither.

Darius Bacon (2010-12-13 20:35:21)

I've found one-legged standing to work for me, surprisingly well and reliably, though I haven't tried to measure it.

## **Chinese Censorship (2010-12-09 20:43)**

A Chinese friend of mine thought I had removed [1]this post.

1. <http://www.blog.sethroberts.net/2010/11/16/guan-er-di/>

---

Gunnar (2010-12-10 12:58:20)

Innernet ;- ) Assange sees something positive in Chinese censorship - that words still have power over there.

## **Dr. Charles Nemeroff "Writes" A Textbook (2010-12-10 23:36)**

The stench was too great. I learned from [1]this article that Charles "Disgraced" Nemeroff, once one of the most respected psychiatry professors in America, has moved from Emory University ([2]where he badly deceived university officials) to the University of Miami. The article tells of more Nemeroff dishonesty: He put his name on a textbook he didn't write. [3]This letter shows how the book was written. The words in the book came from a company named Scientific Therapeutics Information, whose fee was paid by GlaxoSmithKline. Scientific Therapeutics won't answer questions about what it did. Nemeroff says he and his co-author "conceptualized this book, wrote the original outline and worked on all of the content." Worked on, huh? Leslie Iversen, an Oxford professor of pharmacology, may have "worked on" [4]the passages he plagiarized (a few words were changed) harder than Nemeroff and his co-author "worked on" their book. The New York Times added a correction to the article worthy of Wittgenstein: "While documents show that SmithKline (now known as GlaxoSmithKline) hired a writing company for the book, they do not

indicate that the [writing] company wrote the book.”

In twenty years perhaps Nemeroff will forget that he “wrote” this book, just as [5]the first President Bush forgot about a book he “wrote”.

Thanks to Alex Chernavsky.

Anonymous (2010-12-11 04:00:18)

In my department there was a massive “intro” text they made all the freshmen undergrads buy. Its authors were the current department head and the previous two. Whenever they got a new department head, they would make some minor revisions and issue a new edition with the new guy’s name as lead author, and the two previous heads below that.

Seth Roberts (2010-12-11 05:59:21)

anyone know what department Anonymous is talking about?

## **The Decline Effect and Kitty Kelley (2010-12-12 14:23)**

[1]A few posts ago I commented on [2]Jonah Lehrer’s article about replication difficulties, which Lehrer called the decline effect. I concluded it was an indication how poorly science (truth-seeking) and profession (making a living) fit together. Scientists are always under pressure to do what’s good for their career rather than find and report the truth.

Journalism is another kind of truth-seeking. It has the same problem. Journalists are always under pressure to do what’s good for their career rather than find and report the truth. In [3]an essay about unauthorized biographies, Kitty Kelley makes this point:

[Michael] Hastings said that reporters like [Lara] Logan do not report negative stories about their subjects in order to assure continued access. No reporter would admit to tilting a story toward favorable coverage to keep entrÃ©e, but they do, and that is one of the dirty little secrets of journalism today.

Just as no reporter admits this, I have never heard a scientist admit it, with two exceptions: 1. The inventor of [4]the aquatic ape theory of human evolution (Alister Hardy) said he stopped talking about it to avoid hurting his career. It fell to a non-scientist (Elaine Morgan) to develop it. 2. In [5]that famous graduation speech, Richard Feynman pointed out how the first determination of the charge on an electron used the wrong value for the viscosity of air and later

determinations, which did not involve that viscosity, tended to confirm the mistaken value. Unfortunately, Feynman went on to say: "We've learned those tricks nowadays, and now we don't have that kind of a disease." As if human nature had changed.

I conclude that both science and journalism will work best with systems where amateurs and professionals both have substantial power. Kelley doesn't mention that authorized biographers have important truth-seeking advantages over non-authorized ones (e.g., access to old letters).

Daniel Lemire (2010-12-12 17:08:25)

I conclude that both science and journalism will work best with systems where amateurs and professionals both have substantial power. I think that an amateur can be subject to pressure, just like any professional. More so, actually. No conventional journalist would have gotten the kind of heat Assange has gotten: other journalists would have stepped in. You may have the cause and effect backward. People who refuse to "fit in" are less likely to become fully recognized professionals. Could Assange have gotten a job at the New York Times?

Tom Moertel (2010-12-12 19:17:02)

The decline effect is another good reason to push for open-data requirements. These requirements not only hold professional scientists to a higher standard of accountability but also allow outsiders to use existing experimental data to develop unorthodox hypotheses and, sometimes, to challenge orthodox beliefs.

Nathan Myers (2010-12-12 22:23:34)

If the "aquatic ape" meme (not a theory) had not been picked up and promoted, we would all be better off. So, not a good example. Perhaps a better example: plasma fluid dynamics is mathematically intractable, so astrophysicists go out of their way to avoid any hypothesis that might require doing any. Every observation has to be explained by gravitation alone, or it becomes unfashionable to mention at all.

Kevembuangga (2010-12-13 12:33:46)

The decline effect may not be such a big deal, just [1]regression to the mean.

1. <http://blogs.discovermagazine.com/gnxp/2010/12/the-cultural-construction-of-truth/>

Alex Chernavsky (2010-12-15 09:43:27)

Jonah Lehrer's article about the decline effect is one of the most interesting articles I've read in a long time. Using a Google search, I found a full-text version here: <http://crazy.org/science.pdf>. This may be an unauthorized (bootleg) copy, so let your conscience be your guide.

## Different Effects of Omega-3 and Omega-6 on Heart Disease (2010-12-13 16:01)

You have probably read hundreds of recommendations to eat more polyunsaturated fatty acids (PUFAs), which in practice means omega-6 and omega-3. If you shop at Whole Foods, you may see Udo's Blend, a blend of PUFAs which includes both omega-3 and omega-6, as if someone isn't getting enough omega-6. It is unquestionable that omega-3 is beneficial but there is plenty of evidence that omega-6 is harmful, starting with [1]the Israeli Paradox. Why are they lumped together?

[2]A just-published paper in the British Journal of Nutrition makes several new points about the relation of PUFAs and heart disease. Its main point is a new look at experiments in which one group was given more PUFAs than another group. Those experiments – there are only about eight – can be divided into two groups: (a) experiments in which the treated group was given both omega-3 and omega-6 and (b) experiments in which the treated group was given only omega-6.

The two groups of experiments seem to have different results. In the "both" experiments the treated group seems to benefit; in the "only omega-6" experiments, the treated group seems to be worse off. Suggesting that omega-3 and omega-6 have different effects on heart disease. They have been lumped together because experiments have lumped them together (varied both at the same time).

Experiments that try to measure the effect of PUFAs usually say they are replacing saturated fats. More PUFAs, less butter. The paper points out that studies of the effect of PUFAs have at least sometimes confounded reduction in saturated fats with reduction in trans fats. Benefits of the change may be due to the reduction in trans fats, not the reduction in saturate fats.

The paper also makes several good points about the Finnish study, a classic in the fat/heart disease literature. Supposedly the Finnish study showed that PUFAs (replacing saturated fats) reduce heart disease. It had hundreds of subjects but they were not randomized separately. The subjects were divided by hospital. Everyone in one hospital got one diet, everyone in a second hospital got a different diet. This meant it was easy for there to be confoundings (i.e., the treatment wasn't the only difference between the groups). Indeed, there were big differences in consumption of a certain dangerous medication and margarine between hospitals. (Margarine is high in trans fats.)

Perhaps the first author, Christopher Ramsden, who works at NIH, is responsible for the high quality of this paper. Thanks to Susan Allport.

vic (2010-12-13 16:58:23)

The "Israeli Paradox" is an ecologic study without much ability to separate the effect of omega-6. In fact, Israeli arabs who consume tons of olive oil and little omega-6 have higher rates of heart disease than Jewish Israelis who consume omega-6. Other studies have shown that countries that have shifted their cooking oil to omega-6 rich unsaturated fats tend to witness decreases in heart disease relative to countries that have not (e.g., in eastern europe). Also, rigorous epidemiologic studies show a robust inverse association between omega-6 consumption and heart disease, which is evident no matter how you slice the data, and is particular strong among the young (see the work from Willett's lab at Harvard). Obviously, there may still be residual confounding, but this data certainly doesn't support that omega-6 is particularly harmful.

Seth Roberts (2010-12-13 20:49:10)  
Thanks, Vic, that's good to know.

Susan Allport (2010-12-14 06:55:10)

The group at Harvard has been confounding the effects of omega-3s and omega-6s for decades. We absolutely require omega-6s in our diet (on that we all agree) but that robust inverse association b/n omega-6s and heart disease would disappear if omega-3s and omega-6s were properly controlled for (as it is in the current study by Ramsden et al.)

Seth Roberts (2010-12-14 16:02:45)

Susan, thanks for your comment. I don't know what you mean by confounding ("confounding the effects of omega-3s and omega-6s"). In experiments (such as the data analyzed by Ramsden et al.) confounding is changing two things at once. In surveys (such as what Willett et al. do), the only use of "confounding" I know about is the idea of unrecognized confounders – meaning something that wasn't measured is correlated with something that was measured. But Willett et al. measured both omega-3 and omega-6 consumption so that didn't happen.

Alex Chernavsky (2010-12-14 18:49:37)

How good is the evidence for the harmful effects of trans fats? I seem to remember an article (or interview) where Gary Taubes said that the evidence is pretty weak. But I just spent a few minutes Googling it, and I can't find the Taubes reference.

### Walking Creates A Thirst For Dry Knowledge (2010-12-15 15:52)

A few weeks ago I got a treadmill for my Beijing apartment. Two days ago I was walking on it ([1]I try to walk 1 hr/day) while watching *Leverage* to make the activity more palatable. But *Leverage* bored me. It was too simple. So I took out some Chinese flashcards (character on one side, English and pinyin on the other) and started studying them. I was astonished how pleasant it was. An hour of walking and studying went by . . . uh, in a flash. In my entire life I have never had such a pleasant hour studying. The next day it happened again! The experience appears infinitely

repeatable. I've [2]previously mentioned [3]the man who memorized Paradise Lost while walking on a treadmill.

I've noticed before that [4]treadmill walking (by itself boring) and Chinese-character learning (by itself boring) become pleasant when combined. So why was I astonished? Because the increase in enjoyment was larger. The whole activity was really pleasant, like drinking water when thirsty. When an hour was up, I could have kept going. I wanted to do it again. When I noticed it earlier, I was using Anki to learn Chinese characters. Now I am using flashcards in blocks of ten (study 10 until learned, get a new set of 10, study them until learned . . . ). The flashcards provide much more sense of accomplishment and completion, which I think makes the activity more pleasant.

My progress with Chinese characters has been so slow that during the latest attempt (putting them on my wall) I didn't even try to learn both the pinyin and the meaning at the same time; I had retreated to just trying to learn the meaning. That was hard enough. I have had about 100 character cards on the walls of my apartment for a month but I've only learned the meaning of about half of them. No pinyin at all. In contrast, in two one-hour treadmill sessions I've gotten through 60 cards . . . including pinyin. For me, learning pinyin is much harder than learning meaning.

It's like drinking water when you're thirsty versus when you're not thirsty. The walking turns a kind of switch that makes it pleasant to learn dry knowledge, just as lack of water creates thirst. Not only did studying dry materials become much more pleasant I suspect I also became more efficient – more retentive. I was surprised how fast I managed to reach a criterion of zero mistakes.

I had previously studied flashcards while walking around Tsinghua. This did not produce an oh-my-god experience. I can think of three reasons why the effect is now much stronger: 1. Ordinary walking is distracting. You have to watch where you're going, there are other people, cars, trees, and so on. Distraction reduces learning. If the distractions are boring – and they usually are – the experience becomes less pleasant. 2. Ordinary walking provides more information than treadmill walking (which provides no information at all – you're staring at a wall). The non-flashcard info reduces desire to learn what's on the flashcards. 3. On these Tsinghua walks I had about 100 flashcards which I cycled through. Using sets of 10, as I said, provides more sense of accomplishment. I've also had about 20 Chinese-speaking lessons while walking around. The walking made the lessons more pleasant, yes, but it wasn't nearly as enjoyable as the treadmill/flashcard combination. And because lessons with a tutor are intrinsically more enjoyable than studying flashcards, the increase in enjoyment was less dramatic.

As I [5]said earlier I think there's an evolutionary reason for this effect: The thirst for knowledge (= novelty) created by walking pushed us to explore and learn about our surroundings. One interesting feature of my discovery about treadmill and flashcards is that it may take better advantage of this mechanism than did ordinary Stone-Age life – better in the sense that more pleasure/minute can be derived. In the Stone Age, novelty, new dry knowledge, was hard to come by. You could only walk so fast. After a while, it was hard to walk far enough away to be in a new place. Whereas I can easily switch from flashcards I've learned to new ones. An example of a [6]supranormal stimulus.

David (2010-12-15 20:03:11)

How fast do you go while doing the flash cards? Have you ever tried the Rosetta Stone software? I find it much more useful than simple flash cards since it involves more of the senses and is well done. It would be hard to pull off with a laptop, but treadmill + rosetta stone would be interesting. A well executed ipad app would probably work better.

Seth Roberts (2010-12-15 22:17:54)

I walk about 2.5 miles per hour. I haven't tried Rosetta Stone. Because the whole thing has become enjoyable there's no need (yet) for things that make it more pleasant, such as picture and sound. Flashcards allow a really clear sense of accomplishment plus later testing and recording (I can mark on the flashcard itself how well I did). I thought Anki would be an improvement over flashcards but now I think the ease of use of flashcards compensates for the several advantages of Anki. An ipad app with continuous high-quality feedback would be good. I haven't come across a language-learning program with good feedback. Anki has terrible feedback.

Steve G. (2010-12-16 08:40:37)

Perhaps you've seen or posted on this before (<http://www.youtube.com/watch?v=VdheWK7u11w>), but your description of how you learn you characters reminded me of this clip that I'd seen in the past from Alexander Arguelles about one of this language learning techniques. Similar mechanisms at work here? Thanks for the interesting post.

Tom Moertel (2010-12-16 12:55:00)

I suspect that there's a strong natural-selection benefit to being aware of your surroundings, to quickly taking in new territory " threats? food sources? " and to detecting changes in familiar territory. Since walking is what would have exposed early humans to their surroundings, we can predict that walking would have, over time, evolved to engage the brain's capacity to observe, store, recall, and compare. To continue this line of thinking, when walking outside, this capacity would be put to its intended use. We wouldn't notice it because, operating as evolved, it would feel completely normal. But when walking on a treadmill, this capacity would be engaged but unused and, we might predict, foster a sense of boredom. This hypothesis explains why flash cards " something to observe, store, recall, and compare " would seem so fulfilling on the treadmill: this engaged but previously unused capacity is finally given an outlet. One interesting experiment would be to control for exercise effects by comparing walking to, say, low-intensity bicycling for flash-card memorization. Since bicycling is something we would not expect to have been part of human evolution, we would expect it to be less effective than treadmill-walking for this purpose.

jewel (2010-12-19 17:54:36)

Great book that references how our bodies (and activity) help us learn <http://marciaconner.com/learnmorenow/toc.html>

James Hayton (2010-12-19 18:35:59)

I think there's something about the rhythm of movement that helps to cut out distraction and set the right frame of mind for learning. I've found reading on an exercise bike is fantastic, but never tried it with language learning (I memorised most of the Japanese katakana, but it was so boring!). Will definitely try this one

Justin Cancino (2010-12-19 18:59:18)

This is a great motivational read for me. I'm moving to Beijing in 4 months and I've been trying to stick with a program whether it be Rosetta Stone, Live Mocha or the many Mandarin books I have, but it gets old for me really quickly. This is something I can do while on the bike at the gym to help the time go by and hopefully help me pick up my Chinese a bit faster. Thank you!

Justin Cancino (2010-12-19 19:00:16)

Oh, I forgot to ask, where are you getting your characters on the flashcards from? I have a few good sources online but I'm always looking for new ones.

Dave Hamel (2010-12-20 09:09:27)

I don't know if it is true or not, but I heard once that Mao Zedong taught his soldiers to read by pinning characters to the back of each soldier. Each soldier know the meaning for their word and tell it to the soldier behind them. While marching each soldier would be reading the symbol in front of them over and over. Rote learning at it's finest.

steelweaver (2010-12-20 12:41:51)

This reminds me of the rocking motion you see Jewish and Islamic students adopting whilst reciting/memorising scripture - always appeared to me to be a adaptive response to the unnaturally static mental and physical intellectual experience. If you want to go down that route, of course, there's also a possible link to the kind of rocking / repetitive movements you see in traumatised children / animals kept in cages. Walking sounds like a much less maladaptive response to me! I'm gonna give it a try.

Henk Poley (2010-12-26 16:05:51)

Interesting. Personally I would relate it to walking meditation. Our long running forefathers would need to get and remain focussed when running. So the pacemaker rhythms used during walking probably calm some distracting brain centres.

Kolja (2010-12-27 09:32:13)

I noticed a similar thing. Before exams I now always wander through the woods (many paths, not many people, so distractions are not too numerous). I started off with flashcards and quickly discovered the "few at a time"-rule. By now I use the Mental Case iPhone App (no affiliation). It does a similar thing and repeats only a few cards until you get them right, although it switches them out one by one. I think it has to do with giving the moving parts of my body something to do while my brain can concentrate on information. I get really restless after a few minutes of dry learning while sitting, but a three-hour walk per day does wonders to my marks and is still pleasant. I can't compare it to a treadmill though, as I don't have one and don't want to learn in a gym.

## **Walking and Learning in Rats (2010-12-16 21:55)**

[1]Yesterday I blogged that walking on a treadmill made studying flashcards enjoyable. I also felt my retention was noticeably better than when I studied sitting or standing in one place.

Thanks to Matt Weber I learned of a rat experiment that supports the idea I was more retentive. Long-term potentiation (LTP) is a long-lasting (hours) change in synapse properties caused by a certain type of electrical stimulation from electrodes. [2]Leung et al. measured the amount of LTP produced by the electrodes when rats were in one of four states: (a) walking, (b) immobilized, (c) short-wave sleep, (d) rapid-eye-movement sleep. They found clear LTP in all four states, but the LTP was much larger (50 % larger?) when the rats were walking during the stimulation. During the other three states the LTP was about the same.

The walking and immobilization conditions must have differed in many ways. Perhaps immobilization was uncomfortable. Perhaps it required more handling. And so on. Comparing just those two states, you might wonder if (a) walking produces changes that cause things to be remembered better or (b) any of the other walking/immobilization differences made things worse (e.g., the shock of handling reduces learning). The fact that immobilization and the two sleep states produced similar results argues against the second sort of explanation.

1. <http://www.blog.sethroberts.net/2010/12/15/walking-creates-a-thirst-for-dry-knowledge/>

2. <http://www.jneurosci.org/cgi/content/short/23/28/9297>

---

jeff borsato (2010-12-17 08:12:31)

Seth, Recent story about a man who ate nothing but potatoes for 2 months and lost weight, good interview over at Stephan's blog, this seems to correlate with the idea you have espoused before about bland foods, in this instance taken to an extreme: <http://wholehealthsource.blogspot.com/2010/12/interview-with-chris-voigt-of-20.html>

brian (2010-12-18 04:32:57)

This is obvious to me so it is nice to see others thinking and researching this phenomenon. People pace when they think because it increases the effectiveness. I have been doing it my whole life. I speculate this accomplishes two things. One, greater blood flow which probably helps the brain. Two, if the brain and body are occupied in motion, the brain may be less distracted than otherwise.

Yuri (2010-12-19 22:23:10)

I believe walking improves brain function because of, well, danger. Think of our ancestors walking in the forest full of hostile creatures: they had to be super-alert all the time, and after the trek for food find their way back. Thanks for the insight, it will be useful (I'm into improving memory).

### **Quips From A Mall (2010-12-17 15:49)**

I downloaded this week's [1]This American Life (Scenes From a Mall) just to hear one little snippet again. Ira Glass asked three eighth-graders about the economy.

GLASS Has the recession affected the three of you?

GIRL 1 What!? "Recession"? What does recession mean?

GIRL 2 That's a big word.

GIRL 1 We're not the smartest people here.

1. <http://www.thisamericanlife.org/>

---

Alex Chernavsky (2010-12-17 22:02:36)

Reminds me of Jay Leno's excellent "Jaywalking" segments.

### **Self-Experimentation as Legal Gambling (2010-12-19 03:13)**

Listening to [1]Freakonomics Radio on lottery-like savings accounts reminded me of a big reason I self-experiment: it resembles buying a lottery ticket. Whenever you collect data I believe there is [2]a power-law distribution of benefit: large chance of little benefit, small chance of large benefit. (Your sophistication and other things affect the slope.)

Almost all data confirms what you already knew – small benefit. A very small fraction of data gives you a new idea – large benefit. Because self-experimentation is about oneself, new ideas can have tangible benefits, just as winning the lottery provides tangible benefit (money)

Basically I hope for outliers – a sudden jump up or down in something I'm tracking, such as arithmetic speed or sleep duration. This may give me a new idea about what controls that measure. Self-experiments are also valuable because something I'm not deliberately measuring may change. When I started watching faces on TV in the morning to see if it would affect my sleep, my mood, which I wasn't deliberately measuring, suddenly improved.

It really does feel like playing the lottery for free. To not make a measurement I could easily make feels like walking by a perfectly good lottery ticket lying in the street. Loss aversion sets in.

1. <http://freakonomicsradio.com/>

2. <http://www.sethroberts.net/articles/2010%20The%20unreasonable%20effectiveness%20of%20my%20self-experimentation.pdf>

---

Mark (2010-12-19 21:55:45)

Hi Seth, I love your approach of self-experimentation and I'm a big advocate for it. I don't know if the relationship between male testosterone levels and abstinence has been brought to your attention. People who abstain report improved brain function, strength, mood, overall energy and focus. A Chinese study found that men's T peaked after 7 days post-ejaculation [the study seems to have stopped soon after, there is no data it seems regarding abstaining for longer periods]. Similar to your SLD forums, there is this massive forum thread in which hundreds of guys testify to these effects: <http://www.sosuave.net/forum/showthread.php?s=060780d57fe8bcad7e90e782d797c32c&t=20053> It would be great if you could give this topic attention. Many people dismiss it since it doesn't go well with popular belief, but in my opinion the experimental evidence of all of these forum posters is too much to ignore.

Darrin Thompson (2010-12-20 07:51:31)

Data collection always seems like such a lot of work to me. You explained very well why people do it. It reminds me of my own twisted relationship with Google Reader. Except there's a large chance I read mostly mundane stuff. There's always those times where I learn something really interesting or useful. Not too often but enough to keep me, what, addicted? I'll never admit to that. I expect that the random timing of the big benefits strengthens the motivation.

Seth Roberts (2010-12-20 08:07:53)

Mark, thanks, I didn't know about that. "the random timing of the big benefits strengthens the motivation." Good point. Learning psychologists such as me know very well that partial reinforcement (e.g., rewarding only 25 % of bar presses) produces great resistance to extinction than 100 % reinforcement.

Alex Chernavsky (2010-12-20 14:28:22)

Seth, what do you see as the path from your (or anyone's) initial self-experimentation all the way to acceptance by the larger scientific community? In previous comments, you seem to have down-played the importance of replicating your results – or, at least, of scaling-up studies to use larger sample sizes. So... where is one to go after discovering something new in oneself?

Seth Roberts (2010-12-20 18:07:40)

Alex, the path to wider acceptance is to find out if it is true in other people. I believe that is best done by starting small, the smaller the better. It is a poor idea to do big studies before you have done small studies. That doesn't mean big studies are bad

or unimportant; it means small studies should be done first. Maybe my preference for starting small is why you interpreted earlier comments by me as "downplaying the importance of replicating [my] results" which is not true at all. I think it is very important to learn to what extent the results can be repeated.

### Three Observations About Walking and Learning (2010-12-21 00:47)

1. Studying Chinese-character flashcards while walking on a treadmill is [1]as pleasant as drinking something when thirsty. Unlike actual thirst and drinking, the pleasure lasts a long time and the desire is under your control (to turn it on, you start walking; to turn it off, you stop).

2. What is the opposite of betrayal? There is no antonym. The opposite is so rare it isn't even obvious what it is. Betrayal is when your friend becomes your enemy; the opposite is when your enemy becomes your friend. Living in China and not knowing Chinese was not exactly my enemy but it was certainly negative. This treadmill discovery turns it into a positive: Chinese becomes an inexhaustible source of dry knowledge that I can enjoy learning.

3. Learning is the central theme of experimental psychology and perhaps all academic psychology. Psychology professors have done more experiments about learning than anything else. Practically all of those experiments have been about efficiency of learning: The amount of learning (e.g., percent correct) in Condition A is compared with the amount of learning in Condition B, where A and B "cost" about the same. As a result, we know a great deal about what controls efficiency of learning, at least in laboratory tasks. I think many psychologists are surprised and disappointed that this research has had little effect outside academia. I have never heard a good answer to the question of why. If you'd asked me a month ago I would have said it's because they haven't discovered large non-obvious effects. That's true, but says nothing about how to discover them.

My treadmill experience suggests a more helpful answer: Hedonics matter. Learning exactly the same material can be more or less pleasant. When Learning X is pleasant, it is learned easily; when Learning X is unpleasant, it is learned with difficulty or not at all. In the real world, hedonic differences matter more than efficiency differences. If they want to improve real-world learning, psychologists have been measuring the wrong thing. It is a hundred times easier and ten times more "objective" (= "scientific") to study how much has been learned than to study how pleasant was the experience. But that doesn't mean it is better to study.

[2]Michel Cabanac, a physiologist, strikes me as someone on the right path. Cabanac has studied how the pleasantness of this or that experience goes up or down to help us properly self-regulate. A simple example is that cold water feels more pleasant when we feel hot than when we feel cold. A common example is that exactly the same food becomes less pleasant during a meal. The food doesn't change; we change.

1. <http://www.blog.sethroberts.net/2010/12/15/walking-creates-a-thirst-for-dry-knowledge/>

2. [http://www.fmed.ulaval.ca/ap/francais/chercheur/chercheurs/CABANAC\\_Michel.htm](http://www.fmed.ulaval.ca/ap/francais/chercheur/chercheurs/CABANAC_Michel.htm)

---

ET (2010-12-21 16:10:48)

Why wouldn't you say that faithfulness or loyalty are the antonyms of betrayal?

Seth Roberts (2010-12-21 16:26:01)

loyalty isn't the opposite of betrayal because loyalty is a state (like being warm), betrayal is an action. The opposite of Action X

is another action.

ET (2010-12-22 02:17:41)

You can actively loyal.

Hal (2010-12-22 09:28:40)

Seth, you say that "large non-obvious effects" for enhancing learning/memory just haven't been discovered. This in-press paper that I just ran across today presents some of the first serious data I have seen about what learning-method recommendations are and are not obvious. The paper concludes that a number of effective interventions are not obvious at all to the average person (or at least to the average Goucher College student) : <http://www.springerlink.com/content/h5lk98203r440713/> Effect size is another issue—I think the effect sizes are often pretty large, but that's a more complicated discussion...

Seth Roberts (2010-12-22 14:54:41)

Hal, I can't get access to the whole Goucher College article. But I wonder if it assumes that interventions effective in the lab also work outside the lab. In lab experiments, of course, the subjects (students) have to study the to-be-learned material. An unpleasant method of study may be more effective than a pleasant method of study in the lab but outside the lab pleasantness matters and a student may be less likely to do an unpleasant method. When the student predicts "wrongly" the effectiveness of Method X, it may be that the student, unlike the author of that article, is taking pleasantness into account.

## **Cold Shower Report (2) (2010-12-21 16:28)**

After learning that [1]cold showers can raise mood, I started taking cold showers. [2]The mood improvement was hard to notice but it was easy to notice that I became more comfortable in the cold. My apartment seemed warmer.

To increase the effect, I increased the water flow (by unplugging shower-head holes that were clogged) and lowered the water temperature (running the water several minutes before starting the shower). The water was obviously colder and its effects larger. Now the showers did raise my mood, for maybe an hour. It was curious how they were unpleasant for only a second.

After a week or so of the colder showers, it became clear, alas, that my weight was increasing. I gained about 2 pounds. There was no obvious explanation for this other than the cold showers. I hadn't changed my diet in a big way. I hadn't changed my activities. And there is plenty of evidence that skin temperature controls body fat. For example, a study of three types of exercise (stationary bike, walking, and swimming) in women found that the women who biked and walked lost weight but the women who swam did not, in spite of equal fitness improvement. So I have stopped the cold showers.

1. <http://www.blog.sethroberts.net/2010/11/27/cold-showers-raise-mood/>

2. <http://www.blog.sethroberts.net/2010/12/03/cold-shower-report/>

---

vic (2010-12-21 16:46:37)

wow, 2 lbs.? for me, any change less than 5 lbs. is experimental noise...

Nancy Lebovitz (2010-12-21 17:01:48)

Why did the mood improvement seem clearly less valuable than the weight gain?

nathan (2010-12-21 17:05:02)

I wonder if you can reduce the weight-increasing effects of a morning cold shower with an evening hot soak or steam?

troy (2010-12-21 17:07:10)

I started taking cold showers during a period where I was getting very little sleep. I found them to be kind of addictive, refreshing and a nice surrogate for a cup of coffee before leaving the house. I've always been a believer that taking a splash in a body of cold water is one of the most invigorating and natural human enterprises. A short swim in cold water also happens to erase a hangover. Never noticed any weight gain. In the coldest months of winter I usually find they don't have the same appeal. But from May-September I probably could count on one hand the number of hot showers I take.

Petra (2010-12-21 19:13:29)

It is disturbing news for me. As I just got into terms with Tim Ferriss (4hourbody) experiments that cold water makes the body loose fat more quickly. Did I get it wrong? Warm regards, Petra

Greg (2010-12-21 19:33:01)

Having authored a chapter in it, presumably you read The Four Hour Body. What did you think of Tim coming to the opposite conclusion and recommending cold exposure for fat loss?

Alex Chernavsky (2010-12-21 19:35:04)

This is one intervention that I think I won't even try. I've taken a few cold showers in my life (not by choice) – and, unlike Seth ("they were unpleasant for only a second"), I found them to be miserable the whole time.

David (2010-12-21 19:51:56)

Seth, Since you have a masochistic streak, you might try sleeping on the floor (i.e. with only a yoga mat or carpet for padding). I started that a while back to address some lower back pain and kept it up even after the back pain went away. I'd be interested to if you find any measurable effects. All I can say is that I ended up kind of liking it (and in fact I should start doing it again). Unlike you, I'm too lazy and disorganized to collect the necessary data (mood is too hard for me to quantify, for example). David

Wyman Brantley (2010-12-21 19:53:50)

Paul McGlothlin, author of "The CR Way," mentioned yesterday on the Calorie Restriction discussion list that he tried cold showers "but stopped the practice immediately when I found that they play havoc with glucose control when eating afterwards. Measuring subsequent meals with my trusty glucometer told the tale." He didn't explain exactly what the phenomenon entailed, but the potential for a connection with weight gain is intriguing in the present context.

Nathan Myers (2010-12-21 23:01:53)

If the weight gain is a one-time event, so it stabilizes after the initial increase, what's the harm? If you feel warmer, and therefore turn down your thermostat, you're burning more calories just being there.

SDG (2010-12-21 23:15:11)

Tim Ferriss, in his recently released book The Four Hour Body, actually recommends taking cold showers as a way to increase weight loss- [http://www.nypost.com/p/news/opinion/books/the\\_4hour\\_body\\_DO5FDjwAeNFVrFfMvEnvoJ](http://www.nypost.com/p/news/opinion/books/the_4hour_body_DO5FDjwAeNFVrFfMvEnvoJ)

Ahrand (2010-12-22 02:12:33)

David, maybe it was a residual effect from being more connected to the earth's electrical potential ? You could test this by walking barefoot over wet grass (morning dew) and see if you have the same effects.

D (2010-12-22 08:51:49)

I'm working my way through Ferriss' book and have taken two ice cold showers. This news (from Seth) is disturbing!

Kenton A Hoover (2010-12-23 23:30:48)

While you might not have noticed a change in your diet, you probably were eating more. Cold water exposure does that, and it's one reason for the swimmer effect.

Alex (2010-12-25 15:13:13)

I'm sure Seth is aware of the 4 hour body book, since he's actually in the book :)

Seth Roberts (2010-12-25 22:07:37)

In the Four Hour Body, Tim recommends a regimen quite different than what I did. Cronise, from whom Tim got the idea, started like this:

He drank a gallon of ice water between waking and 11 A.M.; he slept with no covers; he took midwinter "shiver walks" of 20-30 minutes with nothing but a T-shirt, earmuffs, and gloves on his upper body. He later found less painful options, but the results were undeniable. He lost almost six pounds in the first week.

I took a 4 or 5 minute cold shower daily – that's all. I am not sure they caused weight gain but my weight started going up shortly after I started them and started going down soon after I stopped them. Tim's milder recommendation is to use an ice-pack on the back of the neck for 30 minutes. Perhaps cooling the blood going to the brain (ice pack) is quite different than cooling all of your skin (what I did).

Ahrand (2010-12-30 14:03:21)

Another easy cold exposure is to wash your hair (just holding your head under the water, not your body) with ice cold water. Much better for your hair than warm/hot water by the way...

Edward (2010-12-31 09:52:27)

Are you sure that the 2lbs was fat gain? I agree with Vic that, for me, 2lbs seems like just normal variation. And for me any weight change would have to be a lot more than 2lbs to have any idea whether the weight change is from increased fat vs muscle vs water retention.

Seth Roberts (2010-12-31 17:35:41)

Edward, it looked nothing like normal variation. It looked like a steady increase. It certainly wasn't increased muscle. I wasn't doing anything to cause increased water retention but I can't easily rule that out.

Josefina (2012-02-16 20:08:35)

I feel your body did not have enough fat to be exposed to cold shower so it added fat to balance it out. Right?

### **Chinese Economics Joke (2010-12-22 07:16)**

Person A to Person B: "See that piece of shit? If you eat it I'll give you 100 million yuan."

Person B eats the shit.

But Person A doesn't want to give him 100 million yuan. He says to Person B: "How about I eat shit too? Then we'll be even."

Person B agrees.

Person A eats some shit. "Now we're even," he says.

They have just increased GDP by 200 million yuan.

---

Paul (2010-12-22 08:16:09)

So, is China really much poorer than GDP figures would lead one to believe?

Michael (2010-12-22 09:19:59)

Ho Ho! Shanghai now has some of the most overvalued real estate in the world. Just wait until the Chinese real estate market goes pop.

Seth Roberts (2010-12-22 15:09:50)

Paul, this joke reflects the common belief that the government cares too much about GDP and too little about living standards. For example, a lot of Chinese GDP involves infrastructure – building roads for example. A little-used road contributes little to living standards. So it is complicated. A well-used road contributes a lot to living standards in the future.

Organism as a Whole (2010-12-22 20:12:04)

Yeah, China cares too much about GDP. Whenever I watch the Chinese news, they constantly talk about how the GDP is improving. GDP is a flawed measure. I wrote an article in 2008 about the flaws of GDP: <http://anarcho-mercantilist.blogspot.com-/2008/11/economics-of-state.html>

BK (2010-12-23 10:59:14)

You could make the same argument for the US re: GDP. I think it also illustrates the confusion of cause and effect in economics. It seems the current administration and many before it, believe that consumption drives economic growth ("go out and spend and help the economy"). It's economic growth, through savings and production that drives consumption.

TomGinTX (2010-12-24 13:10:06)

The joke is wrong, even in joke terms. They increased GDP by zero. If both had eaten, and each paid the other 100M yuan, \_then \_ GDP would have increased by 200M yuan.

Roger Sweeny (2010-12-24 18:54:56)

Person B gave person A an IOU with a face value of 100 million yuan. Person A later used it to pay his new debt. Hey, it works for Social Security. Oh, wait...

Nathan Myers (2010-12-24 19:46:19)

This like my favorite Polish joke. — Stan and Lev are walking home from an evening out, a bit unsteadily. Stan spots a little frog by the side of the road, and says, "Lev, I'll bet you five zlotys you won't swallow that frog." Lev is thinking how he has spent too much, and how an extra five zlotys in his pocket would make for an easier morning at home. He snatches the frog and gulps it down. Stan hands over the money, and they walk on. As they walk, Lev imagines he feels the frog jumping in his stomach. He starts to resent having been tricked into swallowing a frog. After a few minutes, he spots another frog, just a little bigger, and says, "Stan, I'll bet you five zlotys you won't swallow that frog." Stan is thinking that he really hadn't expected Lev to swallow the frog, and that he really couldn't spare the money. He swallows the frog. Lev hands back the five zlotys, and they walk on,

each lost in his own thoughts. A few minutes later, Lev turns to his friend and says, "Stan, why did we swallow those frogs?" — I gather that "swallow a frog" sounds really funny in Polish.

Six Ounces (2010-12-26 02:25:38)

Chinese reports of their GDP are about as credible as the reported age of their female Olympic gymnasts. Find evidence to the contrary of any reported figure, and it will magically begin disappearing on official government websites.

Sunshine (2011-07-02 22:46:16)

At last! Someone who understands! Thanks for posting!

### **Rich and Poor Students: How to Distinguish (2010-12-24 07:17)**

At Tsinghua University, there is a great range of wealth among students. Some are from very rich families, some from very poor. I asked a friend how to distinguish rich students and poor ones.

"At the student store, rich students buy things that cost more than 15 yuan [2 dollars]," she said.

I asked another student the same question.

"By their shoes," he said, "especially sports shoes." Poor students wear Chinese brands you've never heard of. Rich students wear American brands.

Like my friend's answer, this surprised me. At [1]the Beijing Zoo, I paid \$10 for Nike shoes that cost \$100 in America. Yet when visiting America, Chinese people I know have bought Nike shoes, because genuine Nike cost less in America than in China. So the American shoes of the rich students are probably genuine (> \$100) and the Chinese-brand shoes of the poor students cost less than \$10 (< \$5?).

1. <http://www.blog.sethroberts.net/2009/01/10/beijing-shopping-clothes-at-beijing-zoo/>

---

Nacho (2010-12-24 12:02:20)

Well that makes sense... I love Converse All Star, there are imitations anywhere you look around, you can buy fair enough well done converse alike shoes in Zara (one of many brands). I still buy converse, because Converse All Star represents not only a pair of shoes, but a piece of history, a philosophy of the brand and because they keep the same level of quality in their products and you now they will keep doing so, and selling converse all stars in different formats, colors, etc. But you don't know what goes on with the imitators, will they continue doing the imitation if converse goes out of business, will they keep the quality, etc? That is why if I am able to buy the original, I will go for the original... Obviously it's different with really expensive brands as I don't have that much money, so then if I want something really expensive that I like I would go for something similar much cheaper (one has his/her own limitations), but not an exact imitation of the brand because I feel as a creative person than doing so I would damage the original brand somehow. I don't know if for you this makes any sense at all, but is the best I can explain these ideas right now... By the way I am from Spain and I buy my converse all star from UK as they are much cheaper over there, they are even cheaper in US but with the costs of sending them from US to Spain is not so cheap. And Zara is a brand from Spain, so is much cheaper here than US. I'm saying all this because you might find in US that there is such not that big difference in price between Shoes in Zara and Converse or that Zara shoes are much expensive than Converse (I don't know

as I never bought anything from Zara in US meanwhile I was around US at some point).

denshil (2010-12-30 02:08:40)

I don't agree with them on how to distinguish. I think that rich students sometimes have better education, some of them can play music like piano, or can draw. In art school, many students are rich, they use iPhone, LV... Nike is not special item in Tsinghua, I am not rich, but I have Nike and Adidas.

## **Unexpected Christmas Presents (2010-12-24 20:53)**

This year I got two:

1. I taught a class about R and data analysis. On Christmas, one of my students wrote, "Thanks for what you taught us on the class. I love your class. I learnt a lot!" I hadn't taught it before. A few weeks ago I had been abashed to discover [1]a midterm exam from Phil Spector's R class at Berkeley. I know Phil and like and respect him. His students had learned a lot more than mine, it seemed. I had consoled myself by thinking that I couldn't answer some of the questions.

2. Cleaning a cupboard, also on Christmas, I found a "gift" derived from buying a water heater in March. (Buy the water heater, get the "gift".) It looked like an ordinary glass teapot, which is why I had put it in semi-storage. When I opened the box I discovered it wasn't. [2]It has a basket where you put the tea and hot water; when the tea is ready you press a button that releases the water into the bottom of the teapot, stopping the brewing. I drink a lot of tea. A month ago I barely knew these things existed. Then I bought one and thought it was wonderful – but small. The uncovered one is the perfect size.

1. <http://www.stat.berkeley.edu/users/spector/s133/midterm-anno.pdf>

2. <http://frshgrnd.com/2010/07/sama-tea-pot/>

---

Gunnar (2010-12-25 10:39:46)

Happy holy days to you Seth and the readers! Hopefully Mr. Spector's students have fewer other stuff to learn to reduce their burden ;-)

Laura (2010-12-25 18:21:06)

GO BEARS!!

## **My Theory of Human Evolution (Caganers) (2010-12-25 16:18)**

[1]A nativity scene in Barcelona:

He is known in Catalan as the caganer. That translates most politely as 'the defecator' - and there he is, squatting under a tree with his trousers down.

At the nearby Christmas market amid the sprigs of holly and Santa hats rows of miniature, crouching country boys are lined up for sale.

Innocuous-looking from the front, their buttocks are bare and each one has a small, brown deposit beneath.

"It's typical of Catalonia. Each house buys one for Christmas," explains Natxo with a smile and a shrug as he shops. "I don't know why (we do it), it's just a tradition."

Without Christmas, there would be much less demand for these intricate items. I believe the evolutionary reason for festivals and ceremonies is that they create demand for hard-to-make goods. This helps the most skilled artisans (good sources of innovation) make a living and hone their skills.

Via [2]Marginal Revolution. [3]Christmas: an evolutionary explanation.

## Another Mysterious Mental Improvement (2010-12-28 07:35)

[1]

This graph shows results from a test of simple arithmetic (e.g.,  $7-3$ ,  $4*8$ ) that I did once or twice most days. Starting in August, I improved about 9 % (from 600 to 550 msec/problem).

I don't know why I got faster. In early September I moved from Berkeley to Beijing. After the move there was an especially sharp decrease. The increase in October was due to [2]an experiment in which I reduced flaxseed oil/day.

I noticed the decrease after I got to China. At first, I thought it was due to a dietary change – [3]perhaps more walnuts. I stopped eating walnuts and the improvement didn't go away. So it's not walnuts. It's not butter; for the first few months in China, I ate the same butter as in Berkeley.

I can't think of any plausible conventional explanation (e.g., [4]blueberries). Here are the most plausible explanations I can think of:

1. Less aerobic exercise. In China I get much less aerobic exercise than in Berkeley.
2. Less vitamins. In China I consume less vitamins than in Berkeley.
3. Warmer. My Beijing apartment is warmer than my Berkeley apartment. Showers in Beijing are warmer than baths in Berkeley.

In each case the change (e.g., less exercise) could have started in Berkeley. The last one (warmer) is not just the strangest, it's also the most plausible. Unlike the other two, evidence supports it. Fact 1: When I started heavy-duty cold showers my scores started to get worse. Fact 2: When I stopped cold showers, the scores returned to their pre-cold-shower level. Fact 3: When I moved to China it was very hot, which would explain the sharp decline at that time.

---

neuroscan (2010-12-28 09:11:27)

Seth, just a note to say that as a fellow cognitive psychologist, I really appreciate all the info on your site! However, looking at the figure above, I am unable to see the pattern that you describe. If you were to add a trend line to the data, I bet you would see it pretty much describing a straight line which declines from around 620ms in June to perhaps 550ms in January. This would imply that your improvement is independent of geographical location, so perhaps you are simply getting better at these types of tasks. Am I missing something? Regards, neuroscan

Joseph Dantes (2010-12-28 09:23:44)

Bravo. I too notice that winter productivity really takes off, when I can wear warm clothes and work in a cold room. I recently replaced fruit and much of my carb intake with lots of boiled eggs to maximize testosterone production. The extra fat calories successfully killed most carb cravings. The eggs seem to allow a much higher mental labor endurance. I'm collecting data at the moment but not processing it, but anyway the change is dramatic enough to notice unaided.

Seth Roberts (2010-12-28 13:01:35)

neuroscan, the usual line I use to summarize this data (lowess in R, using the default parameters) is flat from March to July, then declines. I thought that was misleading because the months-long decline doesn't start until August. So I omitted it. As you say there might be a small increase and decline in June (in China). Maybe due to too-old flaxseed oil. The August-September decline isn't due to practice because before the decline the scores were roughly flat for about a year (August 2009 to July 2010),

except for a sudden improvement apparently due to butter. For example, compare March and July.

Zans (2010-12-28 20:39:11)

Seth, would you be interested in testing the effects of hotter-than-normal showers?

Seth Roberts (2010-12-28 20:43:09)

Zans, yes. I am curious about the effect of showers. Hotter than normal showers would be unpleasant so I may try (a) varying how often I shower (twice/day instead of once/day), (b) varying the length of showers (e.g., 2 minutes versus 10 minutes), and (c) very cold showers (again).

Zans (2010-12-29 00:42:45)

Those would be some worthwhile experiments. I've tried looking up information on how showers affect one's health last year but there was very little literature on the subject. Have you tried varying the time of day when you take the shower as well? Speaking of cold showers, do you still think there might be some benefit to them, or are you mainly checking if the new results are consistent with the old ones?

Seth Roberts (2010-12-29 04:39:40)

I haven't tried varying the time of day I take the shower. Since the effect appears slowly (over days) it's hard to see why time of day would matter. I want to try cold showers again to see if I get the same results. That such a thing could affect mental speed is a new and intriguing idea.

Kirk (2010-12-29 09:09:15)

I tried cold showers for a week but abandoned them after realizing they made me extremely sleepy about 2 hours afterwards. It was the oddest thing. Cold shower at 7am, which was stimulating for about an hour, a big cup of coffee at 8am, as usual, and then by 9am it was time for a nap.

q (2010-12-30 21:20:41)

if your brain were really working well, it would be able to figure out why.

David (2011-01-04 02:54:07)

What rules out a long term or cumulative benefit from higher butter consumption?

Seth Roberts (2011-01-04 06:53:59)

David, the effect of butter was immediate. It did not get larger over the following months.

jsh (2011-01-22 11:40:39)

My first assumption would be that moving to a totally different living environment causes your mind to sharpen up. You get a lot of brain-gym even at the grocery store trying to figure out what thing are edible. And the performance gain on august before moving, increased overall alertness due anticipation. Another thing that comes to my mind is that if you've been learning chinese writing(even subconsciously) perhaps you've got totally another strategy to "solve" the arithmetics, precisely, you now use your language skills and see "4\*8" as one symbol that can be translated to 24 and don't really do math anymore, or something. One is a bit too small sample to rule out these.

Seth Roberts (2011-01-22 17:19:10)

jsh, according to your brain-gym explanation, my scores should get worse when I move back to Berkeley. We'll see.

## Do Fermented Foods Shorten Colds? (2010-12-29 15:11)

Alex Chernavsky writes:

I had an interesting experience recently. On Thursday afternoon, I started feeling a little run-down. Then I began to sneeze a lot, and my nose really started to run. I thought I was coming down with a cold. I took an antihistamine and felt a little better. I woke up Friday morning with a mild sore throat (the sneezing/runny nose had stopped). Within a couple of hours, my throat wasn't sore anymore – and I haven't felt sick since then. In summary, I believe I had a cold that lasted less than 24 hours. This almost never happens to me. Typically, my colds last at least a week, and usually more (and I usually get two or three colds per year). There is only one other time in my adult life [he's in his forties] when I can remember having a very short-duration cold.

Maybe it's the fermented foods I'm eating. After I started reading your blog, I began to brew my own kombucha, and I drink it every day. I also sometimes eat kim chee, fermented dilly beans, fermented salsa, umeboshi plums, and coconut kefir.

This was the first cold he's gotten since he started eating lots of fermented foods in June. I believe the correlation reflects causation – the fermented foods improve his immune function. The microbes in the food keep the immune system "awake". I also believe that Alex's colds would become even less noticeable [1]if he improved his sleep.

1. <http://escholarship.org/uc/item/2xc2h866>

---

Alex Chernavsky (2010-12-29 15:43:18)

Yeah, I confess that I'm chronically sleep-deprived. I also forgot to mention in my e-mail to Seth that I eat miso soup, as well. Actually, most of this stuff tastes so good that I'd eat it even if I didn't believe that it had positive effects on my health.

Seth Roberts (2010-12-29 19:49:10)

I knew nothing about Alex's sleep when I made that comment.

Nathan Myers (2010-12-29 22:53:08)

I have been told that, usually, a cold that lasts only one day is really food poisoning. I don't understand where the sore throat would come from in that case.

Wyman Brantley (2010-12-30 07:56:08)

The short cold/sore throat thing seems to be a strain that is going around. My spouse and I both had it, and while I eat a fair number of things fermented (thanks from me, too, to Seth) my spouse eats close to none, yet the effect of the "cold" on both of us was comparably mild.

### Which Should You Trust: Scientific Literature or Anecdote? (2010-12-30 19:36)

In a comment on [1]a BMJ paper critical of alternative medicine (the author submitted a fictional abstract to a conference then criticized the program committee for not rejecting it), [2]a retired chemist named Joe Magrath said:

The scientific literature tells us that acupuncture, cupping and reflexology are all nonsense.

I haven't looked into it but I'll take his word for it.

Around the time Magrath said that, [3]James Fallows said this:

During our years in Malaysia in the 1980s, and more recently in China, my wife and I became unlikely converts to a lot of Asian medical practices. I had serious back pain cured by an acupuncturist (who used needles the size of aluminum baseball bats) in Kuala Lumpur. In [4]her book, my wife describes how the gruesome-seeming therapy of [5]fire-cupping, applied in an all-night massage parlor in the city of Yueyang, snapped her out of a serious bout of the flu. Sure, she had big red welts on her back for the next ten days, but her fever was gone!

Which do you believe?

Joseph Dantes (2010-12-30 20:51:54)

I believe I know little, and that placebo effects are large, and that our physiologies are depressed compared to their paleo potential.

sinophile (2010-12-30 21:52:46)

My understanding: Chinese wouldn't waste money on this stuff for thousands of years. The benefits of these treatments must outweigh the costs.

Michael Meadon (2010-12-31 01:06:12)

That's... really easy. <http://ionian-enchancement.blogspot.com/2010/06/anecdotes-as-evidence.html>

Jake (2010-12-31 03:16:31)

After reading your blog for the past months, I have learned the only true science is the science that works for you. Research papers are only suggestions for you to try.

Tom Moertel (2010-12-31 15:57:05)

I'm with Jake, especially when it comes to medical science. Because of the way most medical research is done, with an emphasis on group studies, individual differences and their consequences are not well understood. Doctors don't seem equipped to take advantage of evidence that doesn't fit an established pattern, especially if it's weak evidence. That's one of the reasons I think self-measurement and -experimentation seem to be so effective at improving health outcomes: medical science has a big hole in it, and if you fall into it, there's a good chance it's because of how you don't fit established patterns. Studying your differences from the norm, then, is likely to be profitable.

Michael Meadon (2011-01-01 08:42:32)

This stuff about 'deciding for yourself' is downright silly. In case you haven't noticed, you (yes, YOU) suffer from innumerable [1]cognitive biases and illusions. More importantly - as I point out in the post I linked to above - determining causality when  $n=1$  (as it is in 'your own case') is basically *impossible*. 'What works for me' is usually 'what I think works for me' which often simply doesn't.

1. [http://en.wikipedia.org/wiki/List\\_of\\_cognitive\\_biases](http://en.wikipedia.org/wiki/List_of_cognitive_biases)

Seth Roberts (2011-01-01 16:28:03)

Michael, almost all experiments are  $n=1$  in several ways (e.g., one classroom, one strain of rats), as John Tukey pointed out long ago. Yet science progresses. So there is a problem with your idea that "determining causality when  $n=1$  is basically impossible".

Anthony (2011-01-01 18:26:44)

@Michael, "determining causality when  $n=1$  (as it is in "your own case") is basically impossible" How do detectives determine causality? How do computer programmers? Cooks?

Kenneth Turner (2011-01-01 19:56:48)

Folks frequently complain that "it's merely anecdotal evidence." Actually all evidence is anecdotal. When you write a journal article, you are basically saying "I did this, and I observed that, and this is what I think it means." Publication in an 'official' journal only says that an editor has decided to publish it, sometimes after consulting with one or more other people. If I hear a story from someone I have no reason to believe is lying to me, that can be as convincing (frequently more so) than a published account, by someone whose competence I must infer from the journal and institutional reputation. In fact, I am the most competent observer of my own experiences. Aren't you of yours?

Michael Meadon (2011-01-01 21:45:24)

@Seth: Well, no. Actually, yes but only *in the short run*. Science is a deeply social and collaborative enterprise that takes time. Scientist 1 investigates some topic by doing experiment A. Scientist 2 thinks this is dodgy, so does experiments B-C. Scientist 1

responds with experiments D-F, etc. etc. Over time, the same topic (if it's important enough to warrant sustained attention) gets investigated from all sorts of different angles, disagreements are sorted out and (ideally) a consensus is reached. This is how we got consensus on evolution by natural selection, the efficacy of vaccines, general and special relativity, cold fusion, etc. This process takes time, is difficult and is almost invisible to non-specialists because it's either conducted in recondite spaces (journals, etc.) or in private (conferences, bars, seminars, etc.). [Luckily, blogs are changing this somewhat. Now post-publication peer-review happens rapidly, in public, online]. *That* is why science progresses. If scientists forever focused on only one line of evidence, we'd never make much progress.

Michael Meadon (2011-01-01 22:03:20)

@Anthony: re detectives, programmers and cooks. Well... As far as I'm aware, cooks make many dishes, and the same dish repeatedly, so  $n=1$  for them. (Besides, they often have false beliefs). Similarly, it's not as if programmers can't do the equivalent of experiments on their programs. If I'm coding program X, I can change a bunch of code experimentally, and see what happens. Functionally,  $n=1$  even when working on only one program. As for detectives, they (1) are notoriously bad at their jobs, but, anyway, (2) are not concerned with subtle effects, unlike medicine. But can't a self-experimenter do the same? Like a programmer? Well, no. A programmer has exact control over his program. He can start with v. 0.0.123 of the program, make changes, see what happens; then go back to v.0.0.123 and make different changes. No person, however committed, has anything close to as much control as this. Similarly, medical effects are often subtle: that is, effect sizes are small. No one person could ever have discovered, say, that taking aspirin (slightly) reduces the risk of developing heart disease. Exactly because  $n=1$ .

Bob (2011-01-02 10:58:19)

@Michael, Interesting comments and interesting piece you linked to above. An issue that has received short shrift in the scientific methodology world is that "n" frequently equals one on the object or task side of the ledger in behavioral science experiments. Experimental psychologists, for instance, never seem to tire of taking a large subject sample size, testing these subjects on one task, and then concluding that their results generalize beyond that single task. No such generalization is justified. I think it is possible to learn from single subject experiments if done well, for instance by taking one person and testing this one person across a variety of tasks. Egon Brunswik did an interesting perceptual experiment (1944, I think) of this "n=1" kind when he followed a single subject around Berkeley for several days and randomly asked the subject to estimate the size of objects in her environment. Did Brunswik's results generalize beyond the single person? Yes, to the degree that other people shared the relevant perceptual framework – two eyes, good vision, not color-blind, an environment offering the same cues that the subject encountered in her environment, etc. Brunswik had a theory (constancy) that he was able to test using a subject "n" of one.

Anthony (2011-01-02 16:50:12)

@Michael, "when  $n=1$  (as it is in "your own case") "cooks make many dishes, and the same dish repeatedly, so  $n=1$  for them" Perhaps I am not understanding what you mean by  $n = 1$  here, then. If I'm doing an experiment involving myself, I can do the same thing many days in a row. If I get the same result every day, is  $n > 1$  according to how you are using this concept? "Besides, they often have false beliefs" Everyone has mostly false beliefs. The question is how to improve on our beliefs.

Seth Roberts (2011-01-03 04:32:39)

Bob, you write "no such generalization [to other tests] is justified." It is justified by the history of psychology, which shows that the results with one task turn out to predict the results with other tasks.

Nathan Myers (2011-01-04 23:11:38)

About cupping curing the flu, I will only note that food poisoning symptoms mimic flu, but often pass in a day.

Mike (2011-05-27 19:43:33)

Fairly insightful post. Never believed that it was simple after all. I had spent a beneficial deal of my time looking for someone to explain this subject clearly and you're the only one that ever did that. Keep it up.

## Dissent Over DSM-5 (2010-12-31 14:00)

I liked [1]this article by Gary Greenberg about one psychiatrist's criticism of the upcoming DSM (Diagnostic and Statistical Manual) revision. The DSM is the diagnostic manual of the American Psychiatric Association.

This paragraph stood out for me:

This new disease reminded Frances of one of his keenest regrets about the DSM-IV: its role, as he perceives it, in the epidemic of bipolar diagnoses in children over the past decade. Shortly after the book came out, doctors began to declare children bipolar even if they had never had a manic episode and were too young to have shown the pattern of mood change associated with the disease. Within a dozen years, bipolar diagnoses among children had increased 40-fold. Many of these kids were put on antipsychotic drugs, whose effects on the developing brain are poorly understood but which are known to cause obesity and diabetes. In 2007, a series of investigative reports revealed that an influential advocate for diagnosing bipolar disorder in kids, the Harvard psychiatrist Joseph Biederman, failed to disclose money he'd received from Johnson & Johnson, makers of the bipolar drug [2]Risperdal, or risperidone. (The New York Times reported that Biederman told the company his proposed trial of Risperdal in young children "will support the safety and effectiveness of risperidone in this age group.") Frances believes this bipolar "fad" would not have occurred had the DSM-IV committee not rejected a move to limit the diagnosis to adults.

Emphasis added. Hundreds of thousands of children given brain-damaging drugs because . . . well, one big reason is that Harvard allows its faculty to do what Biederman did. Forced to choose between Harvard and drug company money, Biederman would choose Harvard. I am glad Professor Ross Anderson, a Cambridge computer science professor, [3]turned down an industry request to censor a student, but I am sorry he said the person making the request had "a deep misconception of what universities are and how we work."

[4]American Psychiatric Association incompetence.

---

brian (2010-12-31 22:42:01)

Biederman should recognize that the trial should not be conducted because the trial "will support the safety and effectiveness". He already knows the result so it would be better not to spend the resources on the trial.

Seth Roberts (2011-01-01 04:22:42)

The notion of a drug safety and efficacy trial being conducted by someone who says he knows what the results will be is obscene. That the drug will be given to children makes it doubly obscene. That Biederman got millions for this sort of thing and failed to report it merely confirms what a horrible person he is. That Harvard lets him do this speaks volumes about Harvard. This is far worse than plagiarism and making up data (both of which Harvard tolerates, at least with its faculty).

brian (2011-01-01 21:11:21)

This reminds me of that turn of phrase "I like to think that...". Why do people talk that way?

### Shangri-La Diet Uptick (2011-01-02 07:14)

During the last half of 2010, I noticed today, hits at the [1]Shangri-La Diet forums steadily increased. The number of hits went from about 300,000 in July to about 500,000 in December.

Before that the number of hits had steadily declined from a high of about 900,000 in August 2009. The number of hits had tended to be higher in the summer so the recent increase is counter-seasonal.

1. <http://boards.sethroberts.net/>

---

q (2011-01-02 07:43:47)

i think that's great. seth, i have always had a really hard time navigating those forums. it's also been hard to find a clear, succinct HOW TO / WHY description of the diet that i can tell people about. even sorting by date doesn't work well - it seems to sort by alphabetical month for example. you might try invision boards as a better alternative? (it worked for me - i lost 20 pounds in the first half of last year with virtually no effort on the diet after losing 10 the previous year with huge effort, and i have kept it off - i may try for another 10 at some point, but i'm pretty happy with where i am.)

Laura (2011-01-02 17:03:39)  
SUPER AWESOMENESS!!!

Seth Roberts (2011-01-03 00:06:09)  
q, thanks for the feedback, What is "invision boards"? when I look it up on google I get a skateboard maker.

Arlene (2011-01-03 08:24:53)  
NYT had an article having to do with weight loss a month or two ago. One of the commentors mentioned the Shangra-La diet. I imagine a lot of people googled and found out about it-I know I did. And my goodness, it does work!

Seth Roberts (2011-01-03 15:26:36)  
Thanks, Arlene, I didn't see that.

q (2011-01-04 08:53:33)  
I meant invision forums. One link is here: <http://invisionfree.com/> but there are other hossts.

Seth Roberts (2011-01-05 02:36:23)  
thanks, q

Sharon (2011-02-28 18:14:07)

Probably thanks to the release of "The 4 Hour Body". That's how I found my way to Shangri-La! Really glad I did - I think it will complement the Slow Carb diet very well.

Seth Roberts (2011-03-01 06:48:30)

Sharon, the increase began months before The 4-Hour Body came out. Thanks for your comment.

Alex Chernavsky (2011-03-01 10:30:09)

I second q's request for a easier-to-navigate boards and a concise, on-line "how to" guide (though perhaps such a guide would hurt book sales).

A Aman (2011-06-30 17:53:56)

Just one day on the diet but am amazed how my hunger was diminished. I'm going to use Shangri La in conjunction with Dukan since I've been eating way too much at night on Dukan (even though I'm eating low -carb). For those days on Dukan where I can restrict my calories somewhat, my results have definitely been better. So I have great hopes if things continue to work as they have on this first day. I've got an order in for the Shangri La book. Least I can do for what seems like a great idea. Think it is unfair for some to ask you to put your book online (ie. more specific info and details about the diet) when you aren't even charging for web access. What do some expect you to do, give everything away for free? Is that what they do with their businesses?

Seth Roberts (2011-06-30 18:43:07)

Thanks for letting me know - and buying the book.

### **Chinese Joke (2011-01-03 04:45)**

A few days ago I got the following message (in Chinese) on my cell phone (part of a service):

A monkey, goat, and tortoise were playing together. After a while they got thirsty. They sent the tortoise to get water. Half a day later, the tortoise still hadn't returned. "That \*)?! % idiot is too slow!" said the monkey. From outside came the voice of the tortoise: "If you call me more bad words I won't get water for you."

---

Darrin Thompson (2011-01-03 07:14:58)

Sooooo..... does it roll off the tongue better in Chinese? A friend told me that in Spanish they have a saying similar to our "pot calling the kettle black." They say, "burro telling the rabbit he has long ears," or maybe vice versa.

Laura (2011-01-03 10:30:37)

I enjoy reading jokes! Thanks for posting them!!! They're funny!

### **"Sour" in Chinese (2011-01-03 20:59)**

The Chinese character for sour (pinyin suan) contains a bottle-like element that is sometimes translated wine, sometimes whiskey bottle, and sometimes "the tenth of the twelve earthly branches," whatever that means. The bottle-like

element appears in the character for alcoholic beverage, the character for vinegar, and several other characters with no obvious connection to fermentation. But the connection between sour and fermentation is clear.

My belief that we need to eat lots of fermented food to be healthy began when I realized that would explain why we like sour foods, foods high in umami, and foods with complex flavors – preferences I'd never heard explained. We like those foods, I theorized, so that we will eat foods high in bacteria. Bacteria tend to make sugar-containing foods sour, protein-containing foods high in umami, and all foods high in flavor complexity. I had not previously connected sourness and bacteria – but the Chinese had. I don't yet know the Chinese characters for umami or flavor complexity.

---

Joseph Dantes (2011-01-04 00:20:29)

Good insight. I wonder if this means I should add a fermented animal meat in addition to kimchi. Would aged beef jerky qualify? I hope so!

David (2011-01-04 07:32:22)

Well, "vinegar" literally means "sour wine" from vinum, the Latin word for and source for the English word "wine". Vinum itself is cognate to "vinea", vine or vinyard. <http://www.etymonline.com/index.php?term=vinegar> <http://www.etymonline.com/index.php?term=wine> <http://www.etymonline.com/index.php?term=vine> Ferment itself is from a root meaning to boil: <http://www.etymonline.com/index.php?term=ferment> David

## **Does Shower Temperature Affect Brain Speed? (2011-01-05 05:56)**

In November I learned about [1]benefits of cold showers. So I tried them. I took cold showers that lasted about 5 minutes. I liked the most obvious effect (less sensitivity to cold).

Maybe a bigger "dose" would produce a bigger effect. Maybe the mood improvement cold showers were said to cause would be clearer. So I increased the "dose" in two ways: (a) more water flow (I stopped holes in the shower head) and (b) lower water temperature. After a week or so with the stronger dose, I saw I was gaining weight. It could be the cold showers, I thought. Fat acts as insulation and I couldn't think of another plausible explanation. So I went from cold showers back to warm showers (48 degrees C.) – this time with greater water flow. My warm showers were 5-10 minutes long.

I began to lose weight, suggesting that the cold water did cause weight gain. More surprising was that my arithmetic speed (time to do simple arithmetic, such as  $7-3$ ,  $8*4$ ) began to decrease. Here is a graph of the results.

[2]

Before the cold showers started my arithmetic speed was roughly constant. The mild cold showers had no clear effect. I had noticed the increase during the strong cold shower phase but hadn't paid it much attention – I suppose because it seemed implausible. These results, however, are excellent evidence for cause and effect: cold showers made me slower, warm showers made me faster. The arithmetic tests weren't done soon after the shower. There seems to be some sort of brain-speed adjustment that takes place over ten days or more.

I've never heard of anything like this, whereas I've heard many times is that cold showers are good. There is one complication, which is that December 3rd I stopped eating walnuts. I believe walnuts are bad for the brain, in contrast to [3] the usual belief. I came to believe that because of results from two students of mine who had tried eating them. Improvement due to no longer eating walnuts would explain why line fitted to the strong cold data starts below where the weak cold line ends. The final days of the strong warm phase may be the same as the weak warm phase when adjusted for the walnut difference.

What explains this? Maybe the weight change. When gaining weight, maybe fat was taken from the blood to be deposited in fat cells, thus lowering the fat content of the blood reaching the brain and thus degrading brain performance. Losing weight, the opposite happens. Eventually the weight loss will stop; this explanation predicts when that happens the warm-water effect will go away.

In [4] a previous post I wondered why I had gotten faster at arithmetic over the previous six months. These data suggest that warm showers may be at least part of the reason. In Berkeley I take baths, not showers.

1. <http://www.blog.sethroberts.net/2010/11/27/cold-showers-raise-mood/>

4. <http://www.blog.sethroberts.net/2010/12/28/another-mysterious-mental-improvement/>

---

Maxwell (2011-01-05 06:22:23)

Hi Seth, If I may, what time did you take the cold showers? Tim Ferris argues that taking a very cold shower an hour before bedtime improves sleep. This timing might also reduce the effect on weight, provided you can resist eating til bedtime.

Seth Roberts (2011-01-05 06:29:18)

I took them in the morning and afternoon usually, but no fixed time. The slowness of the temperature effects I observed on arithmetic speed (they took at least 10 days or so to level off) suggests that the time of day doesn't matter, at least for the arithmetic effects.

troy (2011-01-05 07:01:47)

looks like a series of two-handed regressions to me

Seth Roberts (2011-01-05 07:21:27)

troy, I fit the lines using lm, an R function.

troy (2011-01-05 07:57:23)

I believe the lines were fit using a model but, it just looks like there is a lot of noise, and it'd be my hunch that there is room for error in a 40ms range in the recorded data itself. I can imagine a lot of other things might be getting stuffed into the error term over a 3-month period.

Nancy Lebovitz (2011-01-05 12:39:32)

Off-topic: [1]Varieties of digestive experience- a lot about how important it is to find out what's healthy for one's own particular- sometimes veryparticular- gut. Fruits and veggies aren't good for everybody.

1. <http://fatfu.wordpress.com/2011/01/05/2011-resolutions-part-2-the-fodmap-not-taken/>

Nathan Myers (2011-01-05 12:54:46)

You're assuming that temperature was the important controlled variable. But a hot shower exposes you to a lot more chlorine gas, via the lungs, than a cold shower. Depending on how well ventilated your shower is, you might be varying your chlorine exposure substantially, with unknown effect. Teasing apart effects of temperature and chlorine exposure might be difficult, but seems possible. Some water systems don't have dissolved chlorine gas, but instead chloramines. Chloramines would not be released as a gas in hotter water, but any reactions would be speeded up. Many animals are sensitive to chloramines; a subtle effect on humans would not be surprising, although one would expect more effect from ingestion than immersion.

Seth Roberts (2011-01-05 13:34:23)

troy, you write "it looks like there is a lot of noise". To me it looks just the opposite. In statistical terms, I believe the p value associated with the changes is very low (i.e., the probability that the observed changes would happen by chances is very low). In other words, the signal is high relative to the amount of noise. Since you seem to disagree, care to estimate the p value for the difference in slope between the last two phases (which I haven't yet computed)?

CTB (2011-01-05 18:09:38)

Sounds thyroid-related to me. I need to take thyroid hormone replacement because my own gland doesn't work anymore. Occasionally the blood test indicates that I need to up the dose, and when I do, I don't feel the effect for 10-12 days. Others have told me that they've had the same experience. Once I tried stopping the medication totally to see what would happen. After about 10-12 days, I noticed significant memory problems (along with weight gain and constipation). I would walk into a room and initially forget why I was there...but each time I would remember again after about 7 or 8 seconds. So the memory was there, just 'delayed.' One of the things that causes thyroxine to be used up more quickly is cold exposure. And if I remember correctly, iodine deficiency is a problem in China and adequate iodine intake is critical for thyroid hormone synthesis. So perhaps the cold showers are causing you to use up thyroxine at a higher rate and your thyroid gland isn't able to quickly keep up with the demand? That would also explain the weight gain (usually it's due more to excess fluid from decreased metabolism, rather than to fat buildup). Then when you warmed up the showers, your hormone levels were able to catch up.

Mark L (2011-01-05 21:15:33)

Starting with a hot shower and ending with a cold shower is possibly a way to improve benefit; I think some health spas alternate exposure to hot and cold temperatures. I often end my showers with 1-2 minutes of cold (well) water which is about

51 degrees fahrenheit. When I have time, I alternate between hot and cold water a few times; I find it easier experiencing the cold water on the 2nd repetition. Part of the benefit/exhilaration may come from the feeling of accomplishment after having the discipline to take a cold shower. Another important variable is how long to expose yourself to the cold; my hunch is that a brief exposure avoids a cortisol stress response which would come with a longer exposure.

Seth Roberts (2011-01-05 22:04:17)

CTB, your explanation sounds plausible. How can I test it? In other words, what does it predict?

troy (2011-01-06 08:24:41)

Seth sure, if you email me the dataset I'll run it.

CTB (2011-01-06 10:16:15)

There's no direct answer to your question because thyroid is a complicated, multifaceted issue. Some things to consider: Before starting any discussion, you would need to know if your baseline thyroid hormone levels (no cold stress) were normal. Then look at your diet to make sure it contained adequate iodine. If the area's water supply is deficient, iodine can be supplied by iodized salt, marine fish, sea weed, etc. However, the situation is thorny because too much iodine can cause the thyroid to shut down temporarily...and in some individuals it can result in autoimmune destruction of the gland. If thyroid hormone levels decrease, metabolic functions slow down in all tissues of the body, including the adrenal gland. The adrenals are responsible for producing hormones that increase levels of glucose and fatty acids in the blood so that your brain, heart and muscles can react to stress. If you stress the body with a long, cold shower, and your adrenal reserves are lower (secondary to lower thyroid levels), overall response will be slower. Normally, the brain uses glucose for almost 100 % of its energy needs. If a person is starving, the liver can produce ketone bodies from fat...and the brain can use these for energy...but only to a limited degree. To maintain blood sugar levels, the body will then break down proteins and convert them to glucose for the brain. But every one of these processes is slowed by decreased thyroid and/or adrenal hormones. The hormone circulates primarily bound to protein carriers...only the free fraction is active. When a person is given a dose of radio-labelled thyroid hormone, it takes almost a week for the level to decrease by 50 %...so it's probably binding to the carrier proteins instead of being used up right away, which probably has something to do with that 10-12 day period. Presumably that bound portion is 'reserve.' the amount of carrier protein is upped by estrogens, so women have more (especially if pregnant or on the pill). Increased androgens lower the carrier protein levels. Low normal levels of thyroid or adrenal hormones from any cause could mean that you're naturally susceptible to being subpar after stressful activities, while people with higher reserves would bounce back without skipping a beat. Some patients with adrenal insufficiency are only diagnosed after a high stress experience lands them in the ER with hypoglycemia. Interestingly, a high carb diet also uses up a lot of thyroid hormone. You've written about avoiding bread, rice, pasta in your diet. On the thyroid boards, a lot of folks post about being carb-intolerant.

Seth Roberts (2011-01-07 03:27:31)

CTB, my thyroid levels are normal. Now it doesn't sound plausible. What you describe might explain why a cold shower made me slower, but not why a hot shower made me faster. Whereas I suspect the two effects have the same explanation. And I don't think either effect is caused by poor health or malnutrition.

troy (2011-01-09 16:18:23)

So, if you do a two-sample t-test on the strong-cold versus the strong-warm group you get a p-value of .037, so there is strong evidence at least that the samples have different means. The linear model explains about 35 % of the variation for the cold-showers and 69 % for the warm. But, my problem with treating it as very good evidence is that essentially you're using time to explain the difference in  $t_r$ , and assuming that the groups are different at the point you switched from very cold to very warm showers, and that the only inconstant variable is the shower temp. You could easily replace the very cold with "shortening days" and very warm with "lengthening days" (the solstice was Dec 21st) and you'd have just as plausible a relationship. Actually, now that I think about it, that would better account for the appearance of the cold-shower effect being cumulative while applied, and fading-out when not. I'm only skeptical because I always take cold-showers outside of Dec-Feb, and can't say I've ever noted any differences weight, cognitive or other after about 20 minutes of stepping outside the shower.

Thanks for sending the data. Sorry for being annoying. I enjoy the blog. R output on pastebin (t1 is the warm group and t2 is the cold): <http://pastebin.com/DdVmP5UA>

Seth Roberts (2011-01-10 02:15:28)

troy, a t-test is not appropriate. I want to compare the slopes, not the means.

troy (2011-01-10 03:12:52)

why is a t-test not appropriate? It seems obvious the slopes are significantly different, but the sample is small, so a difference of means test seems more robust. asking out ignorance, not disagreement.

Seth Roberts (2011-01-10 08:18:13)

a t test ignores the obvious changes over time. I calculate the p value for the difference in slopes as  $1 \cdot 10^{-8}$ .

How To Self-Experiment | Quantified Self (2011-04-06 06:56:11)

[...] I measure my weight I look at a plot of my weight over the last year or so. Recently I found that cold showers caused me to gain weight, which I hadn't expected. If I hadn't looked at a year of data every time I weighed [...]

Bryan-Sweat (2011-05-23 11:33:45)

Seth can you give me some suggestions about how to design an experiment on becoming more tolerant to hot weather? I don't know if anyone has done this before and I don't know the proper place for me to post this question. Please email me back if you can at [bigbry2k3@gmail.com](mailto:bigbry2k3@gmail.com) I'd love to know where I can start experimenting on this idea as I'm going to go to Thailand in September where the heat and humidity is very bad. However, the thais are quite able to tolerate the heat and I would like to design an experiment to see if a 4NR can adapt to the heat faster.

Seth Roberts (2011-05-23 17:42:52)

If you can figure out a way to measure heat tolerance, you might get somewhere. I don't know how to do that. That is the first step: find a way to measure your tolerance to heat.

Michael (2011-07-25 04:25:54)

I like the fact you carried out the experiment but the conclusion is quite simple in my eyes. When cold water hits the skin vasoconstriction is the body's way of reducing heat loss which in turn reduces blood flow. This will cause a reduced blood flow to the brain meaning less glucose and oxygen which in turn lowers brain speed. When your body gets used to this response in regular cold showers the body will eventually use this response at the hands of a stressor. With hot showers vasodilation occurs meaning a higher glucose and oxygen level available for the brain.

## **I Paid A Bribe (2011-01-05 23:31)**

The website [1]I Paid A Bribe is a great great idea. It is enormously promising as a way of reducing corruption. India and China, the two biggest countries in the world, both have immense corruption problems.

I Paid A Bribe is so promising because it takes small bits of anger (mental energy) and aggregates them. Anger causes people to take the time necessary to complain. The aggregated results can be used to: 1. Focus correction. Anti-corruption efforts can start with the biggest offenders. 2. Embarrass offenders. 3. Help measure the effect of anti-corruption measures. Without long term records, those initiatives have great difficulty measuring effectiveness.

It is hard for most people to grasp the corruption of medical science, which connects I Paid a Bribe to what I usually write about. The corruption isn't exactly on the surface: Only medical school professors take something close to bribes. (The pervasiveness of the problem is shown by the fact that all med schools let them do this or [2]don't

enforce rules against it) The corruption consists of this: Some lines of research are more profitable (e.g., more grant money, more prestige) than other lines of research. That is inevitable. What isn't inevitable is that this is allowed to obscure honest investigation of which lines of research are the most beneficial. The most visible sign of the corruption is that the Nobel Prize in Medicine is usually given for research that hasn't helped anyone. The 2009 award for telomere research was an egregious example. Even in China and India, you can find government officials who have helped people.

The anger or fear felt by someone asked to pay a bribe is mental energy. In the case of medical science, the corresponding mental energy is much greater – it is the suffering caused by a condition for which medical science has no cure or a poor cure. Depression, acne, autism, poor sleep, diabetes, obesity . . . the daily suffering caused by these and other health problems is staggering. I believe that self-experimentation is a way of doing something useful with that suffering. When aggregated via the internet, it is a way around the failure of mainstream medicine to deal with these problems.

Matthew Cornell (2011-01-25 13:45:51)

Excellent points, Seth. The propensity to report is related to the idea that few people who are satisfied with service they receive report it, but many who get poor service make a stink. I'm the same way! My motivation is more a function of my anger (as you point out), rather than the egregiousness of the infraction. Of course I realize it's a waste of my energy staying angry (and it \*likes\* to be fed), so I wonder if the site helps cut that energy down (release) or not.

## **Preposterous Health Claims of 2010 (2011-01-06 21:26)**

Katy Steinmetz, a writer for Time, made a list called "Nutty Health Claims of 2010" and "2010: The Year in Preposterous Health Claims." The list of 12 includes:

- [1]omega-3 makes kids smarter
- [2]probiotics that prevent colds and flu
- [3]Dannon's probiotics as wellness elixir

Preposterous!

Marion Nestle, the New York University nutrition expert, has often said she thinks the health claims made for yogurt are bogus – at least when big companies make them. [4]She recently called Dannon's claims "a case study of successful marketing".

### Inside the Chinese Government (2011-01-07 19:31)

A Chinese friend of mine said that if you are at a high level in the Chinese government, you have a great deal of freedom. Below that level, however, you have very little freedom: You spend all your time doing exactly what your bosses want. And you have no idea how long the slavery will last. American government is different, she said. High American officials have less freedom than those outside government. I agree.

My friend disliked Obama because he constantly spoke about big ideals ("liberty" and so on) that my friend thought were very difficult to achieve. In other words, he constantly made promises that he was not going to be able to keep. She noted Obama's inexperience and said that people in other areas of government are very smart and would outmaneuver him. (Exhibit 1: Goldman Sachs.) This doesn't happen in the Chinese government because the people at the

top are very old and have come up through the ranks, all the way from the bottom. Because of that long experience, they better understand how to get the rest of the government to do what they want.

In China, rich people fear the government. They must do what the government wants or they will be squashed. In America, she said, rich people do not fear the government. If anything, they tell the government what to do. [1]I agree. Many people, such as Hayek and Milton Friedman, want less government. But I have yet to hear one of them answer the point that if government becomes too weak, rich people will control it.

1. <http://sociology.ucsc.edu/whorulesamerica/>

---

Glen Raphael (2011-01-07 21:07:57)

I don't see how your claim relates to those of Hayek and Friedman. Maybe the point of difference is this: a \*small\* government does not necessarily entail a \*weak\* one. Indeed, being smaller is a sign of strength. Small, nimble, flexible versus big, bloated, stodgy. Small startups can get things done in a way IBM can't. Small companies can't get into as much trouble as big ones and can "pivot" more easily when their current strategies aren't working. So a counterargument to your position is that a government which tries to do too many things is unlikely to do any of them particularly well, whereas a government that tries to do just a few things might be able to do those few things much more competently. A small government is easier to watch, easier to check up on and measure how it's doing. A small government wouldn't have such vast resources to give away in the form of secret contracts for TSA scanners or Blackwater security groups or what-have-you so it's less \*worth\* controlling than the current one. So: why do you think "smaller" implies "weaker" when it comes to governments? Weaker in what sense?

Joseph Dantes (2011-01-07 21:39:56)

A trenchant analysis from the Chinese! Not really surprising. Those who are intellectuals and internet savvy approach events with a historical jadedness and lack of western shibboleths that more than makes up for the brainwashing. As for less government versus strong government, the two are not mutually exclusive. The ideal government, in my opinion, is rule by a wealthy, heavily armed middle class, with the aristocracy, villeins, and king playing a secondary role. More on this here: <http://jim.com/rights.html>

Magnus (2011-01-07 22:17:12)

Hey Seth There is two things that must be seperated when talking of the government as weak or small. Hayek and Friedman talk about a society with a small government, not nescessarily a weak one. However the weak/strong-distinction could apply to the government as well as the administration. If the administration is weak people in generel (amongst them rich people) will try to game it if they can get away with it. If government itself is weak (as in it can't enforce its laws) rich people (and people in generel) will generally fare better just paying a bribe and not be affected by it. When Hayek and Friedman talk about a small government they are in a way also talking about a strong cabinet (and parliament) that don't just give out perks to every interest group around. However I think this will rarely be the case â€" being strong might be a good image when campaigning but utterly bad staying in power. The problem is it will always be of value to some group to "install one of the boys" to be in charge espacially if the government is big. In the end the question might be if it is a problem if we are happy with the way government runs. Many fans of free markets look to Hong Kong and Singapore where the governments are small and strong for a examples of good governments that aren't overrun by special interests. I hope it makes sense :) Magnus

thehova (2011-01-08 00:21:59)

"American government is different, she said. High American officials have less freedom than those outside government. I agree." Ultimately I think it's a feature of an English structured democratic government like in America. There are lots of checks and balances. I know that some American's (most notably Tom Friedman) admire the Chinese government's ability to move

quickly on projects. But restricting government also has its features, like protecting human rights.

Seth Roberts (2011-01-08 06:02:40)

Glen, by "bigger government" I meant a government that is involved in more activities. The bigger the government, the more ways it can harm you if you don't do what it wants. This makes it stronger – harder to oppose. I think of strong/weak and competent/incompetent as separate dimensions. A weak government can be competent or incompetent. If fans of free markets have to use Hong Kong or Singapore as examples, I would say that proves my point – that in practice, as a country gets wealthy, you really do have to choose between rich people running things (America, to a large extent) or the government running things (China). thehova, yes, I think great constraints on high government officials also exist in England, as shown by the many scandals that cause people to lose power.

Jake (2011-01-08 06:12:18)

Seth, you have it backwards. If the government has no power than rich people will not try to control it as there is no point. Power corrupts. Remove the power and the corruption disappears.

Jeff (2011-01-08 06:55:57)

Jake has it right, a weak central authority is not worth exploiting. But Seth, you too miss the point. Hayek and Friedman should not be the posts by which you judge the field. Our nation is founded upon Lockean ideals and there is no higher calling in all of governance than to honor those ideals. Hayek and Friedman, as interesting as they may be, convolute the simple. Man deserves to be free and the role of government is to protect his person and his property. From that simple view, governments role is clear.

Zubon (2011-01-08 07:48:45)

But I have yet to hear one of them answer the point that if government becomes too weak, rich people will control it. And they do, so your hypothesis is that the current American government is too weak?

Sonic Charmer (2011-01-08 09:40:44)

What Jake said. The incentive for rich people to influence/control the government, or even to take any interest in it at all, is in proportion to how big and powerful the government is. A small(er), limited government cannot and will not be as easily harnessed or captured by rent-seekers simply because it doesn't spin off that much 'rent' to be seeking in the first place.

Nathan Myers (2011-01-08 13:05:30)

It's way, way too late for that. Rich people already control government. If not, what was that last tax cut extension "compromise" about? Or the no-strings bank bailouts? It's not the first time. It happened before, in the 1890s, and again in the 1920s. Each time it was wrested back, partway. What's different today is that now the Koch brothers have Edward Bernays's successors.

Seth Roberts (2011-01-08 13:18:14)

Zubon, yes, my hypothesis is that the realistic choice is between a government like the one we have now (in the US) or a stronger government (as in China). An example is financial regulation. Brooksley Born argued for stronger regulation; she was dismissed by people, such as Larry Summers, who gave free-market arguments. Summers pointed out the number of wealthy bankers that agreed with him ("there are thirteen bankers in my office..."). That is a specific example where a stronger government would have been less controllable by rich people. On the other hand, the reason I raise this issue at all is not to preach about it – I don't have strong opinions – but to ask . . . I really do wonder what people who believe in smaller government say to the problem of control by rich people. "A weak central authority is not worth exploiting." What did Hammurabi and Moses have in common? Both offered protection. This is why people supported them, I surmise. The weaker the central authority, the less it can protect people. The financial crisis is one sign of how much protection we need. Another is the obesity epidemic, if it is due to the growth of the processed food industry. Perhaps China will have both – a financial crisis and an obesity epidemic – in which case it will be clear that a strong government is not the answer. Perhaps China can avoid a financial crisis but it is less clear it can avoid an obesity epidemic, a diabetes epidemic, a lung-cancer epidemic, and so on.

Paul (2011-01-08 13:36:35)

The comparison seems to me to be a strange one. While there are rich people in China who aren't officially members of the CCCP, aren't almost all high ranking members of the CCCP rich? As well, didn't most of the non party wealthy in China obtain their wealth through their guanxin? I thought that the story of China was more or the less the same as the story of Russia. The state privatizes the assets of public companies, but sells them at a favorable price to those who are politically well connected, who in turn funnel large amounts of cash and other resources to party member. The same thing happens in real estate development, and basically with anything that needs approval from the government, which, from what I understand, is most anything that would stand to make you wealthy. So, I don't really see how this is preferable to the way the U.S. does things. I think that it is correct to infer from Hong Kong and Singapore that governments must be actively involved in an economy if it is to be productive. However, Hong Kong and Singapore have not been governed in the same manner that China has, and hence they are notably much less corrupt. Lee Kwan Yeu may want to believe that leaders of the CCCP wish to emulate him, and some may want that, but I have a suspicion that even more want to emulate Putin.

Seth Roberts (2011-01-08 14:53:37)

Paul, I'm not saying China's way is preferable to America's way. I am saying it is different. Both countries have government enterprises (a minority of people) and non-government enterprises (most people). In both countries, people outside government are wealthy. In America, wealthy people outside government do not fear government officials. In China, they do. The financial crisis – in which a large number of wealthy Americans gambled using taxpayer money and caused great unemployment – suggests that there is a problem with American governance. Obviously there is a problem with Chinese governance – the vast corruption, for example.

American Tax Slave (2011-01-08 15:46:14)

I don't understand: If government is weak, how do rich people control me? Government has a monopoly on force and thereby can tell me what to do, or else. Without that they can't. So how do rich people exercise control over me without co-opting government? I can only see how the rich exercise control over me via government. Perhaps there are other ways I don't see?

Seth Roberts (2011-01-08 18:00:58)

How the rich can control you without government: By degrading your education (e.g., bribing teachers). By ruining your local economy (so you must move away to get a job). By threatening to fire you if you don't do X or Y. By making your workplace less safe. By lowering your salary. By selling crummy products. By cheating you in a business transaction. By lending you so much money at such bad terms that you spend the rest of your life doing payback. By polluting a river from which you drink. By polluting air you breathe. To give just a few examples.

Gunnar (2011-01-09 01:28:00)

Since you people compare governments, you may want to learn that the current (de facto) federal US government is a corporation, and not the de jure government most expect it to be: [http://www.serendipity.li/jsmill/us\\_corporation.htm](http://www.serendipity.li/jsmill/us_corporation.htm) It needs time to let that sink in if it is new for you. I suggest you take that time and maybe research some more yourself.

Stephen M (Ethesis) (2011-01-09 05:40:25)

Actually, when governments are weak, the powerful tend to control them to use them to exploit the processes governments have. That only ceases when the governments cease all together.

Stephen M (Ethesis) (2011-01-09 05:42:39)

Gunnar – the essay is skewed because the author doesn't understand the concept of entities and that of function. /Sigh

Jeff (2011-01-09 07:20:20)

The first thing missing from this discussion is a definition of strong central government. If you agree that a central government can be small but effective, then its court system is what must be strong. With a monopoly on force and an effective judicial system, then you have an ideal scenario. Moreover, the debate between strong and weak central authorities overlooks many

important factors such as state and local governments which provide regional protections of property. Beyond the system of organization, there is the human population and population genetics. There can be little doubt that people of British descent possess a positive combination of behaviors that leads to greater individuality and acceptance of freedom while also respecting the property rights of others. Taken together, it makes any comparison far more difficult. In any case, your suggestions that big corporations can degrade education through bribes or cheating other people are behaviors that were long ago forbidden in the English system. Having a government serve as protector of life and property is not new and does not mean that it has to be large. The remainder of the methods you suggest corporations could control the rest of us, are specious. If a firm sells bad products, then people won't buy. There is nothing for which there is not a realistic substitute, so if a firm invents something and achieves 20 year monopoly control, the public can likely just buy something else. Moreover, people are not going to buy the item if it is not good, when they have unlimited alternatives for spending their cash. The issues of pollution and libertarianism are more difficult to solve, no doubt.

James Oswald (2011-01-09 09:45:02)

If the government becomes weak enough, the rich will have no reason to control it. Why would they control a government that did not subsidize them, regulate them or grant them extra favors? The powers of government that Hayek and Friedman advocated would not have lent themselves for being targets of the rich.

Oli M (2011-01-09 16:48:04)

Seth, Taleb's recent conversation with Ralph Nader is somewhat relevant to what you're considering here: <http://www.corporatecrimereporter.com/taleb010311.htm>

Thomas (2011-01-09 21:33:17)

I dunno - there are just wrong assumptions in every line of this post. First off: I'll never get why people believe in what their politicians say. Shouldn't history taught us by now? Well I guess the Chinese don't - they know the system is rigged. But why on earth believe Obama's words? Look at his actions: He has done nothing he promised. But he is not weak (just look at what Bush did with less political power) - he just never intended to. That shouldn't be surprising to anyone. Rich people in China do pretty well. I doubt most of them fear the government - because ... I mean, I'm no expert, but I bet that the most of the rich ARE the government. And about the idea that "if government becomes too weak, rich people will control it" ... well: then it wouldn't matter, right? The problem is that companies in the US love big government - and want big government (despite saying otherwise). Just not for the people - only for themselves. So they get constant subsidies and bails if in trouble.

Krystal (2011-01-10 07:54:15)

I am with Thomas. it is very true. I mean "THE RICH" would so be the government plus if you see pictures of china they don't maintain it like cuba but cuba is much worse. because in china the place that the tourist see is very nice but behind it it is very messy. Like cuba. Thanks for reading! Krystal :D

Thomas Seay (2011-01-10 11:35:34)

> For the most part, rich people DO control it. Who has the money to pay lobbyists? Not Jimmy, the Factory Worker or Seth, the Berkeley Professor! The rich in China are just as much in bed with the Chinese government as their American counterparts. The Chinese government combines the worst features of Laissez-Faire capitalism with (some) of the worst features of Stalinism. True that at least now there is some freedom of information and travel.

Steve Roberts (2011-01-12 02:39:46)

Hi Seth If you think that a Strong Government is one that can do what the hell it pleases, and conversely a Weak Government is one which cannot necessarily do so, you have comingled as weak both the government which is constrained by constitutional checks and balances, within which it can indeed get done what it pleases (Hayek, Friedman); and the government which may be less constrained in principle, but due to corruption or special-interest-group influence or exaggerated ambition, fails to enforce the law, fails to put its policies into effect, and / or cannot sequester the resources to fulfill its plans. Of course special interests (including 'the rich') will try to overthrow the constraints on the first type, bringing about the second type.

The answer is to defend the principle and actuality of constitutional constraints on government. In terms of how 'the rich' can control you without government, it simply comes down to they can offer you money to do something you wouldn't otherwise do. They can't make you do it, not in the way the government can, with its legislation, policemen, judges, jails and executioners. Actually your list applies pretty well to government too: Bribe teachers - don't need to, just control what they teach and how Ruin your local economy - actually with misguided policy they can ruin the whole economy, not just the local one Threaten to fire if you don't do X or Y - Yes for government employees and through extensive regulation for many many others Cheating you in business - No need to cheat, just take your money in taxes Pollution - Does the government police its own pollution as rigorously as everyone else's?

M (2011-01-13 08:23:56)

Seth, I'm with you here. You say: "The financial crisis â€" in which a large number of wealthy Americans gambled using taxpayer money and caused great unemployment â€" suggests that there is a problem with American governance." That's absolutely correct.

revelo (2011-01-14 18:39:39)

Absent a strong democratic government, the rich mutate into feudal lords. That is, they set up their own non-democratic government, and they oppress their subjects far worse than under our current society. The subjects can't leave because there is always a hierarchy of slaves, guards and boss at the top, such that the boss treats the guards well in exchange for controlling the slaves. This is how things were in Latin America or the American south for that matter back in the good old days that the libertarians pine for. These libertarians better make sure they've arranged to fall into the guard or boss group before exchanging our current flawed democracy for feudalism.

Contemplationist (2011-01-24 22:33:51)

Many people, such as Hayek and Milton Friedman, want less government. But I have yet to hear one of them answer the point that if government becomes too weak, rich people will control it.

Seth, you need to get out more. The field is called "Public Choice Economics" and is now 40 years old. Its dedicated to answering precisely how BIG government is controlled by "rich people." Whatever happened to criticizing the nexus between Wall St and the government? Or Big Agriculture n Govt? Or Big Pharma and FDA? I mean, are you kidding or this argument for real? Unless you are claiming that we currently have laissez-faire, all these instances are strikes AGAINST big government. The libertarian argument is that regulation does not control "rich people" or corporations but gives them more levers to loot the common man. The most effective controller or regulator of corporations is OTHER corporations that compete with them. The key thing to focus on is keeping dynamic, open markets with as low cost-of-entry as possible.

Seth Roberts (2011-01-25 03:32:55)

revelo, I agree completely. Contemplationist, yes, expensive regulation is a wonderfully effective tool that benefits large corporations at the expense of small ones. Food safety laws, for example, require an office for a food safety inspector in certain cases. Small companies cannot afford this, big companies can. But that does not change the overall point that, as the examples given by revelo suggest, governments really do make it harder for the strong to exploit the weak. You may not have heard of the Wallenbergs. [http://en.wikipedia.org/wiki/Wallenberg\\_family](http://en.wikipedia.org/wiki/Wallenberg_family) They are an incredibly wealthy and powerful Swedish family. I asked my Swedish uncle how they compare to the Swedish government. "They act as a brake on each other," he said.

Ren (2011-09-04 21:04:27)

i think chinese government is like a family(the family is not the one in western)the father or mother is the government,and the people are the childrens

### **Design Farmer (2011-01-10 16:08)**

A friend of mine majored in design at Tsinghua and is now working as a designer. Her opinion of her education has gone down. Designers from other schools are better trained than she is, she sees.

At Tsinghua, her teachers denigrated learning to use this or that software program. To design something using a computer program was to be a design farmer, they said. They preferred to talk about big ideas. "I hate big ideas," said my friend.

Her comments reminded me of law professors who would rather teach philosophy than how to be a lawyer (and are [1]surprised when students play solitaire during class) and education professors who [2]don't teach their students how to teach.

### **Christian Schlatter (2011-01-11 14:43:46)**

Wow. I'm studying design in Switzerland and the situation is very comparable to your friend's experience. What's central to design is to be able to build things. It's a craft despite the fact that designers produce increasingly intangible things such as services and systems. It's the craft skill I consider essential to design that's neglected the most in favor of sluggish ideas. It turns out most other students in my batch are frustrated and confused as well. We'll be leaving school and won't have much to add to the portfolios we used to apply to the program to begin with. Students hardly improve their craft or deepen their knowledge. Why does the school exist? And what's the difference between self-study at home and actually attending school? There are great resources on the Internet that I'm already using for lack of anything better. If you're determined and diligent you can learn a lot either way. And that's what I'm hoping for. If I'm going to be a success it's because I worked my ass off, guided myself, and made a distinction between relevant and irrelevant information. It's hard but I learn self-reliance, persistence, and how to coach myself. That's not a bad deal, either.

### **Patrik (2011-01-13 02:07:58)**

Seth, I have a friend who is doing an MBA — he is learning tons of "strategy" that has little bearing in the real world or in any future job prospects — his school has no classes in sales, which is very, very real-world. See "strategy" is unspoiled, pure and full of Big Ideas — and sales is hard and uncool.

### **Jill (2011-01-26 13:13:15)**

So true. I wish schools did more training and less "education" — I have a BS (how appropriate!) in engineering and management, an MBA, and completed the coursework for an ME and most of the coursework for a PhD — and yet feel that all those years in school have left me without any useful skills.

### **What Global Warming Science Really Says (2011-01-12 19:30)**

To see the usual arguments for global warming, look no further than [1]this list, which gives the most popular "skeptical arguments" with rebuttals. The person who made this list presumably read lots of stuff and tried to select the best rebuttal in every case.

That reading led to this:

Skeptic argument: Models are unreliable.

Rebuttal: Models successfully reproduce temperatures since 1900 globally, by land, in the air and the ocean.

Notice what it doesn't say. It doesn't say Models have successfully predicted temperatures . . .

These models have many adjustable parameters. With enough adjustable parameters, you can reproduce anything. The only reasonable test of a model with many adjustable parameters is how well it predicts.

[2]Hal Pashler and I wrote a paper pointing out that psychologists had been doing something similar for 50 years – passing off models with many adjustable parameters as reliable when in fact they hadn't been tested – when their ability to predict hadn't been measured. One explanation of the current global warming scare is that there is something to be afraid of. A more plausible explanation, I believe, is that – again – one group of scientists is passing off complex models with many adjustable parameters as reliable when in fact they haven't been tested.

2. <http://escholarship.org/uc/item/5vt0z72k>

---

Joseph Dantes (2011-01-12 20:35:18)

An intelligent and rare insight, coupled with a brave topic. I salute you, sir.

M (2011-01-12 21:44:59)

I believe you that complex models are often unreliable. But suppose mainstream scientists' complex models were instead predicting a stable climate – would you then be writing skeptical blog posts suggesting we should be afraid of climate change?

Seth Roberts (2011-01-13 00:20:52)

M, in the absence of reliable models I fall back on data that bears on the question without needing a model. In the case of climate change, current temperatures are not unprecedented – the Medieval Warm Period, for example. That makes it harder to believe that humans are causing unprecedented warming. So the answer to your question is no, I would not be saying we should be worried about climate change.

Kim Åyhus (2011-01-13 01:56:45)

I experienced the same unnecessary complexity while working in the industry of oil field simulations. The argument for it was always "The customer wants features." I doubled the accuracy of the simulations just by inventing a simpler and more accurate venturi model, with fewer variables and more realistic behavior. The reactions to this was a brutally hard lesson in practical psychology for me. The customer demanded endless amounts of new documentation instead of just asking why it worked better and paying for that information. The new boss tried to fire me for producing too little code. The supposed expert on the original code claimed my job should have taken a few hours, while never achieving anything like it himself. Eventually most employees there quit. According to the anthropic principle, and my other job experiences, these events are typical. So I guess similar stuff happens in climate modeling, pharmaceutical research, economics, psychology research, whatever. I do not quite understand why this stuff happens, but I find it damn stupid. As for following Ockhams advice of decreasing the number of entities, such as variables: There is another similar trick, which you obviously know, used a lot by J rgen Schmidhuber,

that of making the model more robust as measured by sensitivity to variations in the variables. The entities that are decreased in both cases are the amount of data needed to describe the model, as the number of variables, or accuracy of variables.

M (2011-01-13 08:03:51)

Your approach sounds reasonable (ie, "falling back on data that bears on the question without needing a model"). You point to the Medieval Warm Period. The skepticscience list that you linked to says: "Globally temperatures are warmer than they have been during the last 2000 years." <http://www.skepticscience.com/medieval-warm-period.htm>

Eugene (2011-01-13 11:54:20)

The ability of really, really smart economists (with a pair of Nobel Prizes between them) to create highly accurate models based on past economic performance is why Long-Term Capital Management runs such a successful hedge fund today. Oh, wait, maybe not.

Seth Roberts (2011-01-13 13:46:09)

M, a few years during the 1930s were also really hot. If you leave aside the models, the rest of the data doesn't make a good case that it is so much hotter than ever before we should be concerned. If that website had started by realizing the models are worthless, I might trust it. Since that website takes the models seriously, I don't trust it.

Nathan Myers (2011-01-13 19:40:12)

I seem to recall that climate modelers predicted in the '90s that it would be noticeably warmer today than it was then. Sure enough, it is, and by the amount they predicted (i.e., their worst-case scenario, which is what the data really indicated). Lately, every year is, or matches, the warmest on record. What makes that not a successful prediction?

Seth Roberts (2011-01-14 04:50:44)

Nathan, if we're going to base gazillion-dollar decisions on these models, we might want something a little more extensive and precise than the assessment you've just given ("I seem to recall . . .").

## **Inside the Chinese Government (2) (2011-01-13 04:31)**

I showed a Chinese friend of mine the famous [1]Chinese Professor commercial. In Beijing, 2030, a Chinese professor tells his students about the fallen American empire. It is a commercial against "government waste".

My friend said that in China you would be put in jail for making such a commercial. There is lots of waste in the Chinese government, she said. I asked her for examples. One is restaurant meals. Government officials go out for extremely expensive meals and eat just a few bites. I have heard that one quarter of restaurant spending in China comes from the government. There is a restaurant near my apartment with absurdly high prices; one of my students said that only government officials would eat there. Another example of government waste is cars. Government officials have big expensive cars.

[2]Inside the Chinese Government.

1. <http://www.youtube.com/watch?v=0TSQozWP-rM>

2. <http://www.blog.sethroberts.net/2011/01/07/inside-the-chinese-government/>

Jake (2011-01-13 08:18:47)

If you spent time in D.C. you would come to the same conclusion about our government.

### **Law Schools Deceiving Students (2011-01-13 07:46)**

In [1]an article about how law schools deceive prospective students, one way astonished me. Thomas Jefferson School of Law in San Diego reported that 92 % of their graduates are employed 9 months after graduation. That 92 % included the 25 % of the students they couldn't locate. Which is in accord with the guidelines, said the associate dean of student affairs.

1. [http://www.nytimes.com/2011/01/09/business/09law.html?\\_r=2&ref=business&pagewanted=all](http://www.nytimes.com/2011/01/09/business/09law.html?_r=2&ref=business&pagewanted=all)

---

Allen K. (2011-01-13 08:09:01)

That didn't shock me as much as the "since employment is going to be measured on Feb 15, let's offer them temp jobs for the month of February" gambit. What a scummy pyramid scheme.

dearieme (2011-01-13 10:40:45)

"92 % of their graduates are employed " might also means that 8 % of their graduates, when tracked down and offered six week jobs to cover the period of the study, declined them.

Mike (2011-01-13 20:19:54)

I love how one of the Google ad links on the right is for.... Thomas Jefferson School of Law. Automation at its finest

### **Economic Police (2011-01-17 21:15)**

There exists in China a branch of law enforcement called economic police (I don't know the Chinese name) whose job is to make sure government officials aren't getting rich – that is, corrupt. Only government officials, no one else. The brother of a friend of mine is one of them. He has been doing it for six years. In college he double-majored in police work and economics. He carries a gun but has only used it once – to stop a government official trying to flee from Shenzhen to Hong Kong.

---

Jim (2011-01-18 16:06:29)

This is a great idea whose time has come here in America. Anyone know a member of congress that might be open to this?

### **Thinking Like a Doctor (2011-01-18 14:45)**

Atul Gawande's [1]latest article in The New Yorker (gated) is one of his best. It is about attempts to reduce health care costs by focusing on the most expensive patients. A tiny fraction of people produce something like 30 % of the total cost. You can save a lot of money, it turns out, if you try hard to help them.

To help them, it turns out, you need to do things that aren't obvious, such as hire someone whose last job was at Dunkin Donuts (as a "health coach"). It turns out that not everyone is happy with what you're doing.

[One high-cost patient] had seen a cardiologist for chest pains two decades ago, when she was in her twenties. It was the result of a temporary inflammatory condition but [the cardiologist] continued to have her see him for an examination and electrocardiogram every three months, and a cardiac ultrasound every year. The results were always normal. After the clinic doctors advised her to stop [having the tests], he called her at home to say her health was at risk if she didn't keep seeing him. She went back.

To me, the most revealing part of the article was about a young woman with persistent migraines. During the last 10 months she had required \$52,000 of medical care ("twenty-nine E.R. visits, fifty-one doctor's office visits, and a hospital admission"). Yes, dealing with a persistent migraine by going to the E.R. over and over isn't getting anywhere. But here is what Gawande (a doctor at Harvard, who writes for The New Yorker) recommends:

She wasn't getting what she needed for adequate migraine care—a primary physician taking her in hand, trying different medications in a systematic way, and figuring out how to better keep her migraines at bay.

During those fifty-one doctor's office visits, the woman wasn't prescribed all possible medicines? And, if she was, she needs a doctor's help to figure out if they work – which they obviously don't? How stupid does Gawande think that she and her doctors are?

I don't think Gawande thinks they are stupid; I think he is unable to stop thinking like a doctor, which means thinking that every serious problem has a solution that includes prescription drugs or other medical care. (Unless it's obesity, in which case the solution is the ancient advice to "eat less, move more".) This woman needs to explore lifestyle solutions to her problem. She doesn't need a doctor for that. But most doctors, judging by their actions, cannot imagine such a thing.

1. [http://www.newyorker.com/reporting/2011/01/24/110124fa\\_fact\\_gawande](http://www.newyorker.com/reporting/2011/01/24/110124fa_fact_gawande)

---

vic (2011-01-18 17:30:47)

And if she wants to experiment with different drugs that might help her, why does she have to go through the hassle, expensive, and bureaucracy of seeing a doctor??

Red (2011-01-18 19:02:19)

Vic's hit something there. The solution to medical problems is to have people treat themselves instead of doctors for most common issues. We used to do this and with the internet it should be easy to fix most common problems.

thehova (2011-01-19 01:52:30)

I filed for a primary care physician during a summer in college. I was shocked and disturbed by the prevalence of mental health issues with the doctor's frequent visit patients. I guess it sort of makes sense. It's difficult for people suffering depression to make changes in their life and that leads to other medical issues. I'm not sure what the answer is. But it does seem like mental health drugs do not work as well as we once thought and that cognitive behavioral therapy is fairly effective.

John (2011-01-20 06:25:35)

People, especially the elderly, often go to doctors for a bit of human contact when they feel isolated—drugs can't relieve social isolation on their own. Some researchers are now looking at the placebo effect not only of drugs themselves but of the medical rituals of examining patients, prescribing, etc. For some depression, CBT is effective, and so is psychodynamic therapy—apparently roughly equivalent. The human connection with the therapist is an important factor in healing. For an interesting take on placebos: <http://www.radiolab.org/2007/may/17/>

dearieme (2011-01-20 06:52:57)

Would you like to comment on the recent Statins story? <http://www.telegraph.co.uk/health/healthnews/8267570/Millions-taking-statins-needlessly.html>

Seth Roberts (2011-01-20 08:07:22)

John, Jon Stewart commented on Sarah Palin's talent for turning criticism into victimization. It's the same with placebo effects. If something that should not have an effect does have an effect, it implies the experimenter doesn't understand what's going on. Exactly that, no more, no less. All that talk about placebo effects being due to "expectations" goes beyond the evidence. Yet somehow placebo effects are taken to mean the experimental subject is credulous. Medical researchers, in other words, are showing a talent for turning indications of their ignorance into indications of their sophistication ("we controlled for placebo effects"). dearieme, thanks for bringing that article to my attention. My interpretation is that the skepticism of doctors (dismissing acupuncture, for example) isn't really skepticism, it's self-interest. When being credulous is in their self-interest

(e.g., thinking statins are wonder drugs, without serious side effects), they're credulous.

Nathan Myers (2011-01-20 18:34:39)

I heard Gawande on NPR. He said she was using a weak migraine treatment, and nobody had thought to prescribe a better one, e.g. one that would actually work for her.

Seth Roberts (2011-01-22 07:52:58)

Nathan, that's a good point. Apparently thinking like a doctor means not thinking at all.

Chuck (2011-01-28 15:18:54)

When you say "(Unless it's obesity, in which case the solution is the ancient advice to 'eat less, move more'.)" you go from criticizing doctor think to thinking like a doctor. What about the ancient advice to "go for a walk and work up an appetite." In other words, move more, eat more.

Seth Roberts (2011-01-29 04:52:03)

Chuck, I have a low opinion of the ancient advice.

Chuck (2011-01-29 09:04:46)

Seth, my apologies. I totally miss-read the preceding sentence.

## Another Mysterious Mental Improvement (2) (2011-01-22 07:42)

[1]

[2]A month ago [3]I posted this graph, which shows how long I needed to type the answer to simple arithmetic problems (7-5, 4\*1, 9+0). I tested myself with about 40 problems once or twice per day. Because I'd been doing this for a long time, I no longer improved due to practice. Then, at the end of July 2010, I started improving again.

In September I moved from Berkeley to Beijing. I was worried that in Beijing my scores would get worse. Perhaps I couldn't get good flaxseed oil or butter. Maybe I would suffer from the air pollution. Maybe I would eat contaminated food. But my scores got better in Beijing.

When I eventually noticed the improvement, I wondered what I was doing differently. Obviously my diet and my

life were a lot different in Beijing than Berkeley. Was I [4]eating more walnuts in Beijing? I stopped eating walnuts and my scores didn't get worse. So it wasn't walnuts. The most plausible differences I could think of were: 1. Less aerobic exercise in Beijing. 2. Less vitamins in Beijing. 3. Warmer in Beijing. I collected [5]data that implied that shower temperature matters – and I can take warmer showers in Beijing than in Berkeley.

All of these proposed explanations implied that the crucial difference was Berkeley versus Beijing. But the improvement started in Berkeley – around the end of July. That was a problem. Recently I realized there was another possible explanation. In Berkeley I had had an amalgam mercury-containing filling replaced with a non-metallic filling. Not because I had symptoms of mercury poisoning, but because it seemed prudent.

I checked my records to see when I had the filling replaced. It was July 28 – right when the improvement started. To my shock, reduction in mercury exposure is now the most plausible explanation of the improvement. Two tests of this explanation are coming up: 1. When I return to Berkeley, will my reaction times go up? 2. When I have more amalgam fillings replaced, will my reaction times go down?

If it turns out that reduction in mercury exposure is the correct explanation, this will be important. I have an average number of fillings. I'd guess that half of Americans have as many amalgam fillings as I did. And – if the mercury explanation is correct – this arithmetic test is a sensitive measure of mercury poisoning. Over the last few years, before the filling was removed, I'd had six hair tests done, all from the same reputable lab. They showed that my mercury level was moderately high, perhaps 75th percentile. Not very worrisome.

I changed dentists because my old dentist made a terrible mistake: he put a gold filling next to an amalgam one. Putting one metal next to a different one is an elementary mistake. Contact of different metals creates an electric current (as Galvani discovered) and releases mercury. (So although I have a normal number of fillings perhaps I have more mercury exposure.) I stopped going to him for any dental work. The last time I went there for a cleaning, I was given [6]a booklet ("we must give you this") about the many sorts of dental materials – mercury amalgams plus several new ones. The purpose seems to be to tell people mercury amalgams aren't dangerous (this was stressed) yet get them to choose other materials in the future – mercury amalgams are just one of several possible choices. The controversy about the safety of mercury amalgams is covered [7]here. Sweden, Denmark, and Norway [8]have banned mercury amalgams. The ban began 2008.

---

Joseph Dantes (2011-01-22 08:54:00)

Very impressive, and a strong argument that mercury's effects are linear rather than threshold based.

Anonymous (2011-01-22 10:01:51)

What lab did you use for hair analysis?

Tyler (2011-01-22 11:21:57)

I'm interested to see where this goes. Both my parents have mercury fillings without apparent problems, but perhaps there's room for improvement? Over the last couple years I've lost a lot of respect for the dental profession. Many of the practices seem rash- Mercury fillings, Fluoride applications, Bisphenol-A in all the resins/sealants... It strikes me as incredibly naive, to think that adding new substances such as these that have never been present for the last 2.5 million years of human evolutionary history in these quantities (or at all - BPA), won't have any unintended side effects. What do you think? TS

Alex Chernavsky (2011-01-22 12:10:10)

Seth, I've heard that the process of extracting a mercury filling itself results in a fairly large exposure to mercury. Any thoughts about this?

Pip (2011-01-22 12:43:04)

What about fluoride in the water and toothpaste? I would bet that there is less exposure to fluoride in China.

vic (2011-01-22 13:21:37)

I've read the non-metallic composite fillings have bisphenol-a and other chemicals that can leach... not particularly appealing either

Gunnar (2011-01-22 14:09:10)

What material have you chosen as replacement? Be well.

dearieme (2011-01-22 15:00:38)

I have long argued that the slightly reduced life expectancy of Americans relative to comparable nationalities is caused by their devotion to excessive dental work. You may have hit of the detailed mechanism.

vic (2011-01-22 15:13:54)

also, has your sleep changed in association with your improved mental performance?

Seth Roberts (2011-01-22 21:00:28)

Anonymous, the hair test lab is Doctor's Data. Alex, the doctor took precautions but of course I had no idea at the time how adequate they were. These results suggest they were adequate, in the sense that the removal seems to have done more good than harm. Gunnar, good question but I don't know what the replacement material is. The dentist did a weird chiropractic procedure in which he put various materials in my hand and pushed down. That is silly and next time I should figure out what I want. pip, since the change started in Berkeley the Berkeley/Beijing differences are not especially plausible. Tyler, unlike doctors, who do not themselves take the drugs they prescribe, dentists are exposed to the materials they use. Mercury poisoning is a serious risk among dentists. I don't think anybody has claimed that the new substances wouldn't have any unintended side effects; they just thought the new substances were likely to be an improvement over doing nothing. For example, ether anesthesia. Our houses are full of new substances, such as plastics and metals. They aren't perfectly safe but they are on the whole improvements. vic, that's a good question. I will look into it.

Kim Å~yhus (2011-01-23 02:03:28)

I was told by a dentist that Mercury amalgam is quite safe because it is an alloy with another metal, so the atoms are bound together, so there is no direct contact with Mercury itself. As a solid state physicist I know that is totally false. An amalgam is NOT an alloy. It is instead very thin layers of alternating pure metal, somewhat similar to the ridges in a finger print. This is what gives amalgams their flexibility and crack resistance. So there is indeed direct contact by tongue, spit, and food to pure poisonous Mercury, making even worse chemical products.

Seth Roberts (2011-01-23 02:36:20)

Kim, good point. What I've read about dental amalgams did not make that clear.

KillaCam (2011-01-24 12:37:33)

Seth, What "simple arithmetic problems " test are you using? I'd like to start collecting data on myself! Thanks in advance,

Seth Roberts (2011-01-26 07:17:34)

KillaCam, I use a set of problems generated in R (the programming language). I run the test using R.

Stone Glasgow (2012-03-08 17:17:50)

What type of problems does the program ask you to solve? Seth:  $3 + 8$ ,  $8 * 9$ , problems like that.

### Assorted Links (2011-01-22 21:22)

- [1]According to Dani Rodrik, a Harvard economics prof, in November 2010 Tunisia was an "unsung development miracle." [2]According to a Tunisian, "for years, [President] Ben Ali and his cronies have literally stolen from his people and businesses i.e. stealing money from banks, government reserves, gold, etc."

---

Roger Sweeny (2011-01-23 07:18:12)

"Early on in Neverware's history, Hefter contacted Dell and Intel, eager to share with them his approach. It was the equivalent of calling the major oil companies to show them a design for a solar powered car. 'I also don't know that we'd be interested in "radically extending the life...of desktop PCs,' was the reply Hefter got from a higher up at Intel." Kind of like going to a school system (or--my God!--a School of Education) and saying you have a way of teaching the same amount in half the time.

Tom (2011-01-23 10:45:39)

Seth, I'm curious if you've every experimented with "high meat" (which I just heard of today.) It's 'ultra-aged' meat that's been allowed to turn. People are reporting reduced susceptibility to colds, improved moods and energy, etc. Here is one post, but if you search that forum for the phrase "high meat" (including the quotes) in the forum's Google Custom Search box you'll find a lot more. <http://www.rawpaleoforum.com/display-your-culinary-creations/high-meat-recipe-preparation-for-more-advanced-rafers/msg37877/#msg37877>

Seth Roberts (2011-01-23 20:27:01)

Roger, yeah, it is. If you went to an education professor with a radical idea about how to teach, you would be ignored because it did not fit with the professor's research agenda.

## Episodes (2011-01-24 02:36)

I love [1]this show! It is to comedy what Mad Men is to drama.

1. <http://www.sho.com/site/episodes/home.do>

---

Aaron Blaisdell (2011-01-24 23:54:21)

Good tip. I'll have to put that in my Netflix que.

## Monocultures of Evidence (2011-01-25 02:34)

After referring to Jane Jacobs ("successful city neighborhoods need a mixture of old and new buildings"), which I liked, [1]Tim Harford wrote this, which I didn't like:

Many medical treatments (and a few social policies) have been tested by randomized trials. It is hard to imagine a more clear-cut practice of denying treatment to some and giving it to others. Yet such lotteries – proper lotteries, too – are the foundation of much medical progress.

The notion of evidence-based medicine was a step forward in that it recognized that evidence mattered. It was only a small step forward, however, because its valuation of evidence – on a single dimension, with double-blind randomized trials at the top – was naive. Different sorts of decisions need different sorts of evidence, just as Jacobs said different sorts of businesses need different sorts of buildings. In particular, new ideas need cheap tests, just as new businesses need cheap rent. As an idea becomes more plausible, it makes sense to test it in more expensive ways. That is one reason a monoculture of evidence is a poor idea.

Another is that you should learn from the past. Sometimes a placebo effect is plausible; sometimes it isn't. To ignore this and insist everything should be placebo-controlled is to fail to learn a lot you could have learned.

A third reason a monoculture of evidence is a poor idea is that it ignores mechanistic understandings – understanding of what causes this or that problem. In some cases, you may think that the disorder you are studying has a single cause (e.g., scurvy). In other cases, you may think the problem probably has several causes (e.g., depression, often divided into endogenous and exogenous). In the latter case, it is plausible that a treatment will help only some of those with the problem. So you should design your study and analyze your data taking into account that possibility. You may want to decide for each subject whether or not the treatment helped rather than lump all subjects together. And the "best" designs will be those that best allow you to do this.

## Learning How to Learn (2011-01-26 08:08)

The New York Times [1]reported [2]a study in Science that found that testing yourself on material you have learned is a good way to improve retention. Then they published [3]a set of letters about it.

John Taylor Gatto, whose books I like, wrote:

Real learning is measured only by utility, by application. In the case of this research, the success claimed for practice testing is being measured by further testing – not by any real-world application. So what? Nobody should care whether memorization is enhanced by practice testing or not.

I disagree. Every day I study Chinese. A lot of that study is memorization, such as what characters mean. Learning what the characters mean while studying in my apartment really does help me understand what they mean out in the world. I care a lot how to memorize better.

A Pace University professor and "director of learning assessment" wrote:

Studying, not test taking, is the key to learning. . . . Testing, particularly standardized testing, does nothing to enhance knowledge and hinders the development of an appreciation for learning that should begin in school and last a lifetime.

I couldn't disagree more. After I have studied Chinese, frequently testing myself on what I've learned turns out to be essential to long-term retention. Without those tests – say, daily for a week, and less often after that – I forget what I've learned.

Standardized testing is especially helpful because it helps me see what works and what doesn't work. It makes it easier to compare various conditions, in other words.

"Development of an appreciation for learning that should begin in school . . . " Should? I enjoyed learning long before I started school.

It has taken me a few years to figure out how to learn Chinese. Now I think I am on the right track but these letters illustrate what my self-experimentation also taught me: Experts say the darndest things.

1. <http://www.nytimes.com/2011/01/21/science/21memory.html?scp=1&sq=test%20research&st=cse>
2. <http://www.sciencemag.org/content/early/2011/01/19/science.1199327.abstract>
3. <http://www.nytimes.com/2011/01/26/opinion/126test.html?hpw>

---

ChristianKI (2011-01-26 09:48:59)

"an appreciation for learning that should begin in school and last a lifetime." That sentence is so wrong that it could nearly only come from someone who's blinded by thinking academically. All young children have a appreciation for learning. It's school that kills the appreciation instead of school that creates the appreciation.

David (2011-01-26 10:49:35)

I don't understand the distinction they make between studying and testing. When you take a vocabulary test, you're presented with some words and attempt to define/translate them. When you study vocabulary using flash cards, you look at a vocabulary word and attempt to define/translate it. So studying is often already a kind of testing.

Seth Roberts (2011-01-26 14:34:42)

David, in a classroom the difference is pretty obvious: students are taking a test or they aren't. With flash cards, I agree, you can hardly study them without testing yourself. But there are many other ways to study Chinese besides flash cards. When it comes to Chinese, the learn-by-testing advice isn't trivial. Should I spend 20 minutes staring at lists of English words and their Chinese counterparts, should I spend 20 minutes copying characters, should I spend 20 minutes listening to a tape, or should I spend 20 minutes testing myself?

Justin Wehr (2011-01-26 19:15:57)

I started using free software this month (<http://www.mnemosyne-proj.org/>) to test you at gradually longer increments to help you get things in long-term memory. I don't have a firm ruling on its utility yet, but the potential seems strong enough that I am going to keep using it for at least a year.

Aaron Blaisdell (2011-01-26 19:36:07)

Lots of recent work on the generation effect and what Bob Bjork calls desirable difficulties has shown the benefits of testing on future retention.

Seth Roberts (2011-01-27 17:01:55)

Thanks for mentioning that, Justin. I was curious who runs the Mnemosyne Project but couldn't figure it out from the website. That they are collecting memory data makes it seem like an academic project – something done by a professor somewhere.

## **First Quantified Self Conference! (2011-01-26 13:24)**

The first [1]Quantified Self conference will be held in San Jose May 28-29! Robin Barooah and I plan to lead a break-out session about self-experimentation.

1. <http://quantifiedself.com/conference>

## **Probiotic Helps Children with IBS (2011-01-27 18:02)**

Irritable bowel syndrome (IBS) – basically, recurrent pain during digestion – is common. [1]A new study by Italian pediatricians asked if a probiotic would help. They randomized children into two groups: active and placebo. Children in the active group were given pills with a lot of lactobacillus bacteria, which they took twice per day. The placebo was made by the same manufacturer, so it looked identical. During the study, the researchers did not know who was in each group.

There was a big difference between the groups, which took about four weeks to emerge. The active group had painful episodes less than half as often as the placebo group, and the episodes they did have were less painful.

Overall this supports my broad point that we need to eat plenty of fermented foods to be healthy. That's not what the authors of the study concluded. They concluded:

Demonstration of the efficacy of a given probiotic for a specific therapeutic target will help clinicians choose which probiotic to use when dealing with a specific disease. We are entering the era of targeted probiotic use.

Which reveals a bad case of [2]gatekeeper syndrome. I wouldn't expect them to say their results support the idea that everyone should eat fermented foods – that's an "alternative" (and therefore "crazy") idea. But they could have said their results imply that kids with IBS should eat yogurt.

1. <http://pediatrics.aappublications.org/cgi/content/abstract/126/6/e1445>
2. <http://www.blog.sethroberts.net/2009/11/17/gatekeeper-syndrome/>

Joseph Dantes (2011-01-27 21:06:21)

My dad has a theory regarding this. Let me tell you his theory and add a bit from my own knowledge base. Known fact: I and many others can't absorb much fructose or other sugars in my upper intestine. It therefore passes into the lower, creating a bacterial feeding frenzy. This is called fructose malabsorption. It may also apply to other classes of food. Known fact: Gut bacterial flora balance is hugely important in overall health. Some chronic patients have been cured by the radical procedure known as "fecal transplant," to restore proper gut flora. Hypothetical causal mechanism: Eating the wrong kinds of food causes the wrong kinds of bacteria to flourish in the lower intestine, leading to myriad problems. Actionable treatment and prediction: Taking probiotics and fermented food is good for you, and can mitigate but not wholly eliminate the detrimental effects of eating the wrong kinds of food.

Seth Roberts (2011-01-27 23:19:20)

Joseph, "fermented food" is such a big and vague category that I agree with you that eating fermented foods is unlikely to solve all digestive problems – simply because the range of bacteria in what you eat may be too narrow. A few months ago, I had something edging toward diarrhea. Daily yogurt didn't cure it but kombucha (which has many more types of bacteria than yogurt) quickly did. Here is what I suggest someone with IBS should try: 1. daily yogurt and 1 glass of kombucha. 2. If any foods you eat regularly still cause trouble, do this: Put the food at room temperature, open to air, as long as you can with it still remaining edible. Then put it in the refrigerator and eat it daily in small pieces for a week. This should populate your gut with bacteria that digest it.

Joseph Dantes (2011-01-28 08:41:02)

That is a very interesting potential solution for overcoming things like fructose intolerance. Offhand, I don't know how it would solve the problem of inability to absorb sufficient quantities of fructose in the small intestine, causing it to pass into the large intestine and create problems there. However, theoretical causal mechanisms pale in comparison to hard experimentation. I haven't heard of your experiment being tried. Right now branching out isn't a priority for me... I try to minimize what little carbs (potatoes) I eat, because they slow me down compared to meat. The diet I'm on gives me zero IBS and provide optimal mood and energy and personality effects. However, I will certainly file away this intriguing idea. There may come a time when I want to travel the world and sample cuisines worry-free. It would be nice to be able to digest fruit, alcohol, grains, etc without a problem.

CTB (2011-01-28 08:59:32)

"But they could have said their results imply that kids with IBS should eat yogurt." In the discussion, they could have referenced actual studies showing instances where people eating yogurt experienced IBS relief (or talked about the anecdotal evidence)...and then used their own results with lactobacillus pills as a possible explanation. But they couldn't jump from their results to the implied claim that yogurt should be eaten by IBS kids. Many people with inflamed guts have problems with food intolerance...so the added dairy proteins and acid in yogurt might not be tolerated, despite the potential good effects of the bacteria. Maybe when the gut is healed of the inflammation, yogurt can be eaten prophylactically...but maybe not. I made my own yogurt and ate it as a staple for many years...then had a nasty case of IBS after using antibiotics during dental procedures. I had to go on a very strict elimination diet to figure out what foods were aggravating the condition. Then followed a personalized, restricted diet until the IBS went away. Afterwards, I was able to add back many of the eliminated foods, but, sadly, not the yogurt.

### **For Example? (2011-01-27 21:30)**

My friends know I like examples. My mother has complained I like them too much. Here, [1]via Jonathan Schwarz, is a good example of why I like examples. From [2]a long article by Bill Keller, executive editor of the New York Times:

I'm the first to admit that news organizations, including this one, sometimes get things wrong. We can be overly credulous (as in some of the prewar reporting about Iraq's supposed weapons of mass destruction) or overly cynical about official claims and motives.

Emphasis added. The lack of an example of being "overly cynical about official claims and motives" speaks volumes about the New York Times' relationship to those in power.

1. <http://www.tinyrevolution.com/mt/archives/003429.html>

2. <http://www.nytimes.com/2011/01/30/magazine/30Wikileaks-t.html>

---

Joseph Dantes (2011-01-27 22:46:55)

It would be easy enough to find examples of this for the Republican leadership, Iraq War notwithstanding. Real enlightenment comes when you realize that the Republicans, or rather the conservatives and reactionaries, are never in power even when they appear to be. But rather, it is one uninterrupted march of the bifactional Progressive party. Then your statement becomes true... those in power are never criticized. For details, read Mencius Moldbug. It's called "the Cathedral."

Nathan Myers (2011-01-28 15:53:01)

I just hope it's pleasant to be delusional. But anyway, still no examples. Hm.

### **The Buttermind Experiment (2011-01-29 05:20)**

In August, at a Quantified Self meeting in San Jose, [1]I told how butter apparently improved my brain function. When I started eating a half-stick of butter every day, I suddenly got faster at arithmetic. During the question period, Greg

Biggers of [2]genomera.com proposed a study to see if what I'd found was true for other people.

Eri Gentry, also of genomera.com, organized an experiment to measure the effect of butter and coconut oil on arithmetic speed. Forty-five people signed up. The experiment lasted three weeks (October 23-November 12). On each day of the experiment, the participants took an online arithmetic test that resembled mine.

The participants were randomly assigned to one of three groups: Butter, Coconut Oil, or Neither. The three weeks were divided into three one-week phases. During Phase 1 (baseline), the participants ate normally. During Phase 2 (treatment), the Butter participants added 4 tablespoons of butter (half a stick of butter) each day to their usual diet. The Coconut-Oil participants added 4 tablespoons of coconut oil each day to their usual diet. The Neither participants continued to eat normally. During Phase 3 (baseline), all participants ate normally.

After the experiment was finished. Eri reduced the data set to participants who had done at least 10 days of testing. Then she made the data available. I wanted to compute difference scores (Phase 2 MINUS average of Phases 1 and 3) so I eliminated someone who had no Phase 3 data. I also eliminated four days where the treatment was wrong (e.g., in the sequence N N N N N B B N N B, where N = Neither and B = Butter, I eliminated the final Butter day). That left 27 participants and a total of 443 days of data.

Because the scores on individual problems were close to symmetric on a log scale, I worked with log solution times. I computed a mean for each day for each participant and then a mean for each phase for each participant.

[3]

This figure shows the means for each phase and group. The downward slopes show the effect of practice. The separation between the lines shows that individual differences are large. (There was no reliable difference between the three groups during Phase 1.)

The point of the baseline/treatment/baseline design is allow for a large practice effect and large individual differences. It allows a treatment effect to be computed for each participant by computing a difference score: Phase 2 MINUS average of Phases 1 and 3. The average of Phases 1 and 3 estimates what the results would be if the treatment made no difference.

[4]

This graph shows the difference scores. There are clear differences by group. A Wilcoxon test comparing the Butter and Neither groups gives one-tailed  $p = 0.006$ .

The results support my idea that butter improves brain function. They also suggest that coconut oil does not. In the next post I'll discuss what else I learned from this experiment.

Andrew (2011-01-29 07:13:37)

You're handling the data incorrectly. The normal line shows the diminishing returns to practice - the second line segment has a slightly flatter slope than the first line segment. To the extent the 'kink' in the butter curve is larger than the normal curve, that shows the effect of butter. Your 'difference score' is meaningless due to the effect of practice, and the separation between the lines certainly does not reflect the effect of treatment - it reflects the large pre-experiment differences between the groups, which we need an explanation for before we can trust any conclusions drawn.

PeterW (2011-01-29 08:48:01)

Do you know the website of the arithmetic test? I'd like to use it for my own experiments.

Igor Carron (2011-01-29 09:46:07)

Seth, I don't understand something. Why is the green line so high at the beginning ? should we expect the error bar to go all the way down to the the blue and red starting point ? The blue line seems to show how people get accustomed to the test. and the slope is downward, i.e people are getting better and better. The green slope (coconut) seems larger than the red (butter) clearly showing that on average, it is better to go for the coconut than for butter, wouldn't you say ? It definitely seems to show that it has a lasting effect since the second baseline doesn't go back up as in the case of the butter.

Aaron Blaisdell (2011-01-29 10:26:01)

I agree with Igor. A look at the slopes indicates steeper slopes from Baseline 1 to Treatment and from Treatment to Baseline 2, they look steeper for the two oil conditions than for the Neither condition. Could you compare the slopes statistically to see if this observation is supported?

Kirk (2011-01-29 11:02:14)

Is the raw data available?

Eri Gentry (2011-01-29 11:14:30)

PeterW - the math test is available online at <http://genomera.com/instruments/brain-test-simple-math> Kirk - raw data is available at [https://spreadsheets.google.com/ccc?key=0Agb5ur28ZlcNdGJzVHJDdFo4NVBVNGdzS05w\\_Yk9meXc\\_&hl=en&authkey=CJfV9-EB](https://spreadsheets.google.com/ccc?key=0Agb5ur28ZlcNdGJzVHJDdFo4NVBVNGdzS05w_Yk9meXc_&hl=en&authkey=CJfV9-EB)

Seth Roberts (2011-01-29 14:07:18)

Andrew, using difference scores is a way of estimating the effect of practice and removing it. Removing effects you can easily see to better see what you can't easily see is standard statistical practice. Check out Exploratory Data Analysis by John Tukey for examples. Although you say the pre-treatment differences are "large", they aren't reliable. If you believe that floor and ceiling effects exist, the pre-treatment differences are in the wrong order to explain the difference scores. The Butter group has the least room for improvement but showed the most improvement (as measured by the difference scores). Igor, you ask "why is the green line so high?" Answer: There are individual differences between subjects. It was inevitable that the three lines would not start in the same place. Likewise, it was inevitable that they would have different slopes. I agree that if the effect of coconut oil takes a long time to wear off then a longer washout period would have been better. Aaron, an exploratory analysis of this data would do more tests, yes, and there is room for more analysis, of course. Here I wanted to keep the tests to a minimum (one) because I wanted to test the hypothesis that butter improves arithmetic scores with as much strength as possible. If your goal is to test an idea you already have, as soon as you do more tests, the power of the tests you have already done is reduced. If your goal is to get new ideas, it's a different story. I plan to do an exploratory analysis of the data later.

vic (2011-01-29 15:51:15)

What do you make of this study that shows negative effects on brain (and heart) function of a high-fat diet: <http://www.ajcn.org/content/early/2011/01/26/ajcn.110.002758.abstract>

Stephan (2011-01-29 15:51:36)

Very interesting. Thanks for posting this. Were the participants aware that you were testing the hypothesis that butter improves arithmetic solution time?

Seth Roberts (2011-01-29 17:18:52)

vic, the study you mention, which compared two diets (high-fat/low-carb and standard) does not say what fats composed the two diets. I think some fats make the brain work better, some make it work worse. The study has the peculiar feature that the abstract says that the high-fat diet reduced mood but the results (Table 4) show no difference between the diets. So the abstract is misleading. The study has a small number of subjects (n = 16) and to that extent supports what the buttermind study and my butter and flaxseed oil results suggest: that the fat in your diet has a powerful effect on how well your brain works. Perhaps they injected a lot of bad fat. Bad fat (e.g., corn oil) is much cheaper and more available than good fat. Stephan, yes, the participants were aware of the hypothesis. You write "the hypothesis you were testing". The study was done by Eri Gentry, not me.

Kirk (2011-01-30 18:39:09)

Several things puzzle me about this data and hope you can explain. 1) Rows 518-521 have no Mean in column AJ. Did your calculations use that value (and if so, would R default to a value of 0?) 2) Many of the Q01 numbers, which I conclude is the first test of any particular day, have a number almost double the value of other daily tests for that participant. Any speculation to the reason? Could it be some kind of time delay due to the initial load of computer resources (since this was an online test)? Or perhaps it is that sometimes people neglected to drink their coffee before the first test? (Examples: rows 18, 19, 28, 32, 33 ). 3) Is there an explanation for the occasional huge value? (Examples: 38 Q03, 44 Q09, 45 Q08, 180 Q18, to choose a few at random). I suspicion the large value for that particular test due to a coworker at the cubby entrance asking a question, or an urgent chat message, or a glance at the email inbox. Or a slow network. (Have to admit, I'm not thrilled about the 'online' portion of the test. I've seen way too many stutters in network traffic over the years. Or the remote system logs the transactions and has to wait occasionally for I/O on the disk.) 4) Some of the data looks inconsistent within one day. For example, row 396, where the numbers bounce back and forth. Q07 = 1641 yet Q09 = 876. Q16 = 611 yet Q17 = 1975. Thanks in advance for your time.

Seth Roberts (2011-01-30 23:40:45)

Kirk, to answer your questions: 1. I computed means of logs. That is, I computed an average for each subject myself after log transforming the data. I did not use the averages in the table. 2. Practice effects are often large. 3. I cannot explain unusually large values, but the log transformed values have few if any clear outliers. Eri Gentry collected the data, not I. 4. Easy question, hard question? I think it is really hard to know what is inconsistent and what isn't. If you want to find data generated by a different process you should at least start by looking at log values.

Kirk (2011-01-31 12:39:13)

Several more questions: 5. Do you often find large values in your own testing? 6. If I remember correctly, you use the R statistic package. Is your R system local or is it being accessed across the network? I suspect it to be local, on a laptop running Windows. Local applications are more likely to produce valid data. Although it's possible there would be competition from some higher-priority process (for example, I see some degradation on my desktop when the antivirus scanner kicks in, and also when Flux starts), generally, laptops and desktops, when serving local applications, have generous resources for handling simple tasks. On the other hand, a timing test being run across networks not only has those two issues to worry about, but also network delays, as well as issues on the remote server (queue depth, process priority, i/o, and others). I think it would be illuminating if some of the participants who had large values could comment if he or she noticed anything unusual happening during those large values. As of now, until it can be proven that the test design is reliable, I don't trust this data. It may reflect more a measure of the occasional bottlenecked computer resource than it reflects a measure of human capability as influenced by a biological agent.

Seth Roberts (2011-01-31 18:12:15)

Kirk, to answer your further questions: 5. I don't know what you mean by "large values". 6. I run R on a laptop. In my experience all data collection has flaws, usually many. How could "the occasional bottlenecked computer resource" have caused the pattern in the data I identified? There is a simple test of your idea. First, make clear what "large values" are - the values you seem to think are due to bottlenecks. You might be right about that. Second, make sure you can repeat the analysis I did and get the same answer. Third, see what happens when those large values are removed. If you explain to me what "large values" are and the definition isn't arbitrary, I will do the new analysis.

Kirk (2011-01-31 20:35:36)

I haven't taken the analysis in the same direction you took it, because I find the data looks odd, and because it's odd, it produces strange graphs, as also noticed by Andrew, Igor, and Aaron. I come from the software world where we look at the abnormal

data to determine if something is wrong. For example, one often wants transactions to complete in a consistent timeframe, because users can accept a long-running transaction that logically should take a long time because it's cruising through gigabytes data, but users hate it when a transaction which typically takes 3 seconds sometimes takes three times longer. The test, per the text at the Genomera website, consists of 32 simple math questions, and then the overall score is calculated. Let's look at line 21 on the spreadsheet. This person, on that day, had a low value of 996, or an average of 31.1 per simple math question. (I assume that's 3.1 seconds per simple math question.) And yet there was a high value of 3268, an average of 102.1. The largest is more than 3 times the average of the lowest. That, to me, is an extraordinary difference for what should be a relatively uniform unit of work. This could be the result of a computer bottleneck, or it could be the result of an interruption (coworker asking a question, phone call, urgent text, interesting email). Or maybe it's really that people sometimes have the occasional brain freeze which results in taking 3 times as long to answer simple math questions. During your sessions on your laptop when you solve simple math questions, do you find yourself occasionally taking 3 times as long to answer the questions as you normally do? Would any of the participants in the study, the ones who have the occasional large value, care to comment?

Vince (2011-01-31 20:44:26)

You should exclude the first trial for each test, since the timer for the first trial starts as soon as they click "Go", which is often before they are ready to type in their responses. Responses were a quarter of a second slower on trial 1 than on trial 2, on average, and twice as likely to be over 2 seconds (20 % vs. 10 %).

Seth Roberts (2011-02-01 01:57:43)

Kirk, the data do not look odd when converted to logarithms, in the sense that the data are unimodal, roughly symmetric, and not heavy-tailed. This is common - lots of data make more sense when converted to logarithms. I don't find myself taking 3 times as long as normal but I am very well practiced. Practice reduces variability on a log scale, I suspect. If there were computer bottlenecks now and then that makes finding a significant difference more impressive. Vince, thanks for the suggestion. It is the sort of thing that it makes sense to examine in an exploratory analysis. To improve future confirmatory analyses.

Alex Chernavsky (2011-02-01 05:50:30)

Seth wrote: "I computed means of logs. That is, I computed an average for each subject myself after log transforming the data." Seth, for those of us who don't have a background in statistics, can you elaborate a bit on why you analyzed the data in this way?

Eri Gentry (2011-02-01 13:59:28)

Perhaps not everyone is on the same page as to what is represented in the spreadsheet. It wasn't clear to me at first sight. Each row contains a single participant's (1) name, (2) time the test was begun, (3) reaction times in milliseconds for each correct answer (total=32), and (4) average of that test's reaction time in milliseconds. We typically see greater reaction times for the first question "Q01," which I believe is due to adjustment of starting a test. In my own experience taking the test, I was able to mentally prepare myself for the test's start after practice. This was a little like psyching myself up before some sort of physical exercise. Again, in my own experience, my reaction times varied between questions because some answers came to me more quickly than others. This is fairly common. Some people are brilliant at addition and multiplication, but not so much at division. I usually took a moment longer to answer division questions than addition or subtraction. And, when the questions shift from, say addition ( $1+7=?$ ) to division ( $6/2=?$ ), it can increase the time it takes to answer because we mentally shift gears.

Kirk (2011-02-01 18:20:10)

Thank you for the explanation, Eri, yes, I was confused about the specifics. Eri, do you have an explanation for why your data looks extraordinarily different compared to that of other participants? Most people seemed to struggle to get into the 900s, yet your data mostly sits in the 700s and 600s, and you even generated some astonishing low values (in the 200s and 300s). There was only one major 'burp', a value of 1464 (when the other row values averaged in the 700s). My speculation is that you tested on a local system connected via a local network, just as Seth tests on a local system (his laptop). A second question would be about the design itself: does each simple math question require a request/response from the Genomera server to the client, or were all the questions packaged together in one blob, such as a lengthy Javascript, which was shipped to the client, where the questions were answered locally, and the entire summary shipped back to the server?

Seth Roberts (2011-02-01 19:32:27)

Alex, I used a log transform on the data – that is, analyzed  $\log(x)$  rather than  $x$  – because the data were far more symmetric on a log scale than on the original scale. Here is a paper by me about transforming data: <http://www.sethroberts.net/articles/2008%20Transform%20your%20data.pdf> if you want to read more about data transformation, see Exploratory Data Analysis by John Tukey.

Alex Chernavsky (2011-02-01 19:34:40)

I have a question for Eri (and/or Greg Biggers) about how the reaction-time application actually works. Is the timing done locally (i.e., on the user's computer) with the results simply reported back to the server – or is the timing done on the server? And if it's done locally, is the timing independent of the hardware and independent of other processes that might be running on the user's machine?

Eri Gentry (2011-02-01 23:12:28)

@Kirk, I have no certain technical or metaphysical explanation for why my response times were any different. However, I've been typing for years and worked in my parents' grocery store as a kid, where I added prices together in my head every day. I'm sure both of those skills together gave me a slightly natural advantage. During the study, I simply tried to respond correctly as quickly as possible. For all but one of the testing days, I was using a laptop tethered to the internet via an android phone, as I had neither wireless nor hard-wired internet. So, I was by no means connected locally. I remember the 'burp.' I typed the wrong answer, deleted, and retyped the right answer. I remember because that aggravated me. =/ Btw, great eye to attention for catching that!!! Kirk, if you haven't already, I definitely recommend trying the math test for yourself (link above). The experience will likely inform some of your previous questions. @Alex, below is a response by our lead developer to a question similar to yours. Hope it helps! "" I can't speak to Seth's R program. For ours, I altered the jQuizMe plug-in by adding responseStartTime and responseEndTime variables. I bookended them on the tightest path I could find within the plugin. Certainly there is a bit of intervening plug-in plumbing, but I don't believe it's adding any sort of interesting lag. (The modified JS is at <http://s3.amazonaws.com/genomera/instruments/math/scripts/jquery.quiz.js> if anyone wants to have a read through particularly poorly crafted javascript. You can search for anything I added by "[jtz]").) If we feel like there's a problem, I can construct a static HTML test harness that measures millisecond response time within the context of a single function. This would get the jquery plug-in stuff out of the way. We can each take it and see if there is some kind of meaningful change. At the very least, I'm going to state that our instrument is consistent. So, even if it's 'slow', it's not going to skew the data. "" I want to point you all to our feedback page at <http://getsatisfaction.com/genomera> We have used this as place to host questions and answers about Butter Mind and the math test used for it.

Kirk (2011-02-02 21:19:33)

@Eri, thank you for the explanation of the large value. My conclusion is that the larger values, say, any of those which are double the value of the mean for that participant, are probably the result of a miscalculation (or miskeying) which resulted in a correction. The explanation of the use of the Javascript package seems appropriate. It is not a language I know so I can't review it, but since Javascript was chosen, it proves to me that good design minds understood how to solve this kind of problem space, and thus network latency is probably not an issue. I agree the data shows that people improve at this task over time. I find myself reluctant to draw further conclusions, given the limited amount of data, the continued improvement with practice, and the high penalty for mistakes. Would the results be different if those who made the most mistakes have been assigned to another group? Yet here I must bow out, having exhausted my meager capabilities at data analysis. One final learning: never challenge Eri to a quick-draw gunfight.

Eri Gentry (2011-02-05 10:58:06)

@Kirk, I should be clearer about the large values. The one I mentioned above was due to a "bug," if you will, in the system: when two keys were hit at once, no answer was submitted. However, two numbers would remain in the answer field - which was ALWAYS a wrong answer in our test - so, the one taking the test would have to delete both numbers and re-answer. Other large values could be due to things you suggested: various distractions or thoughtful hesitation. A few more things of note about the test design and how data was collected: - Only correct answers were submitted. Reaction times were collected

for all correct answers and the test continued until the user achieved 32 correct answers. There is technically no penalty for wrong answers (data is thrown out); however some users mentioned this had the effect of "psyching them out," bringing their confidence levels down for the remainder of the test. I believe this effect decreases over time, though I have nothing to back it up but observations of myself. - Questions were designed to have only single-digit answers [0-9], and - Questions automatically advanced after a single keystroke, whether number, letter, or symbol. Any incorrect stroke was called wrong and tossed out. The only bug I saw here was the one I mentioned - when, if two keys are hit simultaneously, the question does not advance (even though the answer is clearly wrong), but must be corrected by manual deletion then entry of a single item. Kirk, I appreciate the time you've spent thinking about the data. Certainly, there is room for improvement in group experiment study design, and even in building the tools to complement different studies. My hope is that more people like you will engage to help create resources on both sides. Generally, being at the beginning of an age that has "room for improvement," AKA one the will keep getting better (with this one, perhaps, the participatory health age... unless some better name sticks :P) is a really exciting place to be. I'll keep doing studies like this and plan to directly integrate user feedback as I move forward. So, everyone, please keep ideas flowing, and thanks for sharing! Lastly, re: the gunfight... hehe. Thanks, I'm strangely flattered :)

Celeste (2011-02-05 17:15:19)

Hi Seth, I never met you, but I'm Mel's sister. I followed a link to your blog from an email she sent me. This is very funny that you did an experiment like this. I actually do a lot of experimenting myself with nutrition since I was a kid...although never a "real" one like this. Raw grassfed butter or sometimes other animal fats has been a big part of my diet for years (10). I sometimes go through 2-3 lbs a week. I have noticed clarity of mind to be a factor of my fat intake. I also found other neurological symptoms like anxiety, neuralgia, MS like symptoms, that have come and gone depending on the source of fat I am using. Fun to look through your blog.

Chris Hogg (2011-02-05 20:23:51)

I really enjoyed reading this discussion. I think discussions like these are helpful, and will push us citizen scientists to create well designed studies and generate meaningful results. I definitely enjoyed all of the really good technical discussion about the instrument, potential bias due to latency, internet connection speed, etc. It is interesting how we all have such different perspectives, as i would not have immediately thought of this as an issue. On the issue of data integrity and validity of results, i think a lot of things that happened in this study are pretty common in any clinical study: significant data outliers, potential technical errors in data capture, etc. In any study (even \$100M pharma-sponsored trials) you will have these issues. Even simple blood tests get messed up, have variability in the measurement, etc. This is just part of the intrinsic variability you will see in any study, and you will try to compensate for it by studying a large enough population. I agree with Seth and Eri that this does not harm the study at all. As long as you assume that these 'errors' are equally balanced between the arms (meaning there is no reason why Butter should have more errors than Coconut oil), this should not adversely impact, or skew, the result. The worst thing you could do here is start to throw out 'outliers' because you think there must be something wrong with their results. Then you have really biased the data and damaged the study. There are a couple of ways to proactively try to address some of the challenges with these potential 'errors'. Most commonly, is simply randomization. When a subject enters the study you assign them to Arm X or Arm Y of the study. You pre-specify things you think could influence the result (age, gender, other baseline characteristics, co-morbid diseases, fast typing in this case, etc) and you make sure all of these parameters are equally balanced between the arms. The other is to set up a priori some data analysis rules (ie. you could specify before the study that results 3 standard deviations away from the mean are 'bad' and exclude them from the analysis). This poses all sorts of problems usually, and will open the study to controversy. Eri, one thing that would be really interesting in a next wave is to see if you could employ some form of randomization. one thing that strikes me from the study that i would like to fix is the different average baseline values for the 3 arms. In this case, i agree with Seth that Butter started out with the least room to improve, yet improved the most. If Coconut Oil had improved the most, i would not have believed the result and assumed it was regression to the mean. I wonder if you could tell people what intervention to use after they did a run-in test without butter or coconut oil. then you could 'balance' the coconut oil and butter arms so that they started from the same average baseline number. this would make the result a lot easier to interpret, and would just be cool if you could pull it off. just for another random thought you could also have them do a typing speed test if you think this is a source of bias, and try to randomize on that as well. The only real question i had is on using a Log transform of the data to do the analysis. i know this

is common in other fields (mathematics, physics, etc), i am just not sure if this is commonly done in biostatistics and analysis of clinical data. i will ask a biostats friend of mine if this is a common practice or is specifically not done for some particular reason. Thanks again for a good discussion.

Seth Roberts (2011-02-06 03:46:19)

Celeste, how does your fat intake affect your mental clarity? Chris Hogg, I hope you will tell me what your biostatistician friend says about data transformation. It isn't controversial; you can see for example Exploratory Data Analysis by John Tukey for a discussion of the reasons for transformation. However, many biostatisticians seem to be living in a statistical dark age, the most obvious signs of which are they don't plot data, they don't transform data, and they do too many tests.

Seth Roberts (2011-02-06 20:01:00)

If you would like to learn more about data transformation, here's a paper by me about it: [http://www.sethroberts.net/articles/2008 %20Transform %20your %20data.pdf](http://www.sethroberts.net/articles/2008%20Transform%20your%20data.pdf) Failing to transform your data is often like throwing away a large fraction of it.

EdwinBoyette (2011-02-06 21:56:10)

Seth, I'm now two weeks into fish oil supplementation, and a week into adding sardines and butter (1/2 to 1 stick a day). Today during my workout I noticed the weights moved faster than last workout even though I increased the weight since last time. I'm 38 years old, 175 pounds and 6'1. Today's workout was all conventional deadlifts without a belt or straps: 135 x 10 135 x 10 205 x 5 Work sets: 275x 4 x 4 (73ish % of 1 Repetition Max) 315 x 1 x 2 (86ish % of 1RM) 345 x 1 x 2 (94ish % of 1RM) I'm not taking any anabolic or androgenic compounds. Since some of the higher weights seems to be dependent on the CNS, I wonder if I have gotten a bit of a boost from the additional oils in the diet. My pace was very fast tonight with short rest times between sets so I was really suprised how quickly the bar moved tonight.

Alex Chernavsky (2011-02-06 22:07:07)

I'd like to see some kind of testing done to verify that these reaction-time applications (Seth's R code and Genomera's web-based app) give accurate and precise measurements that are independent of hardware, operating system, network traffic, and other processes running on the machine. Not sure exactly how to do this - maybe by writing code that is able to simulate pressing keystrokes? Or, perhaps less practically, some kind of hardware device that is able to press keys? In any case, because the interpretation hinges on fairly small changes in reaction time, I think it makes sense to invest some time to ensure the validity of the data-gathering tools.

Seth Roberts (2011-02-07 01:37:47)

Alex, there is error in all measurements. It would be a staggering coincidence if the error in my measurements changed at exactly the time I changed to eating lots of butter. Likewise, it would be a staggering coincidence if the error in the Genomera measurements strongly correlated with the butter/no butter treatment. Try randomly sorting the butter/no butter subjects into two groups and see how often you observe a difference as large as the difference actually observed. This is the purpose of p values - to estimate the chances of the difference you observed being due to something other than what you varied.

Alex Chernavsky (2011-02-07 21:23:59)

Seth, yes, but if you wanted to know the value of the absolute improvement in reaction time, you'd have to know whether the tool was giving you results that were true. Also - and I'm far from an expert on statistics - if it turned out that the reaction-time application gave noisy readings that fluctuated +/- 20 % from the true value, would this fact not make it more difficult to separate the signal from the noise in these types of "Buttermind" experiments? In any case, perhaps I'm being irrational, but when I weigh myself every morning, I like to know that I'm tracking not only changes in weight but also the real weight itself. That's why I always check my bathroom scale against the higher-end scales in two different doctors' offices, whenever I have an appointment.

Jazi yechezkel zilber (2011-11-29 02:40:06)

Seth, I see that with that much participants we got a significant but not earth shaking p-value. While in your own data, you usually show very strong p-values. Why is there such relative weakness in the data here of other people relative to you? Do you think you have more stability in other changes so that there is less noise in your data? Better calibrations? Whatever? Training effect? Or because this group just had a very short time and three conditions? I am wondering because I am contemplating to group people for self experimentation, and these data are somewhat of an indication that maybe it is harder to get significant results than I initially thought

Phil Goetz (2011-12-12 14:39:55)

The results may be significant, but it looks like the initial difference between the groups is even more significant. Why?

### **Fear of Retaliation: Global Warming and Nutrition (2011-01-31 14:01)**

I've [1]said it before but it is worth repeating: Science and job don't mix very well. Career demands can make it hard to tell the truth as you see it. [2]A scientist named Norman Rogers put it like this in relation to global warming:

Mainstream climate scientists are asking for trouble if they become skeptics [about man-made global warming]. They may lose their jobs, their papers may not be published and they may lose their grants. That's why most skeptics are older or retired or from outside of the mainstream - they are less vulnerable to retaliation.

He could have added that global-warming skeptics will have difficulty recruiting others, such as graduate students, to work with them and will face disdain from their colleagues.

I saw this in relation to [3]the work of Ranjit Chandra. At Berkeley, when I told other professors about my doubts, one of them replied: Talk to X. He's had doubts about Chandra for 30 years. I spoke to X. This was correct. I didn't ask X why he'd never said anything publicly about it because the reason was obvious: He feared retaliation.

2. [http://www.climateviews.com/Climate\\_Views/Download\\_Articles\\_files/CookRebuttalb.pdf](http://www.climateviews.com/Climate_Views/Download_Articles_files/CookRebuttalb.pdf)

3. <http://www.sethroberts.net/chandra/index.html>

---

Gunnar (2011-01-31 14:37:46)

An article by NASA about Einstein is of similar opinion: It's a question of authority. [http://www.nasa.gov/vision/universe/stargalaxies/23mar\\_spacealien.html](http://www.nasa.gov/vision/universe/stargalaxies/23mar_spacealien.html) I usually don't trust what NASA publishes, but I can relate to this statement. If you want to know why I don't trust them look up Richard C. Hoagland.

Nathan Myers (2011-02-01 01:23:41)

Maybe he didn't have any hard evidence. Natural Selection skeptics are looked at oddly, too. I wouldn't hire one for department head, even for a Chemistry department. Now, Lynn Margulis has been fond of saying Darwin was entirely wrong about everything, but that's not what I mean. It's one thing to fit another theory to the evidence, and something else to deny

the evidence because it doesn't square with what you would have liked to fit to it.

Gunnar (2011-02-02 10:49:13)

One example for economists: Priceless: How The Federal Reserve Bought The Economics Profession [http://www.huffingtonpost.com/2009/09/07/priceless-how-the-federal\\_n\\_278805.html](http://www.huffingtonpost.com/2009/09/07/priceless-how-the-federal_n_278805.html) The article makes good points regarding the asserted influence/pressure that you talk about, Seth. If you read that article, I think that it's wrong in assuming that the people at the fed are clueless and the disasters happen by accident. If you understand that the fed first and foremostly just prints "money" and that the fed has private owners, you understand that there really is an agenda behind it. But as long as you think they want to "do the right thing", the assumption of cluelessness arises. That some or even many professionals got blinded by their "science" I assume to be the case. Decades of school and university can achieve that.

Jenna (2011-02-03 19:39:41)

Speaking of global warming, I would really like to understand the lengths the monetary-market system i.e. its main beneficiaries/representatives, go to achieving ends through ideological manipulation and inadvertent control. Got any ideas about peak oil? Here in Britain there are 'transition' town movements organizing themselves ready for 'the crash' because they insert, we are so ill equipped for self sufficiency should things 'go wrong, all-of-a-sudden'. I'm really not one for conspiracy theories, at least I try to maintain some degree of skepticism. However when it comes to peak oil, I really struggle to decide what to believe in. It would be great to see a discussion on these issues. I am a young student, and I just am not sure what to believe at a point in my life that I think it is quite important to understand what's actually going on. There are so many people my age (early twenties) giving up their university educations, for farm work etc, because they think that a crash is imminent and the lifestyles we're leading are simply unsustainable and destructive. How am I meant to know what to do, when there are so many blurry lines when trying to determine fact from fiction? Any thoughts on this subject would be much appreciated! Particularly with regards to Peak Oil! Are oil company's/political/economic/corporative think tanks creating fear through scarcity as a means to gain in more profits and to implement more control structurally? Fear a means to socially stratify increasingly to gain in control? Perhaps I do sound like a conspiracy theorist, but for me they are real concerns, I don't know whether I am deluded to consider these possibilities; as how could they be 'proved' any how. I mean everyone clearly has AN opinion. I do realize that our behavior is influenced ideologically in part and so I would like some ideas on what directions to take when considering such a reality. Any ideas, please, would be great! Thanks.

Seth Roberts (2011-02-03 22:27:16)

I'd guess that situations like Peak Oil have been faced thousands of times during human history: A key resource is running out. Until oil was discovered that key resource was whale fat, used for lamps. Sometimes it really does run out before an alternative is found and the society disappears. The book Collapse describes several examples. Much more common, however, is that disaster is averted because innovation allows the society to move to overexploitation of something else. Without plastics for example, a great deal of modern society wouldn't be possible. Yet you don't hear about Peak Metal or Peak Wood - the innovation happened before the catastrophists could start scaring people. On the other hand, I believe that overexploitation is really common and the main reason humans migrated all over the globe - to find places where the food supply hadn't yet been overexploited. Now there is nowhere else to go. Perhaps rising food prices will eventually cause people to start growing food in cities.

Jenna (2011-02-04 05:23:41)

Thanks very much for your response Seth. You have given me a useful perspective.

Gunnar (2011-02-04 09:34:17)

Jenny, good questions. Keep on asking them and research yourself. There is plenty good evidence to be found to answer them. I give you just one superb link to further your research: <http://www.WantToKnow.info/>

Jenna (2011-02-07 05:40:01)

Hi Gunnar, thanks for the link. You have probably viewed this already, but I found Bob Altemeyer's book, amongst other's,

highly thought provoking; <http://home.cc.umanitoba.ca/~altemey/> - If you have more links please do send them on! My blog is; <http://thecontagiousbit.blogspot.com/>

## 6.2 February

### "Reading Seth Roberts Puts Me to Sleep" (2011-02-01 02:25)

... is the charming title of [1]this post by Adam Stoffa. Actually, reading me keeps him asleep. Adam read [2]my long self-experimentation paper and came across my discovery that skipping breakfast reduced early awakening. He had early awakening:

I would wake up sometime between 0400 and 0430. Six hours of sleep was not good. This was a problem that needed my attention.

Like me, he was eating breakfast around 7 am and waking up three hours earlier. He ate a big breakfast. He decided to make breakfast later rather than skip it.

I started experimenting with a late breakfast in August. I was traveling through multiple time zones at the time. So I had no idea whether it was working. But by the time I got back to Korea, eating a late breakfast was becoming a habit.

After recovering from my jet lag, I noticed that the experiment was working. Now, I wake up and get out of bed between 0600 and 0615. Sometimes, I still wake up in the middle of the night, but after a quick bathroom break, I'm right back to sleep. I get to work at 0800. After working for an hour, I take a break and eat (e.g. 3 hard boiled eggs, +/- a cup of cashews or macadamia nuts, and a smoothie). This regiment has been working well for eight weeks and shows no signs of weakening.

Yay!

1. <http://seeadamtrain.wordpress.com/2010/10/30/reading-seth-roberts-puts-me-to-sleep/>
2. <http://escholarship.org/uc/item/2xc2h866#page-1>

---

Nathan Myers (2011-02-01 23:22:55)  
Sorry, which post?

Seth Roberts (2011-02-02 01:14:44)  
well, at least one person is paying attention. Thanks for the correction, Nathan.

Elizabeth Molin (2011-05-10 05:58:01)  
See <http://www.nowforthesciencebit.com/in-the-news/pocket-science-2-8-may-2011> for a marginally related study on sleeping late and weight gain.

## Chinese New Year in Beijing (2011-02-02 04:45)

Sounds like we're under attack. Bombs going off, gunfire. A few fireworks.

More At midnight I was awakened by the densest loudest fireworks I have ever seen. About two per second for ten minutes or even longer. One launch pad was on the street near my apartment; I could see two other sources further away – geysers of glittery light. This proves the Chinese invented fireworks, I kept thinking. They were so pretty and varied I didn't mind being woken up. And it was so nice to be able to watch them from my warm apartment.

---

## Personal Science (2011-02-02 05:16)

In [1]the IEEE Spectrum, Paul McFedries, the author of [2]Word Spy, writes about new words generated by new kinds of science made possible by cheap computing.

Perhaps the biggest data set of all is the collection of actions, choices, and preferences that each person performs throughout the day, which is called his or her data exhaust. Using such data for scientific purposes is called citizen science. This is noisy data in that most of it is irrelevant or even misleading, but there are ways to cull signal.

That's not my understanding of what citizen science means. I've seen it used when non-scientists ("citizens") help professional scientists. The [3]Wikipedia definition is

projects or ongoing program of scientific work in which individual volunteers or networks of volunteers, many of whom may have no specific scientific training, perform or manage research-related tasks such as observation, measurement or computation

Bird-watching, for example.

My self-experimentation is not citizen science. I am not doing it to help a professional scientist nor as part of a project. I do it to help myself – in contrast to professional science, which is a job. Almost all self-experimentation by professional scientists and doctors has been done as part of their job. So let me coin a term that describes what I do: personal science. Science done to help the person doing it.

I believe personal science will grow enormously, for several reasons: 1. Lower cost. The necessary equipment, such as software, costs less and less. I use R, which is free. 2. Greater income. People can afford more stuff. 3. More leisure time. 4. More is known. The more you know, the more effective your research will be. The more you know the better your choice of treatment, experimental design, and measurement and the better your data analysis. 5. More access to what is known. For example, [4]Dennis Mangan discovered via the internet that niacin had cured restless leg syndrome. 6. [5]Professional scientists unable to solve problems. They are crippled by career considerations, [6]poor training, the need to get another grant, desire to show off (projects are too large and too expensive), and a Veblenian dislike of being useful. As a result, problems that professionals can't solve are solved by amateurs. The

best-known example is the invention of blood-glucose self-monitoring by Richard Bernstein, who was not a doctor when he invented it.

---

Joseph Dantes (2011-02-02 09:17:05)

Brilliant summary of the reasons personal science beats professionals.

Gunnar (2011-02-02 11:10:21)

How about "individual science"? The word person is highly influenced by legal fictions. And we are not persons, we are human beings.

Nancy Lebovitz (2011-02-03 01:42:18)

Would you include non-quantitative work like the invention of the Alexander Technique? About a century ago, F.M. Alexander had problems with losing his voice, and found that rest didn't help. He concluded that there was something he was doing when he spoke, and eventually found (with the help of three-way mirrors) that he was tightening his muscles as part of preparation to speak. Then he found ways to break such a strong unconscious habit. This is close observation and testing hypotheses, but no statistics.

Seth Roberts (2011-02-03 02:36:26)

Nancy, yes I include non-quantitative work. Sometimes effects are so clear you don't need numerical measurement to study them. The effect of pork fat on my sleep was/is so clear I didn't need numerical measurement of my sleep to notice or confirm it. Gunnar, the term individual science doesn't clearly exclude professional self-experimentation (by professional scientists, for their careers) which is what I am trying to exclude. Personal is about goals, whereas individual is about methods.

Matthew Cornell (2011-02-09 10:09:26)

> personal science The term is accurate; I like it. > Personal is about goals, whereas individual is about methods. I think you're splitting hairs; both definitions are valid. Plus, how can you do personal science without the scientific method? Or at least the spirit of it. > My self-experimentation is not citizen science. I agree, and I also think we need to move that conversation to that of individuals doing science, i.e., to making citizen scientists. I sketched some ideas here: <http://quantifiedself.com/2011/02/making-citizen-scientists/>

My Personal Development Strategy: Life Is An Experimental Game « Become Unrestricted (2011-05-20 12:31:23)

[...] the last step to see what you need to do. Feel like a scientist, if it helps you. In fact, you do personal science. Read the article Personal Development, Self-Experiments, and the Future of Search on Quantified [...]

Prion Indigo (2011-11-06 04:52:53)

As someone who plans to major in neuroscience, I believe what you are saying about personal science. Science is very personal. It allows one to connect with the universe in the deepest ways. The ability to apply logic and reason can, for some, help to appreciate what is. With modern fields in quantum physics, neuroscientists cannot afford to be strictly materialist any more.

Sheldon Greaves (2012-02-12 19:14:08)

I'm uncomfortable with the evolving definition of "citizen scientist" as a helper or assistant or collector of data. While these are important to scientific research, it's not clear to me that it leads to the kind of personal science you're talking about, or to a greater understanding of science for the citizen scientist. But all that being said, the definition of "personal science" here strikes me as the end goal for any science education that does not take one to a professional scientific career. Science as it is taught should focus on using it in daily life, rather than as a sifting process to identify likely career scientists.

### **Effect of Oscar on Marriage (2011-02-02 16:23)**

[1]This study found that women who win a Best Actress Oscar have a much higher rate of divorce in the following years than the losing Best Actress nominees and the Best Actor nominees, both winning and losing. A Chinese joke I heard recently says essentially the same thing:

There are four kinds of people: 1. Man. 2. Woman. 3. Woman with a Ph.D. 4. Someone who will marry a woman with a Ph.D.

Via [2]Marginal Revolution.

1. [http://papers.ssrn.com/sol3/papers.cfm?abstract\\_id=1749612](http://papers.ssrn.com/sol3/papers.cfm?abstract_id=1749612)

Darrin Thompson (2011-02-03 06:59:17)

Keep 'em coming. Eventually you'll have 60 minutes of the weirdest comedy act ever.

Alex Chernavsky (2011-02-03 17:11:50)

Reminds me of this saying, alleged to be an Italian proverb: There are three ways to make money. You can inherit it. You can marry it. You can steal it.

Seth Roberts (2011-02-03 22:13:02)

Alex, I don't see the connection. I mean, beyond the similarity of "three ways" and "four types". Am I missing something?

Alex Chernavsky (2011-02-04 05:40:40)

Seth, the similarity of "three ways" and "four types" is the only connection. I've always thought that the (alleged) Italian proverb is humorous, and so I remembered it when I read your post.

Geraldine (2011-02-05 13:53:10)

I think it's a funny but telling comparison Seth. It's a wonder that any celebrity marriages stick, all things considered. PS: I now

have my review blog up and running, have featured your book there at: <http://www.myreallifereviews.com/2011/02/shangri-la-diet-by-seth-roberts.html> Cheers, Geraldine

### **Email From Egypt (2011-02-03 16:17)**

One of my students is in Egypt. She writes:

I may be leaving here soon. Two of the foreigners here that I know that were in the protests have been arrested by the army and taken to a military academy- they were able to contact the German embassy as they are German and the embassy came to take them and keep them safe in a hostel until they are able to leave the country. People are beginning not to trust any foreigners here, not only journalists, and have begun to say that foreigners are spies stirring up trouble on behalf of foreign governments. The German girl that I went to the demonstrations with saw her own Egyptian neighbor talking to the army officers about her and her landlord and her roommates while she was being detained. Of course all journalists are being attacked right now. And the mood has just become very hostile towards foreigners. We are getting reports on a mailing list called Cairo Scholars (for foreigners living in Cairo) of all different types of incidents directed at foreigners here.

---

### **Humor as Catalyst (2011-02-04 03:14)**

In [1]this TED video Lisa Donnelly, a cartoonist, says

women + humor = change

I'm not sure what changes she means. But I think she is saying something important. Humor has a way of making change easier.

In the 1980s a friend of mine named Melody McLaren worked as a personal assistant in a London advertising agency. One of her co-workers was a woman named Denise Taylor. Denise was the personal assistant of the managing director, Chris Ogilvie-Taylor. Normally personal assistants get a nameplate on the appropriate door but Denise did not because her boss, Ogilvy-Taylor, was worried about the appearance of nepotism.

Everybody – except perhaps Ogilvie-Taylor – thought this was unfair. But Ogilvie-Taylor's boss was on a different floor. It would have been dangerous and strange to appeal to him.

My friend conceived a brilliant and surprising solution. She wrote a long poem, maybe 60 lines long, with rhyming couplets, about an imaginary town of Taylors (a play on "tailor"). The point of the poem was that Denise deserved her name on the door. Then, with the help of the art department, my friend wrote the poem on a giant card, about six feet high. The card was passed around the office. Everyone signed it. Then it was put in Mr. Johnson's office. Soon Denise got a nameplate.

This was not exactly humor – more like whimsy, with humorous elements. It facilitated change.

Another example comes from [2]a Chinese blogger:

On Oct. 20, a female blogger in northern China nicknamed Piggy Feet Beta announced a contest to incorporate the phrase “Li Gang is my father” into classical Chinese poetry. Six thousand applicants replied, one modifying a famous poem by Mao to read “It’s all in the past, talk about heroes, my father is Li Gang.”

Here too we have the three elements: woman, humor, change.

A friend of mine from Poland was surprised we had jokes in America. He thought the sole purpose of humor was to criticize the government. And our government was pretty good.

Sure, jokes are a way of saying the unsayable (e.g., dirty jokes). Sure, they can empower the weak, not just the strong (e.g., racist jokes). What’s interesting here is (a) Donnelly felt her equation was interesting (she’s right), meaning most of her audience didn’t know it; (b) she didn’t illustrate it well (why not?); (c) humor can be useful in everyday life (as my friend’s example shows), not just to criticize the government. I think this point should be incredibly obvious, like the sky is blue, but it isn’t.

---

Justin (2011-02-04 13:27:46)

I read this quote from an old counseling textbook and it has stuck with me: “Humor makes it easier to explore difficult, awkward, or nonsensical aspects of life. It can be used to challenge beliefs or magnify irrational beliefs to absurdity.”

Amanda (2011-03-30 12:36:38)

Interesting examples Seth, thank you for sharing! It’s worth noting on here that, while humor can be used as a catalyst for positive change, there are also subtle implications if used incorrectly. I work in innovation and the term my company coined, “humorous bazooka”, is a funny, witty comment that, intentionally or unintentionally, shoots down another person’s idea (read: innovation killer). You can read more about our thoughts on it here: <http://bit.ly/gnobzb> Just good to talk about the good, bad, and the ugly of humor!

## More Email From Egypt (2011-02-04 07:21)

My former student writes:

A lot of people here now are calling for a return to normalcy and peace! A fair number of people are beginning to blame the protestors for all the chaos and the fact that we can’t go out and we can’t go to work and Egypt is burning and we can’t order food from restaurants anymore! I think they are the same people who didn’t really support the protestors in the first place though- so we’re still safe- they’re not growing. Unfortunately many of my family members are among those- they just want to go back to work and they’re worried about money and they think we have gained enough concessions. They think the sacrifice is too big.

At the same time, there are maybe a hundred thousand or more protestors in the square right now, peacefully standing and holding signs for the president to step down. And more keep pouring in. My cousin Akram is getting ready to go meet my cousin Khaled and about 20 of his friends to go to the square. Aunt Magda is angry with Akram and telling him that he won't set foot out of the house but actually he is tying his shoelaces now..... The Friday prayer ended about an hour ago so now is the time when most people will be arriving there or on their way. My cousin Karim actually went back to work at Vodafone today after 4 or so days off because of the revolt.

I have promised everyone that I wouldn't go out today because of all the anti-foreign sentiment. There have been steady streams of emails about foreigners being detained, politely, and spoken to and then released after some time. But there are people calling the news stations in angry about Obama's order for the president to step down. One woman asked, "Can any country accept an order for their president to step down?" There is a lot of hostility towards America right now and I don't think the US can win no matter what they do. People criticizing the states for not making a strong enough statement requiring Mubarak's departure, others angry that America would order the president of another country to step down, some angry about all of the past support, and others angry that America would meddle at all...

We haven't seen any violence in the square so far today as there was on Wednesday and Thursday, just a massive sea of anti-mubarak protestors. We haven't seen much of the pro-mubarak supporters today- it seems that they have been hugely overtaken. I really hope it stays peaceful but a lot of people are going out angry today because of the attacks on the peaceful anti-mubarak supporters of the last two days. Many see it as an obligation to go out now and defend those who have been attacked. I am really proud of all those people brave enough to go out...

---

Thomas Seay (2011-02-07 13:23:52)

My feeling is that the protestors need to take action. I mean, aggressive action. They need to win over the army to their cause and forcefully run Mubarak out of the country. I know that's not going to please mealy-mouthed journalists who can only support them as long as they join hands and sing kumbaya; however, this is a war of attrition. People will start to get tired of being in the streets and that is what Mubarak is hoping for. He can stay holed up in his palatial digs, eating caviar for a long time.

### **Humor as Catalyst (another example) (2011-02-06 05:05)**

Melody McLaren, whose giant greeting card [1]I described a few days ago, told me another example of using humor to change behavior:

I was working at LA Incentives, a small promotional merchandise company in Barnes (southwest London). We (Liz Amies, the MD and I) were running a very small company in the midst of a recession (1987-1990). We were having difficulty getting our clients to pay us on time. Money was tight for everyone and the big companies were notoriously late at paying small suppliers, who had no resources to hire people to chase their debts.

So, being desperate, I tried the humor route once again (this was a couple of years after the ad agency incident). I drew cartoons that illustrated why clients might not be paying us - e.g. "You're probably

just trapped under something heavy” under a crude illustration of a guy pinned to the floor by a filing cabinet.Â Weir, whimsical stuff.Â I faxed the cartoons to the companies’ purchase ledger departments.Â Although this didn’t work with everyone, quite a few people paid up immediately. It was the power of surprise, I guess.Â No wars were stopped by this approach - but it did help us keep the company afloat for a while longer.

So effective you might think it would be obvious, but it isn’t. Although economists have a hard time using anything but incentives to explain economic behavior, notice that no incentives were changed.

Justin Wehr (2011-02-06 06:32:58)

”Iâ€™ve never seen anyone change his mind because of the power of a superior argument or the acquisition of new facts. But Iâ€™ve seen plenty of people change behavior to avoid being mocked.” -Scott Adams

Stephen M (Ethesis) (2011-02-06 07:33:27)

Which might be a better approach than these articles: <http://www.wheatandtares.org/2011/02/05/climate-science-after-climategate/> and <http://climateaudit.org/2009/12/12/daily-mail-special-investigation/>

Alex Chernavsky (2011-02-06 21:58:47)

I vaguely remember hearing something about a cop who was particularly good at defusing tense situations via an expert use of empathy and humor. Or maybe that was a movie I saw. Anyway, it seems like a better idea than shooting people (or threatening to do so).

Video gag (2011-09-08 02:25:01)

Dear Blog, Maybe a little off topic, however, Why are there so many white people creating fake profiles proclaiming to be black, then posting dumb stereotypical questions? and Why don’t we see the opposite? how telling is that? and more importantly why do people respond? you only ignite their ignorance or bad humor, whichever is the catalyst BTW great blogpost

## **Growth of Quantified Self (2011-02-07 05:04)**

The first Quantified Self (QS) Meetup group met in Kevin Kelly’s house near San Francisco in 2008. I was there; so was [1]Tim Ferriss. Now [2]there are 19 QS groups, as distant as Sydney and Cape Town.

I believe this is the beginning of a movement that will greatly improve human health. I think QS participants will discover, as I did, that simple experiments can shed light on how to be healthy – experiments that mainstream researchers are unwilling or unable to do. Echoing Jane Jacobs, I’ve said [3]farmers didn’t invent tractors. That’s not what farmers do, nor could they do it. Likewise, mainstream health researchers, such as medical school professors, are unable to greatly improve their research methods. That’s not what they do, nor could they do it. They have certain methodological skills; they apply them over and over. To understand the limitations of those methods would require a broad understanding of science that few health researchers seem to have. (For example, many health researchers dismiss correlations because “correlation does not equal causation.” In fact, correlations have been extremely important clues to causality.) Big improvements in health research will never come from people who make their living doing health research, just as big improvements in farming have never come from farmers. That’s where QS comes in.

The first QS conference is May 28-29. [4]Tickets are still available.

---

SR (2011-02-07 09:30:23)

I think it is ironic that somebody who knows about Veblen, could say something like "Echoing Jane Jacobs, I've said farmers didn't invent tractors. That's not what farmers do, nor could they do it." About Thorstein Veblen's father. "Thomas understood the science of his day. He crossbred Merino sheep to produce a hardier version capable of surviving Wisconsin winters yet produce high-quality wool. He built Kari a loom—an endeavor that required precision far above that necessary for homebuilding. He invented a portable threshing machine powered by two horses that allowed neighbors with small crops to avoid threshing with a flail." My guess is that you don't know any north European farmers, and thus pedal myths that is common in intellectual circles.

Seth Roberts (2011-02-07 16:50:18)

SR, I can't tell what your example is meant to show. Sure, farmers could produce small improvements. Genetics wasn't invented by farmers so I am not sure what your cross-breeding example is meant to illustrate. Likewise, farmers were never metallurgists, so the many metal components involved in a portable threshing machine wouldn't have been possible without innovation that took place far from farms. To the best of my knowledge, the innovations that have led to big improvements in farming – such as tractors – all started and gathered momentum far from farms. If you disagree, please give an example.

WR (2011-02-07 22:30:14)

Hi Seth, new reader, new to QS. Really like the blog. That said, the second to last sentence is a really silly if you didn't intend it to be tongue in cheek – which it now appears you did not. Don't squander your credibility. If your claim is that eg. geneticists (paid researchers very much like those in the health industry) are driving modern farming, you undermine your own argument in the other case. And while genetics may be propelling 21st century farming advances, that is very different from a claim about \*the entire history of farming\*. No need to dismiss the contributions of an entire history of labor in a profession. And many of the so called modern "advances" imported into agriculture since WW2 – and not invented by farmers – I could rather do without. And when I can, I do. Best, WR

WR (2011-02-07 22:35:09)

Came off a bit more rude than intended. Obviously you can do whatever you like on your own blog! Thanks for you work, WR

Seth Roberts (2011-02-08 01:39:36)

WR, you're welcome. And your comment doesn't come off as rude. Let me give two examples. The biggest advance in the treatment of diabetes since the discovery of insulin was home blood glucose monitoring, invented by Richard Bernstein, an engineer. It permitted far better insulin dosing. Bernstein was not a professional health researcher nor, at the time, a doctor. The discovery that smoking causes lung cancer was not made by cancer doctors – it was made by a med student and epidemiologists. I don't mean to imply that conventional health research is useless. But it is often, as in these two discoveries, only half the story. The other half of the story came from elsewhere.

SR (2011-02-08 19:25:44)

"SR, I can't tell what your example is meant to show. Sure, farmers could produce small improvements." I really like your theories about experts being experts in what is known knowledge, and don't really want to check things for themselves, and was kind of disappointed that you did not apply that theory about the US academic myth about the "fly over country" where only uncultured, unschooled mid westerners live. We have this myth about rural people in academia here in Europe as well, where most have visited a third world farm, but not been to their own countryside and gotten to know the farmers there. (I have gone to 4 universities, so I know it is common) A farmer does not need to be a poor peasant, and he does not work with farming all the time. It is also very common in north-European history that people who became rich in the city, bought a farm for the money, just like rich farmers bought education for their children. Just like Veblen's father was a carpenter in addition to a farmer, it was and still is common in Scandinavia that most had some other kind of work, like being a priest, blacksmith, weaver, carpenter, fisher, boat-builder, musician, soldiers etc. Same went for the women, that were midwives, bakers, cooks, spinners, herb-growers. Just like in a "shitty", people specialize to get more money, the main difference being that everybody needed to do their share in harvest or planting and plowing. What this means for a child growing up, is that you get to play with real mechanical objects from a young age if you showed the talent, and thus get a head start, instead of reading about it, or for that matter first become an apprentice, then a journeyman, before you could start doing something by your own design when you became a master. Also a phenomena worth mentioning, is that the smaller the place where you live are, the easier it becomes to become the local expert, where you need to come up with a solution yourself, since there is nobody that can tell you how it is done. "To the best of my knowledge, the innovations that have led to big improvements in farming – such as tractors – all started and gathered momentum far from farms. If you disagree, please give an example." When I saw how sure you were, I became unsure, so I started to read more about tractors, and funny enough, the first "official" tractor was made by farmer who was the son of a farmer. There is no good wikipedia page on him, but a google search for "john froelich tractor" will give a lot of hits. Also since I became unsure, I wanted to check most of the predecessors of the tractor, and it seems that most of them were made of sons of farmers or sons of rural blacksmiths who made or repaired farm equipment. [http://en.wikipedia.org/wiki/John\\_Fowler\\_\(agricultural\\_engineer\)](http://en.wikipedia.org/wiki/John_Fowler_(agricultural_engineer)) [http://en.wikipedia.org/wiki/Richard\\_Garrett\\_\(1755-1839\)](http://en.wikipedia.org/wiki/Richard_Garrett_(1755-1839)) [http://en.wikipedia.org/wiki/Aveling\\_and\\_Porter](http://en.wikipedia.org/wiki/Aveling_and_Porter) [http://en.wikipedia.org/wiki/Portable\\_engine](http://en.wikipedia.org/wiki/Portable_engine) [http://en.wikipedia.org/wiki/Nikolaus\\_Otto](http://en.wikipedia.org/wiki/Nikolaus_Otto) [http://en.wikipedia.org/wiki/Traction\\_engine](http://en.wikipedia.org/wiki/Traction_engine) Some Tractor makers I know today, who were started by sons of farmers, and grew up on a farm. [http://en.wikipedia.org/wiki/Giovanni\\_Agnelli\\_\(FIAT\)](http://en.wikipedia.org/wiki/Giovanni_Agnelli_(FIAT)) [http://en.wikipedia.org/wiki/New\\_Holland\\_Machine\\_Company](http://en.wikipedia.org/wiki/New_Holland_Machine_Company) [http://en.wikipedia.org/wiki/Jerome\\_Increase\\_Case\\_\(CASE\)](http://en.wikipedia.org/wiki/Jerome_Increase_Case_(CASE)) [http://en.wikipedia.org/wiki/Henry\\_ford#Early\\_years](http://en.wikipedia.org/wiki/Henry_ford#Early_years) [http://en.wikipedia.org/wiki/Harry\\_Ferguson](http://en.wikipedia.org/wiki/Harry_Ferguson) You also have these people who grew up on a farm, Borlaug, Mendel, Carl von Linne, and this quote is also quite funny. Darwin began to speculate on how new species could arise by natural observable causes. His idiosyncratic eclecticism led him to investigate some unconventional evidence. He made countless inquiries of animal breeders, both farmers and hobbyists like pigeon fanciers, trying to understand how they made distinct breeds of plants and animals. Gradually Darwin concluded that organisms were infinitely variable, and that the supposed limits or barriers to species was a belief without foundation. In modern terms we would say that Darwin came to accept that life evolves. One conventional view of the time was that species had been created where they are now found, in accordance with the environment. Few men of science then held to the view that there had been only a single species creation event. The fossil evidence seemed to show very many creations had occurred in different geological eras. <http://darwin-online.org.uk/darwin.html>

## The Twilight of Scientology (2011-02-07 21:51)

Soon after I moved to Berkeley, someone I met on the street invited me to a dinner in the Berkeley Hills. I thought it was a religious group; it turned out to be more cult-like. The cult wasn't named. Maybe it was Moonies, maybe Scientology. At the dinner, after the guitar-playing leader learned I was a psychology professor, she ignored me.

The New Yorker has just published [1] a long fascinating piece about Paul Haggis's defection from Scientology. It reminds me of [2] a piece in Spy – an exchange of faxes between the screenwriter Joe Eszterhas and Michael Ovitz, who at the time was the head of CAA (Creative Artists Agency) and considered the most powerful person in Hollywood.

Eszterhas called Ovitz a bully. It seemed to mark the beginning of the end of Ovitz's career.

My interpretation of the piece and associated material is that Scientology is dying. Just as Eszterhas wasn't afraid of Ovitz, quite a few people, the New Yorker piece reveals, are not afraid of what Scientologists might do to them. The New Yorker website has a great deal of [3]fun-to-read source material, which provides a vivid picture of what you can expect if you decide to join. The famous people associated with the movement, such as Cruise and Travolta (and [4]Greta Van Susteren) are getting old. Simple-minded celebrities will always be with us, sure. But any aspiring actor who considers joining Scientology now faces two hurdles not faced by Cruise and Travolta: (1) Fear of ridicule. The [5]Xenu stuff, for example. They tried to keep that stuff secret for a reason. Anyone can now read endless damaging stuff about Scientology. (2) Fear of professional damage. After South Park ridiculed Scientology, Isaac Hayes, a Scientologist, quit the show. Was he forced to quit by his Scientology superiors? Well, [6]one of his South Park bosses said, "He said he was under great pressure from Scientology, and if we didn't stop poking at them, he'd have to leave." Loss of that job must have [7]really hurt him.

---

Geraldine (2011-02-08 13:11:31)

Someone I loved many years ago was a member of this cult. That's what it is. It broke my heart to see how this group manipulated it's members, including this dear friend. I'm amazed that anyone is still "sucked in" by this gibberish (I read the L. Ron Hubbard "bible" Dianetics at the time) but it still seems to appeal to many people, searching for some answers to life's tougher questions. My advice: Keep looking, you won't find them at the Church of Scientology.

Brett\_McS (2011-02-08 18:17:33)

We also seem to be witnessing the end of Masonry. It used to be that one had to be a Mason to get ahead in certain industries/companies. Now those people have all retired or died. Scientology was created by the SF author Ron Hubbard to prove some people will believe anything, wasn't it?

Alex Chernavsky (2011-02-08 18:59:04)

I don't like the Church of Scientology (for reasons that I'll explain below), but I consider them to be mere pikers, Johnny-come-lately dilettantes when it comes to the business of evil cults. By contrast, consider the Catholic Church, which has a long, rich history of abominations (think indulgences, Inquisition, *castrati*, Galileo, birth control, etc.). However, far fewer people seem to get upset by Catholicism than by Scientology. But I digress from the point I wanted to make. I certainly hope that the Scientologists are on their way out. They, unfortunately, adopted anti-psychiatry as one of their pet causes (also one of *my* [1]pet causes), and thereby besmirched the whole movement. In my more cynical moments, I can imagine Big Pharma making under-the-table payments to the Church of Scientology, in exchange for the Church's staunch opposition to psychotropic drugs. "Look!", cries Eli Lilly. "The enemies of Prozac are whacked-out loonies who believe in UFOs and galactic overlords!".

1. <http://www.amazon.com/Anatomy-Epidemic-Bullets-Psychiatric-Astonishing/dp/0307452417>

dub (2011-02-08 21:09:47)

Anonymous has done great work protesting Scientology also...

UncleLongHair (2011-02-09 01:30:15)

Thank you for the mention, that was a very interesting article in the New Yorker. I have read a fair amount about Scientology just out of a twisted curiosity, and have even had a Scientologist try to sign me up in a bar once. The science and mythology behind it are so obviously ridiculous that I can't believe anyone would take it seriously, but obviously some do. The New Yorker article did seem to make the point that some useful techniques for resolving interpersonal conflicts, focusing one's energies, and getting ahead in your career might be taught, which I think would be interesting to learn about, if that could be separated from the cult aspects. I have to admit though that "Battlefield Earth" (written by L. Ron Hubbard) is one of my favorite sci-fi books, I've read it about 5 times (all 1000+ pages). The movie was a total failure but the book is pretty good.

TomGinTX (2011-02-09 07:24:26)

Re MegaProjects: You can add stadiums and arenas to that list.

Thomas (2011-02-09 17:30:05)

And here is a rebuttal of the climate change rebuttal: <http://ourchangingclimate.wordpress.com/2009/06/13/the-nipcc-report/>  
I really don't get this fight - at the end only to save the economy (speak: big corporations that save money when polluting the environment). And if the deniers are wrong, they simply wreck the only planet we have. What a gamble - just to make some bucks. This caricature really hits the nail on the head: [http://4.bp.blogspot.com/\\_rdbTUzF1SIU/TI6Whn2Fj\\_I/AAAAAAAAADE/BVmuqdOU5yQ/s640/What+if+we+create+a+better+world+for+nothing.jpg](http://4.bp.blogspot.com/_rdbTUzF1SIU/TI6Whn2Fj_I/AAAAAAAAADE/BVmuqdOU5yQ/s640/What+if+we+create+a+better+world+for+nothing.jpg)

Nathan Myers (2011-02-09 22:48:16)

*Scientists who believe as I do about climate change write to Congress* This is so sad. They only found two NAS members willing to sign on (out of 2000!), and almost half the rest of the signers are retired. Surely tenure is protection enough for the timid?

Perhaps the explanation for the measly turnout lies elsewhere.

Seth Roberts (2011-02-10 03:05:27)

Nathan, tenure does not guarantee many things professors want, including grant renewal, promotion through the ranks, the respect of your colleagues, this or that award, and competent graduate students. Thomas, if the deniers are right objecting to the current hysteria will help focus attention on the real problems.

vic (2011-02-10 23:07:39)

That's a great argument Seth (in your reply to Thomas)

Thomas (2011-02-11 10:39:35)

"Thomas, if the deniers are right objecting to the current hysteria will help focus attention on the real problems. " Which real problems don't get solved because we try to care about the environment? My main point is about the gamble you're doing. You might be correct - and the majority of the scientists might be wrong. But the probability is low, and if you're wrong you basically support the extinction of humanity (in favor of earning oil companies a couple of more bucks).

Seth Roberts (2011-02-11 14:56:02)

Thomas, among the real problems that don't get solved because of too much emphasis on reducing carbon emissions are problems of pollution, especially industrial pollution – for example, groundwater poisoning (see the documentary Gaslands) and heavy metal pollution. Lots of industrial pollutants are poisons beyond any doubt.

## **Chairs: The Carbohydrate of Furniture (2011-02-11 07:42)**

In the excellent BBC series about the history of design ([1]The Genius of Design), chairs played a large role.Â Perhaps a fifth of the show is about them, far more than any other product. Yet I rarely use them and own only a few. I sit while socializing but otherwise usually work reclining (on a bed or in a rocking chair) or standing up. Long ago I discovered that [2]if I stand a lot I sleep better. Since then I've spent a lot of time on my feet for someone whose job doesn't require it.

My self-experimental discoveries led me to avoid about 99 % of the food sold in a typical store – granola, cake mixes, flour, rice, breakfast cereals, and so on. Most of what I avoid is carbohydrate. Just as we are pushed to sit in chairs, we are pushed to eat carbohydrate. I don't think carbs cause obesity – it's more complicated than that – but they raise blood sugar (making diabetes more likely) and rarely supply essential fats. They are also poor source of microbes, which I'm sure you need to eat.

Over the last 30 years, designers have focused more and more on sustainability, "green design", and so on. I think of this as the second half of the industrial revolution – cleaning up the mess. As far as I can tell, designers have not yet started to understand that we need certain things from our environment just as we need certain things from our food. Here are some things I think we need from our environment: 1. Sunlight in the morning. Some buildings have daylighting to save energy. 2. Faces in the morning. 3. Absence of fluorescent lights at night. 4. Movement throughout the day. 5. An hour of walking per day.

Dennis Mangan (2011-02-12 10:28:42)

Great heading for your post, Seth. The following may be of interest: Sedentary Physiology Part 2 "Can Sitting Too Much Kill You?" <http://blogs.plos.org/obesitypanacea/2010/12/07/sedentary-physiology-part-2-can-sitting-too-much-kill-you/>

Jeff (2011-02-13 17:12:03)

Seth - I'm familiar with your learned calorie association theory and have lost a significant amount of weight as a result, but am curious your take on why so many others have been successful through only eating a low carb diet? Why do you recommend daily movement and an hour of walking? Also why walking as opposed to other aerobic exercises? TIA

Seth Roberts (2011-02-14 06:40:37)

I think low carb diets work because they push people away from foods that have (a) the same flavor each time and (b) lots of quickly-digested calories. Foods that have the same flavor each time are usually food in packages or fast food. And those foods are usually high in carbs: soft drinks, candy, french fries. I have avoided such foods for a long time. When I went from medium carb to low carb I lost no weight. When I stopped eating foods that taste the same each time, not worrying about carbs, I quickly lost weight. I recommend an hour of walking daily because only that caused my fasting blood sugar to be normal. (I posted maybe a year ago about this.) Aerobic exercise every few days did not. Movement throughout the day because it's pretty clear our bodies are not meant to sit all day. Nor stand in one place all day.

q (2011-02-14 07:17:22)

what was interesting to me after going to SLD (lost 20 pounds in half a year after 10 in a year with a willpower diet, stopped gradually six months ago and have gained

q (2011-02-14 07:17:56)

funny, my last content was truncated. i'll try again what was interesting to me after going to SLD (lost 20 pounds in half a year after 10 in a year with a willpower diet, stopped gradually six months ago and have gained

q (2011-02-14 07:18:37)

i think my last content was truncated because i used a less than sign. trying again. if this works, please delete the above? what was interesting to me after going to SLD (lost 20 pounds in half a year after 10 in a year with a willpower diet, stopped gradually six months ago and have gained less than 1 pound since then) was that when i went on there was an immediate change in how my body felt after eating carbs. prior to starting, i felt kind of wishy-washy after carbs - couldn't tell whether i was hungry, felt a craving for more, so hard to stop. after just a short time on SLD - maybe it was immediate - carbs made me feel full. ambiguity about being hungry or not hungry was gone, and cravings were much, much lower. that's persisted more or less until now. and it's PLEASANT not having so many cravings.

## Walking and Learning (2011-02-11 22:50)

[1]A new study supports [2]my idea that walking and learning are connected. Normally I found it boring to study Chinese flash cards. While walking, I found it pleasant. You could say walking made me more curious. Just standing on the treadmill didn't have this effect.

The study divided men and women in their 60's into two groups: (a) walking for 40 minutes/day and (b) stretching. At the end of the study, for persons in the walking group, part of the hippocampus – which is associated with learning – had grown. For persons in the other group, that part of the hippocampus got smaller. Several other parts of the brain, not associated with learning, did not differ between the groups.

1. <http://www.pnas.org/content/early/2011/01/25/1015950108.full.pdf>

2. <http://www.blog.sethroberts.net/2010/12/15/walking-creates-a-thirst-for-dry-knowledge/>

---

Arlene (2011-02-12 07:01:37)

I wonder if growth of the hippocampus also occurs when walking is routine/mandatory-as in getting to a workplace-rather than for fun or even as part of an experiment when one might take a variety of routes.

Anthony (2011-02-12 15:29:20)

Seth, in your other post you mention trying flashcards while walking around Tsinghua. Did you try this walking new routes, or walking routes you were familiar with? Similarly, have you tried walking routes you were familiar with and that had few people?

Seth Roberts (2011-02-13 04:50:14)

Anthony, I walked around routes I was familiar with. Mostly I walked in a nearby park, which was flat and nearly empty of people. This allowed me to pay more attention to the flashcards. A treadmill is far better for this sort of learning because I don't have to pay attention to anything else. I think I'm the first person to report such an effect – that learning dry facts, usually unpleasant, becomes pleasant while walking. I think the simplicity of the treadmill is why it was clear. My treadmill faces a blank wall. Surely I am not the first person to study while walking. I think ordinary walking is pleasant. I think it is much harder to notice a change from pleasant to more pleasant than a change from unpleasant to pleasant. Because treadmill walking (by itself, facing a blank wall) is slightly unpleasant, it made an increase in pleasantness easier to detect.

## AI at IBM (2011-02-12 07:58)

1. [1]playing chess
2. [2]playing Jeopardy!
3. [3]writing New Yorker cartoon captions

1. [http://en.wikipedia.org/wiki/Deep\\_Blue\\_%28chess\\_computer%29](http://en.wikipedia.org/wiki/Deep_Blue_%28chess_computer%29)

2. <http://www-03.ibm.com/press/us/en/pressrelease/33233.wss>

3. <http://www.sethroberts.net/spy/iftthereisonething.pdf>

---

Nansen (2011-02-12 16:40:11)

item 3 seems unrelated to either AI or IBM...

TomGinTX (2011-02-12 19:51:53)

That will be the next challenge for computers, after chess and Jeopardy: understanding the cartoons in the New Yorker. 8-)

Seth Roberts (2011-02-12 19:55:12)

item 1 = past AI at IBM = showing that a computer can play better chess than any human. item 2 = present AI at IBM = showing that a computer can play better Jeopardy than any human. item 3 = future AI at IBM = teaching a computer to write better captions to New Yorker cartoons than any human. My Spy article, to which item 3 is linked, hints there is a formula because there is so much repetition. I wrote another Spy article that showed Jay Leno and David Letterman several times told the same joke. Indicating there is a formula for their jokes.

### **Our Niche in Life (2011-02-13 05:56)**

A Chinese teacher in Los Angeles named Yang Yang, whom you can see in [1]this video, wrote this on [2]her website:

I believe that we all have our own niche - something so unique and innate to us that we enjoy every second of it and can naturally do better than others. Teaching Chinese is my niche.

I think this is the beginning of wisdom about human diversity - a big improvement over judging people by how "smart" they are, as so often happens. (To a college professor, smart = able to imitate a college professor.) [3]My theory of human evolution emphasizes the need for diversity of occupations. In ancient times, occupational diversity arose because different people enjoyed doing different things.

But I also think Yang Yang is wrong in two ways. First, I don't think your niche is innate. I think it can be changed. I think we can come to enjoy and excel at many jobs that we do not enjoy at first. This is the other side of procrastination. Just as we dislike doing things simply because we haven't done them in a long time, we like doing things simply because we did them yesterday. Habits are pleasant.

I also think that where you fall on a pro-status-quo/anti-status-quo (conformist/rebel) dimension is not innate. I think it has a lot to do with your birth order (first-borns are more pro-status-quo), as Frank Sulloway says in Born to Rebel. I didn't read Amy Chua's Battle Hymn of the Tiger Mother expecting to think about birth order and rebelliousness but that's what I ended up thinking about.

---

Alrenous (2011-02-13 07:16:25)

"Just as we dislike doing things simply because we haven't done them in a long time, we like doing things simply because we did them yesterday. Habits are pleasant." I'm exactly the opposite. Am I just that far down the 'novelty seeking' slider?

Seth Roberts (2011-02-13 13:52:27)

Alrenous, you don't procrastinate? Because the prospect of doing something new and different is so enticing? You don't have habits? I've never heard of anyone like this.

D (2011-02-13 14:07:47)

I thought Sulloway's work had been totally discredited (outside the family environment, where it is correct)? At least that's the (very strong) impression I got from reading Judith Rich Harris when she summarizes the conclusions of those who have critiqued his work - both his methodology and looking at other data to see if his hypothesis is borne out. No doubt was meant to be left in the reader's mind.

Seth Roberts (2011-02-13 15:06:21)

D, I'm not sure I understand what you mean by "totally discredited (outside the family environment, where it is correct)". I have read what Judith Rich Harris said on the subject; I found it one-sided. I believe Sulloway could have done a better job of defending himself from the criticism Harris describes. His legal threats took the air out of the room. A great distraction. In any case, I think the extent to which one does what one's parents want - which Sulloway says is controlled by birth order - really matters. The smaller the world, the more your parents are the status quo.

Alrenous (2011-02-13 21:30:09)

I do have habits. And I do procrastinate. I procrastinate on my habits.

Kevin R. Bridges (2011-02-16 03:38:23)

My personal observation on talents is that people tend to grow a talent where they enjoy things. For instance, I was a crummy writer, but an enthusiastic one, for about six years (fifth grade to eleventh) before I had a breakthrough and, literally overnight, "got" writing. In the autobiographical book by physicist Richard Feynmann, "Surely You're Joking, Mr. Feynmann!", he tells a story of an artist he befriends. They make a deal, that his friend will teach him to be an artist, and he will teach his friend to be a scientist. Starting this well into adulthood, Feynmann develops into a very accomplished artist, with seemingly no innate knack. So, in short, I agree with you, that our specialized skills are not innate. At the same time, though, the interests that drive us toward certain activities do have an innate root in our personality. As in, my girlfriend could possibly learn to do programming, but she could not learn to do it for the same reason that I do it. Or, a crude metaphor, a straight woman could successfully have sex with another woman, but she won't be doing it with the innate excitement with which a straight man would do it.

Jazi yechezkel zilber (2011-02-17 18:44:26)

In "the nurture assumption" Judith Harris Reviews the evidence to her conclusion that there is no convincing basis for birth order effects (maybe only a few effects) and that the data has many holes etc.

## **Walking and Learning Update (2011-02-13 23:47)**

I discovered a year ago that walking makes it pleasant to study boring stuff - as I put it then, [1]boring + boring = pleasant. I am still a little amazed.

Like any scientific discovery, I suppose, I had to do serious engineering to make good use of it. In particular:

1. Make walking easier. I use a treadmill in my apartment, which eliminates travel time (to where I do it), elimi-

nates distractions, provides climate control, and allows me to walk barefoot.

2. Steady stream of study materials. Now I am using an Anki deck of Chinese characters put together by someone else. This saves a lot of time. ([2]Anki is an open-source version of SuperMemo, a flashcard program that tries to optimize repetition.)

3. Figure out how much new stuff to study each day. Without plenty of repetition, you are wasting your time – you will forget what you’ve learned. Most of a study session is repetition. This means it’s not obvious how much new material to introduce each day. I found that 10 new Chinese characters is about right.

4. Put laptop on treadmill. To use Anki while on my treadmill, I need to use my laptop on my treadmill. At the [3]Beijing Wal-mart, I found a piece of [4]Sunor metal shelving that works perfectly. I put the shelf (about 90 cm long) across the arms of the treadmill, put the laptop on the shelf.

5. Minimize complications. I first noticed the effect using Anki. But Anki had several features I disliked, so I switched to ordinary flashcards. But they were too complicated – hard to schedule appropriately (you need to slowly expand the time between tests), time-consuming to keep track of progress. I had to keep stopping to make marks on the cards. So I am back to using Anki. Anki lacks a graph of progress – a graph that shows amount of learning versus date. But it is better than flashcards.

Each improvement made things better. With all of them, I lose track of time. Study, study, study, walk, walk, walk. Then it’s over. Not just painless, pleasant – different than any pleasure I have felt before. It feels a little like a new energy source (I imagine it can be used to learn many things), a little like teleportation.

The science aspect of it also interests me. Learning is the core topic of experimental psychology. Thousands of experiments have been done about human learning, thousands more about animal learning. Experimental psychologists are good methodologists; the average experimental psychology experiment makes the average medical-school experiment look retarded. But the walking/learning effect (walking makes learning pleasant) is outside anything anyone has ever reported. Only Michel Cabanac (not an experimental psychologist) has studied how variation in pleasantness regulates action (e.g., eating). Experimental psychologists lack good ways to find new effects. By missing this effect, they are missing a bigger idea:Â learning is regulated, just as a thousand other things inside our bodies are regulated.

Joshua Conner (2011-02-14 01:48:10)

I'd love to see a picture of your laptop "desk" set up. Is the metro shelving (with your laptop on it) just resting on the arms of the treadmill?

Seth Roberts (2011-02-14 02:52:39)

Joshua, that's a good request, I will post a picture. Yes, the shelving just rests on the arms of the treadmill.

M (2011-02-14 06:12:26)

Great post. What brand/model of treadmill are you using? Where did you buy it in Beijing? You might try the "Hanzi stats" plugin for anki. I don't believe it has graphs - but it gives you more statistics about how many characters you have "seen", which you can follow over time.

Darrin Thompson (2011-02-14 06:53:49)

ooohhh snap! The arrrrr word!

bjk (2011-02-14 07:37:18)

I've always found riding on a bus/train and reading is very pleasant (not so much cars or planes). I thought it was that it gave the illusion of progress while doing something sedentary. Or maybe it was the moving scenery, which provided a break from the reading.

gwern (2011-02-14 07:45:10)

> Anki lacks a graph of progress â€” a graph that shows amount of learning versus date. But it is better than flashcards. I use Mnemosyne, but that would surprise me. Leaving aside the issue that 'learning' isn't a clear metric ( # of cards ranked 4? Average ranking? # of cards with intervals longer than a month? A week?), I had understood that Anki had tons of statistics. Even Mnemosyne can display basic statistics like # of cards ranked 4, or 5.

Thomas Johnson (2011-02-14 07:49:40)

Anki definitely has progress graphs. I forget the exact menu to go to, but you can see how many reviews you've done, how many "mature" (i.e., hard-to-forget) cards you have, etc

vic (2011-02-14 12:05:56)

Any idea how one can make writing grant proposals pleasant?

Tom (2011-02-14 12:55:13)

Fascinating. I wonder if the synergy between walking and learning has been selected for? Literature is a recent development, and our brains were huge long before it. Perhaps this gift is in part to map the resources and dangers of large amounts of terrain while walking through it.

Seth Roberts (2011-02-14 13:36:15)

Darrin, by the "arrrr word" you mean "regulate"? Yeah, I think there is some sort of bigger case to be made for regulation of learning - more evidence that points in the same direction - but I cannot figure out what it is. Thomas, you say "Anki definitely has progress graphs." My version (the latest) has eight graphs. Four show something (y axis) versus day in the past (x axis). The four graphs are reps, review time, number added, and first seen.Â None of those four is how much you have learned (which is the progress I care about). One of them shows reviews of mature cards. The total number of mature cards would be a measure of learning but they don't show that as a function of day. The Pinyin Plugin includes a graph of progress, which is one sign that plain Anki lacks such a thing. M, my treadmill goes under two names. In America it is the AFG 5.0 treadmill; in China, it is the Elite T5000. (They are slightly different - the American version, with the 3.0 HP motor, is better.) I bought from a store in Beijing with the website [www.93bill.com](http://www.93bill.com).

Oli M (2011-02-15 22:11:20)

Damien Elmes, the developer of Anki, is pretty friendly and very responsive to user input about Anki. I'm sure he would be happy to hear the observations of an experimental psychologist on how to improve his learning tool, if you were to [1]post on the forum. He seems to respond to just about every thread personally.

1. <http://groups.google.com/group/ankisrs>

Seth Roberts (2011-02-16 01:50:05)

Oli M, thanks for the suggestion. Tom, yeah, the evolutionary reason you give ("to map the resources and dangers of large amounts of terrain while walking through it") is close to what I suggested earlier ("to push people to walk in new places (which provide something to learn) rather than old places (which don't)"). vic, to make writing grant proposals pleasant I suggest you divide the task into tiny pieces and after finishing each tiny piece give yourself a reward.

Evelyn Majidi (2011-02-23 07:49:54)

In the middle east it is common to see young people walking up and down streets or in public parks studying for final exams. They repeat the material to themselves in a sing-song manner until it has been memorized.

Kevin Page (2011-02-23 08:26:51)

Aristotle, the "paripatetic" philosopher, allegedly taught in the Lyceum as he walked around... Presumably, his students followed him about... He may have been onto something... I would rather walk and discuss than sit and discuss like old Socrates - although the Socratic maieutic is a superior way of learning philosophy... Ah well, good insight Seth...

Seth Roberts (2011-02-23 15:54:13)

Evelyn, that's very interesting about seeing people walking while studying. You saw this yourself? Kevin, that's a good reference. I prefer to talk with students while walking rather than sitting in my office.

Evelyn Majidi (2011-03-02 23:00:13)

I lived in Tehran most of the time between 1963 and 1980. Seeing high school and college students studying while walking in public parks and narrow streets was a very ordinary sight during final-exam season. A vital part of the process was repeating the material out loud, over and over, usually to the rhythm of the steps. It reminded me of how easily children learn nursery rhymes, even when they do not understand the meaning of the words, especially when they accompany them with specific gestures or movements. My mother always said that the more senses are involved, the better one learns.

Dan Brown (2011-02-15 10:08:13)

wow! I didn't realize who Marcia Angell is until reading this paragraph, toward the end: "The problems I've discussed are not limited to psychiatry, although they reach their most florid form there. Similar conflicts of interest and biases exist in virtually every field of medicine, particularly those that rely heavily on drugs or devices. It is simply no longer possible to believe much of the clinical research that is published, or to rely on the judgment of trusted physicians or authoritative medical guidelines. I take no pleasure in this conclusion, which I reached slowly and reluctantly over my two decades as an editor of The New England Journal of Medicine."

dearieme (2011-02-16 04:05:46)

My feelings exactly, Dan. Her remarks carry weight.

David (2011-02-17 17:32:45)

Here's a useful link. Any more greatest hits for us to see? [http://books.google.com/books?id=24tXv1nFv40C &source=gbbs\\_all\\_issues\\_r &cad=1](http://books.google.com/books?id=24tXv1nFv40C&source=gbbs_all_issues_r&cad=1)

### **"Do a Small Thing": Good Advice For Revolutionaries and Scientists (2011-02-18 00:15)**

[1] This is the best magazine article I have read in a long time. The subtitle is "What Egypt Learned from the Students Who Overthrew Milosevic", a good description. The Serbian students who overthrew Milosevic had several lessons for budding revolutionaries in other countries, such as Egypt and Burma. One was/is:

Do a small thing and if it is successful, you have the confidence to do another one and another one.

Much like [2] my advice about science: Do the smallest easiest thing that will tell you something. You will learn more from it than you expect. If someone criticizes a study for being "small" they are saying " $1 + 1 = 3$ ". If someone does a large study that fails, they are saying the same thing.

Via [3] Long Form. I knew little about the author, [4] Tina Rosenberg, before this. I am looking forward to reading [5] the book about peer pressure from which this article was taken.

1. [http://www.foreignpolicy.com/articles/2011/02/16/revolution\\_u?page=full](http://www.foreignpolicy.com/articles/2011/02/16/revolution_u?page=full)

---

Tom (2011-02-18 13:28:31)

Pardon the off-topic comment, Seth, but the NY Times has an article today that seems to support your memory+walking research: <http://www.nytimes.com/interactive/2011/02/20/magazine/mind-secrets.html?hpw>

john (2011-02-19 02:00:31)

Interesting - but it's democratic governments that need to be overthrown and replaced with anything - because they are worse than dictatorships in that they race replace the natives while making them to pay for it.

Mike Kenny (2011-02-20 12:13:41)

In a similar vein, I wrote about focusing on the easy stuff in an editing task to make it more tolerable to do: [http://michaelkenny.blogspot.com/2009/08/keep-doing-easiest-stuff-until-you-done\\_03.html](http://michaelkenny.blogspot.com/2009/08/keep-doing-easiest-stuff-until-you-done_03.html) There's the snowball method of debt reduction, Sun Tzu's advocacy of attacking weakness with strength and avoiding attacking strength, and similarly, military theorist Liddell Hart's indirect approach, advocating in part attacking the weaker of two allies first, and following the line of least resistance.

Timothy Beneke (2011-02-21 00:08:45)

Tina Rosenberg won a Macarthur years ago and is an unusually thoughtful journalist. Her brother Paul used to be in social theory and is equally so...

### **Educational Testing Service: Stupid or Smart? (2011-02-19 09:21)**

Since the Educational Testing Service is responsible for measuring intelligence, it is disturbing when they appear . . . not intelligent. A Chinese student of mine sent me the following question, which appears in a set of study questions. You are supposed to identify the "flaw" in the argument.

The article entitled 'Eating Iron' in last month's issue of Eating for Health reported that a recent study found a correlation between high levels of iron in the diet and an increased risk of heart disease. Further, it is well established that there is a link between large amounts of red meat in the diet and heart disease, and red meat is high in iron. On the basis of the study and the well-established link between red meat and heart disease, we can conclude that the correlation between high iron levels and heart disease, then, is most probably a function of the correlation between red meat and heart disease.

By "is a function of" I suppose means "is due to". Sure, there are several imperfections, unstated assumptions, in every argument, including this one, just as every piece of research has several imperfections. But are there obvious important flaws in this argument? I think it is reasonable to assume that red meat is the main source of iron.

Since many scientists have trouble interpreting correlations (they think "correlation does not equal causation" is not misleading) presumably an ETS question writer has even more trouble. And this question reflects that. But maybe not.

---

ChristianKI (2011-02-19 15:47:10)

"Most probably" is a bit strong. It would be worth to investigate the issue further.

vic (2011-02-19 18:53:04)

The flaw they are looking for is that dietary iron could be a proxy for red meat intake and that something else in red meat could be the source of the association with heart disease, not dietary iron per se. Come on, Seth!

Alex Chernavsky (2011-02-20 05:17:15)

Vic, my take on it is different. I think the flaw in the argument is that something else in the diet (besides red meat) may be the source of the high iron that's referenced in the first sentence. In any case, the passage is difficult to analyze because it's ambiguous and poorly worded.

Seth Roberts (2011-02-20 06:39:40)

Vic, the conclusion isn't that the reason for X (correlation between heart disease and red meat intake) is Y (correlation between heart disease and iron intake). It is that the reason for Y is X. I take "Y is a function of X" to mean "Y is caused by X."

dearieme (2011-02-20 06:57:26)

To write a so-called intelligence test question where you have to guess the meaning of an ill-worded passage of English seems pretty stupid. So there's the answer to your headline question: "stupid". mIn fact, there's probably a general point here: I suspect that IQ tests aren't very reliable when used on subjects who are markedly more intelligent than the setters of the tests. Has this been investigated?

TomGinTX (2011-02-20 12:58:42)

FWIW, the SAT and other ETS exams are intended to measure "scholastic aptitude", not intelligence. Sadly, they are not the same thing. 8-(

SR (2011-02-20 16:52:19)

I gave up university when I found out that not even my economics professors understood the maths behind their own articles, but sent them to a math professor so that he could do it for them. This math professor OTOH did not know how to program a computer, to say nothing about stochastic simulations. If you tried to ask them for instance if the model was stable, you just got an empty stare, and some non-answer that that it was statistically significant or that it was a well known economic model. My conclusion was that nobody in economics (academia?) really understood what they were doing, since the models and the statistics they were using were so complicated, that they used their whole brainpower just to learn to use them, leaving little time to understand what they really was doing. This is probably even worse in other faculties, such as psychology or medicine, where I suppose that statistical models are something one just use, without really understanding them at all. If we take correlation as an example, few understand that given enough variables, and a limited sample space, you would get significant correlations just from the randomness-variable alone, without there really being any underlying correlation representing the real world. The implication of this, is that significant correlation alone is basically worthless. The correlation needs to be BIG, if one is to conclude that something is good or bad for everybody. If one goes back to the example of high iron, undiagnosed Hemochromatosis alone would give you a significant higher mortality for the high iron eaters, rendering the correlation worthless for us from say Scandinavia, who have been eating fish, meat and dairy for the last 4000? years, and before that mostly read meat. (A lot of us can't eat gluten though) "Some researchers believe that hemochromatosis originated more than 40,000 years ago in the area we now know as Ireland with a single person whose genes mutated so that he or she could over-absorb iron to compensate for an iron-poor diet. Today, with iron-enriched foods, iron supplements and plenty of red meat, thereâ€™s no need to pull in extra iron, yet many still carry the ancient mutated genes that cause their bodies to do so, at toxic levels. Left untreated, hemochromatosis can lead to everything from early menopause and infertility to diabetes, heart failure, cirrhosis, primary liver cancer and even death. But if caught before damage is done, hemochromatosis patients can be saved, and their health restored through a process called bloodletting, or phlebotomies." <http://www.americanhs.org/Irish%20in%20the%20blood.htm>

SB (2011-02-20 18:05:56)

<http://www.time.com/time/magazine/article/0,9171,2050030,00.html> Has quotes by you.

dearieme (2011-02-21 03:55:04)

"more than 40,000 years ago in the area we now know as Ireland": golly, are you sure? [http://en.wikipedia.org/wiki/Irish\\_Sea\\_Glacier](http://en.wikipedia.org/wiki/Irish_Sea_Glacier)

SR (2011-02-21 12:16:40)

From the hemoc "Some researchers believe that hemochromatosis originated more than 40,000 years ago in the area we now know as Ireland with a single person whose genes mutated so that he or she could over-absorb iron to compensate for an iron-poor diet." dearie me "â€œmore than 40,000 years ago in the area we now know as Irelandâ€: golly, are you sure?" Not at all, and it was not really important here. The reason I mentioned Hemochromatosis is that you would get exactly this result if your sample space consisted of people with partly Irish decent, like in the UK, or the USA, since it is known that undiagnosed Hemochromatosis is a riskfactor for heart disease. To make my point clearer, if I have subpopulations with different levels for what amounts to dangerous or beneficial, then it would be wrong to assume a model where you treat the subpopulations as one population, IF you want to say what is dangerous to the average person. To go back to the Hemochromatosis example, the level they would find Iron was beginning to become dangerous in their model, would not be relevant for the majority of the population, since what would be too high would be the triggering of the ones with undiagnosed Hemochromatosis. From the same article: "In 1997, a year after researchers isolated the mutated genes that cause hemochromatosis, a genetic mail-order test was developed that allows people to be screened for the disease. Those who test positive for the gene can keep their iron levels in check, and prevent iron from ever invading their organs and destroying their lives. Thomas is on a mission to make people aware of the \$125 test, as well as simple blood tests (serum iron, total iron binding capacity and serum ferritin) that doctors seem so reluctant to give. Itâ€™s not that thereâ€™s a conspiracy against patients with iron overload. Itâ€™s just that many doctors havenâ€™t been educated about the latest facts regarding the disease. And since people arenâ€™t routinely tested for iron overload, doctors must be able to recognize warning signs. Unfortunately, the symptoms of hemochromatosis are often serious diseases themselves, and doctors wind up treating the heart trouble, the diabetes or the liver cancer without looking for an underlying cause." Last about the 40.000 years among the Irish, I think it is correct that they present it so, based on their own models, even if geology say that it impossible. If scientists started tweaking their models to make them fit the wanted result, it would be a lot harder to recalibrate the results afterwards when we find out a better model.

### **Meat-Only Diet: Crave Carbs. Meat + Egg: No Craving (2011-02-20 21:15)**

Joseph Buchignani, a businessman in Shenzhen, has suffered from irritable bowel syndrome (IBS) since he was a teenager. He is now in his 20s. By trial and error, he discovered that a meat-only diet eliminated his IBS. However, it also caused craving for carbs. Because carbs caused IBS, he couldn't simply eat carbs. He tried many ways of getting rid of the craving for carbs: eating more animal fat, eating less animal fat, eating oil, eating lard, and eating different kinds of animals and cuts of meat. He varied how he cooked the meat, eating especially fresh meat, and eating fresh whole fish. All of these attempts failed. He did not try taking a multivitamin pill.

Finally he tried adding egg to the meat. That eliminated his craving for carbs. It made his diet much more sustainable.

This is fascinating for four reasons.

1. Sure, some cravings reflect nutrient deficiencies. (Not all cravings: An alcoholic craves alcohol.) But in the cases I know about, there is an obvious or semi-obvious connection between the craving and the deficiency. For example, people who chew too much ice ([1]pagophagia) crave ice to chew. They are iron-deficient. Eating iron eliminates the pagophagia. Long ago, a craving to eat something crunchy would have led you to eat bones. Bone marrow is high in iron. So the craving makes sense. In contrast, there is no obvious or semi-obvious connection between carbs and eggs.

2. It suggests that a paleo diet is a good place to start looking for the ideal diet. Paleo ideas suggest a high-meat diet. But no matter how long you study what Stone-Age people ate, you will not figure out that eggs will eliminate carb cravings.

3. Like many people, especially those doing paleo, I eat mostly meat and vegetables (a conventional low-carb diet). Unlike most low-carbers, I also eat lots of fermented foods. I don't crave carbs, perhaps because of the lactose in yogurt or the sucrose in kombucha. It hadn't occurred to me to start eating eggs regularly but Joseph's discovery suggests I should try it.

4. Joseph's personal science led him to discover something highly useful and completely non-obvious.

1. <http://www.brighthub.com/mental-health/eating-disorders/articles/92909.aspx>

---

john (2011-02-21 07:20:05)

I too have found that eggs decrease carb cravings. I think that they are simply a very satisfying food per calorie amount. Fermented dairy and unsweetened chocolate has this effect with me too. With certain foods, I keep eating until my stomach is too full to continue; with others, I feel satisfied without the physical fullness—I think taste is an important factor, because when I use hot sauce on eggs, or eat meat in a curry-type sauce, I eat much more.

UncleLongHair (2011-02-21 10:02:40)

I sometimes get cravings after a workout (usually 30-45 min intense cardio and some weights). I have tried different things to satisfy them. I have tried carbs, proteins, or a mix, and they don't really do it on their own. I don't feel as hungry, but I still feel like something is "missing". The feeling goes away after an hour or two, but is annoying in the interim, and I feel that I should try to figure out what my body needs for best health. The best thing I have found is whole milk, particularly raw milk, about 3/4 to 1 cup about 20 minutes after the workout. This completely satisfies my cravings for hours and allows me to wait until my next meal for some food. I suspect that this is due to a good combination of fat, carb, and protein, as well as vitamin D. I think a lot of people are "low" (maybe not technically "deficient") in vitamin D without realizing it. I think cravings are interesting and should be studied. I think a craving can be your body telling you what it needs, but only in terms that your body has been "taught". For example pregnant women might crave pickles or pickle juice, when what they need might be salt/sodium or other minerals, and the thing they're most familiar with that is very high in sodium is pickles. I wonder if a woman who was familiar with Japanese cuisine would crave umeboshi instead? A person may be craving ice cream but maybe what they need is fat and vitamin D, and there are better ways to get that than ice cream (i.e. w/o the sugar), but they are not familiar with any foods that have fat and vitamin D but no sugar, so they crave ice cream. I often crave dark chocolate when I am a bit depleted (a long stretch with too little sleep or too much partying, etc), but from experience I know that what my body needs is vitamin B (i.e. taking a B vitamin tablet makes the feeling go away within about a half hour). This doesn't make sense but my body must have some association between dark chocolate and vitamin B.

Nancy Lebovitz (2011-02-21 13:05:47)

I think paleo is an interesting starting point, but not a reliable source of answers for individuals. I don't think bird eggs would have been available through the whole year. On the other hand, it's conceivable that insect eggs would be available more of the time in ancestral environments, and have similar nutritional value.

stuart (2011-06-23 21:59:25)

It has been proven that you can live on a meat/fish only fish diet, and stay healthy the original inuits lived like that and had no cancer, cardiac, diabetes or other civilised diseases, however they aged quickly and had a shorter lifespan, possibly because of a lack of anti-oxidant foods. It is also noticeable that 75 % percent of their calories came from fat, and that they would become sick just eating lean meat.

Anna (2011-07-16 20:21:59)

Um, I don't think there's any evidence of the Inuit aging quickly or having short life spans while eating their traditional diets. At the time studies were done, Inuit were living to 50, while Englishmen and women were dying at 40. So Inuit were outliving Anglo-Saxons by at least 10 years (circa 1900). Many Inuit eat Western diets today and have all the problems associated with Western diets.

### **Beijing Smog: Good or Bad? (2011-02-21 17:18)**

I am in Beijing. The smog is bad. It is more humid than usual and the air is dirtier than usual. At his blog, James Fallows, who is also in Beijing, has [1]posted pictures and pollution measurements. (Incidentally, Eamonn Fingleton, an excellent writer, will be guest-blogging there. [2]In Praise of Hard Industries is one of the best business/economics books I've read.)

The effect of smog on health isn't obvious. Maybe you know about [3]hormesis – the finding that a small dose of a poison, such as [4]radioactivity, is beneficial. It has been observed in hundreds of experiments. It makes sense: the poisons activate repair systems. Even if you know about hormesis, you probably don't know that one of the first studies of smoking and cancer found that inhaling cigarette smoke appeared beneficial: inhalers had less cancer than non-inhalers. R. A. Fisher, the great statistician, [5]emphasized this (pp. 160-161):

There were fewer inhalers among the cancer patients than among the non-cancer patients. That, I think, is an exceedingly important finding.

This difference (a negative correlation) appeared in spite of two positive correlations: Heavy smokers get more cancer than light smokers; and heavy smokers are more likely to inhale than light smokers. It is far from the only fact suggesting [6]the connection between smoking and health isn't simple.

So I am not worried about Beijing smog. The real danger, I think, is [7]not eating fermented foods. Which, thankfully, is infinitely more under my control.

---

Sean Estey (2011-02-21 17:59:51)

One of the most fascinating anecdotes regarding stress and recovery is in this excerpt from the book *Spark: The Revolutionary New Science of Exercise and The Brain*: "In the 1980's the U.S. Department of Energy commissioned a study on the impacts of sustained radiation exposure. They compared two groups of nuclear shipyard workers from Baltimore who had similar jobs

except for a single key difference: one group was exposed to very low levels of radiation from the materials they handled, and the other was not. The DOE tracked workers between 1990-1988, and what they found shocked everyone involved. Radiation made them healthier. The 28,000 workers exposed to radiation had a 24 % lower mortality rate than their 32,000 counterparts who were not exposed to radiation. Somehow, the toxins that everyone assumed and feared were ruining the workers were doing just the opposite. Radiation is a stress in that it damages cells, and at high levels it kills them and can lead to the development of diseases such as cancer. In this case, the radiation dose was apparently low enough that instead of killing the cells of the exposed workers, it made them stronger. Neuroscientists call this phenomenon stress inoculation." I often wondered how this phenomenon transferred to vices like light smoking and drinking, and as you pointed out, exposure to air pollution. It's a fascinating discussion, but when I've ever brought it up in conversation, people look at me like I've lost my mind. Definitely not a politically correct topic, especially for anyone who's lost a friend or family member to cancer (most people).

Seth Roberts (2011-02-21 19:51:11)

Thanks, Sean. I didn't know about that study, which is an especially good one. It is newly relevant in light of concern about the health effects of airport screening. I think the explanation the author gives is a bit off (the radiation "made cells stronger"). The usual explanation of radiation hormesis is that the damage caused by radiation activates repair systems. This is temporary. When the activation wears off, so does the protective effect. "Made cells more vigilant" you could say.

noahpoah (2011-02-21 23:33:23)

You have the Fisher quote wrong. It's "And the result came out that there were fewer inhalers among the cancer patients than among the non-cancer patients." Which fits a little better with your point.

Seth Roberts (2011-02-22 04:36:34)

thanks for the correction, noahpoah.

Joseph Dantes (2011-02-22 05:15:36)

Yes, the anti-smoking science is very weak. However, anecdotally I believe that the new chemically processed cigarettes are very bad... I develop a cough whenever I use them, and start feeling crappy. When I was in Beijing, my lungs burned. You see a lot of people there with bad coughs. I smoke handrolled cigs of pure, reasonably moist tobacco and it's quite smooth, no lung troubles. There's no animal science supporting the link between cancer and smoking; the studies instead all showed major health benefits.

Alrenous (2011-02-22 11:07:25)

Reminds me of a study of people living in a radioactive apartment building I read about once. I even found a link: (<http://www.ncbi.nlm.nih.gov/pmc/articles/PMC2477708/> ) Basically the structural steel got mixed with some radioactive cobalt, and when it was discovered they ran the numbers but found a similarly large reduction in mortality.

Thomas Seay (2011-02-22 12:02:29)

Can anybody here suggest a good book or article on hormesis (I am guessing that the book Sean suggests deals mostly with exercise recovery)? This is fascinating stuff.

Thomas Seay (2011-02-22 15:39:37)

To answer my own question, this is what I have found so far: <http://www.belleonline.com/newsletters.htm> <http://books.google.com/booksid=w1udrdvb9TOC> &pg=PA10 &lpg=PA10 &dq=hormesis+and+homeopathy &source=bl &ots=Qvv3YUrBAv &sig=PdIikQrLuH4Hsb9VTcyKL1z [http://books.google.com/books?id=XRsdXyY\\_5kBYC](http://books.google.com/books?id=XRsdXyY_5kBYC) &dq=calabrese,+edward &printsec=frontcover &source=in &hl=en &ei=2i1kTYusC4a0sAOYnKCPBA &sa=X &oi=book\_result &ct=result &resnum=12 &ved=0CF0Q6AEwCw #v=onepage &q &f=false

Thomas Seay (2011-02-22 18:23:53)

And here is a blog devoted to hormesis. Looks like something people here would be interested in: <http://gettingstronger.org/category/hormesis/>

Sean Estey (2011-02-23 15:08:22)

Thanks for the link, Thomas, this guy seems like he has a lot of great insight.

Todd Becker (2011-02-24 13:36:51)

Great discussion, Seth. I think it is clear that the research on the health effects of smoking is more complex than the simplistic "smoking is bad for your health". From your references, it is reasonable to surmise a low dose hormetic benefit from light smoking. One other confounding variable is the type of tobacco; I've seen some claims that certain additives (including sugar) dramatically increase the carcinogenicity of tobacco and that unadulterated "organic" tobacco is more benign – perhaps even beneficial at low dosages. Other complicating variables besides the tobacco dose and type include: frequency of smoking and individual differences (genetic, environmental, diet) that make individuals more or less susceptible to tobacco's effects. And I really wonder about all the extreme linear extrapolations that have led to a global campaign against "second hand smoke". You've raised great questions about the effects of smog as well. Based on what we see with other hormetic effects, however, I would think that constant, chronic smog would be deleterious, whereas occasional smog days alternating with clear days would be better. Perhaps a study could be done comparing health effects in cities with different smog patterns – you can't just look at the average. All that said, I don't smoke or spend much time in smoggy cities. And I don't work for a tobacco company or polluting industry. I'm just interested in getting to the bottom of the science. That's hard to do when virtually every "health" study is done within a politicized culture where the conclusions and recommendations are more important than the truth. And where we spend more effort banning smoking from bars than addressing serious health issues. Todd BTW, I'm the "guy" that Thomas and Sean mentioned in their posts. I'm glad to see all the interest in hormesis!

Bjarne (2011-03-01 11:00:10)

On Radiation hormesis look at Charles Sanders: Radiation Hormesis and the Linear-No-Threshold Assumption, Springer 2010, ISBN: 978-3-642-03719-1 Up to date book that summes up "all" science on the subject. Also see the video-talk by Dr. Bob Bury on Royal Society of Medicine: <http://www.rsmvideos.com/videoPlayer/?vid=115 &class=videoThumb> Enjoy

Jazi yechezkel zilber (2011-03-12 20:10:00)

The smoking link seems to more yell at bad research than to truly convince that smoking is not bad. I have not reviewed the literature, but the author admits his main point is to show misconduct rather than saying smoking not bad. Would be happy if someone here truly studied the literature. The mixed data on passive smoking is another hint that smoking is not simply bad bad bad linearly. I always wondered at this passive findings. Now I have a clue

## **Memory Palaces and the Walking/Learning Connection (2011-02-23 20:14)**

In [1]this excellent article, Joshua Foer describes how he got really good at competitive memory tests, such as remembering the order of a deck of cards. He competed in the national championships.

Foer writes a lot about using "memory palaces" to remember stuff. You take a familiar building or neighborhood and vividly imagine what you want to remember at different places within it. To retrieve the memories, you mentally visit each place.

This is [2]an ancient and famous method. I knew about it but had not realized until I read the article that it sheds light on [3]my discovery that treadmill walking makes learning Chinese pleasant. (A commenter named Tom also [4]noticed the connection.) Foer gives the obvious evolutionary explanation for why the memory palace method works so well: long ago, we needed to remember where to find important stuff (water, food, special plants, useful materials). So we evolved a memory system well-suited for doing so.

Less obvious is another evolutionary idea: why stop there? It's a system. When you design a car for a certain sort of

driving, you don't stop with the engine. You adjust the drive train, the tires, and so on. If evolution shaped our brains for a certain sort of data (things in places), surely it also shaped our brains to collect that data. Pointless to design a car no one drives.

Two more changes would help make use of the system:

1. Hedonic. Make it pleasant to fill the system with data. This is what I noticed – dry knowledge (such as the order of cards in a deck) became pleasant to learn. Long ago, the hedonic change I noticed would have pushed people to walk in new places rather than old ones.

2. Efficiency. Make learning more efficient (= more learning per unit time). Several confounded comparisons point in this direction. For example, I found that 15 minutes studying flashcards while riding the subway was a lot less help than spending 15 minutes while walking on my treadmill. Of course there are many differences between the two situations. Likewise, using Anki is working much better now than in the past, when I used it sitting down. I will try to study this more carefully.

Years ago, evolutionary explanations such as these were mocked as "just so stories" by prominent scientists, such as [5]Stephen Jay Gould, [6]Noam Chomsky, and [7]Richard Lewontin. It's now clear they were wrong.

---

Nick (2012-03-04 11:07:03)

Filling your life with memorable experiences gives you reference points to compare and contrast just like walking through a memory palace. If you do the same thing every day with little variation than you might get better at it to some degree but will have an un-memorable existence. In the animal kingdom however this seems to be stronger selected for.

## **The Creation of Umami Burger (2011-02-24 07:29)**

He studied umami tastes, most of them having to do with aging or fermentation . . .

From [1]this article. As regular readers of this blog know, I believe [2]we like umami flavors – and sour flavors and complex flavors – so that we will eat microbe-laden food, which is essential for health.

Thanks to Tom George.

1. <http://shine.yahoo.com/channel/food/is-this-the-best-burger-in-america-2452461/>
2. <http://www.blog.sethroberts.net/category/umami-hypothesis/>

---

JRF (2011-02-24 08:07:12)

I do not remember seeing you mentioning dosage in relation to microbe-containing food. Do you have any opinions on how much, say, kim chi or sauerkraut is a good quantity to aim for in a week?

Alrenous (2011-02-24 08:13:50)

Unintentional...? Comedy. "Umami, [...] is voodoo science to me. Others are convinced of its authenticity" "It's clear that he has looked into the heart of the burger and seen what others have not."

Seth Roberts (2011-02-24 15:42:50)

JRF, I have yet to figure out a good way to study the dosage question. My guess is that several servings per day is a good idea. I eat 2 servings of yogurt/day plus 1 glass of kombucha. Plus kimchi, pickles, etc., when available. Alrenous, re "looking into the heart of the burger and seeing what others have not." Umami Burger isn't terribly mysterious (umami makes food taste better) but it's quite true that many others haven't seen this simple truth about what makes food taste good. Last night a friend told me she had gotten a yogurt machine. We discussed how to eat yogurt. I said I put whiskey in mine – a way to add complexity. She said she hadn't heard of such a thing.

Alrenous (2011-02-24 18:21:00)

Whiskey yogurt sounds pretty good.

Walter (2011-02-26 11:42:15)

Seth, How much whiskey in the yogurt? Won't the alcohol kill the microbes? Or at least get them way drunk? Walter

Seth Roberts (2011-02-27 13:26:56)

Walter, I have never measured it but I'd guess 1-2 tablespoons (in 1 cup of yogurt). That's an interesting question about the alcohol killing the microbes. Maybe I will do a test to find out.

### **Automatic Translation of Email (2011-02-24 18:36)**

Yesterday I learned that you can get your gmail email automatically translated. As a professor at a Chinese university, I get a lot of email in Chinese. This gmail feature – which you can find under Labs – is wonderful!

---

THUstudent (2011-02-25 08:23:23)

Dear Professor, Are you offering any classes this semester? If so, what time does it meet? Thank you

Seth Roberts (2011-02-25 14:28:03)  
THU student, I am not offering any classes this semester.

### **The Baltimore Shipyard Study (2011-02-25 15:34)**

In [1]a comment on my last post, Sean Estey described a study of Baltimore shipyard workers, some of whom handled radioactive materials. The ones exposed to more radiation were healthier than those exposed to less. The difference in death rate was huge: 25 %. This is so large and consistent with other data I doubt it is due to a confounding.

You can read more about this study [2]here and [3]here. If one quarter of all deaths are due to suboptimal stimulation of repair systems, that's extraordinary news. The study was finished around 1990. The plausibility of such a large benefit should have led to experiments. The observation that people in mountain states (such as Colorado) have less cancer than those in gulf states (such as Alabama) as well as greater radiation exposure suggested to John Cameron, a professor of toxicology, an experiment in which some gulf state residents are exposed to enough radiation to bring their total exposure up to what mountain state residents receive. This has yet to be done.

In [4]a paper about the effects of low-dose radiation, the authors say we should ignore the Baltimore study because of "the healthy worker" effect – the possibility that persons in one exposure group were healthier than those in another exposure group because workers are healthier than non-workers (and fitness for work may have differed between the exposure groups in the Baltimore study). They give three examples to illustrate the healthy worker effect. In these examples, a group in which everyone has a particular job were healthier than the general public, which includes many people without a job. In their examples, the median effect of being in the full-employment group (in which everyone has a job) is a 10 % decrease in mortality compared to the general-public group (in which some people don't have a job because of disability). That should give a good idea of the maximum size of the healthy worker effect – when something is explicitly varied, that's what happens. The Baltimore study compares person with job to person with job, not person with job to person without job. This suggests that in the Baltimore study, the healthy worker effect was smaller than the effect in the examples, meaning smaller than a 10 % reduction. Such an effect cannot explain a 25 % reduction.

[5]A comment by Alrenous on my earlier post linked to [6]a 2007 study of people in Taiwan whose apartment building was accidentally contaminated with radioactive materials. By the time of data collection, they had gotten far less cancer (3 % of what would have been expected) than the general Taiwan population. A healthy worker effect cannot explain this. Again, the reduction is so great it is unlikely to be due to confounding.

If I could buy something to put under my bed that would expose me to the level of radiation received by people in Colorado, I would.

6. <http://www.ncbi.nlm.nih.gov/pmc/articles/PMC2477708/>

PeterW (2011-02-25 16:02:21)

Maybe all those trans-Pacific flights are doing you some good. Actually, stewardesses and pilots would be two more groups worth looking at.

Robbo (2011-02-26 07:55:32)

"If I could buy something to put under my bed that would expose me to the level of radiation received by people in Colorado, I would." Granite chippings ?

Anonymous (2011-02-26 08:56:03)

I hate to say this, but maybe the new full body scanners at US airports are actually improving the public's health?

PeterW (2011-02-26 09:40:28)

<http://informahealthcare.com/doi/abs/10.1080/095533000601085980> This study criticized the Taiwan study you cite for neglecting the age distribution of people living in the apartment buildings. They found that once you adjust for age and demographics the cancer incidence went up.

Stego (2011-02-26 22:14:06)

In a place called Bad Gastein in Austria and about a hundredfifty years back a bright doctor realised that the miners working the saltmines were a lot healthier than the general populace. Knowing he was unto a good thing he bought the mines - they were on the point of running dry - and starting selling time in the mines by the hour to the - wealthy - unhealthy. The company he founded is still in business today. Back then they thought it must be the highly mineralised air, today it is assumed that the slightly elevated radioactivity in there is the key. The good doctor lived to the age of ninety by the way - quite a feat in those times.

Alrenous (2011-02-27 05:09:55)

"They found that once you adjust for age and demographics the cancer incidence went up." Well, yeah. 97 % reduction in morbidity is way too high to be fully believable. But with separate studies with a similar effect, the question is one of magnitude, not sign. From the study: "increase risks of developing certain cancers in specific subgroups" Shockingly, making your body work harder is not risk-free. Hence Seth's, "The plausibility of such a large benefit should have led to experiments." However, I would also caution against dosing yourself on rads just based on these studies. I symbolize it this way: should those dockworkers expose themselves to even more radiation? So: how do you measure the ideal exposure for yourself as an individual, rather than a population mortality statistic?

PeterW (2011-02-27 07:59:47)

@Alrenous Yes, the magnitude is different, but so is the \*sign\*: "All cancers combined, all solid cancers combined were shown to exhibit significant exposure-dependent increased risks in individuals with the initial exposure before the age of 30, but not beyond this age."

Leonardo (2011-02-27 11:09:29)

I my lazyness I haven't read the linked articles of the studies. What kind of radiation do they refer to? I would assume that not all radiation are equal. Thanks, L

Seth Roberts (2011-02-27 14:18:22)

Leonardo, they refer to (a) radiation from radioactive materials (e.g., uranium) and (b) cosmic radiation (as a possible reason that people in mountain states get less cancer than people who live by the sea).

Thomas Seay (2011-03-01 11:02:42)

Here is a study done on the effects of radon on rheumatoid arthritis from people who visited Radon Spas (places that have relatively high levels of radon): <http://www.radonmine.com/pdf/longterm.pdf> Here is a link for an actual Radon Health spa in

Montana: <http://www.radonmine.com/>

Thomas Seay (2011-03-01 11:07:46)

That said, this question of hormetics is very complex. A good case in point is the hormetic effects of resveratrol. At a lower dose, for example, it may be good for heart protection but also conducive to tumor formation. In other words, the biomedical endpoint determines whether some of these substances are "good" or not. They may be "good" for one biomedical endpoint and "bad" for another. Please see this interesting article by one of the leading researchers in hormetics, Calabrese: <http://www.belleonline.com/newsletters/volume16/vol16-2.pdf> "The current assessment indicates that low concentrations of resveratrol can be potentially beneficial or harmful, depending on the endpoint of interest. The data suggest that low doses of resveratrol would have the capacity to increase the risk of tumor development of a number of organs based on its capacity to enhance cell proliferation in multiple human tumor cell lines. In contrast, a strong case can be made that low doses of resveratrol can be significantly cardio-protective. "

Chris (2011-03-23 03:45:57)

As a Tokyo resident, I'm encouraged by your post...I really hope it's true. I'm curious though, would you choose to live in a place like Tokyo where there's higher than normal radiation in the food/water and possibly the air for the possible benefits?

### **The Best Argument Against Man-Made Global Warming (2011-02-27 05:52)**

The best argument I have ever seen against the idea that humans are dangerously warming the earth – that is, against the view of Al Gore, Elizabeth Kolbert, and thousands of other people who claim to understand what they are talking about – comes, strangely enough, from a supporter of this view.

Steve Connor is the Science Editor of The Independent, a highbrow London newspaper. He [1]interviewed Freeman Dyson – who, [2]like me, thinks the conventional certainty on this issue is far too strong – on the subject. The headline of the interview labels Dyson a "heretic". Connor wants to know how Dyson reacts to what seems to Connor to be overwhelming evidence.

The interview is by email. Dyson says he has no faith in the models. Connor writes:

I was only trying to find out where your problem lies with respect to the scientific consensus on global warming. As you know these models [that Dyson doesn't believe] are used by large, prestigious science organizations such as NASA, NOAA and the Met Office, which use them to make pretty accurate predictions about the weather every day. The scientists who handle these models point out that they can accurately match up the computer predictions to real climatic trends in the past, and that it is only when they add CO2 influences to the models that they can explain recent global warming.

There it is. The scientists who use the weather models every day, who know them better than anyone else say that we should believe them because 1. They can fit "real climatic trends in the past". This is meaningless. [3]The models have lots of adjustable parameters. Perhaps they could have fit any plausible past trends. 2. They "make pretty accurate predictions about the weather every day" – that is, predictions of the weather of the next week or so.

This is admission of defeat. It's as if you say you can throw a ball a mile and, when someone asks how you know this, you say, "I've thrown a ball 10 yards quite often." If you had thrown a ball more than 10 yards you would have said so. If the models had predicted accurately more than a week in advance their boosters would have said so.

It isn't just Steve Connor who unintentionally makes a really good case for the opposite of what he believes. Sir

Paul Nurse, a Nobel Prize winner in Biology and President of the Royal Society, hosted a recent BBC show called [4]Science Under Attack in which we were supposed to believe predictions of global catastrophe because weather models can predict the weather for the next few days. A NASA weather expert said that! Nurse took him seriously.

My goodness. If the President of the Royal Society is this credulous, what are the ordinary members like?

1. <http://www.independent.co.uk/environment/climate-change/letters-to-a-heretic-an-email-conversation-with-climate-change-sceptic-professor-freeman-dyson-2224912.html>

---

Jake (2011-02-27 07:06:25)

There is always a huge disconnect between science and the "scientists" who have access to the mainstream media.

Joseph Dantes (2011-02-27 09:13:47)

Bravo Seth, a great use of your BS-detector and also very insightful about modeling in general. And ballsy to skewer ad sacred cow.

Steve G. (2011-02-27 09:27:14)

Questions from an American pragmatist: Please unpack your sentence "who, like me, thinks the conventional certainty on this issue is far too strong": 1. What level of confidence do you hold that those who argue that humans are affecting climate change are correct in some significant measure? 2. Are you saying those who contend that human action currently influences our weather and climate have the balance of evidence in their favor but you want to take no response? You want to wait and see? What is the potential risk of waiting? (Of course, there are real costs in acting, too.) 3. Given that Al Gore, among others, is only a layman who serves to raise this issue, do legitimate scientists as a whole back the Dyson-Roberts skeptical position? How should a layman, like me, respond? 4. Newton had some very odd beliefs (by modern standards) that seem at odds with his revolutionary physics, so is this a similar case with the otherwise incredibly intelligent Dyson? Can one who produces diamonds also produce dung? 5. Pragmatism uses skepticism, but it does not enshrine it upon an alter, lest it become cynicism or mere contrariness.

Calvin (2011-02-27 09:38:09)

Hi Seth, This is an honest question, not a snarky remark. The main reason that I believe in human-driven global warming is that, after two hundred years of increased burning of hydrocarbons, putting lots and lots of CO<sub>2</sub> into the air, wouldn't you expect global warming? Or, how would you avoid this? I assume that the cause-and-effect looks different from your end, and I'm curious how. Thanks.

Clint (2011-02-27 10:14:48)

If this is the best argument against man made global warming then it declaring it a certainty. That someone that does not work in climatology or weather, and does not know the difference between climate models and weather models doesn't believe their accuracy is the best counter argument is great news for actual scientists working in the field. And stating that weather models cannot predict climate does not change any of the measurable facts of CO<sub>2</sub> increases or warming, or that CO<sub>2</sub> has green house affects.

Tim Newsome (2011-02-27 10:26:31)

I think you raise a good point in that you can't say a model is valid because it predicts the weather. But what would you have to see in a model to convince you that it is valid? Your throwing the ball analogy doesn't really hold up because we don't have the option of throwing the ball a mile. We just have to wait 100 or 1000 years and see if we were right. I think the best scientists can do is create a model incorporating as much as we know about climate, and hope that it is correct. If that is true, then unfortunately the only people who are in a position to evaluate the model are those who have studied it in great detail. Which brings you right back to trusting the scientists because they are scientists. It's a conundrum. Tim

Gunnar (2011-02-27 10:53:39)

I read the other planets in our solar system change drastically for decades. I suggest David Wilcock and his research. No cars on Mars as far as we know. I'm in favor of not using cars and treating the earth well, btw. So that is not at issue. It's about understanding the real cause, which seems to involve at least our whole solar system.

Sean Estey (2011-02-27 13:40:00)

Well, if there's one thing humans are notoriously bad at, it's making predictions about future events. The more complex and chaotic the system, like the stock market, the harder to make predictions. Climate is a very complex, chaotic system, involving a wide variety of fields spanning from geophysics, meteorology, astronomy, and "climatology". And the climatologists don't really have any insight into the other fields. They are looking at a narrow set of variables rather than the true cross-discipline approach that we need to fully understand longterm climate variability. Roy Spencer is a meteorologist who makes a strong claim that Pacific Decadal Oscillations—Pacific ocean temperature fluctuations which operate on 30 year cycles—can explain about 75 % of the climate shift in the 20th century. He speculates that the PDO causes a change in cloud cover which causes radiative imbalance, causing longterm temperature shifts. This is a much more plausible explanation than blaming it all on CO2. The IPCC models don't even take into account the possibility that clouds can be primary drivers of climate change, since studying clouds is more of a meteorology discipline. So there's a lot we don't know about climate, and until we can take a truly cross-discipline approach, we will remain in the dark.

Seth Roberts (2011-02-27 13:42:14)

Clint, someone who works at NASA told Paul Nurse we can trust climate/weather models because they can predict the weather a few days later. I am not making this up. The person at NASA works in the field. Tim Newsome, what I want to see to convince me a model is valid is accurate prediction. The models used by Jim Hansen et al. to predict catastrophe could easily have been used to predict the weather/climate 1 year in advance. Or 2 years in advance. They are what, 20 years old? If that had happened, now we would have a decent set of predictions to compare against what actually happened. But, as you may have noticed, this hasn't been done or at least the results haven't been made public. So people like Steve Connor are reduced to talking about predicting Thursday's weather on Monday. Calvin, adding more carbon dioxide to the air has lots of effects. I don't know which ones matter the most nor how they are related. As the planet gets warmer for other reasons, carbon dioxide is released from the ocean. There is nothing new about big increases in atmospheric carbon dioxide. It hasn't led to catastrophe in the past. Models that say large increases in atmospheric carbon dioxide must cause catastrophic warming are wrong. Sean, good points. I agree. Steve G., I believe that the Cassandras, such as Hansen, are placing too much weight on models that have never been shown to predict accurately. There is no good reason to believe those models. In psychology, the same thing happened: People took seriously models that had never been shown to accurately predict. Perhaps they confused fitting with prediction, I don't know. Maybe Hansen and other climatologists confuse the two – I don't know. But I do know that it is far harder to test a model's predictions than to test whether it can fit past data. Have humans significantly affected the climate? I don't know. I support research to find out. Which means testing climate models, among other things.

Kirk (2011-02-27 14:15:13)

One scientist who has wavered in his views about anthropogenic global warming is Matt Ridley. I highly recommend his book 'The Rational Optimist' where he explains his current (skeptical) views. I consider this a situation where the 'alarmist' crowd has sabotaged their own goals. It just feels so good and righteous to be against Big Oil and the Rich and to be one of those in-the-know as to the next looming catastrophe. And yet they haven't thought this through. How could their imagined dystopia

be prevented? By replacing fossil fuels with renewables. How does one generate political enthusiasm for renewables? The liberal crowd is already there, it's the conservative crowd which needs to throw their weight behind the effort. Which could be done by appeals to patriotism, nationalism, self-reliance, and refusal to fund radical Islam (indirectly) through petro-dollars. Structure it not as an unlimited federal spending spree on research, but structure it to appeal to the capitalists, something along the lines of: The United States Government will buy \$20 billion dollars of renewable energy technology each year for the next ten years (spread amongst the top ten most efficient American-created alternative-energy products). A guaranteed market which opens the funding for the building of factories. State governments could be encouraged to make similar pledges. The airwaves could be filled with slogans about 'Self-Reliance in Ten Years' and various others jingoistic ones having to do with camel racing. Not that the conservatives have been bright enough to figure this one out either. It's just been too satisfying on their side to whine about welfare queens or birth certificates or huge debts (which they conveniently forget were run up by their own leaders). Read Matt Ridley. His optimism sometimes almost overwhelms my disgust with American politics.

Sean Estey (2011-02-27 15:55:45)

Matt Ridley is a smart guy, and the Rational Optimist is a great book, and his arguments are probably on point, but the fact is that alarmism sells and optimism doesn't. Alarmists can claim to be "informed" and "conscious" whereas people like Ridley are written off as naive, or "free market ideologues". They don't even need to argue against his points to write him off, they can just draw an unrelated comparison like how unrestrained capitalism created the recent financial crisis, and just like that, 99 % of people would buy that argument. People like Ridley don't have any influence in this debate, because he's not telling people what they want to hear, whereas people like Al Gore are.

icr (2011-02-27 16:41:42)

For Bruce M Cattanach BSc PhD DSc FRS rose-colored glasses triumph over alleged alarmism: <http://www.astraeon.com/borderwars/2011/02/inbred-mistakes-vi.html> #comments Domestic animal breeding apparently being an animal quite different from climate change.

Clint (2011-02-27 18:24:06)

I believe that you are not making up any of this. However, I think the point of such a statement is not "we can use the weather model to predict future climate" but more along the lines of "we used to be really bad at modeling weather and we have learned new and better ways of modeling and therefore we are fairly confident in our ability to create climate models". If anyone is seriously making the previous claim then they do not know what they are speaking about. And climate history has a bad history of people who are massively qualified in fields other than climatology making ignorant claims about climate science.

Tom Myers (2011-02-28 08:04:15)

You say "They can fit cereal climatic trends in the past". This is meaningless. The models have lots of adjustable parameters. Perhaps they could have fit any plausible past trends" but what you're criticizing includes the specific claim that "that it is only when they add CO2 influences to the models that they can explain recent global warming". Do you mean to say that you consider this to be a lie? If so, it's an odd one, where they (Gavin Schmidt in particular) seem to be working hard to make it easy for you to expose the problem: you can download the Goddard model from <http://www.giss.nasa.gov/tools/modelE/> and the documentation is careful to explain how you can play with the parameters yourself. If you (or a group you can put together, perhaps?) can get the model to match past trends without CO2 influences, or even with a substantially reduced CO2 sensitivity, then you'll really have something interesting. And surprising, at least to me. :-)

Alex Chernavsky (2011-02-28 10:24:45)

I don't know climate models from calamari, but I do think that scientific consensus is over-rated. There is fairly widespread consensus that mental illness responds well to treatment with psychotropic drugs (antidepressants, antipsychotics, etc.). However, I think the truth is that these drugs are [1]dangerous and ineffective.

1. <http://www.amazon.com/Anatomy-Epidemic-Bullets-Psychiatric-Astonishing/dp/0307452417/>

Calvin (2011-02-28 10:29:45)

Seth, and everyone, I think that my main point isn't necessarily CO2. I'm not a scientist, and if I was, I don't think I would be a climate scientist, just because that's not my interest. In fact, I think that most of the comments in this thread are just a lot of lay people talking about what they've read in books and online. Me included. That being said, I don't think that the impact humanity has made on the world, the atmosphere included, is a small thing. There are a lot of things added, and a lot of things taken away. A lot more plastic in the ocean, a lot less uncovered soil on the ground, etc. I think that it's so easy to get behind an idea like global warming (whether it's true or not, I honestly can't say I'm certain) because we know, intuitively, that when something is driven more and more off-balance, it generally will hit a tipping point, and then change relatively quickly to a new balance. Avalanches, Jenga-towers, storms, the straw that broke the camel's back, etc. So my core belief is that we have changed the world a lot, and that changes in nature are prone to the domino effect. I also believe that, at some point, one of these changes, or a consequential change, won't be tolerable to humanity, and that will be that. Whether or not global warming is involved, I guess, will not really be important when we get to that point.

Seth Roberts (2011-02-28 11:26:33)

Tom, no I don't consider that "the only way they can fit recent warming..." to be a lie. Perhaps the models are missing X, and X causes both (a) carbon dioxide increases and (b) warming.

Alrenous (2011-02-28 12:30:22)

It's extremely easy to make that mistake. Models can be useful, and do have to be calibrated. But the calibrations are necessarily ambiguous - as you tune the model to play well with past measurements, various judgment calls have to be made, and if they're made by someone who already believes in carbonic warming, those judgments are going to implicitly assume carbonic warming is occurring. Essentially the models are circular arguments (well, probably) even setting aside all their other shortcomings. My issue is that it appears that the model authors are aware of the problem, and for it is for this reason among others that they refuse to share the model. You can't and shouldn't jail someone for pleading the fifth, but it should make you very very suspicious.

Tom Myers (2011-02-28 12:38:28)

Seth, certainly it's a possibility that all of the GCM models are missing something important; I don't understand how what they're missing could be an X that causes carbon dioxide increases. A GCM model isn't really for predicting carbon dioxide increases anyway; the basic carbon dioxide level in the models is an input. For the postdictions (matching to past data) you were criticizing, that input is what was measured as being in the atmosphere (and sometimes what was measured as being in the ocean, as well.) We know, pretty closely, where the CO2 has been coming from ( [http://en.wikipedia.org/wiki/List\\_of\\_countries\\_by\\_carbon\\_dioxide\\_emissions](http://en.wikipedia.org/wiki/List_of_countries_by_carbon_dioxide_emissions) ), with a little less than 1 % addition by volcanoes, on average. There's plenty of uncertainty left in the modeling, especially (as I understand it) about cloud formation, heat transfers within the ocean, and such. Because of that, you need to use parameters to put in assumptions, as well as parameter that simply represent inputs. But the modelers have been claiming, as you quoted, that they can make it work (postdiction, matching not only global averages but rough spatial distribution) if they assume the overall CO2 sensitivity that they do assume, somewhere in the range of 2-4.5C per doubling of CO2 (see, e.g. <http://www.skepticalscience.com/Hansen-1988-prediction-advanced.htm> ), and they can't make it work without that. A lot of people have criticized their work, but apparently without being able to construct successful postdictions that didn't assume roughly the same CO2 sensitivity. So we have a phenomenon for which we have successful models, but only on that assumption (or range of assumptions, if you prefer.) To me, that's a pretty good test; it doesn't make the President of the Royal Society look credulous. Personally I made fun of global warming models in the early 80s, when as an asst prof of computer science I learned a bit about them; they deserved it then. (I followed Roy Spencer's satellite-data adventures for some years thereafter, since which I've been inclined to ignore him or at least wait for refereed publications and criticisms thereof.) The models are certainly not perfect, but it has been a while since I made fun of them. (But I'm still not worried about global warming in the long run; five years ago I wrote <http://mistakesbytjm.blogspot.com/2005/11/long-run-global-warming-and-other.html> and I'm inclined to stick with a surprisingly large fraction of it.)

Tom Myers (2011-02-28 12:57:50)

alrenous, I'm surprised that you think "the model authors are aware of the problem, and for it is for this reason among others that they refuse to share the model." As I said above, you can download the Goddard (NASA) model from <http://www.giss.nasa.gov/tools/modelE/> and play with it yourself. I'm not sure how many years that's been true, but it's not new: I remember recommending it to a computer science student a couple of years ago (I'm not a prof any more, just a grant-funded programmer who sometimes works on projects that comp-sci students are also working on.) There used to be complaints that it was hard to get the model going, but there now seems to be a community of people doing it. There are other models you can play with as well; see the last question on <http://www.realclimate.org/index.php/archives/2008/11/faq-on-climate-models/>. Enjoy!

Nathan Myers (2011-02-28 23:53:24)

1. Kirk: Matt Ridley isn't a scientist. He's a journalist and hereditary plutocrat. His doctorate in zoology, and marriage to a neuroscientist, do not bolster his opinions on climate. Prophetically, in 2007 he was forced out of chairmanship of the Northern Rock bank – the first of UK's banks to collapse since 1878! – for failing to heed warnings about its unwise policies. Come 2008, he had lots of company in ignominy, which in no way reduces his own culpability or theirs. His sociobiological fancies haven't fared better than his bank. He does not appear to have taken any lesson from his failures. 2. It's curious that Seth refers to climate scientists as "Cassandras". **Cassandra is best remembered for having been right**, but ignored. It was, precisely, ignoring the original Cassandra that brought down disaster on her kin. 3. By the same logic Seth presents, his posting demonstrates the weakness of the denialist argument. The strongest, most persuasive bit of evidence you can muster is an offhand remark, in an interview question, that, examined, turns out to be completely neutral on the topic? 4. For Alrenous, re: "*they refuse to share the model*": as Tom (no relation) points out, the model is readily available; go wild. This, by the way, completely refutes your assertion. 5. For Alex: I was off work for 10 weeks last year with a short-term-memory disability. (Thanks be to our recent ancestors for establishing state Disability Insurance; without, my family would be in penury.) Once the right *dangerous and ineffective* psychotropic drug was identified, I was back at work within days. To convince me they never work, you'll need much stronger evidence than you can muster. 6. Finally: [http://scienceblogs.com/startswithabang/2011/02/weekend\\_diversion\\_jewels\\_of\\_th.php](http://scienceblogs.com/startswithabang/2011/02/weekend_diversion_jewels_of_th.php)

Alrenous (2011-03-01 08:14:54)

"As I said above, you can download the Goddard (NASA) " Yeah, embarrassed myself pretty good there. I even saw your comment - after it was too late. Learn not to post when sleepy, I guess...?"

Alex Chernavsky (2011-03-01 09:49:09)

Nathan, I wouldn't say that psychotropic drugs *never* work. Even a bullet to the head works sometimes, as evidenced by [1]this case report of a man who successfully treated his OCD by shooting himself. Also, I wouldn't consider memory deficits to be a mental illness per se. Sounds more like a neurological problem. In any case, the only drugs that are typically prescribed for treating memory deficits (at least in the US) are the drugs used for dementia – and even many doctors view those drugs as [2]useless (they're essentially placebos-by-proxy – they are designed to make the caregivers feel better).

1. <http://bjp.rcpsych.org/cgi/content/abstract/151/6/855>

2. <http://www.nytimes.com/2004/06/25/us/british-study-sees-scant-value-in-alzheimer-s-drug-aricept.html>

Seth Roberts (2011-03-01 13:08:26)

Nathan, okay Matt Ridley's Ph.D. is in zoology. Here's what I'd like to know: You seem to take climate models seriously. Why?

Nathan Myers (2011-03-01 15:49:03)

Alex: I was allowed to visit a neurologist, too, who explained (among other things) that my problem was certainly not neurological, seeing as it responded in the expected way to this *dangerous and ineffective* psychotropic drug. Despite your no-doubt frequently-reliable instincts, mental health professionals nowadays *do* often cure memory deficits using drugs that are *not* normally prescribed for dementia. Many illnesses still are not usefully treatable, but that's no reason to avoid treating those that are. It is our misfortune that we have no objective way, yet, to distinguish between those than to see which respond

well to attempted treatments. Seth: Because the models have been working well – i.e., predicting subsequent events accurately – for the past few years. In 2000, it was still possible to claim that the evidence didn't demonstrate anything conclusively. Today there is enormously more evidence, and more kinds of evidence, and it overwhelmingly supports one side. You're left grasping at straws, and it's getting embarrassing. Since the models neither incorporate nor predict cloud cover, the planet might leave the models behind if the atmosphere switches to a mode in which cloud cover is radically different. Chaotic systems are commonly near-stable only within a narrow range of conditions, and tend to lurch suddenly and dramatically to new modes in response to what seem like minor changes. The planet could equally as well plunge into a global ice age after a mode change triggered by initial warming. Such an outcome does not strike me as better. If we really trusted the models, we could drive the planet toward some preferred future condition. If you don't trust the models, the only sane action is to *avoid* pushing the system out of its present, precarious balance. In any case, the ongoing obliteration of reefs by carbonic acid poisoning is reason enough, *all by itself*, for heroic efforts to restrict carbon output. Consider the alternatives: (1) status quo, continued poisoning (mercury, sulfur, NO<sub>x</sub>, fouled fisheries, what-have-you), military extremism, and dependence on foreign political stability and largesse, or (2) clean wind and solar energy, with none of the above. What if global warming fizzles, and we got off our coal-and-oil habit "for nothing"? I'd rather live in world (2) either way. Avoiding global climatic catastrophe is a bonus.

Alex Chernavsky (2011-03-01 17:20:05)

"...mental health professionals nowadays do often cure memory deficits using drugs..." And not just *nowadays* – they've been doing it [1]for years. Only the marketing is better today.

1. [http://commons.wikimedia.org/wiki/File:Nerve\\_and\\_Brain\\_Tablets.png](http://commons.wikimedia.org/wiki/File:Nerve_and_Brain_Tablets.png)

Sean Estey (2011-03-01 17:41:52)

Nathan, I don't see how we can get off our coal-and-oil habit "for nothing". Every decision has a cost. There are no free lunches. In this case, imposing carbon emission limitations is likely to have a very heavy economic cost in developing countries, by severely limiting their economic growth. By limiting economic growth, we are prolonging the time they are shackled in poverty, which I would say is a very heavy cost. You might say that we (the developed world) should do all the R & D for renewable energy technology, then pass the benefits along to the developing world, but I doubt this can be done a) anytime soon, and b) without still imposing a high economic and therefore social cost to them. Of course the cost of doing nothing at all is that we do wreak havoc to the climate system, but there is still much uncertainty there, whereas the economic/social cost of reducing carbon is much more certain. On balance, it seems that the most prudent course of action is to wait a little longer for the science to solidify before acting one way or another.

Seth Roberts (2011-03-01 19:24:54)

Nathan, you believe the models "because the models have been working well â€" i.e., predicting subsequent events accurately â€" for the past few years." I am unaware of this correct prediction. Could you tell me where I can learn about it?

Tom Myers (2011-03-02 13:06:05)

I wouldn't have put it the way that Nathan-no-relation did, hence my emphasis on postdiction, but quite a number of counterintuitive predictions have been borne out by the data. Consider <http://bartonpaullevenson.com/ModelsReliable.html> which claims, with references, that Global Climate Models have successfully predicted: \* That the globe would warm, and about how fast, and about how much. \* That the troposphere would warm and the stratosphere would cool. \* That nighttime temperatures would increase more than daytime temperatures. \* That winter temperatures would increase more than summer temperatures. \* Polar amplification (greater temperature increase as you move toward the poles). \* That the Arctic would warm faster than the Antarctic. \* The magnitude (0.3 K) and duration (two years) of the cooling from the Mt. Pinatubo eruption. \* They made a retrodiction for Last Glacial Maximum sea surface temperatures which was inconsistent with the paleo evidence, and better paleo evidence showed the models were right. \* They predicted a trend significantly different and differently signed from UAH satellite temperatures, and then a bug was found in the satellite data. ... .. And so on. Now, it's q

Nathan Myers (2011-03-02 13:06:44)

Sean: By "for nothing", I meant "to avert a catastrophe which later information indicated was not imminent". Such an outcome might, for example, result from an (evidently delayed!) adjustment to changing conditions that increases the biosphere's ability to sequester carbon. We might imagine marine plankton evolving (mystifyingly slowly) to grow thicker shells, which sink to the ocean bottom and remove carbon from circulation. I don't know of any reason why that would occur. All the evidence we have indicates it's not. Remaining on coal and oil has imposed, and imposes, ruinous costs on the world not directly borne by extractors or purchasers. *Only one* of these is the ecological-network collapse and mass extinction that we see following global warming. Another is the ongoing obliteration of coral reefs by carbonic acid, and the fisheries that depend on them. Another is the pervasive distribution of mercury that had been safely sequestered underground. Another is the widespread tyranny and military oppression that ensures the elites' exclusive access to carbon found under poor peoples' land. (I could go on.) A carbon tax, applied scrupulously, would direct a tiny fraction of those costs back to users, and fund an efflorescence of new industries that have long been suppressed by the artificially low prices of oil and coal, soon eliminating such dependence and all of the costs. We have already "waited a little longer", again, and again, and again. All but 2 of some 2000 NAS members consider it solid already. Can you identify any condition that you would interpret to demonstrate the science has solidified? Are you holding out for unanimity? Alex: Disingenuousness should be beneath us here. I'd like to take the opportunity to explore why the double-blind trials always touted as the "gold standard" of drug effectiveness testing fail. It comes down to diagnostic categories. If symptom A has underlying causes M, N, O, P, ..., of which N is seen, clinically, to be effectively treated with drug D, then the success of a trial depends entirely on how well you can distinguish N from M and O *without* resorting to D. If you cannot distinguish them with lab tests, then a trial must include a full population of sufferers of M, N, O, P, ... It will only prove that D is ineffective for most of them, a fact you already knew all too well. This difficulty with trials does not, in practice, cripple effective treatment, except insofar as it keeps useful compounds out of the pharmacopoeia. Psychiatrists and oncologists try D, E, F, ... in succession, and when one is found to work, stop there. It's a stone-age approach that reflects stone-age diagnostic capabilities, but the primitiveness of our present diagnostic capabilities should not keep patients from receiving treatments that are very often very effective. Seth, all you need to do is step out of the echo chamber of the denialists, and you will find yourself deluged with compelling evidence. Bring a kayak.

Tom Myers (2011-03-02 13:14:46)

sorry, not sure how that last was pre-submitted. Anyway I was going to say that: Now, it's quite true that this doesn't give us a usefully testable prediction of the temperature of 2015, it gives us a range. So climate scientists do offer to place bets, but it's not like betting that the Moon will be in its predicted position as of the year 2,000,000AD. But if you're talking, as Nathan is and as I believe you are, about predictions used to validate a model – well, as I said, it's been quite a while since I felt able to laugh at the climate models. (And as Nathan suggests, and as I think Tyler Cowen has said, "uncertainty is not your friend" in this issue; if I were confident that the models were correct, and that the real problem is the long-run problem, then I'd worry less about climate change than I do.) (sorry for split comment.)

Seth Roberts (2011-03-02 13:55:35)

Nathan, you remind me of a surgeon I consulted who said there was plenty of evidence that the operation she recommended was a good idea. I could easily find the evidence using Google, she said. I could not find it. My mom, a medical librarian, could not find it. Confronted with these failures, the surgeon said she would find it. She never did. Let me make a prediction: You are never going to supply an example of the "successful prediction" you claim exists. Tom, I looked at the page you linked to. The main prediction of the models is that there will be excessive warming, so I was especially curious about "global warming" predictions. The latest paper (of evidence) should be the best. Here is the latest paper that page gives: Mann, M.E., Z. Zhang, M.K. Hughes, R.S. Bradley, S.K. Miller, S. Rutherford, and F. Ni 2008. "Proxy-based reconstructions of hemispheric and global surface temperature variations over the past two millennia." *Proceedings of the National Academies of Science* 105, 13252-13257. The title shows this isn't about predictions, it is about fitting past data. Failing to understand the difference between prediction and fitting past data is so naive it seemed pointless to continue. At any time – right now, 5 years ago, 10 years, 15 years ago – the people who work with those models and claim we should pay attention to their predictions could make/have made a set of predictions: next year, the year after that, and so on. Then, as time passed, we would have found out if the models predict correctly. The modelers haven't done that. The more time that passes, the more glaring this failure becomes.

Nathan Myers (2011-03-02 16:34:55)

*You are never going to supply an example of the "successful prediction" you claim exists* And my prediction: you will never look at any example without finding some way to ignore most of it, and re-interpret some detail in just such a way as to make you right all along. Will you wait until after the Amazonian basin is a desert, and insist that at no point was the evidence ever strong enough to act on? My question for you is the same as for Alex: what can you think of, that could happen within a year or three, that would oblige you to change your mind? Is any such thing even conceivable? Ten years ago you could point to Mann's statistical irregularities to proclaim his data too weak to demonstrate, alone, what is now well-supported. Today you're reduced to promoting random offhand remarks as the "Best Argument Against Man-Made Global Warming". Before, said warming was illusory. Now, it's just not caused by CO2. Next will it be the fault of the ocean microfauna for failing to step up and absorb our excess? Where are we going from here?

Tom Myers (2011-03-02 18:21:22)

Two points, I guess. (1) Seth, you say The title shows this isn't about predictions, it is about fitting past data. Failing to understand the difference between prediction and fitting past data is so naive it seemed pointless to continue. I do indeed wonder if it's pointless to continue. If, say, Seth Roberts in his work on diet comes up with an appetite-model which implies a claim about the Paleolithic, and then somebody finds a cave in Iran with traces of ancient campfires which tests that claim, then I'm gonna list it as a "prediction"; the fires themselves were not in your future, but the connection of your model to that data was in your future, and that's what counts epistemologically for evolutionary theory, for geology, for astrophysics or for climate change. These millenia-old datasets, reported in the 2008 article you're rejecting by title, were in the future for Arrhenius in 1896, for Broecker in 1975, and for the guys in between; those are the names in the "Models" column as having originated the general greenhouse-gas global warming prediction for which the 2008 article is among the "Evidence." The compatibility of their models with that data strikes me as a genuine prediction-based test. (Of course the models are compatible with the rise in temperature with rising CO2 since the models were made, and that's another.) And no, I don't know that Levenson's correct about this 2008 reference; I know about some of his references, but not this one. I'm just saying I don't believe you can tell from the title that he's using "prediction" improperly. (2) Seth, you say that At any time "right now, 5 years ago, 10 years, 15 years ago" the people who work with those models and claim we should pay attention to their predictions could make/have made a set of predictions: next year, the year after that, and so on. Then, as time passed, we would have found out if the models predict correctly. The modelers haven't done that. So far as I can tell, that's, well, that's not quite right. The people who work with these models have said what the models predict, which is a little like predicting the water level as the tide comes in during a storm: things go up and down a lot, and there's probably a storm surge adding a bias to your readings, so you cannot predict the exact level at any given time; prediction is rougher than that. It sounds like you're demanding that they predict the waves; if that's what you're demanding, there's not much point talking about it. I'm interested in knowing if the models (which make lots of predictions by which to be tested) are basically correct, because if so things will get gradually hotter and many people think that will be a disaster but I just think it will be a problem – if it gets hotter slowly, a solvable problem. So what predictions do they make? Well, the ones Levenson's page lists... and others. Most famously I'm sure you're aware of Hansen's 1988 Scenarios A, B, and C with B being, he said, the most likely, and we now find, the closest to reality. I already linked to a discussion of that one, which has been dishonestly called a "failure" based on a false description (as described in the page I linked, and many other places) – but was it, honestly, a "success"? That depends on how you score it. From a prediction-evaluation point of view on the page I linked, I'd personally take most seriously Hansen's model correctly projected amplified warming in the Arctic, as well as hot spots in northern and southern Africa, west Antarctica, more pronounced warming over the land masses of the northern hemisphere, etc. The spatial distribution of the warming is very close to his projections. That seems to me to speak to the underlying mechanism of the model. The exact amount is off, but not by much; the best description, as per that web page and other discussions I've seen, is simply that the climate sensitivity number Hansen used (that's one parameter, one number) was within the currently-accepted range, but at the high end, while the number that would have made his curve come out "right" is slightly lower, near the middle of that currently-accepted range. So, looking at that, I look at what the critics (besides the dishonest ones) say about it, and I look for somebody who finds a way to justify an extremely low climate sensitivity number with some other model – something that will also produce amplified warming in the Arctic, etc. And so far, I don't find it. So far, I'm left with the simplest description being "Hansen's climate sensitivity number was a bit high, but it looks like he got things pretty much right." That, to me, is a fairly reassuring

description, because it suggests that we may not have real climate disasters before we can develop the technology to warm or cool the Earth as much as we want. I'm a Moore's-Law sort of geek. But it's not completely reassuring, because all models are wrong, and I do not feel that uncertainty in this matter is my friend.

Seth Roberts (2011-03-02 19:50:50)

Tom, as the term Little Ice Age implies, global temperatures have been rising for a while. When Hansen predicts they will continue to rise at roughly the same rate – and they do – I hope you can see that that is no success for the model. You have to improve on common sense to be taken seriously. My weight-control theory led me to find that drinking sugar water can cause weight loss. That's wasn't common sense – it was the opposite of what everyone believed. That's an example of what should increase belief in a theory.

Nathan Myers (2011-03-03 01:19:55)

I didn't expect my prediction to be borne out so soon and so thoroughly,

Alex Chernavsky (2011-03-03 05:52:37)

Nathan Myers wrote: "My question for... Alex [is]: what can you think of, that could happen within a year or three, that would oblige you to change your mind? Is any such thing even conceivable?" I already changed my mind, Nathan. When I worked on the antidepressant team at a pharmaceutical company (in the 1990s), I had a largely positive view of antidepressants and other psychotropic drugs. But I also learned some troubling things, and I maintained my interest in the subject long after I moved into a different line of work. After reading [1]books [2]like [3]these, and articles like [4]this one, I changed my mind. Incidentally, Robert Whitaker, who is currently the leading skeptic of psychotropic drugs, was recently invited to [5]present at Grand Rounds at Massachusetts General Hospital (Harvard's teaching hospital). He probably didn't change many minds, but his very presence there is a hopeful sign to me that maybe the tide is turning.

Tom Myers (2011-03-03 09:10:42)

Well, Seth, you have done very valuable work in collecting surprises and turning them into theories. I was intrigued when I read Gelman's blog about your work, tried the diet myself a few months later, wrote about it more than a year after that at <http://mistakesbytjm.blogspot.com/2007/02/exercise-diet-self-experimentation.html> and I'm sure that you have an important piece of the puzzle. What impressed me in the end about your model, the "flavor-calorie theory", was the incidental predictions: you could lose weight with sugar water, but your model of that phenomenon then predicted that you could lose weight with unflavored oil, nose-clipping, crazy-spicing, etc, and they all worked – at least for a lot of people, to some extent, with unpredictable individual variations as noted at the forum and random places on the internet. It's clear that the overall picture is complicated (and includes some Taubes-style stuff), but this belongs in it. If I Were In Charge, the main federal involvement in medicine would not be regulation but data-collection, and Roberts' flavor-calorie theory would be one of the initial targets. As I said at [http://mistakesbytjm.blogspot.com/2007/10/self-experimentation-dental-care-he\\_alth.html](http://mistakesbytjm.blogspot.com/2007/10/self-experimentation-dental-care-he_alth.html) "I'm very glad there are people like Seth Roberts in the universe." Besides those items, I started this morning with 45 minutes, just short of five miles, on an elliptical machine with flash cards. Modern Greek flash cards, 45 elliptical minutes every morning – I can't do it on a treadmill because my ankles start hurting after a few days. When I go back to Greece this summer (for a 2nd granddaughter's christening, my daughter-in-law being now Greek-American) I will do better than I did before, and you've made it much easier. So – thanks. But as I said, what made me take the flavor-calorie model seriously was the collection of incidental predictions; it wasn't just saying that you'd made an observation about sugar water and more sugar water was better. Most useful models touch the world in many places. Your comment that we're coming out of an ice age, warming is common sense, is what I heard in the 80s from at least one of the scientists in my family (we run to PhDs, dunno why). He changed his mind when the trend (see [http://en.wikipedia.org/wiki/Global\\_warming](http://en.wikipedia.org/wiki/Global_warming)) went further faster than he was expecting, more than ten years ago. I've heard "global warming has stopped, we're going to be cooling now" claims since about that same

time. Hansen published his curves in 1988, and that was controversial; do you have a comparable prediction from the same time-period, from "common sense" or geophysical modeling? I didn't have a strong sense of how much of a trend to expect, overall, but at about the same time I changed my own mind because there were a lot of incidental predictions, such as those I commented on and then quoted above (Arctic, etc). We're not talking about a single number-sequence; we're talking about a model, one which touches the world in many places. It sounds as if you are saying that you don't intend to check climate models by their incidental predictions because those aren't central, and you don't intend to check climate models by the central warming prediction because you were sort of expecting some warming anyway. And that sounds as if you simply don't want to think about it; you'll wait until...well, you'll wait, never mind the "until". After all, it was below zero here in upstate NY this morning; surely the world's not warming. And that's okay; I'm still glad there are people like Seth Roberts in the universe. :-)

Seth Roberts (2011-03-03 13:41:07)

Tom, I'm pleased you've been able to use my treadmill/learning discovery. It's made a big difference to me, too. About testing climate models: I wrote a paper with Hal Pashler about how to test complex models. That paper was about complex models in psychology but of course the same ideas apply in other areas. I'm saying here what I said there. In psychology, many professors (modelers) at respected universities were essentially cheating by exploiting a gap in understanding. They passed off a test that was easy to pass as a test that was hard to pass and thereby got their models published. The gap in understanding was that the reviewers of their papers didn't understand how to test a theory; they didn't understand what is and isn't a useful test. Proponents of the climate models we are talking about constantly do the same thing: treat an easy test as if it were a hard test. Their models have passed easy tests but not hard tests, as far as I can tell. It's as if they hand me Monopoly money and expect me to treat it like real money. When I say "this money hasn't been tested" they say: Look, it's the right size!

Tom Myers (2011-03-03 14:37:51)

I guess we're back where we started, which is not a bad place to be: you started with a quote including "it is only when they add CO2 influences to the models that they can explain recent global warming" and now you say the tests they pass are easy. Presumably you mean that it is easy to come up with a model that passes the same tests but doesn't depend on the CO2 sensitivity. A model, as Levenson was noting, that generates the temperature distributions across different regions and different layers of the atmospheres and different day/night and winter/summer times, a model that may not be fully precise but was precise enough to show up the errors in Roy Spencer's satellite data and the paleo evidence Levenson notes and ... ? I wouldn't know how to do it, but I'm just a programmer and ex-computer science prof. The tests they've passed have looked pretty hard to me. Of course there are many tests they haven't passed yet, and may never pass (weather is fundamentally unpredictable unless it is someday actually controlled, in the sense that initial-measurement errors necessarily exist and necessarily grow exponentially; I have not seen anything to give me a strong opinion one way or the other on whether or not climate, i.e. average weather, has strange-attractor problems of the same sort. My feeble opinion is no.) If somebody has come up with such a model, let them put it online as open source, like the GISS climate model, and let Hansen, Schmidt et al have a whack at it: I'll buy popcorn. Meanwhile, I am facing the fact that after more than 20 years I haven't seen such a model, and I've been waiting for one. I predict that one won't be forthcoming. Will I bet my life on that? Am I absolutely positively sure there isn't one? Of course not. It may exist. I think the climate models are pretty good; I'm pretty sure they're the best guess we've got; but it's not a perfect world, and being models they are certainly somewhat wrong, and they might be seriously wrong. That's not reassuring. As Tyler Cowen said in a post called "My views on global warming": I do not much trust climate models. Perhaps I have spent too much time doing macro, and the experience carries over. Nonetheless uncertainty about final effects gives us more to worry about, not less. It is the worst-case scenarios for global warming which worry me, not the middling scenarios. Variance is our enemy in this matter. So it goes. (It occurs to me that I really ought to have been writing code all this time, even if I got through the last deadline fine and the next one is a ways off. Anyway, thanks for lots of things.)

Nathan Myers (2011-03-03 15:05:01)

I would like to know Seth's thoughts on the subject of confirmation bias. Alex: You seem to be saying that as a welcome consequence of this turned tide, my psychiatrist would not be allowed to prescribe the medicine that restored my ability to do work and remember phone numbers.

Alex Chernavsky (2011-03-03 19:02:35)

Nathan: I'm in favor of legalizing all drugs (whether I happen to like them or not). So under my system, you'd be able to prescribe the drug for yourself.

Nathan Myers (2011-03-04 02:30:25)

Alex: I would never, ever have thought of using that particular compound for that purpose. Chalk one up for the pros.

sabril (2011-03-05 05:50:27)

"You are never going to supply an example of the 'successful prediction' you claim exists." I agree. I have had the "successful prediction" argument many times with warmists. Very frequently, their example of a successful prediction is actually a back-casting. A post-diction, if you will. And usually these back-casts are a beautiful fit to past data. Which actually makes them even more suspicious.

readmuch (2011-04-11 19:58:52)

apparently u haven't heard many arguments against man made global warming...you bad.

Anthony (2012-04-16 01:12:13)

Are we kidding here? Ok Co2 levels are at levels never recorded before. Co2 IS a greenhouse gas, but not the biggest one. That's Methane. Guess what Methane is also at levels NEVER SEEN BEFORE! Your right, we cant accurately predict whats going to happen exactly. That should scare the crap out of you. The planet will respond. It always has, it always will. The response WILL move the climate out of our comfort zone. There is no argument against Man Made Climate Change. There is scientific conceses, it is happening. We did it. The question is not will it happen, but just how bad it will get. If we stop now, perhaps not as bad as we can fear, if we keep giving out misinformation like this blog then it will get very bad indeed. The Cretaceous was not a time human would like to live in. That was a natural climate. We have pushed the balance past that and into UNKNOWN territory. If that fact alone does not scare the pants off you then you are not paying attention.

## 6.3 March

### Inside Job Wins Oscar (2011-03-01 05:17)

I remember the first time I encountered Spy magazine. It was at Cody's Bookstore in Berkeley. One of the articles attacked Bill Cosby. Wow! I thought. You don't see that every day.

Which is why Inside Job, which just won the Oscar for long documentary of the year, is so important: It attacks prestigious professors at Harvard and Columbia and to some extent the institutions themselves. You don't see that every day. Larry Summers, former Harvard president, is one of the main villains of the piece. Few intellectuals have combined poor understanding and power as much as Summers has. (With bonus points for [1]nauseating treatment of staff.) Perhaps none has done so much harm. Had Summers not blocked Brooksley Born from regulating derivatives, the world would be a different place. And it isn't just Summers. The movie shows that John Campbell, chairman of the Harvard economics department, has trouble understanding the concept of conflict of interest. What this says about Harvard, the most prestigious academic institution in the world, is not something Harvard professors are going to want to think about. Harvard, of course, is the home of [2]Joseph Biederman, the most ethically-challenged professor I know of.

Michael Moore's [3]Sicko did a great job of provoking outrage. At the same time, however, it was empty of interesting thought. It was not a new idea that American health care might benefit from imitating other countries. So

the outrage boils away unused. In contrast, Inside Job contains the beginning of a thoughtful critique: It says that economics professors were corrupted by all the money they could make praising and doing the bidding of Wall Street (e.g., resisting regulation). Summers made out especially well. You won't find this critique in The Big Short, All The Devils Are Here, Too Big to Fail, or How Markets Fail. A viewer of Inside Job might stop giving money to Harvard until Harvard enacts conflict of interest rules for economics professors.

I don't think conflict of interest is the whole problem with Summers et al. Poor understanding is a big part of it. A friend of mine at Berkeley took introductory economics. What about data? I asked her. Where's the data for all these assertions? She went to her professor. Where's the data? she asked. Don't worry about data, he said. Economics professors have started paying more attention to data (Steve Levitt, John List), but they have a long way to go.

---

Glen Raphael (2011-03-01 12:33:58)

I'm confused by that last paragraph. Can you be more specific as to what kind of claims constituted *all these assertions* that needed data to support?

Seth Roberts (2011-03-01 13:01:10)

Glen, claims such as "if this happens, people will do such and such". For example, microeconomic theory. The course was big on "laws" (cause-effect statements), short on data supporting those laws.

Glen Raphael (2011-03-01 15:01:27)

Much of micro is practically self-evident if correctly explained, but doing so includes keeping a lot of nuance that it sounds like was lost in translation here. It's more like "if this happens, people will *tend to* do such and such, on average, all else being equal, assuming simple motives". The underlying principles that lead to those rules get tested a little every time a store has a "sale" and sells more than they did at the old price. Every time the government sets a price control and causes shortages or subsidizes something and causes surpluses. Every time somebody prices something too high and it doesn't sell. Sometimes simplifying abstraction is appropriate. If your student took introductory physics, would you ask "where's the data?" when working out assertions about what would happen when a perfectly spherical billiard ball on a perfectly frictionless table hits another with twice the mass in a perfectly elastic collision? Econ 101 is mostly about the *\*predictable\** components of human action, just as Physics 101 is mostly about the *\*predictable\** components of physical action.

Seth Roberts (2011-03-01 18:43:10)

Glen, my friend's class was before the rise of behavioral economics, the whole premise of which is that ideas about "what people will do" should be tested, not assumed. The rise of that field supports my view (that economists didn't care enough about data), I think. From my point of view, behavioral economists are mediocre data collectors. This is no surprise, since they are just starting, whereas experimental psychologists have a hundred years of practice. Behavioral economic experiments are usually just one step better than demonstrations – they are pretty good for showing whatever idea they started with is right (which is a lot better than not collecting any data), but poorly designed for uncovering new ideas. John List's work on the ultimatum experiment reveals the low average level of experimental technique. That's what I mean when I say economists have a long way to go. An intro physics class that didn't spend at least half the time discussing data would be pretty bad. It should cover how data is collected, how data leads to theory, how data tests theory.

TomGinTX (2011-03-01 19:33:30)

A lot economic theory concerns things that are hard, if not impossible, to measure. How would you measure a demand schedule for Coldplay CDs, for example? Mine is ZERO at ANY price, but I am a special case. 8-)

Nathan Myers (2011-03-02 13:27:06)

People measure demand schedules for Coldplay CDs continuously. Wal-mart fiddles with prices at different stores, and measures with frightening precision empirical demand schedules for thousands of commodities. No, they don't exactly follow the curves microeconomists use to simplify their theories, and the demand for each commodity is far from independent of the prices of various others, but it doesn't matter very much, except, of course, to retailers.

## How to Be Less Efficient (2011-03-01 12:25)

[1]Andrew Gelman links to [2]this post about intellectual working conditions. It reminds me of something I do every day that still amuses me. I keep track of whether I am working or not – and I count making tea as working. This helps me get started: I start by making tea. The opportunity to mislead myself (appear more efficient than I am, get something for nothing) makes me want to start working.

1. [http://www.stat.columbia.edu/~cook/movabletype/archives/2011/02/do\\_you\\_need\\_ide.html](http://www.stat.columbia.edu/~cook/movabletype/archives/2011/02/do_you_need_ide.html)

2. <http://jbdeaton.com/2011/02/03/do-you-need-ideal-conditions-to-do-great-work/>

---

Alrenous (2011-03-01 16:17:22)

I'm attempting to debunk something. I work when I feel like it. As a child, my authorities told me that this would result in no work. I doubted - it seemed to me it only resulted in no pointless work. I'm winning so far. Some hurdles still to study, I don't yet know what all of them actually require to overcome. But - if we're measuring intellectual output one of the hurdles is for me to figure out how to reliably stop working once I've started. I keep staying up way too late. Also my body starts to complain at thirteen hours straight...for some reason... In a sense, it's less efficient. For example, right now I'm commenting on your blog. In another sense, it's infinitely more efficient. I never work in the sense of using self-discipline, but am productive anyway. The main hurdle for me is an HBD issue. So...I don't require self-discipline to do 'chores.' Either a great deal of suffering is entirely unnecessary, or I'm one special snowflake. I think I like these options.

Justin Wehr (2011-03-01 21:40:08)

Seth, I am curious if you have made any discoveries (or have any hypotheses) related to your working or not data. In the spreadsheet I fill out every night, I estimate how much time I spent across 13 categories. One of the categories is "totally useless time" and from that I have a "% time not unproductive" variable. I have found that since I started measuring these timing categories, I have looked for areas of "productive" overlap to get that percentage lower, such as reading outside, or working out while I listen to a podcast.

Seth Roberts (2011-03-02 00:29:16)

Justin, no I have made no discoveries. I've been collecting the data for about a month but have yet to start to analyze it. I've tried this in the past; this time I hope I have a better system. I think it takes a long time just to start to be consistent in the data collection.

Jill (2011-03-04 11:26:21)

I often get started doing actual work by trying to put up the appearance of work - i.e., my boss comes in the room, so I open a few development apps on my PC, and one thing leads to another... Suddenly, I find myself having actually completed an assignment I was going to put off until next week.

## Root Planing Cancelled (2011-03-03 05:45)

My friend Carl Willat writes:

Last June I went to the dentist for a checkup and cleaning, fully expecting my gums to be in great shape since I had been diligently using my Braun Oral B electric toothbrush. Â To my surprise and disappointment the hygienist told me the pockets had actually become deeper and that she was seeing bleeding in many places, to the point where she was recommending I have my roots planed, a painful and expensive procedure I had undergone once before many years ago. So of course I went home and started taking the flax seed oil and ground flax seed ["a couple of tablespoons a day of oil, plus random amounts of ground flax seed"] as you had recommended. Â I also started using a Sonicare toothbrush at that point so it's hard to figure out the degree to which either variable might be responsible, but today she said my gums were much better, and had hardly bled at all during the measurement of the pockets. All talk of root planing was forgotten.

According to [1]this, root planing costs \$400- \$1600. After Tyler Cowen started drinking flaxseed oil (2 T/day), [2]he no longer needed gum surgery.

It is hard to get well-preserved flaxseed oil in Beijing (it goes bad at room temperature) so I now take 66 g/day ground flaxseed instead of 2 T/day flaxseed oil. I add it to yogurt twice/day. I don't know if ground flaxseed is healthier or less healthy than flaxseed oil but it is much less trouble. Preservation is no problem (flaxseeds can be stored at room temperature) and ground flaxseed requires zero willpower to eat with yogurt. I had to push myself a little to drink the oil.

---

Paul Cooper (2011-03-03 07:01:25)

What about flaxseed tablets? Time will tell I guess as I've been taking them and am due a check up at the dentist soon.

dearieme (2011-03-03 07:10:17)

I put flaxseed (we call it linseed in the UK) in my breakfast cereal. Is there any disadvantage in not grinding it?

Evelyn Majidi (2011-03-03 10:50:42)

I am delighted to hear further about people's experiences with flaxseed oil and other products made from flax. After reading the initial story on this website about flaxseed oil's affect on gums, I began to take two tablespoons a day of the product to see if it would provide relief from a severe attack of lichen planus in my mouth. (By the way, I am convinced that lichen planus is

just another name for psoriasis - of which I am also a victim - when it affects tissue other than the skin). After three months of using the oil my mouth is in much better shape, and I am very grateful. As lichen planus, like psoriasis in general, waxes and wanes for reasons unknown to medical science, I cannot say that the flaxseed oil caused this wonderful change - but I certainly intend to keep on taking the stuff.

Seth Roberts (2011-03-03 13:15:56)

dearime, I believe that grinding flaxseeds makes their ingredients more easily digested. More bioavailable. Paul, the optimum amount of flaxseed seems to be 2 tablespoons or more. It isn't easy to get that much per day from capsules. I'm not sure what tablets are but I suppose they are the same as capsules.

David (2011-03-03 14:13:13)

I had a very similar experience to Carl Willat's. Last May my hygienist performed a perio chart and informed me that I had many 3mm and several 4mm pockets. My x-rays showed that I "have the bone structure of a 55 year old man" (I was 36 at the time). Given that my hygiene was good - I have always flossed and brushed fastidiously - and my gums neither appeared inflamed nor bled as a result of the hygienist's prodding, I was told that my condition was probably the result of genetics. There was no discussion of underlying systemic inflammation. At the time I was using a Sonicare toothbrush which I believed was responsible for the painful sensitivity I was experiencing along my gum line. Against my hygienist's advice - she told me that the Sonicare was particularly important to someone with my condition - I decided to revert to a manual toothbrush. In addition, based upon what I'd read on this blog, I decided to bombard myself with omega-3. For the following six months I drank flax oil (3 T/day) and I took 1g/day of fish oil. Last November I had my regular biannual cleaning and my hygienist performed another perio chart. The result? 1-2mm pockets across the board. I should also mention that the sensitivity along my gum line vanished after discontinuing the Sonicare. Sadly, neither my hygienist nor my dentist showed any curiosity in what may have caused my condition to improve between visits. I have decided to quit taking fish oil, but I continue to drink flax oil. It's my belief that flax oil by itself is enough to fight my inflammation because it cleared up and continues to prevent eczema - something I had suffered with for years. Many thanks to Seth and everyone else here who helped lead me down this path.

Seth Roberts (2011-03-03 14:29:42)

David, I'm very glad to hear that. Thanks for commenting. It's interesting the way your hygienist (a) claimed your condition was genetic and (b) failed to be curious about the improvement. Why did you decide to stop taking fish oil?

David (2011-03-03 15:45:00)

Partially because of cost and partially because I took large doses of fish oil in previous years and never achieved the same effects that I did once I started drinking flax oil simultaneously. I lived with eczema and, apparently, gum disease for years while taking fish oil alone (in a larger dose - 2g/day).

Seth Roberts (2011-03-03 18:20:27)

Huh. Thanks, David. Those are revealing comparisons. I have tried fish oil only once. It gave me a headache so I stopped. Flaxseed oil has never given me a headache.

e.h. (2011-03-03 18:57:56)

Another flaxseed and skin story: I have not read your book or know what your method is exactly - other than it gave me the hint to think of my diet in terms of classical conditioning. I started feeding the 'insulin pig' the wrong reward (flaxseed oil) whenever I felt hungry outside meal times. Amount varied between 3 and 12 teaspoons a day, has stabilised around 4 or 5 and appears to be self governing as I don't like the smell or taste and get nauseous if I eat too much. My desire for food plummeted and right now I am content on one meal a day. I've lost 6 kg in as many weeks: Lose another 4 and I will need to re-jig it. My dry, dry skin (eczema as a kid) is 'almost normal' and usually only this good when I am on a small boat far from civilisation and refrigerators eating lots of oil, fish and 'hardware food'. I had never thought of separating oil consumption from meal time. Life changer.

Sam (2011-03-03 22:32:23)

Seth, have you ever tried to replace flaxseed oil with (freshly?) ground flaxseed? These would be way easier to come by and keep fresh, so this should be a big improvement in handling, but of course this would be for naught if they don't have the same effect.

Seth Roberts (2011-03-03 23:12:25)

Sam, yes, I used to use flaxseed oil. Now I use ground flaxseed. That is what I was saying in the last paragraph of my post, which begins "It is hard to get well-preserved flaxseed oil in Beijing (it goes bad at room temperature) so I now take 66 g/day ground flaxseed instead of 2 T/day flaxseed oil." As far as I can tell they have the same effect.

Sam (2011-03-04 08:51:48)

Whoops. Sorry! I remember reading that part and somehow did not realize you replaced the oil completely. One more question: do you grind them fresh, or buy already ground seeds?

UncleLongHair (2011-03-04 14:57:37)

This is interesting. I just went to the dentist a couple of days ago. In my prior 2 visits I was warned by the hygienist that my gum pockets were getting to the point that I might have to consider surgery if they didn't get better. She gave me little toothpick type things intended to stimulate the gums, which I didn't use because I hated them. In this visit I got no such warning. In the interim I took about 2 Tbsp of flax seed oil almost every day. I happened to be lax in my flossing too. I did not take the flax seed oil for the gum condition (I didn't know about the connection until reading this post), rather for general anti-inflammatory health. I should say that I can't definitely establish a cause-and-effect relationship here because I'm not certain the hygienist did the same test this time as last time. However I still find this interesting. So I have a question. This anecdotal evidence is interesting, but I would love to see a more comprehensive study. Why hasn't this idea been explored in a study? It would not have to be enormous or expensive to address the issue. I don't suppose the dental industry would fund such a study, because it would gore their ox if patients could just take oil instead of signing up for expensive surgery. The flax seed industry might fund it, but of course it would be difficult to accept their results as unbiased. Is there any organization that could fund it and produce reliable results?

Seth Roberts (2011-03-04 20:12:14)

Sam, I grind them fresh. Uncle Long Hair, why hasn't this idea been explored in a study? I don't think funding is the problem. Flaxseed oil is cheap. Dental exams cost very little, at least if you are dentist. A study would do an enormous amount of good, I believe. But several factors are against it: 1. Novelty. This idea is really new. 2. Illegitimate origin. Ideas are not supposed to come from blogs. 3. Dentists, who could easily do such a study, don't do research, by and large. That's not their job. 4. Dental school professors, who do research, don't do prevention research. Nor do they read this blog. If you are a dentist and would like to do a study, please contact me.

Tom (2011-03-06 21:17:40)

Seth, I bet if you created an account on a Dentists' Forum (or even commented on a few blogs), you'd get a number of Dentists to participate.

## **Climate Model Predictions and What Happened (2011-03-04 03:39)**

In [1]a comment on [2]a previous post about lack of convincing evidence for climate models – the ones that predict catastrophe – I wrote:

At any time – right now, 5 years ago, 10 years, 15 years ago –” the people who work with those models and claim we should pay attention to their predictions could make/have made a set of predictions: next year, the year after that, and so on. Then, as time passed, we would have found out if the models predict correctly. The modelers haven't done that.

From [3]this talk by Richard Muller, a Berkeley physicist, I learned of two instances where the modelers did what I said they haven't done.

1. In 2009, James Hansen predicted, based on his model, that 2010 would be the hottest year on record. Since temperatures had been roughly constant – not rising – for the previous 12 years, this was an interesting prediction. When 2010 ended, Hansen's own data (analyzed in an unusual way, according to Muller) found this to be true, but two other datasets found it to be false.

2. In 2001, several scientists, based on nine climate models, predicted that Antarctic ice would increase over the next ten years. In fact, it decreased ("exactly the opposite of the prediction"). In response, John Holdren, President Obama's science advisor, said, according to Muller (at 26:22):

Well, those models were really wrong. But now we've changed those models. And now if we run them again they show that the ice will decrease. And therefore this is evidence in favor of global warming.

The audience tittered.

If you think Climategate was not important, and that the scientists whose email was revealed did nothing seriously

wrong – as several official investigations, [4]Bill McKibben ("if you managed to hack 3,000 emails from some scientist's account, you might well find a few that showed them behaving badly") and New Yorker staff writer Elizabeth Kolbert have concluded – you should see what Muller says about it (starting about 30:00).

I liked the talk. Muller makes several points with which I agree and presents helpful data. However, there were several things I didn't like. There is one big gap. Muller thinks current climate models are probably right, but doesn't explain why. I would have liked to know. And he says two things with which I deeply disagree. First, he says scientists shouldn't say what the data will show – that is, make predictions. I believe that making and testing predictions is by far the best way to learn how much we know. Second, Muller says that buying a Prius does nothing. The improvement is too small, the cost of a Prius too great. People in China can't afford a Prius, says Muller. This misses a really important point. When you buy a Prius you are supporting innovation. To solve the big problems that arise in any society, innovators need support. [5]My theory of human evolution goes on and on about this. Long ago, connoisseurs supported innovation. [6]Festivals such as Christmas supported innovation. Art lovers supported innovation. Fashion supported innovation. The great achievement of Tyler Cowen's new book [7]The Great Stagnation, which I will discuss tomorrow, is its focus on rate of innovation. What controls rate of innovation is a supremely important question usually ignored by economists – as Muller ignores it.

In any case, here are two actual predictions and how they fared.

bjk (2011-03-04 06:24:51)  
Tittered.

Dave Lull (2011-03-04 06:41:40)  
OED: twitter "4. intr. To laugh in a suppressed way, titter, giggle." Also: " b. transf. [ . . . ] also (esp. of a woman), to talk or chatter rapidly in a small or tremulous voice." Or perhaps a portmanteau word: to tweet a titter.

Seth Roberts (2011-03-04 06:58:27)  
Thanks, Dave. I have fixed it – twitter is ambiguous.

D (2011-03-04 22:00:50)  
I recommend Muller's book "Physics for Future Presidents". His chapter in climate change is very reasonable, as are his chapters on other controversial topics. The man seemed very honest and perfectly willing to slay a few sacred cows. It's also a good read. I learned a lot.

Vince (2011-03-05 01:08:35)  
"temperatures had been roughly constant" not rising "for the previous 12 years" What is this claim based on? If you take the annual [1]global temperatures from 1998-2009 and plot a best-fit line through them, it has a slope of +.12C per decade.

That's only slightly less than  $+0.16^{\circ}\text{C}$  per decade that you get if you fit a line to the 1970-1998 data. And you picked the endpoint of 1998, which was unusually hot and well above the trend line.

1. <http://data.giss.nasa.gov/gistemp/taledata/GLB.Ts+dSST.txt>

sabril (2011-03-05 05:30:18)

There is another instance where it was done; Jim Hansen presented the predictions of his climate model in his congressional testimony in 1988. His forecast did pretty well for the first 15 years or so, then it started getting off track. See here: <http://wattsupwiththat.com/2009/10/22/a-little-known-but-failed-20-year-old-climate-change-prediction-by-dr-james-hansen/> When I argue models with warmists, the usual defense is to assert that climate is easier to predict over a 20 or 30 year time frame than it is over a 2 or 3 year time frame. But there really is no evidence or reason to believe this is so. Also, the UK met office has been making year-by-year predictions for 10 years or so now. However, any layman can see that this model fails the persistence test. i.e. if you just take each year's temperature and use it as the prediction for the next year, you would have gotten a more accurate prediction than that of the met office model. What's interesting is that the warmist community does not seem to understand or accept that the UK met office model has failed this most basic statistical test of validity.

Seth Roberts (2011-03-05 05:56:43)

Vince, my claim of constant temperatures is based on what Muller said. I am just repeating what he said. sabril, in James Hansen's 1988 predictions there was no comparison to a simple linear extrapolation. Perhaps temperature was already rising at the predicted rate of increase. If so, it was no great success for the model to correctly predict a continuation of that trend. The model should be able to do better than a high school student. The accurate prediction of the first 15 years means nothing until it is clear that the model did better than common sense. Your UK met office example is the same point.

Duncan (2011-03-05 06:10:22)

There's a Scott Adams cartoon that runs as follows. (Enter Dilbert, clutching a box): I got it! I'm the first person in city to own a videophone! (Opening box by the TV): Now all I have to do is set it up and wait for someone to call me. (Videophone is set up on top of TV, all TV displays is static) (TV still displays static, Dilbert sits there vacantly) Dogbert: The funny thing is, we need people like you to move technology along.

Seth Roberts (2011-03-05 08:53:51)

Duncan, yeah, good thing people like to show off their wealth and be holier-than-thou. Dilbert understands what Veblen missed.

Nathan Myers (2011-03-05 17:16:13)

The "climategate" e-mails didn't reveal anything more than pique toward petroleum industry shills. I don't need to *hear* what Muller says; I *read* all the "incriminating" e-mails myself, and their context. *There is really nothing there.* Echoing Seth's comment last week, those were the best they could come up with, and they weren't anything. I don't need to dig deeper and read all the "less incriminating" e-mails – they're even less than not-anything. The whole fake controversy was ginned up by those same shills. The shills are just doing the job they're paid for; what's shameful is in being taken in. (Likewise, the Koch brothers and their teabaggers, respectively.) Seth, people are always pointing you to compelling predictions and proofs. You're having to work harder and harder not to see them, and to make any tiny hint of ambiguity you can eke out into a smoking gun. People who have sent tens of thousands of dollars to Nigerian 419 scams maintain, on their way to prison, that the millions really bare there waiting for them, and they'd have got them already if not for corruption at all levels of government. Psychology must have a name for that.

withrow (2011-03-05 19:49:26)

I think there are three parts of the Global Warming argument to contend with. 1) Are there more greenhouse gases in the atmosphere than in centuries past? I'm not an expert in the field, but the experts seem to be saying that's true and I haven't seen any disagreement on that point to speak of. Maybe there is some controversy on this point, but I haven't seen it. 2) Assuming you except #1, we can ask: are human behaviors contributing to the increase in greenhouse gases? Again, the link between our collective carbon footprint and the evidence of more greenhouse gases seems to be fairly well-accepted. Ok, if

you sign on to those two points, I think you basically have to acknowledge that humans are changing the world in a way that could be dangerous. In other words, we're polluting Earth to the detriment of future generations. It would be nice to believe that the climate models (argument #3 in the Global Warming debate) are going to be accurate so that we could quantify how much in resources we should spend to reduce our carbon footprint. But, like Seth, I'm skeptical of their accuracy. I've spent a fair amount of time watching the models of how we might expect baseball players to perform from one year to the next and that took some time to get right- and it seems much, much easier to predict baseball players' correctly than to shape an accurate climate model. So, I'm skeptical about these models' accuracy. Here's the thing, though. If you're skeptical about their accuracy and you basically accept #1 and #2, I think you pretty much have to admit that the climate models could be underestimating the change. That is, our best scientists, for all we know, could be wildly underpredicting the impact of our carbon footprint. It makes sense to me to use the best science we have to estimate the resources we should spend to correct this situation before future generations suffer from our polluting ways.

Sean Estey (2011-03-05 21:49:11)

This debate is interesting in that the climate change side is firmly convinced that anthropogenic warming is a threat, the denialists side is adamant it's not, and both sides accuse the other of bias. Very few people rest in the middle, which makes this issue almost a matter of politics rather than science, much like Republicans vs Liberals. If you're an environmentalist you're probably going to be on the anthropogenic warming side, and if you're a free market advocate, probably a denier. Has anybody else noticed this?

sabril (2011-03-06 04:47:54)

"The 'climategate' e-mails didn't reveal anything more than pique toward petroleum industry shills." Well would you agree that at a minimum, the e-mails show that (1) one or more of the researchers in question are advocates for a certain point of view? i.e. they wish to put the best possible spin on things in order to persuade the public that their position is correct; (2) one or more of the researchers attempted to prevent the publication of articles which disagreed with their position; (3) one or more of the researchers attempted to game the system to prevent their perceived adversaries from obtaining documents through freedom of information requests.

sabril (2011-03-06 04:50:58)

"Seth, people are always pointing you to compelling predictions and proofs. " I realize that this comment is not addressed to me, but I really would like to see an example where these climate simulations were tested by successfully making bona fide interesting predictions. Let's do it this way: In your view, what is the most compelling example of climate simulations making accurate, bona fide, interesting predictions?

Steve G. (2011-03-06 13:29:55)

I like Withrow's point, at least it describes how I come to this issue. We have a strong reason to believe points 1 & 2, so what do we do now? I agree that models are likely imperfect, and that future testing would be ideal, but we have to decide whether to cross the Rubicon now. And not to choose is to choose. (Sorry, it seems like a stream of cliches, but I hope it gets across my point.) In other words, we can't wait for perfection, we can't wait 20, 50, or 100 years to check out "who was right". Indeed, scientifically, isn't looking into the future much like looking into the past to judge, for instance, evolution? We can't test evolution by its predictive power, we can't replicate it in a lab, but we believe it. (I do.) Isn't the theory of evolution explanatory but not predictive?

Tierney (2011-03-07 15:39:50)

The really damning thing about Climategate was not the emails, but the code that was released. The comments are amazing. Most people have only seen the emails, which are easy to dismiss- the code not so much.

Seth Roberts (2011-03-07 16:31:51)

Tierney, Muller's talk makes clear what a big difference it makes to "hide the decline", also known as "Mike's trick". I had not seen that pointed out before. When you "hide the decline" (which is shorthand for several changes) the graph that you get

(which is what was published) becomes far more favorable to the case that Mann and his colleagues were pushing. And this is entirely separate from the weird data analysis that produced the Hockey Stick. The emails are easy to dismiss, I agree – until you know what "hide the decline" actually means.,

Nathan Myers (2011-03-07 21:59:06)

Sean: Your observation is painfully obvious, but backwards: The sole reason for the "controversy" over global warming is that the honestly expressed implications of the research results demand public policy changes that would ("inconveniently") interrupt extraction of rent on long-held properties. Sabril: Seth has expressed, again and again, that he's *really not interested* in looking at evidence. The dance is a two-step. The first step is that the only evidence worth looking at is global temperature predicted *after* the present. The second step is that the only prediction to take seriously is one that does *not* forecast a temperature rise. The first means that there will never be a time to examine results of predictions. The second means that having predicted *correctly* automatically disqualifies a model as trivial. In response to your three points: (1) All researchers are advocates of a point of view. Some lie and say they aren't. If they express a foolish point of view, legions of other researchers are eager to jump down their throats. When many scientists expose their point of view, it means no serious criticism remains to be demolished. (2) Nobody can prevent publication. The shills in question were handicapped mainly by *never having done any research of their own*. (3) All productive researchers use every imaginable trick (oops! there's that word) to keep [censored] from wasting their time. For each minute of each day, a whole crowd of [censored] lies in wait to make off with it. Scientists not harassed by [censored] are often doing nothing interesting. (Scott Adams's first book was about this, titled, "Always Postpone Meetings with Time-wasting Morons".) Steve G: Natural selection has recently been made predictive, and has been replicated in labs all over the world. As pointed out earlier, "prediction" needn't refer to linear time. Paleontologists routinely make predictions about what a complete specimen (that died millions of years before their birth) will be found to reveal, and are roundly ridiculed when they predict wrong – just as in other disciplines.

Nathan Myers (2011-03-07 22:16:26)

I read the e-mails. I also read the code, and the comments in the code. The "hide the decline" and "Mike's trick" comments have been examined thoroughly by several independent commissions, and have been found to have absolutely innocuous implications. Everyone who cares has seen detailed demonstrations of this. Paraphrasing Seth, again, when the very smokingest gun they can come up with turns out to be a trick cigarette lighter, there's no point in looking further. This is not only because other offerings will be even weaker. It is also because it reveals that they are trying to deceive you, so all further efforts will be to that end.

sabril (2011-03-07 22:29:54)

"All researchers are advocates of a point of view" I basically agree, which is why it is troubling when people like Gavin Schmidt pretend that they are not advocates. "Nobody can prevent publication." Does this mean yes or no? Are claiming that none of the researchers in question attempted to prevent publication of any article? "All productive researchers use every imaginable trick (oops! there's that word) to keep [censored] from wasting their time." So it sounds like you are saying that (1) yes, one or more of the researchers in question attempted to game the system to prevent their perceived adversaries from getting information through freedom of information requests; (2) they did it primarily to save time and not to prevent scrutiny of their work; and (3) all researchers engage in this sort of behavior. Do I understand you correctly? Oh, and in your view, what is the most compelling example of climate simulations making accurate, bona fide, interesting predictions?

Seth Roberts (2011-03-07 22:57:39)

Nathan, according to you "the only prediction [I, Seth] take seriously is one that does not forecast a temperature rise." See Prediction #1 in this post for a counter example.

Nathan Myers (2011-03-07 23:23:43)

(1) There are honest and dishonest ways to advocate a point of view. The former is what Gavin Schmidt is doing. Promoting transparently phony "climategate" scandals is the latter. Being seen to engage in the latter reveals true intentions. (2) It doesn't matter who, if anybody, tried to prevent publication. My opinion about what they meant to do matters even less. If

they had tried to prevent publication of real work, they would fail. If the skills did real work, they wouldn't be skills. Much of the apparatus of science is geared to preventing publication of substandard and deliberately misleading works (although it often fails), and it's part of every scientist's job to help. (3) They did not "attempt to game the system"; they discussed possible actions that they decided against. All *productive* researchers are obliged to engage in variations of "this sort of behavior", if by that you mean putting off time-wasting [censored] whenever and as long as possible. I applaud all such efforts, because I want scientists to do science. I *understand* that not everybody wants that. (4) You can't fool me, it's turtles all the way down.

sabril (2011-03-08 05:04:41)

"There are honest and dishonest ways to advocate a point of view. The former is what Gavin Schmidt is doing" That's simply not true. Here's an (apparent) quote from him: \_\_\_\_\_ "Climate scientists are paid to do climate science," said Gavin A. Schmidt, a senior climatologist with the National Aeronautics and Space Administration's Goddard Institute of Space Studies. "Their job is not persuading the public." \_\_\_\_\_ A reasonable person reading this would understand that Gavin Schmidt is attempting to pass himself off as being disinterested; neutral; NOT an advocate with a position. "It doesn't matter who, if anybody, tried to prevent publication." Why are you evading my question? It's not a trick question. It doesn't have any hidden assumptions in it. Yes or no, please. "They did not 'attempt to game the system'; they discussed possible actions that they decided against." Again, this is simply not true. Here is one of the Climategate e-mails: "I had some emails with him [McIntyre] a few years ago when he wanted to get all the station temperature data we use here in Climatic Research Unit. At that time, I hid behind the fact that some of the data had been received from individuals and not directly from Met(eorological) Services through the Global Tele-communications Service (GTS) or through the Global Climate Observing System" Clearly the e-mail author (Phil Jones) was attempting to invent excuses to avoid disclosing information to a perceived adversary. "All productive researchers are obliged to engage in variations of 'this sort of behavior'" Researchers are obliged to invent excuses to avoid complying with freedom of information requests? Anyway, it's not a waste of time for a researcher to turn his data over to a hostile adversary. The adversary might find something wrong with the researcher's data, methods, or results. This is a valuable and productive result. Besides, if it was really about saving time, the climategate folks would not have objected to the release of the climategate e-mails. Instead, they would have said something like this: "We want to thank whoever leaked this information. We really wanted to do it ourselves, but we did not have the 3 or 4 minutes required to burn all the e-mails to a DVD and drop them in the mail. Thank you for saving us 3 or 4 minutes!!" And again: In your view, what is the most compelling example of climate simulations making accurate, bona fide, interesting predictions?

sabril (2011-03-08 05:50:47)

And by the way, if there were any doubt that a significant part of Jones' motivation was simply to shield his work from scrutiny, he kinda spilled the beans with this little gem: "Why should I make the data available to you, when your aim is to try and find something wrong with it"

Nathan Myers (2011-03-08 13:48:13)

Climate scientists really *are* paid to do climate science. They are also citizens who have a civic responsibility to speak out about public policy that is at odds with reality. There is no contradiction, but they do make conflicting demands on one's time – along with family and other needs. Each of us is obliged to sort out those demands as well as we can. Most of your questions are already answered in my previous posting, typically in the *very next* sentence or clause after the bit you quoted. Do please read. The response to the e-mail release has been profoundly distracting. No one who wanted to actually do, you know, climate science, welcomes such distractions.

sabril (2011-03-08 15:13:19)

"There is no contradiction" The question is not whether it's a contradiction. The question is whether it is dishonest for people like Gavin Schmidt to pretend that they are not advocates when in reality they are. If these warmist researchers came right out and admitted that they are advocates; that they will do their best to put the best possible spin on things in order to support their position; that they will attempt to prevent dissenters from having their work published; that they feel justified in inventing excuses to dodge freedom of information requests in order to shield their work from scrutiny; etc.; then I would have much less of a problem with them. (Of course, I would oppose public funding for such individuals.) "Most of your

questions are already answered in my previous posting” Nonsense, and the fact that you are unable to concede points which are clear to any reasonable person underscores the whole problem with the warmist side of the debate. These are people who (apparently) feel perfectly justified in attempting to silence dissent; withholding data; and in general spinning things to put their pre-determined view of reality in the best possible light. Meanwhile, they have not offered hard objective evidence that their climate simulations are correct, such as bona fide, interesting, accurate predictions. Instead, we are simply supposed to trust them. But their behavior shows that they cannot be trusted.

Daublin (2011-03-08 16:43:52)

withrow and Steve G., it is a fair question, but it's saddening that you aren't even aware of the counter-arguments. A good read would be [climate-skeptic.com](http://climate-skeptic.com). The root of the issue is the magnitudes involved. If the effect of more CO2 is small, then there's no reason to worry. If the effect of emissions control is weak, then it's a pointless strategy to attempt, and we should look for a better answer. The expected effect of more CO2 is where there has been especially shoddy science being published. Occam's Razor suggests that the effect will be small, because the effect is due to the greenhouse effect of CO2 in the atmosphere. We are already past 50 % of the maximum possible greenhouse effect due to CO2, so why would we expect having any more than that effect once more, no matter how much CO2 we put out? There are efforts to argue that we approach some sort of tipping point that would cause the a larger effect from later amounts of CO2 than earlier amounts. There's not much evidence for any such effect that is also consistent with the Earth's history as we know it. In particular, we've had high CO2 in the past without seeing any sort of tipping point, so why should it be different in the modern era? The expected effect of emissions control, meanwhile, is small. To really stop CO2 levels from growing, cutting emissions by half is not enough. The cuts have to be more like 80-90 % world-wide. Such cuts would have severe negative impact on human quality of life, so no such proposals are being floated. However, if the cuts are anything less – or if, like Kyoto, they don't even reduce emissions at all – then CO2 levels will keep rising. In that case, the emissions control just delays our doom instead of preventing it, and we still need an alternate solution eventually.

sabril (2011-03-08 19:36:36)

"A good read would be [climate-skeptic.com](http://climate-skeptic.com)." I agree 100 %. "The root of the issue is the magnitudes involved" I agree with this too. It's amazing how many people there are who think they understand the science but who don't know that the critical issue is water vapor feedback. "The expected effect of emissions control, meanwhile, is small." I agree with this too, and I would add that the proposals on the table are probably even less effective than they seem, since they are likely to result in some amounts of CO2 emissions simply being shifted from places like the US to places like China.

## **The Great Stagnation (Part 1) (2011-03-05 14:21)**

Tyler Cowen has written a short Kindle book called [1]The Great Stagnation. I have a lot to say about it. This post is about the context, how it fits into a bigger picture. In a later post I'll discuss its ideas.

At the end of *The Economy of Cities* (her favorite among her books), Jane Jacobs said if a flying saucer came to Earth she'd want to know how they avoided stagnation. The main battle in any society, said Jacobs, is not between rich and poor or owners and labor but between those who benefit from the status quo and those who benefit from new ways of doing things. The status quo usually wins, no surprise. And the status quo tends to become more powerful over time, which is why Jacobs didn't know if profound stagnation could be avoided as a kind of terminal state. When she wrote *The Economy of Cities* (published 1969), she saw stagnation mounting in the American economy – in transportation, for example. By stagnation she didn't mean lack of growth; she meant lack of useful innovation, causing problems to stack up unsolved. If you keep doing the same things, but more intensely, you will grow in conventional economic terms (e.g., GDP) but you aren't solving your problems. Doing more of the wrong thing (e.g., treating all diseases with pills) counts as growth but such growth makes things worse, not better, because bad ways of doing things become more entrenched.

Most people see Jacobs as [2]someone who wrote about cities. She saw herself as someone with new ideas about

economic development – especially innovation. Cities are important above all because city people are more innovative than rural people. Tractors, for example, grew out of city inventions (the internal combustion engine, etc.). The same person (same IQ, same wealth) will be [3]more innovative in a city than outside of one.

Stagnation is a major problem at all levels of the economy. A few years ago, a friend of mine who worked at the Chicago Tribune said it was clear newspapers were in trouble long before craigslist. As early as the 1980s, he said, there were bad signs. They were ignored. The people in charge kept doing the same things. Had they started trying new things at the first signs of trouble, they might have found a way out. But they were complacent. By the time they stopped being complacent, it was (apparently) too late. *Gone* (1999) by Renata Adler, a great book, is about the disastrous consequences of stagnation at *The New Yorker*. *The Innovator's Dilemma* by Clayton Christensen is about stagnation at industry-leading companies, such as DEC, GM, and Microsoft. Failure to innovate enough was what Christensen found when he tried to understand why industry-leading companies frequently lost their lead. Not only do these companies lose their lead, they often go out of business.

How to avoid or recover from stagnation, Jacobs was saying, is the central question of economic life, with no clear answer. Yet it is roundly ignored. In the Berkeley Public Library a few years ago, I picked up an introductory economics textbook for junior colleges, 700 pages long. It had one page – fact-free, poorly-written – about where new goods and services come from. This is typical of the introductory economics textbooks I've seen. It reflects the profession as a whole: I estimate about 1 % of mainstream economic research is about innovation. It should be half the field.

To study innovation is to study what controls it, what makes the rate of innovation go up or down. Thorstein Veblen (not a mainstream economist) wrote [4]one essay and [5]two [6]books about it. Adam Smith wrote nothing interesting about it, as far as I know, nor did Keynes. I remember nothing interesting about it in *The Worldly Philosophers* by Heilbroner, including the chapters on [7]Schumpeter and Veblen. There have been no Nobel Prizes about it. (Among the Economics prize-winners, Robert Fogel has done the best work about it, whereas Samuelson's textbook is a monument to lack of understanding of innovation and its importance.) Ed Glaeser's new book *The Triumph of the City* emphasizes that cities boost innovation but Jacobs said this 40 years ago. Because cities tend to grow (increasing innovation as they grow), why do whole societies stagnate? Apparently a countervailing force overcomes the innovative power of cities. I have never heard an economist make this point nor say what the countervailing force might be.

In *Collapse*, Jared Diamond showed how whole societies collapsed (ran out of food and disappeared) when they failed to innovate enough. Instead of blaming lack of innovation, Diamond blames overfishing, overhunting, soil problems, and so on. His list of "different" causes of collapse is like a list of "different" kinds of paranoia: persecution by the FBI, persecution by the CIA, persecution by the police, and so on. If a society does the same thing over and over, at increasing intensity, eventually it will collapse. The collapse may have many proximate causes.

Tyler does not assume that all growth is good. Perhaps influenced by Robin Hanson, he points out that vast health care spending has done little for American health. Much poorer countries get the same results. When you spend four times as much but get the same results, it implies stagnation. Presumably the 20 % we share with poor countries is spent on the oldest stuff. If so, the most recent 80 % of growth was worthless and a great deal of it has been a kind of churning, useless research passed off as useful. It entered the health care system, people paid for it, but it didn't help them. It is entirely possible that some of the expensive health care found in America but not poor countries is beneficial and some of it is [8]harmful.

Tyler sees the forest – a society-wide failure to solve important problems. The tremendous accomplishment of his book is to bring the puzzle of stagnation to mainstream economic attention ("the most talked-about economics book of the year so far" according to [9]this review). I am too far from economics to guess what influence it will have on research, but if mainstream economics becomes even 2 % about innovation and stagnation (= lack of useful innovation), that will be great intellectual progress.

---

Mark Cancellieri (2011-03-05 15:08:55)

Seth, I haven't read The Great Stagnation, but Russ Roberts had some interesting insights into one aspect of it: The Great Distortion <http://cafehayek.com/2011/03/the-great-distortion.html> I thought it was interesting. I have found that statistics can mislead us about as easily as they can enlighten us.

Kevin Miller (2011-03-05 15:21:15)

Very interesting post. A couple of points, though: 1. I think that even successful organizations can look as though they're stagnating. One of my favorite books in understanding my adopted state of Michigan, David Halberstam's "The Reckoning" is in part interesting because it shows how completely screwed up Nissan was during the period of its greatest growth in the U.S. As he tells it, only the fact that Japan was so far from the U.S. and the leaders of the company never came here, coupled with the presence of one maverick employee who was later brought back to Japan and punished for his independence, allowed them to be successful here. It was still a much better-run company than Ford was in those days, which is also noteworthy. 2. I read "The Innovator's Dilemma" recently and don't recognize your summary of it. What I found fascinating was his idea that it's exactly well-run, customer-focused companies that have trouble dealing with innovation. The case of hard disk drives was fascinating, where the regular move from larger to small drives seems pretty predictable, yet no company that was the leader in one size was able to maintain that for the next smaller size. Each of the smaller sizes was relatively more expensive and slower, so their customers didn't have a use for it (but other customers did). Then when HP tried to get ahead of the cycle they failed because they assumed people would put the drives in portable devices that might be dropped and needed expensive disk-parking, when the market that developed was for big stationary videogames (where their product was too expensive). I think I agree with the overall thrust of your argument, as well as what it implies about the danger of the "too big to fail" concept. But I suspect from my own experience that the distinction between "innovation" and "stagnation" is only clear in retrospect.

aretae (2011-03-05 16:06:46)

Seth, The stagnation problem was attacked head-on by Mancur Olsen in [1]The Rise and Decline of Nations. I think he has largely explained it, if not solved it. Furthermore, while there are lots of detractors from the significance of his specific contribution, Paul Romer's work on new Growth Theory is pretty good. The popular treatment of the idea comes from David Warsh's book [2]Knowledge and The Wealth of Nations.

1. <http://www.amazon.com/Rise-Decline-Nations-Stagflation-Rigidities>
2. <http://www.amazon.com/Knowledge-Wealth-Nations-Economic-Discovery>

Igor Carron (2011-03-05 17:14:33)

Tiny nitpick, it is Clayton Christensen.

Seth Roberts (2011-03-05 17:37:44)

thanks, Igor, I've fixed it. aretae, Olson's work is certainly important, but from what little I know of it he says nothing about

how new goods and services arise and become widespread. It rarely involves what Olson calls "collective action". For example, tractors were a new good that greatly increased farm productivity. Many people became better nourished. This had nothing to do with what Olson writes about, as far as I know. Paul Romer's work is relevant, I agree.

withrow (2011-03-05 19:54:38)

I have one nitpick about the description of innovation by rural vs. urban people. I think it's important to make this clear in order not to insult rural people. They're just as innovative as urban people, just as clever, etc. The difference is that cities give innovation a better chance to stick as part of our culture. It's the environment, not the individuals, that leads to people making innovation a part of their lives.

Seth Roberts (2011-03-05 23:53:19)

yes, my point is that exactly the same person becomes more innovative when placed in a city than when placed in a rural area.

UncleLongHair (2011-03-06 05:02:10)

There are examples of companies that fail to innovate and then get into trouble (i.e. GM, others mentioned here) but there also examples of companies that don't innovate but remain successful, such as Coca-Cola. They sell essentially the same product that they did nearly 100 years ago, in fact trying to innovate nearly led to disaster ("new Coke"). My view is that economies are like ecosystems, with companies playing the part of species within it. In some areas of the ecosystem, constant innovation (evolution) is required for survival (i.e. birds and bugs in the rain forest). In others, the status quo is required (i.e. sharks, which have not evolved for millinea).

john (2011-03-06 05:03:32)

Doesn't IQ and the Wealth of Nations explain creativity. I like mentioning this kind of book because it's all about race. So if almost all creativity is by smart white men I guess what's needed for creativity is white men. An absence of state funded dysgenics would be good and also an absence of religion.

Seth Roberts (2011-03-06 05:51:18)

UncleLongHair, I think Coke executives would beg to differ with you that their company hasn't innovated. Coke is sold in far more countries now than 50 years ago and the company itself has a much bigger product line. I also hear that a Coke in New York tastes quite different than a Coke in Beijing. The company used to make a big deal of "same taste worldwide". Which brings up another big set of Coke changes: in advertising.

Robbo (2011-03-06 10:10:27)

Seth, I think you would be interested by the work of Genrich Altshuller on technical innovation (known by its Russian acronym TRIZ) eg at [http://aboundsound.blogspot.com/2007\\_07\\_01\\_archive.html](http://aboundsound.blogspot.com/2007_07_01_archive.html) and at [aitriz.org](http://aitriz.org). Altshuller knew his work was important when the KBG arrested him and threw him in a prison camp for it.

Andy McKenzie (2011-03-06 11:22:05)

Seth, love the post! Intrigued by the great divide you mention between those who benefit from the status quo and those who benefit from the way things are. Robin Hanson has listed questions that one should try to answer about a great divide: <http://www.overcomingbias.com/2010/08/questions-for-great-divides.html>. In particular, 1. How is this division a key division, underlying many others? 2. How do people acquire their sides in this conflict? 3. How has this conflict lasted so long, without one side winning? 4. How could one side finally win such an old conflict? 5. Why is one side better than the other in an absolute sense? 6. Why can't those folks be persuaded that their side is bad? 7. Why can't peaceful compromise replace conflict? For 1, I'd cite how this leads to gov inefficiency, which leads to \_lots\_ of issues. For 2, I'd say people take sides based on local incentives, and can have different stances on status quo vs new thing on different issues (although peoples' stances across issues appear to tend to be correlated, perhaps for the sake of cognitive dissonance?). For 3, I'd say it's because once a group gets power they always have the incentive to keep it. For 4, I guess we're not sure whether side can win. For 5, innovation is not better absolute of course, but better in terms of more likely to lead to survival and benefit of humans. For 6,

they don't want to be persuaded because that would mean they'd have to admit their relative selfishness. For 7, it certainly could if you had the right incentive structure in place, but right now it can't. Do you agree with these and/or where do you stand? (sorry for long comment, I got carried away)

Nile (2011-03-06 11:59:48)

I think the innovation solution is known. For years and years, while Dave and Bill were alive, HP was an innovation fire hose. Even today, under leadership which does not value innovation the way the founders did, HP continues to bring significant technology to the world. In 2012, next year, HP will bring its memristor memory to market. A background note - few people are aware of this but it will change the computing world because memristor memory in combination with the crossbar latch can 1) act as a CPU 2) emulate a neuron 3) is incredibly dense - one terabyte per cm<sup>2</sup> or one petabyte per cm<sup>3</sup>! Watch the Stan Williams You Tube videos for more info.

Seth Roberts (2011-03-06 13:33:32)

Andy, my answers to those questions are different from yours and for better or worse are long and complicated. The conflict arises people are always inventing new stuff and new ways of doing things - that's human nature. I think personality differences ("rebel" vs. "conservative") have a lot to do with what side you take and that these personality differences, as Frank Sulloway says, are partly determined by birth order. It's crucial to the health of a society that both sides of the conflict have plenty of supporters. If there aren't enough rebels, innovations will never be adopted. That produces collapse. If there are too many rebels, innovations are adopted too quickly, before they have been shown to be safe. I think there is a "divide" (a bimodal distribution) because the conflict is beneficial - active resistance to innovation pushes innovators to do better. To have someone attacking this or that innovation is better than not having such a person ("peaceful resolution").

Steve G. (2011-03-06 13:46:06)

I enjoyed Cowen's book, and I appreciate you post. As often proves the case, you show that Jane Jacobs was a prescient thinker. As a very interesting complimentary perspective on these issues (including climate change), I highly recommend two works by Canadian political scientist Thomas Homer-Dixon: 1. The Ingenuity Gap: Facing the Economic, Environmental, and other Challenges of our Increasingly Complex and Unpredictable World (2000); and 2. The Upside of Down: Catastrophe, Creativity, and the Renewal of Civilization (2006). Homer-Dixon questions, somewhat like Cowen, although on a larger scale, whether we can continue to innovate our way of jams. In the second book, following the leads of Diamond and Joseph Tainter, among others, he catalogs the perils we face from a variety of challenges, especially concerning energy. Many think that parts of our education are a shambles, yet despite one program after another, we're still "waiting for superman". Likewise with energy sources, we still waiting for an energy regime that minimizes our strategic vulnerability, not to mention minimizing risks associated with carbon emissions. Finally, Ian Morris in Why the West Rules, among others, reminds us that we've lived through an extraordinary 200+ years that are unlike any before and that changed the world more than any since the advent of agriculture, cities, etc. Can this continue? We should do all we can to make it so, but can we plan on it?

John C. (2011-03-06 17:44:33)

I'll have to download this book to my Kindle. My company is really pushing innovation.

### **Spy Magazine Available Online (2011-03-06 16:56)**

Thanks to [1]this article, I learned that many issues of Spy magazine have become available at Google Books ([2]here). I loved Spy. In the last few years it got much worse but before that I would often read each issue three times. Now you can judge for yourself.

1. <http://www.theatlantic.com/culture/archive/2011/03/spy-magazines-digital-afterlife/72049/>

2. [http://books.google.com/books/serial/ISSN:08901759?rview=1&source=gb\\_s\\_navlinks\\_s](http://books.google.com/books/serial/ISSN:08901759?rview=1&source=gb_s_navlinks_s)

---

vic (2011-03-06 17:23:35)

a commenter to your blog posted this a few weeks ago

Seth Roberts (2011-03-06 18:55:18)

OMG. I thought I read all the comments....Now that I have looked through the comments, I cannot find it.

Alex Chernavsky (2011-03-06 20:53:15)

"Spy" was one of only two magazines that I would habitually read from cover to cover on the day it arrived in the mail (the other one was the "Skeptical Inquirer").

David (2011-03-07 17:18:05)

yes, I left it in an Assorted Links dump when you posted your cartoon taxonomy. Valentine's Day. I read Spy pretty fervently. It was great, and then it wasn't, and then it was gone. I see things in McSweenys that target the approximate demographic and mentality, though Spy seemed to be more Gawkeresque, perhaps?

David (2011-03-14 06:46:37)

More Spy nostalgia here <http://www.slate.com/id/2287767/>

## **Personal Science and Graphic Design (2011-03-07 07:21)**

I will always remember the day (today) my work [1]appeared in a graphic-design magazine.

1. <http://blog.eyemagazine.com/?p=2631>

---

Rashad (2011-03-07 07:47:26)

Seth, this reminded me of a question I've had for a while. Have you done some other experiments to see what about the butter is having the effect? Have you tried heavy cream instead, since butter is made from cream? What about clarified butter (ghee)? How about other types of fats? I know you were on the pork belly kick for a while, but what about comparing beef fat, or chicken fat? Just curious.

Seth Roberts (2011-03-07 12:16:24)

Rashad, no, I haven't yet done experiments to study this further. The next experiment I want to do with this is figure out the best dose. The butter replaced pork belly, roughly the same amount. So active ingredient or ingredients must be present more in butter than in pork fat.

## **"My Body, My Laboratory" (TIME article) (2011-03-07 13:30)**

Last week Time published [1]an article about self-experimentation called "My Body, My Laboratory" by Eben Harrell that is now fully available on-line. I am quoted a few times.

I distinguish between two kinds of self-experimentation – part of your job (the usual kind) or self-help (what I do) – and it's easy to put each of the examples in the article into one pile or the other. However, I think that if you go far enough into the future and look back, you will see three varieties:

1. Professional. Self-experimentation done as part of your job (e.g., doctor). A dentist testing a new anesthetic, for example. All famous examples are in this category.
2. Self-help. Self-experimentation done to improve your own life. Done by non-professionals. I call this personal science.
3. Combination of the two. A professional combines job skills and self-help. This is what I did. My job (experimental psychologist) gave my self-experimentation (about weight loss, sleep, mood, and health, all common self-help topics) a considerable boost.

Professionals (Category 1) have skills and resources. The self-helpers, the non-professionals (Category 2) have freedom and (greater) motivation. People in Category 3 have all four. To summarize [2]this paper in three words, that really helps. Please imagine the Venn diagram – one circle ("Professional"), another circle ("Self-Help"), and area of overlap ("Me").

1. <http://www.time.com/time/magazine/article/0,9171,2050030,00.html>

2. <http://sethroberts.net/articles/2010%20The%20unreasonable%20effectiveness%20of%20my%20self-experimentation.pdf>

---

anony (2011-03-07 17:36:36)

Who made YOU the expert on this Seth? I will be correcting this mistaken perception.

Seth Roberts (2011-03-07 18:33:58)

Why am I considered an expert on self-experimentation? Because I wrote a book about a diet based on self-experimentation and a long paper about many self-experimental discoveries.

### Assorted Links (2011-03-08 12:12)

- [1]“But I’m undocumented,” she said, and the room went silent.
- [2]The dog that didn’t bark. Gates Foundation annual letter doesn’t mention global warming.
- [3]Climategate computer code. A reader of this blog named Tierney told me, “The state of their data and databases are AWFUL. I’m not sure how anyone could look at it and still feel highly confident in the climate models!”

Ancorehraq sis (2011-03-08 13:26:35)

It's fascinating how the NY Times article studiously avoids mentioning Ms Castillo's area of study.

Glen Raphael (2011-03-08 14:10:26)

Obama's State of the Union address didn't mention global warming either.

Seth Roberts (2011-03-08 14:31:15)

Ancorehraq, the article says she studied social work ("Ms. Castillo told the governor that she had graduated from college in three and a half years with a degree in social work").

Alex Chernavsky (2011-03-08 20:40:28)

Seth, what's your opinion of chronic fatigue syndrome? This article was interesting - I wasn't aware of the Lyndonville cases. I'm still leaning toward a psychosomatic explanation (think of the epidemic of hysteria in 19th century Vienna). <http://online.wsj.com/article/SB10001424052748704005404576176823580854478.htm>

Seth Roberts (2011-03-08 21:39:08)

Alex, I know very little about chronic fatigue syndrome, sorry. Thanks for the link.

### **Michael Bailey's Defense of Academic Freedom (2011-03-08 13:42)**

I have no problem with Holocaust deniers. They are probably a good thing - a mild irritant keeping the rest of us on our toes (like fermented food). Being forced to look at evidence will do most people good. The people who scare me, who do real damage, are the ones who want to silence Holocaust deniers. They don't meet enough resistance. That Holocaust actually happened is exactly why we should be so afraid of intolerance in any direction (e.g., pro- or anti-Semitic). But Holocaust deniers are too intellectually feeble to do a good job of defending freedom of thought. So, by and large, it is poorly defended. Sure, most "unthinkable" views (such as Holocaust denial) are nonsense. But not all.

The paragraph you just read ("I have no problem...") is a terrible defense of academic freedom. It's vague, argumentative, unemotional, impersonal, and abstract. I think the best defense of a belief is to practice it, which is why, in my lifetime, the best defense of academic freedom has been [1]The Man Who Would Be Queen (about male homosexuals) by Michael Bailey, a professor at Northwestern. The book led to [2]a campaign of vilification against Bailey led by Lynn Conway and Deidre McCloskey. [3]I blogged and corresponded with McCloskey about it.

Bailey has again defended academic freedom by practicing it. Last week [4]Bailey's Human Sexuality class caused controversy because of an after-class demonstration in which a woman was brought to orgasm on stage using an unusual device. Again we are learning the actual consequences of academic freedom, as opposed to simplistic arguments (like mine) or homilies about how good it is.

The Human Sexuality controversy led to publication of [5]this story (which I have shortened):

As an undergraduate at Northwestern University, I only saw one professor argue with his students. It happened several times in the same class, Human Sexuality. [The first time was in 2005.] The professor, J. Michael Bailey, had been leading us through some provocative research, which suggested that if you

control for a whole variety of factors, adults who were sexually abused as children are not much more likely to have psychological pathologies than adults who were not.

[During the question period] a dark-haired young woman in the back of the class stood up right away. Hundreds of heads turned to look at her.

“You’re talking about sexually abusing children,” she said. “No matter what the research says, that is morally wrong.”

Bailey said that his moral judgment had nothing to do with the matter, that he was presenting research and that was all.

The student said, “What would you say if one of your daughters was molested?”

“If one of my daughters was molested, I would be devastated,” he said. “But I would take comfort in knowing that the molestation would not necessarily ruin her life.”

The young woman sat down. Bailey got back to his lecture.

What have I learned from this? At the simplest level, here are two stories – two pieces of evidence, two things to think about. Something more subtle is that a blunt argument (e.g., my first paragraph) is a kind of intolerance all by itself. The opposite of blunt argument is telling a story.

1. <http://faculty.wcas.northwestern.edu/JMichael-Bailey/TMWQBQ.pdf>
2. <http://sethroberts.net/articles/2008%20Dreger.pdf>
3. <http://www.blog.sethroberts.net/2010/04/10/the-man-who-would-be-queen/>

---

Thomas Seay (2011-03-09 10:48:42)

Seth, I am not entirely sure I understand why you say that your first paragraph is an instance of “intolerance”. Could you elucidate that and perhaps rewrite how you would have written the paragraph in a more “tolerant” fashion?

Seth Roberts (2011-03-09 11:08:45)

Thomas, the rest of the post is a “tolerant” version of the first paragraph. If that strikes you as too long, then just take the story about Bailey’s class. I could have stated my disapproval of those who suppress Holocaust deniers by telling that story. When the subject of Holocaust denial came up, I could say, “I heard about something that strikes me as relevant...”

anony (2011-03-09 15:24:08)

I think you were trying to make a point here but it didn’t quite come off perhaps as you expected. A little editing would fit the bill.

john (2011-03-10 16:29:14)

This reminds me of Bradley Smith’s comment about “The irrational vocabulary of the American professorial class” and that when the chips are down they always support the state. There are a few notable exceptions, Butz, Rushdon, Ellis, Brand, MacDonald, all of them persecuted to some degree, but generally speaking most professors are spineless kids who’ll join in

the persecution at the drop of a hat.. Academic freedom means the state has the professors by the balls, and it doesn't take much squeezing to get them to fall in line.

### **Independent German Journalism Students (2011-03-09 10:58)**

At Berkeley, I found that the more I let my students decide for themselves what to learn, [1]the more they learned. What they chose to learn was more valuable to them than what I might have taught. A student with severe fear of public speaking decided to give a talk to a high-school class. Every step was a struggle, but she did it. "I have learned I can conquer my fears," she wrote.

I told a friend of mine, a German professor of journalism named Lorenz Lorenz-Mayer, about this. He told me about some independent students in his department:

They were students in the class of 2007 in our online-journalism program at Hochschule Darmstadt University of Applied Sciences. [They had just graduated from the German equivalent of high school.]

During their very first term as freshmen, instead of focusing on new-media projects as we expected, they started producing a kind of city magazine for students, called Darmspiegel. The name is a pun on the unsavory name of the city we work in (Darmstadt = Bowel City), and Germany's most important news-magazine, Der Spiegel. Darmspiegel literally means colonoscope. Another idea we couldn't talk them out of. ;-)

Because they couldn't afford to print their magazine they started with a pdf version. After some experience with it, they started a marketing department, acquired advertising, and successfully printed something like four more issues.

[2][http://shop.darmspiegel.de/product.php?id\\_product=13](http://shop.darmspiegel.de/product.php?id_product=13)

After having done this for a year and learned their lessons, they chose their next project, which was to be . . . a book. This was when the group, something like 60 % of the 40 students in the class, together with some two dozen friends from other departments, asked us to make them media partners for a term project, voicing the unforgettable threat: "You can of course coerce us to do some other project, but you should reckon with the possibility that our heart will not be completely in it. If, on the other hand, we do this thing together..."

So two of our professors negotiated a compromise: It would have to be a book on Darmstadt. The outcome:

[3]<http://nachtsindarmstadt.de/>

"nachts in darmstadt" turned out to be wonderful book, full of moving stories, beautiful pictures, even an oil painting on the night the bombs fell on the city at the end of WW II was painted, dedicated to become one of the illustrations. A delegation went to far north of Norway to see the midsummer sun in Trondheim, a partner city of Darmstadt. They used a Wiki to coordinate their efforts and a weblog to promote the ongoing project:

[4]<http://nachtsindarmstadt.de/2009/>

They tried several old and new forms of marketing (like nightly "guerrilla gardening", illegally planting flowers in Darmstadt city). The book was published and – predictably – soon sold out.

Some minor projects followed, then the class had to do their obligatory 6 months of internship in different media companies. After returning, some of them majored in Public Relations, others continued Journalism, never quite reaching the prior level of productivity, as a team. Three of the group have burnt the midnight oil again (while still finishing their studies) and together with friends started a bookazine publishing house:

[5]<http://herznote.com/en/team/>

They've already published one multi-lingual magazine issue, on fashion topics (each issue is going to have a different topic), collecting and curating texts and pictures from fashion blogs:

[6]<http://circus-bookazine.com/en>

A second issue on travel is ready for print, they have started taking preorders.

Wow! They did so much. I get the same impression I got with my students: Something powerful inside of them had been freed.

---

Eric (2011-03-09 11:46:48)

This is the main idea behind the experimental liberal arts college I attended, New College of Florida. Control over coursework leads to flourishing. Three main features facilitate this. 1. There are no grades; classes are pass/fail and students receive narrative evaluations from their professors. This lets students decide for themselves when to put forth their best efforts (no bad grades for bad or uninteresting classes). 2. Students can design their own classes if a professor agrees to sponsor. 3. Passing criteria is determined by a contract each semester that students agree to after designing it with their sponsor. E.g., passing 3/3 hard classes, passing 4/4 or 5 moderately hard classes, or passing 4/7 if the student wants breadth that semester. The format can be taken advantage of. When it works, however, there is nothing like it. And, like me, many of my fellow alumni report being better prepared for graduate work than many of their grad school peers.

Alex Chernavsky (2011-03-11 08:27:46)

The system described in the blog post seems like it would work well for highly motivated, inquisitive students. But what about students who perhaps lack a strong work ethic and a sense of curiosity? And what about subjects that may be important to know but may not appeal to otherwise-inspired students?

Seth Roberts (2011-03-11 16:09:30)

Alex, I did not encounter these problems (lack of work ethic, lack of curiosity). Every one of my students had something they wanted to learn about. As for subjects "important to know" but not appealing, in psychology statistics is one of those subjects. I think the problem is professors wanting to appear scientific. At Berkeley, at least, few psychology majors want to do research. They go on to law school, become high school teachers, and so on. Statistics isn't actually important for them to know.

## **Does Blood Pressure Medicine Always Work? (2011-03-09 22:15)**

[1]Apparently not:

I was a very naughty patient and, after taking Atacand for 135/75 blood pressure (benign essential hypertension was the description) for a number of years on my doctor's prescription, decided to do a little experiment. That is, I cut back on it gradually, monitoring my BP every day. No change.

I eventually got to no Atacand at all and have been there for the past four years, during which time the BP has remained the same as when taking the drug. Now, whether the BP is going to kill me is perhaps a separate question (I seem to be in excellent health at 65) but the Atacand doesn't appear to have made much difference at all — except for the \$600/year it cost me, even after insurance had picked up on some of the expense.

I began to grasp how helpful self-experimentation could be when I discovered that tetracycline, an antibiotic that my dermatologist had prescribed, did not reduce my acne. When I told my dermatologist about the research that revealed this, he said, "Why did you do that?"

Had this person's doctor told him that Atacand might not work? Clearly not. Did the doctor even know that Atacand might not work? Apparently not, since there was no doctor-guided attempt to find out. Perhaps the doctor who prescribed Atacand would defend himself by saying, lamely, that all he knew is what the drug company told him. I wonder what the drug company knew.

How much money could be saved by stopping the prescription of drugs that turn out not to work? Should all drugs come with a label that says the fraction of patients for whom this drug doesn't work? It is a warning that is truly needed.

Thanks to Rajiv Mehta.

1. <http://well.blogs.nytimes.com/2011/03/09/rethinking-normal-blood-pressure/?hp#comment-657310>

---

dearieme (2011-03-10 06:02:34)

Why would one worry about 135/75? [http://www.spacedoc.net/does\\_treating\\_high\\_blood\\_pressure\\_do\\_any\\_good](http://www.spacedoc.net/does_treating_high_blood_pressure_do_any_good)

Seth Roberts (2011-03-10 06:28:14)

dearieme, that's a good point. so there were three things wrong here. 1. no medicine needed. 2. medicine didn't work. 3. doctor didn't care whether medicine worked. Perhaps four: 4. drug company didn't reveal that medicine often failed. What a

system.

sabril (2011-03-10 15:12:10)

I wonder if part of the problem is that most people are not sophisticated and disciplined enough to accurately measure their own blood pressure once or twice a day in order to really nail down the effects the medication is having on them. If a doctor instructs all of his patients to self-evaluate in this way, he can be sure that a large percentage will not do it properly. If somebody screws up and is hurt as a result, would the doctor be open to charges of malpractice? If the doctor tries to pick out who is likely to comply, will he be open to charges of racism or classism? Perhaps there is a kind of rule utilitarianism at work; the simplest and most effective course of action for the doctor is to just prescribe the medication to all patients who are above age X and blood pressure Y.

### **Kiviaq, the Fermented Food of Greenland (2011-03-11 00:17)**

From the new BBC series [1]Human Planet, which I like even more than Planet Earth, I learned that Greenlanders store birds they catch in summer – during a migration over the island – in a sealskin bag. Stuff 300-500 little auk birds into the bag, press all air out, sew up the opening, cover with heavy rocks, and wait three months.

The fermented birds are called [2]kiviaq.Â Kiviaq is valued highly, served on special occasions such as weddings. The aroma should "sting the nostrils. . . The flavor should resemble extremely intense Gorgonzola cheese."

The kiviaq segment ends with this voiceover:

And it's nutritious, full of vitamins and minerals that will sustain people over the winter months ahead.

Reflecting the mainstream view that microbes (made abundant by fermentation) don't matter.

1. <http://www.bbc.co.uk/nature/humanplanetexplorer/>

---

Kevin R. Bridges (2011-03-11 09:02:36)

The microbes definitely matter. I've been eating sauerkraut after dinner every day for a couple of months now, and I no longer underestimate it.

Thomas W (2011-03-11 15:59:30)

Bad kiviaq also killed Knud Rasmussen, the famous Greenlandic explorer.

tom (2011-03-15 14:08:19)

This is a self-experimenter plus (and he ate only meat): <http://www.nytimes.com/2011/03/15/us/15stanley.html?hp>

Nick (2011-10-13 08:29:42)

I just wrote an article about Kiviaq and other bizarre cooking methods! Check it out <http://bit.ly/pOiJbX>

### Lack of Evidence For Climate Models Intensifies (2011-03-11 16:40)

[1]A few weeks ago I pointed out the lack of a good reason to believe the scary predictions of climate models. Al Gore, Bill McKibben, and a million other public figures say we should believe what the models predict about global temperature ten years from now. Yet, as far as I know, the models have never made accurate and surprising predictions of global temperature. They are claimed to do what they have never been shown to do. In contrast to the absence of accurate predictions of global temperature is the presence of [2]wrong predictions.

The lack of persuasive predictions is clearest when experts who believe climate models fail to supply them. This is why [3]I linked to a warmist web page with a wealth of "supporting" information. Surely its creator had studied the issue deeply. This is why I noted that the Science Editor of The Independent, a major English newspaper, [4]failed to supply such evidence. Surely he had read a lot about the issue.

And this is why I note that [5]a graduate student in atmospheric science has failed to supply such evidence. On my Psychology Today blog I reposted one of my earlier posts about this.Â The graduate student said I was "misinformed about the nature of climate models" and that he "could go on for pages" about why. But he too failed to supply an example of an accurate surprising global-temperature prediction. (For an inaccurate prediction of a 1986 model, see [6]here.)

---

Alex Chernavsky (2011-03-11 18:37:36)

I didn't even know that Seth had a *Psychology Today* blog. It's here: <http://www.psychologytoday.com/blog/personal-science>

sabril (2011-03-12 06:56:30)

I agree 100 %, but I would add two points: First, you don't even have to note the lack of accurate predictions to be skeptical of these climate simulations. Because climatologists don't understand things like what caused the Little Ice Age or what caused global surface temperatures to rise from 1890 to 1950. If there are important mechanisms which (1) are capable of significantly changing global surface temperatures; and (2) are not understood, then it's obviously an extremely difficult task to model and predict global surface temperatures. Second, your example illustrates the warmist mentality. The fact that most warmist researchers have not condemned Hansen is further evidence that they have a war mentality about this controversy. That they cannot be trusted to play fair.

Nile (2011-03-12 09:41:47)

I live in Minnesota, USA. 12,000 years ago the land where my house stands was under a half mile thick ice sheet. There must have been extreme global warming to melt that much ice. Did/do the models predict that outcome? Can the climate change believers explain what cause the last ice age to end?

Seth Roberts (2011-03-12 12:50:48)

Nile, I don't think the models go back that far. Sabril, you make a good point about Hansen. The saying is: lie down with dogs, wake up with fleas. I wouldn't/don't expect any climate researcher to "condemn" Hansen because it would be a terrible career move. But I wonder if letting his extremism (absurd faith in his models) go unpunished encouraged other extremism, such as Michael Mann's. The whole profession wakes up with fleas.

Brad (2011-03-12 14:29:44)

How do other disciplines (eg psychology, economics, political science) compare to climate science in supplying models that can predict the long-term future accurately?

Seth Roberts (2011-03-12 16:50:11)

Brad, a book called The Predictioneer's Game <http://www.amazon.com/Predictioneers-Game-Brzen-Self-Interest-Future/dp/081297977X/> is about social science predictions.

sabril (2011-03-13 07:09:54)

"I wouldn't/don't expect any climate researcher to 'condemn' Hansen because it would be a terrible career move" Probably so, but the fact that even tenured professors are reluctant to publicly call out Hansen for his shenanigans doesn't say much for climate science as a field. It's really a shame that Richard Feynman isn't around anymore. He would have had no problem calling BS.

Brad (2011-03-13 14:35:54)

Thanks Seth. I really enjoy the blog by the way - it's been a big help with understanding issues in statistics and data analysis.

Seth Roberts (2011-03-13 15:28:23)

"It's a shame Richard Feynman isn't around any more." Yeah, that is a strange aspect of this - that more top scientists don't join Freeman Dyson.

sabril (2011-03-13 17:43:22)

Well 99 % of people will go along with the dominant view. Richard Feynman was a unique man - brilliant and absolutely unafraid to disagree with anyone. If God himself had spoken to Feynman, Feynman would not have been afraid to contradict Him. They say that during the Manhattan project, Oppenheimer preferred to discuss ideas with Feynman because Feynman was not afraid to contradict his superiors. Anyway, part of the problem is the way that people become scientists. I suppose you would know more about this than me, but I think that to make it through graduate school, post-docs, the tenure process, get funding, get published, etc., arguably the most important thing is to please the people above you. Particularly if you are not brilliant.

drewski (2011-03-16 07:27:29)

"Yet, AS FAR AS I KNOW, the models have never made accurate and surprising predictions of global temperature." You either are too lazy to avail yourself of the mountain of evidence and the increasingly accurate predictions made by climate scientists or you simply like lying to yourself.

Seth Roberts (2011-03-16 15:52:43)

drewski, thanks for a new example of my point - that the supporters of the models make the best arguments against them (unwittingly). You mention "the mountain of evidence" and "increasingly accurate predictions". The only evidence that matters

is accurate predictions (not "increasingly accurate"). Your statement implies that as far as you know, accurate predictions are rare or non-existent. Because you seem to know more about this than I do, coming from you such a statement is more persuasive than when it comes from me.

Sam (2011-03-17 06:45:11)

Maybe drewski can put some facts behind his words and provide some evidence? Should be easy enough for him if there really are mountains of it. But probably it's just hot air with not a single fact behind them. Sadly.

## **Climatology Light Bulb Joke (2011-03-12 14:02)**

Q: How many climate scientists does it take to change a light bulb?

A: None. No need to change it. Because it's been changed in the past, they say, it will be changed in the future.

A tiny fraction of climate scientists publish papers showing how their model can fit past data – say, global temperatures from 1600 to now. The authors of these papers claim that this sort of thing shows their model can predict accurately. In fact, [1]it means roughly nothing – perhaps the model was flexible enough to fit any plausible past data.

[2]Outsiders take fitting past data seriously, but what do they know? However, when [3]a graduate student in atmospheric science takes fitting past data seriously ("it is perfectly reasonable to treat reproductions of the past climate as [successful] predictions"), the whole field has a problem.

---

sabril (2011-03-12 14:50:10)

There is an interesting cognitive process at work here, it seems to me, which I can demonstrate with a thought experiment. Suppose I create a stock market simulation which I claim can accurately predict the stock market. If my claim is correct, the simulation is worth millions and millions of dollars. I claim that the simulation is valid on the ground that it accurately matches stock market history for the last 20 years. I offer to sell the simulation to Gavin Schmidt and James Hansen for \$10,000. Surely these men would refuse to pay even \$100 for my simulation. They would instantly see that the correspondence between my simulation and history is not even strong evidence that the simulation is valid, let alone proof. So it seems to me that any educated person, including warmist researchers, has the ability to see the worthlessness of these climate simulations. Indeed, it's reasonably obvious to any educated layman who looks at the issue with an open mind. My conclusion is that there is a massive amount of self-deception and motivated reasoning going on here.

John S. (2011-03-12 15:16:58)

As someone once said (and I've seen the saying attributed to everyone from Yogi Berra to Niels Bohr) it's difficult to make predictions, especially about the future

sabril (2011-03-12 15:29:23)

Another interesting thing about climate simulation models is that if you compare them to temperature histories, it's usually a very nice fit, even looking at history year by year. So if the climate simulation models are not BS, they should be able to predict future temperatures on a yearly basis. And do so very nicely. Yet they cannot. The only reasonable inference is that these simulation models match history only because they have been tweaked and tuned to do so. Thus the fact that they match history is meaningless.

LemmusLemmus (2011-03-12 15:40:24)

In fairness to the graduate student, he was talking about fitting the model on one set of data and then "predicting" another set of data (different years) with it. I don't know whether that's what climate scientists actually do, but I think you're misrepresenting his argument here.

Sean Estey (2011-03-12 16:17:18)

There are so many sources of bias within the climate change debate, at all levels, that it's hard to disentangle them all. First you have the media/environmental NGO alarmism bias, which is going to overstate any threat risk to make for higher ratings/funding. This filters down to the general public who become scared and feel the need for political action. The widespread anti-capitalism bias helps, of course (confirmation bias). Now the politicians can look like heroes by funding more climate research, as well as using the issue as a political tool to enact more legislation (for which they can claim credit). Of course, the funding bias will ensure that most of it goes to studies attempting to confirm anthropogenic warming theory, rather than falsifying it. Suddenly a lot of new climatologist jobs are created, as well as entire arms of the UN like the IPCC, the continued existence of which all rely on confirmation of anthropogenic warming, creating heavy researcher bias to justify their jobs. This is the same thing that happened with the diet-heart and lipid hypothesis, and almost 5 decades later, were still mired in thick of it. Seems rather hopeless.

Seth Roberts (2011-03-12 16:18:49)

LemmusLemmus, if climate scientists tested their models using data that had absolutely nothing to do with the development of those models, I would agree with you. There's no sign that's what happens. Here's what the grad student wrote: "Once the climate model simulates the current climate well enough, then they run the simulation of the past 150 years or so to see whether it accurately reproduces the climate." Well, what happens if it doesn't accurately reproduce the climate? I have a funny feeling they change the model. Eventually the model reproduces the past and they publish it. It makes sense to use reproduction of the past as a filter. To completely ignore the past until you are satisfied with your model seems impossible and would require special care. You would have to ignore all previous research that used the past as a guide. I have never heard of anyone doing model-building this way ("don't show me that paper, it might contaminate my work!"). sabril, that is a good point. If those models are so wonderful, why don't they just predict the next 10 years, everyone will see how well they predict, and the debate will subside? When skeptics come along, they will be easy to answer. Yet that hasn't happened. And we are 25 years into this. If the predictions turned out to be wrong, that would be good too – at least for mankind – because it could be used to improve the models. Yet somehow we never hear about the predictive record from the warmists.

Mike W (2011-03-12 17:24:21)

sabril's analogy strikes home for me - I used to write stock market simulation software. I was just the programmer, not the modeler, and I thought most (but not all) of the models were hoey. But believe me, we got plenty of investors to buy our software, for a lot more than \$100. These investors were no dummies, they knew the models weren't going to predict the future with any precision. The idea was they would be right often enough to improve the investors' odds of timing the market correctly. Every model had "tunable parameters", since each stock or commodity has its own unique volatility and behavior patterns. The way I would tell if a model was any good was I'd optimize those parameters to best fit price movements for a given year (say, 2009), then apply that same tuned model to the next year's data to see how good the predictions were. I

would hope the climate modelers did the same thing (I don't know if they did). That is, they should pretend the year is, say, 1900, and create their model and tweak its parameters to best match the previous 100 years' observed data. Then, they should come back to the 21st century and apply their 1900-tuned model to the 1900-2000 interval. If the model was truly developed without any post-1900 data, but accurately predicted 1900-2000 climate observations, then they've got a good model, and, yes, the world should take it seriously.

Seth Roberts (2011-03-12 17:38:12)

Mike W, there's more to the flexibility of the models than the tunable parameters. There are a thousand things (all sorts of approximations) that they can include or leave out. How closely the earth is approximated, for example. John S., here's my version of the Neils Bohr saying: It's easy to predict the past if you don't mention your failures.

sabril (2011-03-12 17:54:56)

"If the model was truly developed without any post-1900 data, but accurately predicted 1900-2000 climate observations, then they've got a good model, and, yes, the world should take it seriously." I would say it depends. What if you create a model, run it, and it doesn't match the post-1900 data? What do you do then? Do you quietly discard it and put together a new improved model? Or do you give up on modeling forever after your first attempt fails? (Those are the only two possibilities.) Common sense says that researchers do the first, and that they repeat until they have a "good model." But for all practical purposes, that iterative process is essentially the same as using all available data to construct the model. Here's an analogy: A claimed psychic predicts that there will be a revolution in Egypt in 2011 followed by a massive earthquake in Japan. It sounds impressive, but to really evaluate it you need to know what other predictions the psychic made. If he has been predicting revolutions in every Arab country every year since 1970 and has been predicting massive earthquakes every year in every Pacific rim country since 1970, then he is not so impressive after all. It's the same with climate models. The fact that they have been tested by back-casting on fresh data is not impressive unless you know how many versions of the model ended up on the cutting room floor, so to speak. As Roberts points out, researchers don't report this kind of information. And even if they did, I would be skeptical of their claims. That's why the acid test is making bona fide, interesting, accurate predictions. And making them publicly.

sabril (2011-03-12 18:01:20)

"Well, what happens if it doesn't accurately reproduce the climate? I have a funny feeling they change the model. Eventually the model reproduces the past and they publish it. It makes sense to use reproduction of the past as a filter." Exactly. If you discard every model which doesn't match history, it's the same as if you tuned your model to fit history from the very beginning.

sabril (2011-03-12 18:04:50)

"There are so many sources of bias within the climate change debate, at all levels, that it's hard to disentangle them all." There's a simple way to cut through the Gordian Knot, which is prediction. If a scientist makes interesting, accurate, bona fide predictions, I will listen to him whether he is funded by Exxon-Mobil or Greenpeace.

John S. (2011-03-12 18:54:57)

I keep an open mind about global warming, but this discussion brings to mind the prophecies of Nostradamus. They're great at predicting past events, but have a bit of trouble with the future. James Randi calls this "retroactive clairvoyance".

sabril (2011-03-13 02:40:12)

By the way, Warren Meyer had a very insightful point about all this. Check out this IPCC graph: [http://www.coyoteblog.com/global\\_warming\\_climate\\_graphs/image039.jpg](http://www.coyoteblog.com/global_warming_climate_graphs/image039.jpg) The pink line represents the average model output; the black line represents historical temperatures. The blue line represents model output once you remove anthropogenic factors from the models, such as CO2. (The IPCC uses graphs like this as "proof" that recent warming must have been caused by CO2.) Anyway, if you look at the blue line, it rises until 1950, peaks, and then descends. In essence, the IPCC is saying that without anthropogenic influences, global surface temperatures would have declined after 1950. Says Warren Meyer: "With the peaked shape . . . they are saying there is some natural effect that is warming things until 1950 and then turns off

and starts cooling, coincidentally in the exact same year that anthropogenic effects start taking off. I challenge you to read the IPCC assessment, all thousand or so pages, and find anywhere in that paper where someone dares to say exactly what this natural effect was, or why it turned off exactly in 1950. " I agree with Warren Meyer 100 %. This unidentified natural forcing is obviously an artifact of aggressive tweaking of climate models; smoking gun evidence that warmist climate modelers tune their models to fit history.

Eugene (2011-03-13 08:23:14)

Nassim Taleb suggests (around 17:00) that when people make forecasts about the future, go back five or ten years and see how accurate their predictions were about what supposed to happen right now. It is better, he says, to create systems robust enough to tolerate the prophets being inevitably wrong. <http://www.charlierose.com/view/interview/11516>

Adam (2011-03-18 07:02:45)

Hey Seth, have you seen [www.climate-skeptic.com](http://www.climate-skeptic.com) ? If so, what is your opinion of the material presented there? The author also did an interview that I found very interesting: [http://www.freedomainradio.com/Traffic/\\_Jams/FDR\\_1556\\_global\\_warming\\_interview\\_meyer.mp3](http://www.freedomainradio.com/Traffic/_Jams/FDR_1556_global_warming_interview_meyer.mp3) If you have time, maybe you can have a listen and share your thoughts.

Seth Roberts (2011-03-18 15:15:53)

Adam, I listened to the whole interview, thanks for the link. I learned a few things. However, the guy being interviewed, the guy who runs [climate-skeptic.com](http://www.climate-skeptic.com), failed to make the one point that matters: no accurate predictions. If it had been shown that climate models can predict the temperature 10 years in the future, I would put faith in their predictions of temperature 10 years from now. Because that hasn't been shown, I don't believe their predictions. Period. The many things discussed in the interview, although interesting, are trivial compared to that.

## **PFCs, Ultrasound, and Autism (2011-03-13 17:54)**

Robert Delaney is a geologist who does environmental cleanup in Michigan. While cleaning up an abandoned military base, he found remarkably high contamination by a chemical called PFOS. He had been wondering what causes autism. He came across [1]a rodent study that found that the combination of PFOS and ultrasound was much more damaging to the nervous system than either alone. (See also [2]this study.) He remembered that study when he read [3]my posts about ultrasound and autism. He wrote to me:

You will know the chemical PFOS (perfluorooctane sulfonate) from spray-on fabric treatments that protect clothes from stains and water. I want to tell you about the possible connection between PFCs (perfluoroalkyl chemicals, especially long chain PFCs) and autism. I learned that mice and rats contaminated with PFOS, a PFC, when exposed to ultrasound convulsed and died. I was reminded of that finding when I read your blog about Caroline Rodger's idea that prenatal ultrasound causes autism. I have thought that PFCs were causing autism for some time. I wondered if lower levels of PFOS would cause some type of brain injury, short of convulsions and death, when the mice were exposed to ultrasound.

I work on cleaning up military sites and attend a lot of related conferences and meetings. I am working on a focus group with the Association of State and Territorial Waste Managers Organization that is looking at emerging contaminants (contaminants that are not regulated or so recently regulated they are still a problem). Because of that, I was recently made aware of the PFCs because the military had identified these contaminants in firefighting foams. I was doing a cleanup at the former Wurtsmith Air Force Base in Michigan. I decided we should check for PFOS and PFOA at the site. There were high levels of both PFOS and PFOA even though it was 20 years since the based had been used. When we checked groundwater, we found it in every well at every depth. In my 25 years in the environmental business I have never seen anything like it.

I started researching the chemicals as it was apparent that I would have to deal with them. I discovered that at least 98 % of Americans have them in their blood. That isn't surprising because they are in everyday products such as food wrappers and popcorn bags, shampoos, cleaning supplies, carpeting, furniture materials, clothing, and dental floss. They are used in firefighting foams, pesticides, automotive parts, computers, electronics, and lubricants. They have ended up in our food supply and drinking water.

I had been researching the occurrence of autism for other reasons. It had occurred to me that whatever was causing the dramatic rise in autism around much of the world, it had to be ubiquitous in the environment, of recent origin, with increasing use, and found in at least the US, Canada, Europe, Japan and Australia where the autism rates were exploding.

PFCs fit these characteristics. They are found around the world in mammals, birds, fish, shellfish, etc. In fact, the Canadian government reported that the blood levels of PFCs in polar bear above the Arctic Circle were higher than the levels of any pesticides they had ever measured.

Research in the Great Lakes Region is showing high levels of PFOS in the lakes. In some places in the Lakes the contamination exceeds preliminary drinking water standards. Because these are huge bodies of water, to have so much contamination is amazing. High concentrations have been found in mink, fish, gull eggs, eagles, etc. around the Great Lakes. Fish and drinking water in Minnesota have been impacted over large areas. Europe has now banned PFCs for most applications.

What got me wondering about autism and PFCs was that in lab animals and in test tube experiments with human brain cells they are developmental neurotoxins. Many chemicals are neurotoxins, such as chlorinated pesticides and other chlorinated compounds (such as PCBs), organic mercury, and lead. However, we in the western world have been aware of these facts and for the last thirty years have been reducing use and exposure to these chemicals. But while we have been reducing our exposure to mercury, lead, and so on, neurologic diseases have been on the rise. No one suspected PFCs were harmful to humans. Their use has continued to increase.

The half life of the chemicals in our body is around 5 years, so in 5 years, if you have not gotten any more exposure to PFCs, half of them would still be in your body.

There are a lot of reasons to think PFCs may cause autism. Here are a few. First, the company that invented PFCs (3M) is located in Minnesota. There is widespread PFC contamination in Minnesota. As I was preparing a talk last week, I googled..."autism state rates." The first site to pop up listed Minnesota as having the highest levels of autism of any state. New Jersey has unusually high PFO contamination of drinking water; they also have a very high level of autism. The military, which has used a great deal of fire-fighting foam, has double the rate of autism of the general U.S. population.

In laboratory experiments PFCs influence brain wiring. The impact of PFCs in some mammals is sex-dependent with males being more affected; autism is 4 times more common in boys than in girls. PFCs are associated with repressed immune systems in animals which has been associated with autism as well. Deranged behavior/ADHD behavior has been reported in PFOS-exposed mice. ADHD in children has been associated with prenatal exposure to PFCs.

Unfortunately, the EPA did not include PFCs in their list of chemicals that might be causing autism. My colleague and I have put together a web page if people want more information: [4]<http://www.autism-pfos.net/>

Yes, why does Minnesota have such high autism rates? It is not an industrial state. It is not a rich state. Yet it is where PFCs were invented and manufactured in large amounts (e.g., ScotchGuard). I can't think of a plausible alternative explanation. The lab results (ultrasound plus PFOS far more damaging than either alone) makes perfect sense: If there is a bad molecule in neural tissue, it is going to do a lot more damage if you start shaking it, which is

what ultrasound does.

---

sabril (2011-03-14 05:21:32)

I did a google search for "autism rates by state" and found this chart: <http://www.stellamarie.com/index.php/201-0/06/24/autism-rates-per-state> Just eyeballing it, it looks like there is a strong correlation between autism rates and percentage of votes for democratic candidates in recent presidential elections. Put another way, there are a lot of blue states at the top of the list and a lot of red states at the bottom. So my hypothesis is that there is something political at work. For example, perhaps liberal states are more aggressive about diagnosing autistic children and putting them in special education. Just from general observation of adults, it is clear that there are a good number of borderline autistic people. Is there a clear, objective definition for autism which is universally applied?

Seth Roberts (2011-03-14 05:55:13)

Sabril, if you make a scatterplot of autism rates (log) vs percent vote for Obama (or some other measure of "percentage of votes for democratic candidates in recent presidential elections") I would be happy to post it. Your idea doesn't easily explain why autism is higher among military families than in the general public nor does it explain the huge changes over time. I think plausible explanations for autism must be able, above all, to explain the huge increase over time; there is no precedent for such a giant change being due to diagnostic vagueness.

UncleLongHair (2011-03-14 11:30:33)

Correlation is not causation...

dearieme (2011-03-14 12:58:00)

"there is no precedent for such a giant change being due to diagnostic vagueness": except in psychiatry?

Seth Roberts (2011-03-14 15:51:33)

"except in psychiatry"? I know of no psychiatric examples. The occurrence of depression has increased by a large factor over the last 100 years. This is accepted as real, in spite of diagnostic vagueness.

sabril (2011-03-14 20:25:39)

I tried to post this before but it got swallowed. I don't have the time and skills to create a scatter plot, but I did create a map: <http://monarch.tamu.edu/smrs/16162627.gif> The blue states represent the 25 states with the highest levels of autism; red the lowest.

Robert Delaney (2011-03-14 20:53:50)

In response to UncleLongHair, I totally agree that correlation and coincidence do not prove causation. For example, if one looks at a long list of facts concerning the assassination of President Lincoln and President Kennedy, one can find lots of correlations. All that proves is that if you look at enough random facts about any two events, you will find interesting coincidences. I am not claiming that there is definitive proof that PFCs cause autism. In science, we view a phenomenon and then postulate about possible causes. We then determine ways to test our hypotheses. The "proof" of any hypothesis comes when we can use that hypothesis to make predictions and those predictions prove to be true. As for Sabri's comment, there are many

autism "clusters" that have nothing to do with political boundaries, but might be explained by different types of PFC exposure scenarios. As Seth points out, the rise in autism rates over time must be explained. I appreciate Seth's patience to explain things. For myself, I am just looking for a few highly qualified, careful and objective individuals that can tackle the difficult job of studying the toxicology of PFCs, and who can do the epidemiologic studies. I hope no one "knows" that PFCs cause autism because some geologist thinks so. I understand contaminant fate, transport and human exposure. I leave the real toxicology and epidemiology to the experts. Fortunately, I have already run across some experts since I wrote to Seth that are interested in the subject, and one epidemiologist who was actually beginning to look at the possible link between PFCs and Aspergers. A public debate at this time is folly without hard science. However, the stakes are incredibly high and we need to find the cause or causes of these diseases as fast as possible. Pointing in one possible direction of a cause is not the same as faking data as happened in the case of the vaccination hypothesis. Sabril's comment, although not taking into account multiple lines of evidence, is still useful as it points out the need for care with correlations and allows me to explain why people should not jump to the conclusion that PFCs and ultrasound cause autism. Researchers that are qualified have to look at the data, determine if they think this might be an idea to examine, design the tests, and then communicate the results to other qualified scientists for them to test and examine. Unfortunately, that is a slow process while we are facing a very urgent problem.

sabril (2011-03-15 05:24:31)

To follow up on my previous comment, the map could easily be an electoral map. (Ok, with a few exceptions like Texas and Illinois, but still.)

sabril (2011-03-15 05:28:01)

Oh, and check out the map here: [http://voices.washingtonpost.com/ezra-kl-ein/2010/04/the\\_red\\_state\\_ripoff.html](http://voices.washingtonpost.com/ezra-kl-ein/2010/04/the_red_state_ripoff.html) It allegedly divides the states up based on the flow of tax revenue and is very very similar to the autism map.

Peter Andrews (2011-03-28 13:55:30)

"why does Minnesota have such high autism rates?" Perhaps because of its latitude and corresponding low average levels of vitamin D. [1]ncbi autism vitamin d search

1. <http://www.ncbi.nlm.nih.gov/pubmed?term=vitamin%20d%20autism>

### **Chinese News (2011-03-16 03:10)**

The media in China are government-controlled. There is a 30-minute newscast every day at 7:00 pm. A friend described it to me like this:

First 10 minutes: Government officials doing their jobs.

Middle 10 minutes: Chinese people being happy. Sports, food, achievements.

Final 10 minutes: People in other countries suffering.

---

Joseph Dantes (2011-03-16 03:54:12)

I lol'ed

blinded1 (2011-03-16 07:51:56)

Why am I not surprised? I guess anyone can become a China expert and begin to write about that country after heard someone saying something, or read a article. Actually, this is exactly many reporters, commentators are doing.

UncleLongHair (2011-03-16 10:18:57)

This is in contrast to the US media news reports: First 10 minutes: murders, rapes, fires, political scandals, regional weather that could turn dangerous, schools losing their funding, increasing homeless populations, teens doing too many drugs. Next 10 minutes: unsolved and unsolvable political problems, graphic coverage of overseas wars, stock market declines, high oil prices, a little old lady who was kicked out of her house due to foreclosure. Final: a few football and basketball scores. It's no surprise that hypertension and depression are on the rise in the US.

Gunnar (2011-03-16 13:30:06)

People still watch mainstream news? Here in Germany it's similar to how UncleLongHair describes it. Pretty much for the same reasons. To frighten the people is one of them.

Seth Roberts (2011-03-16 16:46:07)

It is like what I say about climate models: the supporters (unwittingly) make the best arguments against. This newscast could contain whatever the government wants.

## **Is Medical Research a Veblen Good? (2011-03-16 17:24)**

[1]Felix Salomon argues that fancy restaurants often manage to make their food a [2]Veblen good – something that becomes more desirable when the price goes up. Restaurant food is a way to show off your wealth, in other words.

Veblen and I differ on the long-term value of Veblen goods. Veblen saw them as sort of ridiculous – which is why he coined the amusing term conspicuous waste. Whereas [3]I see them as a way of promoting innovation: Long ago, desire for luxury goods, goods with "wasteful" features, helped the most skilled artisans make a living. These artisans were the best source of innovation within a society.

Unfortunately everyone likes to show off, not just fancy-restaurant-goers. Throughout the medical research community, there is an obvious preference for expensive research over cheaper research. (I'm not saying experimental psychologists such as me are any better: We're not.) Few medical researchers understand that expensive studies are a last resort and the larger your sample size, the less you understand what you are studying. (Experimental psychologists do understand this.) When people doing research related to health are too concerned with showing off (e.g., doing studies that require expensive equipment) to do effective research, the benefit-cost ratio of Veblenian behavior goes below one. Desire to show off gets in the way of solving health problems. This is why personal science – using science to solve your own problems – is so important: The personal scientist will do whatever works, regardless of how impressive it is.

1. <http://newyork.grubstreet.com/2011/03/gastronomics.html>

2. [http://en.wikipedia.org/wiki/Veblen\\_good](http://en.wikipedia.org/wiki/Veblen_good)

3. <http://www.blog.sethroberts.net/category/human-evolution/my-theory-of-human-evolution-directory/>

Jake (2011-03-16 22:15:04)

Thanks to you I am no longer retired, I am now a personal scientist.

Michael (2011-03-17 12:02:16)

On the idea of fancy restaurants being Veblen goods, I've thought this may also partly explain why so many expensive foods/drinks are acquired tastes. Very few people enjoy the taste of fine scotch, or moldy cheeses on the first try - most people I've seen trying straight whiskey for the first time make a face of disgust. The ability to consume such products without grimacing shows that you can afford to routinely indulge in such expensive pleasures. Of course, anyone could learn to enjoy scotch by drinking cheap whiskey, but such a person wouldn't learn the language used to describe scotch, and could still be readily identified. Were these goods cheaper so that anyone could afford to acquire the taste, perhaps many less would bother.

Jazi yechezkel zilber (2011-03-18 23:54:34)

You need a big sample only when the effect is small, which already means the meaning is low

### **Terrific Essay by Cory Doctorow (2011-03-16 19:58)**

I highly recommend [1]this editorial by Cory Doctorow about the dangers of allowing a small number of people – such as big companies – to control how everyone's computer, smart phone, etc., operates. I especially like his conclusion, modeled on Isaac Asimov's T[2]hree Laws of Robotics:

But we'll only arrive at those solutions once we stop reflexively demanding limits on the general functionality of a PC and a network “and the sooner we do, the sooner we'll legitimize a technology world whose first rule is “Obey your owner” and whose second rule is “Protect your owner's interests”.

In case it isn't obvious, self-experimentation and personal science increase your control of your body, just as Doctorow wants each person to control the technology they own. Without self-experimentation and personal science – and their ability to solve health problems in a way best for you – you give control over your body to doctors, drug companies, medical school professors, nutritionists, alternative-medicine advocates, and many others whose interests differ from yours. Often the difference is large – drug companies prefer expensive dangerous solutions to cheap safe ones.

### **Asthma and Farm Life (2011-03-17 19:33)**

For a long time it's been clear that living on a farm protects children against asthma (compared to city life). [1]A new study, done in Germany, tried to go a little further than that: to ask if it was microbial exposure that made the difference. Non-American scientists have been far more interested in the environmental causes of disease than American scientists.

They measured microbial exposure by studying mattress dust. One branch of the study used DNA techniques to measure microbial diversity of the dust; the other branch measured microbial diversity by seeing how many microbes could be cultured from the dust.

They found the usual farm/city difference in asthma: The city kids had roughly twice as much. They found the expected farm/city difference in microbial diversity of mattress dust: For a given species of bacteria or fungi, there was roughly twice as much chance of finding it in the farm dust.

Did the microbial difference explain the asthma difference? To find out they corrected for the farm difference. I think this means they looked within the farm kids to see if in this restricted group there was a microbial diversity/asthma risk correlation. In one branch of the study, there was a significant correlation. In the other branch, the correlation was nearly significant.

In all, the results support the idea that differences in microbial exposure explain the farm/city asthma difference. The biggest strength of this study is that they gathered useful evidence related to a major problem (asthma). The biggest weakness is how difficult it was. It involved about 15,000 kids and probably cost more than a million dollars.

Thanks to Aaron Blaisdell.

Pat McGee (2011-03-18 05:18:38)

I can't find the reference now, so take this with appropriate grains of salt. I recall reading a couple of years ago that a team of researchers had discovered a gene that coded for something that gave people substantial protection against asthma. Almost all humans had this gene, but it was not active. What activated it was exposure to hepatitis. (I'm pretty sure it was Hep-A, but might have been B. Certain it wasn't C.) (Please note carefully: 'exposure to', which is not the same as 'having active disease'.) The epidemiology is plausible because most human populations in the past had substantial exposure to Hep-A, as demonstrated by presence of antibodies. Currently, several populations do not - and those have high incidences of asthma. I would guess that this fits quite well with the data points cited here. I would expect higher exposure rates on farms.

dearieme (2011-03-18 10:50:17)

### **Miso Bar (2011-03-19 06:38)**

At a hotel buffet restaurant near Tsinghua I had fermented food in a form new to me: a miso-soup "bar". You serve yourself from a tureen of miso soup and have a wide choice of add-ons: carrot, turnip, tofu, pickled ginger, green onion, Japanese pickle. Adding color, visual diversity, crunch, and DIY to the soup makes it taste much better - and it already tastes really good.

If I made a scatterplot of all the foods I can make, with difficulty on one axis and deliciousness on the other, this would be a bivariate outlier: very easy and very delicious.

---

AC (2011-03-19 13:41:51)

Re: radiation: <http://xkcd.com/radiation/> Seems like you can get a comparable amount of radiation from living in a stone, brick, or concrete building vs. living in high-altitude areas with high background radiation.

Seth Roberts (2011-03-19 23:22:47)

AC, thanks, I didn't know that. In Beijing I live in a brick building.

Tin (2011-03-20 06:29:04)

hi. Can I use Extra Virgin Olive Oil? I don't see anything in the market about ELOO...what portion do you suggest should I ingest? Can I do the whole tablespoon too? Thanks

Seth Roberts (2011-03-20 21:18:36)

Tin, yes you can use Extra Virgin Olive Oil but you must keep your nose closed while you drink it (e.g., with swimmer's nose clips). You can find out much more about how to do the diet at the Shangri-La Diet forums ([boards.sethroberts.net](http://boards.sethroberts.net)).

Thomas Seay (2011-03-21 09:56:28)

Doesn't high-degree cooking destroy the beneficial organisms in miso? For health benefits I \*believe\* you should add the miso at the end when you take the soup off of the stove. For that reason, I would think eating soup from a buffet or restaurant where the miso is kept hot all the time would not be beneficial. A lot of the miso here in the United States is pasteurized which, I would think, would destroy many of the benefits. I am not sure about the above, so if anybody would like to correct me, please do so.

Elizabeth Molin (2011-04-05 06:00:50)

Peripherally related and, I thought, very interesting: <http://www.nowforthesciencebit.com/in-the-news/dirty-filthy-health>

## **My Talk at EG (2011-03-20 16:35)**

Last year I gave [1] a 20-minute talk at EG (EG is short for Entertainment Gathering) titled "You Had Me at Bacon" about my self-experimentation. I described some of the things I've discovered by self-experimentation. Then I tried to say why it had been successful – why I had managed to discover such useful stuff. My conclusion is that my success came from the combination of four things: 1. Self-experimentation. Much faster, more flexible than ordinary research. 2. The Stone Age = good idea. I used the idea that our bodies were shaped to work well under Stone-Age conditions to choose what experiments to do. 3. Subject-matter knowledge. My knowledge of psychology, experimental design, and data analysis helped a lot. My weight-control theory, for example, was based on ideas from animal learning. 4. Freedom. I could do and say what I wanted. Most scientists cannot. They fear career damage. The combination of these four things is why my work was effective.

After my talk, a few people asked: Were you serious? No doubt you've heard Arthur Clarke's maxim that "any sufficiently advanced technology is indistinguishable from magic." Let me propose a related idea: Any sufficiently advanced science is indistinguishable from a joke.

1. <http://www.youtube.com/watch?v=2oPEeddjEP8>

---

Alex Chernavsky (2011-03-20 17:49:37)

Seth, you should write-up some kind of "how to" guide for other people who want pursue this type of self-experimentation. I know that much of the pertinent information is already on your blog, but it's scattered among many different posts. I think that for most people, statistical analysis will prove to be the most-difficult part of the process. I wonder what kind of concise guidelines can be created for people who don't have time for a full-blown education in data analysis.

Craig Fratrik (2011-03-20 18:03:45)

I agree with Alex. I kind of have the question, "how does one start self experimentation?" But I feel the answer is, "start recording data." Still, overcoming the initial inertia is challenging, and perhaps guidance would be helpful.

Sean Estey (2011-03-20 20:34:44)

Good talk. I think the "were you serious" reactions were from the cognitive dissonance people experienced when they thought you were advocating animal fat as a healthful endeavor. I mean you may as well have been in a church telling people that God doesn't exist. It's easy to see why they would have a hard time reconciling the dogma that fat is bad with the concept that animal fat might be good. And the next slide showing the saturated fat vs country comparison would have served to only create more cognitive dissonance. The concept that self-experimentation can actually be a legitimate source of empirical study already goes against the grain—we're led to believe that more is better when it comes to experiments—so the animal fat thing seems like it complicates the message. Maybe a little disclaimer like "I'm not your medical doctor, I'm not advocating that you change your diet, I'm just saying what worked for me" might help ease things. Even though the animal fat part wasn't even the core message, I still think that explains some of the strange reactions (including the awkward crowd response when you bring up the pork fat slide).

cremes (2011-03-20 20:38:02)

Very interesting overview of your experiments from the last several years. I noted that you did not discuss the effect of butter on your cognitive abilities which you have been posting about for a long time. There was only so much time in that 20m talk; I will still be impressed by the amount of information you were able to convey. I wasn't in the room, but from watching the video the laughter sounded "off." My take was that it was derisive like, "This guy is crazy." I'm not at all surprised to read that a few people asked if you were serious about this. In particular, there was a large and sustained reaction from the audience when you displayed the slide about animal (pork) fat and sleep. You followed it up with another slide showing that more animal fat consumption is correlated with lower incidence of heart disease, but clearly they weren't buying it. It goes against "settled" science as explained by the Lipid Hypothesis. Between the work you are doing, Taubes, Eades, Kock (HealthCorrelator.blogspot), and several others, all of this settled science is becoming quite unsettled. Keep it up, please.

Seth Roberts (2011-03-21 00:59:21)

Alex, plotting your data is 95 % of a good data analysis – that's my concise guideline about this. And it's easy to plot your data using R. I think statistics textbooks are misleading about this. They emphasize the hard parts of data analysis, which are much less useful than the easy parts.

Robbo (2011-03-21 03:53:19)

I have a maths degree, and I've done a fair amount of statistics in business. I absolutely endorse Seth's point to start by plotting your data. You can do this with graph paper and a pencil. If the eye can see an effect, you have an interesting result, something to build on. If the eye can't see one, chances are that any effect is too small to be interesting. If I was going to take the next step and do some mathematical analysis, I would use the sign test - simple, obvious, and requiring few assumptions about the data. I think this leads to another point about self-experimentation. If you are experimenting on other people, and with the aim of benefitting other people, you have ethical duties towards both populations, especially to be very certain that your findings are valid and not artifacts of the experiment design or data processing. Experimenting on yourself, you do not need

such a high level of certainty, since the issue is 'How does this work for me?'

ChristianKI (2011-03-23 06:36:49)

I think that a lot of people would fail if you told them to take a .csv file and plot it in R. There might be a much of people who could benefit from a step-by-step instruction to record their data on a piece of paper, enter their data into the computer and then plot it in R.

## **Growth of Quantified Self (more) (2011-03-21 01:09)**

At the Quantified Self blog, Alexandra Carmichael has posted [1]several graphs showing how much the Quantified Self movement has grown during the past year. The number of QS meetup members has grown by a factor of 3; the number of groups has grown by a factor of 6.

Measuring yourself is a step toward controlling yourself – especially, controlling your health and well-being. Almost everyone wants more control of these things. I believe that the idea, which the Quantified Self movement encourages, that ordinary people can do useful science is a shift with implications on the order of the shift from religion (the Sun revolves around the Earth) to science (the Earth revolves around the Sun). When ordinary people begin to do science, I predict we will learn a lot more about how to control our bodies.

Before science became powerful, people knew lots of correct useful stuff (e.g., metallurgy). But there were limits on what could be learned (e.g., Galileo was imprisoned). Now religion is much less powerful but most people believe that science can only be done by certain people (e.g., professors). This too places serious limits on what can be learned. For control of the outside world (e.g., material science, physics), I don't think these limits matter (although[2] the case of Starlight suggests that even here amateurs can make important discoveries). But for control of the inner world (our bodies), the message of my work is that these limits matter a lot. By studying myself I managed to learn a bunch of useful things that professional scientists could learn only with great difficulty. For example, I could learn from accidents how to sleep better; I could easily test ideas about how to sleep better. Few if any professional sleep researchers measure sleep night after night for long periods of time; nor do they do cheap fast experiments.

## **Effect of One-Legged Standing on Sleep (2011-03-22 06:05)**

In 1996, I accidentally discovered that [1]if I stood a lot I slept better. If I stood 9 hours or more, I woke up feeling incredibly rested. Yet to get any improvement I had to stand at least 8 hours. That wasn't easy, and after about 9 hours of standing my feet would start to hurt. I stopped standing that much. It was fascinating but not practical.

In 2008, I accidentally discovered that one-legged standing could produce the same effect. If I stood on one leg

"to exhaustion" – until it hurt too much to continue – a few times, I woke up feeling more rested, just as had happened when I stood eight hours or more. At first I stood with my leg straight but after a while my legs got so strong it took too long. When I started standing on one bent leg, I could get exhausted in a reasonable length of time (say, 8 minutes), even after many days of doing it.

This was practical. I've been doing it ever since I discovered it. A few months ago I decided to try to learn more about the details. I was doing it every day – why not vary what I did and learn more?

One thing I wanted to learn was: how much was best? I would usually do two (one left leg, one right leg) or four (two left leg, two right leg). Was four better than two? What about three?

I decided to do something relatively sophisticated (for me): a randomized experiment. Every morning I would do two stands (one left, one right). In the evening I would randomly choose between zero, one, and two additional one-legged stands. Sometimes I forgot to choose. Here are the results for three sets of days: (a) "baseline" days (baseline(2), baseline(3), baseline(4)) before the randomized experiment and during the experiment when I forgot and (b) the "random" days (random 2, random 3, random 4) when I randomly choose and (c) a later set of days ("baseline 4") when I did four one-legged stands every day.

Each morning, when I woke up I rated how rested I felt on a scale where 0 = not rested at all (as tired as when I went to sleep), and 100 = completely rested, not tired at all.

[2]

This shows means and standard errors. The number of days in each condition are on the right.

The main results are that three was better than two and four was better than three. The three/four difference was large enough compared to the two/four difference to suggest that five might be better than four. The similarity between random 4 and baseline 4 means that the amount of one-legged standing on previous days doesn't matter much. For example, on Monday night it doesn't matter how much I stood on Sunday.

These differences were not reflected in how long I slept. Below are the results for "first" sleep duration, meaning the time from when I went to sleep to when I woke up for the first time – which is when I measured how rested I was (the graph above). On a small fraction of days, I went back to sleep a few hours later.

[3]

These results mean that one-legged standing increased how deeply I slept, what you could call sleep "efficiency".

I also computed "total" sleep duration, which included first sleep duration, second sleep duration, and nap time the previous day (e.g., nap time on Monday plus sleep Monday night). If I took a long nap, I slept less that evening. Here are the results for total sleep duration.

[4]

The results also support the idea that one-legged standing made me sleep more deeply.

The randomized experiment had pluses and minuses compared to a simpler design (such as an ABA design, where you do each treatment for several days in a row). The two big pluses were that the conditions being compared were more equal and you could simply continue until the answer was clear. The two big minuses were that I often forgot to do the randomization and lack of realism. If I decided that four was the best choice, I'd do four every day, not in midst of two's and three's.

Overall, it was clear beyond any doubt that four was better than two, and clear enough that four was better than three (one-tailed  $p = 0.02$ ). The results suggest trying larger doses, such as five and six. I've only done six once: be-

fore a flight from Beijing to San Francisco. It was one of the few long flights where I slept most of the way.

If you try this and you do more than one right and one left, leave plenty of time (two hours?) before the second pair, to allow the signaling molecules to be regenerated.

---

Wayne (2011-03-22 13:51:20)

This is brilliant work, and informatively presented. I intend now to utilize one-legged standing more methodically on myself. A couple of questions: 1. How you rate restedness: Can you tell about how you anchor your 0-100 scale, because it looks like your range of responses there is very slim (99 % - 99.4 %). 2. You mention waiting for signalling molecules to regenerate. Can you elaborate on this further or is it just a really good guess (makes sense to me). Thanks! Wayne

Seth Roberts (2011-03-22 15:54:55)

Thanks, Wayne. I hope that you can use one-legged standing to give yourself permission to surf the Web – you surf while standing on one leg. To answer your questions: 1. My range of rested ratings is small only because I wake up really rested every day. (I do other things that help, such as no food until 3 hours after waking up and plenty of sunlight in the morning). For a long time the average was lower, around 95, and 99 was rare. Somehow I can judge the "size" of how tired I feel when I wake up and compare that size to the size of feeling really tired. A psychologist named S. S. Stevens and others have done many studies of what is called "magnitude estimation" of such dimensions as loudness and brightness with rating scales similar to mine. They found great regularities. 2. I'm just guessing about the signaling molecules. They make more sense than an electrical signal because it doesn't seem to matter when during the day I do the standing. As if the molecules sit in the blood waiting for sleep.

Yechezkel Zilber (2011-03-22 18:38:22)

Exercising extreme (cross fit etc.) leads to exhaustion and sleeping well. Source, "the great fitness experiment" I tried last week to do very short "all out" sprints on a sprint cycler (gym) found myself falling very easily asleep. Even falling asleep by mistake midday

Chris (2011-03-22 19:02:33)

Have you seen the Zeo? Might be a way to quantify more than "how rested you felt" <http://www.myzeo.com/>

Seth Roberts (2011-03-22 19:14:43)

Yechezkel, like you I have found that exercise makes me fall asleep much faster. But I have also found that does not make me sleep more deeply. It had no obvious effect on my probability of waking up too early. It was one of the first things I tried to reduce early awakening. Chris, yeah, I would certainly like to try the Zeo.

Cliff Styles (2011-03-22 22:09:57)

FYI, when I started standing while working a couple of years ago (partly inspired by your comments), I also experienced some foot pain, but discovered that I could fix that by taking my shoes off. I also added some of those gel mats that some chefs and others use, and now I regularly stand about 10 or 11 hours a day (I'm 64). My sleep has definitely improved, and my wife noticed the difference in the quietness of my sleep, too. The improvement in my sleep could be conflated with other changes though, since I noticed a dramatic improvement in apnea when I stopped eating wheat some years ago. Also, I end up standing

on one leg for some time each day, with one leg up on the desk, just because it feels good. I started the standing up while working as an experiment, and continued because I noticed a pretty dramatic alertness improvement. Now, I simply do not like to work sitting down.

Kevin (2011-03-22 22:57:11)

Have you checked if squats has a similar effect?

Seth Roberts (2011-03-23 00:31:37)

Kevin, the answer to your question is no. That's a good idea.

vic (2011-03-23 01:31:48)

Seth, do you also watch how close to bedtime you eat? I've seen recommendations to avoid food 3 hours before bedtime...

Chris (2011-03-23 03:53:35)

I tried one leg standing for a while and found that I definitely was a lot more alert when I woke up...I also woke up earlier than my usual alarm clock by half an hour or so. I gave it up, however, because I found that I'd get a lot more fatigued late in the day on days where I woke up alert. For me at least it felt like a zero sum game, alert in the morning but then cranky and irritable at night on days after one legged standing.

Seth Roberts (2011-03-23 05:16:09)

Chris, when I first started standing a lot (like 8 hr/day) I was enormously tired the first few evenings. But after a week or so that went away and the benefits persisted. By the time I started one-legged standing I already stood a lot. The one-legged standing caused no fatigue in the evenings. I think there is just an introductory period you need to get through. vic, I rarely eat after 8 pm. I agree, bad idea to eat near bedtime.

JBB (2011-03-24 04:00:25)

Perhaps I'm just being foggy brained (not rested enough this morning?), but I'm not sure I understand your counting. When you say "two", "three", "four" - is that two times standing on one leg to exhaustion, or two times on each leg. That is, left leg to exhaustion followed by right leg to exhaustion - is that one, or two?

Seth Roberts (2011-03-24 04:21:20)

that's two. I am counting per leg. two = one right leg, one left leg. four = two right legs, two left legs.

bokbadok (2011-03-29 18:51:21)

Bryan (2011-06-16 15:43:31)

A really interesting device you might want to try to find is called a Sleep Timer made by the author of "No More Sleepless Nights" Murray Jarman. It's basically a little timer that you have to squeeze to keep it from starting itself. Once the person falls asleep they no longer squeeze the trigger on the Sleep Timer. The idea is to measure "sleep latency" or the amount of time it takes to fall asleep. The author presents a scientific approach to finding the best way for the individual to fall asleep fast. However, this may or may not be the best way to judge sleep quality. Maybe neither is the "first sleep" idea. What do you think is the best way to measure sleep quality? Perhaps number of times awoken in the night? REM cycles?

Seth Roberts (2011-06-16 22:07:47)

Time awake during the night is a good measure of sleep quality (more time = worse).

Andy Fallows (2012-03-21 17:37:39)

Interesting article, thanks. But do I understand your first chart correctly? It appears to display that how rested you felt on awakening varied over a VERY VERY narrow range of between approximately 98.7 % and 99.5 % ?!! This suggests you were rating how rested you felt on your 0 %-100 % scale to small fractions of 1 percent. Surely the numbers along the x-axis of the chart must be wrong? Thanks! Seth: The x axis is correct. The ratings are very close to the edge of the scale (100 %). Thus the precision. If this is hard to understand, think of me as rating the amount of a substance that makes me feel tired. When there is none of it, the restedness rating is 100 %.

Andy Fallows (2012-03-22 12:19:49)

Thanks for your reply Seth. It is hard for me to understand: I don't know what you mean by "think of me as rating the amount of a substance that makes me feel tired." Substance? My current expectation/belief is that most people would probably struggle to rate their perception of their own restedness on a 1-20 scale to the nearest whole number (ie., to within approx 5 %) with much confidence, let alone to within fractions of 1 percent. Regards. Seth: Suppose someone asked you to estimate how many grains of flaxseed were on a plate. Suppose the number could range from 0-1000. You can look at the plate for only a few seconds. For convenience, you decide to give your estimates as percentages 0-100 %. When the number of flaxseeds is very small (e.g., 6), you will be able to make remarkably precise estimates (e.g., 0.6 %). With larger numbers, your estimates will be less precise. The point: when you are at the edge of a scale, estimates can be more precise than at the middle of the scale.

Andy Fallows (2012-03-23 07:41:39)

I understand now Seth, thanks.

Jarno Virtanen (2012-04-04 02:17:34)

"If I stood 9 hours or more, I woke up feeling incredibly rested. Yet to get any improvement I had to stand at least 8 hours. That wasn't easy, and after about 9 hours of standing my feet would start to hurt. I stopped standing that much. It was fascinating but not practical." In the light of recent news [1], it seems one has to actually stand (or at least not sit) for at least 8 hours a day, preferably even more. :-) [1] <http://healthland.time.com/2012/03/28/standing-up-on-the-job-one-way-to-improve-your-health/?xid=huffpo-direct>

### **Danger of Low-Carb Diet: Not Enough Vitamin C (2011-03-23 00:28)**

I eat a low-carb diet for reasons that have nothing to do with weight loss: To keep my blood sugar down. I am sure high blood sugar is bad. A few months ago, I noticed that my lips were chapped, which was unusual. I suspected it was due to lack of Vitamin C. About two months before that, I had stopped doing two things that I usually did: taking a multi-vitamin pill (which had Vitamin C) and eating fruit. I don't know if the Vitamin C in the pill is absorbed but I'm sure the Vitamin C in fruit is. I started eating kumquats – the skins of four kumquats/day. (One kumquat contains about [1]15 % of the recommended daily allowance of Vitamin C). My lips returned to normal.

Paul Jaminet, author of Perfect Health Diet, had [2]a similar experience, which I knew nothing about when I noticed my chapped lips. While eating "a lot of vegetables but no starches and hardly any fruit," he developed outright scurvy, including wounds that wouldn't heal.Â This happened while he was taking a multi-vitamin pill with 90 mg Vitamin C (my four kumquats contain only 35 mg Vitamin C). "Four grams a day of vitamin C for two months cured all the scurvy symptoms," he found.

Why do we like sweet foods? The usual answer ([3]so that we will eat more calories) is nonsense (except for children). The striking thing about our liking for sweetness is that it disappears when we are really hungry, which is the opposite of what the calorie-seeking explanation predicts. Desserts are served at the end of a meal because they taste much better then. But our liking for sweetness (when we're not hungry) is so strong and obvious it must mean something important. I think it is pushing us to eat more fruit so that we will get enough Vitamin C. Fruits are much sweeter than other food groups and they are much higher in Vitamin C. We don't like sweet things when we are hungry because a high-fruit diet is terrible (it is low in omega-3, other necessary fats, several minerals, and microbes, for example). But a small amount of fruit may be a big help. Paul and my experiences suggest it may be hard to get enough Vitamin C in other ways.

More Paul has [4]a different idea about why we like sweetness.

---

vic (2011-03-23 01:17:50)

Not sure why that would be - lots of vegetables are loaded with vitamin c, more so than most fruits - bell peppers, broccoli, cabbage, garlic, etc.

Gian (2011-03-23 01:35:11)

Green chillies are rich in Vitamin-C and are very low-carb. Far superior to fruit in this respect in my opinion. And one can easily eat 3-4 whole green chillies in a meal. That should provide more than sufficient Vitamin-C.

Joseph Dantes (2011-03-23 02:29:33)

Given that arctic explorers used fresh meat to avoid scurvy with great effectiveness, I find this odd. I have not eaten fruit in many months and show no signs of vitamin C deficiency. I've been eating only meat. How do you square Stefansson's all-meat 1 year trial with this idea that low carb creates vitamin C deficiency? Perhaps in your case the problem was something other than lack of vitamin C, and in that other guy's case, he wasn't eating enough fresh meat.

Richard Gay (2011-03-23 04:03:30)

It's true that fruits are sweeter than other foods (but keep in mind sugar cane, sugar beets, honey, stevia, etc.), but one perspective I've read is that modern man has bred fruits for sweetness, and 'twas not always so. I'm not sure I agree with this; breeding for sweetness doesn't necessarily lead back to the idea that fruits were sour before that. I'm sure there is a bit more personal science you might do to test the theory that you were lacking vitamin C, v. something else that showed up in the kumquat skins. 130mg isn't much, after all.

jimrandomh (2011-03-23 04:54:28)

Paul Jaminet developed outright scurvy while taking a multivitamin pill that contained 90 mg Vitamin C? That can't be right. It seems much more likely that they were mislabeled or defective. Did he have a lab test done to confirm that they contained what they're supposed to?

Paul Jaminet (2011-03-23 05:12:36)

Thanks for the link, Seth! Jim, vitamin C needs are highly variable - they rise from mg to grams per day during infections, cancer, or other severe stresses. The point of bowel intolerance of vitamin C can be as low as 2 g/day or as high as hundreds of grams/day depending on C needs. C needs also depend on the presence of other antioxidants (glutathione/zinc/copper/selenium) which are needed to recycle C. Oxidized C is degraded and excreted, reduced C is conserved. I had severe chronic infections at the time and was probably deficient in selenium and copper as well. Seth, fascinating point about the craving for sweets following rather than preceding dinner. Very true but I hadn't thought of it before. Best, Paul

damaged justice (2011-03-23 05:18:49)

Others have questioned Jaminet's "zero carb" experience. Personally, I can only say that I was plant-free for one year, didn't get scurvy or any other deficiencies, and had no problems whatsoever. The only organs I ate were beef liver once or twice a month and heart and tongue less frequently.

Paul Jaminet (2011-03-23 05:25:00)

Another n=1 experience on the appetite - vitamin C association: When I had scurvy I was always ravenously hungry. I ate 5,000

calories a day but was losing weight. As soon as I started supplementing vitamin C, my appetite dropped back to normal. I didn't notice a specific craving for sweets, but it's clear that vitamin C deficiency can induce hunger.

Seth Roberts (2011-03-23 05:37:12)

Joseph, I ate/eat a lot of butter and roast pork. The roast pork is a few days old, at least. So I suspect it is low in Vitamin C. Vitamin C in meat may degrade much faster than Vitamin C in fruit – especially when the meat is cooked. Vitamin C is water-soluble, whereas I eat a great deal of fat. Because I eat so much fat relative to other foods and almost never eat fresh meat cooked rare, I suspect it is harder for me to get enough Vitamin C without eating fruit.

Scot Colford (2011-03-23 05:42:08)

As a type II diabetic, I also eat a low-carb diet, but certainly make sure to eat plenty of fruit and vegetables with vitamin C. I'm curious about your reasons for eating low-carb, though. You say "I am sure high blood sugar is bad" but what makes you think your glucose level is high? Do you monitor it with a meter? Just as dangerous – and \*more\* dangerous in the immediate sense – is allowing your blood sugar to drop too low. Don't mess around with it unless you're under the supervision of a doctor. And I'm also confused by your statement that fruit is sweet because it contains vitamin C. That's just not true. Fruit is \*tart\* because it contains vitamin C. It's \*sweet\* because it contains fructose and other sugars, of course!

Seth Roberts (2011-03-23 05:47:00)

Richard, I think fruit trees have a different strategy than other plants. Fruit wants to be eaten; this is why it is colorful, not just sweet. Being eaten causes the seeds to move further from the tree, reducing competition and increasing diversity of habitat. Perhaps high Vitamin C content made them more attractive.

Paul Jaminet (2011-03-23 05:47:03)

Those wondering about the variability of vitamin C needs may be interested in reading about Dr. Cathcart's experiments with vitamin C supplementation during different infectious conditions: [1]<http://perfecthealthdiet.com/?p=636> In some infections, such as mononucleosis and pneumonia, the rate of vitamin C loss can go as high as 200 g/day. The normal whole-body vitamin C pool is only a few grams. It doesn't take long to create a deficiency during infection!

1. <http://perfecthealthdiet.com/?p=636>

Seth Roberts (2011-03-23 05:59:11)

Scot, I believed my blood glucose was high because I measured it every morning. I fail to understand why eating a low-carb diet might cause my blood sugar to become too low. In any case, that has never happened, according to my measurements. I didn't say fruit is sweet because it contains Vitamin C – I said that perhaps people like sweetness because a liking for sweetness would have pushed us to eat more fruit. Which contains Vitamin C, which we need. Our food preferences are obviously a guide to what we need to be healthy; I am trying to fill in the details. vic, when I said fruit is "almost necessary" to get enough Vitamin C I should have emphasized I meant under Stone-Age conditions. Nowadays of course fruit isn't necessary. You can take a Vitamin C pill, for example. If you don't want to eat green peppers. If you are simply following your natural preferences, eating what tastes good, I think you are unlikely to swallow a Vitamin C pill or eat green peppers or green chilis or other high Vitamin C vegetables. Whereas you are likely to eat fruit.

MAS (2011-03-23 07:09:52)

Beef liver has Vitamin C. Did you eat organ meat during this period? <http://thehealthyskeptic.org/natures-most-potent-superfood>

Seth Roberts (2011-03-23 07:14:12)

I sometimes eat chicken livers. But of course they are cooked, which may destroy the Vitamin C.

Kevin Bridges (2011-03-23 07:52:00)

I've been on a low-carb diet for a while now, but haven't had any issues with this. Looking back at what I've been eating, though, I've been snacking on a lot of carrots, and the water I'm drinking has a bit of lime juice in it, so I think I have my bases covered. Unless I start seeing symptoms of deficiency, then I'd re-evaluate my diet.

Scot Colford (2011-03-23 09:04:12)

Oh, yes. Sorry for misquoting you about the sweetness of fruit. Still, I think it's a likely a mistake to attribute preference for sweets to vitamin C requirements. People do need glucose as fuel for the brain. It uses no other compound for this purpose. Well, for that matter, neither do the rest of the cells in your body, but you'll notice it pretty damn quickly if your brain fails to receive enough glucose. And yes, you can experience low blood sugar levels by eating insufficient levels of carbohydrates. You can't rely on your stored glycogen as your sole source of glucose. Now, of course, you say you're on a low-carb diet, not a no-carb diet. And you're using an objective measure of your blood glucose level. Just would hate for someone without your commitment to scientific principles to attempt otherwise.

Tomas (2011-03-23 09:36:17)

Seth, I have read several books on the Traditional Chinese Medicine and they attributed that increased craving for sweets is in fact signalling some serious nutritious deficiencies. They said that it's in fact meat or starches or other nutritionally dense foods that will soothe the craving, but sweets are more readily available. The taste of meat is in fact sweet as well. In my experience this seems (the TCM view) to be true. I always have been very skinny, but eating enormous amounts of sweets. After I switched to a proper, paleo-like diet, the situation changed in many aspects and I no longer have such strong cravings and slowly I am gaining some weight. So to sum it up, I think that taste for sweetness might mean more than taste for vitamin C

Thomas Seay (2011-03-23 11:22:50)

Can someone here explain to me why humans, unlike a lot of animals, don't create their own vitamin C endogenously? > I don't agree with this. It doesn't fit with my experience, and I suspect it is a cultural phenomenon. Most of us were told as youngsters that we had to eat our dinner first if we wanted a sweet. The idea was that we WOULD eat the sweet first, if we could, and that might destroy our appetite so that we wouldn't eat the other nutritious food.

Thomas Seay (2011-03-23 11:24:39)

Sorry, what I don't agree with in the above is that we naturally won't eat sweets when we are hungry, as Seth suggests.

Seth Roberts (2011-03-23 14:16:57)

Thomas, you disagree that "we naturally won't eat sweets when we are hungry." There have been a bunch of studies showing that hunger reduces preferences for sweets, done I think by Elizabeth Capaldi. An article about this phenomenon mentioned among other things that in the Nazi concentration camps, where people were starving, a candy bar had zero barter value. Perhaps children are different than adults, I don't know. Tomas, that's an interesting point. Greater-than-usual desire for this or that food generally signals a nutritional deficiency, yes, as far as I know. Do you know what deficiencies causes greater-than-usual desire for sweetness?

Kevin Bridges (2011-03-23 14:53:30)

I've been trying to think of this all day, and I just remembered. Some peppers have a lot lot (lot) more vitamin C than oranges. Hot green chillis have about more than three times the vitamin C of navel oranges, per weight. <http://nutritiondata.self.com/facts/fruits-and-fruit-juices/1968/2> <http://nutritiondata.self.com/facts/vegetables-and-vegetable-products/2767/2>

Seth Roberts (2011-03-23 16:41:23)

Kevin and others who have brought up the point that certain non-fruits are high in Vitamin C, I am wondering what you conclude from that about the evolutionary reason for our preference for sweetness. How would you explain our preference for sweetness? Look at the same thing in a different domain: our preference for sour foods. It's strong and obvious,

just like our preference for sweet foods. Lemons are sour. Does that mean we like sour things so that we will eat more lemons? Probably not because there is a bigger picture to consider. A much wider range of facts supports the idea that we like sour foods (such as yogurt) because we require plenty of microbes in our diet to be healthy. Microbes often make food sour.

thehova (2011-03-23 17:09:09)

Interesting stuff. I'm on a low carb diet. But I take an Emergen-C every 2 days. A big part of me doubts if it's improving my health. But it is a cheap and more healthy alternative to Coke. And after reading this, perhaps it is beneficial.

Alex Chernavsky (2011-03-23 18:49:12)

Seth, since you eat a lot of animal fat, have you ever looked into the theory that animal fats are sources of lipid-soluble toxins? And China is rumored to have a serious problem with industrial pollutants.

Seth Roberts (2011-03-23 23:03:09)

Alex, no I haven't looked into that theory. The animal fat I eat the most of (butter) is from America.

Kevin Bridges (2011-03-24 09:35:32)

Well, I also wonder how a human living here (in the Pacific Northwest) would get his or her vitamin c before agriculture and the advent of shipping foods around the country. Like Native Americans. We can't grow citrus fruits up here, and I don't thing peppers grow naturally, either. I've heard that pine needles have a lot of vitamin c, but I can't imagine they're very agreeable? So what flavors would a tribe living here in Washington have to be attracted to in order to get their vitamin C? As for the evolutionary preference for sweetness, do you know for sure that there is a universal human preference for sweetness? Are there always sweet dishes in the pre-westernized cultures of the world? I'm not saying there aren't, and you may know more about it than I do.

Sam (2011-03-24 12:30:15)

I thought vitamins are stored in animal bodies, too. Mainly in some glands, but live might contain some, too. So if you eat the right parts of the animal you'll get your vitamins.

Nathan Myers (2011-03-24 14:35:47)

But don't eat the wobbly bits. It seems to me this is really jumping to conclusions. Yes, we need vitamin C, but we need lots of other things too. Maybe the chapped lips were the result of some other deficiency, and the actual fruit countered the other deficiency. Fruits are made of a lot of compounds other than vitamin C.

Seth Roberts (2011-03-24 14:52:16)

Nathan, do you have any specific nutrient in mind? Lack of Vitamin C unquestionably causes connective-tissue problems. Paul had bad gums, for example. With other necessary nutrients, such as magnesium, sodium, and many others, a connection with connective-tissue problems isn't clear. Is there a universal human preference for sweetness? Well, very young babies like sweet things. Long before they could have been taught to like them. In children, the conventional explanation for sweetness preference (sweet foods are a source of calories) makes sense. They haven't yet learned flavor-calorie associations that make food (containing calories) taste better than non-food (without calories), so a preference for sweetness helps them (because sweet things do usually have calories-extractable energy).

Tomas (2011-03-25 01:52:43)

Seth, sorry, I don't remember and I am not even sure the books went deeper than just covering this general concept. I'll try to find the corresponding passages, but first I need to find the book...

Nathan Myers (2011-03-25 02:42:26)

Preference for sweetness is equivalent to preference for ripeness, in fruit. The learned association between sweetness and color makes this a very adaptive trait, because climbing a tree after fruit must be worth the risk. Plants convert starches to

sugar in ripe fruit when the seed is viable and, perhaps, some environmental condition favoring germination is satisfied. This also is very adaptive, within the environment of animals that have been trained to recognize the ripeness they are encouraged, by the sweetness, to prefer. Co-evolution. I don't know of any specific nutrient that may be in fruit that counters chapped lips. But then, I don't believe we have identified every important substance we get from food. It certainly seems plausible that people who indulge in unusual diets (as defined by American custom of the mid 20th century), "unusual" activities (e.g. smoking, pregnancy, childhood, grave injuries, infections, starvation), or (particularly!) normal genetic variation seem likely to require substances not readily noted in lab testing, or much larger amounts of certain familiar substances. It has been suggested that autism, schizophrenia, and epilepsy are sometimes examples of such cases. I understand that some (of the terrifying variety of) mitochondrial genetic illnesses are known examples. Any drug that must be consumed daily to maintain normal health may be counted as such a substance. Just as several drugs may treat one condition, a variety of carotenes satisfy our need for vitamin A. The only difference, really, is how widespread the need is. Our need for vitamin C started as an example of normal genetic variation, and is now universal among primates, making it a proper vitamin. Including the rest of Mammalia in the population preserves its status as "needed for certain genetic variations".

Joseph Dantes (2011-03-26 02:39:59)

Seth, are you buying the roast pork already cooked or cooking it yourself? Plus you're in Beijing... which is a pretty tough environment on the lips anyway. It's pretty much an article of faith for me at this point that eating the meat of any animal sufficiently large & fatty monotonically supplies all nutrients necessary for life, if not the optimal balance. I tried butter in a tiny quantity by the way, and it obliterated me.

Joseph Dantes (2011-03-26 02:50:22)

Anyway I'm almost always eating meat packed the same day. I don't exactly cook it rare, as in still pink, but I don't char it either... just quit when the ground beef changes color or the fish gets soft. So there's no overcooking. So I'm probably getting a lot of Vit C... If you can trust the Chinese on meat freshness at MNC supermarkets. Which I think you can, ironically enough... meat freshness is something they're culturally very particular about, and as far as I know they don't employ the chemical treatment techniques designed to make meat look fresher longer used in the US.

Seth Roberts (2011-03-26 04:57:22)

Joseph, the roast pork I eat is roasted by others. About your idea that eating enough of a sufficiently fatty animal supplies all necessary nutrients: That doesn't explain why we like sweet things so much (except when we're hungry). In spite of what Tomas says, meat isn't significantly sweet. (One indication of this: Koreans marinate meat in a sauce that contains sugar.) And I'm sure we need plenty of microbes, which fresh meat doesn't supply.

Julietta (2011-03-30 18:54:19)

I've always believed that we like sweets at the end of the meal (along with a nice cup of coffee) to counter-act the sluggish feeling we get from a big dinner. The sugar and caffeine perk us up a bit, so we can drag ourselves from the table....

Paleo Pepper » Blog Archive » Why did we evolve a taste for sweetness? (2011-05-23 02:31:21)

[...] the sweetest of any animal. Other hypotheses are that a) we need fruit for a variety of reasons, particularly vitamin C, b) that we need glucose and therefore evolved craving carbohydrate in general, or c) that benefit [...]

Kelly (2012-01-06 13:54:42)

If sweet foods are craved after a 'regular' meal, it's possibly because too much protein was eaten at that meal. That's at least the theory in TCM.

## The Shangri-La Diet: Why No Revolution? (2011-03-24 03:07)

David Mandel, CEO of Alliance United Insurance Company, asks a very reasonable question:

Despite all the success stories [on the Internet] regarding the Shangri-La Diet, and the mainstream media stories in 2006 after the book publication, the diet never picked up and seems almost unknown today.

Whether this is right or wrong depends on expectations. In December, SLD got a great push from being on the web-site of Tim Ferriss's Four Hour Body [1] under the attractive title "Alternative to Dieting". Tim's book was published in December and registrations to the SLD forums jumped dramatically. Yet even before that, [2] forum traffic was growing. Traffic of course grew when the SLD book came out, later shrank, and now – surprisingly – is growing again. My interpretation is that the initial growth was caused by mainstream publicity and blogs. The current growth is caused by word of mouth.

If I google "Shangri-La Diet" I get about 800,000 hits, a decent amount. "Sonoma Diet" – the book came out the same time as mine – gets 200,000 hits. "Eat Right For Your [Blood] Type" and "Eat Right 4 Your Type" get a combined 150,000 hits. That book was a huge hit when it came out in 1997. The usual pattern is Google hits go down, but SLD hits have gone up over the years.

On the other hand, given that my book contained a new theory of weight control that made about 100 times more sense than the usual ideas and led to counter-intuitive new ways to lose weight that actually worked and that obesity is often considered the world's #1 health problem – yeah, it is "almost unknown" compared to what one might have expected.

I was wondering if you had any insight as to why it did not go viral, if nothing more from word of mouth from success stories sharing with everyone who will listen to their excitement. It seems all but impossible to me that something this simple, and universally successful which can benefit the masses has managed to not go mainstream in all these years. I am utterly baffled, and assumed there must be a big downside, but all my searching online has revealed nothing but the success stories and initial feedback, mostly from 2006 and 2007, and little since. I am just overwhelmed with curiosity as to how this did not become the norm for everyone.

When my agent circulated the proposal for the book, one editor regretfully declined to bid on it because she said the book was "15 years ahead of its time." Perhaps she was just being nice, but when people tried the diet, and it worked, they wouldn't tell other people because the diet sounded crazy. Which means it really was far ahead of its time. Good Morning America filmed me for a short Freakonomics-related segment and they played it for laughs: crazy professor.

So that's my explanation for why it has spread more slowly than one might have expected: fear of ridicule.

q (2011-03-24 04:01:20)

fear of ridicule from whom? the media? or people won't try it because they are afraid someone will make fun of them for doing it? i can think of one reason it hasn't taken off. from anecdotal evidence (i did it, lost 25+ pounds and am no longer overweight, now sometimes on and sometimes off) a lot of people are disgusted by the idea of drinking oil. the idea of this turns off a lot of people, and still others try it and give up quickly because they don't like the feeling. (if someone asks me i can say "well you can do this with sugar or any other food if you noseclip" - but that's not the primary message out there.) in fact it's difficult to find a concise and clear description on the web of how to do shangri-la. it's so simple, but it's hard to find the rules anywhere.

Seth Roberts (2011-03-24 04:04:48)

Fear of ridicule from the person you are telling about your success ("you did what?"). Were I to write the book again I would say you can do the diet three ways: 1. drink sugar water with no smell. 2. drink an oil, such as extra light olive oil, with no smell. 3. eat any food nose-clipped. I've done all three and I vastly prefer eating butter with a bit of meat nose-clipped. Butter alone is not so pleasant but butter with a bit of meat is fine.

disgruntledphd (2011-03-24 04:41:37)

Personally, i reckon it has more to do with the lack of support networks than the nature of the diet itself. Take weightwatchers, for instance. They have a weel-known brand and meetings everywhere, and these meetings are probably a major factor in helping people to lose weight. Conversely, the shangri-la diet does not have this kind of group around it, so people may feel isolated on it and thus not stick to it as much (or at least not talk about it). With wieghtwatchers, its respectable and people feel free to attribute their success to it. Just my two cents anyway.

Thomas (2011-03-24 05:06:27)

Hm, self reflection without any self critique? I mean, really... its just not successful because its "too far ahead of its time"? Can it get more self congratulating? I love your blog. I find much of what you write very interesting. But many other things are seriously odd - and cant be true when thinking 5 minutes about it. I can imagine it's this dichotomy that turns people away from the good parts of your ideas. Oh, and disgruntledphd's point is very good.

Seth Roberts (2011-03-24 05:42:26)

"Can't be true when thinking 5 minutes about it" - such as?

David (2011-03-24 07:07:37)

Hi Seth, One thing that appeals to me about the way you made SLD public is that you didn't try to monetize it by gimmicking it up. A less scrupulous, intellectually honest, and curious person might have tried to create a whole "lose weight now, ask me how" type pyramid scheme from it. You might have sold flavor free but calorie-laden products to sell to people with a lot of other paraphernalia and a marketing machine to push it on people. Instead you took a more open source approach. As a result, you learned a lot from the crowd. I agree that it takes some courage to explain it to people in a peer-to-peer kind of way. When I first did it, I patiently explained it to many people and got a lot of sh\*t for it. Finally I gave up. It wasn't worth the trouble. It seemed that most people weren't willing to try it with an open mind anyway. If I explain it to anyone now, it's only if they seem open minded and intellectually curious enough to give it a shot. David

john (2011-03-24 07:11:06)

I think almost any diet that challenges the "calories in, calories out" chant has a low shot at becoming a "revolution." In mainstream world, the only thing that helps (other than simply "reducing gluttony and sloth") is fiber, because it "fills you up." Very few people care or "absorb" why/how certain diets work: they just want an authoritative figure to give them a list\* of rules to follow. And because there are so many authoritative figures that use the above chant(s), other diets will be dismissed as quackery or unscientific [in the sense that they somehow imply defying the laws of thermodynamics]. To me, the main problem with low carb, or at least high [animal] fat, is that the marketing is geared toward eating foods that are popularly considered terrible like butter and bacon and steak. While this catches a lot of peoples' eyes, most will still "know" it's complete crap. I think a better angle to take is a long term traditional diet route, but, as I said above, very few will be swayed, even when

confronted with good evidence. Maybe "paleo" has potential to reverse popular animal fat beliefs, as it seems to have an attractive veganism-like mystique. \*For example, directing someone to Kurt Harris' site (as he does have a list and is a medical doctor) is the only way I've ever seemed to affect someone's diet (obviously I choose Kurt because his advice is good). Sorry, this wasn't that specific to Shangri-La.

David Mandel (2011-03-24 08:05:48)

I believe the answer may be to team up with a capable company who can produce and market a "healthy" flavorless shake, which can be marketed as a miracle diet and possible meal (lunch or breakfast) replacement with simple instructions to "consume one per day with no other food or beverage for at least an hour before or after", while leaving the concept as a new breakthrough, and the theory a mystery. With proper marketing, enough will try it, and then with the success, the product would go viral, reduce obesity, and make the marketing company a fortune in the process.

August (2011-03-24 08:21:00)

There's an intelligence level, or maybe just an ability to be consistent level, required for SLD. The bar seems low, just take in unflavored calories; how hard could that be? And yet, just think about what contraception is likely doing to the human race. Those who are 'smart' enough to take the pill everyday pro-create less than those who aren't, so we've got to hope there are enough smart people who won't take the pill for moral reasons. Otherwise there will be a generation upon this earth incapable of managing the simple daily task of taking a freaking pill! Anyway, the thing is, those who are smart enough to apply SLD tend to be those who've been indoctrinated with the mainstream message. These people are looking at me, seeing a very obvious success, and just deciding I'm crazy- or perhaps more politely, that I am too extreme (especially since I follow a low-carb paleo diet and don't want to eat the sweets that appear at practically every social event). One of the troubles with being smart is that you can rationalize the crap out of things, especially if you feel emotionally invested in something, and there are multi-billion dollar industries out there 'helping' you rationalize. Meanwhile, SLD is really something you have to try; you don't really get the theory until you experience its effects. Naturally, those who are willing to try SLD tend to be those least invested, and subsequently not very authoritative in the modern social structure. Now, if you manage to convince someone to try it and they succeed, well, that actually makes a sort of social structure, and the idea begins to look a lot more inviting to more people because they now have an alternative (however small) to whatever social structure it is that's feeding them the bad info. Also, for many people, this alternative social structure has to appear in their world, not just on-line.

Kevin Bridges (2011-03-24 09:21:57)

I did the oil-drinking for a couple of weeks, and it made me feel a bit nauseous during the day, and then my liver (I think it was my liver) started to feel sore. I started munching a lot of carrots and apples and stuff, and it went away. I can't prove the correlation, but I was playing on the safe side. I still use the principle, though, noseclipping my protien shakes in the morning.

Richard Gay (2011-03-24 10:11:39)

I think the oil drinking meets some resistance for a basic "eww" factor and the persistence of the lipid hypothesis in the public mind.

Alex Chernavsky (2011-03-24 10:28:58)

I have a few thoughts on this subject. When I first set out to try the diet about a year-and-a-half ago, I couldn't find any single source of information that described the diet in a concise, "user friendly" format. (Yes, I suppose I could have bought the book, but I was impatient - I didn't want to wait for the book to arrive in the mail.) Some sites had fairly impractical variations, such as the guy who advocated getting up in the middle of the night to drink oil. The forum is hard to find and is difficult to navigate. Some of the featured promotional blurbs are over the top and inconsistent with my own experience (for example, someone named Kathy Sierra wrote, "Within three days I was actually forgetting to eat"). About 20 % of the reviews on Amazon.com are negative (one or two stars). Having said that, I think Seth is onto something. Most people think I'm nuts when I describe the diet to them (despite the fact that I've lost approx. 28 pounds on it). One of my friends did say that he was going to try it, but that was about six months ago, and he hasn't mentioned the subject again. Here's the summary of my experience with the diet: <http://www.astrocyte-design.com/shangri-la-diet/index.html> I haven't updated the page since last July (July, 2010). I'm

currently hovering around 195 pounds, though my weight oscillates by about 3 pounds, depending on how strictly I adhere to the diet.

Kainin (2011-03-24 11:16:20)

Actually, I think Seth is right about the fear of sounding crazy. I started the diet with the oil in September. I've lost 52 pounds as of this past Saturday, almost all of it without even trying. (301 lbs. - 249 lbs.) I learned about the diet from reading a comment on a blog that openly wondered if Seth's theory might be correct when the poster noticed their weight drop slightly after eating tasteless nuts for a daily snack. I tracked down the book and decided, in a very skeptical mode, to give it a shot. To say I've been pleased with the results would be an understatement. Who have I mentioned it to? Surely, I should be writing a Gospel of Seth where like a lion's voice crying out in the desert I begin with Seth buying a flavored French soda in a cafe. But I am not. Only my wife really knows and I told her because you can't hide anything from wives, especially gulping Extra Light Olive Oil ever morning. I've been asked a few times what I was doing, but I just answer with watching calories (which is true) and walking more (which is also true). The only other person I told was my doctor. It went like this: Doctor: You're doing a hell of a job. What are you doing to lose all this weight? Me: Well, nothing really. Just watching what I eat. Trying to avoid snacks. Doctor: Don't tell me that's all you are doing. (His face grows concerned that my weight-loss might be a sign of a health problem) Me: There is one thing I'm doing differently. I've added more fat to my diet. Doctor: More fat?! Me: Yes, I've been taking two tablespoons of olive oil in the morning. (Doctor looks confused.) It helps suppress the appetite. Doctor: So you've been eating less. Me: And I've been walking. Doctor: Ah ha!! That's what's been doing it. Walking is great exercise..... (digression into the best way to use walking for exercise.) I didn't have the heart to tell him that I'd only walked in October and had just started up again the week of my appointment in February. So, no, the walking didn't lead to the weight-loss, but what was I going to do, argue with him? There is one more thing I should admit that stands in the way of my preaching the glories of Shangri-La, and that is a part of me that is worried that it will stop working. Every dieter knows about the rebound. The losing of the weight and the putting it back on. So in the back of my mind there is this thought that its going to loose its effectiveness and my current success will be temporary. I don't want to go around telling everyone about my amazing success and how they can follow in my footsteps only to find that it turned out to be fool's gold and I started the rush. In addition, I think Q is also right, my wife knows about the diet, she sees the success, she needs to lose weight - she can't bring herself to start drinking the oil with me. She is more open to it right now than she was, but she isn't read to start yet. But I suspect she'll eventually jump on the wagon as well.

Glen Raphael (2011-03-24 12:23:42)

The obvious conclusion is that the diet isn't, as claimed, "universally successful". The success stories in your forum are a self-selected sample - the people for whom it seems to work stick around and post to the forums, the people for whom it doesn't might post to one of your many "it's not working" threads but then eventually fade away. Some discuss it elsewhere. For instance: [http://lesswrong.com/lw/a6/the\\_unfinished\\_mystery\\_of\\_the\\_shangrila\\_diet/](http://lesswrong.com/lw/a6/the_unfinished_mystery_of_the_shangrila_diet/) <http://ask.metafilter.com/90366/Shangrila-diet-have-you-tried-it> There are oodles of celebrities/actors/bodybuilders who are \*hugely motivated\* to try anything that might help, no matter how goofy the idea. If SLD were the panacea portrayed, it would have caught on with these people and we'd be hearing about it via Enquirer headlines. So maybe the problem is one of these: (1) it doesn't work for everybody, (2) it works for a while, then people hit a plateau short of their goals, so although it works it only solves \*some\* of their problem (3) it works for a while, but usually the effect wears off (4) it works for most people \*if\* they keep at it, but many/most people find it too difficult to keep doing for the rest of their lives. In short, it could ultimately be a [1]fad diet. FWIW, I tried SLD a few times, told lots of people about it, blogged about it, tried to fix the parts that weren't working for me, but ultimately gave up and stopped using it. I never lost more than about 10 lbs while on SLD. To make it a true panacea worthy of the name, you'd need to do a real scientific study, \*verify\* your hypotheses about how it works, and figure out what factors there are in common among the people for whom it works/doesn't work so those can be addressed.

1. [http://rationalwiki.org/wiki/Fad\\_diet#Where\\_fad\\_diets\\_come\\_from](http://rationalwiki.org/wiki/Fad_diet#Where_fad_diets_come_from)

David #2 (2011-03-24 18:41:23)

I've had very good success with the diet when I had the patience to stick with it and have been pretty evangelical about it as well. (I actually quit when I went overseas for eight weeks and dropped 15 pounds without blinking an eye; was it all the mutton?) I can't speak generally, but when I was introduced it was via the ELOO and it worked like a champ and I was astonished. The sugar hasn't had the same anti-appetite effect, so I've never pushed it. Most of my friends who have tried it

tried with the oil and found it disgusting and these aren't the type of people that "diet" in any serious sense, so that they tried it at all, I think, is something of a triumph.

James A Donald (2011-03-24 19:17:05)

I concealed the fact that I was doing the SLD diet from everyone. It is heresy, and a somewhat sinful heresy.

Glen Raphael (2011-03-24 21:23:05)

The [1]chart Alex Chernavsky linked above brings up an excellent point. Here's somebody who lost 25 pounds on SLD...but whose goal was to lose 45. This person has been taking oil instead of lunch for a year and a half, making no \*new\* progress after the first 6 months. So did SLD "work" in this case? So maybe that's the question to ask people in the forums: "have you achieved your goal weight?" Not "have you lost weight" but "have you been able to lose \*all\* the weight you wanted to?" If the answer to that question were yes, they would be telling the world about it. But if the answer is no then people who are on SLD are merely \*less\* overweight than they might be without it. But they're still overweight, still in search of a more complete solution, still inclined to drop SLD if something better-sounding comes along.

1. <http://www.astrocyte-design.com/shangri-la-diet/index.html>

Seth Roberts (2011-03-25 01:01:23)

Glen, I don't think a comparison with perfection is going to tell you much. It is obvious from the incidence of obesity that no diet is anywhere close to perfect. A more helpful comparison is with what already exists, with other diets. I never thought that SLD was perfect, I wrote the book because I thought it was better than what already existed, at least in its conceptual basis. I believed that writing a book about something imperfect would help everyone find better ways of losing weight. That's what happened: because of the book, the noseclipping idea came along, which is a big improvement. You can eat an unlimited number of calories noseclipped and they can be as healthy as you want them to be. For example, I eat a lot of butter noseclipped. I suspect Alex could lose more weight if he started noseclipping.

Jill (2011-03-25 06:47:54)

My two cents: I've never tried the diet, because the idea of eating/drinking something tasteless turns me off. It makes the whole diet sound bland and unappetizing. Also, I think someone else had said somewhere that it took some effort to change up his diet frequently enough to keep the food "unfamiliar".

Alex Chernavsky (2011-03-25 06:48:42)

I eat a fairly high-carbohydrate diet (bread, pasta, potatoes, and particularly chocolate & other sweets) – so I think I'd probably lose more weight if I ate a higher proportion of protein and fat. I may start to add macadamia nuts and coconut oil to my diet.

q (2011-03-25 08:54:25)

i can pose another answer based on anecdote. people i know who have tried fad diets or atkins are usually obnoxiously vocal about it. not just that, it's part of their personality to be annoyingly vocal about personal matters. people i know who have tried SLD are generally loners and introverts. i have no idea why this is, or if it is something general or just confined to my circle.

Seth Roberts (2011-03-25 12:35:55)

Jill, I once wondered if white fish cooked plain would cause weight loss. I couldn't eat it for more than a day or two so I share your view that bland food is unappealing. However, I have no trouble at all eating butter & meat noseclipped. Because of the nose-clipping, it has no flavor; but I enjoy eating it because of the protein and fat. We have protein and fat receptors in our mouths. Food without smell can also be pleasant to eat due to crunchiness.

Anna (2011-03-25 14:05:07)

I was planning to tell lots of people about this diet when it worked, but it isn't. I bought the book at the beginning of March, got really excited and started doing about 3 tbs of canola a day. I've fiddled with the amounts (2 or 3 1/2 tbs) and the times I'm taking it. I am a bit less hungry, I guess, but my weight has been mostly stuck in one spot all month and today am up a pound

and a half. I suppose I'll try it for another week or so... Any tips? I am finding it impossible to look up specific advice on the forums. I need to lose about 40 pounds, but at this point I think I'd be thrilled with five.

Nancy Lebovitz (2011-03-25 14:29:34)

I wonder if part of the problem is that the usual ideas about weight loss involve the drama of resisting temptation. While it isn't easy for a lot of people to get around to nose-clipping and consuming tasteless calories, those don't seem to have the visceral intensity of not eating food that one really wants and/or is generally considered very tempting, or of exercising when not exercising would be much more comfortable. Admittedly, this is an ad hoc theory- Atkins has the alternate drama of eating food one isn't supposed to, and getting at least some of the rewards which are supposed to go to low fat/deliberate calorie restriction. At the same time, SLD is more work than the dream of effortless weight loss.

Mark L (2011-03-25 16:38:04)

I am a regular reader of the blog. Months ago, I tried holding my nose for a few days, but I didn't like not being able to breathe through my nose and my nose clips were slightly painful. Today I tried a way of eating which minimizes the sensation of taste by consciously closing off the connection between mouth and nose. As Seth mentioned above, food can be pleasant even without the full use of the nose.

Seth Roberts (2011-03-25 18:57:51)

Anna, canola oil often doesn't work well, for unknown reasons. I suggest you replace it with butter eaten noseclipped. I do 1/2 stick of butter per day (1/4 stick twice per day). I cut the 1/4 stick into 6 pieces and eat each piece of butter with a small piece of meat. Mark L, some of the noseclips I've seen allow you to adjust them so that they are comfortable. You just bend the metal.

Anna (2011-03-25 21:29:21)

Thanks Seth. That's kind of awesome - hopefully one day I'll be able to respond to questions of, "How have you lost so much weight?" with, "Oh, I eat a half a stick of butter a day. With a fork." I have noticed my balance is better, by the way. I don't have a scale - I weigh myself on the wii fit. I used to have to concentrate to stay balanced during the balance test or I would lean to the right. Lately, I'm always almost dead center. I also want less coffee and diet coke.

TMS (2011-03-25 23:06:32)

Also a lot of people don't get the concept even after you've explained it to them. To me it made intuitive sense. Your body learns what has calories and when that food is around. Some people just don't get it and if they don't get it then it really seems weird and like a gimmick.

Seth Roberts (2011-03-25 23:24:26)

Anna, I too noticed my balance was better when I tried using flaxseed oil (high in omega-3). Then I did a heap of experiments confirming the balance effect and showing there were other mental benefits, no doubt due to the omega-3. Canola oil, for all its problems, is high in omega-3. Butter is not. To continue the omega-3 benefits and get even more SLD calories, you might want to take 2 tablespoons/day of flaxseed oil, nose-clipped. Your gums should greatly improve as a result. I have posted about the visible benefits of omega-3 many times.

M (2011-03-26 04:26:48)

I've always been thin and my weight varies very little. I also have a fairly poor sense of smell. I can smell things - but it seems to me not as keenly as other people. I wonder if these things are related. Perhaps there is some test of sense of smell out there that could be correlated with body weight?

Sadie (2011-03-26 13:08:26)

If I may say so, your book often seemed condescending and angry. Those are not traits that make people want to take your advice. I also felt that the mechanism (flavor-calorie learning) you described in your book seems incomplete. It is at best one of many forces making SLD work. For example, we know that eating carbohydrate without protein triggers the selective

uptake of tryptophan into the brain, leading to an increased production of serotonin (see "The Serotonin Power Diet has an easy-to-follow explanation of this, plus experimental verification). Increased serotonin lowers appetite. We also know that fats trigger a hormone response that suppresses appetite and causes the sphincter at the end of the stomach to close (YOU On a Diet has a tedious lay explanation, plus cartoons and lame jokes), causing you to feel full faster. It seems more likely to me that this is how appetite suppression occurs on SLD.

Seth Roberts (2011-03-26 17:19:33)

Sadie, I found that 300 calories/day of sugar water produced roughly the same effect as 300 calories/day of extra-light olive oil. This equivalence is hard to explain if the sugar water and olive oil suppressed appetite in two different ways. Nor would your two different mechanisms explain why a third way of applying the theory behind SLD – namely, noseclipping – also appears to work.

Linda (2011-03-27 11:48:19)

I bought the book on my Kindle and got up at 5 AM to finish reading it because I just know it will work. My husband who is naturally thin has always had a sugared drink between meals and he only eats two meals a day because of it. I who struggle have always avoided sugar and I am hungry all day long. Today I had one tablespoon sugar in hot water like it was tea. Wonderful. I have no urge to snack. I also take flax oil seed capsules as well. I am calm and free of my usual nagging hunger. Let's see what happens. I would be happy to lose ten pounds. Could it be this easy?

Geraldine (2011-03-28 20:30:40)

I think whenever something seems too easy or too good to be true, it turns off many people from taking a diet (for one example) seriously or even giving it a try. I've always tried to have an open mind when it comes to matters of health and wellness in particular. So many so called "fads" ended up being the answer over the years. It wasn't so long ago that anyone who thought that diet had anything to do with cancer was considered uninformed or worse. I always thought it was the other way around, how could anyone NOT think that diet and cancer were linked? As far as your diet is concerned, it works no matter what anyone thinks. The thousands of people who have been successful with your plan are proof of that. The lucky ones with open minds, willing to give yet another diet plan another try. This one's different though, because it's not really a diet and it does really work. What I have found personally is that I am able to control how much I eat without using the sugar water or oil every day. The carry over is significant. And although the weight loss is slow, it's been significant about 25 lbs and I wasn't really overweight to begin with. Thanks again Seth! Geraldine, BC Canada

Jazi yechezkel zilber (2011-03-30 22:40:24)

There is a psychological problem with tricks. The idea of conditioning etc. Is not directly about nutrition (eat less eat differently) but a way around. And it does not register very well. This is clearly a cognitive distortion. As tricks can be as useful or more than "straight" corrections. I think that the very question in the headline assumes rationality and following logic. It is not how human mind and public psyche works. The question builds in logic. Here is problem. Here is highly doable solution. Do it. But the sequence does not work in most humans.

Rakhi P (2011-04-05 00:01:50)

Just started the SLD a week back, I am using sugar water .....so far the results are not showing but yes my appetite has become less.....I am having around 4 tbs of sugar in half ltr water.....hope I am going in right direction in terms of following the diet....

Seth Roberts (2011-04-15 17:23:44)

I think there is a lot to the "loners and introverts" comment. Yeah, those who have less invested in the standard belief system (e.g., "calories in calories out") have less to lose by challenging it – by trying something that violates that system. But because they are outsiders, they are less influential than people firmly in the mainstream. So they don't make good evangelists. This is related to another claim in this line of comments – that I say things here that "5 minutes thought" would show to be untrue. This means I too am not a good evangelist.

beth bobbins (2011-11-08 16:44:56)

Can you replace the olive oil with coconut oil?

Seth Roberts (2011-11-08 17:47:53)

You can replace olive oil with coconut oil if you hold your nose shut when you drink it.

## **Methodological Lessons From My One-Legged-Standing Experiment (2011-03-25 13:59)**

A few days ago I described an experiment that found [1]standing on one leg improved my sleep. Four/day (= right leg twice, left leg twice) was better than three/day or two/day. I didn't know that. For a long time I'd done two/day. I think the results also contain more subtle lessons. At the level of raw methodology, I found that context didn't matter. The effect of four/day was nearly the same when (a) I measured that effect using four days in a randomized design (where the dose for each day is randomly chosen from two, three, and four) and when (b) I measured that effect using a dose of four day after day. Suppose I want to compare three and four. Which design should I use: (a) 3333344444, (b) 3434343434, or (c) 4433343434 (randomized)? The results suggest it doesn't matter.

The experiment didn't take long (a few months) but it took me a long time to begin. I noticed the effect behind it (one-legged standing improves sleep) two years ago. Why did I wait so long to do an experiment about details?

I was already collecting the data (on paper) – writing down how long I slept, rating how rested I felt, etc. But I wasn't entering that data in my laptop. To transfer months of data into my laptop required motivation. Most of my self-experimentation has been motivated by the possibility of big improvements – much less acne, much better mood, and so on. That wasn't possible here. I slept well, night after night.

What broke the equilibrium of doing nothing? A growing sense of loss. I knew I was throwing away something by not doing experiments (= doing roughly the same thing day after day). The longer I did nothing, the more I lost. To say this in an extreme way: I had discovered a way to improve sleep that was unconnected to previous work – sleep experts haven't heard of anything like it. It was real progress. To fail to figure out details was like finding a whole new place and not looking around. Moreover, the experiments wouldn't even be difficult. The treatment takes less than a day and you measure its effect the next morning. This is much easier than lots of research. Suppose you know that radioactivity is bad and you discover something radioactive in your house. A sane person would move that radioactive thing as far away as possible – minimizing the harm it does. I had discovered something beneficial yet wasn't trying to maximize the benefits. Crazy!

An early lesson I learned about experimentation is to run each condition much longer than might seem necessary. If you think a condition should last a week, do it for a month. Things will turn out to be more complicated than you think, having more data will help you deal with the additional complexity that turns up. Now it was clear I had gone too far in the direction of passivity. I did the experiment, it was helpful, I could have done it a year ago.

Elizabeth Molin (2011-03-26 08:40:47)

This might interest you: <http://www.nowforthesciencebit.com/opinion/how-to-tell-if-something-is-true-part-xii>

Jazi yechezkel zilber (2011-03-26 20:15:47)

I think a public website for executing experiments, automatically handling data and room for comments will be great. Benefits.  
1) a database of experiments will allow others to use the information. And provide a wide range of ideas for those who want to start  
2) experimental convenience. If the tools are good it can be very helpful (a software can even suggest variations and so on)  
3) motivation. The public attention and use can motivate very much

Jazi yechezkel zilber (2011-03-26 20:28:02)

Think how useful would it be just to have all your self-experimental results tabulated in lines with links to longer discussions. In one look one can figure what can be relevant for him and also get an impression how strong the idea is. Double this with an assortment of dozens of such, (not to talk about interaction effects)

### 1.5 Years on the Shangri-La Diet (2011-03-27 20:24)

[1]

Alex Chernavsky has kindly given me several years of weight data he collected by weighing himself daily. He read about the Shangri-La Diet in 2005 and several years later decided to try it. The graph above shows what happened: Starting at 222 pounds (BMI = 32), over 11 months he lost 31 pounds, reaching a BMI of 27. Since then – while continuing the diet – his weight has increased at roughly the same rate it was increasing before he started the diet.

He started by drinking olive oil and sugar water, switched to olive oil alone, and then, finally, to flaxseed oil alone of which he drinks 3.5 tablespoons/day (= 420 calories/day). He does not clip his nose shut when he drinks it but he washes his mouth with water afterwards. More about his method [2]here.

Almost all weight-control experts would say these results are impossible: 1. Alex lost weight because he ate more fat. Fat is fattening say most nutrition experts. 2. Atkins dieters, who don't say that, think the secret of weight loss is to reduce carbohydrate. Alex didn't do that (and eats plenty of carbohydrate). 3. He didn't restrict what he ate in any way. 4. He didn't change how much he exercised.

Quite apart from how it contradicts mainstream beliefs, including Atkins, the data are remarkable because the change was so simple, small, and sustainable, the weight loss so large, the rebound so minimal, and data period so long.

An ordinary clinical trial has obvious advantages over such one-person data, such as more subjects and more data per subject. Less obvious are the advantages of this sort of data over clinical trials:

1. Long pre-diet baseline. Clinical trials never have this. It allows one to judge if weight increase post-diet, often called "regain", is due to the weight loss or other factors. In this case the rising pre-diet baseline shows that other factors are causing slow weight gain over time.
2. Motivation. In a clinical trial, the motivations of the researchers and the subjects are different. The researchers want to measure the effect of an intervention; the subjects want to lose weight. If paid, they may want to make money. The difference in motivations causes problems. How closely the subjects obey the researchers and how truthful they are is usually hard to know. This data does not have that clash of motivations and incentive to lie.
3. Realism – what methodologists call ecological validity. These data, unlike clinical trial data, come from the situation to which everyone wants to generalize: people trying a diet by themselves at home without professional support or guidance.
4. Level of detail available. You (the reader) have access to something resembling raw data. In clinical trial reports, the data available is heavily filtered (e.g., shortened, simplified) and the nature of the filtering rarely described. For example, you rarely learn in any detail what the subjects ate. With this sort of data, but not clinical trial data, you can get a better sense of whether the results are likely to apply to you.

---

Alex Chernavsky (2011-03-27 20:56:25)

That slow upward trend is a little worrisome to me. I think it might be caused (or exacerbated) by the fact that about eight months ago, I started eating breakfast two or three times per week (I still almost never eat lunch). I enjoy eating a home-cooked breakfast with my wife on weekends.

Seth Roberts (2011-03-27 22:02:07)

Alex, such slow upward trends are very common – and yours seems to have started at least as early as 2008. I think they are due to strengthening of food-calorie associations – what most people think of as "food becoming more familiar". I came across a study that found that the thinner people are at age 20, the slower the weight gain in their 30s and 40s (comparing one culture to another).

Robert (2011-03-28 02:22:08)

It occurs to me that the obvious confounding factor is that by taking on this ritual of dosing with oil and waiting to eat, a person may start to pay more attention to food intake and subsequently lose weight. In any event - good work, Alex!

Alex Chernavsky (2011-03-28 06:34:56)

Seth – you've mentioned nose-clipping. Anything else you might recommend to flatten or reverse that upward trend?

Kevin R. Bridges (2011-03-28 07:58:36)

I was going to mention to you, and I guess this is as good of a place as any, that I've been noseclipping protein shakes in the morning (and rinsing as well. The flavor is very strong and sticks around without rinsing). I wasn't sure about what kind of results I was getting, hunger-wise, until I, while lying in bed, realized that I could easily list everything I'd eaten that day. I got up, added up the calories, and it was about 1200. This is an unbelievable reduction, compared to before I started using your advice. I'm very pleased and impressed.

Seth Roberts (2011-03-28 12:17:44)

Thanks, Kevin. How long have you been doing this Alex, no, no other suggestions. About noseclipping: I find it much easier to noseclip butter (with a little piece of meat) than ordinary food. I think that is because with ordinary food, noseclipping reduces how enjoyable it is. For example, a noseclipped sandwich is less pleasant than a sandwich eaten normally. Whereas with the butter, all of the pleasure is in the texture (which isn't just fat, the protein helps). Noseclipping has no effect on that, so the nose-clipped butter is just as pleasant as the butter eaten normally. To be vegan about it, I'd eat the butter on a snap pea or a cracker.

Carl Willat (2011-03-28 17:39:51)

I really enjoy my spelt toast with flax seed oil and ground flax on top (to absorb excess oil) in the morning, though I do it nose-clipped.

Seth Roberts (2011-03-28 19:04:13)

I found that toast with flaxseed oil eaten noseclipped tasted the same as toast with lots of butter.

Nathan Myers (2011-03-28 21:50:24)

I don't noseclip, but I use a squirt bottle to bounce the oil off the back of my throat. In Berkeley, the ordinary Barlean's brand comes in a squirt bottle, which I imagine has the extra advantage of minimizing oxygen exchange, so maintaining freshness. Of course any brand of oil can be put in a squirt bottle.

Jarno Virtanen (2011-03-29 00:27:48)

I wonder if the reason why Atkins works (for a while) is that meat without carbohydrates does not create as strong calorie-flavor association as it does with carbs. I personally do like meat, but a meal of only vegetables and meat does not create a genuine craving for me. Whereas high-calorie dinner with a good amount of carbohydrates does. People say it's great that you can eat all the meat you want with Atkins diet, but I wonder if it is just not as satisfying. This could explain why people find that even Atkins diet takes some self-discipline. They still crave for foods that have a lot of carbohydrates. Atkins is still to adhere to than the normal calorie-restriction diet, but it's not automatic like Shangri-La diet is (when it works). This could also perhaps explain why many people can't keep with their Atkins diet. (I don't know the actual numbers, but I've understood that lapsing is somewhat of a problem with Atkins too.)

Stephen M (Ethesis) (2011-03-31 19:09:11)

I found that my diet really switched around, but that at some point the food I was eating seems to have become too regularized. I'm now working on changing that. Though if I go back to rigid eating, my weight drops again. I'm working out how to get away from rigidly eating a basically flavorless diet and how to deal with eating at restaurants and such on a regular basis. I'm starting to consider just skipping lunch every day.

paul hardcastle (2011-04-01 09:58:02)

I start my SLD today Over a year ago I weighed 85 kilos today I weigh 108 ks a cool 238 lbs. 9 months ago i gave up smoking (40 aday habit) and stopped working from Aid work: 18 warzones and more. When I worked in Greece many greeks took 2 tbs of olive oil a day as laxative. One question light olive boil is labelled 'light and mild' I assume its the same as in the US? Thanks Paul

kevin (2011-04-02 11:01:46)

I've been doing it for a couple of weeks in combination with a slow carb diet

## **Evolutionary Health Journal to Start (2011-03-29 16:49)**

Building on the success of the [1]Ancestral Health Symposium – it will be in August, but it's already a success – Aaron Blaisdell is planning to start a scientific journal on the subject.

It will be an historic thing. The notion that ancient lifestyles are especially healthy has been around, and taken seriously, for at least a few hundred years. Serious data began to be gathered in the early 1900s. Weston Price is an example. For a very long time this idea seemed to go nowhere, or at least the mainstream ignored it. In the 1970s there began a small irregular stream of publications (e.g., a book called [2]Western Diseases edited by my friend Norman Temple) but again the mainstream ignored it.

But mainstream medicine doesn't work very well. The notion that when you get sick you should take a dangerous expensive drug doesn't make a lot of sense. You didn't get sick because you lacked the drug. More plausible is that when you get sick you should reverse the environmental conditions that caused the sickness and find out if your body can heal itself. Even more, you should prevent disease from starting. Along with mainstream medicine's implausible intellectual foundation has come pathetic results. Robin Hanson has [3]emphasized the RAND experiment that found that a large fraction of medical spending produced little benefit. Tyler Cowen [4]has pointed out that Americans spend far more than other countries on health care with no better results. A doctor at a county hospital once told me, "The truth is that we can't help most people that come in." They come in with diabetes, obesity, and so on. Why don't you do something that does help? I asked. Because when you do prevention research, she said, you don't get people thanking you. She was describing a protection racket: make people sick – if only by failing to tell them how to be healthy – so that they will come to you for help.

An academic journal with a steady stream of articles and supporting evidence is a big step toward getting the paleo alternative taken seriously. It will help researchers who take paleo ideas seriously publish their work, of course, but it will also help them get feedback. Because it will help them publish, it will help them get research support. Because the journal (like any new journal) will be open access, it will help those who want to learn about those ideas. When ideas about health are forced to compete on their merits (such as cost, safety, effectiveness, and quality of the supporting evidence) and becoming an M.D. confers less of a monopoly (on information and treatment), a great change will come. Richard Nikoley recently posted [5]an example of what a difference this can make.

Tyler (2011-03-29 20:10:15)

This is great! I've been hoping something like this would come along for a while. Cheers to Evolutionary Health.

Darrin Thompson (2011-03-30 08:01:16)

Please let it be open. Please let it be open. Please let it be open.

Tom Moertel (2011-03-30 11:32:46)

Yes, please let it be open. Given the [1]the citation-rate and influence advantages of open-access journals, when a journal is offered, in part, to make headway against an unyielding flow of entrenched beliefs, that journal probably ought to be open access to have any hope of success. The ideas in such a journal must be seen and spread, and both are more likely with open access.

1. <http://opcit.eprints.org/oacitation-biblio.html>

Aaron Blaisdell (2011-03-30 20:42:47)

But of course the journal will be open access.

Erik Cisler (2011-03-30 23:28:57)

Excellent!

## **The Growth of Paleo: Patrick Vlaskovits Interview (2011-03-31 08:23)**

I wondered if [1]Patrick Vlaskovits, who runs the question-answer site[2] PaleoHacks, could shed some light on the recent growth of interest in a Paleo approach to health. So I asked him a few questions.

SETH What have you learned from PaleoHacks about the growth of the Paleo movement during the last year?

PATRICK Well, one thing is certain ... the Paleo movement IS growing. One can look at various proxies for this - Google Trends - for example - [3]<http://www.google.com/trends?q=paleo+diet> - or more frequent mentions in the mainstream media. But your question is about what I have learned from PaleoHacks.com with regard to growth. PaleoHacks.com's traffic is definitely growing and my sense is that Paleo (by that I mean eating in an evolutionarily appropriate manner) is about to cross the chasm into the mainstream.

A few interesting measures of growth vis-a-vis PaleoHacks are:

1) The increasing frequency of meta-discussions on PaleoHacks - people who have been eating Paleo for some time are now looking to the future about what it means to be "Paleo" and how long-time Paleo eaters are changing their Paleo diets. This is, IMO, is a good thing as Keynes said: "When the facts change, I change my mind - what do you do, sir?" We are learning more about how our health changes after some time eating Paleo - and what needs to be fine-tuned when it comes to things like bacterial/gut health (probably the most important thing to worry about) and hormonal changes relative to our environment, e.g. cortisol levels increasing due to lack of sleep which can result in unwanted/unhealthy weight gain or weight loss.

2) More people are blogging about Paleo and also more people are trying to monetize Paleo and I see them on PaleoHacks. (For the record, I have no problem with anyone trying to monetize Paleo as long as they are responsible about it as I feel that anyone monetizing Paleo should also be a good steward of Paleo.)

SETH How much has PaleoHacks traffic grown over the last year?

PATRICK Short answer: A lot. Longer answer: Depends on which metric you use — but still a lot. Ranges from 6x to 8x YOY increase in visits, uniques and page-views. Currently, PaleoHacks gets +500k page-views a month. [I double-checked my internal stats with public information on Compete.com & Quantcast - and it looks like they undercount (BTW this is a well-known and hotly debated topic).]

SETH What do you think is causing such fast growth? The broad idea is really old. Even the details are old – Weston Price wrote in the 1930s, for example. The Weston Price Foundation, which was started many years ago, is growing much more slowly.

PATRICK Cutting to the chase: no idea. Some thoughts:

Paleo's growth appears highly correlated with CrossFit – but what has caused CrossFit's growth? Not sure. It too has been around a while.

Social media have certainly accelerated/lubricated Paleo's growth but I don't if social media actually \*caused\* Paleo's growth. What causes memes like Paleo to spark, and then die out or go dormant and then spark again to grow into a raging wildfire? I wish I knew.

Getting a little meta and perhaps off-topic – my assumption is that is true for most "Big Ideas". We rarely recognize or know of their true "discovery" because for-whatever-reason the implications are not fully, if at all, appreciated at the time of discovery. For example, I believe this was the case with penicillin. A French medical student discovered it 1896, Fleming re-discovered it in 1928 and then it lay around until 1939 when Florey fully appreciated it.

I certainly didn't put two and two together when I read [4]Why We Get Sick back in 2000-ish. I thought it a fantastic book (and still do)– but I didn't think of applying the evolutionary lens to diet/nutrition, even though in retrospect, it seems obvious.

1. <http://about.me/vlaskovits>
2. <http://PaleoHacks.com/>

David (2011-03-31 08:36:54)  
I just checked out PaleoHacks. Patrick seems a bit of an asshat.

Patrik (2011-03-31 09:41:52)  
LOL. Yes, I am an utter & total "asshat".

AJ Chillin with VJ (2011-03-31 10:04:02)  
He is - I can vouch for that!

Aaron Blaisdell (2011-03-31 10:08:31)  
Great interview Seth. Thanks for doing it Patrick! I never heard of an asshat, but it sounds sexy. Where can I get one for myself?

Robin (2011-03-31 11:50:59)  
I wonder how much of the growth is due to Gary Taubes, in a roundabout way? That's how I got to PaleoHacks, at any rate. Gary Taubes convinced me that eating fat was good, I started reading more about nutrition, then I started eating less carb and more fat, which led me to a number of paleo blogs (PaNu & the like) and not-really-paleo-but-close blogs (Whole Health Source & the like), eventually I found PaleoHacks. I don't eat a true paleo diet, BTW, but find the PaleoHacks site very helpful for a

whole range of food-related issues from sourcing healthy food to nutrition to cooking. And I love the way the site is set up.

Darrin Thompson (2011-03-31 12:09:34)

I will have to spend more time there. That's a nice use of stack exchange.

Patrik (2011-03-31 14:20:49)

@Robin Gary Taubes is most definitely influential and his ideas have tremendous overlap with Paleo. @AJ This is true. You can vouch for my alleged ass-hat-edness.

Thomas Seay (2011-04-01 12:59:41)

Do you think it is very Paleo to wear an ass hat? I was under the impression that they just bared their ass to the world.

Joe (2011-04-01 21:21:40)

You can stick a feather in your ass-hat, as it's paleo. Just don't call it Macaroni.

anonymous (2011-04-02 16:35:44)

"Asshat n. One who has their head up their ass. Thus wearing their ass as a hat. Asshat." sethroberts.net is also good for my vocabulary! Thanks!

## 6.4 April

### Assorted Links (2011-04-01 15:39)

- [1]Interview with Peter Pronovost. "The pilot who neglects a checklist before take-off would not be allowed to fly, and most safe industries have transgressions that are firing offenses. ... There hasn't been that kind of accountability in health care. ... Hospitals don't pressure physicians about teamwork for fear of jeopardizing the business they bring to the hospital."
- [2]Doctors taking kickbacks. Dr. William H. Resh, one of the accused doctors, defended himself like this: "I believe that it goes without saying that a doctor who agrees to consult with a company does so because of the confidence level they have in the company and the quality of its products."
- [3]Advanced navel-gazing – nice article in Forbes about self-tracking.

### Effect of Graphical Feedback on Productivity (2011-04-02 03:41)

After talking to [1]Matthew Cornell a few months ago, I decided to try to measure how much time I worked. Measuring it might help me control it. I'd done this before but hadn't gotten anywhere. Maybe this time . . .

I used R. It was easy to record when I worked. I work a while (e.g., 60 minutes), take a break (e.g., 30 minutes), go back to work, take another break, go back to work, take another break, and so on. The R programs I wrote recorded when each bout of work started and stopped. A typical day might have six bouts of work, interspersed with breaks. It was harder to write a program to show the data so I collected data for about eight weeks before I looked at it.

The display program I eventually wrote showed "efficiency" (total time spent working that day/available time that day) as a function of time of day. Each bout of work generated two points on the graph: one when it started, one when it ended. For each point, the efficiency of the whole day up to that point was computed. For example, if a bout of work started at 10 am, the efficiency for that time was how much work I had done before 10 am divided by how much time I had available before 10 am. Time available was computed from 3 am or when I woke up, whichever was later – as amusing/horrifying as that might sound. Suppose I woke up at 5 am. At 10 am, then, I had had 5 hours available to work. Suppose I had only worked between 8 am and 9 am. Then total work up to that point = 1 hour and efficiency = 20 % (= 1/5). So I plot a point at (10 am, 20 %). Suppose I work for an hour. End point: 11 am. Total work up to that point: 2 hours. Efficiency: 33 % (= 2/6). That's a point at (11 am, 33 %).

Although I had collected the data to test an idea, I also thought it would be interesting to see how the current day compares to previous days. Was I doing better than usual? Worse than usual? To make this comparison I plotted the data from the current day as a line rather than as points, to make it stand out. I also made it a different color. I often ran the display program while working. It showed the results up to that moment.

All this had a surprising result: I became considerably more efficient. Here is an example of the graphs I looked at many times per day:

[2]

The brown line is the current day. The line goes up when I work, down during a break, up again when I resume working. Blue and green points are previous days. Blue points are from the days before I started looking at graphs like this, green points from the days after I started looking at graphs like this. In other words, the difference between the green and blue points shows the effect of looking at graphs like this. The red and black points are the final points of the day – red from the days before feedback, black from the days after feedback began. They summarize the day. The higher they are, the more efficient I was.

The green points are mostly above the blue points – and, especially, the black points are above the red points. This suggests that the graphical feedback made me more efficient. Before it began, I was about 25 % efficient throughout the day. After this feedback began, I was about 40 % efficient. The only change was addition of this feedback.

I was shocked by these results – the improvement was sudden and large. Had I an inkling that such a thing was possible, I would have tried it long ago. The comparison isn't feedback vs. no feedback. Before the graphical feedback started I got printed feedback ("120 minutes [work] so far") as often as I wanted and whenever I started or stopped work. And I've kept records of how much I work in other ways for a long time. My professional research area is animal learning – not far from studying the effect of feedback.

If the improvement persists, I will try to explain it. I once spoke to an engineering professor who started measuring his calorie intake, hoping to lose weight. As soon as he started keeping track, his once-a-week binges of eating a whole carton of ice cream in a sitting stopped. That's the closest result I can think of and it isn't that close.

anagement-recap/

2. <http://www.flickr.com/photos/sethroberts/5581283747/>

---

SB (2011-04-02 04:47:07)

Can this not be explained by the Hawthorne effect? "The Hawthorne effect is a form of reactivity whereby subjects improve or modify an aspect of their behavior being experimentally measured simply in response to the fact that they are being studied, not in response to any particular experimental manipulation."

Joseph Dantes (2011-04-02 05:03:42)

Now THIS is why I read you. I REALLY want that program. I think the program is the big breakthrough, not the insight that continual graphical tracking increases productivity. Although the fact that you quantified it is impressive. I've been doing this on a cludgy basis, on and off. PLEASE share the program. I will learn R. I don't care.

Joseph Dantes (2011-04-02 05:04:42)

Read it again SB, no it can't. This is about Continuous Graphical Feedback. All 3 elements. Non reducible.

Seth Roberts (2011-04-02 05:15:44)

SB, I was already measuring my behavior when I started this graphical feedback. The measurement started two months earlier. So the improvement cannot be due to the measurement. The improvement must be due to some details of the feedback, and I cannot easily say what those details are.

Mike (2011-04-02 09:44:44)

For a behavioral econ take on this.... <http://faculty.chicagobooth.edu/christopherherhsee/vita/papers/mediummaximization.pdf>

Richard Gay (2011-04-02 10:41:36)

I saw a response on a blog from someone who simply began weighing themselves every morning. They wanted to see if simple observation caused them to lose weight. They lost a substantial amount of weight in a reasonable period of time. Obviously it wasn't watching that did the trick, it was some unmonitored path between that and their eating and activity choices (which they did not consciously change). But in any case, just knowing the state and trend made a difference.

wr (2011-04-02 17:17:03)

this is \*fantastic\*

Shane (2011-04-02 19:18:04)

Love this post. Agree w/ Joseph Dantes. Some additional questions: 1) How did the program "know" whether you were working or not? Did you have some kind of "clock in/clock out" thing? Just hit return when you started working, return again when you stop, or start to goof off? 2) What counts as 'work?' This is my damn problem. Start out doing something that is absolutely, positively work (I had decided that x needs to be built, so if I am actually building x then that's work). Get into a grey area (doing background reading on something that's keeping me from making progress on x). Drift into something that's probably not work (researching something peripheral to x, that might be important later, or important for something that comes after I finish x) to something that's definitely not-work. Seems like you might have some of these same issues - how did you deal with them?

Alrenous (2011-04-02 19:25:20)

Not that surprising. More intense feedback is better feedback. I would guess the actual causal path is that a printed word form limits the computation to rational consciousness (highly abstract) but a graphical form can be understood by the subconscious,

which would allow you to rope more of your brain into understanding and pursuing the goal of working more efficiently. In me the transition is marked by the issue changing from an airy feeling to a solid and broad gut-level response. If I can get this gut response to a goal, it can mean the difference between being impossible and being unavoidable.

Seth Roberts (2011-04-02 20:00:29)

Thanks, wr. How did the program know I was working? When I started working I ran a program called work.start that recorded a few things. When I stopped working I ran a program called work.stop. Since R is always open this was easy. What counted as work? I have a broad definition: Making tea while working is work. When answering email (which is work), reading links people send me counts, even though I enjoy that. Although I enjoy writing my blog, that too is work. Also included is standard work: writing scientific papers, for example. You can think of my definition like this: ordinary work plus stuff I have to do and want to spend more time doing (e.g., email). "More intense feedback is better feedback." I doubt that intensity is the only important thing I changed. Perhaps the feedback was effective because progress was easy to see. It was easy to see because of the detailed comparison to previous days. I didn't just show the average of previous days. From looking at the data I could see my percentile compared to previous days. Was I better than 60 % of previous days? 80 %? 99 %? Right/wrong feedback isn't like that.

Wayne (2011-04-03 09:59:59)

If I'm reading you correctly, I see two differences: 1. Motivation: you basically turned it into a contest with yourself by phrasing it as "today compared to previous days". That probably draws on various emotional reserves and helps push through tedium. 2. Concreteness. I'm finding it hard to put it into words, but it seems to me that you were originally working with data in abstraction: what does "good" or "better" really mean, in realistic terms? A rough eyeball of your blue data says 40 % efficiency was probably average, so does that make 50 % good? Is 90 % sustainable? Once you focused your comparison to "how am I doing compared to yesterday?" the actual scale (50 %, 40 %, 90 %) and "what is good?" don't really matter anymore since you can focus on the much more concrete: "am I doing better than in the past?" Does that make sense? I would also guess that the reframing of your data and what it means probably affected what you called "work". Before, it was abstract data: points in a cloud. Now it was an attempt to do better than you had before, so perhaps you were subconsciously more generous with what you tagged as work. You were competing with "them" (you, actually), and perhaps became a bit more of a "rules lawyer" who was more likely to call something work.

Darrin Thompson (2011-04-04 18:31:23)

The lean quality people hold the use of simple visual feedback mechanisms as a fundamental principle of quality and efficiency. I've seen some of them recommend use of a simple magnetic whiteboard in place of an ERP computer system for some surprisingly large organizations, for reasons like the one you are describing. "Agile" software development also rejects complex project management software in favor of post it notes, whiteboards, and poster sized hand drawn graphs. Possibly part of the effect is due to you having chosen and created the visual feedback yourself? For instance, if you mandated my the use of your R program and graph at work, would it work as well? Also, you defined efficiency as sitting at your computer? That probably wouldn't work in all cases, for instance, like me. Look what I'm doing right now..... :-)

Seth Roberts (2011-04-04 18:50:28)

Darrin, I agree with the point about visual feedback but not about the "simple". This feedback isn't so simple: see all the points. Nor is my attempted improvement (see today's post) where I compute a percentile. I think part of the reason this works is that there is comparison of the current score against the whole distribution of past scores, not against some simple summary. Does it work because I created it myself? Yeah, to the extent that it is tailored for just my situation. Do I "cheat" on what I call working? No more now than before the graphical feedback started. I learned long ago that it was a good idea to count making tea as work.

macondo (2011-04-04 19:19:20)

Interesting. Off-and-on I use an application called "Time Rescue" to monitor my activities / efficiency on-line.. to try to manage how I balance content consumption with production and also other wasteful activities (messenger apps, etc.). If you have any suggestions on better applications I'd love to hear them! Thanks, Eugenio

sdz (2011-04-05 05:55:44)

I fully support Joseph Dantes idea: I guess many people would appreciate advice on how to build something like this for themselves. Probably not that interesting for the author but such practical postings could have a big impact on ordinary readers' lives. Some hints for the reader with basic knowledge of statistical software would probably suffice.

Aaron Blaisdell (2011-04-05 07:09:55)

Hey Seth, this was a fascinating post. It strikes me that what you found is kind of like the opposite of the Shangri La diet! In the SLD, you claim it is the explicit pairing of calories with flavors that contributes to increases in weight set point (or some correlate thereof). To reverse that you unpair calories from flavor. In the current experiment, work and visual feedback of productivity are typically unpaired, but you found a way to pair them and therefore allow visual feedback to reinforce productivity! Cool. As an aside, I wouldn't characterize my activities as work versus non work (or play or rest or whatever other term for "non work" you may wish to use). Instead, I categorize my activities into productivity and inductivity. I'm being inductive when I'm not actually being productive. I think this is not merely a means of making myself feel better about time spent in non-productive activities, but actually acknowledges the value of these non-productive times as contributors to the eventual results of my productive times. I tend to think Nassim Taleb would agree, and just as eating and exercise follow power law functions, so does productivity. One can think of pounding away at the keyboard writing a paper or other productive efforts as being like chronic cardio (to lift Mark Sisson's term). I'd rather intersperse long periods of inductivity with brief and intense bouts of productivity. Just like I prefer long periods of restful or slow activity (walking, lounging, etc.) punctuated by brief and intense bursts of activity (sprinting, lifting heavy things, etc.).

Seth Roberts (2011-04-06 16:08:24)

Aaron, yes, I agree, it is something like using ideas about associative learning for practical purposes. Perhaps the feedback, by rewarding work, made it more likely. Or perhaps it punished not working. If work is like exercise, what is the equivalent of walking? of sprinting? Perhaps sprinting = work that requires a lot of concentration, but then walking = work that doesn't require much concentration. The analogy suggests people should spend plenty of time doing work that doesn't require much concentration, just as they should spend hours/day walking. But where work is concerned I think the power-law idea leaves out something important: we like doing stuff we have done the day before. So repetition is crucial. It is important to do stuff day after day. Then it will keep being easy and pleasant to do. Stop doing it for several days and it will become difficult to do. The best feature of this productivity graph is that it encourages me to do stuff day after day.

Seth Roberts (2011-04-06 16:10:20)

sdz, that is a good point. After I've been using it long enough to fix problems, be sure it works, and so on, I'll consider writing a version that people can download. So if you are willing to install R you can try it.

## **Dangers of Antibiotics: Case Study (2011-04-03 04:01)**

[1]A column in [2]The Telegraph by a doctor named James Le Fanu describes the following case:

It started eight years ago when he was laid low, while on holiday in Sri Lanka, by diarrhea. His symptoms cleared with antibiotics but he was left with a churning gut and frequent loud belching. This carried on for a couple of years until, listening to Farming Today, he heard an Australian vet talking about his belching sheep. "I got in touch and explained that I seemed to be behaving like one of his flock," he writes. The vet suggested his bowel infection might have interfered with the gut enzymes for metabolising sugars, causing him to be intolerant of fructose. A test dose of orange juice immediately brought on his symptoms, and his gut problems settled on reducing his sugar intake.

In other words, no one consulted about this case, including the Australian vet and Dr. Le Fanu, seems to have understood that (a) a large fraction of our digestion is done by bacteria and (b) antibiotics kill bacteria. If you take antibiotics you risk digestive problems. I predict the belching would have gone away had he started eating fermented foods with

bacteria that digest sugar. It was certainly worth a try.

1. <http://www.telegraph.co.uk/health/healthadvice/jameslefanu/7869006/Doctors-Diary-James-Le-Fanu.html>

2. <http://www.telegraph.co.uk/health/healthadvice/jameslefanu/7869006/Doctors-Diary-James-Le-Fanu.html>

---

vimspot (2011-04-03 07:21:48)

It strikes me as a massive violation of the Hippocratic Oath that doctors routinely prescribe anti-biotics without prescribing probiotics. My girlfriend once prescribed acidophilus to a patient and the pharmacist refused to fill it, feeling it was inappropriate.

Alex Chernavsky (2011-04-03 08:34:53)

So he had these symptoms for several years? It seemed strange to me that his gut flora wouldn't return to normal during that time - but then I found this article via Google: <http://steadyeddie.posterous.com/antibiotics-play-hell-with-gut-flora>

Joe (2011-04-03 09:38:48)

Seth, you'll find these articles on fecal transplantation interesting: (expand the 'transcript' link in this one): <http://freakonomicsradio.com/the-power-of-poop.html> This one has a self-experimentation twist: <http://www.slate.com/id/2282768/>

Duncan (2011-04-04 01:00:13)

More on gut bacteria and fecal transplants here. Did I mishear or do they say that probiotic starter cultures - i.e. for probiotic yogurts, etc. - come from healthy human bowels? <http://www.bbc.co.uk/programmes/b00z6dvv>

Anne Weiss (2011-04-04 09:31:17)

More on fecal transplants. Toronto researchers doing major study later this month. Some useful do-it-yourself info included.

Anne Weiss (2011-04-04 09:34:22)

Sorry. Here's the link. <http://www.healthzone.ca/health/newsfeatures/research/article/968384-hospital-to-try-fecal-transplant-as-cure-for-superbug?bn=1>

Thomas Seay (2011-04-04 14:37:00)

By the way, reading a great book, "Bacteria for Breakfast" by a Professor of Pharmacology (!) at Penn State (author's name is Kelly Karpa). It cites a lot of studies but is also a good popular read on the important role of bacteria in our body.

## **Why Did Graphical Feedback Improve My Work Habits? (2011-04-04 18:40)**

[1]A few days ago I posted about the effect of efficiency graphs - graphs of time spent working/available time vs time of day (see below for an example). I used these graphs as feedback. They made it easy to see how my current efficiency compared to past days. As soon as I started looking at them (many times/day), my efficiency increased from about 25 % to about 40 %. I was surprised, you could even say shocked. Sure, I wanted to be more efficient but I had collected the data to test a quite different idea. In this post I will speculate about why the efficiency graphs helped.

[2]Commenting on my post, a reader named Wayne suggested they helped for two reasons:

1. Motivation: You basically turned it into a contest with yourself by phrasing it as “today compared to previous days”.  
..

2. Concreteness. . . . You were originally working with data in abstraction: what does “good” or “better” really mean, in realistic terms? . . . [Now] you can focus on the much more concrete: “am I doing better than in the past?”  
This is a good guess. Before the graphical feedback, I had gotten plenty of non-graphical feedback: (a) how many minutes worked so far that day and (b) how many minutes during the current bout of work. Naturally I compared these numbers to previous days – certain total minutes per day and certain bout lengths were good, others were bad (e.g., working only 20 minutes before taking a break was bad, working 50 minutes before a break was good) – but I barely corrected for time of day. I vaguely knew that a certain amount by noon was good, for example. In other words, I did compare present to past, but vaguely.

Why were the efficiency graphs better than the text feedback? In addition to Wayne’s suggestions, I can think of other possible reasons:

1. Small improvements rewarded. When I was working, the line went up. Seeing this I thought good! – that is, I was rewarded. A good thing about this scheme is that it rewarded small improvements. A reward system that dispenses plenty of rewards (at the right times) will work better than a system that dispenses few of them.

2. Realistic goals. The goal – doing better than in the past – wasn’t hard to reach because the feedback was based on the whole previous distribution. I felt good if I was doing better than the median and even better the further from the median I was. This is more realistic than, say, dispensing reward only if I do better than ever before.

3. Pretty. The graphs are more attractive than a line of print (“40 minutes worked so far, 120 minutes so far today”) so I looked at them more often. Any feedback mechanism will work better if you pay more attention to it.

4. Loss aversion. Looking at the graphs caused a low-level pressure to work when I wasn’t working because I imagined the line going down. With previous feedback, loss was less obvious. With the previous feedback, if I didn’t work, minutes worked just didn’t increase; it did not go down.

5. Gentle pressure. When I didn’t work, my efficiency score went down slowly because it was based on the whole previous day, not just the last 10 minutes. This made the whole thing more sustainable.

In hope of rewarding even smaller improvements, I added a number to the graph: the percentile of the current efficiency score to efficiency scores near the same time of day. Here is an example.

[3]

Each point is the start or end of a bout of work. Blue points = before graphical feedback, green points afterwards. The red and black points are the final points of the days. The brown line is the current day.

The large 77 in the upper right corner means 77th percentile, which means that the current efficiency score (shown by the end of the brown line) is in the 77th percentile compared to efficiencies measured within an hour of the same time of day. Let's say the time was 9 pm. Then this percentile was computed using all scores (all the dots) between 8 and 10 pm. 77th percentile means that about 23 % of the surrounding scores were higher, 77 % lower.

The reason for this change is to make the feedback even more graded and realistic – even more sensitive to small improvements that are possible to make. [4]My theory of human evolution says that art and decoration evolved because tools did a poor job of rewarding improvement. Until you could make the most primitive example of a tool, there was no reward for increased knowledge. The reward-vs.-knowledge function was close to a step function. Desire for art and decoration provided a more gradual reward-vs.-knowledge function. (I just finished a new write-up of that theory, which I will post soon.) . That's what I am trying to do here.

Frank (2011-04-04 20:46:22)

Hi Seth, I've been a huge fan and reader for a while after seeing your work on the Quantified Self then 4HB. One angle to look at the productivity increase is your recognition and reinforcement of your intentionality through visual feedback. You mention the difference before and after seeing feedback when a previous reader mentioned the Hawthorne effect, and I kind of dig the experimental set-up. It isn't the information that changed your work efficiency. but a subconscious change in your behavior that indicates an increase in self-efficacy. In this post you name a gentle pressure and realistic goals from already establishing a baseline for comparison. Mindfulness practitioners would call this a non-judgmental attitude combined with an acceptance of your previous efficiency. By visually feeding this back, you could explain the benefit to your efficiency through behavior change that arose from the awareness aspect. I generally liked your definition of work (actual work + related tasks), though email is

such a tricky THING to categorize. It definitely is difficult to thread the needle between doing work and being busy with "work". :)

Mike Kenny (2011-04-06 14:53:06)

There's that Drucker line, something like, 'If it gets measured, it gets managed.'

Seth Roberts (2011-04-06 15:57:04)

Thanks, Mike. The Drucker line does not explain what is interesting here: one form of feedback was more powerful than other form. In both cases, work was being measured.

Mike Kenny (2011-04-06 17:27:03)

Oh, I see what you mean.

ryan (2011-05-25 04:35:12)

all these are pretty useless if we don't have the software you use....

Seth Roberts (2011-05-25 09:12:39)

I posted the R workspace on my website: [http://www.sethroberts.net/about/2011-05-20\\_percentile\\_feedback.RData](http://www.sethroberts.net/about/2011-05-20_percentile_feedback.RData)

## **How to Self-Experiment (2011-04-06 14:53)**

At the upcoming QS Conference (May 28-9, San Jose), Robin Barooah and I will run a session about self-experimentation. Alexandra Carmichael asked me to write a post about how to do self-experimentation as a kind of advertisement for the session. Robin and I will be giving examples of what we have done and what we learned from them. Here's some of what I've learned.

1. Easier to learn useful stuff than I expected. In contrast to the rest of life, where things turn out harder than expected, learning useful stuff by self-experimentation was always easier than I expected, in the sense that the benefit/cost ratio was unexpectedly high. I learned useful things I never expected to learn. An example is acne. When I was a grad student I had acne. My dermatologist had prescribed two drugs, tetracycline and benzoyl peroxide. I believed that the tetracycline worked and the benzoyl peroxide did not work. My results showed the opposite. It hadn't occurred to me that I could be so wrong, nor that my dermatologist could be wrong (he believed both worked), nor that the establishment view (treat acne with tetracycline) could so easily be shown to be wrong.
2. Don't be afraid of subjective measurements. By subjective measurements I mean non-physical measurements, such as ratings of mood or how rested I felt – what professional researchers call "self-report". They routinely say [1]self-report is misleading. At first, I wondered if my expectations and hopes would distort the measurements. As far as I can tell, that didn't happen. Instead, I found [2]such measurements helped me learn plenty of useful stuff I couldn't have learned without it. For example, I learned how to improve my mood and how to wake up more rested.
3. Complex experimental designs were rarely worth the extra effort. Now and then I tried relatively complex experimental designs (e.g., randomization, a factorial experiment). Usually they were too hard.
4. Run conditions until you get 5-40 days of flat results (flat = what you are measuring is not going up or down). Ideal is 10-20 days. Suppose I want to compare Treatments A and B (e.g., different amounts of butter). I decide to make one measurement/day. The first step would be to do A for several days. I keep doing A until whatever I am measuring (e.g., sleep) stops steadily increasing or decreasing and then run several more days – ideally, 10-20. Then I do B for several days. I keep doing B until my measurement stops changing, then I do 10-20 more days of B. If the B measurements looked different from the A measurements, I would then return to Treatment A. It's always a good idea to run a

treatment until your central measurement stops changing, and then run it longer. How much longer? I've found that less than 5 days makes me nervous. Whereas running a condition for more than 40 days of flat results is a wasted opportunity to learn more by trying a different treatment.

5. Data analysis is easy. The most important thing is to plot measurement versus day. It will tell you most of what you want to know. For example, most of the graphs in [3]this paper show whatever I was measuring (sleep, weight, etc.) as a function of day.

6. When you add data, look again at all the data. Each time I collect new data, I plot all of the data, or at least a large chunk of it. This helps spot unexpected changes. For example, each time I measure my weight I look at a plot of my weight over the last year or so. Recently I found that [4]cold showers caused me to gain weight, which I hadn't expected. If I hadn't looked at a year of data every time I weighed myself, it would have taken longer to notice this.

7. Don't adjust your set. My conclusions often contradicted expert opinion. Again and again, however, other data suggested my self-experimental conclusions were correct. Acne is one example. Later research supported my conclusion that tetracycline didn't work. Another example is breakfast. Experts say breakfast is "the most important meal of the day." I found it caused me to wake up too early. When I stopped eating it, my sleep got better. Other data supported my conclusion. The Shangri-La Diet is a third example. According to experts, it should never work. [5]Hundreds of stories show it works at least some of time.

The most useful lesson I learned was the most basic. You will be tempted to do something complicated. Don't. Do the simplest easiest thing that will tell you something. The world was always more complicated than I realized. Eventually it sank in: Complicated (experiment) plus complicated (world) = confusion. Simple (experiment) plus complicated (world) = progress.

Hugh (2011-04-06 15:41:15)

Do you have a preferred method of storing your data, like perhaps a plain ol' spreadsheet? I've been tracking my weight in a free calorie counting program (cron-o-meter) that creates the pretty graph for me without any additional work - I know creating a graph in excel is easy once you've done it a few times but might be a pretty big barrier to entry for a lot of people. I don't have a fancy smart phone yet but there exists a great opportunity for someone to build a powerful self-experimentation app..if there isn't already one.

Seth Roberts (2011-04-06 15:55:11)

I use R to store my data. It stores it in a structure that R calls a "data frame" - like a matrix, except that the columns can be different data types. For example, one column can be text, another numbers. I like R because it gives me great flexibility of data analysis.

Alex Chernavsky (2011-04-06 16:48:24)

Sorry if this double-posts. My first attempt at posting didn't seem to work. Seth, the "Buttermind" study didn't seem to reveal anything interesting, until you log-transformed the data (a straight linear plot didn't reveal much). Is transforming data a technique that you would recommend to people who don't have formal training in statistics? If so, what kind of concise guidelines can you provide?

Seth Roberts (2011-04-06 21:37:21)

to learn about transformation, I suggest you read the relevant chapter in John Tukey's Exploratory Data Analysis. Transformation is not quite as important as 1. plotting your data. 2. averaging your data but it is #3 in a list of the most important statistical techniques.

Lumberton (2011-04-14 19:34:57)

My own advice would be never to think about general equilibrium effects.

Seth Roberts (2011-04-14 22:46:36)

"never think about general equilibrium effects" – what do you mean?

Elisa (2011-04-18 18:55:20)

Self-reporting isn't unreliable because it's subjective, it's unreliable because people lie/signal. For example people tend to underreport the number of calories they eat. Calories in isn't "subjective" (compared to, say, "Do you eat well?"), but people lie to both themselves and whoever they're reporting to because they want to be seen as someone who eats less. But even if you lie to yourself, as long as you do it in a consistent fashion, you could still see progress over time. :)

Seth Roberts (2011-04-18 20:30:26)

This strikes me as a too-theoretical critique. Sure, people lie, and scales break. In my experience, all forms of measurement have weaknesses and limitations. The comparison with perfection ("people lie") doesn't interest me for that reason. Self-report is used with success very often in social psychology, clinical psychology, and psychophysics. If the critics of self-report would point to examples where self-report was misleading, that would interest me.

## **My Theory of Human Evolution: New Version (2011-04-07 18:00)**

After [1]a casual article, [2]a talk, and [3]many blog posts about my theory of human evolution, I managed to write [4]a book chapter about it. Blogging helped. You may remember the ideas that language began because it increased trade and art began because it increased innovation. However, the center of the theory isn't language and art, but procrastination. Above all, humans are the animals that specialize and trade. That's obvious. Not obvious is that specialization begins with repetition – doing something over and over makes you an expert. The tendency to repeat had to be attachable to all sorts of activities, so that our ancient ancestors become expert at a wide range of things and could trade with each other. The mechanism behind this arbitrary repetition made it easy to repeat what you did yesterday and hard to do something new. Nowadays it does the same thing and thereby causes procrastination – difficulty starting something new.

The arbitrary day-after-day repetition began before trade. I believe it began when our ancestors were still hunting and gathering, like chimps. At some point there was a long-lasting surplus of food. The surplus lasted so long that it became beneficial to specialize while foraging. I suspect the great surplus was the discovery and exploitation of seafood, just as Elaine Morgan says, but what caused the abundance doesn't matter for my theory. Specialization during foraging led to specialization during free time (hobbies). Trade began, part-time jobs (trading your specialty for necessities) began, and, when the pile of knowledge grew big enough, full-time jobs began.

The notion that repetition is behind expertise is supported by the idea that people who are really good at something have practiced a lot – say, 10,000 hours. I am saying two new things here: 1. Repetition is increased by hedonic changes: We want to repeat what we did yesterday. Doing something today makes it more pleasant to do tomorrow. 2. It's not just superstars, such as the Beatles and Wayne Gretzky (Malcolm Gladwell's examples), it's everybody. Arbitrary repetition is behind Adam Smith's "division of labour". Our whole economy grew from a tendency to repeat today what you did yesterday.

Joe (2011-04-08 16:10:42)

I think it's part of why we hate tax time so much. It's not that prepping your taxes is *intrinsicly* that hard or stressful; it's hard and stressful because a year passes between repetitions.

Thomas Seay (2011-04-08 17:35:43)

See Paul Lafargue (who married Karl Marx' daughter Jenny). He wrote "La Sagesse de la Paresse". (The wisdom of laziness). The idea being that human civilization evolved paradoxically because of laziness.

Digby (2011-04-09 08:41:10)

Repetition and/or laziness might also explain why oppressed peoples around the world, down through the ages, have been so reluctant to rise up against their oppressors which would seem the logical thing to do.

joe (2011-04-09 15:28:52)

More likely it's hopelessness. "Peoples" is a theoretical construct, and theoretical constructs cannot reason. Only individuals have logic, and those individuals have to have some reason to believe that their *personal* rising up will be met with something other than immediate torture.

Gary Wolf (2011-04-10 17:42:53)

The "exposure effect" is different from what you are talking about here (doing rather than perceiving) but I wonder if some of this research is relevant: [http://en.wikipedia.org/wiki/Exposure\\_effect](http://en.wikipedia.org/wiki/Exposure_effect)

## **Effect of Graphical Feedback on Productivity: Another Look (2011-04-10 05:00)**

A few months ago, inspired by talking to [1]Matthew Cornell, I started tracking when I was working. After a while I [2]added graphical feedback like this:

[3]

The graph shows efficiency (time spent working/time available to work) versus time of day. The line shows the current day (not today, the current day when I made this graph). The higher the line, the better. When I work it goes up; when I take a break it goes down. The points are previous days. When the line is higher than the points, I am doing better than previous days. As I said in [4] my first post, this seemed to help a lot: compare the green points (after graphical feedback) to the blue points (before graphical feedback). I [5] blogged about possible explanations.

Here is more analysis. This graph shows efficiency versus day. Each point is the final efficiency (the efficiency after my last bout of work that day) for one day (the black and red points on the previous graph). These results suggest that the graphical feedback caused a sudden improvement, supporting the impression given by the blue/green (before/after) comparison of the earlier graph.

Before graphical feedback, the graph shows, efficiency was slowly increasing. Perhaps that was due to measuring when I was working, but I suspect it was due to the text feedback I got. I often used my tracking system to find out

how long my current bout of work had lasted and how much I had worked so far that day. (For example, right now the text feedback is "15 minutes of blog, 73 minutes today", which means I've spent 15 minutes writing this blog and before that worked 58 minutes on something else.)

Let me repeat what I said in another post: This was a big surprise. I collected this data for other reasons, which had nothing to do with graphical feedback. Before this project, I had made many thousands measurements of work time, but they were (a) tied to writing, not all work and (b) recorded inside the program I use for writing (Action Outline). Using R would have been slightly harder – that's why I used Action Outline. I never studied the data, but I had the impression it helped.

You may know about the brain-damage patient H.M. His brain damage caused loss of long-term memory formation. He could remember something for a few minutes but not longer. The researcher working with him had to keep introducing herself. A pleasant side effect was that he could read the same thing again and again – a magazine article, for example – and enjoy it each time. This is like that. I am stupid enough that the results of my self-experimentation continue to surprise me (which I enjoy). You might think after many surprises I would stop being surprised – I would adjust my expectations – but somehow that doesn't happen.

AZ (2011-04-10 08:19:01)

Do you manually record how much time you spend working? Is there a way to automate it? I don't think I could do what you did if manually recording is required because I would forget to do it. But if there was a way to automate it (like a computer program in the background), then it could be set up once and ignored until it was time to collect the data.

Seth Roberts (2011-04-10 13:05:55)

When I start a task I go to the R window and type something; when I stop doing a task, I go to the R window and type something. In that sense it is not fully automated.

joe (2011-04-10 22:14:12)

This is tremendously important. On top of that, it's way bitchin'. :-)

Brandon Thomson (2011-04-13 00:01:48)

Interesting. I wonder if a more interactive or animated type of visual feedback could increase efficiency further or would reduce it by being too distracting.

Seth Roberts (2011-04-13 02:16:05)

If it were always present on my screen, that might make a difference. I don't see what can be animated.

## Shangri-La Diet Success Story (2011-04-11 05:00)

On the [1]Shangri-La Diet forums I found a link to this:

[2]A middle-aged man named Kainin has lost about 60 pounds since September (7 months) and described his experience in great detail. On Weight Watchers, he lost 40 pounds in 6 months before gaining it all back (plus 10 pounds more) – he started at 290, went down to 250, and back up to 300. On Nutrisystems, he lost 20 pounds in 6 weeks before gaining it all back. So the Shangri-La Diet has already helped him more than those two methods, not to mention being easier.

At the end of February, his BMI went below 35, the level indicating Morbid Obesity.

To celebrate I went to the local party store to look for a mylar balloon saying something like "Congratulations on being just Obese!" but found – NOTHING! The closest I found was a bereavement balloon that read "Sorry for your Loss". Not exactly what I was looking for.

The roughly 100,000 posts on the SLD forums make the case for the diet far better than I ever could. Now, if I could just get rid of spammers ...

1. <http://boards.sethroberts.net/>

2. <http://boards.sethroberts.net/index.php?topic=7713.0>

---

PONYTALE (2011-06-04 08:17:20)

I am so happy for you Kainin. I've been on SLD for 1 week and lost 8 lbs. I started at 350 and weighed in today at 342. I only half did it and got great results. I do 3 tbs. ELOO in the morning before work and get in SW during the day. I still have some hungry periods and that's when I start to drink the SW. I don't quite have the 2 hr window together yet but I'm working on it. This is a diet (I mean a way of living) that I can use the rest of my life.

## Statins Reduce Cholesterol But Not Heart Disease Progression (2011-04-12 05:00)

The notion that high cholesterol (more specifically, high "bad" – LDL – cholesterol) causes heart disease may be as widely accepted as the notion that humans have caused dangerous global warming. It is much easier to test, however. [1]An excellent study published in 2006 compared two groups of people at risk for heart disease: those given a high dose of statins and those given a low dose. The high dose reduced LDL cholesterol levels; as it was meant to; the low dose did not. But there was no effect on coronary heart disease progression. After a year of statins, persons in both groups had increased their coronary artery calcification score by the same amount – about 25 %. Totally contradicting the cholesterol hypothesis.

Regular readers of this blog may remember that after a year of eating butter (half a stick per day), [2]my coronary artery calcification score decreased 24 %. Because increases of about 25 % are the norm, my score was about 50 % less than expected. Decreases are very rare, I was told.

Thanks to [3]Hyperlipid. [4]Statin side effects.

---

Ragout (2011-04-12 07:50:30)

Saying that the study "compared two groups of people at risk for heart disease" leaves out a crucial fact. The study compared two groups of people \*who responded well to low doses of Lipitor\*. That is, patients with high bad cholesterol (<160) were recruited and treated with 10mg Lipitor. If their bad cholesterol fell below 130, they were kept in the study, and only then were they split into the low-dose (10mg) and high-dose (80mg) groups. About half the patients were excluded from the study due to their inadequate response to low-dose Lipitor. So we can conclude that \*among people who responded well to low-dose Lipitor\*, high-dose Lipitor provides no additional benefits (at least according to the measure used in this study). To me, it seems foolish to draw more sweeping conclusions than that from this one study. And of course, none of this changes the fact that other studies have found that Lipitor and other statins reduce the incidence of stroke and heart attack.

UncleLongHair (2011-04-12 12:06:46)

I find that the conclusions from these studies are always highly qualified, for example: "Using high doses of cholesterol-lowering drugs called statins appears to reduce the risk of heart attack, stroke or the need for additional cardiac procedures more than regular doses of statins in people who have had a stroke or suffer from heart disease, two new studies find." This applies only to certain high-risk individuals, which doesn't include Seth, me, or most of the population. So while this is interesting to a small subset of the population, it isn't accurate to say that "Lipitor and other statins reduce the incidence of stroke and heart attack" without lots of qualification, at least say "in certain people under certain circumstances." I agree with what Seth and many "statin skeptics" state or imply, which is that nobody should rush to put themselves on an extremely strong drug for the rest of their lives if they are healthy to begin with. This is just common sense. Where are the studies that compare a sedentary lifestyle and high-carbohydrate diet to the opposite, and then measure the health effects? I don't think we'll see any, because there is no money in it.

Sean Estey (2011-04-12 18:53:14)

The best part is the last sentence of the abstract for this study: "The possibility remains that the time window was too short to demonstrate an effect." Yes, more testing is definitely needed. Never mind the 6 decades of repeated failures to confirm the Lipid Hypothesis. Never mind that the results of the Framingham study in 1960 should have been enough to falsify the theory. Let's just keep spending more money and misapply more research resources and beat this dead horse some more.

Seth Roberts (2011-04-12 23:02:35)

The benefits of statins – in studies done sparing no expense to maximize those benefits – are small. Here is a reference about this: <http://pharmamkting.blogspot.com/2008/01/statin-lottery-number-needed-to-treat.html> which doesn't even factor in the cost of the bad effects of statins. It is interesting, to say the least, that one of the most prescribed drugs in the world is barely (if at all) beneficial. The study I describe here suggests why: It is based on wrong ideas.

Ragout (2011-04-13 05:40:06)

Statins are "barely (if at all) beneficial?" I think you mean that randomized clinical trials haven't demonstrated large long-term benefits. For someone who's so skeptical of clinical trials, it's odd that you're implicitly demanding a 20-year randomized trial

when the trials already conducted suggest major benefits. That is, according to the business week table at your link, statins are awesomely effective in preventing a second heart attack (in people who've already had a first). Just that, plus the fact that statins seem to work by preventing plaque build-up in the arteries suggests that long-term use by those at moderate risk is likely to be highly beneficial. Add that to the fact that such use by those at moderate risk has some benefits even in the short term (reducing risk of a cardiac event from 1.5 % per 3 years to 1.0 %) seems like a very strong argument for long-term use to me. Against that very strong evidence, you cite (unspecified) "wrong ideas," (implicitly) cite the lack of a very long term clinical trial, and (reasonably) point to side effects. I think I'll keep taking statins, thank you very much, and stop if side effects develop.

Seth Roberts (2011-04-13 07:28:56)

I meant my critical remarks to apply to the use of statins for primary prevention – that is, given to people who haven't yet had a heart attack. That's how most statins are used. Here is a paper about the overselling of statins: <http://www.ncbi.nlm.nih.gov/pmc/articles/PMC1079612/> for primary prevention. Here is a quote from that article:

Does the doctor say: 'Mr Smith, if you take statins this will reduce your risk of dying from heart disease by 30 %'? Or does she say: 'Mr Smith, if you take statins, then in seven years' time there is a one chance in about 120 that your death will have been prevented'? We argue that the latter is a much more honest version of the clinical reality.

UncleLongHair (2011-04-13 08:47:27)

>> ...statins are awesomely effective in preventing a second heart attack (in people who've already had a first). Just that, plus the fact that statins seem to work by preventing plaque build-up in the arteries suggests that long-term use by those at moderate risk is likely to be highly beneficial. << I think it's the leap from your first sentence to your second one that many find objectionable. There are studies that show benefit for certain high-risk individuals. But none that show benefit for healthy people, and many that show harm. Assuming that something that makes sense for high-risk people also makes sense for low-risk people just doesn't logically follow. Some studies have found that moderate smoking can help prevent Alzheimer's in certain groups of people. Should we extrapolate from this that the general population should begin to smoke moderately in order to prevent Alzheimer's? Obviously not.

Ragout (2011-04-13 10:04:30)

*in seven years' time there is a one chance in about 120 that your death will have been prevented* Yes, if you only examine \*direct evidence from randomized clinical trials\*, you can only show that statins have this (pretty important) benefit for those with some cardiovascular risk factors. But why do we have to limit ourselves to this tiny slice of the evidence? In fact, there is every reason to believe that statins are even more beneficial when taken for decades. Many heart attacks and strokes are caused when blood clots lodge in arteries that have been narrowed by plaque buildup. Many studies have shown that statins reduce this plaque buildup ([1]for example). Applying the slightest bit of deduction to these facts, we can conclude that statins, taken over many decades by those moderately at risk, are likely to reduce the incidence of heart attack and strokes.

1. <http://www.ncbi.nlm.nih.gov/pubmed/9264419>

Seth Roberts (2011-04-13 14:27:36)

Thanks for the reference. You write: "many studies have shown that statins reduce this plaque buildup". If it's so clear and repeatable, why did the study I discuss fail to find a difference in plaque build up between a high dose and a low dose? As far as I can tell, the authors expected a difference – agreeing with you – but they didn't find one.

Ragout (2011-04-13 14:30:37)

*Some studies have found that moderate smoking can help prevent Alzheimer's in certain groups of people.* We know little about the causes of Alzheimer's and I doubt we have much idea about how smoking might prevent it, so of course we shouldn't be convinced by one study. But we know tons about the causes of heart attacks (e.g., blood clots lodging in plaque-narrowed arteries), and we know tons about how statins suppress one cause of heart attacks (statins suppress plaque build-up). That really ought to be enough to convince us of the benefits: studies that show that statins actually do prevent heart attacks are just icing on the cake.

Ragout (2011-04-13 15:40:26)

*why did the study I discuss fail to find a difference in plaque build up between a high dose and a low dose?* I could explain why I think their power analysis was incorrect, and hence the sample size was much too small to detect the expected effects. But I doubt you mean this as a serious question, so I'll just give a general answer. The main reason is that they were testing high-dose vs. low-dose statins, rather than statins vs. a placebo, so one can expect smaller effects that are harder to detect with a small sample. Of course, they designed the study that way because the benefits of statins have become so widely accepted in the medical community that it would now be unethical to test statins vs. placebo.

Seth Roberts (2011-04-13 15:46:52)

I did mean it as a serious question. What's the answer? "The sample size was much too small to detect the expected effects." The sample size was about 500 people. You seem to be saying that the effect was so small that an experiment – not a survey, an experiment – of thousands of subjects would have been necessary to detect it. Experimental psychologists routinely find reliable effects with  $n = 8$ . The beneficial effect of lime juice on scurvy was noticed with  $n =$  about 10. The idea that such an effect – one that requires a year-long experiment with thousands of subjects to detect – is large is new to me. "The main reason is they were testing high-dose versus low-dose statins". The amount of progression they measured was what you'd expect from people taking no statins. Suggesting that neither the high nor the low dose had an effect.

Ragout (2011-04-13 16:06:36)

*The amount of progression they measured was what you'd expect from people taking no statins.* I think you're wrong to suggest that a 25 % progression per year is some kind of universal law. For example, in the study the researchers cited in their power analysis (Callister et al), untreated patients experienced a 50 % progression per year. Anyway, here's the mistake the authors make in their power analysis (used to determine the needed sample size). The authors write: "With regard to the sample size, a reduction of LDL cholesterol levels by 20 % was expected in the 80-mg atorvastatin group compared with the 10-mg atorvastatin group. On the basis of results presented by Callister et al<sup>16</sup> with a regression coefficient of 0.6, a difference of 10 % between treatment groups was expected for progression of the CAC volume score." Unfortunately for the authors, if you look at the regression in Callister et al, it's a regression of the change in plaque on the \*level\* of LDL cholesterol. But what the authors need for their power analysis is a regression on the \*change\* in LDL, a very different thing, so their power analysis is wrong and they used too small a sample size.

Timothy Beneke (2011-04-13 23:23:45)

I take statins, various blood pressure medications, and now a drug for diabetes, plus baby aspirin, plus an antidepressant. When I asked my doctor, who I respect, whether we really know that these are helping prolong my life, he was honest. He said we don't know, but that something is helping at-risk people like myself to live longer with fewer heart attacks and strokes; it could be reducing stress or better aerobic exercise, or people changing their diets, more than the medications. There is simply no way to disentangle what is causing the positive effects, but no one is denying that people at risk who take these drugs are living longer, with less morbidity... Correlational data is dubious and you can't do studies where you deprive people of exercise and rest and take it from there. And longitudinal follow-up studies have serious problems as well... So I take them... My intuition is that getting plenty of rest and plenty of exercise are probably the 2 most important factors, but it's only an intuition, probably biased by the fact that I get plenty of both...

Ragout (2011-04-14 04:07:14)

*The beneficial effect of lime juice on scurvy was noticed with  $n =$  about 10.* Presumably – unlike the study you cited – they compared lime juice to placebo! Imagine if ethical considerations forced them to compare 1 oz. to 2 ozs. lime juice, or lime juice to lemon juice!

Seth Roberts (2011-04-14 07:05:35)

A graph that shows plaque change per year as a function of LDL concentration certainly allows one to estimate how much plaque change per year will go down (or up) if LDL concentration is altered. So I am afraid I don't follow your criticism of the power analysis.

Ragout (2011-04-14 09:55:43)

*So I am afraid I don't follow your criticism of the power analysis.* It's wise of you to focus on this distinctly secondary question. I'll answer it, but first, let me ask you about the main question: how you can possibly rely on this study to back up your original claim about statins? To recap: numerous studies of statins against placebo have shown that statins reduce plaque build-up and reduce the incidence of heart attacks and stroke. Now scientists can no longer ethically or legally conduct such studies, since it would be immoral to withhold drugs the medical community has determined are beneficial, so scientists have moved on to secondary questions. In the study you cite, the secondary question is whether high-dose statins have additional benefits in patients already responding well to low-dose statins. Even if the answer to this secondary question is no, how can you possibly conclude that statins have no benefit? On the question of what precisely is wrong with the power analysis of the particular study you cite: surely you don't deny that using change in LDL would be better for the analysis than the level of LDL, since changing LDL is exactly what the authors plan to do in their experiment. More generally, I see no special reason to think that these two regressions will have the same coefficient  $b$ : (1)  $d \text{ Plaque} = a + b \text{ LDL}$  and (2)  $d \text{ Plaque} = a + b d \text{ LDL}$ , where  $d$  is the 1-year change. In fact, there's every reason to think that the  $b$  coefficients will be different. I think that LDL in regression 1 is a proxy for the previous lifetime path of LDL, which is what really matters. By contrast, in regression 2, past values of LDL have been differenced out. In short, what you're really missing is that atherosclerosis (plaque buildup) is a cumulative process that occurs over many years.

Ragout (2011-04-14 11:12:31)

*A graph that shows plaque change per year as a function of LDL concentration certainly allows one to estimate how much plaque change per year will go down (or up) if LDL concentration is altered.* It occurs to me that a simpler answer is: no it doesn't. A graph that shows the level of plaque as a function of the level of LDL might arguably allow one to estimate the change in plaque as function of the change in LDL. However, the graph you mention (changes vs. levels) simply doesn't.

Seth Roberts (2011-04-14 13:27:09)

How can I say statins have no benefit? I don't. I say the benefit is surprisingly small, given how much money is spent on them. Re the power analysis. Your two regressions are: (1)  $d \text{ Plaque} = a + b \text{ LDL}$  and (2)  $d \text{ Plaque} = a + b d \text{ LDL}$ , where  $d$  is the 1-year change. With regression 1 you would look at the graph and compute a difference:  $d \text{ Plaque}$  at one level of LDL minus  $d \text{ Plaque}$  at another level of LDL. That would give you the difference to expect between groups in your experiment. The scatterplot behind the second regression is mysterious (how could it be made? what does it mean?) and could not tell you what difference in  $d \text{ Plaque}$  to expect between groups. One way to make a plot with  $d \text{ LDL}$  on the x axis would be to compute differences between groups. But then the y axis would be  $d d \text{ Plaque}$ , not  $d \text{ Plaque}$ .

Ragout (2011-04-15 05:28:43)

*[Regression 1] would give you the difference to expect between groups in your experiment.* Regression 1 gives you the difference to expect between people with initially low LDL and initially higher LDL, but these aren't analogous to the treatment and control groups in the experiment. In fact, because the experiment is a randomized trial, both groups will have the \_same\_ initial level of LDL, on average. So regression 1, used by the authors of the paper you cited, tells you nothing relevant to the power analysis. More properly, the treatment group consists of people whose LDL will go down more during the course of the experiment compared to the control group. So you make regression 2 by looking at an earlier experiment. For each person in the earlier experiment, you know (a) how much their plaque changed over the course of the experiment and (b) how much their cholesterol changed. You plot a against b. What's so hard about that? (aside: you might want to use only the treatment group in your plot). So Regression 2 would have been the relevant calculation to perform for the power analysis. *I say the benefit is surprisingly small, given how much money is spent on them.* Then you should look at experiments that examine the benefits of statins (vs. placebo), not whether more statins are better than less statins!

Seth Roberts (2011-04-15 16:57:44)

You bring up a good point. I am indeed assuming that the statin changed LDL quickly – in a week, say. If the statin changed LDL more slowly – say, took 1 year to have its full effect – then your comments make sense. I think the statins change LDL quickly – so a person who starts taking a statin January 1 will have much lower LDL (if the statin dose is large enough) for

almost the whole year. But I did not make that assumption clear. I think it is correct, however. Now I understand your Regression 2, thanks. It makes an assumption of linearity that the power analysis done by the authors does not. (For example, it assumes that a change from 80 to 40 will produce the same effect as a change from 60 to 20.) Their power analysis however assumes fast-acting effects of statins, as I said. I don't agree with you that your assumption (linearity) is plainly more plausible than theirs (fast-acting effects), but at least I now understand what you are saying. I prefer dosage-variation experiments to placebo-vs.-treatment experiments because they are far less confounded. I'm afraid that's the last comment I am going to make about this. Thank you, Ragout, for your comments, which have helped me understand this better.

Ragout (2011-04-15 19:28:28)

Prof. Roberts, Your last comment does not accurately describe my position (I think statins are fast-acting \*on LDL\* and I never said or implied otherwise) nor do I think it accurately describe the study authors' (entirely linear) calculations but I certainly agree that I've learned something from the discussion and that we've beaten this topic to death.

Bryan (2011-04-19 08:49:09)

A friend of mine is an ER nurse with over 10 years experience. When I introduced her to your blog and ideas, this was one of the first posts she read. She was appalled. She pointed out that the machines measuring your cholesterol were calibrated a year apart by 2 different techs and wondered if one of the readings might be an outlier.

Seth Roberts (2011-04-19 21:08:14)

Bryan, I'm afraid I don't understand your friend's comments. Why was she "appalled"? I would have thought someone in health care would be happy that I managed to reduce my heart disease risk. By "the machines measuring your cholesterol" I assume you mean the machine measuring my heart disease progression. My two heart disease progression measurements were done on the same machine. I strongly doubt your friend knows details of the machine's calibration, such as who calibrated it ("two different techs"), when it was calibrated ("a year apart"), and the accuracy of the calibration. Neither of my measurements is unusual, that is, neither is an "outlier". It is when they are compared that the results are unusual.

Bryan (2011-04-20 11:37:09)

My fault for not being more specific: she was appalled that you were eating so much butter b/c it totally contradicts everything she knows about nutrition.

Lumberton (2011-04-20 15:35:03)

Let me just offer some appreciation to Ragout for his critical analysis, insights, and responses here. His comments suggest how difficult some of these phenomena are, and how important it is to be wary of cut and dry inferences from complex studies.

## **Another Reason the Shangri-La Diet is Not More Popular (2011-04-13 05:00)**

On [1]my Psychology Today blog someone left a surprising comment about why the Shangri-La Diet isn't more popular:

Seth, I'll tell you why. Because we are majorly competitive bitches, we women who care about our appearance. I'm 41, I have three children and I am a size 6. I fit into my wedding dress and the jeans I wore in college. How? Shangri-La. And there is no way in hell I am going to share my secret with anyone.

Went to the movies this weekend with a group of friends. They had the usual movie fare, I ordered a cup of tea (bag on the side), added two tablespoons of sugar (put the teabag in my purse for later), sipped it slowly throughout the movie, had not ONE craving for the popcorn or nachos or M & M's everyone else was scarfing. I went home and had a light dinner and felt terrific!

Sounds more like an ad than an actual comment, but it could hardly be more vivid and I believe it.

1. <http://www.psychologytoday.com/blog/personal-science/201104/the-shangri-la-diet-why-no-revolution>

---

john (2011-04-13 06:18:25)

That's pretty funny. Whenever I come up with a nice idea (not necessarily nutrition), I always go back and forth about whether to share it or not. In the end I usually do share because it's exciting and fun to talk about, but it's easy to understand why some may not.

UncleLongHair (2011-04-13 12:01:56)

I think the reasons why the diet is not more popular is because it flies in the face of conventional thinking, and it isn't continuously promoted. The unconventional nature would appeal to a certain small subset of the population that likes to try offbeat things or believes that solutions are to be found in unusual places. This will gain traction with certain people but in order for the idea to attain a broader appeal, it has to be packaged in a way that it can be easily consumed (the idea, not the diet). The Atkins diet was unconventional, but was also heavily promoted, not just with a single book but an orchestrated marketing campaign. For example Wikipedia says that the Atkins Center had 87 employees in the mid-90's. People with a scientific / engineering bent often think that a great idea will market itself. This is the downfall of many a nascent software company for example. Unfortunately, this isn't true. An idea needs to be effectively and continuously promoted in order to take hold.

Brian (2011-04-13 17:00:40)

In my experience, women generally do not discuss diets unless they're selling something, e.g. if they work for Weight Watchers. Men discuss successful diets with anyone who will listen.

Seth Roberts (2011-04-13 17:25:43)

Brian, last night I told a female friend of mine about the competitive-women comment. She thought it was very funny and said she wouldn't be like that - she would tell her friends. So I guess in a year - if it works for her - I can ask her how many friends she has told.

Denshil (2011-04-14 00:26:09)

U can use the comment as an ad on your cover " A method that girls never share" or something When will this good method have Chinese translation

Jenny (2011-04-14 04:46:16)

Makes me chuckle. I think the comment says more about the commenter than about the commenter's diet. When I find something that works in some way, I want to scream it from the rooftops so that all my friends and family could reap the benefits, (but I put a lid on it for the most part not to be a nag, unless they ask). Why wouldn't I want people I love to lose weight and feel better?

Nansen (2011-04-14 12:39:07)

Too much nobility is required to bear the frustrations of trying to overcome people's resistance-to-the-weird.

Jon (2011-04-15 10:07:33)

Brian is right on the money. In addition trying to share something even with relatives is tough. Everyone has their own way of thinking, mine just happens to have become so calculative that I take in ALL DATA and FACTORS and form a very comprehensive world view that incorporates all perspectives and facts. Other people only siphon what is of interest to them and refuse to step outside of their comfort zone, and effectively restrict themselves to strict parameters that do not vary. Sharing may be caring

but not many people are receptive to care these days :)

Steph (2011-04-15 13:59:16)

Jenny, I'm with you. I loved the SL book, and have been using the oil (not consistently - need to get back on track), and I love how it helps suppress appetite, and I did a post about the SL diet to spread the word, and told some family members who confided that they want to lose weight, and gave the book away to one of them... And there have been no takers, just polite, "Oh! Interesting. Well, I just need to make better food choices and get moving..." Which is great, but not at all incompatible with SL. I don't know why anyone would NOT try something that is 1. safe, 2. painless, 3. healthy, and 4. potentially very effective for weight loss. I'm stumped.

Alex Chernavsky (2011-04-15 20:49:37)

Steph, I think it might be a psychological effect whereby you're more likely to explore some interesting, off-the-wall idea if you've discovered it through your own research vs. having someone (particularly a relative) recommend it to you.

Steph (2011-04-16 03:44:18)

"Particularly a relative"...I'm sure you're right, Alex. And it's true, I also like to be the "first" (in my circle) to figure something out. Then I'm happy to have everyone on board. (Again, so long as I got there first...gah, such an ego.)

#### Downward Spiral of Whole Foods House Brand (2011-04-14 05:00)

My friend Carl Willat sent me this photo with the comment "noticeably worse" – meaning that the new version (on the right) is noticeably worse than the old version (on the left). 365 is the Whole Foods house brand. Years ago, the

label of 365 balsamic vinegar said "aged 5 years". Then one day it didn't. The younger vinegar (aged 1 year?) tasted noticeably worse. In a side-by-side comparison, it was obvious.

Side-by-side comparisons, I discovered thanks to Carl, are powerful – and I could use that power to improve my life. A long time ago at his apartment I tasted five versions of limoncello (Italian lemon liqueur) side by side. Of course the differences became clearer—that's obvious. The surprise was that all of a sudden I cared about the differences. Before that tasting, I had had plenty of limoncello. But only at the side-by-side tasting did I develop a liking for the good stuff (more complex flavor) and a dislike for the cheaper stuff (simpler flavor). I stopped buying cheap limoncello and started buying expensive limoncello. I got a lot of pleasure out of it. I still do this. A few weeks ago I bought some rum to flavor my yogurt. I started with the cheapest brand. A week later, to compare, I got a more expensive brand. Side-by-side tasting showed it was clearly better. Now I sort of relish it – the side-by-side comparison made rum drinking more enjoyable. Soon I will get an even more expensive rum, to see how it stacks up.

I'm pretty sure such side-by-side comparisons are how connoisseurs are made. The evolutionary reason for this effect, I believe, is that [1]connoisseurs will pay more than other people for well-made stuff, thus helping skilled artisans – during the Stone Age, the main source of innovation – make a living.

In Carl's picture the new vinegar looks much cheaper than the old vinegar. The previous change (from aged 5 years to not aged 5 years) wasn't accompanied by a cheaper-looking label. Maybe Whole Food headquarters had received complaints from manufacturers of other balsamic vinegars: Your house brand is too good. And they replied: Okay, we'll cheapen it.

1. <http://sethroberts.net/articles/2011-04-08%20How%20Economics%20Shaped%20Human%20Nature.pdf>

---

Mike Kenny (2011-04-14 06:46:40)

That reminds me of something I read about McDonald's in a book called "Decision Traps". McDonald's had a rule that guided their decision making—if customers couldn't tell the difference between a cheaper version of a product and the currently used product, replace the currently used product with the cheaper one. But customers started noticing the overall drop in quality. Product A was indistinguishable from cheaper Product B, so Product B was used. Product B was indistinguishable from cheaper Product C, so Product C was used, but Product C when compared with Product A was obviously worse. So went the logic, I guess.

vimspot (2011-04-14 07:06:25)

Do you do a blind taste test, or do you do it knowing the brand and cost of different items? Not sure what's better, blind has the appeal of "rationality" though we never actually drink anything blind. Hence the "pepsi paradox" (in blind taste tests people prefer pepsi to coke, but in real life they choose coke, and even legitimately enjoy coke more when they see that it's a coke) <http://seekingalpha.com/article/198629-pepsi-paradox-or-why-the-iphone-is-poi sed-to-outsell-blackberry>

gwern (2011-04-14 07:43:03)

> I'm pretty sure such side-by-side comparisons are how connoisseurs are made. The evolutionary reason for this effect, I believe, is that connoisseurs will pay more than other people for well-made stuff, thus helping skilled artisans — during the Stone Age, the main source of innovation — make a living. That sounds like group selection... What's in it for the would-be connoisseur? Also, in your paper, you missed a great example - better than buying stuff in China - of how language isn't necessary for barter; the African [http://en.wikipedia.org/wiki/Silent\\_trade](http://en.wikipedia.org/wiki/Silent_trade)

Alex Chernavsky (2011-04-14 11:19:01)

It wouldn't have surprised me if the cheap vinegar tasted as good as or better than the more-expensive vinegar. See: <http://www.bbc.co.uk/news/uk-13072745>

Seth Roberts (2011-04-14 13:37:27)

I've noticed the connoisseur effect (an increase in both (a) the hedonic range produced by a product – more pleasure from the best, less pleasure from the worst – and (b) discriminability) in both blind taste tests and non-blind taste tests.

Seth Roberts (2011-04-14 13:47:03)

"That sounds like group selection." I suppose. I disagree with the Williams et al. arguments against group selection. There is plenty of shared fate in a community (whether your neighbor survives affects whether you survive) – for one reason, if all the fertile and younger females go extinct all the males will also go extinct. Shared fate also comes about if one member of a group can follow another member of the group to a food source. This shared fate, which does not depend on degree of kinship and which the critics of group selection didn't notice (at least in what I've read), is why I believe cooperation between unrelated members of a community evolved. By helping (unrelated) others survive, you were helping yourself survive. In the particular example you mention, communities with connoisseurs outinnovated communities without connoisseurs. Thanks for reading my paper and thanks for the Wikipedia reference.

Carl Willat (2011-04-14 15:55:52)

The 365 vinegar originally came to my attention many years ago when the Chronicle ran a blind taste test on several balsamic vinegars and the Whole Foods house brand won, surprising the local food experts who had acted as judges, because back then it only cost \$4. The quality really did decline when they stopped aging it as long, but recently when they stopped aging it in wooden barrels it got a lot worse. When the bottles with the new label first appeared I immediately bought what was left of the old stock on the shelf at my local store, so I still have about ten bottles left that have been aged in wood. I go through that stuff pretty fast, though, so I need to find a new brand.

Lumberton (2011-04-14 19:24:10)

Has anyone thought to ask for a comment from whole foods?

Seth Roberts (2011-04-14 22:53:46)

"so I need to find a new brand" – yeah, the outside brands were right to complain. Or maybe this is just an example of making stuff worse and worse until people complain loudly enough.

UncleLongHair (2011-04-15 07:21:24)

The publication Cook's Illustrated and the associated TV show America's Test Kitchen does legitimate side-by-side comparisons of various food products, and the results are often surprising (sort of, unless you're somewhat cynical of consumer marketing). Often the cheaper products rate better, and those that are more expensive, "organic", or endorsed don't rate as well. Not always though, sometimes the more expensive products rate better. In the case of both rum and balsamic vinegar, I can say with some experience that there is a radical difference in flavor between cheap and not-cheap products, and both are products where you almost always get a better experience the more that you spend. The same is not true of other products such as say supermarket chicken stock.

Carl Willat (2011-04-15 10:00:22)

I once did some commercials for one of the big brands of instant coffee. Before we got started I was talking to the brand manager for the product, and I asked him if it were any good, if I would like drinking it. He said I would probably prefer one of their more expensive brands. "But what about the one we're selling, does it taste good?" He explained that the idea wasn't to make it good, but to make it as bad as possible but where people would still buy it. That way they knew their profit margins were maximized. "So can you honestly say anything good about this coffee we're advertising?" I asked him. "It has a low twig count."

Seth Roberts (2011-04-16 07:28:11)

Low twig count...I wonder why that's good. I like Japanese twig tea.

Kevin Burton (2011-04-16 12:16:57)

There's also the fact that Whole Foods sells homeopathic remedies which is no fun...

Robot Zorro (2011-04-16 14:59:16)

whitewhine.com

Seth Roberts (2011-04-16 17:50:59)

haha!

Joe (2011-04-19 22:44:51)

Reminds me of a story I heard over twenty years ago about the Xacto company. They had a solid business, but revenues and profits were basically flat for many years. So they brought in an expert to make suggestions. The expert told them that their problem was that they were using too good an alloy in their blades. As a result, the blades never went dull, so were only replaced when they broke (a rare event.) They took his advice and went to a softer steel. Since there aren't any Xacto blade sharpeners, sales (and profits) exploded.

If you live in Beijing, it may interest you that on April 23 (Saturday) I will give a 30-minute talk at Tsinghua University (Weiqing Building, Room 507) titled "The Value of Personal Science". The talk will start at 1:30 pm.

---

Thussy (2011-04-17 11:24:23)

Professor Roberts, What time will the 30-minute talk begin? Thanks

Seth Roberts (2011-04-17 12:53:42)

oops! The talk will start at 1:30 pm.

### **Dear Gmail: Publish Break-in Stats (2011-04-16 05:00)**

A year ago my gmail account was hacked. I recovered it in an hour or so, not before a friend of mine had [1]an amusing conversation. Recently, judging by [2]James Fallows's experiences, there has been a rise in these attacks. My mistake, I believe, was using the same password on my gmail account and another account. I suspect the recent outbreak of gmail break-ins is happening because there was recently a large exposure of passwords elsewhere.

But I can't be sure because I cannot compare break-ins over time. What does a graph of break-ins-versus-time look like? Is what Fallows has noticed a recent spike? (It probably is.) If so, that supports my explanation of its cause (passwords lost elsewhere). Or has there been a steady increase over time? That would contradict my explanation. It is revealing that Fallows provides two security suggestions, one of them really time-consuming (two-stage verification) in the long haul. He says nothing about making sure your gmail password is not used anywhere else. If he could have seen that break-ins-versus-time graph, he could better judge whether the gmail hacks are due to duplicated passwords. If I am right about the cause of these hacks, Suggestion #3 should have been [3]don't use your gmail password anywhere else – and would have been the most effective.

Gmail developers can help all of us be safe at reasonable cost by publishing graphs that show break-ins (and probability of break-in) per day. I think that is estimated by the number of account recovery requests they receive per day. After my gmail account was hacked, I contacted Google to recover it and soon did. Perhaps those account recovery requests could involve the person making the request giving a reason (e.g., "account hijacked"). Then Google could simply tell us (with a graph?) the number of hijacked accounts reported per day.

Security departments and others don't like to provide this sort of information. Persons at the top of companies worry it will scare customers! Those in security departments worry people will be less scared – thus reducing their power. From a user point of view these are horrible reasons not to make this information public. With accurate knowledge of the likelihood of break-ins, gmail users can make reasonable estimates of the costs and benefits of various security

options. Without knowing the likelihood of break-ins, they can't.

### Yogurt Accident/Discovery (2011-04-17 05:00)

I've made yogurt a few hundred times, mostly with a yogurt maker (picture below). The usual recipe is 1 quart milk, 1/4 teaspoon whey (from previous batch), incubate 24 hours. Yesterday, after incubation finished, I opened the machine to find this:

[1]

The milk (now yogurt) had squeezed together to form a perfectly round disc a few inches thick. It had squeezed out all the whey. The only unusual feature of this batch – besides the fact that it is getting warm and relatively humid here in Beijing – is that I used maybe 10 % less milk than usual. This difference means the pulling inward force was less resisted by sticking to the sides, so this outcome indeed was more likely than usual.

This is my yogurt maker.

[2]

I bought it because it came with a glass bowl. Most yogurt makers have only a plastic bowl. You simply pour the milk in the glass bowl, add the starter (whey), add hot (boiling) water around the glass bowl, and wait a day – infinitely easier than the [3]insanely complicated yogurt recipes I find on the Web. And I am beginning to think the hot water is unnecessary.

---

Richard Gay (2011-04-17 06:01:54)  
Does this require raw milk?

Seth Roberts (2011-04-17 12:54:37)  
no. I used regular milk – an expensive Chinese brand.

Margaret (2011-04-17 19:11:23)  
Did the yogurt disk taste okay?

Seth Roberts (2011-04-17 22:19:48)  
yeah, the yogurt disk tasted fine. Texture of crumbly cheese cake.

Mike (2011-04-19 17:28:30)  
Cute yogurt maker Seth.

Cakeb Cooper (2011-04-21 15:29:54)

You probably already saw Paul Jaminet's post on how things that threaten potential pathogen infections upregulate HDL, and how HDL plays a key role in the immune system. It made me immediately think of your theories about fermented foods improving the immune response. Do you think the mechanism might be fermented foods signaling the body to make more HDL?

Seth Roberts (2011-04-21 16:47:38)

Caleb, I doubt it's that simple. I believe fermented foods – more specifically, the bacteria they contain – cause the immune system to become more active. When it becomes more active lots of things happen. I now eat far more fermented foods than I ate several years ago but my HDL isn't much different.

seagull (2011-04-22 12:02:22)

1/4 teaspoon of whey seems like a tiny amount for a quart of milk - I use much more than that, but maybe I'm using an unnecessarily large amount.

Seth Roberts (2011-04-22 15:39:43)

Seagull, I tested smaller and smaller amounts and got better and better results. Better in the sense that the final product was more uniform. Smooth, not lumpy. With less starter, I suppose you need a longer incubation time.

## My Treadmill Desk (2011-04-18 05:00)

[1]

[2]In 1996 I put a treadmill in my office so that I could work standing up. My goal was better sleep ([3]the more I stood, the better I slept), not weight loss ([4]the usual reason for a treadmill desk). It was hard to walk a lot. Mostly I stood still. It was noisy, too – my neighbors complained. When the treadmill broke I didn't replace it.

Now I walk on a treadmill for different reasons: to [5]lower blood sugar and [6]learn Chinese. Above is my current setup. I use the laptop to study Chinese (using Anki) or watch TV or movies. Studying Chinese while walking is much easier than studying Chinese while standing still or sitting. I have used flashcards but Anki (shown on the computer screen) helps space repetitions optimally. The headphones (Bose noise-reduction) are for TV and movies. I don't need them for Anki.

---

Tobias (2011-04-18 10:54:13)

Now that more people view you as some sort of guru of quantification, and lest you want to become like the pompous academics you constantly make fun of, I'd suggest you start qualifying your statements for your broader audience ("Studying Chinese while walking is much easier than studying Chinese while standing still or sitting.") This is not true for me.

Seth Roberts (2011-04-18 22:33:40)

Thank you for your advice about over-broad statements – I agree. I should have said I find it much more pleasant to study Chinese while walking than while sitting. That's not true for you? How long have you studied it?

Marcus Yogaman (2011-05-02 07:34:56)

Great idea Seth! Does it not get a bit off putting? ie. is it really easy to concentrate whilst walking on it?

Seth Roberts (2011-05-02 21:22:48)

It is easy to study Chinese, if that is what you mean by "concentrate".

Daniel (2011-08-31 10:42:46)

Haha, this looks like a great setup. I've also heard of people using stationary bikes or something similar. I agree that I am able to think a lot more when I'm walking, in fact going to take a walk is one of the best ways for me to clear my head or sort something out that I'm thinking about.

## **What I'm Watching (2011-04-19 05:00)**

1. The Killing (the American version on AMC). The best TV is getting smarter and smarter and this is an example. It seems formulaic (combine good acting, good writing, good visuals, suspense . . . ) but the formula is so effective and well-executed I am drawn in.
2. The Good Wife. The last drama standing.
3. The Spice Trails. The global and historical origins of pepper, cinnamon, nutmeg, cloves, saffron and vanilla.
4. Civilization: Is the West History? Pleasantly conceptual. Why did China decline, while Europe rose? Why did democracy do so much better in North America than South America?
5. A History of Ancient Britain. Through the eyes of an archeologist.

## The Global Warming Test (2011-04-20 05:00)

One episode of [1]A History of Ancient Britain, the recent BBC series, is about the Ice Age. If you know there was an Ice Age, you should grasp that the Earth varies in temperature a lot for reasons that have nothing to do with human activity. To measure the effect of recent human activity on global temperatures, you need to know what the Earth's temperature would have been in the absence of human activity. Then you find the effect of humans by subtraction (actual temperature - predicted temperature assuming no human activity).

That's hard to do. Because the non-human effects are so large, you need a really accurate model to "control" for them. No such model is available. No current climate model has been shown to accurately predict global temperatures - [2]the IPCC chapter called "Climate Models and Their Evaluation" (informal title: "Why You Should Believe Them") is the most humorous evidence of that. Lack of accurate predictions means there is no good reason to trust them. (That the models can fit past data means little because they have [3]many adjustable parameters. "With four parameters I can fit an elephant," [4]said John von Neumann.) The case against the view that humans have dangerously warmed the climate (sometimes called AGW, anthropogenic global warming) is that simple.

Because it is so simple, "the other side" consists of saying why 2+2 really does equal 20 or whatever. Sure, many people say it, so what? When I was an undergrad, I gave a talk called "The Scientific \_\_\_\_". I said usage of the term scientific without explaining what it meant was a sign of incompetence and a reader could safely stop reading right there. That isn't terribly helpful, because few people use scientific that way. My grown-up version of this test is that when someone claims AGW is true, I stop taking them seriously as a thinker. I don't mean they can't do good work - Bill McKibben is an excellent journalist, for example. Just not original thought.

1. <http://www.bbc.co.uk/programmes/b00xchyf>

4. [http://en.wikiquote.org/wiki/John\\_von\\_Neumann](http://en.wikiquote.org/wiki/John_von_Neumann)

---

Timothy Beneke (2011-04-20 16:53:02)

I've followed your global warming comments for some time now and, while I'm relatively ignorant, I'm intrigued. I assume that since we have no adequate models to "control" for non-human causes of global warming we don't know what part of global warming can or cannot be attributed to human activity. So one can neither claim nor deny that AGW is true; all we can say with confidence is that it's getting warmer for reasons we cannot confidently assert. Would you also dismiss as a thinker anyone who claims with authority that AGW is false? Or am I misreading your logic? Or are you claiming that the burden of proof in these matters falls completely on the shoulders of those who support AGW, since it is well established that non-human causes frequently alter climate? Could you tease this out more precisely for me?

Nathan Myers (2011-04-21 00:53:20)

I've asked this before: What evidence could be presented that would change your mind? Famously, J.B.S. Haldane (might have) said a pre-Cambrian rabbit fossil would refute evolution. Slightly less famously, Peter Duesburg says AIDS is not caused by

HIV, and that anti-retroviral drugs are of no value in treating it. He persuaded the S. African govt to withhold them from AIDS patients, with imaginable consequences. I wonder how many people he would need to see pulled back from death's door by such treatments before he would change his mind. What is your rabbit? And what should we conclude if there is none?

dearieme (2011-04-21 02:54:13)

There are two lines of argument advanced in favour of AGW. (i) The present warming is unprecedented. I have three counterarguments to that. (a) Your present day figures are faked: whatever the increase may be, you have exaggerated it with bogus "adjustments" to the data, and by failure to adjust properly for such effects as UHI, airport sitings of instruments, decline in the number of instruments, relocation of instruments, changes in instruments and improperly operated instruments. (b) You have resorted to lies about earlier warm spells to allow you to claim that presently reported warming is unprecedented. (c) Your low levels of competence - for example your woeful grasp of statistics - lets me dismiss that part of your work that isn't dishonest as largely dud. (ii) Our models require CO2 induced warming to allow them to model observed warming. I have three counterarguments (a) you are comparing your models with rubbish (see (a) above). (b) I have written, or supervised the writing of, mathematical models of physico-chemical systems since 1967. Consequently I am aware of the difficulty of modelling such systems, even when results from controlled experiments are available to guide the modeller in his task. Your task is orders of magnitude more demanding than any I have undertaken, and your guidance is from haphazard and incomplete sets of observations of dubious validity (see (a)). I find your hubris about your ability usefully to model the climate just risible. Or, as we say in Britain, "Oh Bollocks!". (c) Not only do I find you hubristic, I am also struck by your generally low intellectual calibre (by the standards of the physical sciences), and inability to think critically. You are, in general, not fit for purpose. Another question, potentially important, is "Suppose that AGW is real - small, perhaps, but real. Then what?" To which I'd reply "Then let's do intelligent economic analyses of the likely consequences rather than just assume that such a change must be a wicked and disastrous thing, to be avoided whatever the cost."

Cam (2011-04-22 19:02:38)

You're not quite as clever as you think you are. AGW and "dangerously warmed the climate" are two separate propositions. Throwing in the "dangerous" is a common trick of climate skeptics. Even John Christie now accepts the AGW part but argues against the dangerous part. Have you stopped taking John Christie seriously as a thinker?

sabril (2011-04-22 19:47:00)

"I've asked this before: What evidence could be presented that would change your mind? " I realize this question is not addressed to me, but I will answer it anyway. (1) If somebody presented a climate simulation which consistently made interesting, accurate, and bona fide predictions, and that same model, when run with pre-1950 CO2 levels predicted a much cooler world than what we got over the last 50 years. In that case, I would accept that recent warming is largely due to increased levels of CO2. (2) If somebody demonstrated that recent temperatures (or rates of increase) are well outside the range of natural variation, I would accept that mankind's activities are likely the cause. (3) If somebody developed a theory of climate which explained past temperatures and was sufficiently simple and elegant that it was highly unlikely to be just a coincidence, and that theory predicted significant (amplified) warming due to CO2.

Seth Roberts (2011-04-22 20:25:18)

"Trick"? I use "dangerous" because that's what I mean. Whether humans have had tiny effects on the climate is a question that doesn't interest me. I don't know who John Christie is.

Seth Roberts (2011-04-23 00:19:29)

Thanks, sabril. I come close to agreeing with that. Basically my answer is your #1: (a) someone creates a climate model that makes accurate predictions and (b) that model - run with and without the effects of humans - shows that humans have dangerously warmed the planet. As for #2, I think it is clear that current temperatures and rates of temperature change are not unprecedented. As for #3, I think too many parameters need to be estimated from the data relative to the amount of data. Fitting past data will not convince me of anything.

Seth Roberts (2011-04-23 00:30:45)

We don't know if AGW is true. That's what I believe. To claim AGW is false is less egregious, because there is no clear AGW "signal" (e.g., unprecedented rates of warming). But, yeah, to be sure it is false is also going beyond the evidence, in my opinion. As a practical matter, I think we should spend our attention on things that are undeniable problems. There are plenty of those. Perhaps AGW will someday be an undeniable problem, or maybe not. Quite apart from AGW, it's important to develop new sources of energy and (what amounts to the same thing) conserve energy.

sabril (2011-04-23 05:52:11)

"As for #2, I think it is clear that current temperatures and rates of temperature change are not unprecedented" I agree 100 %. You don't even have to look back far or do anything sophisticated to find precedent. For example, melting glaciers in the Alps have revealed mountain passes used by humans during the Medieval Warm Period. The reasonable inference is that temperatures now are roughly the same as they were then. "As for #3, I think too many parameters need to be estimated from the data relative to the amount of data. Fitting past data will not convince me of anything." Well I'm talking about a model without this problem of parameters. For example, suppose somebody came up with the hypothesis that global surface temperature change is the result of cosmic radiation. Suppose we let T represent global surface temperature anomaly (in degrees Celcius) and C represent cosmic ray intensity anomaly in watts per square meter. And suppose we knew T and C pretty accurately for the last 2000 years. What if it turns out that  $T = aC$  holds true from Year 1 to 1950, where a is a constant, the only parameter in use in the model. In that case, I would be reasonably convinced that global surface temperature anomaly really is caused by cosmic rays. Further, if temperatures after 1950 were significantly and increasingly higher than  $aC$ , I would agree that they are probably the result of man's activities. Of course, the difference between this model and the simulations being pushed on us today is that my hypothetical model has one and only one parameter. Further, there are a priori reasons to believe that cosmic ray intensity might affect global surface temperatures. So the chances that the relationship is a coincidence are pretty low. By contrast, and as you point out, the situation where a model or simulation has dozens of parameters is very different. There's actually a very good chance that the fit with history is just a coincidence.

sabril (2011-04-23 06:41:29)

"We don't know if AGW is true. That's what I believe. To claim AGW is false is less egregious, because there is no clear AGW 'signal'" I would actually go further than this and say it's possible to be reasonably confident that AGW is false. The key point is that AGW is actually two completely independent hypotheses, which are as follows: (1) Increased levels of CO2 in the atmosphere will result in mild increases in global surface temperatures; and (2) Any such mild increase will be amplified to dangerous levels through the mechanism of water vapor feedback. i.e. temperature increases will cause more water to evaporate and since water vapor is itself a greenhouse gas, surface temperatures will increase further, and so on. If (2) is not true, then mankind does not need to worry about AGW since any temperature increases will be too small to make a big difference. Anyway, there is good reason to believe that (2) is false. For one thing, it posits positive feedback which would be unusual in a system which has been around for a long time. If you push on a system which has been around for a while, you would normally expect it to push back in the opposite direction. (It's the same thing with your theory about diet and set points. If you start eating less in an effort to lose weight, your body system will push back by reducing its metabolism and increasing your appetite. Negative feedback. Which makes sense – systems which have been around for a while tend not to go into death spirals when they are stressed. Because if they did, they would have disappeared long ago.) So one would naturally expect that warming due to CO2 will be dampened by the climate system and not amplified. The second piece of evidence is that there is no "hot spot." i.e. The theory of CO2 induced global warming enhanced by water vapor feedback predicts enhanced warming in the air 10km above the surface in the tropics. The actual measurements don't seem to bear this prediction out. See here: <http://joannenova.com.au/2008/10/the-missing-hotspot/> Based on these two points, I'm pretty confident that AGW (as the term is popularly understood) is false, although I do agree that mankind's CO2 emissions are likely to cause some increase in global surface temperatures.

Seth Roberts (2011-04-23 14:52:47)

I agree, it is comforting that the system has been around a long time. On the other hand, the human race has been around a long time and just recently (around 1980) the obesity epidemic – a massive failure of a feedback system – began. Feedback

systems can work fine for an extremely long time and then fail. In the case of climate, it is obvious, as you say, that the negative feedback has overwhelmed the positive feedback for a very long time (the entire history of the Earth). But that could change – e.g., due to changes in land cover. But I have had the same experience as you. The more I have looked at this, the more I encounter evidence suggesting that AGW is wrong.

sabril (2011-04-23 16:56:42)

"On the other hand, the human race has been around a long time and just recently (around 1980) the obesity epidemic — a massive failure of a feedback system — began. " That's true, and it's logically possible that CO2 is a stimulus which can overwhelm the system like large amounts of unhealthy foods can foul up a person's health. However, there have been lengthy periods in the past when CO2 levels were far higher than current levels now and temperatures were not very different.

Seth Roberts (2011-04-23 18:55:32)

I believe changes in ground cover (e.g., more asphalt, fewer trees, etc.) may affect the feedback system, causing it to work worse (= reduce negative feedback, increase positive feedback) than in the past. I'm not saying this is true, just that it is a possibility. It is a source of uncertainty that causes me to back away from strong statements either way about AGW.

M (2011-04-23 22:33:55)

It strikes me that you may be applying a higher standard to the AGW question than to other issues. For example, what if your first sentence above was rewritten this way: To measure the effect of [diet change] on [weight], you need to know what the [person's weight] would have been in the absence of [diet change]. Then you find the effect of [diet change] by subtraction (actual [weight] – predicted [weight] assuming no [diet change]). My understanding is that you would say this is wrong and that we don't need a good model of weight in order to make at least preliminary conclusions. So help me out - why the different approach to climate questions? Why your emphasis on models? I agree that there may have been some (or even a lot) of bad climate modeling done. But there are also other approaches to studying climate questions.

Seth Roberts (2011-04-23 23:20:07)

In the absence of exercise or diet changes, most people's body weight is close to constant or increases linearly. So it is easy to see what the weight would have been in the absence of the diet. The diet has a sharp onset and large effect relative to noise (unexplained variation). With human activity and climate there is no sharp onset and no large effect.

Nathan Myers (2011-04-24 04:52:07)

You responded to an apparent one-time 1 % weight gain by dropping all experimentation with cold showers. Yet, increasing CO2 content of the entire planet's atmosphere by 40 %, with half of it occurring during your own lifetime, doesn't count as sharp onset? Remind me not to ask you to call the fire department when I spot a house on fire.

Seth Roberts (2011-04-24 05:49:46)

The existence of a sharp onset for CO2 weakens your case, Nathan. It makes the absence of clear evidence for AGW even more embarrassing to AGW advocates.

Nathan Myers (2011-04-25 22:25:11)

You seem to be saying that both presence of, and absence of, a sharp onset would weaken the case for AGW. What course of events would you *not* take as weakening the case for AGW? Do you disbelieve in global warming, or do you disbelieve in an industrial cause for observed global warming? Statements of one undermine those of the other, but I see both here. Is this an even-day/odd-day thing?

Seth Roberts (2011-04-27 14:50:26)

Nathan, perhaps you could provide me with an example of Stephen McIntyre being dishonest?

### **Google Uses My Credit Card Without Telling Me (2011-04-21 05:00)**

Last week, while looking at Google Voice I noticed a button that said "Get \$10". I thought it meant "get \$10 credit for trying it" so I pushed the button. Ten dollars credit showed up. Since Google Voice is free for the calls I make I had no use for \$10 credit but maybe someday....

A few days later I happened to look at my credit card bill. Google had billed me \$10! I didn't even know they knew my credit card number! It hadn't been required for the \$10 transaction. I haven't consciously used Google Checkout. I haven't given it to them in any other connection. Talk about data mining...

When I go to Account Settings listed under my Gmail address, one of the sections is My Products, meaning My Google Products. Under that is listed Google Checkout, although I've never signed up for it and (I thought) never used it. So why is it there? I looked in Google Checkout. The Google Voice \$10 transaction is the only transaction listed. As far as I can tell, this proves I didn't use Google Checkout in the past (say, 4 months ago) and forget about it. Google really did get and use my credit card number without telling me, much less asking me.

My credit card company quickly gave me a refund.

---

Paul (2011-04-21 11:54:09)

What happened to don't be evil? If more stories like this pop up, Google will lose a lot of customers from bad publicity. This story actually has me thinking of switching to Bing and IE. And doing something about my gmail account.

laura (2011-04-21 12:46:18)

uc berkeley gave me a refund too. although i had to go through hell to get it. not even the manager of the psychology department would give me the refund! i even talked to all these people in person! what worked: my writing. and the fact that i have an ipad2 + 3G. i can write anywhere! refund amount: almost \$1500

Dawn (2011-04-21 15:02:34)

Google knows everything! I took a look under my own Account Settings and I don't have a My Products listed. I guess this means that something you have used seems to have opted you in for the My Products and - I guess - added your credit card in too. Scary. Big Google is watching you!

Sean Estey (2011-04-21 15:21:25)

A similar thing happened to me where I received a receipt for a pair of sunglasses purchased through Google Checkout. I investigated, but the charge had reversed itself. I have never given my credit card to Checkout now used it in my life. Google is really screwing up in the privacy area lately, but at least now that Schmidt has taken a back seat from CEO, the public face of

Google won't be as creepy. The man just radiates creepiness.

Jim (2011-04-23 09:09:44)

if you have an android phone that syncs with your google account that's probably what did it. when you buy an app through your android phone the purchases show up through google checkout.

Seth Roberts (2011-04-23 14:44:59)

Thanks for the suggestion. However, I don't have an android phone. After several days of thinking about this, I am still completely clueless about how Google got my credit card info.

Cordie (2011-04-24 16:32:22)

I was recently forced by Google to cancel my YouTube and Blogspot accounts, even though I had had both accounts since before Google took over those sites. Why? Because Google wanted my phone number in order to let me log in to MY OWN Blogspot site that I'd had for like 2 years already. I don't give my phone number to drunks in bars, creepy guys who hit on me in the library, or anyone else who has no business calling me. The only reasonable response to a dick move like that was to cancel my Google account (which I NEVER signed up for, but apparently got by default when they took over my youtube and blogspot accounts). Cancelling the Google account that I did not sign up for also cancelled (I had no choice about it) my Blogspot, and my Youtube accounts. A few weeks ago, I thought Google was a pretty great search engine, and had no negative feelings about it. Now, I find Google creepy in the extreme, just like the smelly 50-year-old men who hit on me in the library when I was 16 (gross!). I don't use the search engine any more. Other search engines turn out to be completely sufficient for my needs.

Bryan (2011-04-24 19:58:59)

Nothing to complain about here Seth. You were given the money back, no hassel. Besides, GV is a free, but I'm almost 100 % sure that when you first sign up for GV you have to provide a credit card # as ID.

Seth Roberts (2011-04-24 20:29:11)

that's interesting. but I don't have Google Voice, just a cell phone icon with my email. So I never signed up for Google Voice or the cell phone icon among my gmail contacts.

Ben (2012-04-06 20:05:07)

Same thing just happened to me about 5 minutes ago.. I'll be calling my bank first thing in the morning to get this straightened out. I'm not sure where I clicked that Google can randomly charge my check card \$10 but I'm not happy about it.

## **Ten Years of Weight Measurements (2011-04-22 05:00)**

Alex Chernavsky, whose Shangri-La Diet experience [2] I described recently, has recorded his weight for almost ten years, with the results shown in this graph. During that period, he's changed his diet and exercise several times.

The first change was to a low-carb diet (Atkins-like, with lots of meat and fat). He made this change after reading Gary Taubes's New York Times article "What If It's Been A Big Fat Lie?". As advertised, the low-carb diet caused him to lose a lot of weight but – not as advertised – after about a year he started to regain the lost weight. For other reasons, he changed to a vegetarian and later a vegan diet. They slowed down the weight regain but did not stop it. In 2005 and 2006 he managed by walking a lot – in 2006, 90 minutes/day or more 5 or 6 days every week – to lose almost 30 pounds, but then his weight resumed creeping upward. Then he lost about 30 pounds due to the Shangri-La Diet. He did the diet by drinking 3.5 tablespoons of flaxseed oil instead of lunch. He drank a glass of water afterwards to get rid of the flavor.

I have never seen a weight record this long. It suggests several interesting points:

1. A low-carb diet, as advertised, quickly produces substantial weight loss.
2. Not as advertised, the weight loss is followed by regain after a year or so. This implies that studies of low-carb diets and weight loss need to last several years to give a clear picture of how much weight loss to expect.
3. Low-intensity long-duration exercise (walking for 90 minutes almost daily) causes substantial weight loss. This isn't surprising.
4. ... but it is surprising the effects of the exercise appeared to last at least a few years after the exercise was stopped. I have never seen this reported.
5. The Shangri-La Diet worked well. Alex did the diet somewhat differently than other people so it was not obvious this would be true.
6. After he stopped losing weight on SLD, his rate of weight gain was roughly the same as his rate of gain before he started the diet.

1. <http://blog.sethroberts.net/wp-content/uploads/2011/04/2011-04-20-more-Alex-Chernavsky-weight3.jpg>

Justin (2011-04-22 14:53:14)

Love it. I am about 7.5 years behind Alex, but here is my weight data through January: [http://s3.amazonaws.com/data.tumblr.com/tumblr\\_lf2yhowHFg1qb27qzo1\\_1280.png?AWSAccessKeyId=AKIAJ6IHWSU3BX3X-7X3Q&Expires=1303595476&Signature=nufah1VKJwmYkxE4p47Z%2FNxvhr0%3D](http://s3.amazonaws.com/data.tumblr.com/tumblr_lf2yhowHFg1qb27qzo1_1280.png?AWSAccessKeyId=AKIAJ6IHWSU3BX3X-7X3Q&Expires=1303595476&Signature=nufah1VKJwmYkxE4p47Z%2FNxvhr0%3D)

Stephen M (Ethesis) (2011-04-23 08:21:55)

I've a friend who went to no flour, no sugar, lost 190 lbs in about twelve months and has kept it off for four years, tomorrow (he was a day short this morning when we talked). But his Taubes style diet is rigorous. He is part of a group using it and they've noted that any deviation and the weight starts to come back. Interesting, my weight has gone up and down (my rest point is 189 +/- 10 lbs, though it went up to 205 over Christmas, is down to 197 this morning). I've been paying attention to various inputs that seem to make a difference and find the whole very interesting. If I switch to a noseclipped meal in addition to my normal regimen, I drop weight. If I increase ditto food I can push weight up. I'm not sure how far I can push weight up with ditto food, I bailed out at 205. I lack the willingness to embrace weight gain for scientific study, at least past a certain point where my comfort zone ends ;)

Perfect Health Diet » Around the Web, Easter Vigil Edition (2011-04-23 14:13:29)

[...] 10 Years of Weight Loss: My favorite post this week was from Seth Roberts, reporting 10 years of weight measurements from one of his [...]

Jeff (2011-04-24 07:49:56)

Seth - Why does daily low intensity long duration exercise such as walking reduce weight vs. other forms of aerobic exercise? Does it have anything to do with keeping blood sugar stable?

Seth Roberts (2011-04-24 20:31:51)

I've never heard a good answer to why exercise causes weight loss. Obviously it lowers the set point (which will come as news to 99 % of doctors) but I've never heard anything convincing that goes deeper than that.

Mike (2011-04-25 08:01:56)

I thought I was the only low-carb vegan who does the Shangri-La Diet. Congrats on your weight loss, Alex!

laura (2011-04-26 20:45:21)

i fit in a size 6 dress today because of sld. wow!! yay!!

Alex C. (2011-04-30 07:10:35)

Mike, if you're still reading this thread, please contact me at [alexc@aya.yale.edu](mailto:alexc@aya.yale.edu). It would be nice to compare notes. Thanks.

Jolly (2011-05-06 12:12:27)

I have rough data for weight/bf since 2003 <http://physicsdiet.com/Chart.ashx?t=WeightLoss&s=0001-01-01&e=2011-05-06&u=Jolly> and <http://physicsdiet.com/Chart.ashx?t=BodyFat&s=0001-01-01&e=2011-05-06&u=Jolly> The 2005-2009 weight drop was caused by me being on ADHD medication. The early 09/11 weight spikes were caused by massive amounts of dairy intake. In 2005 I changed my weight scale body fat analyzer measurement from "athlete" to "regular" which is why the bf % shot up. Otherwise my bf % is highly correlated with my total weight. I've been eating paleo/primalessq/lc since around

September 2009.

Seth Roberts (2011-05-07 16:07:15)

Thanks. How tall are you? On the weight chart, what's the difference between red and green? On the percent body fat chart, shouldn't the percent change abruptly when you changed the setting on your body fat analyser? Instead, it changed gradually.

## Personal Science and Lyme Disease (2011-04-24 05:00)

[1]Here is a website devoted to a new way to cure Lyme disease: ingesting large amounts of Vitamin C and salt. The website is vague about who made it but it certainly isn't a for-profit enterprise. It begins:

After 13 years of suffering with Lyme disease, a possible cure has been stumbled upon. A cumulative effect of much research has produced the possibility that salt and vitamin C may be all that is needed to beat this elusive illness. Without going into a lot of detail, our theory is that Lyme is not just a bacterial disease, but also an infestation of microfilarial worms. . . From experimenting with the treatment of salt and vitamin C, we settled on a dosage of 3 grams of salt and 3,000 mg of vitamin C, each dose taken 4 times per day. . . . The Treatment can be grueling; taking it with food may aid in digestion. The results [= the improvement] should be almost instantaneous.

Unsurprisingly, people a naive person might think would be interested turned out to be not be interested:

We have tried on three occasions to get help [= interest in our findings] through the CDC to no avail. The responses were things such as: thanks, we'll forward to a lyme researcher; or, we don't accept contributions or downloads from individuals; or, these pictures are obviously fakes. . . . We tried the university routine. A public health researcher put us onto a microbiology chair, who sent us to a CDC parasitologist, who said he wasn't a clinician and suggested a pathologist. . . . We tried the most noted lyme sites on the web. We were disappointed that most of them seem more concerned with fundraising than disease.

Which sounds like "we" is one person – a man. In any case, I hope "they" will allow outsiders to contribute experiences, perhaps by adding forums to the site. This is terrific work.

1. <http://www.lymephotos.com/>

dearieme (2011-04-24 14:24:34)

"We were disappointed that most of them seem more concerned with fundraising than disease." I've heard that complaint about charities in Britain.

goldman (2011-04-25 11:04:40)

One of the big problems with the personal science movement you espouse is that idiots on the internet can suggest really harmful things. This is one of them. Nowhere on that website does it say that you should monitor your blood pressure, and if you're eating that much salt 4 times a day, you really should be monitoring your blood pressure. Another example: all over the internet people talk about the few papers which link iron deficiency with RLS. The problem is, that's only for \_some\_ class of RLS patients, and it's not easy to get iron levels tested on your own. Taking supplemental iron pills, which I've seen recommended on RLS fora all over the place, can cause long term heart damage. If you don't publicly talk about this kind of thing, and suggest or discuss ideas to remediate it, you are part of the problem, since you are strongly recommending to people that they try things like this. One reason doctors are so cautious is liability. I think this post is pretty close to something that should be considered liable if people read it, go and eat salt until they have strokes.

Seth Roberts (2011-04-25 14:34:14)

Coming up with and publicizing a new way to cure Lyme disease is a "really harmful thing" because it didn't say you should measure your blood pressure? Perhaps the author of that website felt it was obvious. Or perhaps he himself did not get high blood pressure from the salt he was eating. Both of those would call your outrage ("idiots") into question. However, I agree with you to a certain extent. As I said, the author of that website should make it easy for others to share their experiences. Whether that often includes high blood pressure remains to be seen. In the case of RLS, you seem to fail to understand that if your RLS is cured by taking iron supplements, it is likely you had an iron deficiency to start with. People who have iron deficiencies and then take iron are unlikely to get heart damage from doing so.

Ans (2011-04-25 15:42:20)

Thanks for the link, Seth. I will give this a go and report how I feel in a few days.

Thomas Seay (2011-04-26 13:18:53)

I have hear different view on "Chronic" Lyme. A lot of people say that it doesn't exist. That is the mainstream position that may or may not be right. IA few years ago, I was diagnosed with Lyme and even got Lab results from Igenex lab that indicate I have Lyme and Babesia. I was sent to a "Lyme specialist" who put me on an expensive protocol. I became frustrated because of a severe reaction to the antibiotics prescribed and because I was confused as to whether or not "Chronic Lyme" even exists. I am tempted to try this protocol (aafter all, it's cheap) except for one thing. Wouldn't it cause just as much gut dysbiosis as a course of antibiotics? What do you think?

JeffR (2011-04-26 13:30:47)

There's a lot that seems wacky about that website.

Eric (2011-04-26 14:45:03)

Ans, I'm interested how you feel in a few days. Make sure you drink enough water!

Seth Roberts (2011-04-26 14:54:22)

Yes. But the underlying idea makes sense.

Seth Roberts (2011-04-27 14:43:38)

Yes, it might cause gut dysbiosis. But I believe you can easily recover from that: eat plenty of fermented foods.

Thomas Seay (2011-04-27 15:21:56)

How many species of "good" bacteria are in our gut? I think I read at least 150 different species. Do fermented foods, or even

the best probiotics, normally come near supplying that many species? I don't think so. On this protocol, you are killing bacteria every few hours (take the Vitamin C and salt with meals). Can you really repopulate your gut with such an aggressive protocol? Don't get me wrong...if you KNOW that you've got Lymes, it would be worth the risk. I have some of the symptoms that the Chronic Lyme people suggest indicates Lyme disease (including some lab results), but it's such a long laundry list that just about anybody could have Lymes, based upon that. According to the website, it might be necessary to persist with this protocol for up to 3 years. What kind of havoc could that play on your gut bacteria?

Seth Roberts (2011-04-28 05:43:44)

yes, exactly how to use fermented foods to preserve or restore healthy gut flora is an open question but I'm sure it involves eating quite a few fermented foods.

Thomas Seay (2011-05-06 10:23:33)

I wonder if Ans tried this protocol and, if so, how it is working out.

Eric (2011-05-08 12:57:10)

Also still curious, as a know someone that struggles with Lyme...

### **Roche is Deceptive and Evasive (2011-04-25 05:00)**

In [1]an article about Tamiflu, an anti-flu drug developed by Roche, Helen Epstein writes:

[Non-Roche researchers] noticed yet more discrepancies between the articles that had appeared in scientific journals and Roche's internal documents, many concerning the drug's safety. According to published articles, no potentially drug-related serious side effects—or "serious adverse events" as they are called—were reported in the papers describing two Roche-sponsored clinical trials in which 908 people took Tamiflu; but according to Roche's unpublished documents, three "serious adverse events" that were possibly related to Tamiflu occurred in these trials.

In 2008, an article in the journal Drug Safety, signed by a group of Roche authors, claimed that rats and mice, both given a very high dose of Tamiflu, showed no ill effect. But according to documents submitted to the Japanese Ministry of Health, Labor, and Welfare by Chugai, the Japanese Roche subsidiary, the exact same dose of Tamiflu killed more than half of the animals. As they died, the rats exhibited many of the same central nervous system symptoms that Hama had described in his case series on the Japanese children.

That's deceptive. Here's evasive:

"Do the 'full study reports'" containing all five modules exist?" I asked my correspondent at Roche. "A simple 'yes' or 'no' answer will do." In reply, she did not say "yes" or "no," but repeated her claim that the Cochrane group had all the information it needed to analyze the Tamika studies.

This sort of thing is why I don't trust drug companies. They're dishonest again and again, with trivial consequences. Epstein's article would have been even better had she given the names of the Roche employees she criticizes (the authors of the deceptive studies, the evasive correspondent).

---

Alrenous (2011-04-25 12:20:34)

I have a policy of mistrusting all official communication unless I have specific evidence to the contrary. Do I know for certain they're usually punished for misleading statements? Have they been reliable in the past? Do I have independent corroborating evidence? Need I say how very never this is the case?

Seth Roberts (2011-04-25 14:21:16)

Alrenous, I'm curious how this works in practice. If I go to the DMV (Department of Motor Vehicules) and start questioning everything I'm told I would be quite rightly treated as a nut. I think there are forces that push public officials to tell the truth; there are also forces that push them to lie. Whether your ideas about this, which strike me as too black and white, actually help I would like to know. What do you actually do as a result of this approach?

Dawn (2011-04-26 00:02:50)

Anyone who remembers history would distrust the major drug companies. They have an appalling track record and have been caught lying numerous times. But I sort of expect that - after all, they're in business to make money. What scares me more is that we can't trust our government officials to tell the truth either.

Alrenous (2011-04-26 21:58:15)

"and start questioning everything I'm told I would be quite rightly treated as a nut. I think there are forces that push public officials to tell the truth;" So there's two possibilities here. Either you have specific evidence (forces for truth?) that your DMV is generally truthful, or else you're just taking it on faith. Either you already follow this technique, or what makes you a nut is failing to question them - just don't do it out loud to DMV officials. Are we talking about renewing your licence, or are we talking about motor vehicle policy? I actually would distrust everything a DMV official told me. I would, however, intentionally look for evidence if it was important - say there is a threat of jail. Sometimes I even investigate if I'm told something I originally thought was true, and these things have turned out wrong frequently enough to be worthwhile. Even the simplest official communications are often misleading. The only time I default to acceptance is where the lie has no possible benefit and the odds of incompetence are nearly zero. Again, just about never. If we're talking licence renewal, then lies would have no benefit and it's completely obvious for most of them. "You're next in line." Yes, yes I am, good work. Though come to think I would even doubt and check "The line starts over there," - been burned by that lie before. "You need to fill in this form." Usually not true. Some bureaucrats will get more tetchy about it than is worth the hassle, but if you manage to pass back a mostly-empty form, you'll get your licence anyway. If we're talking motor vehicle policy...Hmm, does "Rolling stops are illegal," count as an example? I suppose it is illegal, but nobody ever gets prosecuted for them. Regardless, you stop at stop signs because you'll get hit if you don't, not because it's the law - if it stopped being illegal today the change in driving would be hardly noticeable. Indeed, judging by the improvements in those townships that removed all signs and lights, mortality would likely go down. Whereas if we invented inertial dampeners and negated all crashes, running stop signs and such would drastically increase. (I'd personally try to drift through mine. Bumper cars at 40 sounds like fun to me.) Have you heard the one about how it's illegal to go over OR under the speed limit? That one's good too. Even some of the things cops routinely say when they pull you over can be ignored, and though I'd have to double check which ones. When an official in any capacity says something about X, it's a hint that you should investigate X, not evidence about X either way.

Seth Roberts (2011-04-27 14:36:18)

We're talking about license renewal. I have specific evidence that when they tell me to wait in line X, that is actually the right line to wait in. An example of the evidence is that the place looks orderly - it is not full of angry people who have waited in the wrong line for 1 hour. I don't investigate whether they are truthful. "The lie has no possible benefit." Well, yes, now you are coming close to what I mean by "pressure to be truthful" - certain lies would have big bad consequences and smaller (or no) good consequences. For those statements there is pressure to be truthful. It varies from statement to statement whether the

bad consequences outweigh the good consequences.

Seth Roberts (2011-04-27 14:47:30)

I agree about the terrible record of drug companies ("caught lying numerous times"). "I sort of expect that – after all, they're in business to make money." Every day I deal with a dozen businesses that are in business to make money. A newstand, a grocery store, my Internet provider, and so on. They don't lie to me, by and large, and certainly not in the extraordinarily dangerous way that drug companies lie. I think it is their power that lets drug companies lie like this, not their motivation. Too Big to Tell the Truth.

laura (2011-04-26 20:53:27)  
cream pie!! omg!!

[1]

Here is another example of the efficiency graphs I've blogged about ([2]here, [3]here and [4]here). The line is the current day; it shows how well I'm doing compared to previous days. It goes up when I work, down during breaks. The number in the right corner ("77") is the percentile of my current efficiency (at the time the graph is made) compared to measurements within one hour (e.g., a measurement at 2 pm is compared to previous measurements between 1 pm and 3 pm).

The blue points come from before I started the feedback; the green points, afterwards. The red and black points are the final points of a day (that is, at quitting time). That the green points are above the blue points suggests that the graphical feedback helped. Here is a better way of seeing the effect of the feedback.

[5]

I didn't expect this, as I've said. It is not "the effect of feedback"; before the graphical feedback, I'd gotten non-graphical feedback. It is a comparison of two kinds of feedback.

Why was the new feedback better? Here's my best guess. It helped a little that it was pretty (compared to text). It helped a lot that it was in percentile form (today's score compared to previous scores). This meant the score was almost never bad (from the beginning the percentile was usually more than 50) and yet could always be detectably improved (e.g., from 68 to 70) with a little effort. I wish I could get such continuous percentile feedback in other areas of life - e.g., while treadmill running. I think feedback works poorly when it is discouraging or unpleasant and when it is too hard to improve. When I taught a freshman seminar at Berkeley, I got feedback (designed by a psychology professor) that was so unpleasant I stopped teaching freshman seminars. Because it came only at the end of the term, it was hard to improve - you'd have to teach the class again to get a better score. Moreover, it compared your score to everyone else's. I think I was in the lower 50 %, which I found really unpleasant. There was no easy way to give feedback about the feedback; maybe it is still in use.

In contrast, I love the feedback shown in the upper graph. Not only does it really help, as the lower graph shows, it leaves me at the end of the day with a feeling of accomplishment.

Keri (2011-04-27 09:39:44)

We all know that it works incredibly well, that's why we're all so desperate to have it! Could you please release the program that you're using? It doesn't matter how crude it may be, you'd have lots of grateful readers.

michmill (2011-04-27 10:51:00)

I'm not sure if this has been mentioned in the comments to previous entries, but Rescuetime does this automatically. It tracks what program you're in, or even what website you visit, and allows you to say what you were doing when not on the computer. <http://www.rescuetime.com/> When I was having trouble focusing at work, I downloaded it, and it greatly increased my productivity. Just knowing that I was 20 % more productive than the average user was a strong motivator to keep it up. It also immediately showed me where I was wasting time and what days were the most productive, so I could tweak my work schedule to optimize this (I was best right when I got into the office and the few hours before I left, so I tried to get meetings in the middle of the day).

Seth Roberts (2011-04-28 05:37:21)

Keri, thanks for your interest. I am mulling over some sort of very crude release.

Keri (2011-04-30 09:52:49)

Ah, that's brilliant. Thanks a lot, the both of you.

## 10 Years of Weight Measurements: What Was Learned (2011-04-28 05:00)

[1]

For ten years Alex Chernavsky has measured and recorded his weight (above). I asked what he learned from this. Here's what he said:

I started the tracking because I thought that the very act of measuring (and recording) my weight every day would inspire me to lose weight. I don't think it really worked that way, though. In order to lose weight, I had to take active measures.

What did I learn? I learned that low-carb diets work well in the short-run (as you said), and I also learned that eating low-carb is far, far easier than eating a calorie-restricted diet (which I've tried in the past, before I began recording my weight daily). I learned that regular exercise does lead to weight loss, although I can't rule out a possible confounding factor: I wouldn't be surprised if it turned out that I changed my eating habits at the same time that I started an exercise regime. That's probably what Gary Taubes would claim.

I also learned that the Shangr-La diet works well for me. I think that the current upward trend is caused (at least in part) by the fact that I'm eating breakfast more and more often. I didn't start eating breakfast until sometime last autumn. I will try eliminating breakfast again to see if it reverses the trend. I must say, though, that it's a little difficult to watch my wife eating some scrumptious morning meal while I just drink coffee. The temptation is hard to resist.

I also learned that my weight fluctuates for no apparent reason at all. If you look at the period of roughly April 20, 2008 through mid-July 2008, you'll see a drop of about ten pounds. I remember being surprised and puzzled during this time, because I could not think of any plausible reason why this weight loss would occur. I still don't know. In any case, it was short-lived.

I also learned that I should have kept much better notes about what was going on during those ten years. I'm kicking myself now. I plan on continuing to collect data, and I will try to annotate the data better in the future.

My comments [2]here.

1. <http://blog.sethroberts.net/wp-content/uploads/2011/04/2011-04-20-more-Alex-Chernavsky-weight3.jpg>
2. <http://blog.sethroberts.net/2011/04/22/ten-years-of-weight-measurements/>

---

Joe McCue (2011-04-28 11:16:54)

I'd be interested to see this data expanded horizontally, with smaller units on the x axis, particularly in light of the "no reason at all" weight drops. It's possible that the "random" weight drops are related to changes in long-cycle circadian rhythms (on the order of seasons, not days). There are other well-established long-cycle circadian rhythms, and it wouldn't surprise me if increased amounts of daylight slightly altered metabolism in such a way as to reduce energy stores, whereas decreased total daylight levels might be associated with small anabolic basal metabolic changes.

K (2011-04-29 03:29:28)

Hi Seth, I just read this article by Stephan Guyenet in which he talks about body fat set point as a function of flavor. He references a rat study which showed that rats overate if given a chocolate drink but not with strawberry-flavored or vanilla-flavored drinks. <http://wholehealthsource.blogspot.com/2011/04/food-reward-dominant-factor-in-obesity.html>

Seth Roberts (2011-04-29 05:13:19)

Yes, that finding supports my theory. I explain it by assuming the chocolate flavor produced stronger flavor-calorie associations than the strawberry and vanilla flavors. Many theories cannot easily explain it.

## **The Kennedys (TV mini-series) (2011-04-28 17:00)**

[1]This reviewer hated it, [2]this reviewer panned it ("trivializes history"), but I loved it. Never has "behind every great

fortune lies a great crime" (here, a great criminal, Joe Kennedy) been so well dramatized. Yet I came away from this series executive-produced by a Republican with a higher opinion of JFK and Bobby.

When I was in sixth grade, I did a survey in which I phoned random strangers and asked them history questions. To my chagrin, one of my "correct" answers (to the question "what year was the Bay of Pigs?") was wrong. Until I watched this series, I didn't really know what the Bay of Pigs was. Until I watched this series, I didn't know important details of several other big events of the time, such as the struggle to admit James Meredith to the University of Mississippi. Supposedly JFK threatened the Governor of Mississippi with loss of all future NCAA Bowl invitations. "You can't do that!" said the Governor. Surely fictional, but a nice touch.

---

lisa (2011-06-18 12:00:17)

I enjoying the first double bill series last night already, it shows the dynasty of the kennedy family as a political determined family unit and yes with good connections and not to forget the kennedy money, the shows great i have empathy for mother Rose with her husbands joe's mistress but then again this was a different time, and tolerating his behaviour for the family, i hope the next series is as good,

Glen Raphael (2011-04-29 09:18:12)

I'm sure it's true that clinical studies overstate drug effectiveness, but the conclusion that the FDA ought to be \*more\* restrictive in approving drugs "for wider use" doesn't follow. Maybe the government should be more restrictive in deciding what to reimburse, but banning the use of a drug entirely is a truly terrible way to accomplish cost savings. If we allow more drugs to get approved, (a) there will be some competition between vendors that could drive down prices or improve quality, (b) people for whom the most popular drug doesn't work well will have other options. The idea that nothing should be allowed on the market unless the FDA is well and truly satisfied that it's an unambiguous improvement over what was available before is one of the many reasons drugs are so expensive. (Imagine if anyone who wanted to sell a new breakfast cereal had to prove it wasn't just reasonably safe and nutritious but also was \*better\* than existing cereals that it resembled, as judged by a panel of cereal experts reviewing years of test results. How many cereals would you expect to find on shelves and how good a value would they be to consumers?)

jay cobal (2011-04-29 11:50:43)

Prof. Roberts, you may find this familiar: <http://wholehealthsource.blogspot.com/2011/04/food-reward-dominant-factor-in-obesity.html>

Seth Roberts (2011-04-29 16:13:44)

I don't say improvement should be required for approval. I do think that large comparative studies – experiments that compare the proposed drug to the best existing drugs for the same problem – should be required for approval. And the results of those comparative experiments should be widely-publicized and easy to find – in the packaging, for example.

Jonathan Graehl (2011-05-02 19:26:58)

The 'rapid responses' to the calcium heart attack/stroke risk meta-analysis leave me hesitant to update much. For example, [http://www.bmj.com/content/342/bmj.d2040.abstract/reply#bmj\\_el\\_259724](http://www.bmj.com/content/342/bmj.d2040.abstract/reply#bmj_el_259724) points out that (most of) the studied individuals weren't randomly assigned to supplement vs. placebo groups - they chose their own supplementation regime. It doesn't look like a high quality piece of evidence after 2 minutes' evaluation.

Jonathan Graehl (2011-05-02 19:39:26)

Re: mercury amalgam, what's the evidence of harm? This mainstream (status quo is fine) view is pretty good at tarring the anti-amalgam movement by its association with some quacks - <http://www.quackwatch.com/01QuackeryRelatedTopics/mercury.html> If there are good alternatives that leak \*NO\* mercury (as opposed to "totally healthy small amounts") then of course those should be used for new fillings.

Seth Roberts (2011-05-02 20:47:43)

Quackwatch has zero credibility with me. The amalgam filling essay you link to is typical. He simply leaves out the best evidence of harm. There is a reason mercury fillings are banned in several countries but Quackwatch says nothing about that. Using one of those mercury-vapor measurement devices, I found I had surprisingly high levels of mercury vapor in my mouth – without chewing on anything beforehand. This is one reason I decided to have an amalgam filling taken out. At exactly the same time as the extraction happened, my arithmetic scores (how fast I could do simple arithmetic) started to improve after being stable for months. There were no other obvious changes in my life at the time. There's evidence of harm for you.

Seth Roberts (2011-05-02 21:07:32)

"They chose their own supplementation regime." You have misunderstood the experiment. Subjects were allowed to supplement in addition to the experimental assignment. The data were then analyzed taking the self-chosen level of supplementation into account.

## Scientific Illiteracy at The New Yorker (2011-04-30 05:00)

A week ago, this passage appeared in [1]an article about timing and the brain:

If you're hiking through a jungle and a tiger growls in the underbrush, your brain will instantly home in on the sound by comparing when it reached each of your ears, and triangulating between the three points. The difference can be as little as nine-millionths of a second.

As if people had three ears. "Triangulating between the three points" is gibberish. The between-ear time-of-arrival comparison gives you a direction, not a location (which is what triangulation does). Perhaps it was added by a copy editor. If you delete it, the passage makes sense.

Wouldn't that make a nice newsbreak (one of The New Yorker's column-ending "Funny Usage Mistakes Made by Other Publications")? I tried to submit it but couldn't. So I wrote a Letter to the Editor about it.
