Alex Holcombe (2008-09-27 03:39:10)

could write a paper and submit it to J. of Medical Hypotheses. It's even indexed by PubMed

seth (2008-09-27 05:23:33)

Igor, that's a good question and my answer is ignorance. I am unaware of facts reported in blog entries making their way into general knowledge. But you're right, it's not like I have a large sample.

Aaron Blaisdell (2008-09-27 08:53:36)

Treat vegetarianism as an experimental variable and take a group of people consisting of vegetarians and non-vegetarians on a high-altitude hiking trip (without revealing the real purpose of the trip). Record what happens (how people feel). Sounds publishable in a reputable journal to me.

Tom in TX (2008-09-27 09:50:52)

You could add it to the Wikipedia article.

Igor Carron (2008-09-27 11:12:37)

Seth, In saying this, I was specifically remembering this story: <http://nuit-blanche.blogspot.com/2006/11/google-can-save-your-life.html> Igor.

Igor Carron (2008-09-27 11:22:07)

Seth, This other analysis of my logs is also indicative of something along the lines of my first remark: <http://nuit-blanche.blogspot.com/2007/11/outliers-in-long-tail-case-of-autism.html> Igor.

Gyan (2008-09-28 22:21:53)

Just saying vegetarianism is not sufficient. There are many kinds of vegetarians. Not all are low in iron. Some are traditional vegetarians like Jains They know how to combine proteins and optimize iron. Some are new-fangled Americans whose idea of being a vegetarian is to gorge on soya.

Chris B. (2008-09-30 12:58:21)

"You could add it to the Wikipedia article. " No, I think it would count as Original Research, a no-no in WP.

### **How to Consume Flaxseed Oil (2008-09-27 09:41)**

My friend [1]Carl Willat has the following suggestion:

To make it easier to consume flaxseed oil, put it on toast. About one tablespoon of flaxseed oil per slice of bread. Eat nose-clipped.

I tried it. Flaxseed on toast, noseclipped, is delicious. It tastes just like toast with butter.

1. <http://www.carlsfinefilms.com/>

---

Rasmus (2008-09-27 11:49:01)

Sounds good, but after trying to drink flaxoil, even noseclipped, I've developed a strong enough aversion to the stuff that I can hardly look at a bottle of it without retching a little.

thehova (2008-09-27 19:05:19)

Yeah, I concur with Rasmus. Flaxseed oil is awful stuff. Walmart is selling fish oil and flaxseed oil capsules at a price that I believe is cheaper than purchasing the oils, themselves. Is there any disadvantage to taking capsules rather than oil?

Fred Gibson (2008-12-16 21:03:25)

I put two tablespoons in my morning cereal, and I've really grown to like the taste a lot.

### **Announcing: A Wiki for the Shangri-La Diet (2008-09-27 10:18)**

It's [1]here. Not much content yet.

Anyone can contribute, you just need to register first.

1. <http://shangriladiet.wik.is/>

---

Matt (2008-09-27 17:14:41)

The link's currently got a typo. It should be: <http://shangriladiet.wik.is/>

Eric Vlemmix (2008-09-28 05:04:24)

Good idea! (website is at <http://shangriladiet.wik.is/> , the link in the blogpost has a problem) I've made some initial pages and an index go get things started.

seth (2008-09-28 05:43:20)

Thanks, Matt and Eric. Typo fixed.

### **Most Drug-Cancer Studies Not Published (2008-09-27 15:34)**

According to a [1]new study,

Fewer than 20 % of cancer trial results are published in peer-review journals. . . Industry-sponsored trials only achieve publication one time in 20.

[2]A new website hopes to increase visibility of clinical trials. Publication bias is one reason a method that allows you to see for yourself – self-experimentation – has value.

[3]The study.

### **Science in Action: Why Did I Sleep So Well? (part 16) (2008-09-28 06:36)**

A few days ago I spoke on the phone to someone who'd written me that one-legged standing improved his sleep. I mentioned this replication [1]earlier but the new details are interesting.

He is a 35-year-old man with an office job. He now works in the Washington, D.C. area. Until about a year ago, his sleep was fine. He would sleep 7-7.5 hours no matter when he went to bed.

About a year ago he went through a tough time with a lot of stress and anxiety. After that he started waking up after only 6 hours of sleep. He'd wake up early in the morning, 3 or 4 am, still tired but unable to fall back asleep. This is exactly the problem I had when I started to self-experiment to try to sleep better.

He went to a doctor for help. (I considered seeing a doctor.)<sup>1</sup> The doctor prescribed:

1. Ambien. It worked for 1 or 2 nights.
2. Lunesta. Like Ambien, it worked for only the first few nights.

After using these two drugs, the problem got worse. Now he awoke after only 4 hours of sleep. He tried non-prescription drugs:

3. Melatonin. It made him foggy during the day.
4. Tylenol PM. It worked okay, but he would still wake up after 6 hours.

Then he decided he didn't want to take pills of any sort – even if they worked, he'd have to take them for the rest of his life. (This is why I didn't go to a doctor and never tried pills.) He tried conventional alternative treatments:

5. Changed his attitude about the problem. Although he was waking up very early, he wasn't tired during the day. He had four extra hours. After this change in attitude, he began to fall back asleep a few hours after waking up. Gradually the amount of time he was awake in the middle of the night got shorter.
6. He has cold feet. He can't fall asleep when his feet are cold. He read somewhere that if you imagine your feet are warm, they will warm up. This gave him an idea. What if he imagined going into an MRI-like machine that induces sleep? He started doing this. When he'd wake up at 2 a.m., he'd imagine himself going into this machine. This enabled him to fall back asleep with a short latency.

In August he read my posts about this and started one-legged standing, often while watching TV. He does it without stretching the other foot: puts one foot on top of the other or behind the other. He might or might not balance. Usually stands on a pillow. He does it until it hurts, twice for each leg. In the beginning it took only 5-10 minutes but now it has gotten much longer and he has started doing other things, such as wearing a backpack with books, to shorten the time.

From my point of view the main points are these: 1. He had tried several other treatments. Some were awful, some were okay, but none sustainably solved the problem. Not only did one-legged standing help, it apparently helped more than six other plausible treatments, including two powerful and expensive drugs. 2. What he did differed from what I did – verbal descriptions are always inexact and omit a lot – but still worked well right away.

[2]Directory.

## Barack Obama Understands Jane Jacobs (2008-09-29 05:14)

From [1]this video:

Keith Wilkowski I'm holding the most important book ever written about cities.

Obama Is it Jane Jacobs?

Obama goes on to correctly state the main point of two of her later books, *The Economy of Cities* and *Cities and the Wealth of Nations*.

1. <http://www.youtube.com/v/--v1T1iGF0g&color1=0xb1b1b1&color2=0xcfcfcf&fs=1>

---

Nansen (2008-09-29 17:56:10)

I recall you once said that you wished Jane Jacobs could be president (while she was alive, of course).

seth (2008-09-29 20:59:34)

I don't remember saying that. But it sounds like something I would say.

### 3.10 October

#### My Pleasantly-Strange Trip to Beijing (2008-10-01 13:23)

I am now in Beijing. On the way (12 hours nonstop from San Francisco):

1. Without asking, my seat was switched to one of the best seats in economy: aisle of the bulkhead row.
2. Boarding was last rows first. So rational, so easy, no special equipment or software required. I have never before encountered this. Good work, Air China.
3. A riveting movie, which I'd never heard of, was shown: [1]The Children of Huang Shi, which is a [2]Chinese Schindler's List. In both Chinese and English, with Chinese subtitles when the characters were speaking Chinese. The best movie I've seen on a plane.
4. The plane was old. Well-maintained, yes, but the film was VHS, the headphone jacks were double-pronged, and my supplied headset was broken. Maybe this is why the price was surprisingly low (about 40 % less than the competition).
5. Midflight, a fly alighted on my book ([3]Traffic by Tom Vanderbilt).
6. Three times I did my [4]one-legged standing. Seeing me, two others started stretching. For the first time on one of these long flights, I had no trouble sleeping in my seat. (In the past, I've been able to sleep well only on the floor.)
7. The flight was 78 minutes early. I didn't know such a thing was possible – like the fly.
8. The Beijing terminal (Terminal 3 at [5]the airport), which opened six months ago, must be the biggest in the world. Nicely decorated with bamboo plants. At debarkation, a sign said we were 10 minutes from Customs. No line at Customs. After Customs, we took a shuttle train to luggage pickup. The ride – within one terminal – seemed about a mile long. I look forward to spending more time there, to study the 72 restaurants, for example.
9. The trunk of my taxi was perfectly clean.
10. During the taxi ride, I saw a bike rider. He was about to go from the on-ramp onto the freeway, apparently to ride on the line between lanes. It was a normal unclogged highway, with cars going 60 or 70 mph. I didn't know such a thing was possible.

thanks for 6. For 7, the winds do make a difference. I am eagerly waiting to see how you are going to deal with the jet-lag when you come back stateside. It always takes me three days to recover. Igor.

## **The Neglected Importance of Diversity (2008-10-02 07:01)**

In *The Black Swan* (2006), Nassim Taleb wrote:

Globalization creates interlocking fragility, while reducing volatility and giving the appearance of stability. In other words it creates devastating Black Swans. We have never lived before under the threat of a global collapse. Financial institutions have been merging into a smaller number of very large banks. Almost all banks are interrelated. So the financial ecology is swelling into gigantic, incestuous, bureaucratic banks “when one fails, they all fall.” The increased concentration among banks seems to have the effect of making financial crisis less likely, but when they happen they are more global in scale and hit us very hard. We have moved from a diversified ecology of small banks, with varied lending policies, to a more homogeneous framework of firms that all resemble one another. True, we now have fewer failures, but when they occur “I shiver at the thought.

To me, this sounds Jacobian. Jane Jacobs disliked calls for reduced family size (e.g., Bill McKibben) not merely because she was a third child but because she disliked reducing the diversity of family ecology. In public health, it’s called the dangers of monoculture. The Irish potato famine (which “dwells in my memory as one long night of sorrow” – William Butler) is a dietary example of Taleb’s point. When one (potato) crop failed, they all failed.

Self-experimentation is a more positive example of the broad point. Self-experimentation derives its power from two things: 1. Motivation. You are more motivated to solve your own problems than other people’s problems. 2. Diversity. The self-experimenter can do anything – change anything, measure anything. Other scientists cannot. For people with serious problems, such as depression, reduced diversity of the associated science (e.g., the science of what causes depression) is a long slow catastrophe when the associated science, because of its restricted nature, cannot find the best solutions (as I believe is the case with depression).

My animal-learning research also centers on this point. It is about what controls variation in behavior. Dave Stahlman (UCLA), [1]Aaron Blaisdell (UCLA), and I will soon finish a paper about this. With too little variation, catastrophe is too likely, as Taleb says. So mechanisms to produce diversity have evolved. Just as the importance of diversity has been neglected by financiers, it has been neglected by research psychologists.

1. <http://pigeonrat.psych.ucla.edu/>

---

MT (2008-10-02 12:57:29)

Great point – I think a new framework in finance and economics could be an optimization problem between the very legitimate benefits of economies of scale and the costs of homogenization and interdependence. Somewhere between the two is an ideal and determining that point should inform federal and multilateral policy. How much consolidation to allow in an industry could be based on research in that area, and considered at national and international levels. Free market benefits collapse as you approach oligopolistic and monopolistic states in most cases. Also reminded of the benefits of collaboration and

interdisciplinary research as, in this case, ecology, psychology, finance, and urban design are drawing on one another – which is a heterogeneous approach, making the post rather metaheterogeneous. A diverse post about the value of diversity.

seth (2008-10-02 13:16:47)

Thanks, MT. As you suggest, my animal learning research is about how animals optimize (not just produce) diversity of action. The diversity of what they do depends on external events.

Nansen (2008-10-04 17:11:44)

Your point about depression being a "long slow catastrophe" reminds me of a related point by [1]Ellen Frank about the treatment of bipolar disorder: This approach [of putting the emphasis on the prophylaxis of mania], however, left many bipolar patients to suffer protracted and debilitating (but not dramatic) depressions. We now recognize that these low-grade depressions are actually associated with more impairment than the more dramatic, impressive manias [citation], but this was not appreciated for much of the psychopharmacological drugs era. (From [2]Treating Bipolar Disorder, page 29)

### **Proposed Book: How to Lie with Experimental Design (2008-10-02 09:11)**

From [1]ABC News:

Angelo Tremblay [a professor at Laval University] noticed something odd every time he worked up a grant application for his research program in a Quebec university. He had a craving for chocolate chip cookies.

Professor Tremblay wondered if this meant that thinking makes you fat – which is curious, because it implies that the rest of his job didn't involve thinking, or at least less of it. More likely is that anxiety makes you crave pleasure-producing food (such as chocolate-chip cookies) to dull the pain; there is a term for it, emotional eating. Grant writing is anxiety-producing, of course: You worry about not getting the grant. Yet – to his credit – Tremblay did experiments to test his idea. And these experiments, he believes, supported his idea that thinking alone can cause obesity, which I'm pretty sure is wrong. It makes me want to write a book: How to Lie With Experimental Design (although I'm sure Tremblay wasn't trying to deceive anyone). Its predecessor, How to Lie with Statistics, was a big success.

Thanks to Dave Lull.

More From a [2]documentary about Ranjit Chandra:

In the Nestle and Mead Johnson studies, Chandra concluded that those company's products helped reduce the risk of allergies, while the Ross formula which was virtually the same did nothing.

Masor says he asked, "'Dr. Chandra, how can you explain that we didn't see anything with our study and you did with the Nestle study?' And he said, 'Well, the study really wasn't designed right.'

"I said: 'Dr. Chandra we designed the study with you. You designed it. That's why we went to you, so you would be able to do it correctly.' And he said, 'Well, you didn't really pay me enough money to do it correctly.'"

An extreme case.

2. <http://www.cbc.ca/national/news/chandra/>

---

Timothy Beneke (2008-10-02 13:49:44)

I've often noticed that anxiety either feels like, or stimulates hunger. It's that unsettled, frightened, butterflies feeling in the stomach that does it. Last night I downloaded a Norton Securities update; this morning I could not get online with Internet Explorer. I felt a lot of anxiety until after it was fixed. The anxiety makes me want to eat, in fact seems almost inseparable from hunger, except it's located only in the belly, and is not so globally disorganizing to my functioning the way hunger itself can be...

### **Diet and Acne (continued) (2008-10-03 11:23)**

I've blogged [1]several times about environmental causes of acne, especially diet. Cynthia Graber, a science journalist, wrote a [2]whole article about diet and acne, a link that dermatologists deny much more strongly than the evidence warranted. Why do they act so sure? I asked Graber. Because, low on the medical totem pole, they want to appear more scientific, she said. Genetics and drugs – that's science. Diet – that isn't science.

Here is more data on the subject, from two widely-different sources. The first is a [3]comment on [4]Dennis Mangan's blog:

I had some acne when I was a teen. I was considered a very "pretty" teenager, but was painfully shy whenever my face "broke out". I remember going to a dermatologist who put me on a sulfur cream and antibiotics for it. He emphasized over and over that diet "had absolutely nothing" to do with it, and that I should eat whatever I wanted and that "only by eating huge amounts of fish" could I actually aggravate it.

I still had some breakouts even until my twenties every so often. Because I was basically bodybuilding as a "hobby", I switched to diet colas and started eating a great deal of tuna and canned chicken around this time. Guess what? The acne completely went away at about 21 and didn't come back until about 26. At 26 I had some hard bumps under my chin like boils. The dermatologist said they were folliculitis and told me to make sure my razors were dry and my sink was super clean. But I noted that I had drifted back to a fast food diet and was drinking regular colas again—and kind of power-lifting a couple of days a week but not hitting it hard.

I got back into it at the gym, and wanted a six-pack again. I went back to diet cola and started dieting again. The result? The acne completely went away. This time I made a connection.

I have sworn up and down to some of my friends that I think our diets might lead to acne when we're teens. One of my pals, Myron, took his kids (both teens) off cokes and instant soups and started cooking for them and making them drink orange juice and apple juice and tea. Their faces completely cleared up (they were 14 and 16) in about two months. No trips to the doctor, no anti-bacterial soaps, nothing. Just diet. They have had lovely clear skin ever since.

I have another friend at work whose teenage daughter "got off" colas and he started cooking for her (single parent). Her face cleared up. He mentioned it. She was a pretty girl but used to break out fairly badly. According to him, she's on top of the world now that her skin is cleared up and is confident (and she should be because she really is a cutie).

I read a little bit about the study doctors cite about acne and diet. They fed a big chocolate bar to one group and fed another a CANDY bar that didn't contain chocolate to another group. Since both groups had acne at the same levels, they declared that diet had nothing to do with acne. WHAT HOGWASH!!!! If they were both drinking sodas, both eating tons of refined white flour, white pasta, and both eating a big candy bar (so what if one was toffee and one was chocolate) every day, they still were eating a "western diet".

Anyway, I've read about the severe uptick in acne in newly "Westernized" populations. I've read about the rate of prostate difficulties of Asian-Americans versus rural Asians. Diets do INDEED affect much more about ourselves than we'd like to admit. I can guarantee you, because I've seen it on my own face and have friends who I trust who have seen it on the faces of their children, that diet does indeed influence acne and that high glycemic index foods and colas and sugars certainly worsen it at the least.

The thing that REALLY got me thinking this was a few years ago, I saw a couple of very Indian-looking Mexican teenagers. They didn't look like they had a drop of European blood in them. They had BAD acne on their cheeks. Hell, I thought those people never broke out, yet there they were at a convenience store buying two colas and potato chips-looking like Oxy poster-children.

The second source is [5]Arbor Clinical Nutrition Updates, an excellent Australian publication aimed at nutrition professionals. The latest update, which I cannot link to, is about acne and diet. From its conclusions:

For many years the conventional wisdom dispensed by physicians on the relationship between diet and acne vulgaris has been that there is none. In a recent study, the fact that nearly a half of a group of final year medical students believed that diet was an important factor in acne was held to be an unfortunate misconception – likely to perpetuate misinformation in the community.â€?

The "expert view" from doctors is in stark contrast to what their patients think. Many studies have shown that the average person is under the distinct impression that diet can indeed affect acne, particularly fatty foods and chocolate.

A careful look into this question reveals something rather fascinating – that although medical textbooks used to strongly support the idea of "acne diets", in the last 50 years this has completely reversed. Yet experts'™ current confidence that there is nothing to the diet-acne story is itself based on almost no evidence.

The update describes two studies. [6]One found that a low-glycemic-index diet reduced acne. The [7]other found that, in teenage boys, greater milk consumption was associated with slightly more acne.

More Maybe Graber was too kind. Confidence that diet had nothing to do with acne allowed dermatologists to prescribe dangerous and expensive drugs. I wish I could be sure no payola was involved, but – given [8]a horrifying story in today's NY Times about several psychiatrists' total and dishonest disregard of conflict-of-interest rules – I can't. From the article:

From 2000 through 2006, Dr. [Charles] Nemeroff [of Emory University] earned more than \$960,000 from GlaxoSmithKline but listed earnings of less than \$35,000 for the period on his university disclosure forms, according to Congressional documents. Sarah Alspach, a GlaxoSmithKline spokeswoman, stated in an e-mail message that "Dr. Nemeroff is a recognized world leader in the field of psychiatry."

What does that say about psychiatry?

[9]Shannon Brownlee on the subject. [10]A blog on the subject. [11]A letter from Senator Charles Grassley to James Wagner, the president of Emory, describing Nemeroff's behavior and asking for more information.

Methuselah - Pay Now Live Later (2008-10-04 01:03:13)

Seth - there's been more discussion and testimony (including my own!) over on Whole Health Source: [1]Acne: Disease of Civilization and [2]Acne Anecdotes This idea that the medical establishment sees drugs as science and diet as not science pretty much says it all.

1. <http://wholehealthsource.blogspot.com/2008/09/acne-disease-of-civilization.html>
2. <http://wholehealthsource.blogspot.com/2008/10/acne-anecdotes.html>

Seth's blog » Blog Archive » Academic Horror Story (Emory University) (2008-10-05 03:53:00)  
[...] Diet and Acne (continued) [...]

Ahmed Darwish (2008-10-05 22:21:09)

Completely agree. I've posted a very positive experience about no-sugar-or-starch diet and my acnes below:  
<http://www.board.crossfit.com/showthread.php?t=37519>

Jay (2008-10-09 10:23:09)

Seth, Just wanted to say first and foremost that I really enjoy you blog. I have always found that creating a diet full of natural supplements and organic goodies has always helped me stay clear of acne. I recently started a blog about green tea and its effects on my weight loss and as well its anti oxidizing powers that have helped my acne. My latest post describes all the scientific properties behind green tea which help with anti-oxidizing, you can view it at Green Tea Blog

AS (2008-10-09 14:48:04)

My story: In college, I started getting cysts on my face. They would often start off as whiteheads or closed pimples and then just grow and grow. They was extremely ugly. They would take weeks to finally go away, upon which there would usually be a scar to mark the spot. I tried reforming my diet, that is cutting out all junk food. I also tried the standard antibiotics and retin-A regimen. It didn't really seem to make a difference. (For what it's worth, I have never had a soda habit). What finally worked was drastically reducing my intake of dairy products. My small pimples would just stay their normal size and clear up quickly. I also had a habit of nervously touching my face and of resting my face on my left hand. I noticed that I had far more pimples and cysts on my left cheek than on my right. So not touching my face helped. Finally, I felt exercise also helped.

The Acne Relief (2008-12-06 18:25:16)

I've always felt like certain foods broke me out. For a doctor to say there is no correlation between acne and food is crazy. That doctor is book smart only and honestly making his money selling prescriptions.

BjÄ¶rn (2009-05-28 15:58:46)

This post is dumb. The whole argument is stupid. What dermatologists say is that no link between acne and diet HAS BEEN PROVEN. For every study that detects a correlation between foodstuff X and acne, there are ten that do not. Then stating that diet is the cause of acne is irresponsible because it is not backed up by the evidence. Also, if you suffer from severe acne, take a good long look at your parents and their grand parents skin. Odds are very high that they have acne scars and did or do have acne problems. How can that be? Two generations ago people ate healthier yet still had acne. How can people who are allergic to dairy products have acne if it is the dairy products that are causing it? People had acne back then too, and that means that the dietary argument is false.

### **Beijing Public Transit Economics (2008-10-03 18:16)**

Bus fare is 1 yuan – 15 cents. If you buy a card the fare goes down to 0.6 yuan.

ME How long does the reduction last?

FRIEND Forever.

### **Academic Horror Story (Emory University) (2008-10-05 03:52)**

From Claudia Adkison, Emory University dean, to Charles Nemeroff, Emory University professor of psychiatry, in [1]a 2006 memo:

I have been grateful that the reporter was not sophisticated enough to ask all the right questions.

Grateful. She was grateful. Ugh. Double ugh. Professor Nemeroff, [2]you'll recall, took vast sums of money to advocate the prescription of dangerous drugs to millions of people and hid this fact, even after several warnings. Dean Adkison was grateful, let me repeat, that a reporter didn't ask "all the right questions" to expose this.

This is why New York Times reporter John Schwartz's [3]lack of understanding matters.

1. <http://graphics8.nytimes.com/packages/pdf/health/04DRUG/2006-07-20Adkison.pdf>

University Diaries » More Commentary on Emory University's Professor Charles Nemeroff (2008-10-05 06:49:42)

[...] \*\*\*\*\* From Claudia Adkinson, Emory University dean, to Charles Nemeroff, Emory University professor of psychiatry, in a 2006 memo: [...]

Stephen M (Ethesis) (2008-10-05 18:04:41)

That memo must be a story in itself. Guess it just was in this post.

Seth's blog » Blog Archive » What Does It Say About Psychiatry? (2008-10-06 02:20:50)

[...] Academic Horror Story (Emory University) [...]

### **What Does It Say About Psychiatry? (2008-10-06 02:15)**

It isn't just GlaxoSmithKline (who called Emory professor [1]Charles "Disgraced" Nemeroff "a recognized world leader in the field of psychiatry"). It's also the Emory University administration. According to a presumably well-thought-out [2]statement:

Dr. Nemeroff is recognized internationally as a leader in psychiatric research, education and practice. He has made fundamental contributions to the field over many years.

What this says about the moral compass of the Emory administration is clear – that they are unable to grasp the awfulness of what Nemeroff did. (As Emory dean Claudia Adkinson [3]revealed in spades.) If they did, they wouldn't spend a millisecond defending him. The harder question is: What does this say about psychiatry?

---

Pietr Hitzig (2008-10-06 17:18:08)

Fifteen years ago, I attended a conference about a new antidepressant. The Harvard equivalents of Nemeroff were stroking their beards while they pontificated about "Type I" and "Type II" depression. The former needed hospitalization and the latter

treated as outpatients. Puckishly, I suggested that actually Type I had insurance and Type II did not.

MT (2008-10-10 04:17:03)

It is disheartening that the treatments research shows to be the most effective and longest lasting for depression and anxiety – cognitive and other talk therapies – are underprescribed and not considered primary treatments by many doctors. It is further disheartening that research into the role of nutrition in mental health is underfunded – which seems to be because there is no way to patent nutritional interventions, so no motive for private research funding. Some of Seth's self-experiments on Omega 3 here, as well as other research support the merit of more research into nutrition for health, as does the intervention proposed by Truehope, which has not been properly researched, but should be given startling evidence of a relationship between nutrition and bipolar, ADHD, and possibly other mental health issues. Things are indeed seriously awry in psychiatric research.

Seth's blog » Blog Archive » Med School Profs As Drug Company Lackeys (2009-09-09 17:13:36)

[...] 1. I blogged earlier about Duke professor Charles "Disgraced" Nemeroff taking huge amounts of money — which he then failed to disclose — to encourage doctors to give dangerous poorly-tested drugs to children. Nemeroff is (or at least was) considered a top psychiatry professor! [...]

### **Professor Charles Nemeroff Predicts the Future (2008-10-06 14:02)**

The case of [1]Charles "Disgraced" Nemeroff, the Emory University professor of psychiatry, is a touchstone in the sense that it reveals something about the morals (or lack thereof) of those who brush against it. That GlaxoSmithKline (which called Nemeroff "a recognized world leader in the field of psychiatry") is amoral we already knew – a kind of positive control. The responses of Emory dean Claudia Adkison ("[2]grateful" that a reporter didn't know enough to fully expose Nemeroff) and the Emory administration (which [3]called him "a leader in psychiatric research, education, and practice") are more interesting.

But Nemeroff is also a touchstone in reverse. Not only can we learn about X and Y by seeing how they react to Nemeroff, we can also learn about X and Y by seeing how Nemeroff reacts to them. In a 2006 New Scientist series called Brilliant Minds Forecast the Next 50 Years, Nemeroff wrote [4]this:

In the next 50 years, we can expect several breakthroughs. Identifying gene variants that confer vulnerability [to major psychiatric disorders] will result in the emergence of a new field, preventative psychiatry. Elucidating the causes of mental illness will lead to novel treatments. We will also see breakthroughs in understanding the biology of resilience, now poorly understood. And in contrast with our largely trial-and-error-based system, treatments will be individualised, based on genomics and brain imaging.

That Nemeroff likes these ideas suggests they are wrong. Supporting what I've [5]said earlier.

---

Pietr Hitzig (2008-10-06 17:12:11)

Ernst Mach advocated a version of Occam's razor which he called the Principle of Economy, stating that "Scientists must use the simplest means of arriving at their results and exclude everything not perceived by the senses." (1) Brain imaging, genome analysis and proprietary pharmacotherapy are the way to go according to Nemeroff and those owning the current paradigm of medicine. He and his colleagues foresee a future in which the tools become more and more complex and the treatments more expensive and toxic. I suggest that correcting and balancing the CNS neurotransmitters will be the future. Simple, cheap and safe, precursors of dopamine and serotonin can correct craving and neuropsychiatric disorders; but Glaxo and Nemeroff will be redundant when this is recognized. 1. <http://math.ucr.edu/home/baez/physics/General/occam.html>

seth (2008-10-06 18:52:24)

"He and his colleagues foresee a future in which the tools become more and more complex and the treatments more expensive and toxic." That's a great way of putting it. The increase in danger usually goes unmentioned.

Stephen M (Ethesis) (2008-10-07 04:53:50)

I'd love a way to teach and inculcate resilience rather than merely biology.

Nathan Myers (2008-10-07 22:59:45)

Do you know the expression, "Oracle of Wrong"? It's really hard to be always right, and hardly anybody is, and it's even harder to recognize one who is. It seems to be amazingly easy, though, to be always wrong, and it's not very hard to find people who are. The latter are *almost as useful* as the former. After you've identified an Oracle of Wrong, then when in doubt you just do the opposite of what they recommend.

Eric D Peselow M.D. (2008-10-21 05:18:07)

I myself have done psychiatric drug trials but usually for others. I did not get remuneration. Nemeroff and the other 7 Grassley went after (Biederman, Wilens, Keller, Rush, Wagner, DelBello and Schatzberg) are legitimate scientists with talent and I personally believe their science is honest. However there are numerous small-fry who run drug company mills who have no scientific talent whose findings are whatever the drug company wants them to find. Some of them are tied to medical schools. These are the guys who make drug money as a living and need to be investigated

Patrik (2008-10-22 10:31:38)

Whoops – the html tags goofed up my previous submission. This one should be better. *But Nemeroff is also a touchstone in reverse. Not only can we learn about X and Y by seeing how they react to Nemeroff, we can also learn about X and Y by seeing how Nemeroff reacts to them. ... That Nemeroff likes these ideas suggests they are wrong. Supporting what I've said earlier.* @Seth I would advise caution in drawing this type of conclusion. You are falling prey to the anti-expert fallacy. Nemeroff liking those ideas and those ideas being wrong (or right) are in fact, independent of one another. Allow me to illustrate: From Bryson's A Short History of Nearly Everything: *In one of his last professional acts before his death in 1955, -A FAMOUS SCIENTIST- wrote a short but glowing foreword to a book by a geologist named Charles Hapgood entitled "Earth's Shifting Crust: A Key to Some Basic Problems of Earth Science". Hapgood's book was a steady demolition of the idea that continents were in motion. In a tone that all but invited the reader to join him in a tolerant chuckle, Hapgood observed that a few gullible souls had noticed "an apparent correspondence in shape between certain continents." It would appear, he went on, "that South America might be fitted with Africa, and so on....It is even claimed that rock formations on opposite sides of the Atlantic match. Mr. Hapgood briskly dismissed any such notions, noting that the geologists K.E. Caster and J.C. Mendes had done extensive fieldwork on both sides of the Atlantic and had established beyond question that no such similarities existed. Goodness knows what outcrops Messrs. Caster and Mendes had looked at, because in fact many of the rock formations on both sides of the Atlantic are the same- not just very similar but the same.* If that was all you knew about this famous scientist, is that he endorsed a book that erroneously attempted to invalidate the theory of plate tectonics, and you followed your line of reasoning, you would think this person's judgement suspect and likely wrong on many other important ideas, no? And perhaps he is. But for record, the person who endorsed Hapgood's book and ideas was none other than Albert Einstein. <http://en.wikipedia.org/wiki/Charles>

\_Hapgood

Patrik (2008-10-24 10:51:51)

BTW another person came to mind — the arguable father of modern science wasted many a year obsessing fruitlessly about alchemy. Yet his genius and contributions to modernity may be almost unparalleled — yet if all you knew about him was his fetish for alchemy, you probably wouldn't take Isaac Newton very seriously.

muscle relaxer (2009-12-09 15:52:08)

You need think about it. Despite the emails, the overwhelming evidence showing global warming is happening hasn't changed. "The e-mails do nothing to undermine the very strong scientific consensus . . . that tells us the Earth is warming, that warming is largely a result of human activity," Jane Lubchenco, who heads the National Oceanic and Atmospheric Administration, told a House committee. She said that the e-mails don't cover data from NOAA and NASA, whose independent climate records show dramatic warming.

### **Cheated Again! The 2008 Nobel Prize For Medicine (2008-10-06 14:09)**

Somewhere in suburban Maryland, [1]Dr. Robert Gallo, ex-discoverer of the AIDS virus, is [2]shaking his fist.

1. <http://www.virusmyth.net/aids/data/srlabrat.htm>

2. [http://www.nytimes.com/2008/10/07/health/07nobel.html?\\_r=1&hp&oref=slogin](http://www.nytimes.com/2008/10/07/health/07nobel.html?_r=1&hp&oref=slogin)

---

Jeremy Cherfas (2008-10-07 02:13:26)

Your link to your own piece is broken – you have sethroberts first. That's no way to boost your Googlejuice.

Scott (2008-10-07 08:03:18)

Or perhaps it is rightly given to the original discoverers... seeing as your article was written in 1990 and "in June 1991, Gallo finally admitted that the AIDS virus he had "discovered" in 1984 really came from the Pasteur Institute" <http://www.newscientist.com/channel/opinion/dn14881-comment-was-robert-gallo-robbed-of-the-nobel-prize.html> As the article states, perhaps Gallo was crucial enough to the early HIV/AIDS research that he should be included in the Nobel, but not necessarily for the virus discovery itself.

seth (2008-10-07 19:44:17)

Thanks, Jeremy. Scott, Gallo repeatedly claimed – before yesterday – that he had been cheated out of two Nobel Prizes. Yesterday surely makes three.

Nathan Myers (2008-10-07 22:43:27)

I didn't know this about Gallo. Wikipedia says he still has a lab, and that the Gates Foundation handed him \$15M last year. It also has two broken links to a "Lab \_Rat \_color.pdf" on this very site (refs 3 and 11) but none to the virusmyth site. The article linked is on an HIV denialist site, apparently not updated since 2002. Did they decide in 2002 that the HIV-AIDS link is OK?

Nathan Myers (2008-10-07 23:01:36)

(Oops, ref 11 is ok.)

## Chinese Cell Phone Economics (2008-10-07 19:15)

In China, you get a cell phone number by buying a SIM card (a small plastic chip) that you put in your phone. Yesterday I bought one. I was shown a page of 12 possible numbers. At the top of the page it said 168 yuan ( \$25). But one of the numbers was cheaper: only 120 yuan ( \$18). Why the difference? I asked. The cheap number was "hard to remember," I was told. I studied the 12 numbers; they looked equally hard to remember. So I got the cheap one.

Hard to remember was a euphemism, I learned later. Some digits (8, 6) are considered lucky, others (4, 7) unlucky. My number: 1170784.

This is related to self-experimentation. I suppose few scientists believe in lucky and unlucky phone numbers but many believe in "good" and "bad" ways of doing science. One example is a belief that [1]self-experimentation is bad, another is a belief that Bayesian tools are "[2]irrelevant to the business of science"; a third is [3]the blue-ribbon panel that would only use data from double-blind experiments when deciding nutritional requirements. Scientists (and the rest of us) pay more than 48 yuan ( \$7) for such beliefs, which pervade science. Their effect is that scientists fail to use tools that would help them with their research; the rest of us suffer from the lack of progress that could have been made (e.g., discovery of better ways to treat depression). At the end of [4]a paper about my self-experimentation I made this point:

Belief that something is bad makes it hard to learn what it is good for.

1. <http://query.nytimes.com/gst/fullpage.html?res=9C0DE4DB1530F931A35753C1A9639C8B63&scp=2&sq=%22felice%20bedford%22&st=cse>
2. [http://www.stat.columbia.edu/~cook/movabletype/archives/2008/07/responses\\_to\\_my.html#comments](http://www.stat.columbia.edu/~cook/movabletype/archives/2008/07/responses_to_my.html#comments)

---

Mark (2008-10-08 09:29:36)

"Hard to remember" might have been partly true. In Japan numbers can be assigned two or three sounds, and people remember numbers by forming them into words ("goroawase"). Some numbers that appear hard to remember to us are easy for Japanese. For instance, "4649" can be pronounced "yoroshiku," which is a very common word (used in polite requests) and is in high demand for phone numbers by businesses.

Tom (2008-10-08 15:34:33)

Not exactly self-experimentation, but an interesting post by Dr. Davis on how Edward Jenner followed up on a milkmaid's idle remark and discovered the smallpox vaccine: <http://heartscanblog.blogspot.com/2008/10/accidental-health.html>

a-duo (2008-10-08 18:50:27)

it is ture that Chinese like lucky number.

MT (2008-10-10 04:08:19)

SIM cards are standard in the UK and Europe as well, and much more practical than the US/Canada format of attaching phone numbers to phones. If a phone breaks or is replaced I simply move my SIM card with all my contacts and my phone number attached to it.

seth (2008-10-10 04:11:55)

yes, I like SIM cards much better. They don't come with a voice mailbox but that doesn't matter – everyone in China uses text messages in place of voicemail messages.

ywsz2008 (2008-10-30 22:41:14)

### **My New Job (2008-10-09 04:21)**

I am starting a new job as a professor of psychology at [1]Tsinghua University, Beijing. My particular task is to help everyone in the Psychology Department – newly reestablished this year – write their papers in English. At a department meeting today, introducing myself, I said, "To help you with your English will be easy, learning Chinese will be hard" – but I didn't get to the second part ("learning Chinese...") because everyone laughed after the first part.

1. [http://en.wikipedia.org/wiki/Tsinghua\\_University](http://en.wikipedia.org/wiki/Tsinghua_University)

---

Stephen M (Ethesis) (2008-10-09 19:45:24)

I hope it goes well. Is this permanent or just a sabbatical from Berkley?

### **A New Way to Prevent Migraines (2008-10-10 04:28)**

Michael Solberg, who works at the State Department, has had migraine headaches for about 10 years. He recently wrote me about how he discovered a new way to prevent them.

They'd been slowly getting worse and worse as I got older. [He's in his early thirties.] About 4 years ago, I was getting about 3 or 4 a week. Fortunately, I had abortive medication, so when I get a migraine, the medication (Zomig) makes them go away in 1-2 hours.

Doctors tried to put me on all kinds of preventive medication - Amitriptaline (sp), Atenolol, Propanolol, and finally Neurontin (which gave me severe chest pain). Finally, I called it quits with the medication and decided to go at it on my own. I knew what my triggers are (lack of sleep, dehydration, low blood sugar, neck and/or eye strain mostly).

Quite independently, while I was living in Jakarta, Indonesia from Aug 2005 to July 2008, I took up rock climbing. There's not a lot to do in Jakarta, and rock climbing – on a rock climbing wall at a mall in Jakarta – was a way to be active. It was essentially a trainer-led workout. Wall climbing in Jakarta isn't like anywhere else I've ever been – the instructors do all the belaying, and if you go in the evenings, they'll run you through drills and exercises to build strength. A couple of times, I had to do 15 consecutive climbs in 10 or 15 minutes – hence the fatigued muscles and intense sweating (it was all outdoors).

After climbing for 2 or 3 months, I noticed that I wasn't getting migraines any more. It was weird – I was getting a stockpile of my medication because I wasn't using it nearly as often. I went from getting migraines 3 times a week to less than 3 times a month, and the ones I did get were very weak. I began to figure out that for about 7 to 10 days after I did a hard rock climbing training session, I would be migraine free! I'd only get them if I traveled somewhere and stopped the training for a week.

At first, I narrowed it down to three possible causes:

1. When rock climbing, I would sweat profusely, so maybe I was sweating out toxins from the body.
2. When rock climbing, I was building all kinds of muscle (and, in fact, I lost about 30 pounds when doing this, and I was already pretty skinny).
3. When rock climbing, you are exposed to a lot of magnesium in the form of the chalk climbers use keep their hands dry. I'd read a lot about how some migraine sufferers were shown to have magnesium deficiencies in their blood stream. A lot of us take magnesium supplements along with multivitamins.

Towards the end of my time in Jakarta, I had less time for rock climbing, so I began a training program at home. I've pretty much convinced myself that it was the muscle-building component of the training that made the difference.

I'm not sure when I finally decided that hypotheses 1 and 3 were wrong, but I noticed that if I do a simple workout in the gym focusing on arms, upper back, and chest, the effect is the same – migraine free for 5-7 days. When I work out in the gym, I don't sweat nearly as much as I did when I climbed. Because I got the effect by working out in the gym, I decided that muscle building exercises was the likely culprit.

When I was at home in Arkansas a few weeks ago, I spoke to a friend of mine who's an [1]holistic healer. He said that when you build strength in the shoulders, upper back, and arms, you stimulate the liver to rid the body of the toxins that can build up and trigger migraines.

But no holistic healer has come up with this prevention strategy as far as I know – if you know otherwise, please let me know.

I don't know if that's the case, but even now when I'm not rock climbing, I go to the gym once or twice a week to work on my shoulders, chest, and arms, and I'm more or less pain-free (about 1 or 2 per month).

Incidentally, I wrote to the National Headache Foundation, but they never wrote back. I also posted on a migraine message board, but got absolutely no response. I suppose it sounds too good to be true – free therapy for migraines – but I'm not selling anything and have nothing to gain or lose if people try this or not. It's worked for me and has kept me pain-free. When climbing, I lost all kinds of weight, and probably paid out the same amount of money per month [for climbing] that I paid for all the drugs and vitamins.

If you try this to prevent migraines, please let me know what happens.

1. <http://www.bachertwellness.com/>

---

Sam (2008-10-10 05:45:51)

I had migraine during my childhood, getting worse and worse, driving me up walls. The medication I got helped a bit, but not by much. Funny thing is, the migraine went away over night. It took some months for me to realize it, but the migraine left me the moment I moved out from my parents and quit school, both for good. Years later, in an stressful and unhealthy relationship, I started to get migraine attacks again - I knew I had to change my life, and ending the relationship immediately ended my migraine attacks. Funny how life works out sometimes.

Heidi 555 (2008-10-10 15:20:43)

A friend of mine use to get really bad cluster headaches. They're much worse than migraines. He was able to get rid of them by running daily, self massage, and relaxation. He thinks that energy flow and circulation were key to his success. There was a time when he was younger that he lifted lots of weights, but that didn't help his headaches at all. Also at one point he did huge numbers of push-ups to get rid of a headache once he had one. But the push-ups didn't prevent him from getting them in the first place. It's interesting that it was the aerobic exercise that worked for him and not the muscle building.

Willy (2008-10-10 16:03:24)

This contradicts what doctors repeat, that the liver has nothing to do with headaches. Maybe it is the same case as with acne and food, they deny a relation but if you reduce fats you get less acne.

Nathan Myers (2008-10-10 16:48:24)

"Not selling anything" is death for a therapy. If there's nothing to patent, there's no profit to be made, so who could possibly be interested (other than sufferers, of course)?

Edith (2008-10-11 13:22:49)

My neurologist told me that exercise is related to migraine. For many years I did about 20 minutes of exercises a day--the Royal Canadian Air Force program. It had no effect on my migraines at all. If you can suggest a particular regimen that helps, I'd be most grateful.

seth (2008-10-11 18:11:05)

Edith, maybe your exercises weren't hard enough. I think as you get stronger the exercises need to become harder so that the difficulty - the challenge - remains high. I think only when the muscles are stressed so much that they grow does the exercise make a difference. If I do 20 pushups today it will cause my muscles to grow. But if I do 20 pushups a day for many years doing 20 pushups will no longer cause my muscles to grow.

MT (2008-10-13 06:57:13)

So between the migraine/upper-body exertion connection and the sleep/one-leg standing exertion, there seems to be a new idea about exertion and brain function. It would be interesting to try and switch one-leg standing and upper-body exertion to see if either produced the same effects on the other conditions, and also to test other aspects of brain function - concentration or memory for instance - on either of these exertion parameters.

Kris (2008-10-15 13:42:20)

I used to get migraines often when I was younger, probably once a month or so. Often, I went to my soccer games even with the headache. It would feel a little better after warming up and would usually go away early in the game. It felt like getting the blood pumping would force the blood vessels to loosen up. Now that I eat less carbs, more fat, no breakfast, I rarely (maybe once a year) get a migraine. I think cereal or high carb/low fat for breakfast plus a late lunch that started with carbs would be the trigger. Once it started, I would down softdrinks to get me through the day and collapse when I went home.

David (2008-10-16 15:59:05)

I'm a headache doctor, and none of my patients have reported this. There is certainly an association between obesity and headaches, so the weight loss could have played a part. Most headache experts, while recommending a healthy lifestyle overall including avoiding any known food triggers, getting enough and regular sleep, and moderate exercise; recommend not exercising if you feel a headache coming on.

Ben Fury (2008-10-18 20:56:44)

Migraine. 3 things. Eat low carb. Eat ZERO grain. Consume ZERO caffeine. Have seen ZERO migraine in clients that implement those three suggestions. Of course, several have complained and whined about the suggestions and still have migraines which proves nothing except some people would rather complain than feel better... Be well, Ben Fury, CFT, CMT

NE1 (2008-10-19 07:39:33)

Nathan, that's not correct. There is a legion of physical therapists who would be more than happy to charge you for helping you fulfill an exercise cure for migraines. Seth's anecdotes are interesting, but personal accounts can't always be counted on as reliable evidence via the scientific method (see his posts about acne, where many a teenager is cured of acne after finally discovering the magic elixir!... at 25.) It's very interesting that the standard advice is to avoid exercise before a migraine, though.

IndianGirl (2008-11-15 23:08:21)

I have experienced this. I have been getting migraines about twice a month since the last 15 years. However, when I went to dance class (an hour a day on alternate days-comprising of rigorous aerobic exercises and dancing, definitely working up a good sweat for an hour), I became migraine free for that period. I went to dance class for about 6 months and was migraine free during those 6 months.

Khalil Salman (2008-12-06 08:53:00)

Rock climbing might have helped you because you were in direct contact with earth/ground which in my opinion was (earthing you) just like an electricity plug. So all the extra electricity that might lead to a migraine finds its way to the ground. just a thought....

Denise Marie (2011-09-17 07:45:22)

I also was suffering from migraines that were getting worse and worse. In the past, I was able to manage them with food restrictions, medications, and massage, but about 8 months ago, it quit working. I was getting bad migraines for about 3 days a week, and I was missing work because the meds (relpax, etc.) weren't working for me. I started rock climbing and seeing a chiropractor at around the same time. Almost immediately, my migraine frequency lessened. It has been 2 1/2 months, and I have had about three, easy to manage migraines. I've been working in an office for the last 10 years, and I think my upper body muscles were weak and not properly supporting my head or spine. Before joining the rock climbing gym, I worked out 2-3 times a week with weights, but I was still very weak in my upper body. It's just another account, but I recommend it to anyone that's suffering to give it a try.

## **Chinese Transportation Economics (continued) (2008-10-10 20:17)**

In China, when a journalist comes to cover your event, you are expected to give them 200 yuan ( \$30) in an envelope to cover the transportation cost. To put this in context, the 30-minute cab ride from the airport to my apartment cost 85 yuan.

In Beijing, a subway ride from anywhere to anywhere costs 2 yuan. The minimum price for a cab ride is 10 yuan ( \$1.50), which will get you about a mile.

---

## A Few Things America Can Learn From China (2008-10-12 01:42)

From [1]this discussion. The speaker is Noriel Roubini, the NYU economics professor:

In U.S. the total consumption's about \$9.5 trillion. Take the entire consumption of 1 billion Chinese, it's about \$1 trillion.

The average American thinks: We're rich, they're poor. It's more complicated than that. The Chinese, in hundreds of ways, do more with less. They pay less for the same quality of life. Here are some examples:

1. The lights on the stairs to my Beijing apartment are sound-activated. Works well, saves electricity. In Berkeley I pay \$4/month to light the stairs to my apartment and why should my landlady install sound- or motion-activated lighting?
2. The water-heating system in my apartment is flash heating, that is, just-in-time heating. It works just as well as an American-style water heaters and there's no heat loss when you aren't using it.
3. My washing machine doesn't use heated water. Incoming water is heated to room temperature by a set of baffles.
4. The doors to campus cafeterias are a set of hanging plastic strips. It gets cold in Beijing in the winter. When someone enters there is much less heat loss than when a door is opened.
5. Bicycles are everywhere (in my part of town, the university district, at least) and are easy and safe. They are also very cheap. I could have bought a used one for \$15 but instead a friend gave me hers – she takes the bus to work. While bicycles are basically transportation for people who live close to work, as students do, electric bicycles – in which China leads the world – are far more powerful and could probably replace a lot of cars if downtowns were safer for them.
6. The better you cook, the cheaper ingredients you can use and achieve the same result. The Chinese, who are great cooks, use lots of vegetables, which are cheaper than meat and of course easier on the environment.

1. [http://www.cfr.org/publication/17365/financial\\_crisis.html](http://www.cfr.org/publication/17365/financial_crisis.html)

---

Gabe (2008-10-12 10:29:18)

... and of course all of the above apply to many parts of Europe too

MT (2008-10-13 06:29:45)

The UK is ahead too – but the electric bikes in China are amazing – my flatmates are Chinese and described the ubiquity of the electric bike, and that some city's are banning motorcycles to encourage more bike use. So China is ahead in many

environmental areas despite perceptions to the contrary. An electromagnetic countertop burner is also common there, yet I've never seen one in the West.

Patrik (2008-10-13 13:23:16)

Seth – you implicitly contradict yourself. You write: 3. *My washing machine doesn't use heated water. Incoming water is heated to room temperature by a set of baffles.* Which I think you see as a plus. Fair enough, each to their own, but I think we can agree that my honkin' electricity eating American washing machine when set to hot water and full of Tide is gonna give me a better, more powerful wash than its room temperature Chinese brother. But then you write: *While bicycles are basically transportation for people who live close to work, as students do, electric bicycles – in which China leads the world – are far more powerful and could probably replace a lot of cars if downtowns were safer for them.* Isn't the electric bicycle analogous to my washing machine? My washing machine doesn't need hot water, but it is certainly more powerful with it, just as an electric bike is more powerful than a standard bike, but doesn't need a motor. Perhaps the Chinese are more indulgent than Americans in this regard. I should also mention that electric bikes (and cars for that matter) need to, obviously, be powered by an energy source. All those coal fired power plants powering all those electric bikes — when they could be simply pedal powered — can't be good for the environment.... So which one is it? (Pardon the over-over-over-simplification) Weak washing machine = good, then electric bikes = bad. Or Electric bikes = good, weak washing machine = bad. In my eyes, you are, at least, superficially inconsistent. Thoughts? Also, here you are way off-base: *The average American thinks: We're rich, they're poor. It's more complicated than that. The Chinese, in hundreds of ways, do more with less. They pay less for the same quality of life.* In aggregate and on average, the Chinese are much more poor than Americans and the vast, vast majority do not enjoy the same quality of life whether they pay more or less for it. I wonder about your claim as to whether they pay less. My guess is that as a percentage of income they pay MORE for foodstuffs and medicine than the average American. But in the end, I don't know. People vote with their feet. You simply don't see a mass influx of permanent immigration to places like China, Cuba etc etc unlike places like the USA.

seth (2008-10-14 00:49:37)

Sure, the Chinese are much poorer than Americans. I'm trying to point out some non-obvious reasons for the difference in consumption per capita. I'm not saying Chinese have a better life overall, just that in certain ways Americans can learn from them. As for bikes, the Chinese have discovered the value of electric bikes. Americans have yet to. In the case of washing machines, Americans could surely get by with weaker washing machines but haven't discovered this (although cold-water detergents are now sold). We overclean our clothes, just as we overheat our water (keep it warm when not necessary).

Patrik (2008-10-14 14:11:17)

Hi Seth, I don't you are addressing my point about the inconsistency of your argument in the post. *As for bikes, the Chinese have discovered the value of electric bikes. Americans have yet to.* To dovetail on this, taking into my account what I wrote above, would you not agree that the Chinese have yet to discover the value of American-style washing machines? I would argue my machine is more efficient, it takes more washes, more water, more detergent, more power via a Chinese machine to achieve the same level of cleanliness. This is not idle speculation — this is what I have observed in Central America and Eastern Europe. *In the case of washing machines, Americans could surely get by with weaker washing machines but haven't discovered this (although cold-water detergents are now sold).* Well, we could 'get by' if we had no machines either. Let's have the women out by the wells with a washboard and handsoap! :) My guess, all things being equal, you show a Chinese woman an American machine and a Chinese one, she'll go with the American one. The reason the Chinese ones are handicapped, b/c it is a poor country and they cannot afford my washing machine. *We overclean our clothes, just as we overheat our water (keep it warm when not necessary).* The merits of flash heating are debatable. My experience (quite a lot) in former and current Communist countries is that when you scratch the surface a bit, things are a lot less efficient than they seem.

Mark (2008-10-15 05:43:36)

Sounds like how we live in Japan. On-demand water heaters are great. You get 80-degree C water right out of the faucet. I use it to fill a heating tank to put under the covers of my bed, and it's still warm in the morning. I can fill up a saucepan without removing it from the stove and it's boiling in seconds. We don't have hot water for washing machines either, and it's just not

missed (nor are dryers). The thing I just really can't figure out are dishwashers. When I visit my family they use dishwashers that in effect require that you pre-clean the dishes or the thick stuff will bake on, and you have to arrange the dishes just the right way. Because the dishes have been "pre-cleaned," they don't look dirty, so it's hard to tell if the dishwasher contains dirty or clean dishes. My mom has some sort of code: she leaves it latched or not latched or something to remind her. In Japan I just wash the dishes while I cook. There are plenty of little 30-second moments during meal preparation to clean everything you've used up to that point, and then the remaining table dishes are all that's left. But, oh, I forgot: Americans can't cook. They can "Food Channel" cook, make big production number dishes, but they can't efficiently throw together a delicious, cheap meal out of a few fresh ingredients picked up on the fly in the market, using a couple burners and few dishes. You didn't mention split-ductless heating. That is huge! Each room (or each major room) has its own heating and air conditioning. And since we don't have huge "great rooms" and high ceilings, you can heat or cool the room(s) you're using very cheaply. And the suckers only cost a few hundred dollars. Split-ductless is available in the U.S. for historical buildings that don't have ducting areas in the ceilings, but when I looked into them for an apartment building I own it turned out that they cost thousands (for the same devices, I'm convinced).

seth (2008-10-15 06:19:18)

Yes, the split-ductless heating/cooling is very important. The weather has been so nice here I haven't turned mine on.

### How to Spot Incompetence (2008-10-14 02:23)

Nassim Taleb [1]says, "When someone says he's busy, he means that he's incompetent." I think he also distrusts anyone wearing a tie. In college, I wrote an essay called "The Scientific \_\_\_\_\_" in which I argued that any writer who uses the term scientific without explaining what it means is incompetent and you should stop reading immediately.

I still believe that. Now, for the first time, I am going to update my list of incompetence giveaways: Plotting something on a raw scale that should be on a log scale. Size-versus-time data should usually have the size axis on a log scale.

[2]This presentation by someone at Sequoia Capital, the Silicon Valley venture capital firm, is full of examples. The Dow Jones Industrial Average (from the 1960s to now) is on a raw scale (where the distance from 5 to 10 equals the distance from 10 to 15), should be on a log scale (where the distance from 5 to 10 equals the distance from 10 to 20). Same for an index of housing prices. Same for the Nikkei. Many other examples. You can still believe the data, of course; just don't trust what's concluded from the data. Given the ubiquity of this practice (plotting on a raw scale what should be on a log scale), especially among financial supposed-experts, Taleb and I are not far apart.

More Taleb makes a similar point in his [3]online notebook. Writing about a debate with Charles Murray:

Finally I showed a graph of the rise of the US stock market since 1900, on a regular (non-log) plot. Without logarithmic scaling we see a huge move in the period after 1982 – "the bulk of the variation comes from that segment, which dwarfs the previous rises. It resembles Murray's graph about the timeline of the quantitative contributions of civilization, which exhibits a marked jump in 1500. Geometric (i.e. multiplicative) growth overestimates the contribution of the ending portion of a graph.

1. <http://www.timesonline.co.uk/tol/money/article4938008.ece>

2. <http://www.slideshare.net/eldon/sequoia-capital-on-startups-and-the-economic-downturn-presentation>

3. <http://www.fooledbyrandomness.com/notebook.htm>

Ashish M (2008-10-14 09:23:37)

Umm, can you explain why size-versus-time data should have the size axis on a log scale? Thanks.

seth (2008-10-14 13:47:23)

The simple answer is: Because doubling in size in a year is equally impressive whether the absolute change (end point minus starting point) is a small number or a large number. The more complicated answer is: Because plotting size on a raw scale means that major changes in the rate of growth at small scales (e.g., between 50 and 500) will be invisible if some of the growth takes place at large scales (e.g., between 5000 and 50000). Interesting structure, if present, will be invisible.

Patrik (2008-10-14 17:17:27)

Seth – absolutely fantastic points. This is especially great as most people are unconsciously cowed by the authoritativeness of the "experts", in this case, VCs.

seth (2008-10-14 19:41:28)

thanks, Patrik

Andrew Gelman (2008-10-14 20:09:00)

Seth, I am busy, and I wear a tie, yet Nassim respects me (I think).

OneEyedMan (2008-10-14 20:35:01)

Shouldn't log scales be reserved for series with geometric growth? In finance this is usually the case, but there are lots of places where it would mislead, like anything with S-curve behavior that hasn't reached the asymptote.

seth (2008-10-15 03:59:54)

Andrew, maybe it helps that you understand the value of log scales.

Andrew Gelman (2008-10-15 08:27:30)

Logs are so important. I never know how much to cover them in my classes. We have some log transformation activities in our Teaching Statistics book.

Patrik (2008-10-15 14:53:47)

Allow me to add to your list of incompetence giveaways: Ordering (ostensibly) meaningful multidimensional data in alphabetical order\*, especially in charts and graphs. This makes me insane! All of the major media do it all the time. Once I noticed that The Economist even does this, I lost a lot of respect for it. [http://www.economist.com/markets/bigmac/displaystory.cfm?story\\_id=11793125](http://www.economist.com/markets/bigmac/displaystory.cfm?story_id=11793125) Look at the Big Mac Index, it would make a helluva lot more sense if it was ordered (largest to smallest or smallest to largest) by either the 3rd, 4th or 6th column items. \*Yes, alphabetical order makes sense for, say, a guest list or any other sort of one-dimensional list.

seth (2008-10-15 15:54:11)

Patrik, I agree. I've heard Andrew Gelman make this point several times. OneEyedMan, "reserved for series with geometric growth" – not at all. There are lots of other cases where log scaling is an improvement, such as power-law-like histograms. The power-law (Pareto distribution) similarity is nearly invisible unless you use log scales for both the x and y axes.

Chris (2008-10-16 09:36:27)

In fairness to The Economist, they produce countless charts of cross-national statistics. Keeping countries in the same order promotes a kind of global coherence - the presentation matches users' expectations. Besides, the typical user won't read the chart thoroughly; they'll scan for the one or two countries they're interested in. On the other hand, I'd say there's a case for them organizing countries by region rather than putting them in one alphabetical list. Tie-wearing? It really depends on your work environment. The underlying factors here is (IMO) dress as an indicator of ability to read social cues.

Patrik (2008-10-16 10:52:42)

*Keeping countries in the same order promotes a kind of global coherence - the presentation matches users'™ expectations.*

@Chris I think what you are saying is that since The Economist thinks its readers are lazy, they should be lazy too. You could say the same about not using log scales, many readers don't expect to see them, so why use them? The average reader of the The Economist has an IQ that is more than enough to process such data presented in a meaningful manner. By organizing multidimensional data in such a lazy manner, that is, alphabetically, The Economist casts away immediate and intuitive meta data that surely its high-income, highly-educated readers value. This is not People Magazine we are talking about here. *Besides, the typical user won't read the chart thoroughly; they'll scan for the one or two countries they're interested in.* I don't think so. I think, at the very least, people will want to see their home country and then the greatest and least in the same category. And then, who they are comparable with. Alphabetization does not help them at all. My stats professor always joked/stressed, presenting data alphabetically is criminally irresponsible. And after a few thousand corporate PPT presentations, I agree.

### **Amory Lovins Speaking in Berkeley (2008-10-14 13:51)**

Amory Lovins  
Chairman and Chief Scientist  
Rocky Mountain Institute

Natural Capitalism:  
The Next Industrial Revolution

Tuesday, October 28, 2008 - 4:10 p.m.  
Lipman Room, Barrows Hall 8th Floor, UC Berkeley Campus

---

Benquo (2008-10-14 19:27:22)  
Amory Lovins! Worth it for the name alone.

Nansen (2008-10-15 16:33:09)  
Speaking of appearances, Andrew Gelman will be [1]on C-SPAN2's Booktv this weekend. (Note: the viewing times are in Eastern Standard Time.)

1. <http://www.booktv.org/program.aspx?ProgramId=9825&SectionName=Politics&PlayMedia=No>

### **Live-Blogging the Presidential Debate (2008-10-15 18:58)**

Both candidates are left-handed; left-handedness is far more common among Presidential politics than the general public. Andrew Gelman and I taught a seminar on left-handedness. We did two surveys that found that lefthanders tend to have left-handed friends more than righthanders.

---

Timothy Beneke (2008-10-16 08:51:00)

The more older brothers a man has, the greater the likelihood that he will be gay; if a man has 10 older brothers there is a 50 % chance. This is tied to hormonal effects in the womb apparently. But what's interesting, the effect does not occur if the man is left handed, which rules out any socially learned explanation, i.e., older brothers "initiate" boys into same sex behavior. Marc Breedlove is my source on these matters: <https://www.msu.edu/breeds/research.htm> #4 I'd be curious if anyone knows what's been found about left-handedness and personality in general.

CaroleS (2008-10-23 03:43:33)

Interesting survey result. I am left handed but only have two friends who are left handed.

### **Live-Blogging the Presidential Debate (part 2) (2008-10-15 19:01)**

"Childhood obesity is one of the biggest problems we have." Tomorrow I'm giving a talk at Tsinghua University (Beijing) called "The Secret History of the Shangri-La Diet." Childhood obesity is becoming a serious problem in China.

### **What Should Double-Blind Placebo-Controlled Trials Be Replaced With? (2008-10-17 05:31)**

For a sick person, which is worse?

1. Getting better for the wrong reason.

## 2. Wasting a lot of money.

It sounds like a joke – #1 isn't even harmful, whereas the cost of health care is a very serious problem. Yet the FDA and legislators with FDA oversight have been given this choice – and chosen #1. They have chosen to protect us against #1 but not #2.

If you get better from a placebo effect, that's the wrong reason. How dare you! The requirement that drugs be better than placebo controls prevents this from happening. The requirement might have been – but isn't – that a new drug be better than pre-existing alternatives. Many aren't but they are always more expensive – not to mention more risky.

---

T. J. Kuhn (2008-10-17 08:51:49)

Seth, I think your post is a bit misguided. 1) The reason that drugs are required to perform better than a placebo is because the placebo effect tends to only occur in a small set of patients. That is that the mental makeup of a specific patient is the cause of a placebo response (irregardless of the treatment). It is also not clear whether a placebo respondee is "actually getting better". It is just as likely that they were not actually sick in the first place (or as sick as they thought). 2) Those patients who are not predisposed toward exhibiting placebo responses need to be given an actual effective treatment to "get better" and therefore deserve medications that exhibit "better than placebo" characteristics. 3) There is a requirement from FDA (and regulatory agencies worldwide) that new drugs be as good or better than existing medications; or that they provide some sort of unique benefit (or reduced risk). 4) The expense of new medications is largely due to the high cost of research to make those medications (and fund future research). The low-hanging fruit is largely gone. Best, TJK

seth (2008-10-17 18:25:21)

T.J. Kuhn, thanks for your thoughtful comments. I've never before heard the idea that "the placebo effect tends only to occur in a small set of patients." It's a surprising and puzzling idea because there are so many different placebo effects, i.e., so many different situations in which some sort of supposedly-impotent treatment has an effect. What is this idea based on? I don't grasp the reasoning behind #2. It doesn't seem logical. If Person X doesn't respond to placebos, why the need to study or use them? The FDA requirement you mention is useless. Any drug can be claimed to have a "unique benefit." There's always something. "The expense of new medications is largely due to the high cost of research." Huh? Drug companies spend vast sums on advertising and marketing. This surely affects the price of drugs. See my recent posts on Charles "Disgraced" Nemeroff. The reason he's disgraced is how much money he was given (and failed to report).

T. J. Kuhn (2008-10-23 05:06:42)

The important thing to remember about a placebo response is that the response is not due to the treatment. It occurs because of the expectations of the patient. In some studies, there has even been a negative placebo response (that is, the patients were expecting to get worse and did because of their expectations). With regard to my second point: Placebo use in double-blind trials is not an attempt to study them. Rather, placebos are used to better study the actual investigational product independently of the subjects expectations of what taking medicine should do. With regard to advertising and the cost of drugs: Kraft, Coca Cola, Toyota, Miller Beer spend vast sums advertising their products. Surely that has an effect on their prices as well. However, drug companies spend hundreds of millions of dollars researching new treatments. The best (although imperfect) analysis puts the cost of bringing a single medication to market at over 800 million US dollars. I'm pretty sure that Kraft doesn't spend that much on their latest line of crackers. Your point, however, is well taken; "should we allow advertisements for prescription drugs?" There are a lot of valid points on both sides of that debate. I see both benefits and drawbacks; so I think the jury is still out on drug advertising. Have a good day, TJK

## Learning Chinese in Beijing (2008-10-18 23:46)

Learning Chinese here – at least the first baby steps – has turned out be easier than expected. I'd expected to hire tutors. A Berkeley grad student I know who had lived near where I live now had done that. I found ads offering tutoring on a craigslist-like site. I started with the cheapest ( \$10/hour – which is a lot in Beijing). After an hour, I cut short the first lesson. It had been excruciating. "X means this. Y means that." In my tutor's defense, we didn't yet have a textbook to work from but paying \$10/hour for a textbook reader seemed pricey. By then, two people – a Tsinghua student I'd met in a dining hall and the girl who sold me my cell phone – had offered me free Chinese lessons.

"Why should I pay you if others will teach me for free?" I asked my tutor.

"Why did I spend four years in college learning how to teach Chinese to foreigners?" she replied. (That was her major.)

That wasn't persuasive, I said.

She said she had a Mandarin accent but others might not.

"To speak with everyone I should learn from everyone," I said. This is an attractive feature of Beijing: It's much more a melting pot than other Chinese cities, such as Shanghai.

By now I've had several lessons from three different people who offered to teach me for free. It felt like fun, not work. They volunteered to teach me because they would learn English at the same time. Most Tsinghua students want to go graduate school in America, where they can expect to do very well – [1]Dark Matter notwithstanding – so long as their English is adequate. I may be at the exact place on earth – the Tsinghua campus – where English-speaking ability is valued most highly. It might be a special time, too: As the Chinese educational system improves its teaching of English, I expect the value will go down. If I were in Sweden, no one would volunteer to teach me Swedish.

The difference between my paid and unpaid teachers reminds me of a famous psychology experiment on extrinsic versus intrinsic motivation done by Mark Lepper and colleagues at Stanford and published in 1973. They took two groups of kids and put them in a room full of toys. One group was told they would be rewarded if they played with the toys. The other group wasn't told this. Two weeks later, the kids were put back with the toys. Kids rewarded for playing with the toys played less with them than the other kids did. It's such a profound effect it's like there are two different motivational systems.

1. <http://www.darkmatterthefilm.com/>

---

RasmusF (2008-10-19 08:46:12)

"If I were in Sweden, no one would volunteer to teach me Swedish." I assume you're talking about fairly large commitments of time and effort, because one of the most common interactions I've observed between tourists, or exchange students, and Swedes is helping each other learn a little bit about the other's language. Travelling I've found that one of the easiest ways to strike up conversation is to ask strangers to help me pick up a little of the local language. I do think Sweden might be interesting to study if you want to learn more about adults learning a new language. Since we've had huge immigration rates the last few

decades there's tons of observations about mandatory Swedish classes not working and self motivated learning working really well.

Aaron Blaisdell (2008-10-20 07:41:07)

Seth, are you learning to read/write Chinese as well? I took a year of it at UCLA (sat in on the undergraduate level 1 course) which helped me immensely. The grammar is actually quite easy, but the tones take some getting used to. For me the killer is the huge quantity of homonyms. Not only are there four ways to say any particular phoneme, each way can have multiple meanings depending on context. The same pronunciation of "shi" can mean "TV" or "stone" or a bunch of other things as well. Keep it up, it is a very interesting language. Aaron

seth (2008-10-20 12:28:56)

Yes, I'm learning to read Chinese. Not write it, at least now. The reading part is relatively easy; the speaking part is really hard. I can't even properly say the name of my school.

Patrik (2008-10-20 14:19:37)

Tim Ferris has a few interesting thoughts on this. He is quite the self-promoter and I think, very prone to hyperbole, but, in his defense, does make some incisive observations on language acquisition. (Ignore the bombastic titles and exaggeration) <http://www.fourhourworkweek.com/blog/2007/11/07/how-to-learn-but-not-master-any-language-in-1-hour-plus-a-favor/> <http://www.fourhourworkweek.com/blog/2008/09/22/why-language-classes-dont-work-how-to-cut-classes-and-double-your-learning-rate-plus-madrid-update/> Would love to know if any of his recs would come in handy for Seth.

### **Is Your Milk Safe? A Statistical Fable (2008-10-20 04:44)**

This recently happened in a class at the Beijing Language and Culture University:

TEACHER Your milk is safe if you buy it at a supermarket.

STUDENT What do you mean, "supermarket"? Where else could you buy it?

TEACHER That's a good question, I don't know the answer. They told us to say that.

When analyzing their data, a vast number of scientists more or less blindly do what a statistics book told them to do, just as this teacher said what she'd been told to say. Even worse, a vast number of statistics textbook writers simply copy other textbooks (not word for word, just the ideas and recommendations). The scientists and the textbook writers take refuge in false certainty. They fail to grasp that although the recommendations are black and white, the world is not – just as it isn't black and white what milk is safe. Unlike this particular classroom, no one questions this.

Thanks to Sally McGregor.

---

Patrik (2008-10-20 14:12:52)

Your observation, while part and parcel of the human condition (we tend not to question authority/'experts' or popular opinion etc etc), is even more pronounced in Communist countries. Probably tenfold more.

## Jane Jacobs on Experts (2008-10-22 07:16)

Her leitmotif was a swipe at the whole notion of expertise. She went to work for Architectural Forum, she told me, when the Office for War Information was consolidating its staff in Washington, and she didnâ€™t want to leave New York. . . .

â€œI went to Architectural Forum, and they said well, youâ€™re now our school and hospital expert,â€ she explained. â€œThat was the first time I got suspicious of experts. I knew nothing, not even how to read plans.â€ She paused for a moment. â€œAnybody who would want to be an expert, I have some advice for you: apply at a magazine.â€

From an [1]article by Paul Goldberger.

---

thehova (2008-10-22 09:35:36)

I hate to get political. But I think this is all part of the reason why many libertarians like myself feel uncomfortable with the the Democratic Party (not that the Republicans are much better...but at lest they seem to support the empowerment of state and local governments and have more of a hands off approach to regulation).

## Dutch Unmentionables (2008-10-22 18:10)

My friend in Holland wrote again:

Dutch people might say that they think the Queen should be democratically elected, but they never say, "She owns Royal Dutch Shell, if she paid taxes on the \$4 billion contract she just signed with the Pentagon last week, I wouldn't be paying 42 % on my income... We need to re-examine that."Â They'll talk about the golden horse-drawn carriage she rides around in on Prinsjesdag, and how cool it looks on TV.Â And what an impartial symbol of Dutchness she is.

[1]Â What beleg means. [2]Dutch law about sex with animals.

1. <http://www.blog.sethroberts.net/2008/03/20/what-beleg-means/>
2. <http://www.blog.sethroberts.net/2008/04/02/more-from-holland/>

---

Nathan Myers (2008-10-23 17:03:46)

Does she own Royal Dutch Shell? Would she be obliged, as a regular citizen, to pay large absolute quantities of tax? I don't know these things, so don't know how to interpret the quote.

Chris (2008-10-24 10:41:41)

Even if she owned 100 % of Royal Dutch Shell, and your friend's figure of \$4 billion represented her personal profit, even taxing it at 80 % would lower your friend's income tax rate by no more than one percentage point (figuring on 10 million Dutch taxpayers paying 42 % tax on an average income of US \$30,000 - I haven't looked anything up, but this should be in the ballpark). Under realistic assumptions (the Queen is a minority shareholder, the margin on the deal is

Chris (2008-10-24 10:44:55)

Weird, my last comment got truncated (probably because I used a less-than sign in the original): Even if she owned 100 % of Royal Dutch Shell, and your friend's figure of \$4 billion represented her personal profit, even taxing it at 80 % would lower your friend's income tax rate by no more than one percentage point (figuring on 10 million Dutch taxpayers paying 42 % tax on an average income of US \$30,000 - I haven't looked anything up, but this should be in the ballpark). Under realistic assumptions (the Queen is a minority shareholder, the margin on the deal is less than 10 %), the prospective tax relief shrinks to practically zero. Sounds like your friend is an anti-monarchist, so it's logical for him to regard money spent (or taxes forgone) on the monarchy as pure waste. But really and truly, monarchies do not cost that much in comparison to the other functions of the modern state. If you're going to have a monarchy, it must project an appearance of opulence, because the monarch as the personification of the nation needs to overawe all private interests (flashy billionaires etc.). But this can all be done on a few hundred million a year - chicken feed, relatively speaking.

### **Tsinghua versus Berkeley (2008-10-24 05:46)**

UC Berkeley is far better known than Tsinghua University, the best university in China. Of course, Berkeley's prestige rests on research and graduate teaching. At the undergraduate level things are quite different. Tsinghua probably has the smartest undergraduates in the world (1 in 10,000 students who take a national test get in); Berkeley isn't close.

At Tsinghua, every department is assigned a quota of undergraduate majors (e.g., 100) that is the maximum number of undergraduates in that major. The departments fight over this number: Every department wants to increase it. I use italics because the situation at Berkeley (and probably every other American research university) is the opposite: Everyone fights to do as little undergraduate teaching as possible.

I learned these facts from a visiting professor at Tsinghua. Why is the situation so different at Tsinghua than in America? "They're fun to teach," he said, meaning the undergraduates. "No one ever says that at Berkeley," I said. Later I learned he was a visiting professor from Berkeley. Implicit in his comment was that both of us knew that the Berkeley undergraduates are not fun to teach.

That little comment - "They're fun to teach," which was said a bit ruefully, acknowledging that Berkeley, where he spends most of his time, was much different - expresses in a nutshell what's wrong with all American higher education. Berkeley undergraduates would be fun for someone to teach. I liked many of them. They have many good qualities. But very few of them want to be professors; nor do their talents usually lie in that direction. Forcing them to be taught by people (professors) who really only know something (how to be professors) that their students don't want to learn, and forcing Berkeley professors to teach students who don't want to learn the only thing they really know, is just a recipe for unpleasantness and low-level misery on both sides (professor and student). That's exactly what professors and students feel most of the time.

Just as drug companies hide the side effects of their drugs, both professors and students hide the side effects of this life-wasting situation. At Berkeley, few non-professors know the vast array of deals that are struck to reduce one's undergraduate teaching. In Psychology, there has been long-lasting resentment that you can't use grant money to buy your way out of teaching. Students hide how much cheating goes on. A Penn student told me: No student project at Penn is completely honest. At Berkeley, surveys have revealed high amounts of cheating. Few outsiders

know the low level of lecture attendance at Berkeley.

A better system would be one that helped Berkeley undergraduates – not to mention the students at every other American college – be in contact with people who would enjoy teaching them. (And in that situation, I'm sure their many non-academic talents, which professors usually didn't notice, would shine.) Simple as that. The current system hinders that contact. Columbia University has taken a step in the right direction by having no classes on Friday, making it easier for students to do internships. When I taught a class that helped Berkeley undergraduates learn what they wanted to learn, my colleagues complained. According to them, my students weren't learning proper psychology. It's true, they weren't. My students were learning what they themselves wanted to learn instead of what some professors thought they should learn. My approach was about a thousand times more effective in producing learning but my colleagues had lived in darkness so long they could no longer see light.

---

Nadav Manham (2008-10-24 07:19:58)

Seth, What makes the Tsinghua University undergraduates fun to teach? Are they for the most part future academics, and therefore want to learn what their professors want to teach?

Patrik (2008-10-24 10:47:53)

Great post. Good on you. *When I taught a class that helped Berkeley undergraduates learn what they wanted to learn, my colleagues complained. According to them, my students weren't learning proper psychology. It's true, they weren't. My students were learning what they themselves wanted to learn instead of what some professors thought they should learn.* Nothing like a little professional jealousy courtesy of colleagues mired in the status quo. I have to say, one of the things I very, very much enjoy about this blog is your honesty regarding higher education.

Josh (2008-10-24 13:21:33)

Having suffered through nearly three years of college myself, your points are dead on. I particularly like the idea of giving the students Friday's for internships, which will help them far more in preparation for the real world than any amount of class lectures.

Ashish M (2008-10-24 18:30:20)

All so true. (Well, the parts about the Berkeley undergrad experience, anyway.) But even if we all agree, under the current system, who has an incentive to change the status quo? No one. The anomaly isn't Berkeley - the anomaly, at least based on what I've seen of the US higher education system, is Tsinghua. A more interesting comparison to Tsinghua might be with Caltech - are their undergrads all grade grubbers with disinterested research-focused profs? I've heard otherwise.

seth (2008-10-24 19:10:51)

Why are Tsinghua undergraduates fun to teach? Nadav, I haven't yet taught them, but I know enough to say you are exactly right: They have similar strengths and interests as the professors. Tsinghua undergraduates are indeed like Caltech undergrads. I think that every day – I was a Caltech undergrads. That might be the American example closest to Tsinghua. Who has incentive to change the current system? Well, the students do, obviously. Berkeley professors would like to teach much less. Which would happen if someone else – those who would enjoy teaching Berkeley students – did more of the teaching. The taxpayers would benefit from an economically less wasteful system (and the parents among them would like to see their children happier and better appreciated). I think all three sides have incentives to change. But I agree with your overall point, which is that the system is hard to change. Perhaps the big barriers to change are three: 1. Change would require acknowledgment of how bad the current system is, and that would mean acknowledgment of the self-serving lies that have been told about it ("we're teaching them to think"). 2. The future system would probably contain fewer research professors. Maybe a lot fewer. 3. The

biggest victims of the current system are students, who are relatively powerless.

Andrew Gelman (2008-10-25 17:47:32)

I found the Berkeley undergraduate stat majors fun to teach. Also, you write "Columbia University has taken a step in the right direction by having no classes on Friday." This must not be the Columbia University in New York, where I teach on Fridays every semester!

seth (2008-10-25 23:48:45)

Andrew, Columbia has nothing like this?

Marty Nemko (2008-10-27 23:37:08)

Precisely correct. That's why the freshman-to-senior value added in reading, writing, thinking, quantitative reasoning, etc. is so low. See my article on the subject in the Chronicle of Higher Ed. [chronicle.com/free/v54/i34/34b01701.htm](http://chronicle.com/free/v54/i34/34b01701.htm)

Seth's blog » Blog Archive » Tsinghua versus Reed (2008-10-28 01:02:09)

[...] Tsinghua versus Berkeley [...]

seth (2008-10-28 01:05:11)

Marty, I thought of you as I wrote it.

Elaine Chan (2008-11-14 11:44:11)

Seth, could you comment on how you structured the class so that students learned what they wanted to learn? Did you start out with a syllabus that changed throughout the semester? Did you start out with no syllabus at all? How did you solicit information about what students were interested in learning?

seth (2008-11-15 05:04:22)

How did I structure the class "so that students learned what they wanted to learn"? I let them do whatever they wanted – volunteer work of some sort – off campus. We met once a week and talked about it. In other classes, I let students do their term project on whatever they wanted so long as it was off campus and not library research (thus pushing them out of their comfort zone and requiring them to do something new). They inevitably did something they wanted to learn about.

barry (2008-11-29 07:08:21)

Why did you retire so early from Berkeley? Is this why? You're now at Tsinghua....isn't there only a few faculty members in your department? I hope you like it better. Not use being unhappy in our life if we can get out of it...

## My Chinese Cell Phone (2008-10-24 19:36)

...looks a lot like this one. The China/America comparisons are all in one direction:

1. The Chinese plan is prepaid; the American plan is not. The slight inconvenience of having to recharge one's phone every now and then is far outweighed by a much lower price. The plans can't be directly compared but I pay about \$50/month in America and about \$10/month in China. I pay \$15/month to keep my American number while I'm in China!
2. No voice mailbox in China. I don't miss it. You send a text message instead. I got about one text message/month in America (at 15 cents each); I get about 6/day in China (at 1.5 cents each).
3. My Chinese phone cost about \$40. My American phone came as a Free New Phone Every 2 Years thing but re-tailed for about \$200.
4. My American phone had so many features I never used, including a camera, I had great trouble finding a feature I now use all the time on my Chinese phone: a day planner.
5. Verizon, my American service provider, had/has excellent customer service but the girl who sold me my China Mobile phone plan gives me free weekly Chinese lessons. During working hours.

---

mike kenny (2008-10-25 12:27:12)

flying pig key chain, nice! i'm surprised they don't have voice mail. why is that? just cheap texting is a fine replacement?

Andrew Gelman (2008-10-25 17:44:33)  
You can get prepaid cell phones in the U.S.

seth (2008-10-25 23:10:41)  
Andrew, I didn't know that I wonder if I can switch my number.

Willy (2008-10-27 07:39:19)  
I agree that one of the most useful application in a cellphone is the calendar. The phone is one thing you will carry most of the time. Surprisingly many good phones do have adequate ones. Low cost Motorola phones have good calendars (e.g. repeat events, icons). Other brands may not have the same features. I find the keys in the C series of Motorola uncomfortable. I like cameras in cell phones. You can capture information easily, like taking a pic of a book you found at a bookstore when you don't have paper and a pen or because it is faster. I read an article where someone used the camera to remember where he parked his car :) Regarding price, it seems the deal is cheap phones/expensive rates or vice versa.

a-duo (2008-10-28 19:04:38)  
I think you can find Voice Mailbox in this website:<http://www.chinamobile.com/en/mainland/products/nb05.html> but I do not know whether it is what you mean voice mailbox in US.

Chris at Prepaid Cell Phones Guide (2008-11-07 13:56:22)  
There are now a bunch of well-priced and convenient prepaid cell phone plans available. The large companies like Verizon and T-Mobile are competing because they see that the market is changing. No longer will they be able to wield the two year contract over their customers-if they go for the prepaid or pay as you go plans. That seems ridiculous you have to pay \$15 a month to "keep" your American phone number.

jordi (2008-11-28 23:14:24)  
It is good that you are meeting many people in Beijing. How are you able to do that when you don't speak Mandarin or Cantonese? I've noticed throughout your blog entries that you trust people very easily. I hope you will be careful in China. What you think of in your mind when interacting with someone there might be different than what he or she thinks, since the Chinese have a different culture.

## **Cold Jokes (2008-10-25 23:39)**

A cold joke is a sort of nonsensical joke that is funny because it's not funny, sort of like [1]the New Yorker Anti-Cartoon Caption Contest. Two examples:

1. A piece of bread was walking down the street. It got hungry, so it ate itself.
2. Hanging in the hallway at Whites High School in Wabash, Indiana, are basketball team photos. In the center of the front row in each picture someone holds a basketball identifying the year: "62-63", "63-64", "64-65", etc. One day I saw a freshman looking at the photos. Turning to me, he said, "Isn't it strange how the teams always lost by one point?"

1. <http://www.radosh.net/archive/002497.html>

dj superflat (2008-10-28 14:52:33)

aren't some of these meta jokes? e.g., you're pointing out the silliness of a piece of bread walking down the street, feeling hungry, and then you return to the real world where a piece of bread is food. my favorite meta joke is too long for a comment, here's the short version: two eggs in a frying pan, one egg says to the other "gee, it's so hot i'm beginning to coagulate," the other says "gee, a talking egg."

Isak (2008-10-29 21:52:36)

This video is an excellent example of what you are talking about: <http://www.collegehumor.com/video:1772014>

### **Beijing Traffic (2008-10-26 00:15)**

This morning (Sunday), two friends and I wanted to go see the leaves change on some maple trees in a famous place. We went to the bus stop. The first three buses were utterly, totally packed – I have never seen buses so packed.

So we decided to take a taxi. The taxi couldn't go there – congestion was so bad that only buses, using special lanes, could get through.

We went back to the buses. Three or four more buses were utterly totally packed. We decided to go another time.

In the time we spent waiting for the buses we could have almost walked there; it's only about 5 miles away. Maybe next time we will bike there.

---

### **Interview with William Rubel, Food Historian (part 1) (2008-10-27 06:53)**

My friend [1]William Rubel is writing a history of bread. I'm sure it will be fascinating, so I interviewed him about it.

ROBERTS Can you give the background of your book, the book you're writing now? What led you to write it? Why did you want to write about the history of bread?

RUBEL I've been interested in bread since I was a child. I started making bread when I was eleven from the American Heritage cookbook. I made Anadama bread.

ROBERTS What kind of bread?

RUBEL It's called Anadama. In the headnote it uses the word "damn," and that wasn't a word used around my house so I was very excited to see it in print so I could show it to my mother, as I recall. It's a molasses cornbread. And probably with an inaccurate culinary . . . the history in the headnote is probably not accurate. But that's a different story.

I've always been interested in bread and I have for a long time been surprised at how difficult people seem to think making bread is. Long before I started this book, in conversations with people they'd say, "Oh

but making bread is very hard.â€™ And Iâ€™ve always found it to be rather easy. Iâ€™ve always found bread to be a natural process that is pretty difficult to fail at.

One of my primary interests in researching the history of bread is to find stories about bread that will inspire bakers but also to find older ways or different ways of writing bread recipes so that bakers will feel empowered. I think that the modern recipe format, and this might be not quite on topic, but you can cut it to someplace else, the modern, particularly American recipe format with its specificity of measurement and technique, I think actually undermines the bakerâ€™s confidence, the cookâ€™s confidence, rather than builds it. Right now particularly with bread recipes, the recipes are becoming increasingly specific so that a brioche recipe might run for ten pages and does in one of the cookbooks on my shelf. I think that you are in a vicious circle where more specificity breeds more tension and undermines confidence and actually reduces the number of people who are willing to just sit down and put together a bread.

ROBERTS I think thatâ€™s a great point.

RUBEL With the exception of pastries, which are chemical recipes that require precise ratios for a very, very specific effect. You canâ€™t make a puff pastry if the percentage of butter is wrong, and there is a right and wrong for making something like the puff pastry. But for most recipes, and certainly for bread, there isnâ€™t really a right and wrong. One thing that Iâ€™m learning, but it was also something I was looking for in historic text, is that there really isnâ€™t, thereâ€™s rarely a single definition or a single recipe for a bread. For example, if we take modern breads, like the baguette, modern cookbooks offer a recipe titled â€˜Baguetteâ€™ and then there is a recipe—a very specific recipe—for that bread. But if you go to Paris, which is indisputably the home of the baguette, and if you buy a baguette at every bakery you pass for a period of hours . . .

ROBERTS How many baguettes are we talking about?

RUBEL Well, it depends how fast you walk and it does depend what district youâ€™re in, but you could certainly collect 20 or 30 baguettes in a couple of hours. Youâ€™re going to find that they are all long, skinny breads, and they all have diagonal slash marks along the top—that opens them up. But past that, itâ€™s also clear that there isnâ€™t one recipe. Some will be very fluffy inside with an even crumb and very white. Some are going to be cream-colored inside with large, irregular crumbs. Some are chewy, some are not. Some are made with whole wheat or certainly flours that are not all white. Some are made with yeast, some are made with leaven—with sourdough. Thereâ€™s just every combination—many different recipes. I think youâ€™re going to find that all wheat bread—and thatâ€™s really the definition of a baguette—something simple like a wheat bread that weighs approximately 450 grams and is long and skinny and has diagonal slash marks on the top.

By going back into history, I tried to find inspiration and confidence; stories for cooks that will help them understand that they can be more relaxed when they approach a bread and that there isnâ€™t necessarily one answer.

But maybe more generally, and to answer that question more directly, I discovered in my book, *The Magic of Fire*, which is a book on hearth cooking, that cooks went from cooking in the fireplace, more or less in the blink of an eye—all at once—to cooking on iron stoves and then these gas and electric ranges. And nobody had written down, no cook wrote down, what it was like to cook in the fireplace. There was no manual. But all of our recipes are derived from hearth cooking.

When I took the recipes back to the hearth then I found that there was often potential for flavor and texture, in particular, that were implicit in the recipe once you got it to the fireplace. They were implicit in the recipe but unrealized until it was brought back to the fireplace.

ROBERTS By implicit in the recipe, you mean those ingredients could produce a much better result than they

usually got?

RUBEL Take a lasagna. You layer the boiled big pieces of pasta down with some ingredients and maybe you put cheese on top. And then you put it in a pan in the oven and you bake it. Originally it was not baked in the oven like that, it would have been originally baked in a Dutch oven, what we call a Dutch oven: a pot that you can put a lid on and you can put embers on the lid as well as embers underneath the pot. Or it was baked in the bread oven.

Now if we take the hearth cooking situation, which would have been the most common, because most people did not have ovens at home, you have straight, independently controlled heat sources. You can heat the Dutch oven just from the sides closest to the fire, from the side heat. You can heat it from embers underneath and you can heat it by embers on the top. So you might have your lasagna well cooked—heated all the way through—but you want to brown the top. At that point you can throw embers onto the top and brown it. You can take away all the other heat sources and just focus on that top. You might like to have crust on the bottom and the sides, so you would also have control of the heat source just to do that, whereas in an oven, everything’s a steady 350 degrees, top and bottom.

ROBERTS I see. Now I understand.

1. <http://www.williamrubel.com/>

---

Nathan Myers (2008-10-27 21:34:25)

Speaking of lasagne, you don’t need to boil the noodles. They can absorb all the water they need from the zucchini, spaghetti sauce, and what-have-you layered in between, and you’ll end up with a more flavor-concentrated lasagna. Don’t use tomato paste. I’ve got very lazy about bread lately: I get Trader Joe’s pizza dough.

### **Tsinghua versus Reed (2008-10-28 01:02)**

Let’s say I’m a record producer. A 20-year-old tells me he wants to be a record producer, and I say, okay, I’ll teach you. Do I write a syllabus? Set up class meetings? Give lectures, homework assignments, tests, grades? Of course not. None of that. Not necessary. I just say: Hang out with me. And he does, and both of us benefit. He learns what a record producer does, I have someone to whom I can pontificate (one of the pleasures of blogging) and who will do menial tasks. And having an assistant makes me look and perhaps even feel more important. The same thing could be done with almost any job. That’s real teaching. It’s as natural and easy as breathing or eating.

Contrast this with (a) undergraduate teaching in any American research university, such as Berkeley and (b) the situation described in an email to alumni I got today from Colin Diver, the President of Reed College. President Diver taught a seminar at Reed and described his experiences. Does he say the students were “fun to teach” as [1]a Tsinghua University professor told me? Not at all. Quite the opposite. His main observations:

Courses at Reed must be very carefully planned. . . . Leading a successful Reed conference [= seminar] takes considerable finesse. . . . Tamara [his co-teacher] and I spent hours planning and debriefing [= discussing afterwards] classes. . . As an instructor, you can never be too well prepared. . . . Both student enthusiasm and modern information technology conspire to extend the class hour virtually around the

clock. . . . Teaching at Reed means giving (and getting!) lots of feedback. . . Teaching at Reed is both exhausting and exhilarating! [Details of exhilaration not given.]

This is a fund-raising letter! A friend of mine got a teaching job at Reed and quit to take a lower-status job because the teaching was exhausting, as President Diver so clearly explains. But, [2]as I said about Berkeley faculty, President Diver has been in darkness so long he can no longer see light – in this case, he cannot see how unpleasant he makes teaching sound, at least for the professor. He fails to grasp he is describing sickness not health.

President Diver seems to have faintly discerned that there might be something wrong with the picture he had painted so he added:

Despite the long hours and hard work, the experience of teaching helped me understand why faculty find the experience of teaching at Reed so satisfying. . . .Nathalia King, professor of English and humanities, once said to me: "When you put teachers who genuinely love to teach together with students who genuinely want to learn, magic happens."

Magic, huh? Black or white? The end of Diver's letter is all about a new program that will allow Reed professors to teach less. "The new program will, to be sure, slightly reduce the amount of time faculty spend in the classroom over their careers." Actions speak louder than words.

1. <http://www.blog.sethroberts.net/2008/10/24/tsinghua-versus-berkeley/>

2. <http://www.blog.sethroberts.net/2008/10/24/tsinghua-versus-berkeley/>

---

Stephen M (Ethesis) (2008-10-28 05:43:05)

I taught a little and really enjoyed it. But I was teaching post graduate students. You make a good point though, about how much of what is going on seems aimed at finding ways for "teachers" to spend less time with students rather than more.

Stuart Buck (2008-10-28 07:38:43)

You make a good case for apprenticeships rather than schooling.

Aaron Blaisdell (2008-10-28 09:37:34)

Seth, What you describe sounds like an apprenticeship, which is what graduate student training is like. I use this approach with my graduate students and post docs, but also with the undergraduate assistants in the lab, as well as the occasional high-school student. This method works great and is very enriching for both the master and the apprentice. It is, however, impractical when a large number of students are involved. I teach a course with 250-300 students, another with about 70, smaller seminars of about 5-20 and a lab course which I limit to 10 students so that we can do a manageable project (a rat study) together. Speaking from my experience as an undergraduate at SUNY Stony Brook, I enjoyed my classes the size of 250-300 as much as the smaller seminars. I got something out of each one, and I knew what the constraints of each format were. I recognized from the very beginning that the large lecture hall classes are largely a one-way dissemination of information to lay the landscape for a particular field of knowledge and investigation. After having established some groundwork, I could then take smaller, upper-division courses where I could explore a particular topic in more depth and in a more intimate setting. I enjoyed both formats and excelled in both. I think one problem that occurs in college is that many students want to get a job or a career rather than an education. Education in science, arts, humanities, etc., involves more than just practical skills, which of course are very important. But moreover, getting background knowledge in many

spheres of interest (i.e., a broad education) allows one to use the critical thinking skills one hopefully also acquires in college to make a life and career. As a psychology professor, I see a lot of students that just don't get that psychology is not just a practitioner's field, but also is a field of investigation with a scientific and philosophical basis. Some of these students discover the joy of scientific discovery accidentally, but some of them resist it thinking that it is a waste of time. Maybe for them it is a waste of time, but then they had been misled about what psychology is or what a psychology major entails. Yes, teaching is difficult and takes time away from scholarship and research. But every time I teach, I find enjoyment, pleasure, and discovery—whether it is the large lecture course or small seminar. Also, I have made many insights that led to changes or enhancements in my own research during the process of teaching. Teaching has truly enriched my scholarship. And, there are always students, often many, who honestly report enjoying the courses they have taken with me. Tough, yes. Rewarding, you bet!

Chris (2008-10-28 23:44:21)

Seth, I'd be curious to hear your thoughts on how well prepared the students are for the challenges after school. I'm American educated (grad degree) been living/working in Japan and actually have had a chance to visit Tsinghua as we have a branch office amidst all the tech companies near there. My interpretation of Asian vs. American education models is that Asian ed is successful at knowledge transfer but not at teaching self-reliance and an ability to learn outside the classroom setting while the American one (through factual failure?) teaches self-reliance at the expense of knowledge. For successful Americans, they learn social and some skills in primary school and then education gets progressively less hands on through high school and then are given a "we won't spoon feed you any more" environment in college where you have to really learn to figure out what you want to do, who you want to be friends with etc. After college, the (successfully?) western educated realize that they have to keep figuring things out to be successful in life and so they continue to strive and the marketplace rewards those that figure out more things. In Japan/China they start the same way but if you're considered the cream of the crop (via test taking) you end up at schools where they 1) hand hold the students and 2) praise their students as being the best of the best in effect creating what Carol Dweck coined as the Fixed Mindset where you're considered so smart that fear of failure becomes an impediment. In work, I struggle in hiring Asian educated students from the top schools. They know a lot more about physics, engineering, literature, history, etc. but they have a lot more trouble learning how to get things done in a non-academic setting and create advances out of fear of failure. Self-experimentation to me is all about a personal inclination to learn. It'd be great to hear through the months where you see experimentation in China coming from—is it from the specially groomed elites or from the worker class?

seth (2008-10-30 02:13:27)

Stuart, yeah, apprenticeships are "natural" teaching. I'm sure that how things worked for many thousands of years. Aaron, I don't mind universities teaching something besides job skills but they do a miserable job of it. Professors at universities such as Berkeley and UCLA often claim that they teach "critical thinking" – and fail to grasp the far greater importance of curiosity and appreciative thinking. In my experience, professors at Berkeley, on average, fail completely to teach either one. All that Berkeley professors really can teach – and quite well – is how to be research professors. I saw this in class after class. When they claim that they can teach anything else, I scoff.

## Advances in the Shangri-La Diet (2008-10-28 16:11)

A friend writes:

[My girlfriend, who is 5' 5" and started the diet at 174 pounds] has lost 12 pounds [over 2 months], no longer feels constantly hungry since starting the diet. We've been putting the flaxseed oil on toasted sourdough rolls (from Trader Joe's) because the oil doesn't seep through as easily.

I like the way flaxseed oil tastes on toast but in this circumstance we're nose-clipping so we don't taste it. The toast makes us feel less queasy afterwards than taking the oil straight. We do two tablespoons/day instead of three because we're including the calories in the toast which we also don't taste. The TJ's honey whole wheat bread is denser and holds the oil a little better than the sourdough stuff she likes. Either way there's usually oil left on the plate that came through the holes in the bread. I said, since you can't taste it why not use the whole wheat? The texture, she says, but I think it's really because her mother made her eat whole wheat bread growing up which she never liked and still doesn't even though under these circumstances she can't taste it. Bad associations, maybe? Good old Pavlov, it's like he's still around. The effect on my back pain [it made his back pain go away] has become even more noticeable. If I skip the oil for a couple of days I start feeling it again. [emphasis added]. I haven't been consistent enough with it to lose weight, and now that [my girlfriend] has gotten a little skinnier she's starting to make comments to me about how I might want to lose a few pounds.

I have tried flaxseed oil on toast, eaten nose-clipped, and it is my favorite way to consume the flaxseed oil. It tastes like hot buttered toast. It's not so easy here in China where I don't have a toaster. You can't do it with untoasted bread – the water repels the oil, so it doesn't soak in.

---

Stephen M (Ethesis) (2008-10-28 19:52:50)

I need to get some courage and start eating oil and bread while nose clipped. Have you tried adding a little sesame seed oil for the sesamin to see if it does anything for you?

Igor Carron (2008-10-29 00:07:34)

Seth, I have noted the back pain effect myself but some warning might be of interest: <http://www.sciencedaily.com/releases/2008/10/081027140817.htm> Igor.

karky (2008-10-29 03:27:42)

Maybe you could try toasting your bread in a dry frying pan.

Aaron Blaisdell (2008-10-29 10:13:39)

Igor, thanks for the link. My wife was recently pregnant. I asked her doctor if it was a good idea for my wife to increase omega 3 consumption during her pregnancy. She said yes if the source was fish oil but not if it was from flaxseed oil. She said there were data indicating that pregnant women had greater difficulty processing flaxseed oil, due (I guess) to the hormonal changes during pregnancy.

Patrik (2008-10-29 11:03:54)

I wonder if the Shangri-La diet would work with lard? I know lard has a bad reputation, but quite simply put: That is bullshit. A couple of interesting links: <http://wholehealthsource.blogspot.com/2008/03/l-word.html> *The fatty acid profile of lard might give us a clue. A major portion of lard is monounsaturated, 40 % by weight. This is the same type of fat that predominates in olive oil (73 %), and which is widely recommended by mainstream nutrition experts. Another prevalent class of fat in lard is saturated, at 48 %. More than one third of this saturated fat is stearic acid, which even the most hardened lipophobe will agree has a "favorable" effect on blood lipids. Then there's the 8 % polyunsaturated fat, which has been the darling of mainstream heart disease research for decades due to its ability to lower blood cholesterol (for the record, I believe the polyunsaturate content is lard's least healthy feature). The omega-3:6 ratio depends on how the pig was raised, but is typically skewed more toward omega-6. So what does that leave us with? 66 % fats that we're told are heart-healthy, and 30 % non-stearic saturated fats that are supposed to be unhealthy. But if you still believe saturated fats cause heart disease, check out this post, this one and this one. Well if the fat composition of lard isn't unhealthy, then what else could be the problem?*

[...] Comment on Advances in the Shangri-La Diet by Aaron Blaisdell [...]

SusanJ (2008-10-30 19:58:17)

Since both carbs and wheat gluten are bad for you, it seems silly to consume them noseclipped so you can't even enjoy them. You can easily find many good sources to support my claims about carbs and wheat. However, I highly recommend the Hyperlipid blog as a starting point: <http://high-fat-nutrition.blogspot.com/>

dj superflat (2008-11-03 16:25:54)

don't get the nose-clipping, i just pour the oil into a spoon, drink it down, got used to the taste pretty quickly (my 11-month-old loved it from the get-go).

### **Beijing Traffic (more) (2008-10-30 01:57)**

Today I went to a special building, only a 10-minute drive from my office, to get a physical exam needed for a special visa. The administrative assistant of the Psychology Department accompanied me. We set off about 8 am. He mentioned a vision exam so I went back to my apartment to get another contact lens. (I wear just one, so that I have good vision both near and far.) Then we tried to get a taxi. We found one but, stuck in traffic, it went nowhere. After 10 minutes or so, we got out. We decided to go in the administrative assistant's car (he preferred to take a taxi because he didn't know where the building was.) It's now 9:10 am. We set off. We reach the building around 9:20. Oops - I forgot my passport. We get a taxi to take us back to campus so I can get it. The driver tries to cheat us by taking a long route. On the way back - on a reasonable route - we get stuck in traffic again. We get out of the taxi. We'd like to go back to the exam building, pick up the administrative assistant's car, and take a different route back, but that would require crossing six lanes of busy highway to get a taxi going in the right direction. That's too scary so eventually we get a taxi that goes back to campus via another route. Now it's too late to do the exam. We'll try again early tomorrow. For some reason - exhaust fumes? too much sitting in a car? - my head hurts.

More What a difference a day makes. I went back the next morning and there were no problems at all. We found a taxi easily, the trip was fast and smooth, the exam didn't take long, and the trip back was fast and smooth. We passed a man trying to start his car in the middle of a big street.

---

Mel (2008-10-30 18:38:03)

When my MIL visited China in the late 80's, she came back with the story that crossing the street was so dangerous that she took a cab. We laughed. We adopted both our daughters from China and I want to testify that nothing could get me to cross a street! The pedestrian has no "rights". One morning our guide tricked us into crossing a busy street because she thought we were wasting our money on taxi fare. It was a very scary minute. Melinda

## **Unread Contracts (2008-10-31 05:00)**

From James McGregor's fascinating One Billion Customers (2005):

The Chinese were befuddled and worried by the five-hundred-page contract that McDonnell Douglas lawyers drafted to seal the \$1 million deal. The Shanghai director looked forlornly at Chang [a McDonnell Douglas employee] as he signed it. "I am signing this because I trust you," he said.

Yeah. I read this the day after I signed a five-page employment contract with Tsinghua University – the hard part was coming up with a Chinese name – that I couldn't read a word of. I signed it because I trusted them.

---

Patrik (2008-10-31 15:36:57)  
That is insane.

## **Who Steals Bikes? (2008-10-31 05:37)**

At Tsinghua University, students are said to spend more on bike locks than on bikes. A friend of mine, a senior, is on her fourth bike. I met a faculty member who went to get her bike just as it was being stolen. She saw how it was done: The thief had a large number of keys. She shouted at the thief to stop, a crowd gathered, and he gave the bike back. Later she encountered him while buying pork: He was the butcher.

---

Eric Vlemmix (2008-10-31 08:27:42)

Same here in The Netherlands. The population is some 16 million people, and how many bikes are being stolen? In 2006 760000 (760 thousand!) bikes were stolen. For young people/students, one out of seven bikes get stolen. Who is stealing the bikes? Junkies and general low-life, then selling the bike for some fast money ( \$15 or less). Some students then seem to consider bikes to be 'public goods', so when your bike is not there anymore, you just take another. So if you do not want your bike to get stolen, invest in good bike-locks. Also, in my hometown, in the city center there are a couple of underground 'garages' just for bikes. These are operated by the local government, employing people that normally have problems getting employed via the regular routes. Stalling your bike there is free of charge and quite safe!

Patrik (2008-10-31 15:51:56)

This is a big problem in low-trust countries. It usually stems from the following ironic vicious cycle. In Hungary, petty (and not so petty) theft is quite common. Gypsy peddlers come around peddling stolen goods, which people are happy to purchase from them at a 'discount'. Not caring they are generating market demand for stolen goods. Ergo, more demand for stolen goods, more goods stolen. Ad infinitum.

Eric H (2008-11-02 19:50:38)

I once read that all bikes in the Netherlands weigh the same: a cheap bike is heavy and does not require much in the way of a lock, but a good, light bike requires at least two good locks, whose combined weight brings the net back up to that of a cheap bike.

Vesna (2008-11-05 09:45:32)

If roving thieves are carrying key rings loaded with possible matching keys, it seems that combination locks, rather than locks with keys, would be more secure. Also ... the butcher! What!?

Jlm N (2008-11-26 13:14:24)

When I worked delivering food by bicycle (in New York City), thieves would come by all the time trying to sell us bikes. I realized that restaurants that deliver food were the prime market for stolen bikes. Later observations bore this out. Some local restaurants were using relatively expensive bikes to deliver food. Wonder if the butcher made deliveries. Many people have told me that bike theft is rampant in Amsterdam. When I was there, I saw many bikes locked with extremely cheap cable locks, or not locked to anything but themselves. Maybe the problem is cultural? Living in New York, of course my locks are worth the same as my bike.

## 3.11 November

### My Beijing Life: The Surprises (2008-11-02 20:36)

I've been here a month. I'd been here before – not just to Beijing but this exact area. I taught a month at Beijing University, right next to Tsinghua, met lots of PKU students, who are similar to Tsinghua students. So many aspects of life here don't surprise me. But here are four things that have surprised me.

1. The beauty of the Tsinghua campus. It's huge, more like a village than a campus, and it has an unusual Jane-Jacobsonian beauty. Lots of new building, lots of old buildings, vast diversity of uses (elementary school, high school, big natatorium, little corner shops that repair bikes, barbers, tailors), lots of paths of different sizes through lots of greenery. Few cars, lots of bikes. It isn't pedestrian friendly because things are so far apart but it is very bike-friendly. Basically quiet.
2. How much time I spend bike riding. Perhaps an hour in a typical day. It is still a little scary to ride outside campus but I have seen a vast amount of bike riding and no accidents. There are big bike lanes – very different from Japan.
3. How slowly I am learning Chinese. I thought I would learn in some conventional way – hire a tutor, go through a textbook – but [1]the one tutor I tried was boring and the conversational textbooks teach stuff people never say (just as my Chinese friends reply to "thank you" with "not at all"). But I do have a burning desire to learn, it is connecting that desire with the right knowledge that is the problem. Ideally I would have someone with me all the time and when I wanted to say something or understand something I would be told the answer.
4. How rarely I leave my neighborhood. I've gone downtown once. I went somewhere else once. Just getting internet access has taken a significant amount of time.

Basically I've been turned into a child. Learning the language, bike riding, not going far from home. Fortunately without school to attend.

## **Natural versus Unnatural Learning (2008-11-04 03:03)**

My criticisms of undergraduate education (e.g., [1]here) have three bases:

- my experiences at UC Berkeley. Both sides – faculty and students – disliked the situation. I accidentally found a way that worked much better.
- my theory of human evolution. [2]My theory explained what I saw at Berkeley, and a lot of other stuff. It says that learning specialized job skills is a basic part of being human. Our brains have been shaped by evolution to make this happen.
- the everyday observation that people successfully learn specialized job skills all the time and did so long before colleges. Or any schools.

Set up by people who didn't understand how learning works – the crucial ingredients – colleges teach poorly, just as malnutrition is common.

At Berkeley I was a teacher. In Beijing I'm on the other side – a student – in a different but similar learning situation: learning Chinese. We learn languages naturally, without any special structure, just as people learned job skills. There is the same broad dichotomy: between language learning via official channels, involving classes and textbooks, and natural language learning that happens without any classes and textbooks. So there should be a better way to learn Chinese than via a textbook or a class or even a tutor.

What that is, I'm trying to figure out. For reading, flash cards may work. I'm starting with food words – I see hundreds of them every time I eat a meal (in the student dining halls) – and sign words and the preset messages on my cell phone. Listening and speaking is harder. When I get better maybe I can watch TV but now I can't understand any of it. I always enjoy my Chinese lessons but they happen without context. During the day I may want to say "Where is \_ \_ \_ \_ \_?" but my lesson happens much later, when the motivation has gone. Maybe I will get a tape recorder show I can record what people say to me and then play it for my teachers to translate.

---

NE1 (2008-11-04 10:31:22)

Surely we didn't evolve to be thrown in our old age into a country with a completely different language, but to absorb our native language from the cradle or adapt the group's language to changing times (slang). Learning via book is just a tool to simulate your father's patience in teaching you a new language when the old is all you know, or using only simple structures at first. There's nothing wrong about using tools. If we only had evolution on our side, for example, we would be no match for viruses and bacteria (and this may yet be how it ends). I've found no better practice for learning to write characters than repeating nearly identical or banal sentences in a workbook. Vocab, there are a couple flashcard programs out there that you might like (Supermemo claims to be the best, the others are probably equal for language use), but there (where repetition and not insertion is the point) it can be tedious to enter the words—I'm glad my textbook's lists were available online.

KenF (2008-11-04 13:26:55)

We are evolved to learn language as children, not as adults. If you want to learn as an adult, you need to use "unnatural" means, i.e. general learning strategies. Starting with food terms isn't a good idea, you don't need to know those characters and they don't come up in conversation. You should get a textbook and work through it with a tutor. Use flashcards for the characters in each chapter, learn to write each word as both the character and the pinyin and learn the correct tones for each word. Just rote learn a first-year textbook, rote-learn the dialogues and the practice them with a tutor. With that rote learning under your belt, then you can go ahead and learn the language "naturally". But you need the boost of the rote learning, and you shouldn't assume you are smarter about language learning than the textbook writers. You aren't. Chinese is exceptionally difficult to learn, that is why you are having problems.

KenF (2008-11-04 13:55:29)

Also, having employed Chinese tutors myself, let me give you advice. The best way to do it is to have them go through a textbook. It gives structure to the whole interaction. The most important parts: read the vocabulary items together, having them correct your pronunciation do the dialogues together Chinese grammar is relatively simple. The difficulty comes in pronunciation and of course characters. Realistically, you don't need to learn to write characters by hand. You only need to be able to recognize them and correct pinyin so you can generate them via computer. But learning to write might be an aid to learning them. I'd forego the writing, though, unless you have a personal interest in that.

Patrik (2008-11-04 13:57:46)

Aside from the tools you have mentioned, I would advise listening to songs. It is always fun to translate pop songs. Also, they tend to be more colloquial and idiomatic which is very important in achieving fluency.

Beijing Sounds (2008-11-07 04:50:25)

If you walk around with a recorder you might end up with something like Beijing Sounds! My experience is that it's not very efficient for actual learning, though. Mostly fine advice from my fellow commenters. My two cents 1. Practice simple dialogs with a partner 2. Ignore characters but learn Pinyin The dialogs ensure that you are getting spoken Mandarin, which like English (but to an even greater extent) uses quite a different and much more limited vocabulary than written. If the contexts are good enough – i.e. they are from situations that you could reasonably see yourself encountering in your everyday life – you can practically memorize them and the vocab will be useful. Chinesepod and Popup Chinese now have some free materials to start with. Ignoring characters is bound to be a wee bit more controversial, but for the vast majority of learners it is going to be a better use of time in the beginning stages. Essentially the tradeoff is to spend many hours learning to recognize characters or to spend many hours acquiring the sounds/grammar/vocabulary. I did this for about five years before buckling down to learn characters, a task that is made infinitely easier since I can already speak the language with some degree of fluency.

KenF (2008-11-09 14:38:17)

I don't think characters are such a huge barrier to study unless you try to learn to write them. Just recognizing them really isn't that hard, especially at beginning stages.

## Beijing Shopping (2008-11-04 17:35)

In [1]Moscow on the Hudson, the Robin Williams character, a Russian defector, goes into a New York supermarket and faints: So many brands of breakfast cereal! Whereas my head merely spun when I shopped for headphones and encountered hundreds of choices in a building near me. It's an electronics mall, full of office-sized booths each with a different owner and product line. Maybe eightÂ specialize in headphones. In Berkeley I live miles from a Circuit City where I might find four or five headphones I'd consider. Radio Shack is closer; they might have two or three possibilities. In Beijing several of these electronic malls are near me.

During my Chinese lesson with the girl who sold me my cell phone I told her that after the lesson I was going to shop for headphones – the electronics mall is across the street. How much do you want to spend? she asked. About \$40, I said. Because you are a foreigner, they may cheat you, she said. Her boss went away and came back with two choices. One was \$40, the other about \$60. After the lesson I went to the mall. I found the \$40 headphones. Price: \$9. Before bargaining. I went back to my teacher and told her what had happened. She spoke to her boss. She came back and said: Maybe it wasn't the real product. As if someone would counterfeit a brand (Somic) you've never heard of. It was exactly the same item.

"One bed two dreams" is a Chinese proverb. Here the two dreams were \$9 and \$40. In One Billion Customers, James McGregor writes, "The Chinese will ask you for anything because you just may be stupid enough to agree to it." It has nothing to do with being a foreigner. "In China business, the expectation is to be cheated," says McGregor. A friend of mine graduated from Beijing University, one of the top two schools in the country, with a finance major. She got a real estate job in Shanghai, her home town. When she got there her salary was half of what she had been promised.

1. [http://en.wikipedia.org/wiki/Moscow\\_on\\_the\\_Hudson](http://en.wikipedia.org/wiki/Moscow_on_the_Hudson)

---

Patrik (2008-11-04 18:23:51)

Unfortunately, you will always be the 'rich' foreigner in China — so the first price you receive will always be the first. Once in a restaurant in Italy with an Italian friend, we got our menus, our friend looked at the prices, told the waiter, give us the menus with the non-inflated non-tourist prices. The waiter completely non-nonchalantly gathered up the menus he had given us and gave us new ones. Same menu, something like 30 % cheaper.

seth (2008-11-04 18:59:27)

"Will always be the first" – you mean the highest? The person who told me \$9 had no idea I had previously been told \$40.

NE1 (2008-11-05 00:40:20)

Oh, it wasn't the store-minder that tried to cheat you, but the guy who was on his way up. Yeah, stuff like this is the reason I lost my optimism about China. The final straw was this (series resolution) [http://jamesfallows.theatlantic.com/archives/2008/08/emptyseat\\_mystery\\_cont.php](http://jamesfallows.theatlantic.com/archives/2008/08/emptyseat_mystery_cont.php)

seth (2008-11-05 01:47:47)

"The guy on his way up"? No it was a guy in a booth in a different building – the building where I bought my cell phone also has a bunch of little electronics businesses – smaller than the ones in the electronics mall.

## Watching the Election Returns (2008-11-05 04:36)

I watched the election returns Wednesday morning in a totally packed Beijing cafe. Two McCain supporters, maybe 80 Obama supporters. I had to leave a little early; what I had thought was a dinner invitation was a lunch invitation, I had learned the day before. I sat next to two students from Harvard studying at Tsinghua. They found Tsinghua students more passive than Harvard students. I told them the story about [1]the Berkeley prof who liked teaching Tsinghua students but not Berkeley students. Do Harvard profs like teaching? I asked. Their answer was vague. They told me about Tsinghua students, not to mention Harvard students, agonizing over the personal statements required with grad school applications. I told them that I'd seen thousands of those statements and no one in my department (at Berkeley) cared about anything but (a) do you want to be a professor? (the correct answer is yes) (b) do you want to work with me (the prof reading it)? and (c) your research experience. Once I came upon one that was unusually interesting and well-written and I said, "hey look at this person" but no one else agreed with me. When Obama was projected to win Ohio I figured he would win. The cheers of the crowd when the Ohio win was announced reminded me of when I watched a World Cup final, France versus Brazil, in a room full of French students and France scored a goal.

Thank god we have a president [2]who understands Jane Jacobs.

1. <http://www.blog.sethroberts.net/2008/10/24/tsinghua-versus-berkeley/>

2. <http://www.blog.sethroberts.net/2008/09/29/barack-obama-understands-jane-jacobs/>

---

mike kenny (2008-11-06 13:46:34)

that seems kind of bothersome to me that professors wanted people who wanted to be professors. what's the incentive there? don't they want people to go out into the world and do something practical with their degrees? i mean particularly with psychology it seems like there would be lots of opportunities to do things of merit out in the world. but of course you've mentioned veblen...it's strange if the only aimed at result of training grad students is so they become professors. there are more professors than grad students—you have this strange self-perpetuating organization of professors who replicate many versions of themselves. i guess it makes sense from an evolutionary perspective—a discipline and universities grow themselves, professors standing in for genes to some extent i suppose.

seth (2008-11-06 23:04:58)

"Do something practical with their degree"? How would that benefit the professor under whom the student got their degree? It wouldn't. Whereas if a student becomes a professor his or her advisor becomes more famous. The practice would be defended on less selfish grounds by saying "the only thing our program really trains students for is to be professors."

mike kenny (2008-11-07 18:16:49)

good point. i think i recall reading gordon tullock say something similar. i don't know, i mean wouldn't it be great if a professor taught someone who put their work to great use in the world. to me that seems like a great reward. i guess the reward is not as palpable as teaching someone who then writes a certain amount of articles and expands on your ideas and maybe quotes you and improves your citation stats. and you would have potential followers i suppose helping to spread your ideas—though that is hard to quantify in some respects. but i do sort of find it surprising that the veblen-ian wall between practice and theory seems to match the evidence. i would have thought people out in the world who are applying professors' ideas in the fields of business or public policy or wherever would be exciting to professors and a strong motivator. it does seem like some economists are into practice—there are some nobel prize winners who had ideas that influenced finance (possibly not in a positive way!) and in psychology, freud or carl rogers or albert ellis seemed like they were interested in both theory and

practice. but i don't hear of english professors advising fiction writers, i don't think. i was a history undergrad and came to think that many historians were deeply un-interested in 'learning lessons from history.'

Andrew Gelman (2008-11-09 18:16:00)

Seth, That's so horribly cynical. I have no doubt it applies to some college professors, but let me give you an alternative story that is more charitable. 1. Professors think they're doing something useful to the world, perhaps directly useful (e.g., research on weight loss and depression), perhaps indirectly useful (educating people who will make future discoveries or who will teach future students). Even something with little direct material value (e.g., studying Shakespeare) can be useful if it makes people's lives richer. 2. The vast majority of professors know that the vast majority of our students will not become professors. We're not hoping that all or even most of the graduate students become professors (in a sort of industry-wide pyramid scam); rather, we believe that our fields of study are important—that's why we decided to devote our lives to these topics—and so we hope that we can train people to help teach a future generation of students. 3. In my experience interacting with professors, becoming "more famous" is not a common goal. I mean, sure, I'd like to become more famous, but my impression is that most profs would like to avoid the limelight; what they really want is time to do their research. I agree that some profs play the status-seeking game of "my student got a better job placement than your student did," but I don't think that's the key motivation here.

seth (2008-11-09 23:24:11)

Hmm. When did it become "horrible" to be cynical? I too can argue the non-cynical side of it, that is, come up with less self-interested reasons for what I observed. I'm only speaking about profs at Berkeley and by "famous" I don't mean in a worldly sense, I mean in an academic sense. I would be curious to hear evidence that supports your interpretation. Here's evidence that supports my interpretation. At Berkeley there was a requirement that all introductory psych students act as research subjects – spend a certain number of hours as subjects. This was free labor for many professors; what they would have had to pay thousands of dollars for (e.g., 200 subjects for 1 hour each) they got for free. Sure, the first hour of being a subject might be reasonably argued to be educational; perhaps even the second hour. But the fourth hour? the fifth hour? the sixth hour? Of course not. The requirement was six hours! This was pure exploitation. And we're not talking one weird professor here – this was department policy.

Andrew Gelman (2008-11-11 22:15:59)

1. I don't mind cynicism in general but I don't like it so much when it's directed at people like me. 2. Regarding your story about intro psych students: sure, I agree that profs, like just about everyone else, like to get something for nothing and not pay for other people's labor if they can get away with it. But I don't see that as evidence that these professors want to be more famous in an academic sense. I think the profs want to do their research, and if they can get experimental participants for free, they can do more research. Just like artists would like to get paint, canvas, and artists' models for free, too, if they could get it. I'm not saying this is honorable behavior (even though I do the same sort of thing myself sometimes) but I see it as consistent with what I wrote above.

## Science in Action: Why Did I Sleep So Well? (part 17) (2008-11-07 00:55)

The story so far. Standing on one foot till exhaustion twice during the day vastly improved my sleep that night. I slept longer and, especially, woke up much more rested.

Theory. I have a theory about what's going on. When muscles are stressed – used until some of the muscle fibers break – two things happen: 1. More muscle fibers grow (= you become stronger). Everyone knows this. 2. A chemical is released by the muscle that travels to the brain and increases depth of sleep. This is a new idea. The big picture is that sleep is controlled by many things; this is one of them. Morning light is also important but that is pretty obvious, at least to sleep researchers. Morning light appears to control both the timing and depth of sleep. These muscle-produced hormones appear to mainly affect depth of sleep; I don't notice any change in when I sleep. The

evolutionary rationale is plain: We grow muscles better when we're asleep. If we need to grow muscles more than usual, we need more sleep than usual.

New data. I want to understand what the effect depends on. What makes it weaker or stronger – especially stronger? As my legs grew stronger, the effect became slightly weaker, presumably because it was harder to produce new muscle growth in a practical amount of time. My main measure of the effect is how rested I feel when I awake. I assess that on a 0-100 scale where 0 = just as tired as when I fell asleep and 100 = completely free from tiredness. I reached scores of 100 years ago when I was on my feet for 9 or 10 hours during the day and once or twice on camping trips. Standing that much is impractical so 100 appeared impossible to reach regularly. In Berkeley, during the months before I discovered this effect, this score averaged about 95. After discovery of this effect, it was usually 99 – a big easy-to-notice improvement.

But 99 was impossible to maintain because as my legs got stronger it started to take a really long time to exhaust them. I shifted to standing on one bent leg. This obviously reduced how long I needed to stand to produce exhaustion but it was less effective (presumably because fewer muscles were involved). When I shifted from standing one-legged however I wanted (two bouts/day) to standing with the leg bent most or all of the time (four bouts/day), the scores went down to 98 or 97. After a week or so of bent-leg standing I started using the cycle 50 seconds bent, 10 seconds straight; I repeated this as long as I could.

Here is a graph showing how long I stood.

The interesting point is that the strength increase finally levelled off at a bearable amount of time, yet the effect has persisted. If I spend about 8 minutes 4 times a day watching TV or a movie (and standing on one bent leg at the same time) I can substantially improve my sleep. This is practical. It's the easiest exercise I've ever done. No special equipment. Watch TV at the same time. Big benefit. I've tried other muscle-building exercises, including push-ups done two different ways, jump-roping, and something vaguely resembling a biceps curl done with a thick rubber band. None has had a detectable effect. For example, after a day with jump-roping and two bouts of one-legged standing, I sleep about as well as after a day with just two bouts of one-legged standing.

Can I say again how wonderful it is to wake up totally rested? It seems almost within my grasp.

[1]Previous posts about this.

Confidence (2008-11-07 01:48:17)

0-100 is a really high resolution for such a subjective parameter. Clearly any number you come up with is an estimate. What is your confidence level on the estimate? In other words, if there was an objective measure of how well rested you were after sleep, how close do you think your subjective estimate would be to the other objective one.

Beijing Sounds (2008-11-07 04:52:25)

Do you wake up to an alarm or wake up whenever you like? How does this relate to time slept?

Timothy Beneke (2008-11-07 11:46:02)

Obvious empirical question: do people who start lifting weights either as a practice, or implicitly as part of a job they start working at, who have previously been sleeping poorly, suddenly start sleeping better? I recall sleeping best after helping friends move and carrying lots of heavy boxes up stairs and across relatively long distances. I used to jump at the chance to help people move. And once tried carrying boxes across my room for 15 minutes a day but it was boring and I didn't stay with it. Your theory about standing was about muscle maintenance as well. A friend years ago recommended I treat my depression by working construction; she said the cumulative effect would be to free my mind by relaxing my body. She did it and discovered muscles she didn't know she had and said she slept better. This may be yet another astonishing finding Seth to add to your list – pretty incredible!

Nansen (2008-11-07 13:41:34)

Ditto on astonishing and incredible.

seth (2008-11-08 04:42:44)

I don't think lifting weights would do much – unless you lifted those weights with your legs. One thing about my standing research I never appreciated until now: the amount of standing varied from day to day (from low such as 5 hours to high such as 9 hours) which meant that 9 hours would always be difficult – in contrast to a design in which I stood 9 hours every day (in which case 9 hours would get easier and the effect, I now predict, would have become weaker).

seth (2008-11-08 04:49:51)

Beijing Sounds, I wake up whenever I want. No alarm. Confidence, a 0-100 scale is unusual, yes, but unusual compared to studies done with unpracticed subjects – and anyway estimates close to the edge of the scale may be much more accurate than those in the middle. Quite apart from that the proof is in the pudding: the estimates turn out to be useful. The confidence

interval would be pretty small for the numbers close to 100; maybe 2 or less. As for objective versus subjective measures, I can't imagine what you mean by 'the objective measure.' There are so many possibilities.

MT (2008-11-08 12:26:45)

While I remain impressed by the results, I don't find the muscle-chemical theory convincing. I think that there must be something else about one leg standing that has a unique physiological effect. Perhaps some nerve is triggered in a special way after nine hours standing, and that effect is exaggerated with one leg standing to exhaustion. My reasoning is that you are reporting much greater sleep benefits than other people who exercise their legs (and other muscles) more strenuously. One leg standing is remarkable in part because it is so UNdemanding. Yet you realised more benefits to your sleep after 20 minutes than people who lift heavy weights (including leg weights) for an hour or more. I have lifted weights to the point I would be sore for a few days afterward (muscle tissue breakdown no less, which you suggest as a source for the chemical release) and never experienced the benefits you describe. Nor has anyone else reported them to me. Given millions of people you would think someone might have noticed something. Standing on one leg – a comparably rare activity – has produced someone noticing something. Admittedly, you are unique in your observation of these things, but there are so many millions of people who have done strenuous exercise for decades, it seems unlikely to be as simple as a chemical released by muscle breakdown. I'm impressed and convinced that you're realising these benefits, but find the theory wanting. Which isn't that important – if the results are useful, that is more important. If they can be replicated, even better. I tried it about a dozen times and didn't notice any benefits.

seth (2008-11-08 20:02:25)

MT, I think the muscle-brain connection is chemical for three reasons: (1) The effect of the exercise seems to sit there until I fall asleep. Neural signals are more transient. (2) Once I did a set of 4 close together in time. Usually I do two (right leg, left leg) than wait several hours before the next set of two. When I did the set of 4 close together in time it seemed no more effective than a set of two. The chemical explanation is that there wasn't enough time to replenish the chemical signal that had been released. Nerves, in contrast, recover very fast. (3) There are no nerves that transmit from muscles to brain. There are only nerves that transmit from brain to muscle. Why has no one noticed this before? Here are some possible reasons: 1. Hard to publicize. You notice it but you can't spread your discovery. 2. Self-experimentation not popular. You notice better sleep but you don't investigate. 3. Off the beaten track of exercise. I originally did it as a stretch not as a way of muscle building. Conventional muscle-building exercise consists of many repetitions. That may target the wrong system. 4. If you simply do the same thing again and again the effect goes away. 5. Hard to separate signal from noise. I had trouble figuring out why I had slept so well – and I had previously discovered a similar effect (involving standing a lot). 6. I was keeping track of how well I slept, so this really stood out. Hardly anybody does this.

Stephen M (Ethesis) (2008-11-09 19:40:53)

Should be interesting when your legs get strong enough that you can tire them out doing pistol squats (one legged squats).

MT (2008-11-10 06:42:35)

Seth, re: 1. I'm not sure neural and chemical can be distinguished so clearly, but think the 'sitting there' sensation (if I'm interpreting properly) could come from another source, 2. neural signals themselves may operate rather quickly but set in motion systems that oscillate over various time-periods, from seconds to hours to days or longer – as when a nerve signal triggers the release of melatonin that helps regulate the sleep cycle – such a nerve signal could be involved here – chemicals and nerves interact 3. what do you mean there are only nerves that transmit from brain to muscle, not the other direction? what about sensory signals like pain? Perhaps my biggest sticking point is that I am guessing that one-leg standing is helping your sleep more than more strenuous alternative leg exercises are helping others. If this effect were caused by muscles releasing chemicals when they are broken down, then people who broke down more muscles, releasing more chemicals, would have more profound sleep effects. This doesn't seem to be the case in my experience having lifted weights and having friends who have. One-leg standing takes little energy and does not produce the soreness that is caused by broken muscle tissue – or at least produces less of it than things like cycling, running, weight-lifting. It seems to me something about the way the load is distributed – as with 9-hour standing – but somehow the one-leg standing accelerates that effect. The two have parallels, and I don't think the parallel is a chemical or damaged muscle tissue. Similarly, you described the 9-hour standing as

dose-dependent. You didn't see an effect until you crossed a certain standing threshold, then you saw a big effect. I'm guessing one-leg standing and 9-hour standing are related. Exercise generally improves sleep, that has been observed and is well known. You seem to be describing/experiencing something more.

efm (2009-10-31 20:08:44)

Very interesting blog. I've struggled with sleep issues for years, so I'm always interested in reading about what people try. In the discussion about strenuous exercise vs. one-leg standing, I think there's a clear difference between these two types of exercise that I don't think anybody has mentioned. If you're doing conventional weight lifting, you are doing short contractions of the muscle (i.e. lift, release, repeat). Even exercise like running or swimming is composed of short, repeated contractions, albeit spread over a span of time. Whereas when you do the one-leg standing, the muscle is contracted CONSTANTLY for a long period of time without release. If you're theorizing and considering why one-leg standing works and weight-lifting doesn't, I would say that long, constant contraction works better than long, punctuated contractions. That being said, have you ever tried holding a push-up position (or the plank yoga pose) to exhaustion? I'd be curious if this would work like the one-leg standing, since it uses such a large number of muscles to hold this position. Finally, I just wanted to share some things that have helped with my sleep (I don't have much trouble staying asleep, but I have trouble falling asleep). A lot of people complain that melatonin makes them very foggy the next day, as did the man you mentioned in an earlier post. I had a similar experience when I tried melatonin years ago. Recently, however, I read that the dose in which melatonin is sold is much higher than what the body actually needs. Most melatonin is sold in 3mg tablets, whereas the body only needs about 175 micrograms. Instead of taking a full tablet, I cut the 3mg tablets into quarters or smaller so that each is less than 1mg and take one of these small fragments about a half an hour before I go to bed. I've been doing this for 2 months and have never been able to so consistently fall asleep (even when traveling across time zones). It's been a miracle. Additionally, I started to wear earplugs when I sleep and the quality of my sleep has improved significantly. Good luck with your sleep trials! I certainly understand the value of a good night's sleep.

seth (2009-10-31 22:56:58)

efm, I tried doing pushups to exhaustion. This had no clear effect on my sleep. I think the difference is that leg muscles are much larger than the muscles used for pushups.

Chris | Martial Development (2010-06-01 23:09:59)

Very interesting topic. I and many others have found that standing before bed improves sleep. There are a few variables I didn't see mentioned here... - Eyes open, or closed? - Lights on, or off? - Standing as still as possible, or wobbling around (accidentally or intentionally)? - Hands down, or up? If up, then in what position?

## **How to Brew Tea (2008-11-08 19:33)**

I have brewed thousands of cups of tea. Always: 1. heat water. 2. add to cup. 3. add tea. 4. wait fixed duration (e.g., 5 minutes). 5. remove tea. 6. drink. Sometimes I put the tea in the water then heated both in the microwave. After getting tea education at Slow Food Nation, I started making sure the water was about 165 degrees F when I added the tea.

My Tsinghua office has a source of hot water. Now I do this: 1. add water to cup. 2. add tea. 3. drink. (I'm using green tea. This wouldn't work so well with teas that need higher brewing temperatures.) I don't worry about length of brewing. Much simpler. I bought a cup with a cover but while taking off the wrapping dropped the cover and broke it. You don't even need a cover (at least for some teas). The secrets are (a) as the water cools, it stops brewing the tea - you don't have to worry about timing and (b) the leaves sink to the bottom so you don't need to take them out to avoid drinking them.

The interesting question is why nobody told me this. I have heard tea experts talk six or seven times. It certainly

means their expertise is less necessary – the cynical explanation. The less cynical explanation is that most people don't have access to hot water of the right temperature and/or most people don't drink green tea.

---

Aaron Blaisdell (2008-11-10 08:29:53)

This is how green tea is always served at "authentic" (i.e., not Panda Express or P.F. Chang) Chinese restaurants in California.

peter (2008-11-10 18:09:29)

you lose a lot of the health benefits of green tea by not brewing it in hot water (this according to "foods that fight cancer" (i think that's the title), written by a group of micro-biologists; the book states that the full value is realized by brewing the tea for 10 minutes; i don't following this because i've read that anything past 4 minutes increase the oxalate content, which is associated with kidney stones)

seth (2008-11-10 18:47:52)

Peter, maybe I should have added I refill my cup with hot water several times. Thus extracting more of the healthy chemicals.

Helen (2008-11-10 21:47:52)

Speaking as a Chinese person, it was amazing to me when I first heard people put tea leaves in little bags and that they even came in different flavors. By the way, make sure you find out which brands are the best. You can probably even start putting flowers or goji berries in your tea for the added health benefits. Best of luck!

## **Flaxseed Oil Alert: Don't Take When Pregnant (2008-11-10 02:21)**

From a [1]press release:

A study has found that the risks of a premature birth quadruple if flaxseed oil is consumed in the last two trimesters of pregnancy. The research was conducted by Professor Anick B  rard of the Universit   de Montr  al's Faculty of Pharmacy and the Sainte-Justine Hospital Research Center and Master's student Krystel Moussally.

In Canada, 50 percent of pregnant women take prescription medication. Yet many of them prefer to use natural health products during the pregnancy. "We believe these products to be safe because they are natural. But in reality, they are chemical products and we don't know many of the risks and benefits of these products contrarily to medication," says B  rard.

B  rard and Moussally set out to conduct one of the largest studies ever undertaken on by analyzing data from 3354 Quebec women. The first part of the research established that close to 10 percent of women between 1998 and 2003 used natural health products during their pregnancy. Before and after pregnancy they were respectively 15 and 14 percent to use these products. The increase means that about a third of women consuming natural health products stopped during the pregnancy.

The most consumed natural health products by pregnant women are chamomile (19 percent), green

tea (17 percent), peppered mint (12 percent), and flaxseed oil (12 percent). BÃ©rard and Moussally correlated these products to premature births and only one product had a very strong correlation: flaxseed oil.

"In the general population, the average rate of premature births is 2 to 3 percent. But for women consuming flaxseed oil in their last two trimesters that number jumps up to 12 percent," says BÃ©rard. "It's an enormous risk."

The correlation existed only with flaxseed oil, yet women consuming the actual seed were unaffected. Even if more studies must be undertaken to verify these results, BÃ©rard recommends caution when it comes to consuming flaxseed oil.

Thanks to Joyce Cohen.

1. [http://www.eurekalert.org/pub\\_releases/2008-10/uom-pwc102708.php](http://www.eurekalert.org/pub_releases/2008-10/uom-pwc102708.php)

---

MT (2008-11-10 06:12:50)

Sounds like about 350 women would have been taking flax, and about 40 premature births would have been seen from that group. Very striking. Could anything else have explained this? A different type of interaction or another aspect of lifestyle from the type of women who use supplements? What else was controlled for? It would be interesting to see this contrasted with other types of Omega-3 supplementation. I'm assuming it is another constituent of the flax causing this - maybe the lignans? If that is the case, I would wonder whether the problems flax creates in pregnancy isn't having some smaller effect on general consumers, which is not noticed because the O3s are offsetting a still greater problem. Would be interesting to know quantities. Most people probably only take a few of the capsules a day, so if these women were taking such small quantities that is really alarming.

Patri Friedman (2008-11-13 19:09:53)

This is quite strange, since omega-3s, in other studies I've read, reduce the risk of prematurity. (Prematurity is related to inflammation, omega-3s reduce systemic inflammation).

Mini Moo Moo (2009-09-29 13:07:18)

We needed this info. It has just settled a disagreeemnt! \*Bookmarked\*

### **A Nice Gesture (2008-11-10 07:08)**

At [1][www.newyorker.com](http://www.newyorker.com),

This week, all articles are freely available to all visitors.

Celebrating Obama's victory, no doubt. Our version of the issue devoted entirely to John Hersey's [2]article on Hiroshima.

### **Special Days in China (2008-11-12 02:07)**

On Monday, by virtue of being a Tsinghua professor, I got a big box of apples (about 40). I haven't figured out why. On Tuesday I got a lovely tea set that I will blog about later; it was the 15th birthday of the founding of the School of the Humanities at Tsinghua. My department is within that school. Today is Boys Day at Tsinghua University (a school-specific special day). November 1st is a nationwide day for people without boyfriends or girlfriends. It is Only One Day; in 11-1 there are only ones.

Speaking of only one, did you know that China's One Child policy (if you have two children both parents will lose their jobs and pay a fine) applies only to cities? In rural China you can have two children. Some families have three. The central government has little control over rural areas; it would be too hard to enforce a one-child policy there.

---

mike kenny (2008-11-12 14:50:30)

Hm, can one move to the city with multiple kids? Do people ever go to the country to have multiple kids then move to the city?

William (2008-11-13 22:52:52)

Haha, Boys' Day is Nov 11th, because it has the most '1'

Harold Melvin (2008-11-23 14:24:54)

Dr. Roberts - why did you move to China and how long will you be there? Just curious...

seth (2008-11-25 15:11:10)

Why did I move? I was offered a job at Tsinghua. The job allows me to split my time between Berkeley and Beijing (e.g., spend half a year in each) and I hope to be doing that for a long time.

### **Happiness in China: Who Wants to Be a Construction Worker? (2008-11-12 20:31)**

A recent survey of happiness/life satisfaction among various groups of people in China found that Shanghai construction workers were quite satisfied with their lives. (The details are only in Chinese, as far as I know.) They were happier than middle-class Chinese, in spite of earning much less. This has nothing to do with low Chinese prices, since the construction workers paid the same prices as middle-class Chinese. The researcher who discovered this attributed it to two things: 1. They got paid every month. The construction workers came from agricultural areas where payment is less frequent: only after a harvest. The construction workers sent money home to their villages. The steadiness of their income was a source of respect. 2. Because they live far from home, they can break all the rules, including sexual rules. A middle-class Chinese man, living with his family, is more constrained.

The massive rural-to-urban migration happening all over the world, especially in China, is one of the most important events in human history. The Chinese part of this story has usually been told through the eyes of a young woman who leaves her village and finds factory work – for example, a series in the Wall Street Journal, the documentary [1]China Blue, or the new book [2]Factory Girls by Leslie Chang. These results suggest that the male side of the story is much different.

These findings also suggest a big problem with conventional academic economics, which revolves around measurements of money (e.g., prices, salaries, savings, GDP, the ultimatum game). If desire for respect and personal freedom motivate major economic changes, measurements of money will miss a lot.

1. <http://www.pbs.org/independentlens/chinablue/>

2. [http://www.nytimes.com/2008/11/09/books/review/Keefe-t.html?\\_r=1&ref=books&oref=slogin](http://www.nytimes.com/2008/11/09/books/review/Keefe-t.html?_r=1&ref=books&oref=slogin)

---

pd3 (2008-11-13 16:06:54)

dude, the last time you lauded sexual freedom in a country—it imploded. remember iceland?

1 (2008-12-05 22:40:58)

seth, is it bad for a Chinese man to be "constrained?" Is having more sexual freedom supposed to improve their life? What are you trying to say about Chinese men and sexual rules? or are you talking about men in general.....

### **Cargo-Cult Universities (2008-11-13 19:28)**

From [1]an article about bureaucratic suppression of Indian higher education:

Mr. Rao says space requirements are calculated to ensure students have the room to learn. "For quality education, you need enough space – enough space for labs, for teaching. Our experts decide based on these requirements after examining world-class universities."

Richard Feynman [2]criticized what he called cargo-cult science – pseudo-science (including my area, animal learning) that had the appearance of science but didn't actually work. Mr. Rao's beliefs about what quality education requires are based, like cargo cults, on what is easy to see.

1. <http://online.wsj.com/article/SB122652421295221817.html>

2. <http://www.lhup.edu/~dsimanek/cargocul.htm>

---

Jim Breed (2008-11-14 07:19:02)

I seem to remember Feynman writing in his book, What Do You Care What Other People Think, on the differences between the facilities at MIT and Princeton. His comment was that the facilities at MIT were more cramped, less well funded, and

required more ingenuity to accomplish work than those at Princeton. I also seem to recall that he felt that it was his opinion that devising ways around the constraints was helpful to the educational process. This is from my memory of reading the book shortly after it was published. Its in a box in my storage unit so I can't supply quotes.

NE1 (2008-11-15 13:34:08)

The focal point of the article is the number of highest caliber universities (see the table). It seems pretty bulletproof that laboratory space is necessary to be in this category, although maybe teaching space (if not truly a constraint atm) is an indication of success rather than a necessity. The government seems to have made the decision that having highest caliber universities is more important than many podunk U's. This might be a poor decision, but that's the real story here.

Stephen M (Ethesis) (2008-11-15 20:51:53)

NE1, thanks for the analysis, it helped with some perspective.

### **Walking is to Driving as Idea Generation is to Idea Testing (2008-11-15 04:44)**

Mary Soderstrom, a Montreal writer, has written a recently-published book called The Walkable City. From a [1]blurb:

The idea that a city might not be walkable would never occur to anyone who lived before 1800. Over the past 200 years there have been dramatic changes to our cities.

Over the same period there were also dramatic changes in the practice of science. Maybe the biggest change was the introduction of significance tests and the associated logic. Just as cars took over cities, so did significance tests take over statistics textbooks. Cities built for cars made it hard to walk; statistics textbooks full of significance tests made it hard to teach how to generate ideas.

How to generate plausible new ideas – ideas worth testing – is pretty much a mystery to most scientists, as far as I can tell. The idea generation:idea testing :: walking:driving analogy provides a little guidance, and at least makes it clear that something is missing from today's scientific education. Walking is slower than driving; idea generation is slower than idea testing. Walking is more exploratory than driving; idea generation is more exploratory than idea testing. Walking is much cheaper than driving but it may take a lot of walking to discover somewhere you want to drive; techniques for idea generation should be very cheap because it may take a lot of use of them to discover an idea worth testing. Walking is "softer" than driving; perhaps idea generation will never be as mathematical as idea testing. Walking is far more flexible than driving; idea generation methods must be far more flexible than idea testing methods. It is hard to drive somewhere that no one has ever driven before but it is easy or at least much easier to walk somewhere new. Which should suggest to a scientist that if all you know how to do is test ideas, it will be hard for you to innovate.

The way science is supported in America is horribly biased against idea generation – grant proposals must be all about idea testing. I don't know if the people who run that system have any idea how unbalanced and unhealthy it is.

1. [http://www.vehiculepress.com/cgi-bin/dbman2/db.cgi?db=default&uid=default&view\\_records=View%2BRecords&ISBN=978-1-55065-240-6](http://www.vehiculepress.com/cgi-bin/dbman2/db.cgi?db=default&uid=default&view_records=View%2BRecords&ISBN=978-1-55065-240-6)

Mark (2008-11-15 20:36:44)

I think the opposite. Most grants in the health field are for things like mining databases for disease-lifestyle correlations (i.e., looking for ideas about possible causes of disease). Very few are for actual research into causation and the mechanisms of causation. So huge numbers of what are essentially hypotheses are generated each year, but few are followed through on and established and proven. Hypotheses are merely step 1 in the scientific method, and that's as far as anyone ever goes these days.

seth (2008-11-15 22:49:41)

"Most grants in the health field are for things like mining databases for disease-lifestyle correlations"? You have a source for that? Schools of public health, where such correlations are studied (in the epidemiology department) get far less money than schools of medicine.

Mark (2008-11-17 02:56:08)

My source would be our daily news feed, where we report on about 30 health news stories per week. Perhaps schools of medicine put out fewer press releases, but I doubt that. Or perhaps we unconsciously select stories of a certain sort. But I'm pretty confident I'm right. Publish or perish. It's easier and takes less talent to data mine, especially when there are so many "peer reviewed" journals of varying quality that almost anything can be published (check out Brian Wansink's thirteen 2007 publications – they're not all crap, but there's quite a few of them are). It takes time, money, and true insight to actually cook up a research protocol that can go beyond correlations, so there are fewer publications by fewer researchers. You obviously can't meet the Wansink annual quota of thirteen publications if you're doing serious research, even if you dribble out all kinds of interim papers based on a major research project.

seth (2008-11-17 06:44:23)

Now I understand. Epidemiology generates far more press releases per grant dollar than lab science. University press offices don't bother trying to get publicity for 99 % of the research their faculty do.

## **Interview with William Rubel, Food Historian (part 2) (2008-11-15 23:03)**

[1]William Rubel is the author of [2]The Magic of Fire, about hearth cooking.

RUBEL I started to think, once I finished that book, I thought, "well, this bread that I've been interested in for so long, I wonder if they ever wrote down how they made bread when they were still doing stone-ground flour and working the bread by hand at home or in the bakeries." And the answer is, really, that they had not written down with much precision. So my goal—another primary goal—is to find the lost part of the techniques that were not written down and revive them in a way that will provide inspiration for modern bakers.

A third idea is that I've certainly noticed that our current bread culture is exceedingly narrow. In other words, the artisan culture—the slow food breads that we all like—tend to be French breads that trace their lineage to France and the primary ingredient is flour, water, and salt and either yeast or leaven, which is a sourdough starter. And in this bread culture, the leaven starter is preferred. There's also a preference for an irregular crumb—big holes on the inside of the bread but not a regular shape; some of them are big, some are small. We like the color to be little bit off-white, to be cream. We tend to like a crusty crust. It's very specific. We tend to badmouth other breads like Wonder Bread as a garbage bread and fast-risen yeast breads or breads with soft crusts and soft interiors, we tend to feel that those are bad breads, that there's a good bread which is that French-inspired one and these other ones are bad. But as an historian, I say that bread is an invention of human culture. There is no bread—farmers don't farm breads, they farm grain. You could say that this is a perfect apple, an apple at peak ripeness, and you can measure the sugar content in the apple to know that it is at peak ripeness. But there is no ideal bread because bread is just an expression of human culture; it's simply an invention. So once you start saying that something is good and bad, really you're saying that this culture that produces that bread that you don't like is bad. You are

demeaning the people who like that bread.

In one way I'm thinking of using history books to comment on the present, much the way that historians in totalitarian states—like in Stalin's Soviet Union—would write about Medieval Period and they could talk about problems there (and political problems in the Medieval Period), whereas they could not directly address similar problems in the modern state. I'm also using this work to critique our own values and value system when it comes to bread and hopefully help readers to see themselves in the story of bread and in the historical continuum of bread culture.

ROBERTS That's what fascinates me the most. I think that everything about your history of bread is fascinating, but the last thing that you said is what fascinates me the most. Why don't we turn to that now? When I've talked with you about the book, when you've been talking about the book, one point you made that I especially liked was about white bread and how white bread was seen and how we came to have white bread. Can you say a little about that?

RUBEL White bread is the starchy part; the white flour is the starchy part of the grain called the endosperm. The way you got that historically, before the invention of modern roller mills (steel mills with steel rollers in the 19th century), was that you ground the grain between stones and then you sift it. Before agriculture was invented, the hunters and gatherers who had settled in the Fertile Crescent around the big fields of grain had stone scythes and they had grindstones. The archaeological sites are littered, when you look at drawings of archaeological sites of the hunter-gatherers—we're talking 13,000-15,000 years ago in the Fertile Crescent—these sites are just littered with grindstones. Metates: we think of Mexican women grinding the corn to make the tortillas, grinding the boiled corn they mixed \_ \_ \_ \_ to make Tamasa.

It was certainly possible for people to have ground grain—we don't know that they did—it was certainly possible that grain was being ground a very, very long time ago. Once you have ground grain, separating out the white part—the powdered part—is fairly easy. Whether people did it, we don't know, but certainly if you can make a sieve and if they could make a basket, if they could make cloth, then they could make sieves. You can go to the Metropolitan Museum of Art and in their Egyptian room they have a storehouse of linen cloths—bolts and bolts of the finest linen cloths you can imagine. Anyone with fine linen cloth can make the very, very fine white flour.

ROBERTS Because you can use the linen as a filter?

RUBEL You'd sift it; that's what they'd use. They would use linen or they would use silk. Until nylon bolting cloths were developed, silk was the highest grade bolting cloth. But anything you can weave—horsehair (they had horses in Mesopotamia), a horsehair sieve—you can sift. Remember, you're talking about a high status product, so you've got lots of slaves. You also could just shake and blow; you don't even need to sift. You can certainly make a whiter flour than a whole wheat flour just by shaking a bowl of it and the finer particles will fall and the coarser particles will rise to the top. If you take fine sand and coarse sand and just shake, the fine will go one direction and the coarse sand will go another.

### **My Theory of Human Evolution (Chinese birthday gift) (2008-11-17 00:12)**

In 1952, following the Soviet model, Tsinghua University was stripped of its humanities and social science departments and became an MIT-like university entirely devoted to engineering and science. Eventually it became clear this was a mistake. Fifteen years ago a School of Humanities and Social Sciences was established to begin to restore things. Two weeks ago, because I am a faculty member in that School, I got a fancy tea set to mark the 15th anniversary of its founding. Here is what the tea set looks like:

I asked a Chinese friend of mine to explain it to me. She pointed to the tools in the box with the cups. "They're useless," she said. She pointed to the slatted bamboo box. "I think it's useless," she said.

To pour the tea you put the cups on the slats. The box is slatted so that if you spill some tea while pouring the surface will continue to look good. It's not the total uselessness my friend saw but she is right that the added value

of the slats and the tools, in practical terms, is very low.

[1]My theory of human evolution says that the reason for gifts, ceremonies, and special days (such as Christmas) is to provide a demand for hard-to-make stuff. This allows artisans on the cutting edge to make a living and further develop their skills, advancing the state of the art. This is why gifts and ceremonial things are typically hard to make and, were it not for their value as gifts, not worth making. My friend's reaction illustrates this. My theory predicts that this feature of gifts, ceremonies, and special days has a genetic basis and should be found in all cultures. This example shows it is found in a culture quite different from American culture.

### Flaxseed Oil Used to Treat Cancer (2008-11-17 22:50)

The Budwig protocol is the food treatment and cure for cancer and other major debilitating diseases created by Dr. Johanna Budwig. It was designed for use with extremely ill and wasted cancer patients who had been sent home by their doctors to die. These were patients so ill that many were unable to take any food at all in the beginning, and had to be initially treated with enemas. The protocol is so simple that it can be tailored to fit whatever situation is encountered, from use with someone at death's door to use as a preventative and part of a healthy lifestyle.

There are only two essential foods in the protocol, flax oil and cottage cheese or some other sulphurated protein such as yogurt or kefir. The oil provides electron-rich fats, and the cottage cheese provides the sulphurated protein to bind with the oil and render it water soluble. In this state, the oil is able to carry immense amounts of oxygen straight into the cells. Cancer cells cannot thrive in an oxygen rich environment.

From [1]Natural News. Yeah, the explanation ("electron-rich fats") is absurd, but the general empirical idea (the use of flaxseed oil and cottage cheese to cure cancer) is of course very important. It isn't complicated why flaxseed oil might be highly beneficial: Our diets used to provide much more omega-3 than they now do; flaxseed oil, high in omega-3, reduces the deficiency. The idea that cottage cheese makes flaxseed oil more digestible is also very interesting.

Thanks to Peter Spero.

1. <http://www.naturalnews.com/024719.html>

---

Nadav Manham (2008-11-18 11:07:01)

Seth, Apparently Weston Price gave cod liver oil with butter oil, which seems to have improved its effectiveness: <http://www.westonaprice.org/basicnutrition/cod-liver-oil-menu.html>

david (2008-11-18 13:28:15)

The tone of that site sounds nutty BUT I will say that after I started consuming more flax oil (mostly using it to make a salad dressing) for the omega-3s, I happened to eat some yogurt with a spicy Indian meal. I'd been avoiding yogurt since I'd had trouble with dairy in the past, but this was a good quality plain "Bulgarian yogurt with live acidophilus" so there was a good chance it wouldn't give me any problems. After having the yogurt, I found myself craving the yogurt and now eat a jar a week at least. In addition, I seem more tolerant of dairy in general. I don't know if there's any connection between any of that, but I thought I'd throw that in.

John (2008-11-18 14:41:04)

Also sounds like a low carb diet. Lots of fat, a nice amount of protein, very low in carbohydrates. The Budwig Diet itself, not so much.

MT (2008-11-18 15:18:41)

The linked article describes a "proven cure and preventative for cancer" but doesn't substantiate those claims at all, it simply asserts a theory and protocol. This article is bad science and bad journalism. A disingenuous title misleading readers about the article's content (low journalistic integrity) and failing to support its claims to even the most basic scientific standard. I wonder if people who follow this link will feel that it has been approved by Seth Roberts, professor and author, and attempt to cure themselves of cancer this way? Reading it, you get the sense the author believes chemotherapy is more dangerous than cancer itself, and seems to discourage chemotherapy as a treatment. So I guess we are getting a natural experiment. People being encouraged to refuse treatments offered by the "cancer industry" and to use flax oil and cottage cheese instead. Would be interested to learn which group has better outcomes, but I don't imagine the data will be collected.

seth (2008-11-18 19:34:00)

MT, yes, the linked-to article is a mess. As I pointed out and as you point out. Whether it is worthless or even harmful, as you seem to say, is a very different question. I assumed that Budwig did in fact publish papers with supporting data but I wasn't able to find links to them. Someone who wants to know more about this could track them down and decide for themselves. I do endorse trying to find out more about this – especially if you have cancer.

Adam (2008-11-25 11:16:10)

I've been eating 1/2 cup of no fat cottage cheese with 1 tbs. of flax 2 or 3 times a day with my nose clip for a few weeks now. Regardless of whether it prevents/cures cancer, it is a good appetite suppressor because of the fat and protein.

donald a, (2009-03-05 20:44:46)

dr.budwig noticed the interaction between flaxseed oil and cottage cheese in the 1950's, being a noted german chemist and all. there are hundreds of testimonials to support what she claimed, and even if you only believe half of what her patients have said, maybe there's some credibility to it. she did live into her 90's, so maybe it works for some. seems like a cheap insurance policy if it does some good. we need those omegas in our diet anyway.

seth (2009-03-05 21:45:48)

Here is another article about Budwig: <http://www.cancertutor.com/Cancer/Budwig.html> The Budwig diet curiously combines my two latest nutritional interests: flaxseed oil and fermented foods.

Jack (2009-03-11 15:29:13)

It sounds like you're creating problems yourself by trying to solve this issue instead of looking at why there is a problem in the first place

Angela (2011-08-18 20:54:02)

My cousin, before developing another condition, tried flax oil and cottage cheese to treat her cancer, and it took her pain away. I think that, had they tried it sooner, it might have helped to keep her alive.

## **The Washing Machine Principle (2008-11-19 06:04)**

Suppose I want to improve performance of my washing machine. Ways I might do this fall into three categories:

1. Supply missing inputs. It needs water, soap, and electricity. If any one of them is missing, I can greatly improve

performance by adding it – by plugging the machine in, for example. These changes are easy because water, soap, and electricity are easy to get.

2. Replace broken parts. This will also greatly improve performance. These changes are very difficult unless I am a washing machine repairman.

3. Everything else. To improve performance any other way will be difficult and any improvements will be small. These other methods of improvement – such as putting special disks into the wash – are also likely to be dangerous.

All complex machines are like this. What I call the Washing Machine Principle says that humans are also like this. This means that non-transplant attempts to improve human well-being fall into two clusters: 1. Easy, safe, and highly effective. 2. Difficult, dangerous, and only slightly effective.

Some simple examples:

- Vitamins. If you have a deficiency disease, getting more of the right vitamin will cure you easily, safely, and rapidly. They supply a missing input.
- Antidepressants. They are dangerous, difficult to make and obtain, and don't work very well. In controlled studies, they do only slightly better than placebos. Patients typically must try several to find one that works. They don't supply a missing input.
- The mirror treatment for certain neurological conditions that Atul Gawande recently [1]described:

[The patient's] left hand felt cartoonishly large“at least twice its actual size. He developed a constant burning pain along an inch-wide ribbon extending from the left side of his neck all the way down his arm. And an itch crept up and down along the same band, which no amount of scratching would relieve. . . . [These symptoms had lasted 11 years. Gawande suggested trying the mirror treatment.] After a couple of weeks, his hand returned to feeling normal in size all day long. The mirror also provided the first effective treatment he has had for the flares of itch and pain.

The mirror treatment is cheap, safe, and, in this case, highly effective. Clearly it supplies a missing input.

To be continued.

1. [http://www.newyorker.com/reporting/2008/06/30/080630fa\\_fact\\_gawande?currentPage=all](http://www.newyorker.com/reporting/2008/06/30/080630fa_fact_gawande?currentPage=all)

---

Matthew (2008-11-20 10:53:28)

Certainly antidepressants have the potential for harmful side-effects, but if the problem is caused by low serotonin levels, would not an SSRI supply (indirectly by inhibiting reuptake) a missing input? Since depression has so many causes and these causes are very hard to observe, it is not surprising that they would not do much better than placebos \*on average\*. But that doesn't mean that they couldn't work remarkably well for those whose depression is actually caused by low serotonin levels. I know several people who were very effectively treated by antidepressants of various types, but almost all of them required trial periods of at least two drugs, whether they be SSRIs, SNRIs, and/or NDRIs. A drug that supplies an input that's not actually the missing one will of course not work. So of those patients who were not affected in the trials, how many do you think might have eventually found a drug that works? It's not without risk, but as you've said, neither is flax oil (for pregnant women), or vitamins (for those

who don't have a deficiency). If there were a trial that found that flax oil on average has no statistically significant effect, I would hope you would jump all over that study. Concluding that it doesn't help \*anyone simply because it doesn't significantly effect \*everyone is the kind of error that I've learned from you and Dierdre McCloskey to avoid (that's why I commented a while back that you two have a lot in common despite your disagreements over gender identity). But I suspect that your skepticism of these medications disinclines you to come to this conclusion when the subject of the trial is antidepressants. What do you think?

Mike (2008-11-21 13:28:36)

I agree with Matthew. Saying antidepressants don't work is sort of like saying vitamins don't work, because zinc, copper, magnesium, iron, and potassium supplements don't help your calcium deficiency. Antidepressants are a broad category of drugs treating a broad spectrum of symptoms. Of course, on average, they'll be a wash.

seth (2008-11-22 04:14:52)

Serotonin is not an input. By "input" I mean what we take in from the environment – what we eat, see, hear, etc. As for safety, vitamins are much much safer than antidepressants – that was my point. I'm not saying "antidepressants don't work" – I'm saying they work much worse than vitamins when the vitamins are used to treat a deficiency disease, e.g., Vitamin C is used to treat scurvy.

seth (2008-11-22 23:14:06)

A comment that someone else was unable to post: Matthew's argument presumes that, for some people, "depression is actually caused by low serotonin levels." Even strong advocates of psychopharmacology do not agree. For example, Ellen Frank notes that, "It may be that the biological changes produced by antidepressants can lead to changes in mood, concentration, and interest by setting the stage for circadian reentrainment." (see Treating Bipolar Disorder, page 23) Jump-starting the brain's machinery may "work"; it doesn't follow that jump-starting is the best way to operate the machine.

Tony (2008-11-25 03:30:23)

Antidepressants might work at treating (some of) the symptoms, but they don't (at least in the large majority of cases) solve the cause of depression. The cause of depression is usually a basic human need being unfulfilled. Vitamins do address the cause of certain diseases - basic nutritional needs. Low serotonin levels, properly understood, aren't causes of depression but effects. Saying depression is caused by low serotonin levels is like saying that the washer malfunction is caused by some lever that causes the water to enter the tank not flipping on - and ignoring the fact that the lever isn't moving because there's no electricity being supplied to the machine.

Patrik (2008-11-25 11:07:17)

*I'm not saying "antidepressants don't work" - I'm saying they work much worse than vitamins when the vitamins are used to treat a deficiency disease, e.g., Vitamin C is used to treat scurvy.* Comparing vitamins to treat deficiencies with anti-depressants is not entirely fair. Clearly, anti-depressants are non-optimal and treat the symptoms of depression, not the actual cause (sadly just like 99 % of modern medicine), but they can be thought of as a temporary patch on a flat bicycle tire. Yes, the tire still has a hole from the thorn. Yes, the patch only covers the hole, and therefore the patch has not addressed the underlying cause i.e. the hole still exists i.e. you would prefer to ride a bike with your bicycle tube wholly intact than one with a patch...but if all you got is a patch, i.e. you can only treat the symptom, and no new bicycle tube exists, you are still a helluva lot better off with the patch than without. ———— BTW I am skeptical of the scurvy and vitamin C via fruit and vegetable hypothesis (yes, I know that makes me sound insane), for the following reasons: 1 - Poor absorption of antioxidants provided by fruit and vegetables. 2 - Antioxidants when tested in a lab most likely have very different effects when ingested. 3 - Antioxidants may not be beneficial, but may actually be deleterious to health. See here: <http://barrygroves.blogspot.com/2008/10/eating-fruit-may-increase-heart-attack.html> 4 - Our requirements for vitamin C are probably very low. 5 - Vitamin C is required to digest carbohydrates, grain does not provide vitamin C. Less carbohydrates, less need for vitamin C. BTW according to Barry Groves of 'Trick and Treat', only those British sailors who were eating the ships biscuits were prone to scurvy. The Masai, Inuit and Samburu, who eat no or very little vegetable matter do not suffer from

scurvy. So, where are they getting their vitamin C from? It appears as if organ meats such as liver are a better source of vitamin C as they provide more vitamin C and are more readily absorbed by the body. BTW this was referenced on this very blog here: <http://www.blog.sethroberts.net/2008/07/21/errors-in-the-queen-of-fats/>

Anthonyology » Consumerism, Depression, and Causality (2008-11-28 23:23:28)

[...] Here on Seth Roberts' blog, I respond to a comment by someone who suggests that low serotonin levels cause depression. (Thinking low serotonin levels cause depression leads to solutions such as drugs that increase serotonin levels, which is convenient for the pharmaceutical industry. ) In this case, the causality is exactly backwards (at least in the large majority of cases) - depression, rather, causes low serotonin levels. Change the things that cause depression, and not surprisingly the serotonin levels go up on their own. [...]

### Lohao City (2008-11-21 06:39)

Today I visited the flagship store of the [1]Lohao City chain here in Beijing. (Lohao stands for Lifestyle Of Healthy And Organic.) I needed more flaxseed oil. It was a straight line from the subway stop but I needed to call the store twice to convey this to the taxi driver. The store was a lot smaller than I expected for a chain with six locations. It was a little bigger than a 7-11. It had a baking area, a wine area, a produce area, and a wheatgrass growing area where you could get wheatgrass juice and other healthy juices. They were sampling some delicious organic wine made from a fruit the English-speaking clerk didn't know the word for. I was a little surprised it only cost \$6/bottle.

The chain is just a few years old. It specializes in organic food. The chain owns its own 22,000-acre farm where they grow the food they sell – a new type of farmer's market. By growing the food they sell they can guarantee how it is grown. This really is an innovation in food selling. I hope the six stores (one in Shanghai) mean the concept is successful rather than they started with a lot of money.

I wanted to buy six bottles of flaxseed oil but the store only had one. The clerk went to another store to get five more but came back with only one more. One bottle (250 ml) might last me a week so I need to search for other

sources.

I told the clerk the flaxseed oil was for my research. "Can you really tell the flaxseed oil improves your brain?" he asked. Yes, I said. He was studying English at a private school in Beijing. He's in his second year of college, majoring in "commercial diplomacy" which means business diplomacy (e.g., negotiations). He predicted that even though Obama quit smoking for the campaign, he will start smoking again now that he's President.

The chain puts out a biannual magazine now on its third issue. The magazine said something very true: "As people earn more money, they start caring whether they are healthy enough to enjoy their fortune."

[2]More about healthy food in China.

1. <http://www.blog.sethroberts.net/www.lohaocity.com>

2. [http://www.newyorker.com/reporting/2008/11/24/081124fa\\_fact\\_dunlop](http://www.newyorker.com/reporting/2008/11/24/081124fa_fact_dunlop)

---

Mark (2008-11-22 15:58:36)

The WaPo had a column the other day that concluded that Obama has not been successful in his attempts to quit: "Let the Guy Smoke: Obama Is Probably Fibbing About Giving Up Cigarettes. That's Okay." <http://www.washingtonpost.com/wp-dyn/content/article/2008/11/19/AR2008111903531.html> The Chicago Tribune and some other papers also chimed in the next day with analyses of his conflicting and vague statements. Like Laura Bush and Al Gore, he must be pretty good at avoiding being photographed doing it.

Stephen M (Ethesis) (2008-11-22 20:10:41)

BTW, another interesting story on medical transparency and the lack of it: <http://www.mormonsandscience.com/1/post/-2008/11/we-need-more-tansparency-in-medicine-and-the-light-of-christ.html>

Nathan Myers (2008-11-25 03:36:11)

I wonder if it says something deep about China that such a chain has to have its own farm. Maybe the customers wouldn't trust third parties to deliver actually organically-grown produce to the store. They might shop there anyway, and hope, but wouldn't pay more because they wouldn't have any confidence that they (and the store) weren't being cheated. Or, maybe, nobody will pay extra for organic, but the store can only keep cost parity with other stores by cutting out the middleman.

### **English-Speaking Contest (2008-11-23 23:12)**

Last night on Chinese TV I watched the first day of an English-speaking contest. Contestants gave a short prepared speech, then gave an impromptu speech based on a randomly-chosen debate topic (e.g., should TV advertising aimed at children be banned?). After the impromptu speech they defended their position for a few minutes. It was a test of both English and public speaking. The contestants were college students. I really liked it. It's a statement of, and promotion of, certain values; it says that society – at least the owners of the TV station and viewers – value something outside of themselves (English) and intellectual (learning a foreign language). China has been called a "nation of bookworms" (by James McGregor in *One Billion Customers*) so a show glorifying learning isn't entirely surprising but it is a big improvement over American TV game shows, which glorify office politics (*Survivor*), strange tasks in foreign countries (*The Amazing Race*), and singing (*American Idol*). I supposed the closest thing in America is the Scripps National Spelling Bee, which glorifies a useless

skill (spelling obscure words). What might American TV do like this? I can't think of a contest revolving around learning from other cultures but I can think of some contests that would promote useful intellectual pursuits:

- Green engineering contest. Give teams of high school students home-engineering tasks involving energy use: Insulate a window, boil water, light a room.
- Joke-telling contest. Tests the ability to use jokes in everyday life – for example to defuse difficult situations. Americans have lost this ability so completely I suspect some of them don't even realize it exists. I'm an example – I'm terrible at joke-telling.
- Editing contest. Contestants take an everyday piece of writing and improve it.
- Literature appreciation contest. Shown a passage from a famous novel, short story, or poem, contestants explain what is good about it. Bonus points for identifying the source.

Chinese gameshows are intellectual. « BC in OC (2008-11-26 09:44:33)

[...] Chinese gameshows are intellectual. Posted on November 26, 2008 by bryan No, really, they are. [...]

### **Learning Chinese (2008-11-24 21:21)**

My cell phone has a service number that you call to get your account balance or to recharge your account. You press 1 for in Mandarin, 2 for English. Today for the first time I pressed 1. It reminded me of being 9 and going into the adult section of the library for the first time. I looked at a few books. They were full of words I didn't know. Likewise, I didn't understand a word of the Mandarin I heard. But I can listen to it again and again.

---

William (2008-11-28 08:13:14)

I think your learning is progressing steadily. At least you are willing to face the challenges directly now : ) As you know, Chinese is almost the most difficult language to master all over the world. Good Luck! btw: is the problem of the movie settled?

Ray (2008-11-29 23:24:50)

Using the calling cards to call my wife when she is Taiwan from the us is challenging since all the phone voice instructions card menu is in mandarin. Please enter the card. And then the part of enter the phone along with how many minutes you have left. I guess After 20 years of marriage and bringing up our daughter bilingual I know enough with some guesses to call successful

### **The Four Abundances (2008-11-25 20:29)**

Someday, if I am lucky, I would like to write a book called The Four Abundances. It would be about how four incredibly important things that were once impossibly scarce, became or will become, to everyone's surprise, abundant:

1. Water. Free and everywhere. So cheap my Berkeley landlady pays my water bill. This has been true for a long time.
2. Knowledge. I mean general knowledge. Via the Web, reference book knowledge and news is instantly accessible for free. A recent development, although books and newspapers were a big step in this direction.
3. Health. A future abundance. Health is far from abundant right now. On the other hand, health has improved dramatically during the last 200 years, as Robert Kugel has documented. It is clearly approaching abundance.
4. Happiness. Another future abundance. I suppose it seems impossibly far off – but abundant water once seemed impossibly far off. Here it's hard to find signs of improvement, much less approaching abundance. Depression has become more common, not less, during my lifetime.

My self-experimentation has convinced me that health and happiness depend on things that were common in Stone-Age life, just as there was enough water and knowledge during that time. (Now we have more than enough water and knowledge, which is fine.) We need to figure out what those elements are. Self-experimentation provides a way of doing so.

In my little corner of Beijing, transportation is becoming a fifth (or third) abundance. Mostly I ride a bike – my bike was free, costs pennies to maintain, doesn't pollute, provides exercise, easy to park. For longer trips I take the subway (30 cents/ride) or a cab (a few dollars a ride). Many people take the bus (a few cents/ride). I might get an electric bike for a few hundred dollars. Doesn't pollute, very cheap per mile, easy to park, little congestion.

I've thought about this for months; what made me finally decide to post this was noticing that two little tools I use every day – a penlight and a brush to clean my keyboard – were free, giveaways at trade shows.

---

Jeremy Cherfas (2008-11-26 03:00:27)

You are so very wrong about number 1, in Berkeley, in Beijing, just about everywhere.

Patrik (2008-11-26 10:41:09)

Seth, I think you are missing basic point. Almost nothing is free. You write: *Water. Free and everywhere. So cheap my Berkeley landlady pays my water bill. This has been true for a long time.* Well, it is not free since your landlady pays the bill, and you pay the landlady your rent, you are in essence paying for your water bill. Yes, she sends off a check to the utility company every month, but only b/c she knows your check is coming to her. Also, Lomborg, founder of the Copenhagen Consensus would disagree with your assertion that water is free, cheap and everywhere. <http://www.copenhagenconsensus.com/Default.aspx?ID=1150> *1.1 billion people lack good, clean water supplies, and 2.7 billion have no access to proper sanitation. Sophisticated modern piped water networks are far too expensive for most developing countries, but there are a number of low cost local interventions which are very cost effective and can increase the quality of people's lives significantly.* Not only is water not free, there are a host of things you mention that are costly, but appear free or low-cost to you. *For longer trips I take the subway (30 cents/ride) or a cab (a few dollars a ride). Many people take the bus (a few cents/ride).* We don't know the marginal cost of that subway ride, but I surmise that you are bearing all of it. I assume that like almost all public transportation, it is heavily subsidized by taxpayers. Meaning, it is not as cheap as you see it being.

seth (2008-11-26 15:11:04)

Jeremy and Patrik, "free" has multiple meanings. One is the price you immediately pay for something. By "everywhere" I

meant in an average American's life. You don't agree that water is abundant at least some places and that this is amazing?

Patrik (2008-11-27 11:03:48)

Hi Seth, I think you used the word 'free' a bit inaccurately, I think you mean inexpensive or cheap, which is not quite the same as free. :) *You don't agree that water is abundant at least some places and that this is amazing?* Something interesting to think about. Why is water relatively cheap to, say, diamonds? Sure, water is more abundant than diamonds, but we certainly cannot live without water, while the reverse is not true, no? Here is why: The marginal utility of water declines faster than that of diamonds. The second/third/nth diamond is just a little less valuable than its predecessor, while second/third/nth unit of water's value declines faster.

Heffbelly (2008-11-28 14:11:17)

Thomas Jefferson said on the topic back in 1776: "It is neither wealth nor splendor, but tranquility and occupation, which give happiness."

### **Reciprocity in China (2008-11-26 15:02)**

A few years ago, I asked a woman I know why she decided to go to graduate school to study cultural psychology. She told me she had been in the Peace Corps in Africa, I forget where. Maybe Kenya. Early in her stay a native had been a big help to her. To thank him, she baked him a cake. This angered him. "You think you can pay me back with a cake?" he said. To pay me back, give me something I want, he told her.

A more subtle version of the same thing happens in China. About a month ago, the friend of mine who had invited me to come here told me I had been invited to visit a university near Shanghai by a professor of psychology there who was a dean at the university. I wrote to the person who invited me:

I look forward to visiting you in ---. I don't have a lot of plans; I could come almost any weekend. When would be a good time for me to visit?

Her assistant replied:

Professor --- will not be free on 6-9 Nov 2008.Â And she will not be free on 15 Nov 2008.Â Â For other days, that's OK.Â Â I will come back when I get more message from Professor ---.

I replied:

Thanks. A weekend later than those will be fine.

Her assistant replied:

This evening, I talked with Professor --- about your visit to ---.Â Professor --- is expecting to explore any possibility of research collaboration with you.Â Professor --- mentioned the best time will be the last several days of November or early December for your visit to ---.

I replied:

Late November or early December is fine with me. I do not have any other plans.

Then I got this:

Professor --- is wondering whether you are interested in some collaboration, such as psychology research design guidance, psychology paper modification (the papers is written in English, but may not as good as expected), and some other research project collaboration.

I was surprised – just the Peace Corp volunteer was surprised. I replied:

I would be happy to talk about research design guidance with Professor ---. I cannot say more than that because I don't know anything about her research. So I don't know if our research interests overlap. About paper modification – improving the English – I am less sure. I am busy helping students and colleagues here at Tsinghua with their English.

The reply:

Professor --- will only ask you to improve the English for only one paper, which she expect to have that paper be published in USA.

I was puzzled what to say to this. Before I could reply, I got another email:

Professor --- talked with me this afternoon.Â She mentioned that the paper is related to ERP.Â She needs your help with the English language improvement with the paper, after her graduates' [students'] translation from Chinese to English.

I replied:

I just finished spending many hours fixing the English of a paper written by a non-Tsinghua researcher whom I will never meet. I am not eager to repeat the experience. However, I am happy to help Professor --- with the English of her paper if she will help me with my Chinese.

The reply:

Professor --- said that that's OK.

But it wasn't okay. I heard nothing for a week and wrote again:

When should we figure out the details of my visit?

The reply:

This afternoon, we discussed how we can benefit to each other, when you are here. Would you please list out what you can offer us, and what you expect us offer you, when you are in Suzhou?

I replied:

During my trip to —, I hoped to learn about —, the university, and the research being done there. I haven't traveled much in China so I thought the trip would be fun.

As for what I might offer you, I wrote The Shangri-La Diet, a New York Times bestseller that describes an entirely new approach to weight control; I am a statistics expert; and I have done innovative work in experimental design as well. Thousands of people read my blog because they think I have interesting views about the world. You can learn more about my work at [www.sethroberts.net](http://www.sethroberts.net). My blog is at [blog.sethroberts.net](http://blog.sethroberts.net).

Why did you invite me to visit?

The reply:

We discussed your response. And we need to mention the following two points: We need someone to improve our paper in English. But the paper has not finished yet. This is not a good season for sightseeing in — because of the cold weather. For above the two points, we cannot fix the time when you come to —. We may arrange your visit later. Keep posted.

My reply:

Do I understand you correctly? You invited me to — "to improve [your] paper in English"?

No reply. In other words, the answer was yes.

Yesterday I met a graduate student from the Philippines. She's studying architecture here on a scholarship from the Chinese government. How do you like it here? I asked. When she got here, she said, she was positive. "I was all 'It's an amazing place.' " Now, after more than a year, she isn't positive. Whenever someone does something for you it turns out they want something in return, she said, but you don't find out right away. She didn't want to give details. "I should stop talking," she said. I told her I'd had the same experience – the invitation I just described.

The whole thing reminded me of [1]something I wrote about Robert Gallo, the AIDS researcher:

A researcher in Gallo's lab once told the boss that Einstein was his favorite scientist; he especially admired Einstein's magnanimity. Gallo replied, "You are naive. Einstein could afford to be magnanimous because he was a genius." The other scientist asked, "You mean magnanimity is good only if you're a genius?" Gallo said, "Yeah, because then you don't have to worry about the competition."

And the reciprocity norms of rich countries take the form they do because the countries are rich.

1. <http://www.virusmyth.com/aids/hiv/srlabrat.htm>

---

Seth's blog » Blog Archive » Moral Stages in Different Countries (2008-11-26 15:43:15)  
[...] Reciprocity in China [...]

alexis (2008-11-26 16:11:27)

This is fascinating. But are you sure you have your causality right? Maybe some countries are rich because they have less selfish reciprocity norms

seth (2008-11-26 16:41:03)

Thanks, Alexis. I find it hard to believe that economic prosperity, a big complicated thing, depends on reciprocity norms to a big extent. Maybe a small extent. But you're right, I'm not sure.

Patrik (2008-11-26 19:42:03)

Didn't you find it strange that you were communicating through the professor's assistant? Or does the professor not speak/write English?

Mike W (2008-11-26 21:46:22)

I had similar frustrating experiences when I was working in Taiwan for a month in the 90's. There was a strange quid pro quo dance going on all the time, and I felt like I didn't understand the rules at all. My Taiwanese friends were appalled at times by my obtuseness - what was so obvious and natural to them felt awkward to me. Since Taiwan is pretty wealthy (compared to the mainland), I'm more inclined to attribute the experience to cultural differences, not affluence.

seth (2008-11-27 00:22:10)

I don't know why we were communicating through the assistant. Maybe the assistant's English is better.

Aaron Blaisdell (2008-11-27 09:57:45)

Strange, stray thought: If a Romulan and a Vulcan had a baby together, it would be Chinese.

seth (2008-11-27 14:33:30)

Mike W, that's really interesting. Could you give an example?

Mike W (2008-11-28 11:26:27)

Trying to think of an easy-to-summarize example... While in Taiwan, I was invited to the home of the parents of an engineer I was working with. His dad, Mr. Lee, was a fairly affluent businessman, I don't know what business he was in. I was treated to a very nice, big dinner. There were a couple other guests who also worked with us, but I was the only American, and clearly the "guest of honor". I didn't speak much Mandarin, and the Lees knew little English, so we mainly talked through my colleague R.L., acting as an interpreter. Anyway, as I was leaving at the end of the evening, thanking my hosts, Mr. Lee asked when I was going back to the States. me: Next Saturday. Mr. Lee: Come here on Friday and we can discuss some things. me: I'm sorry, I'll be up in Taipei all next week. R.L. (quietly but urgently): Say yes! me: But I can't... R.L.: Just say yes! me (to Mr. Lee): Sure, next Friday. Mr. Lee (smiling): Good! The conversation with R.L. afterwards... me: What does he want to talk to me about? R.L.: I don't know, but you had to say yes. me: But I have no intention of going there. You know I'll be in Taipei. Is he expecting me to show up? R.L.: Maybe, maybe not. But it was very rude to say you wouldn't. Needless to say, I didn't go back to the Lee's, and I never found out what he wanted from me. It seemed to be more than just an invitation for another social visit, there was something specific on his mind. I was a little baffled that in this case a false commitment was the correct response, rather than a polite, honest refusal. There are two things going on here, I think. One is that I owed them some kind of favor after their hospitality. The other is that Asian emphasis on "saving face", where being polite is much more important than

being honest. (There's some of that in American culture, but usually we limit it to insincere compliments.)

Seth's blog » Blog Archive » Gary Taubes Answers Questions (2008-11-28 14:38:57)  
[...] Reciprocity in China [...]

seth (2008-11-29 07:05:37)

Thanks, Mike W. That's roughly as mysterious as my example. In my example, how was I supposed to know that the original purpose of the visit (explore research collaboration) wasn't the real one?

Tom (2008-11-29 11:59:11)

*I was a little baffled that in this case a false commitment was the correct response, rather than a polite, honest refusal. There are two things going on here, I think. One is that I owed them some kind of favor after their hospitality. The other is that Asian emphasis on "saving face", where being polite is much more important than being honest. (There's some of that in American culture, but usually we limit it to insincere compliments.)* By that measure, Los Angeles is part of Taiwan. The correct response to a social invitation you know you won't accept is, "That sounds GREAT! I can't WAIT! I am totally gonna try to make it!" Great shoes, by the way. Where'd you find them?

Wong China (2008-11-29 19:46:47)

Well, I think this kind of reciprocity is very common among Chinese universities, if Univ.A invite the professors of Univ.B for a conference, when the professors of Univ.B have some programs or conferences, they are expected to invite Univ.A. Because the program or conference is not considered as a matter of academic exchange, rather than an opportunity to share the money. Your case is quite reasonable in our logic: first, for the university, all the Chinese universities need to strengthen their overseas relationships to "build the world first-class university", and strong relationships will bring the money - the national program to the university. Second, for the department. The professor uses the money of department to invite you, and the accommodation especially the airplane tickets are expensive according to the exchange rate. So the department would like to ask something back, even just a good willing or wishes. I guess the professors want you and Mike to express the intent to widen the cooperation, including to invite them to the U.S. This mutual-beneficial intent is more important than what you actually do - it's OK if you promised but do not carry out due to some reason. That's why Mike was asked to say YES in Taiwan, I think what they need is just a good willing to cooperation. Last, for the professor, though the paper on an international journal will benefit her a lot, it makes no sense to ask you directly as a return. You know there are many paper companies where she won't spend a lot (about US \$200) to get her paper modified. Why she preferred to ask a professor to do so? Perhaps, the assistant loses the focus of the professor, maybe the professor just said "ask for mutual-beneficial cooperation, such as a course to the students, even a paper modification". Though I have no confidence in the morality of my fellow Chinese, I believe the international cooperation is what they want, and an English paper is just a piece of cake.

alex (2008-11-29 23:30:57)

I am a Chinese. This really happens in some places of China, but I do not think this could be attributed to just "cultural differences". I have a theory, so called "reciprocity" is related to high population density, especially high immigrant population, without a stable common culture. In fact, in Chinese, so called "reciprocity" is called "ã,ä%©" (Shi Kuai), with a derogative tincture.

seth (2008-11-29 23:54:20)

Wong China, I don't think she could just pay \$200 to get her paper fixed. It is technical psychology material, someone not a professor of psychology would probably make a bunch of mistakes. I'm sure the assistant didn't misquote the professor; the request for English help, when it came, was very clear. I don't mind at all that they expected to get something back; the problem for me was that this wasn't made clear at the beginning. In the beginning all that was mentioned was "research collaboration" - nothing about English help. Had they been more upfront about what they wanted, and the paper not needing too much work, I would have been happy to help them.

dt (2008-11-30 02:04:44)

The reason why they didn't mention the english paper help at the beginning may be that their request is known to all, and they didn't want others know the paper modifying request. And I felt the assistant's letter was with impoliteness, his/her request sounds like a command, this goes against the basic culture core of the chinese-modest and politeness. So when i firstly read your emails, I felt something wrong with the assistant, maybe it was just his/her english problem(both paper and letter)...

Wong China (2008-11-30 06:41:05)

Seth, now I understand what you mean, but I still don't know why can't she welcome your coming without any condition, and give you a nice reception to establish a tie of friendship, after that, talk about the article (or ask you to be a co-writer). You would not refuse a hospitable host, right? Frankly speaking, we Chinese are very cunning, it's hard to see any genuine reciprocity or dedication, as well as any awkward bargain. Chinese are good at packing the nakedly exchanges into kindness and friendship. So I just wonder why she has to be so honest to make it as a condition before you go...I felt a little sick to go on. The norms of reciprocity, love, thanksgiving, selfless, devotion, service...are the mental terms correlated to the cultural background, especially religious background. And the gentle side of human society is what social scientists pursue, without that, the richer people get, the poorer society is.

seth (2008-11-30 08:57:30)

Wong China, yes, I agree with you, "she [could] welcome [my] coming without any condition, and give [me] a nice reception to establish a tie of friendship, [and] after that talk about the article" - that would have been fine.

Crane Wang (2008-11-30 09:31:42)

OK, as a Chinese, I have to admit I didn't figure out what was going on. I also run into such awkward communications now and then. oops. I suppose sometimes people just feel an invisible psychological compulsion to show hospitality. Not exactly because they want to be friendly or they are really that happy to having friends around, it's just according to such psychological compulsion (maybe cultural as well), having friends & showing hospitality indicate a positive reputation and good social status.

alyce (2008-11-30 23:09:42)

Only one incident cannot represent whole China.

seth (2008-12-01 01:09:28)

Can one incident represent all of China? A better question is: Can one incident shed any light? If it was completely weird, maybe not, but the experiences of the Filipino graduate student convinced me that it was not completely weird.

Nico (2009-06-01 23:00:12)

As an American who's lived in China for about 2.5 years, I agree with Prof. Roberts that this kind of thing is common in China. In my more cynical moments (I try to keep those to a minimum) it seems like many people are only interested in "friendship" with me so they can ask me for a favor, something they often do quite soon after initiating the "friendship". I also would be fine with a straight-up proposal for an exchange, but that is often not how it goes. Even a request after some kind of hospitality would be OK ,though this may also seem a bit weird to me, depending on the details. It seems like I just don't have the background assumptions about how reciprocity works that the Chinese do. I think Prof. Roberts is also right that it has to do with poverty. In poor societies, highly local cooperation is a major source of social and material resources, and these norms become internalized. People from developed countries are more willing to make less binding social relationships, because the marginal benefit of an additional relationship is much smaller. The fact that you see the same norms in Taiwan suggests to me that norms like this are sticky; they outlast the economic conditions that gave rise to them (just an armchair hypothesis, for what it's worth). I should mention that I have several very good Chinese friends, whom I'm happy to help anytime.

seth (2009-06-02 07:15:29)

In my brief experience in China, this sort of thing is rare. What is much more common is sort of the reverse: Where people are friendly when it seems to me they have nothing to gain from our friendship.

## Moral Stages in Different Countries (2008-11-26 15:43)

Speaking of cultural psychology, right after I wrote [1]this I read [2]this – George Packer complaining that the moral development of Wall Street executives resembled the moral development of two-year-olds. He noted that Swiss and Japanese financial executives were further along.

Great post, Mr. Packer. My question is: Why?

1. <http://www.blog.sethroberts.net/2008/11/26/reciprocity-in-china/>

2. <http://www.newyorker.com/online/blogs/georgepacker/2008/11/the-moral-stage.html>

Charles (2008-11-28 01:04:06)

A couple of years ago, I had business that brought me to Shanghai a few times. I don't like cities at all, and I don't like breathing air that I can actually see, but I fell in love with the place. Well, maybe not the place itself, but being there. Unlike Phoenix, in Shanghai, and in China in general, there is so much there, there. In Shanghai, you could feel the energy of Asia being sucked there as if Shanghai was the center of a giant cultural and economic whirlpool. There is nothing like it in the United States. It makes even NYC seem like an interesting, but rather slow-moving and self-involved little town. I'm not saying I'd move there, but there is nothing like China on the planet now other than China, if there ever was. If you have not been there and experienced it, you cannot know what the world is really like, because China is more of the world than you can imagine if you haven't been there.

Shayne (2008-11-28 07:22:29)

Those are all good websites that you mentioned and I'd like to mention two others. The food review website dianping.com is a marvelous resource, although it's only in Chinese. But it does list the highest rated restaurants and their most popular dishes, so you really only need a little chinese or machine translation to get alot out of it. Also, alljapaneseallthetime.com is a great site with a different theory of language learning especially for east asian languages.

Mariel (2008-12-15 11:53:10)

I've heard of some of those sites. I personally use [www.nciku.com](http://www.nciku.com) because you can start your own account and build vocabulary lists, look up words by drawing them on a character recognition tool and they use more than one source for translating words from english to chinese and chinese to english to make the meaning and usage of chinese words a lot clearer than just looking up a definition in a standard dictionary.

## **Gary Taubes Answers Questions (2008-11-28 14:38)**

Michael Eades has posted [1]Gary Taubes's answers to questions sent in by readers. The first one, curiously enough, concerns China: "How do Asians and others living a seemingly high-carb existence manage to escape the conse-

quences?" Taubes's answer:

There are several variables we have to consider with any diet/health interaction. Not just the fat content and carb content, but the refinement of the carbs, the fructose content (in HFCS and sucrose primarily) and how long they've had to adapt to the refined carbs and sugars in the diet. In the case of Japan, for instance, the bulk of the population consumed brown rice rather than white until only recently, say the last 50 years. White rice is labor intensive and if you're poor, you're eating the unrefined rice, at least until machine refining became widely available. The more important issue, though, is the fructose. China, Japan, Korea, until very recently consumed exceedingly little sugar (sucrose). In the 1960s, when Keys was doing the Seven Countries Study and blaming the absence of heart disease in the Japanese on low-fat diets, their sugar consumption, on average, was around 40 pounds a year, or what the Americans and British were eating a century earlier. In the China Study, which is often evoked as refutation of the carb/insulin hypothesis, the Chinese ate virtually no sugar. In fact, sugar consumption wasn't even measured in the study because it was so low. The full report of the study runs to 800 pages and there are only a couple of mentions of sugar. If I remember correctly (I don't have my files with me at the moment) it was a few pounds per year. The point is that when researchers look at traditional populations eating their traditional diets – whether in rural China, Japan, the Kitava study in the South Pacific, Africa, etc – and find relatively low levels of heart disease, obesity and diabetes compared to urban/westernized societies, they're inevitably looking at populations that eat relatively little or no refined carbs and sugar compared to populations that eat a lot. Some of these traditional populations ate high-fat diets (the Inuit, plains Indians, pastoralists like the Masai, the Tokelauans); some ate relatively low-fat diets (agriculturalists like the Hunza, the Japanese, etc.), but the common denominator was the relative absence of sugar and/or refined carbs. So the simplest possible hypothesis to explain the health of these populations is that they don't eat these particularly poor quality carbohydrates, not that they did or did not eat high fat diets. Now the fact that some of these populations do have relatively high carb diets suggests that it's the sugar that is the fundamental problem.

Tsinghua students are almost all thin, although they eat a lot of white rice (a refined carb). My explanation is that they eat a diet with great variation in flavor. Almost everything they eat is made by hand from scratch – including noodles! – and the choice is staggering (hundreds of dishes easily available at lunch and dinner). They don't eat a lot of sweets, as Taubes says, but because you can lose weight by drinking sugar water, sugar alone cannot cause obesity.

The Filipino graduate student I mentioned in [2] a recent post told me she lost a lot of weight (too much!) when she came here; I attribute it to the novelty and variety of the food. This may be the only time a young woman has told me she lost too much weight without trying. Because Beijing is the capital of China it has lots and lots of Chinese regional food (and the Tsinghua cafeterias do as well). The variety of cheap food available here may be unmatched anywhere else in the world.

Thanks to Dave Lull.

---

cindy (2008-11-29 07:32:11)

Seth, what have you been eating in Beijing? Are you still able to keep up with your diet? I believe it must be hard to find

flaxseed oil there, if you could not find it a Lohao City.

Eugene (2008-11-29 12:46:37)

A few more variables about rice to consider (from a Japanese perspective): 1. Cooking rice isn't like popping bread into a toaster. Japanese rice cooker technology is amazing. But you've got to scoop the rice out of the bag, rinse it (a long-ingrained habit), and wait for it to cook. And then wash the cooker before using it again. 2. As a side-dish, white rice is not flavored. Try chowing down on mashed potatoes with no salt, pepper, butter, milk. Or bread made without salt. 3. Because of government price-support policies, white rice in Japan is expensive. Price signals work not only in terms of demand, but can affect a food's social status, and its "culture of consumption." 4. You eat the whole rice grain—that when cooked expands considerably in volume—not a ground flour made from the rice. The rice grain itself has a unique "mouth feel." 5. There's no equivalent of gluten intolerance with rice. I suspect that the human body reacts much differently to refined rice carbohydrates than to refined wheat carbohydrates and sugars. 6. Chopsticks. Seriously.

seth (2008-11-29 15:46:44)

yes, I've been continuing my diet – I consume a few tablespoons of flaxseed oil every day. I found flaxseed oil at Lahao City just not as much of it as I would have liked. I wanted to buy six bottles but was only able to buy two, even though an employee went to another store to find more.

Gordon McNutt (2008-12-01 17:38:57)

It's true that the Chinese diet has an amazing amount of variety. It stretches belief, however, to think that everybody exploits this variety instead of routinely choosing favourite items on a daily basis. Furthermore, it's my personal observation that other Asians with less varied diets are also almost universally thin – so long as they remain in Asia. Aside from processed sugar and flour, the other thing conspicuously missing from Asian diets is dairy (Indian cuisine does have some exceptions). Have you tried the local ice cream?

seth (2008-12-01 22:55:01)

Good point, Gordon. Let me add that in the Tsinghua cafeterias everything is made from scratch, including noodles. Just as everything was made from scratch in the much-less-diverse American diet back in the 1950s, before the obesity epidemic. I've had some ice cream here but I don't know where it came from. It was vanilla with a lot stronger flavor than American vanilla ice creams. Tsinghua students drink some milk and yogurt.

1 (2008-12-02 20:21:36)

I work in a UC Berkeley cafe and the students eat everything! Healthy and unhealthy, whether or not they are thin.

ChrisC (2008-12-02 21:32:16)

Speaking of lifestyle factors that might contribute to thinness, how common is smoking in China?

Jess (2008-12-04 08:23:58)

Have you heard of the China diet? <http://archive.fortes.com/2006/10/27/chi-na-diet/>

Sophie (2010-06-28 11:24:23)

China is changing quickly. When I was in Shanghai (where the traditional cooking is full of fat and sugar, yum!), a lot of the kids were overweight - and directly after school they would go to their local convenience store and buy more sweets and fat. Furthermore, in China, being fat has historically been seen as a status symbol (you only get fat when you don't do manual labor and sit around munching food all day because you can afford it). Historically, because there were only a few rich people compared to the total population who were near starvation levels, the Chinese were considered a nation of "thin people". Another reason for the fat increase seems to me to be that, because the grandparents are often the ones to take care of the children, and they starved most of their lives (remember the famines under Mao?), they could be making up for their past starvation by feeding their grandchildren too much. Children are considered 'little emperors' and are given as much food as they

can hold. Here's an interesting article on the subject of obesity in china: <http://www.bmj.com/cgi/content/full/333/7564/362>

### **What Makes A Good Student? (2008-11-30 18:37)**

One of my Chinese teachers – the one who sold me my cell phone – said I was a good student.

"Why do you say that?" I asked.

She didn't quite understand the question. "Number 1: You work hard. Number 2: You work hard. Number 3: You work hard," she said.

She had never heard the joke about how to get to Carnegie Hall ("practice, practice, practice"). The joke is one of those convenient and reassuring lies. The real way to get to Carnegie Hall is 1. Ability to play well (based on practice, no doubt). 2. Charisma. 3. Money. See Judith Kogan's brilliant [1]Nothing But the Best: The Struggle For Perfection at the Julliard School for more about this. A few years ago I went to the Julliard bookstore and asked them about this book. They hadn't heard of it!

---

Ryan Holiday (2008-11-30 19:40:23)

The new Malcolm Gladwell book has a good chapter on this. He traces the western and eastern differences on the issue back to rice paddy vs farming culture. It's interesting...

1 (2008-11-30 20:41:55)

One PhD student I met at Berkeley said that she visited Tsinghua as well. I asked her how she survived without knowing the language. She said that her Chinese friends would write down things she wanted to say on an index card. Then she would use that index card to help her communicate with others who couldn't speak English. Seth, I think it's great that someone said you are a good student. I bet you are a great professor, too! When I was trying to learn languages, I would teach myself using books I got from Barnes and Noble, then practice the things I taught myself with other people, including students at Berkeley and my coworkers. It was a great way to learn languages because if I misunderstood something, then others can correct it for me. I really like your blog because it is very uplifting and encouraging. Your view of life is very unique!!!!

zzz (2008-12-01 05:50:28)

That Chinese often think of diligence more highly than usual accounts for the answer of the teacher, I suppose. Hence, I am never considered a good student in my teachers' eyes, though my works are not bad.^

## **3.12 December**

### **How Safe is Melamine? Is This Funny or Horrifying? (2008-12-01 03:26)**

From [1]Natural News:

Up to 90 percent of the infant formula sold in the United States may be contaminated with trace amounts of melamine, the toxic chemical linked to kidney damage, according to recent tests. The FDA's test results, which the agency hid from the public and only released after the Associated Press filed a Freedom of Information Act request, showed that Nestle, Mead Johnson and Enfamil infant formula products were all contaminated with melamine. . . .

Prior to these test results being made public, [2]the FDA had published a document on its website that explained there was no safe level of melamine contamination in infant formula. Specifically, the FDA stated, "FDA is currently unable to establish any level of melamine and melamine-related compounds in infant formula that does not raise [3]public health concerns."

Once tests found melamine in U.S.-made formula products, however, the FDA changed its story. As of today, the FDA has now officially declared melamine to be safe in infant formula as long as the contamination level is less than one part per million (1 ppm).

Astonishingly: The FDA has no new science to justify its abrupt decision declaring melamine to be safe!

I would have loved to have been a fly on the wall when that decision was made.

1 (2008-12-02 12:28:12)

I am surprised that with all the things you have to do, you still have time to read a lot. How do you have time to juggle all the stuff you have to do? I always wondered ever since I read "self experimentation" because you were able to have a life and record a lot of stuff about yourself for your research.

Genevieve Long (2008-12-02 12:32:49)

China Admits Nearly 300,000 Infants Hurt by Melamine <http://genevievelong.wordpress.com/2008/12/03/china-admits-nearly-300000-infants-hurt-by-melamine>

Mark (2008-12-02 23:38:41)

It stands to reason that there is some level of melamine that is safe. For instance, one molecule per lifetime is probably safe. Two is probably safe. And how many babies have died? Six, the Chinese say. So let's say it's really 60. And let's say that 6,000 received some meaningful injury of some sort that will manifest itself in the future. No, let's make that 60,000. How many babies drank the milk? Probably 60 million. So the conclusion is that only 1 in 1,000 babies was harmed by the melamine in Chinese milk. So there is in fact a safe level, and it seems to be way more than 2 molecules per lifetime. I like the fact that the FDA is coming up with some number, however much of a guesstimate it is. The alternative is to give activists ammunition to make unreasonable demands to make the milk 100.0000 percent free of anything that might speculatively shorten your life by 1 second. This is kind of a pet peeve of mine because of mercury-in-fish activism by ocean conservationists. As a resident of Japan it is bumblebees-can-fly clear that eating an order of magnitude more fish than anyone ever eats in the U.S. is not harmful (and you should probably be reaching the same conclusion in China by now). Yet the FDA's previous screwup in pulling a low methyl mercury number out of a hat has caused fish eaters/sellers no end of problems and has scared the public away from eating a very beneficial food in favor of manufactured soyburgers. [Exercise left to the

student: Try to follow up on Genevieve's source in the previous comment. You'll learn a lot about activist misinformation tactics.]

Sol (2009-09-18 05:28:49)

breastmilk has no melamine.

## **Self-Experimentation on Someone Else: Alzheimer's Disease (2008-12-01 14:55)**

From the [1]St. Petersburg Times:

After two weeks of taking coconut oil, Steve Newport's results in an early onset Alzheimer's test gradually improved says his wife, Dr. Mary Newport. Before treatment, Steve could barely remember how to draw a clock. Two weeks after adding coconut oil to his diet, his drawing improved. After 37 days, Steve's drawing gained even more clarity. [The three drawings are shown in a photo.] The oil seemed to "lift the fog," his wife says.

. . .

He began taking coconut oil every day, and by the fifth day, there was a tremendous improvement.

The wife took her husband's treatment into her own hands, just as I tried to [2]improve my sleep myself – it was self-experimentation in that sense.

This is related to [3]my omega-3 research in that it is another example of a fat having highly beneficial brain effects.

2. <http://repositories.cdlib.org/postprints/117/>

3. <http://www.blog.sethroberts.net/category/nutrition/omega-3/omega-3-directory/>

---

peter (2008-12-01 16:12:17)

FWIW, when i took coconut cream (which is very hi in coconut oil) my results of computing simple mathematical problems increased. (see <http://maxi.kabutz.net/>, Maxi Maths with GWT) I didn't keep track so i can't tell you by how much it increased, but i noted at the time that i was surprised.

1 (2008-12-02 12:22:27)

I started taking flaxseed oil a few weeks ago. I drink 1 tbsp a day. I put it in some water before I drink it. I think it has helped my depression. I feel a lot better, like the edge has been taken off.

Nathan Myers (2008-12-02 19:39:18)

I wonder if having taken flaxseed oil regularly actually interferes with correct nerve function, such that it is restored immediately but only temporarily after a dose. This would correspond to an addiction / withdrawal response. I don't think it's likely, but it seems possible, and easy enough to check. To check, you would have to find somebody not taking it and measure them, and then measure immediately after the first dose, and again after they've been taking it for a while, to see what the correct baseline is. Right?

Kevin (2009-04-12 08:09:27)

Healthy Fellow has a great blog post: <http://www.healthyfellow.com/208/coconut-oil-and-alzheimers-disease/>

### Unfortunate Obituaries: The Case of David Freedman (2008-12-02 14:59)

One of my colleagues at Berkeley didn't return library books. He kept them in his office, as if he owned them. He didn't pay bills, either: He stuck them in his desk drawer. He was smart and interesting but after he failed to show up at a lunch date – no explanation, no apology – I stopped having lunch with him. He died several years ago. At his memorial service, at the Berkeley Faculty Club, one of the speakers mentioned his non-return of library books and non-payment of bills as if they were amusing eccentricities! I'm sure they were signs of a bigger problem. He did no research, no scholarly work of any sort. When talking about science with him – a Berkeley professor in a science department – it was like talking to a non-scientist.

David Freedman, a Berkeley statistics professor who died recently, was more influential. He is best known for a popular introductory textbook. The work of his I found most interesting was his comments on census adjustment: He was against adjusting the census to remove bias caused by undercount. This was only slightly less ridiculous than not returning library books – and far more harmful, because his arguments were used by Republicans to block census adjustment. The undercounted tended to vote Democrat. The similarity with my delinquent colleague is the very first line in [1]Freedman's obituary: He "fought for three decades to keep the United States census on a firm statistical foundation." Please. A Berkeley statistics professor, I have no idea who, must have written or approved that statement!

The obituary elaborates on this supposed contribution:

"The census turns out to be remarkably good, despite the generally bad press reviews," Freedman and Wachter wrote in a 2001 paper published in the journal *Society*. "Statistical adjustment is unlikely to improve the accuracy, because adjustment can easily put in more error than it takes out."

There are two kinds of error: variance and bias. The adjustment would surely increase variance and almost surely decrease bias. The quoted comments ignore this. They are a modern Let Them Eat Cake.

Few people hoard library books, but Freedman's misbehavior is common. I [2]blogged earlier about a blue-ribbon nutrition committee that ignored evidence that didn't come from a double-blind trial. Late in his career, Freedman spent a great deal of time criticizing other people's work. Maybe his critiques did some good but I thought they were obvious (the assumptions of the statistical method weren't clearly satisfied – who knew?) and that it was lazy the way he would merely show that the criticized work (e.g., earthquake prediction) fell short of perfection and fail to show how it related to other work in its field – whether it was an improvement or not. As they say, he could see the cost of everything and the value of nothing. That he felt comfortable spending most of his time doing this, and his obituary would praise it ("the skeptical conscience of statistics"), says something highly unflattering about modern scientific culture.

For reasonable comments about census adjustment, see Eriksen, Eugene P., Kadane, Joseph B., and Tukey, John W. (1989). Adjusting the 1980 census of population and housing. *JASA*, 84, 927-943.

1. [http://www.berkeley.edu/news/media/releases/2008/10/20\\_freedman.shtml](http://www.berkeley.edu/news/media/releases/2008/10/20_freedman.shtml)

2. <http://www.blog.sethroberts.net/2007/08/08/something-is-better-than-nothing-part-2/>

---

Dennis Mangan (2008-12-03 10:01:15)

You seem to be saying that Freedman was a bad person because you disagree with his view on censuses and because republicans agree with him. You think it obvious that he was wrong, but I don't see anything obviously wrong with it.

seth (2008-12-03 13:31:13)

"Bad person"? No, bad behavior. You're right, Dennis, that he was wrong might not be obvious to a someone not professionally involved with estimation – and I suppose at least a few statistics professors even agreed with him. (But when I brought up Freedman's position with my friends who were statistics professors, they agreed with me.) That's why I gave a citation with a detailed explanation of why his position was wrong. No one doubted that the census undercounted some people more than others. Freedman was against fixing this so that you could no longer predict who was undercounted. Suppose a store systematically overcharged you. What would you think of someone who opposed solving the problem using the best methods available so that, on average, you were charged the correct price? That Republican politicians agreed with him is not part of why I dislike his behavior. It was why his behavior was influential.

Ed (2008-12-03 14:44:15)

Seth, He may have been a bastard, he may have been ideologically blinded. But the time to address those issues was when he was alive. Obituaries are romanticized for the benefit of the survivors. –Ed

seth (2008-12-03 15:41:37)

Ed, I made these points when Freedman was alive, too. Many times. I hope you're not saying no one should criticize a dead person or the culture that produced him. I'm not saying he was a bastard or ideologically blinded, certainly not. For all I know he was a Democrat. The problem with the obituary is not "romanticization". My point is not that Freedman did this stuff but that other professors saw this as okay, even good. My point is about the culture, in other words. It is one reason academia is called the ivory tower. Romanticization in obituaries is fine. Romanticization would have been to leave the census stuff out of the obituary. Freedman did a lot of perfectly good other stuff.

Ed (2008-12-04 09:16:11)

Seth, I didn't mean to say that one shouldn't criticize the dead. And you didn't call Freedman a bastard. Anyone's obituary, bastard or ideologue is romanticized. I think I understand now. The issue is the "Census Stuff" that should have been frowned upon and challenged, wasn't, even worse it was celebrated in his obituary. Didn't get that on first or second reading of the post, maybe I need more flaxseed oil. Anyway, thank you for your posts on academia. –Ed

Jas (2008-12-18 01:40:32)

It is not clear if census adjustment would have reduced bias (at the cost of variance) as you state. Indeed my bet is that David Freedman is correct: model adjustment would have made the bias worse. The issue is not one of just random sampling. Much model based extrapolation was being proposed. The devil is in the details, and vague gestures do not an argument make. A hint of the complexity is that by the 2000 census the partisan impact of the undercount was probably the reverse of what you conjecture. For the purposes of apportionment, the south west (e.g., states like Texas) would have gained Congressional seats and hence electoral college votes at the expense of the north east. So, a correction would have been a win for the Republicans in national elections. Note that apportionment counts illegal immigrants, although they cannot vote. Much like many academics, the political parties took their positions based on weak evidence and held their ground even when the facts shifted. Of course the scientific issue is that the undercount is difficult to fix and who is being undercounted is constantly changing. The problem is more difficult than calculating the partisan impact, and most people can't even get that part right.

seth (2008-12-18 17:52:49)

Jas, where is it argued that census adjustment was more likely to increase bias than reduce it? I have never heard that argument nor do I understand it.

Asad Zaman (2008-12-20 17:46:16)

Freedman argued that census adjustment would introduce bias of unknown magnitude. He proved this by following essentially the same methodology but making minor changes, and showing that substantial differences would arise in the adjustment. As Jas says, the devil is in the details, which must be understood here to follow what is going on. Following the census, there is a survey which attempts to measure the undercount which occurred in the census. This survey itself is subject to the same undercount problem as the census. A fundamental assumption which makes adjustment possible is that these two undercounts are INDEPENDENT. Freedman argues that this is not true – a person who is undercounted in the census is also likely to be undercounted in the subsequent survey. This makes eminent sense. If there is correlation between the undercounts, this will lead to bias in the adjustment. How large this bias can be is assessed in the paper cited below, which shows that it is likely to be so large as to make the adjustment worse than useless. K.W. Wachter and D.A. Freedman. “The fifth cell: Correlation bias in U.S. census adjustment.” *Evaluation Review*, vol. 24 (2000) pp. 191–211

Terry Weadock (2008-12-30 20:49:18)

I don't think anyone is disputing whether biases exist in the census adjustments. On any given census you can be sure that it will be biased one way or another depending on the methodologies used. Given the likelihood that undercounts are correlated, I agree with Mr. Zaman, Wachter and Freedman, in that the adjustments are likely “less than useless”. *taw*

seth (2008-12-30 22:01:00)

Terry, you wrote “given the likelihood that undercounts are correlated” – I don't think anyone disputes this either. This is the puzzle behind Freedman's criticisms: he seemed to equate lack of perfection with uselessness. I haven't read the Wachter and Freedman yet, but I will, and then after that maybe I will understand Freedman's criticisms better.

Tom in TX (2008-12-31 13:20:44)

Once the decision is made to adjust the census results, the adjustment will be just one more political issue. There is no guarantee that unbiased statistical methods will be used. Do you think the average (or above-average) Congressman understands the difference between variance and bias? Would he even want to? All he has to know is how to get his party's statisticians on the committee that does the adjustments. On a related question, how would everyone feel about using statistical methods to adjust the vote totals in elections? The arguments would be similar. A lot of people don't vote, we could get a more accurate outcome with adjustment. Right?

Mike (2009-01-12 18:24:12)

To summarize: you read Freedman's conclusions about the census in the obituary, decided they were self-evidently false without reading the arguments supporting them, and concluded that he was a bad and/or dishonest statistician. Now there's good science!

seth (2009-01-13 11:46:45)

Mike, I knew about Freedman's census ideas long long before his obituary. Asad Zaman, I've now read the citation you gave. You are wrong when you write “a fundamental assumption that makes adjustment possible is that these two undercounts are INDEPENDENT.” The assumption that makes adjustment possible is that the two undercounts are not PERFECTLY CORRELATED. Which is far more plausible. Wachter and Freedman, as far as I can tell, ignore this point. No sane person ever thought census adjustment would eliminate bias; they merely thought it was more likely to reduce it than increase it.

Mike (2009-01-13 15:32:57)

<http://www.stat.berkeley.edu/users/census/612.pdf> provides detailed arguments explaining how census adjustments can be harmful. Your rhetoric is not just to disagree with Freedman, but to claim the conclusions are “ridiculous.” If you want to take

the scientific high ground, say something about the actual arguments in the paper.

seth (2009-02-16 22:57:41)

Mike, thanks for the reference. I've read that paper. Before I read it I understood that adjustments are inevitably inaccurate and thus increase the variation of the final estimate. Their value is that they are more likely to decrease bias than to increase it – at least, this is the heart of the argument for adjustment. Going on and on about whether the adjustments increase or decrease "accuracy" as that paper does is just a distraction.

Asad Zaman (2009-04-28 20:31:01)

Technically you are right that there is a possibility of adjustment when the sample/resample undercounts are not perfectly correlated. Practically speaking, I do not know of any census adjustment schemes which allow for and adjust for such dependence. Erikson-Kadane et. al (EK). whom Freedman was arguing against, did assume independence in producing their adjustments. It is strange that the central issue: whether or not an adjustment will produce a more accurate count, is viewed as a distraction by you. I propose to subtract random numbers to adjust the census – this is likely to improve the census, since it is known that there is an undercount. EK proposed a scheme which, as Freedman demonstrated, was essentially equivalent. He showed this in three different ways. A: Following exactly the same methodology, but using an alternative series to the one picked by EK (out of 18 equivalent series) produces seriously different adjustments. B: Changing some of the theoretical assumptions (in particular independence) required for the adjustments to more plausible ones, leads to seriously different numbers for adjustment. C: "Shrinkage," the Bayesian methodology for producing adjustments used by EK requires specification of a prior distribution. This is elegantly finessed via the empirical Bayes method actually used by EK, where prior assumptions are hidden at a deeper level. By changing these, one can arrive at substantially different numbers. In particular, someone who knows the game well can produce numbers which favor one state over another or to suit his own political preferences.

seth (2009-04-29 07:34:44)

"Whether adjustment will produce a more accurate count." As I said, to talk about "accuracy" is confusing. Accuracy has two components: variance and bias. Adjustment will very likely increase variance and reduce bias. The EK scheme was "equivalent" to a scheme where you "subtract random numbers"? Another confusing statement. Random numbers can be anything.

Mike (2009-05-14 09:34:19)

Seth, As you say, adjustments will likely increase variance and reduce bias. A large increase in variance may not be worth a small reduction in bias, so it is not clear that adjustments are a good idea. To talk about "accuracy" is simply to talk about the net effect, which is what we care about. It seems much more misleading to focus on only one component at a time.

seth (2009-05-14 13:43:24)

Mike, the average person doesn't know there are two components. Lumping them together under the name of "accuracy" glosses over the question of how to weight them. I don't see how it is misleading to say that adjustments will likely increase variance and reduce bias. Complicated, yes, misleading, no.

Mike (2009-05-14 17:32:03)

Seth, You initially claimed that it was "ridiculous" to recommend against trying to remove bias. It is not ridiculous if the attempt to reduce the bias increases the variance so much that the mean squared error increases overall, which is exactly what the quote (and the paper) from Freedman says. I bring up mean squared error since that is the thing of which variance and (squared) bias are components. Freedman didn't say "mean squared error" since the average person would not have understood that. Instead he said "accuracy." The misleading quote from you is "He was against adjusting the census to remove bias caused by undercount. This was only slightly less ridiculous than not returning library books." You have offered no argument for this statement; Freedman on the other hand, offers a detailed argument for his position in the paper cited.

seth (2009-05-14 21:57:49)

Mike, your "mean squared error" is only one of an infinity of ways of combining bias and variance to get an overall measure of goodness/badness. Given that we value fairness (lack of bias) more than uniformity (lack of variance), it is hardly an obvious choice. Freedman's idea that his particular relative weighting of bias and variance was so sure – on such a "firm statistical foundation" – as to not need mentioning or discussion, that no reasonable person could disagree, really does resemble not returning library books in its self-centeredness. For more about why I thought Freedman's position resembled not returning library books, read the rest of the post.

Mike (2009-05-15 00:00:14)

Seth, Mean squared error is indeed arbitrary, as is the notion of variance itself. That is not the main point. The main point is that pretty much however you would like to define "total error," it is possible to increase the total error while reducing bias (unless the only thing you care about is bias, in which case what you want to do is pick a really random sample of one person). Freedman argues that this actually happens, for a reasonable (and conventional, though arbitrarily so) measure of total error, when the usual techniques are applied to adjust the census. You are claiming, I think, that the bias-reduction benefits of census adjustment outweigh the costs of increasing other kinds of error. This isn't self evidently true or false. Freedman has given some reasons for believing it is false. What are your reasons for believing it is true?

seth (2009-05-15 06:35:15)

Mike, no I'm not claiming that. I'm claiming that it was a bad idea to omit the bias/variance distinction when discussing the "accuracy" of the census and the effects of adjustment. In a certain way I agree with you. It doesn't necessarily resemble not returning library books to claim the census shouldn't have been adjusted. If someone made clear the bias/variance difference and explained their relative weighting scheme – why they chose to weight bias like this and variance like that – that would be reasonable. I saw nothing like that in Freedman's writings.

Mike (2009-05-15 08:51:49)

Section 14 of the paper discusses estimation of bias and variance from adjustment methods, and makes explicit that they are being combined in the conventional way: by adding the squared bias to the variance to get mean squared error. Maybe mean squared error is not the right way to measure accuracy, but it's not like Freedman invented it just to make his argument! In fact, he's responding to arguments in favor of adjustment which also cast the discussion in this framework. For better or for worse, most of the common statistical tools (mean, variance, regression) are closely tied to MSE. At least, MSE has the virtue that the random and systematic errors can be separated additively, which makes it a lot easier to discuss their relative contributions. If, for example, we were primarily interested in mean absolute error, another reasonable candidate, we would have no nice way to decompose it into systematic and random parts, and "variance" (MSE of an unbiased estimate) would have no particular importance. So, if your criticism of Freedman boils down to "he used MSE without justifying it" – I agree he is guilty of that, along with most of the rest of the statistical profession. However, it doesn't seem to justify the harsh words in your original post.

Seth's blog » Blog Archive » How Much Should We Trust Clinical Trials? (2009-07-02 20:32:25)

[...] Kolata also quotes David Freedman, a Berkeley professor of statistics who knew the cost of everything and the value of nothing. Perhaps it starts in medical school. As I blogged, working scientists, who have a clue, don't want to teach medical students how to do research. [...]

## **Making a Living in China (2008-12-03 13:44)**

Several buildings are being built on the Tsinghua campus. At least one woman makes a living as a prostitute among the construction workers. She is known as Qikuaiban, which means seven and half yuan (about \$1). The name came about when she offered her services to a worker, he said, "All I have is seven and a half yuan," and she accepted that payment.

## [1]Happiness in China: Who wants to be a construction worker?

1. <http://www.blog.sethroberts.net/2008/11/12/happiness-in-china-who-wants-to-be-a-construction-worker/>

---

1 (2008-12-03 15:44:10)

I met a prostitute on the streets of San Francisco many years ago and she was very interesting to talk with. She told me a lot about her life. She told me to buy clothes at this one store called "Hong Kong Fashions." She told me the clothes there are for ladies and are in style. That is where she buys her clothes. I've been shopping there for 4 years! I always get great compliments on my clothes from Hong Kong Fashions, but it is expensive there. I believe it is worth it, though. The sales lady there always remembers me.

pd3 (2008-12-04 08:19:48)

putting the victorian era assumptions to the side for a second, isn't it a little sad that this woman is called "one dollar"?

Aaron Blaisdell (2008-12-04 08:52:51)

I guess over here we would call her a "dollar whore" (play on "dollar store"). Thank you, come again!

seth (2008-12-05 06:57:06)

pd3, yes that is why I posted this: because it is sad.

1 (2008-12-05 23:06:02)

when i was homeless in san francisco, i wanted to get into the sex business. i had contemplated being a prostitute and the prostitute i met in san francisco became a really good friend of mine. I met her several times while she was walking the streets and she told me how to get into her line of work. but i was afraid because it was illegal, but if it was a legal "job," i think i would have tried it. i met a "madame" who wanted me to join her group of girls. i met the madame when i was homeless at the lark inn, a homeless shelter for young adults in san francisco. what i am trying to say is that maybe it seems sad to you, but maybe if you talked with the lady, you would think otherwise. maybe she has a good reason to be a prostitute and call herself "Qikuaiban." Before I left san francisco to travel to boston, i almost learned how to be a stripper! being homeless in san francisco is one of my best memories....

## Marxism Studies at Tsinghua University (2008-12-04 16:26)

All Tsinghua undergraduates are required to take four Marxism-related classes to graduate; next year the requirement will be reduced to three classes. A friend told me about her Marxist philosophy class, which she thought was pretty interesting:

- There is no homework. No reading, no papers.
- If there will be a final, it hasn't been mentioned.
- The teacher doesn't take attendance. Now and then he calls on students to answer questions and if the student isn't present, this is noted.

My friend, who is a member of the Communist Party, couldn't suppress a smile when she told me about the lack of homework.

Andy McKenzie (2008-12-04 16:57:01)  
Seth: is your blog banned in China yet?

### **Bike Culture in Beijing (2008-12-05 07:27)**

The Tsinghua campus is really big so everyone has a bike but bikes are very prevalent elsewhere as well. In several ways the surroundings have been shaped by this:

- Bike mechanics scattered around campus. There are about seven of them. Fix your bike instantly. Also sell spare parts – locks, seats, baskets, and so on.
- Huge bike lanes. On the road from the subway to where I live, the three lane road is divided into one shoulder lane, one lane for bikes, and one lane for cars. The appearance is that the bike lane is twice as wide as the car lane. The effect of these huge bike lanes isn't trivial: I feel safe.
- Bikes parked everywhere. At big stores, parking attendants charge 5 cents/bike. Payable when you leave.
- Discarded bikes. Near the subway station is a pile of 20-odd bikes. About once a year discarded bikes are removed from the Tsinghua campus.

---

1 (2008-12-05 23:43:27)

i like public transportation because i have a discount pass and in the bay area, i usually just pay half the regular fare. even for the bart, i get a big discount. in one of your blog entries, seth, you wrote that one sunday morning you were going to go with your friends to see some leaves change colors at a famous place. then some buses passed by and they were packed! so maybe in beijing the public transportation is bad. when i am on the berkeley campus, going home, the #51 bus going down bancroft st towards the bart station is almost always packed with students going to shattuck, same place im going. i just try to squeeze in!!! i used to carry around a rolling backpack, but because i travel via public transportation so much and i have to squeeze in places all the time, i just use a backpack. but it is so heavy...now that i carry around my laptop. but the pluses of carrying my backpack outweigh the minuses....and i try to travel light but because i buy things for people on the way, i wish i still could bring around my rolling backpack! reminds me of when i was homeless in boston, massachusetts and i was standing with my homeless friend at harvard university. we were looking at one of our homeless companions who slept outside the coop (the bookstore near harvard), and he had all his stuff piled up and my homeless friend said, "now that's not traveling light!" and we both laughed. when i was homeless, i laughed a lot more and was happier when i had nothing. now i have a job and money and i am more anxious than ever. but i am getting better slowly...flaxseed oil helps me. better than cod liver oil... hey seth, maybe you could have lent me your really supercool scooter before you left for beijing???? and one thing i'd like to add about the flaxseed oil...i'm not as sleepy in the morning as i used to be.

Sean Abrahams (2008-12-12 14:27:17)

I've been riding my bike to get around everywhere in San Francisco for near five years. It's been encouraging to see the increase in bicycle riding here and the culture around it, but the experience of biking in San Francisco leaves much to be desired. The SFBC (San Francisco Bicycle Coalition, a non-profit bike advocacy group) has done a good job of lobbying for bicycle infrastructure improvements, but as a daily bike rider the progress hasn't been fast enough. The main problem is safety. Striped bike lanes creating a false sense of safety and separation as opposed to physically separated bike lanes through the use of curbs (see Stockholm, Sweden). Lack of driver education that bicycle infrastructure improvements help everyone (bikes get out of the way of cars and vice versa, making both safer). I hope China continues to support infrastructure for bicycles such as you have highlighted here. I feel that bicycle infrastructure improvements are a bit of a chicken and egg problem here in San Francisco. The city would be more interested in providing improvements if there was more demand (and thankfully demand is growing), but who's going to ride a bike when they don't feel safe while riding? I'm of the belief that in this case, if the city were to provide the appropriate infrastructure we will see demand and use skyrocket. Thanks for the observations.

Quercki M. Singer (2008-12-14 08:24:28)

Sean Abrahams said "who's going to ride a bike when they don't feel safe while riding? I'm of the belief that in this case, if the city were to provide the appropriate infrastructure we will see demand and use skyrocket." That's right! Oakland has a bike advocacy group with a blog about the latest developments (What's the latest on bike access around the new Kaiser building?) <http://www.walkoaklandbikeoakland.org> (I'm html-challenged, so I put their link in the "website" section of the comment form. One of them ought to be clickable. )

### **The Blog of a Girl Who Killed Herself (2008-12-05 13:11)**

In November, a Tsinghua undergraduate killed herself by jumping out of a building. She kept a blog. After her death, a friend of mine read her blog – as did a few thousand other people – and told me it was full of sadness. My friend, a Tsinghua student, was puzzled that the friends and family of the dead girl had read her blog and done nothing. Will you translate some of it for me? I asked my friend (who translates other things for me). She begged off. I was puzzled: Surely the girl had wanted others to read what she had written, I thought.

I found another translator. After a few minutes of translation I had to stop: It was unbearably sad, maybe the saddest writing I've ever come across. I could see why my friend didn't want to translate it.

Here is one entry. It takes the form of a questionnaire:

Question 1: Which student phase [primary school, middle school, high school, college] do you miss the most?

Answer: High school. Get together with a lot of friends. I know where I should go, even if it turns out to be wrong.

Question 2: Talk about your current life.

Answer: Listless. Feel half asleep. Do not want to wake up. I want to kill the people who wake me up. I love this world. I live for my goal.

Question 3: Do you have dreams? What are they?

Answer: I have many dreams. Make a movie . . . performance art [she was an art major].

Her [she was ga y]. Forgive me. Dream this day will come. Believe.

Question 4: Which kind of friend do you like best?

Answer: Any kind is fine. Understanding me a prerequisite.

Question 5: Could you give up going back to your hometown to be with your parents, to be with your lover?

Answer: No.

Question 6: What do you most want to do right now?

Answer: Sleep, dream. Find her . Just dream, do not want to meet anyone.

Question 7: Up until now, what is your happiest event?

Answer: I didn't lose my past.

p.s. I don't want any blessing. [A custom/game among Chinese teenagers is that after you answer a few questions you are "blessed" by your questioner.] Wish everyone happiness. Don't ask me these boring questions again.

News of the girl's death was posted on the student forums. What was the response? I asked my friend. Most of the comments were "Bless," she said. The English word bless. That's a customary thing to say when you learn someone has died.

---

1 (2008-12-06 00:12:42)

interesting you put this post. i actually had thought of attempting suicide last monday because i hate my job at uc berkeley and i don't want to work. can you believe it? everytime i come across suicidal ideation i tell people and nobody does nothing. i just never tell my therapist when i feel this way because he'll put me in the hospital! and then i'll end up in the psych dept at my regular hospital and have to face all the doctors and psychologists and nurses who had seen me doing so well in the past. i can't face them when i had been doing so well and then all of a sudden want to hurt myself. i would feel so embarrassed... once when i wanted to hurt myself, i went to boston university er and the nurse sent me back out and said, "you're not gonna drown in the charles river, it's frozen." (it was winter and i was new in town and i wanted to commit suicide by falling into the charles, a river next to MIT) although i've seen some of the best doctors and know some wonderful psychologists and lcsw, i've never once gotten a convincing answer to my question: why should i not kill myself? i'm not suicidal anymore, but like my anxiety, the desire to hurt myself always comes back. it has haunted me for 10 years now.... i don't mean to offend anyone, but this blog entry you wrote, seth, does not seem sad to me....

Anthony (2008-12-07 09:17:48)

1, you might want to read these 2 books, they might have some useful ideas: [http://www.amazon.co.uk/How-Master-Anxiety-Overcome-Obsessions/dp/1899398813/ref=sr\\_1\\_1?ie=UTF8&s=books&qid=1228666131&sr=8-1](http://www.amazon.co.uk/How-Master-Anxiety-Overcome-Obsessions/dp/1899398813/ref=sr_1_1?ie=UTF8&s=books&qid=1228666131&sr=8-1) and [http://www.amazon.co.uk/depression-Fast-Human-Givens-Approach/dp/1899398414/ref=pd\\_bxgy\\_b\\_text\\_b](http://www.amazon.co.uk/depression-Fast-Human-Givens-Approach/dp/1899398414/ref=pd_bxgy_b_text_b) If you hate

your job, it might be a source of a lot of stress for you - and it might make sense to instead find something that you love doing, where you can also make money at it.

1 (2008-12-07 08:25:55)

I had a conversation about Jane Jacobs with professor emeritus Michael B. Teitz, at Berkeley. It must have been a twenty minute conversation and I am interested in reading more about Jane Jacobs. Seth, how come you like Jane Jacobs so much? I remember the day when Seth gave a book talk in San Francisco, at Stacey's bookstore. On his blog, he mentioned that he had wanted a book by Jane Jacobs. But after the talk when he wanted to buy it, the book was gone! I learn a lot of stuff on this blog that help me talk with other professors at UC Berkeley. I like how your mind works, Seth.

peter (2008-12-07 15:27:32)

i read only part of the Gladwell critique, but it sounds like blinding envy to me; Gladwell is brilliant (IMO) and i always listen/read what he has to say.

Tom (2008-12-09 23:23:42)

When I lived in London, I concluded that British envy is different from American envy. An American might say, "I'm every bit as good as him - I deserve a promotion!" The Brit will say, "He's no smarter than I am - he should be demoted!"

John (2008-12-10 01:33:35)

I'm sure there's much that can be disputed in Gladwell's books. But to claim, as the Gladwell Critique does, that the message of the newly published Outliers is simply that genius takes hard work is a ridiculous distortion. The thesis of the book is rather that success has much less to do with individual merit-understood as natural talent or ability plus hard work-than we generally like to believe, and much more with to do with factors external to the individual: parental upbringing, culture, random opportunity,

and arbitrary advantages. This is not a trivial claim, and it is well worth discussing, especially in America. I can't say now whether Gladwell accurately reports all the social science he relies on, but I found *Outliers* a very thought-provoking book. (See also his related piece in the current *New Yorker*.)

## Self-Experimentation and Strength Training (2008-12-07 17:42)

From [1] Marilia Coutinho, a competitive powerlifter and researcher:

There are two distinct approaches to achieving the "special maximum strength" observed in certain meets: the extreme stress-driven performance, with a lot of screaming, hitting and other means of enhancing alertness and stress response, and the focused approach. The latter is less common.

With the help of a more experienced and accomplished lifter, I came to adopt the focused approach about a year and a half ago. We called it the "white chair thing". Basically, I spent the moments preceding my turn to lift facing the back of an available white plastic chair, emptying my mind. It is hard to claim this is the one or chief reason why my performance leaped to another level, I broke a couple of national and continental records and visibly improved. There were other factors involved.

After this event, however, I started systematically searching for evidence in the literature. Besides a very old article from decades ago showing competent Olympic lifters performed [more] mental rehearsal of their lifts [than] less competent ones, there was very little published material. The search brought me to martial arts techniques. . . .

I spent one year . . . learning qigong in a tai-chi-chuan program. During this one year, I was frustrated. My performance was irregular, mediocre at competitions and my injuries were a real impediment.

About three weeks after I quit tai-chi-chuan, however, I started applying some qigong techniques in weight training. The results impressed me. I want to create a self-experiment on this and record my results. . . . This might be of great help to many athletes who still believe they need a lot of stress enhancing devices to achieve good marks.

1. <http://www.istadia.com/blog/marilia05/372>

---

1 (2008-12-07 19:44:35)

Perhaps trying self experimentation to solve my psychiatric problems might be more beneficial than I ever realized. When I come across cognitive behavior therapy techniques, therapists try to get you to write things down and solve the problem in a scientific way. That is what they want, but it's up to you to actually do it. If I remember correctly, in Seth's self experimentation paper, the researchers who commented on his technique noted that he could have come to his discovery faster if he had discussed more of it with others, instead of just doing it mostly alone. It took him 20 years of self experimentation before writing that research paper. I have many psychiatric problems which modern doctors cannot solve or cure, but maybe self experimentation is the only way I can solve them..... I read in a magazine that Britney Spears has bipolar disorder. She is working on a "comeback." With all her money, she did not quit working and try to depend on money from the government for the rest of her life. Her psychiatric disorder did not stop her from continuing to be a contributing member of society and I feel that people aren't looking down on her because she is mentally ill. I don't know if she will gain weight on her meds, or

experience other problems like that with trying psychiatry as a way to solve her mental problems, but she is so strong and seems so stabilized even though she just started this psychiatric journey. I believe once you start those psych meds, it's gonna be really hard to stop, and perhaps you can never stop....stopping them abruptly can be dangerous to your health. I really am impressed with Britney, as she is my age, and her ability to function with her mental illness as if she were normal, has really inspired me.

iStadia (2009-04-09 01:50:36)

Hi Marilia has continued her self-experiment and it has been interesting to follow. Following on from the comment by "1" about writing things down, there are quite a lot of therapeutic techniques that simply involve writing about one's condition. I attended a conference a couple of years ago and they were researching the effects of writing from a number of different motivational perspectives (using the states from Reversal Theory) and this was proving to be highly effective because one of the common aspects of mental conditions tends to be a level of 'stuckness' and being able to articulate different perspectives on the situation helps people to become 'unstuck'. The same can be said of using art, and the 8 states of Reversal Theory have been used to create an '8 Rooms' technique whereby patients 'visit' the room that they need according to their emotional state. Once initiated, I guess a lot of this can be thought of as self-experimentation, to some degree.

### **What Happens When a Professor is Wrong? (2008-12-08 01:23)**

In [1]an article in the Financial Times, Nassim Taleb and Pablo Triana write:

Risk methods that failed dramatically in the real world continue to be taught to students in business schools, where professors never lose tenure for the misapplications of those methods. As we are writing these lines, close to 100,000 MBAs are still learning portfolio theory “it is uniformly on the programme for next semester. An airline company would ground the aircraft and investigate after the crash” universities would put more aircraft in the skies, crash after crash.

Years ago, a cousin of mine was fond of saying something similar. He was majoring in English at UCLA. He didn't think much of his professors. "What happens when a professor is wrong?" he would ask. "When an engineer is wrong, the bridge falls down. When a doctor is wrong, the patient dies. What happens when an English professor is wrong?" The answer, of course, was "nothing". Now we will find out what happens when finance professors are wrong.

Thanks to Dave Lull.

1. <http://www.ft.com/cms/s/0/4f86d422-c48f-11dd-8124-000077b07658.html>

---

Igor Carron (2008-12-08 03:02:22)

Seth, I made a similar point recently with the eye of a nuclear engineer: <http://nuit-blanche.blogspot.com/2008/10/trust-but-verify.html> In particular, in no other engineering fields, one would have been allowed to go on for so long without some sort of risk mitigation strategy. As you know, risk is not just the probability of something happening but the product of that probability and the consequences that it entails. With that in mind and the fact that we already had near collapses before (LTCM) I am at loss to see how this is not taught and more importantly enforced at some level. In the Nuclear Engineering curriculum, we have specific classes dedicated to risk analysis and to the study of all previous accidents. After their studies, folks can either go into design/production/safety analysis or in regulation enforcement. In the world described in this NYTimes, it looks like everybody

goes into "production". None of the best minds seem to choose enforcement as there is no incentive in the system for that. Igor.

seth (2008-12-08 05:55:21)

That's a good way to put it, Igor. I read your post and I have a question: In the phrase "trust but verify" what does "trust" mean?

James (2008-12-08 08:24:16)

I think "trust" means you don't assume bad faith, but you have to "verify" because it's too important to leave to good faith assurances.

Igor Carron (2008-12-08 09:23:28)

James does a good job of defining it. I think Reagan stole the sentence from Thatcher. In the context I use it, the phrase was coined when the U.S and the then U.S.S.R were checking on compliance for a treaty (maybe SALT II). It took the form of U.S. teams going to the U.S.S.R to check if a specific missile was being dismantled and vice versa. The warheads were not destroyed per se but the teams were somehow making sure that the missile being dismantled in front of them was not made of dummy warheads. Trust was even further boosted when the foreign team would decide by the flip of the coin which missile to check and find out that indeed it was what it was supposed to be. Igor.

Timothy Beneke (2008-12-08 11:17:13)

Part of the problem is that "experts" have trouble evaluating the state of their knowledge and thus, how seriously they should take their claims. Gary Taubes has made it clear, to me at least, that nutritional "experts" way over-authoritize themselves and know far less than they claim. If you read what 19th century astronomers have to say about the universe the problem is not that they don't know more given their tools, but that they take what they say with far too much confidence. Economics really is the dismal science, grounded totally in correlations and fancy math and theories. No one should take their theories too seriously. Or think of very smart psychoanalysts who thought they could perceive psychological causality and construct the truth of why people have psychological disorders – it was all nonsense. Part of the problem is social-psychological: people in positions of authority have trouble saying, "The truth is I don't know, but this is the best I can do right now." They would lose their authority if they told the truth, both in their own eyes and the eyes of others...

seth (2008-12-08 16:42:42)

James, would someone who believed only "verify" act differently than someone who believed "trust but verify"? The term "trust" seems to have no concrete consequences.

James (2008-12-08 20:39:49)

Seth: Assuming bad faith is likely to get you a lot less cooperation from the people you're trying to correct. In some cases, eg a police investigation you have the power of law backing you up, but in most others you are at least somewhat reliant upon the behaviour of the people you're investigating. If you don't make it clear you trust them, they're far more likely to become hostile and hinder you. The [1]Wikipedia guideline covers it a bit more, though not as much as I thought it did.

1. [http://en.wikipedia.org/wiki/Wikipedia:Assume\\_good\\_faith](http://en.wikipedia.org/wiki/Wikipedia:Assume_good_faith)

seth (2008-12-08 22:08:43)

Thanks, James, but I'm still having a hard time visualizing what you are talking about. When Reagan said "trust but verify" what did he do that showed he "trusted"? If you don't like the Reagan example, choose another example of the use of that phrase.

igor Carron (2008-12-09 04:51:57)

Seth, In the case I was mentioning, there were all sorts of possibilities to cheat the other party. In effect, you could not have the other party's warheads in your hands or in your labs. In fact you could not even see them when inspecting the site. You could only see the missile in which they were hosted and the only information you had was the one you derived from your own instruments that you brought with you. In other words, if your detectors were detecting something you thought was a

warhead then it was a warhead, even though you did not actually have an absolute proof of it. Furthermore, you were bringing your own instrumentation in that foreign country and as you know, the detector tells people more about what you know and don't know. As you can see, in a hierarchical layer of secrets and goodwill, a simple Yes or No from a written document couldn't enforce that trust. In the end, with all the verification they allowed the other party to perform, they still had to resort to some type of trust. Now that i think about it, the argument resembles very much the zero-proof knowledge argument explained by Bernard Chazelle in this Nature paper: <http://www.cs.princeton.edu/~chazelle/pubs/nature07.pdf> In other words, trust comes from the ability to ask several questions to one's satisfaction without ever knowing the underlying proof. Reagan used the term, I think, to differentiate it from the generic trust imparted by treaties signing where only accidents would reveal non-compliance by some parties. Igor.

Timothy Beneke (2008-12-09 11:31:13)

A bit of humor in the form of an aphorism from the Sufi tradition: Trust in God, but tie your camel first.

Nansen (2008-12-09 16:29:19)

A bit of anecdotal evidence. I went to a talk titled "The Role of Statisticians in Quantitative Finance before and after the Crash", given on November 5th by an adjunct professor at UC Berkeley. The talk was mostly about how great portfolio theory was. The only mention of the crash was about how lucky the speaker was to have left a local risk management firm just weeks before the crash.

Seth's blog » Blog Archive » Cornell President Says Ivy League Schools Teach Students "To Think" (2008-12-09 17:01:02)  
[...] What Happens When a Professor is Wrong? [...]

seth (2008-12-09 20:41:34)

Thanks, Igor

Anthony (2008-12-09 21:07:22)

When English Professors are wrong, you can get very damaging affects in your culture. Not nothing.

seth (2008-12-10 05:22:29)

Anthony, my cousin meant there is no corrective feedback when English professors are wrong. But in any case your comment is intriguing. What are the "very damaging effects"?

Anthony (2008-12-11 11:17:08)

Well, the study and promotion of literature is a central aspect of a society's culture. When you have a bunch of English Professors buying into, say, bad psychology, this ripples out into the culture at large, causing dysfunction (i.e., pain, suffering, sadness, anxiety, and so on) where it need not be. When doctors are wrong, a patient can be harmed. When figures in or related to literature are wrong, a culture or people can be harmed. There is an effect, and so there is potential corrective feedback, but there might not be as much of a sense of responsibility in the latter ...

Stephen M (Ethesis) (2008-12-12 17:14:25)

One of the real problems is that the applied statistics crowd and the time and motion guys were so successful, across genres and disciplines. All economists since have wanted to make the same kind of splash, to be experts in all areas like the major textbook writers once were (mostly due to specialized math skills that got them involved in NASA and a lot of other areas). Interesting, isn't it, how much of what is taught is really the trend or fad of the month (so to speak) rather than science.

## Cornell President Says Ivy League Schools Teach Students "To Think" (2008-12-09 17:00)

President Nixon made some anti-Ivy-League comments. [1]Here is how one Ivy-League college president recently responded:

David Skorton, the president of Cornell, was apprised of Nixon's comments over the phone. "My mouth is open," Skorton said, after the line went quiet. "Gosh, what a negative thing to say. Ivy League schools, like all good universities, teach people to think and to reason, and why would anyone be against that?"

To think and to reason. Now and then I'd hear a Berkeley professor say he taught his students "to think". When they'd say it to me I'd ask what they meant by thinking. It always turned out that they meant critical thinking, seeing what's wrong with this or that. Never appreciative thinking. This was like a flight school teaching take-offs but not landings. It also always turned out that they were teaching their students how to be like professors—teaching professorial job skills, in other words. To call those job skills "thinking" was like saying the world ended at the nearest river. Sure, their job involved thinking but other jobs also involved thinking, of a much different sort – were they not aware of this?

david (2008-12-09 22:38:39)

They also say that Latin "teaches you to think", so obviously "teaches you to think" is just another way of saying "is useless". Useless, however is useful as a class marker since it declares to the world "I'm so rich, I can afford to spend all this time and money on something useless" (see Paul Fussell's *Class* which in turn cites Veblen). I think Fussell even talks about Nixon...

Seth's blog » Blog Archive » When is Science Helpful? (2008-12-10 05:18:41)

[...] Cornell President Says Ivy League Schools Teach Students "To Think" [...]

seth (2008-12-10 05:26:01)

David, that's a great point. The next time someone says he teaches his students to think I will say, "I've heard learning Latin teaches you to think."

Aaron Blaisdell (2008-12-10 11:26:41)

I'm a Psychology professor at UCLA. I teach a large lecture course on learning, a seminar on animal cognition, and a lab course on animal learning and cognition (a rat lab). In the seminar and lab course in particular, I try to teach the students to approach science as a problem solving task in an analytical manner (i.e., I try to teach them to think critically). But in my view, critical thinking is a balancing act between being open-minded yet skeptical. I often will present them with some experimental results that have been published and attempt to lead them Socratically through a process of interpreting the results in a theoretical context and then to lead them to evaluate these hypotheses and attempt to generate alternative explanations. Finally, I try to lead them through guided discussion to think about how they could test the alternatives and what kinds of evidence would support each of the alternatives. I try to get them to see how some types of evidence can be ambiguous in that it can support more than one alternative, whereas other types of evidence can more clearly discriminate among the alternative hypotheses by making differential predictions. I am attempting to provide a forum where they can discover the process of interpreting observations, generating multiple hypotheses to explain those observations, and then to attempt to devise manipulations

(interventions) that could discriminate among the alternatives. I also tell them that failure to support hypothesis A but supporting hypothesis B does not mean that A is wrong and B is right. It suggests this, but really further tests and theoretical development is needed. And it is an organic process (i.e., it is dynamical, subject to constant revision, and often wrong for the right reasons, right for the wrong reasons, and occasionally right for the right reasons). And finally science is a human endeavor and humans have foibles and biases and constraints which all play out in doing science. But rather than throwing the baby out with the bath water, I hope to instill in my students a sense that this is one of the best processes we have for advancing our understanding of the world. There will always be setbacks, but there will be successes, too. Finally, if all else fails, I hope to impart some sense of excitement and thrill in doing science and in thinking in an open-minded yet skeptical manner. AND I'm not saying I do all this, I attempt to do this. And I hope I'm at least somewhat successful.

Ben Casnocha (2008-12-10 14:31:54)

Seth, what do you mean by: "It always turned out that they meant critical thinking, seeing what's wrong with this or that. Never appreciative thinking." By "appreciative thinking"?

Gordon McNutt (2008-12-10 17:41:25)

In your previous post the quote from Nassim Taleb tries to make the point that even critical thinking is not being taught. But in the defense of teachers, it is hard to teach people to think. Sometimes I wonder if we are really designed to do it, let alone teach it. I did, however, encounter a wonderful method of learning to think (at least about a large class of problems) while I was an undergrad. It involves a computer, a program known as a compiler, and thousands of lessons in failure. There's nothing like being certain you're right and then proved wrong over and over again. I'd recommend the method to everyone, but be warned: it turns some people into extreme skeptics.

seth (2008-12-10 20:00:15)

Aaron, thanks for the detailed description. What is missing from your course, in my opinion, is detailed examination of what can be learned from this or that study. What ideas are ruled out or made less likely, for example. How this or that study was an improvement over what came before. What difficulties the authors overcame. That sort of thing. At Berkeley there was a weekly meeting called Animal Behavior Lunch. Each week we would read and discuss a recent animal behavior paper. The graduate students were terrible at seeing the value of the paper under discussion. All they could do was find fault. Week after week after week. They never understood what they were failing to see. The faculty were much better but the behavior of the graduate students reveals the extreme bias in their education.

Aaron Blaisdell (2008-12-11 11:51:16)

Hi Seth, You're right, I forgot to mention "what can be learned from this or that study." I do cover this though perhaps I should be more explicit and systematic in class. I also forgot to mention that I put the experiments under discussion in the socio-historical context in which they were conducted. Too often I see either insufficient or no presentation of background information that motivates a focal study. I also notice that graduate students and sometimes postdocs are worse at this but more senior scientists seem to be better. I think a lot of this has to do with how we learn to take the perspective of others and get better at knowing what they need to know.

## **When is Science Helpful? (2008-12-10 05:18)**

Last spring, fourteen Chinese students from elite universities – seven from Tsinghua – traveled to several elite American universities, including Stanford, Harvard, and Yale, under the auspices of [1]a program called IMUSE to discuss sensitive Chinese social topics, such as Tibet or censorship. One of the main events was panel discussions. The American students struck the Chinese students as admirably pragmatic but also in some cases "ignorant and arrogant". In response to American students' criticism, one Chinese student said this: "I eat a lot of rice. My ancestors ate a lot of rice. If you tell me to eat a lot of bread, I don't know what to eat. I don't know how to get a healthy diet."

When I heard that comment, I said it was exactly right. Nutrition is perhaps 75 % science, 25 % religion. (The discovery of vitamins = science. [2]Thinking the obesity epidemic is due to lack of exercise = religion.) The science part is helpful, the religious part is useless or, if taken seriously, harmful. Nutrition science is too uncertain to choose over the tried and true. Physics is almost 100 % science. The stuff in physics textbooks has been used to build lots of useful stuff: buildings, bridges, computers. Economics and political science are perhaps 25 % science – too little to rely on their recommendations, which was the Chinese student's point. Better to rely on tradition. No one tells the American students any of this, however, and they believe far too much of what their professors tell them. (So much for all that teaching how "[3]to think and to reason.") The result is they give foolish advice.

At [4]Edge, four American experts tried to answer the question "Can science help solve the economic crisis?" Here is a bit of what they said:

Two basic assumptions must guide any thinking as we undertake these tasks. First, economies, financial institutions and markets cannot function without a context of rules and laws, which regulate them. . . . Second, mathematics, physics and computers already play a major and necessary role in our economic affairs.

They believed such statements are helpful. Nassim Taleb responded:

I spent close to 21 years in finance facing "scientists" in some field who show up in finance and economics, realize that economists and practitioners are not as smart as they are (they are not as "rigorous" and did not score as high in math), then think they can figure it all out. Nice, commendable impulse, but I blame the banking crisis (and other blowups) on such "scientism". . . . Meanwhile the most robust understanding is present among practitioners who do not have the instinct to reduce ambiguity and uncertainty that scientists have. . . . Please, please, enough of this "science". We have enough problems without you.

The Chinese student and Taleb are both saying that Big Ideas from elite American universities do not automatically improve on what people elsewhere have done for a long time. Weston Price and Jane Jacobs said the same thing. Somehow elite universities fail to teach this important lesson – perhaps because their professors haven't learned it.

Thanks to Dave Lull.

Sean Brown (2008-12-10 13:45:56)

FA Hayek made a very similar point in *The Constitution of Liberty*. Over the generations, the original reasons (which may not have even been the "correct" ones) for a traditional practice are often forgotten. In trying to innovate, the "arrogant scientists," unable to think of good reasons for the traditions or norms, often assume they are unnecessary or even backward.

Nathan Myers (2008-12-10 21:13:14)

Is physics really 100 % science? Up until, say, 1980, it was close. How about modern physics, which is to say string theory? It's hard to say if there's any science there at all. There's still plenty of physics to be elucidated, e.g. in the realms of plasma and solid states, but not many people are working on these. The mathematics are unpleasantly messy.

seth (2008-12-11 04:12:45)

I agree Nathan, that's why I said "almost" 100 % – because of questionable work on string theory.

Nathan Myers (2008-12-11 17:46:05)

OK, but as I understand it, string theory is what most physics departments are doing nowadays. I wonder if psychologists are doing more actual science, these days, than physicists. What percentage of what psychologists do nowadays counts as science?

Seth's blog » Blog Archive » China and Tibet: The Other Side (2009-10-05 16:47:35)

[...] Yes, Chinese students are brainwashed about this. (When I googled "Tibet slavery" and tried to follow the links, all of sudden nothing worked.) But the smartest among them know more about it than smart American students who have been brainwashed the other way. Here's what one of them told me about the Chinese side of the argument: [...]

jonathan (2009-10-24 14:27:47)

Economists turn their chins up at PoliSci types To put economics and political science in the same epistemological league just denigrates both.

Nathan Myers (2008-12-13 00:51:14)

I'm curious about how much of mental illness is directly caused by people silently repeating a statement over and over to themselves. Most of such statements are false or indeterminable, of course, but I suspect even true statements would cause

trouble. This is a culturally encouraged behavior in many settings, particularly religious ones. Has anybody looked into this, that you know of?

seth (2008-12-14 02:31:23)

I don't know of anyone looking into that.

### **What's Appreciative Thinking? (2008-12-12 05:21)**

[1]Ben Casnocha asks what I mean by appreciative thinking. A good question, since I invented the phrase. To learn appreciative thinking is to learn to appreciate, to learn to see the value of things. More or less the opposite of critical thinking.

That I had to make up a phrase shows the problem. I have complained many times about an overemphasis on critical thinking at universities. Sometimes I'd say, "Have you ever heard the term appreciative thinking? No? How many times have you heard the term critical thinking?"

When it comes to scientific papers, to teach appreciative thinking means to help students see such aspects of a paper as:

1. What can we learn from it? What new ideas does it suggest? What already-existing plausible ideas does it make more plausible or less plausible?
2. How is it an improvement over previous work? Does it use new methods? Does it use old methods in a new way? Does it show a better way to do something?
3. Did the authors show good taste in their choice of problem? Is this a problem both important and possibly solvable?
4. Are details done well? Is it well-written? Is the context of the work made clear? Are the data well-analyzed? Does it make good use of graphs? Is the discussion imaginative rather than formulaic?
5. What's interesting or enjoyable about it?

That sort of thing. In my experience few papers are worthless. But I've heard lots of papers called worthless.

The overemphasis – the total emphasis – on critical thinking has big and harmful consequences on graduate students. At Berkeley, in a weekly seminar called Animal Behavior Lunch, we would discuss a recent animal behavior paper. The dozen-odd graduate students could only find fault. Out of hundreds and hundreds of comments, I cannot remember a single positive one from a graduate student. Sometimes a faculty member would intervene: "Let's not be too negative. . . ." But week after week it kept happening. Relentless negativity caused trouble for the graduate students because every plan of their own that they thought of, they placed too much emphasis on what was wrong with it. Trying to overcome the problems, their research became too big and complicated. For example, they ran control groups before obtaining the basic effect. They had been very poorly taught – by all those professors who taught critical thinking.

1. <http://ben.casnocha.com/>

---

Jim N (2008-12-12 08:03:42)

The word "critical" has two meanings. In the phrase "critical thinking" it means "with careful examination", whereas the popular meaning of "critical" is more along the lines of "finding fault". I think you are conflating the two meanings. When someone says that a Melville course emphasizes critical thinking, they are not saying it's a course where we figure out what's wrong with Moby Dick.

Darrin Thompson (2008-12-12 08:46:52)

The opposite of critical thinking is lean thinking. Lean is identifying value \_first\_, then removing waste that impedes the value stream. Learning to think lean is often described as "learning to see." It has been around for decades and needs no inventing.

Ben Casnocha (2008-12-12 10:32:35)

Thanks for clarifying, Seth! It seems one way to paraphrase your definition is: "To learn to appreciate the positive aspects or lessons to be had from something."

seth (2008-12-12 14:22:50)

Jim, you're right. I haven't spoken to any English professors about this. When someone says that a Melville course emphasizes critical thinking, what do they mean by critical thinking?

Stephen M (Ethesis) (2008-12-12 16:56:09)

This is a great post, it has gotten me thinking. For me "appreciative thinking" means to extrapolate and cross-link from the concepts presented. It is important to succeeding with derivative approaches and analysis.

Anthony (2008-12-13 14:50:48)

Philosophy departments are similar - presentations are followed by a barrage of critical questions attempting to find what's wrong with the paper. Rarely do people ask questions or make comments with the intent of finding or focusing on what's right with it (except that what remains, implicitly, might be right). I think this behavior probably stems in part from attempts to increase status ...

Glen Davis (2008-12-14 10:23:09)

Too few academics can say: "the research is good but not perfect" - too many instinctively say, "the research is not perfect and is thus bad." After reading your post I stumbled across an example of appreciative criticism from the middle of the last century. I offer it to you in case you should ever need an example. At the end of a book review T. W. Manson observed "While it must be said that Mr. Lund has overdriven his thesis in many directions, it must still be admitted that he has a thesis. There are clear cases of the kind of arrangement he describes." (from T. W. Manson's review article of Nils Lund's *Chiasmus* in the *Journal of Theological Studies*, 45 (1944), page 85. It's available online at <http://jts.oxfordjournals.org/cgi/reprint/os-XLV/177-178/85-b> if your institution has a subscription. You can also see the Manson passage quoted at the top of [http://books.google.com/books?id=mmz1Wm3XlvcC&pg=PA47&lpg=PA47&source=web&ots=Au9gals7iH&sig=zlg-S8WojxpmPQKI47Fr7WuQmpk&hl=en&sa=X&oi=book\\_result&resnum=1&ct=result](http://books.google.com/books?id=mmz1Wm3XlvcC&pg=PA47&lpg=PA47&source=web&ots=Au9gals7iH&sig=zlg-S8WojxpmPQKI47Fr7WuQmpk&hl=en&sa=X&oi=book_result&resnum=1&ct=result), which is where I found it)

Andrew Gelman (2008-12-14 13:50:08)

There's a balance: we're highly appreciative of our own work and highly critical of everybody else's!

Evelyn (2008-12-14 17:13:59)

It sounds like you haven't heard of Appreciative Inquiry: <http://appreciativeinquiry.case.edu/> I agree it's easy to forget to look at the good. It's probably a side effect of the decision making bias that we feel losses twice as much as gains.

Paddy Carter (2008-12-15 12:59:40)

Seth, This is an idea very close to my own heart. In my experience, the best academics are good appreciative thinkers. I expect you have no inclination to do so, but I wrote something along these lines a while back called [1]'the fallacy of clever objections' which was about people being so busy picking holes they don't stop to appreciate what's there, which you might like to read.

1. [http://docs.google.com/Doc?id=dc3hb973\\_1984ptc4nfd](http://docs.google.com/Doc?id=dc3hb973_1984ptc4nfd)

jack (2008-12-15 13:33:50)

You're being pretty critical of critical thinking...

RSaunders (2008-12-15 14:46:41)

Ah, somebody beat me to the appreciative inquiry idea. This seems like a big deal in human/community/organizational development and coaching/counseling/consulting psych. I think it captures much of what you're after.

Mandolin (2008-12-15 15:38:22)

A term that has already been coined on this subject is "value finding". I first heard about it in the personal development sphere. Appreciative thinking sounds like another way of saying the same thing. Get this. I've read and agree that people tend to view things as on a continuum from -10 or so to positive 10. So they can see something as being a -2 or so on a scale. Not good. Pretty bad actually. (See I'm being critical). When actually, many of these things being measured can not go below a 0 in value. There is always some degree of value or thing worth appreciating there. One can apply this shift in the value continuum to many facets of life. On a side note, I found the last sentence to be somewhat ironic because the word "poorly" is critical! Caught in your own game, admit it! One could shift this to an appreciative statement by saying perhaps, "Learning critical thinking is one aspect of appreciative thinking so in order to fully develop their logical analytical skills graduate students will have to build on the groundwork already paved by their critical thinking professors." Or something like that. I appreciate that you are thinking about this with regards to academics because similar discussions have cropped up recently with regards to job performance and personal development. It's killing me that I can't remember the book I read about it in. Here is a resource you might find entertaining. <http://philosophersnotes.com> He is offering free yearly access to 25 philosophersnotes. (I'm don't work for them, I just think you may "appreciate" this)

Etl World News | Assorted links (2008-12-15 15:55:19)

[...] 1. Appreciative thinking [...]

Peter Boettke (2008-12-15 17:31:27)

Seth, In Nelson and Winter's Evolutionary Economics (Harvard, 1981), they distinguish between "appreciative theory" and "formal theory". While not identical to your notion of "appreciative thinking", it is attempting to get at something similar but at the level of the scholar himself/herself and our enterprise in general. Pete

Adam Forni (2008-12-15 19:28:12)

Great post Seth. Academia is not the only realm affected by over-negativity, in my opinion. It's popular to "bash" these days. Critical thinking is essential, but we should also be able to extract some kernel of worthwhile information from every single life experience.

Jlm N (2008-12-17 15:34:50)

Seth, I think that the meaning of "critical thinking" in an English Lit course is what you are describing as "appreciative thinking". It's a way of saying that students will be expected to say more about the subject than "awesome" or "it sucked". They will be expected to recognize it as an artifact of a time, an author, and a culture. What's Melville doing when he spends dozens of pages on detail of whale butchering? Is it meant to be taken literally, or is he saying something else, and if the latter, was he

successful? That's critical thinking, in the Western academic school of thought. There are different schools of criticism, though, within and without academia, and some works are more or less suited to one or the other.

Evelyn (2008-12-18 14:30:43)

And here's another example of appreciative thinking: <http://positivedeviance.org/> As seen in the NYTimes ideas article this week. Look for how excellent people act, and emulate them.

Sean Murphy (2009-12-20 01:35:29)

Seth: Evelyn has already suggested two good frameworks for appreciative thinking, let me suggest one reference for each that are useful for employing them in a problem solving context. The Thin Book of Appreciative Inquiry <http://www.amazon.com/Thin-Book-Appreciative-Inquiry-2nd/dp/0966537319> The "Positive Deviant" article by Ed Dorsey in the November 2000 Fast Company has a clear codification of Sternin's approach <http://www.fastcompany.com/magazine/41/sternin.html> In one of those weird synchronicities I had blogged about this here <http://www.skmurphy.com/blog/2009/12/15/early-customer-conversations-use-appreciative-inquiry-and-amplify-positive-deviance/> One other thing I started to do about three years ago was to count my blessings by posting endorsements on LinkedIn for folks that I had worked with in the past and either had a shared success with or come away impressed from our interactions. It's another way to encourage yourself to appreciate people's strengths and contribution to your own successes. I very much enjoy your blog and your disciplined approach to self-experimentation. "Knowledge comes by taking things apart: analysis. But wisdom comes by putting things together." John A. Morrison

Mickey Schafer (2009-12-21 06:34:46)

Hi, Seth. I entered into my MA program very much in the hard-nosed tradition of critical thinking. The school I was attending, The School for International Training, was a very different place. One of the profs recommended that I read Peter Elbow's "The Believing Game", an essay published in 1972 in the appendix of his wildly popular book "Writing without Teachers". This essay was instrumental for me as a social scientist and teacher. Here is an updated version, a 2008 essay in which Elbow has re-cast his concept as "Methodological Believing" - it's very much like what you're advocating in Appreciative Thinking; I hope you find it useful! [http://works.bepress.com/cgi/viewcontent.cgi?article=1019&context=peter\\_elbow](http://works.bepress.com/cgi/viewcontent.cgi?article=1019&context=peter_elbow)

Levi Stahl (2009-12-21 08:00:03)

This reminds me of baseball writer Bill James, from whom I learned a lot about critical thinking when I was young-but who also went out of his way to emphasize that even a player who is bad in some aspect of the game might still offer value in other areas that is sufficient to make him a good player. It's a good principle to keep in mind in a lot of areas of life.

Floyd B. Pishko (2009-12-21 08:21:52)

Seth, I totally agree. I went to grad school in international development economics, and one big reason why I'm not working in the field is because I have partially lost the ability to have optimism in development initiatives. Grad school taught me to be so critical of every idea that it's hard for me to see what might work and think that 95 % of efforts are wasted. Help, please!

q (2009-12-21 09:49:54)

nice post - i just added your blog to my RSS because of it. i'd posit that most creativity is because of mistakes. most people are focused on learning from their own mistakes but it's considerably less painful to learn from others' mistakes. academia and business have an obnoxiously strong ethic about covering up failed work. can you publish a paper which shows all the approaches you tried but did not get a result? can you even publish a paper which shows the approaches that tried and failed only to succeed on the 20th try? no, you omit the mistakes. i think that's unfortunate.

Tyler S (2009-12-21 10:27:35)

Well done! I think you're touching on a deeper point. It's very easy to I.D. problems, yet exponentially tougher to solve them. WHY you like (or dislike) some piece of work takes actual thought. Thinking is hard work.

caveat bettor (2009-12-21 14:10:17)

This reminds me a bit of DeBono's Six Thinking Hats, of which the Yellow Hat represents appreciative thinking and the Black Hat with finding fault. DeBono's thesis is that undue influence of the Socratic/Platonic/Aristotelian methods that ideas and values are too easily made extinct in the darwinian nature of competing ideas, arguments, etc.

Sid (2009-12-21 16:05:07)

In the 60's Richard Niebuhr, younger brother of Reinhold, encouraged a version of appreciative thinking to his grad students at Yale. His advice was to pay more attention to a comment that sees value, less to one that sees only fault. I think his point was that fault finding is more about scoring, less about discovery.

anotherpanacea :: Appreciative Thinking (2009-12-21 22:00:03)

[...] I've been having a debate on a friend's Facebook page about the value of Martha Nussbaum (I'm a fan) and serendipitously I found this post on "appreciative thinking" via Tyler Cowen. It's a kind of inverted critical thinking, from Seth Roberts: When it comes to scientific papers, to teach appreciative thinking means to help students see such aspects of a paper as: [...]

Rafe Champion (2009-12-22 19:24:30)

Appreciative writing is a useful task for second and third hand dealers in ideas when major figures have become forgotten or neglected because they were out of step with the fashions of their time or have been benched for various reasons. Like changes in fashion and failure to do the academic and entrepreneurial networking that is required to keep their ideas alive (see Selgin on the failures of Menger and Bohm Bawerk and Ian Jarvie on Popper). Other examples of neglected major figures are: Ian D Suttie (1889-1935) who could have radically changed the course of psychoanalysis in a more scientific and humanistic direction. Jacques Barzun (1907 - ) a towering figure in education, cultural studies and the history of ideas. Rene Wellek (1903-1995) arguable the leading figure in literary scholarship of the 20th century. Yvor Winters (1900-1968) who explored the many and various ways that irrationalism is promoted by defective theories of literature with particular reference to American novelists and poets. Karl Buhler (1879-1963), a pivotal figure in psychology and linguistic studies, driven out of Austria in 1938 into academic obscurity in the US and scandalously written out of the history of psychology by academic rivals. Profiles of the above figures (and others such as Bill Hutt and Peter Baur who were marginalised until picked up by the Austrians) can be found in the four editions of the Revivalist series. <http://www.the-rathouse.com/Revivalist.html>

Thomas Robinson (2009-12-22 19:41:42)

Whether you criticise or praise a paper, to do the job well you have to start by taking it seriously. This means assuming the content is true and trying to imagine what are some of the implications. If the implications are absurd or contradictory then your approach will be considered critical. If they are novel and interesting then you will be considered appreciative. But it's basically the same process either way. And either way you do honour to the paper.

Simon Bostock (2009-12-27 03:00:03)

Great post. I have my own version of this called Benign Gullibility ("Hey, this new idea looks spiffing! I wonder what happens if I base my life on it?" - for a few moments or so) but I like yours better and might steal it. Three things: 1. The first two comments made me so cross, I wrote a post criticising them. 2. The rest of the comments more than made up for them. 3. Just in case, I strongly recommend following all of Sean Murphy's reading recommendations. Ace. I wonder if you could develop your Appreciative Thinking by working on developing an ability in and an awareness of the Semantic Pause?

Josh Joseph (2009-12-28 22:22:03)

Seth, agree with so many here – this is a great post and also ages well. I had a prof in grad school who understood this and was able to get it across very effectively. Will share it on the chance it may be helpful to others. The prof was editor of a leading psych journal and taught a course in reviewing. Students were given papers that had been previously submitted to

the journal and on which editorial decisions had already been made...only we didn't know the results. Our job was to read, critique/appreciate and then decide whether to accept or reject each submission. Needless to say, we were all good at finding flaws in everything. But the real lesson came when we had to say "in or out." Although we could find faults and flaws in literally everything, we saw that the litmus test for acceptance was whether the paper made a meaningful contribution to the field..warts and all. That really stuck with me. Recently came across George Box's quote "All models are wrong, some are useful," which is even more succinct. – jj

seth (2009-12-28 23:19:44)

Josh, that's a good way to teach it. I'm amused that it was called a course in reviewing. That's like calling a course in arithmetic "how to add 5 and 6". The skills are far more useful than just making you a better reviewer. An editor would be more likely than the rest of us to teach such a course because of the access to rejected manuscripts.

### **A Book About Scientific Failure (2008-12-12 14:49)**

Failure: the last taboo subject. I loved [1]Selling Ben Cheever, a book about a series of low-level service jobs that Ben Cheever took after he left Reader's Digest and couldn't sell his third novel. In the introduction, Cheever noted that no one wanted to talk to him about what it was like to lose a job and have to start over. [2]How Starbucks Saved My Life by Michael Gates Gill is another excellent book along those lines. (Curious that both authors are the sons of well-known writers, John Cheever and Brendan Gill.)

Now comes a scientific third-person account of failure: [3]Sun in a Bottle by Charles Seife, about attempts to produce nuclear fusion in the lab.

Seife's message: fusion scientists should just cut bait. By analogy to your closet, if you haven't worn it, throw it out. If you've been trying it for the last half-century and it hasn't worked, then enough already.

According to its subtitle, the book covers "the science of wishful thinking." Was it wishful thinking or avoidance of the f-word? I will have to read the book to find out, it sounds fascinating.

1. <http://www.archipelago.org/vol5-3/cheever.htm>

2. [http://www.usatoday.com/life/books/excerpts/2007-09-17-starbucks-saved-my-life\\_N.htm](http://www.usatoday.com/life/books/excerpts/2007-09-17-starbucks-saved-my-life_N.htm)

3. <http://www.nytimes.com/2008/12/14/books/review/Finkbeiner-t.html?8bu&emc=bu>

---

Stephen M (Ethesis) (2008-12-12 16:47:50)

Well, fusion is different in that many people think it is just a matter of engineering – kind of like using light to make computers. Predicted in the 40s and 50s, finally getting engineered. The other thing is that predictions of how much longer it would take,

back in the early 1970s before they even had a first bottle attempt, were between 20 and 100 years. I read through all the congressional reports for the era (for another project) and the debate and estimates were quite interesting. We don't have Mars mission, and they've been working towards one for forty years. Should they just cut bait? Or is it predictable engineering and cost issues? Does that make sense? I'm not sure they are right, but why they feel the way they do makes a lot of sense.

Stephen M (Ethesis) (2008-12-12 16:54:46)

Oh, I should add that the "long time" position won out, for the purposes of planning national energy policy. I'll have to pass on how well the executed on the planning (/sigh), but at least they realized in 1972 that fusion was not going to bail them out by the year 2000.

## Self-Experimentation by Anesthesiologists (2008-12-13 15:54)

[1]Notes of an Anesthesioboist summarizes [2]a long report of events a hundred years ago:

Bier pricked Hildebrandt's thigh with a needle. Then he passed a blunt, curved needle into the soft tissue of the thigh. No pain.

He pushed a long needle down to the thigh bone a few minutes later. No pain.

A few minutes after that, he applied the burning end of a cigar to Hildebrandt's legs. (A cigar in the lab...how quaint...)

He pinched a leg (no pain). He pinched the upper chest (lots o' pain).

He yanked body hairs down below, if you catch my drift (painless - eew). He yanked hairs up high ("very painful"). . .

Both of them subsequently developed debilitating post-dural-puncture headaches that lasted for days (much less common with the finer needles used today).

1. <http://anesthesioboist.blogspot.com/2008/12/quincke-and-pain.html>

2. <http://www.anesthesiology.org/pt/re/anes/fulltext.00000542-199808000-00028.htm;jsessionid=J18YnNpvGtn1p78nMLb1ghXB1vD894q8h1Lf1gLzv2vD1GXtQHC!-1157250347!181195628!8091!-1>

Mike Kenny (2008-12-13 23:01:08)

Hahaha-A wonderful combination of very rational and totally irrational! :)

Nathan Myers (2008-12-15 13:15:05)

I sat next to an anesthesiologist on a long flight, once. His advice was, if you ever need general anesthesia, ask for *adenosine*. Its effects completely dissipate in seven seconds, leaving no hint of dopiness behind. (But be sure the surgeon sprinkles in lots of lidocaine while stitching up!) He related a story about his teacher, who had been an insufficiently-trained medic in the Japanese Army, ordered to administer adenosine for an operation, but used a little too much. The patient's heart stopped, and he fainted. When he woke up, a few seconds later, the surgeon had noticed neither his fainting nor that the patient had died, and the patient's heart was already beating again. He stood up and administered the adenosine for the rest of the

operation without saying anything. The story calls attention to another fact of anesthesia: the anesthetist is the only person in the operating room paying attention to whether you're still alive.

### **Alternate-Universe Korean Food (2008-12-14 03:52)**

Near my university is a neighborhood that locals call Korea Town. I like Korean food and last night tried my sixth Korean restaurant in the neighborhood. Unlike the others, the menu had no English; it was in Korean and Chinese. My Chinese friend had little experience with Korean food so the menu puzzled both of us. Finally I asked the waitress what was popular and we ordered that.

I've eaten in Korean restaurants hundreds of times; I've even been in Korea for a week. Our food had no overlap with any Korean food I'd ever had. We ordered three dishes. They turned out to be:

1. Bacon over pea sprouts and onion, topped with a sweet and sour sauce.
2. Bacon wrapped around enoki mushrooms (long and thin) on top of chunks of green and (sweet) red peppers, covered with more sweet and sour sauce.
3. DIY wraps. A big plate of two-inch strips of chicken, carrots, egg yolk, egg white, fish cake, and pea sprouts. You dip them into soy sauce and wrap several of them with a big thin piece of white radish.

No kimchi, no hot sauce, no little appetizer plates. There was a refrigerator full of soju.

It was like stumbling into a piece of science fiction. Some little thing had happened differently in the past and as a result Korean food had turned out differently . . . Can anyone reading this explain it?

---

Chris (2008-12-14 20:56:13)

Hmmm...sounds similar to Japanese "Yoshoku" which translates to Western food. But it doesn't mirror European/American dishes and we commonly consider their 'western food' be Japanese food these days. These are dishes like Om(lette) Rice, Tonkatsu, and curry rice/udon. Apparently they were introduced in the mid 1800s. Perhaps with time they grew to be far less like western food. [http://en.wikipedia.org/wiki/Y %C5 %8Dshoku](http://en.wikipedia.org/wiki/Y%C5%8Dshoku) <http://en.wikipedia.org/wiki/Washoku> Either that or someone just slapped on the Korean food title on their restaurant to make it sound exotic (somewhat like how the Japanese KFC convinced the locals that all americans eat fried chicken for christmas).

mike (2008-12-14 22:30:50)

This is very interesting to me. The fact that there was chinese on the menu indicates it may have been a korean-chinese restaurant, which is literally different than korean food and chinese food. You will find foods on the menu at a korean-chinese restaurant that are not available at strictly korean or strictly chinese restaurants. But you probably know this, as you seem pretty familiar with korean food. The food actually still doesn't sound familiar to me, either. It may be that hearing it described

in English throws me off. Sometimes, if I read the English descriptions on a Korean restaurant, the food will sound disgusting, and then I'll read the Korean name for it, and will realize, "oh yeah, I had that before, it's delicious."

seth (2008-12-14 22:47:44)

Chris, it was unlike any Western food I've had – or did it resemble Japanese versions of Western food. The restaurant was full of Koreans; I assume it was some sort of common genuine Korean food. Mike, I imagine that there was Chinese on the menu because the restaurant is in China. The food wasn't Chinese-like at all; it was vaguely Korean.

Nathan Myers (2008-12-15 11:47:30)

Korea used to be a big place before everybody moved to Seoul. Maybe all the "Korean" you've had before was Seoul style, and this place did dishes from somewhere else.

Vickie (2008-12-15 12:49:14)

I had something like the DIY wraps at a Korean restaurant in MI, however the items were to be wrapped in wilted cabbage pieces instead of thin radish strips. I was told it was popular with older Koreans who ate it when they were younger. There is also a Korean dish, samgyeopsal, that could be related to the bacon items. The sauce in samgyeopsal is certainly not sweet and sour though. Interesting for sure. Just curious, what area/town was this in? There are areas of China with Korean residents that have lived in China a long time. Maybe their Korean food is more traditional and has also been modified over time.

## **Museum of Tap Water (2008-12-15 04:24)**

Beijing has a [1]Museum of Tap Water, I learned from Google Maps. And I thought Seoul's [2]Kimchi Museum was unusual. It isn't the usual museum topic, of course, but as [3]I blogged earlier, tap water is a kind of miracle.

1. <http://german.china.org.cn/english/features/museums/139777.htm>

2. [http://en.wikipedia.org/wiki/Kimchi\\_Field\\_Museum](http://en.wikipedia.org/wiki/Kimchi_Field_Museum)

3. <http://www.blog.sethroberts.net/2008/11/25/the-four-abundances/>

---

Timothy Beneke (2008-12-15 13:10:38)

That's astonishing, given that when I was in China in 2002, there was apparently nowhere public in the country where you could safely drink the tap water – certainly not in the 5 cities I visited. My girlfriend and I stayed in a 5 star hotel in Shanghai where they proudly informed us that we could safely drink the tap water within the hotel. Neither of us trusted them and didn't take them up on it. Have things changed since then? I'm curious as to the motivation or set of assumptions behind the museum... Your blog continues to be well worth visiting...

Museum Resource (2010-01-18 04:57:09)

The Beijing museum of Tap Water is built on the original place of the first water plant in Beijing Zhongzhimen Water Plant. This Museum is great place for visitors.....

## Academic Horror Story (Virginia Tech) (2008-12-15 15:50)

In an undergraduate poetry class, Joe Newbury [1]writes,

The first assignment [was] to write a one-page description of our influences and what they meant to us. I submitted a tongue-in-cheek, but graphic and flamboyantly described list: Jeffrey Dahmer, Ted Bundy, [and] a woman I™d slept with who had a giant mole on her rear end.

After this, his teachers forwarded all his work to the university administration, without telling him (and later denying it). Somehow this forwarded work showed he was dangerous. Eventually a cop told him,

"I believe you are a threat to yourself and to the people around you. If the University is not going to do anything about it, I will."™ She then announced that she was contacting Social Services to have my daughter taken away.

Because of something he wrote in poetry class.

1. <http://truthaboutvtshooting.blogspot.com/>

---

Ryan Holiday (2008-12-15 22:07:58)

To be totally fair, the guy could be a complete weirdo independent of the assignment and then when combined, set off red flags.

Anastasia (2010-04-16 13:01:28)

Just because someone is weird, it does not mean they are dangerous...

## How Bad is LDL Cholesterol? (2008-12-15 20:28)

We all know the term bogeyman – a fictional monster that empowers its inventor. According to [1]Wikipedia, "parents often say that if their child is naughty, the bogeyman will get them, in an effort to make them behave." I always think of the Falkland Islands. In 1982, by acting as if the Argentine invasion actually mattered, Margaret Thatcher got herself a big boost in popularity. In the 1960s, by acting as if Berkeley student protests were dangerous, Reagan got elected president. The day after 9/11, I said my big fear was overreaction. I doubt the persons behind the bombing understood how useful they were to those in power. Bush got a boost in popularity that lasted years.

When it comes to health, cholesterol is one of the biggest bogeymen. [2]Hyperlipid begins [3]a post about LDL cholesterol like this:

You would be forgiven for thinking that the apoB100 protein (which defines the LDL or VLDL particle) has been evolved over the past 4.5 billion years to cause cardiovascular disease and the less of it you have the longer you will live. Listening to a cardiologist that is (or a BBC reporter on the Today Program grovelling before a cardiologist). The lower the better. It's impossible to have too low an LDL concentration. Statins in the drinking water. You know the patter.

The [4]scientific paper on which his post is based concludes:

Apolipoprotein B at homeostatic levels in blood is an essential innate defense effector against invasive *S. aureus* infection.

Thanks to Dave Lull.

1. <http://en.wikipedia.org/wiki/Bogeyman>
2. <http://high-fat-nutrition.blogspot.com/>
3. <http://high-fat-nutrition.blogspot.com/2008/12/cholesterol-and-innate-immunity.html>
4. <http://www.ncbi.nlm.nih.gov/pubmed/19064256>

---

Maestro (2008-12-17 17:59:42)

I can guess at what "Apolipoprotein B at homeostatic levels in blood is an essential innate defense effector against invasive *S. aureus* infection." means, but would you be so kind as to translate that into English, please?

Rose Smith (2008-12-17 19:08:52)

Agree about LDL; love Hyperlipid; but must pick a nit: surely you mean that Reagan was elected governor, not president, in the 1960s...?

seth (2008-12-17 22:55:00)

Reagan's actions against the student protestors as governor brought him the national attention that led him to the Presidency.

seth (2008-12-17 22:56:46)

Maestro, it means "having normal amounts of LDL cholesterol is a good defense against a common infectious bug."

Patrik (2008-12-18 17:44:12)

Good post. However, I detect a bit of antipathy to Conservatives and a bit of fallacious logic. *I always think of the Falkland Islands. In 1982, by acting as if the Argentine invasion actually mattered, Margaret Thatcher got herself a big boost in popularity* It may not have mattered to you, but it certainly mattered to the Argentines (after all they were the aggressors). It also mattered to the Brits as, if what you suggest is true, her popularity benefited with a forceful British response. *In the 1960s, by acting as if Berkeley student protests were dangerous, Reagan got elected president.* Much too glib here and much too ex-post facto as well. Er, one of these protests became a riot. Riots are dangerous.

seth (2008-12-18 22:30:31)

Thanks, Patrik. I must disagree: I don't think Argentine takeover of the Falklands mattered to the Brits. The Brits were fooled into caring. This is why the term bogeyman exists: the strategy works.

Patrik (2008-12-20 00:05:11)

I understand the point you are trying to make about bogeymen. But what evidence do you have that Argentine invasion of the Falklands didn't matter to the Brits? And that they were 'fooled into caring'?

seth (2008-12-21 00:17:35)

Patrik, my belief that possession of the Falkland Islands didn't matter to Brits is based on the small population of the islands (about 3000) and their economic unimportance. According Wikipedia, they are self-sufficient except for military expenditures. So apparently they are a net drain on the rest of the British economy.

Patrik (2008-12-21 01:21:03)

Seth, 1) The Falklands are a British Overseas Territory. If the Falklands are attacked, the United Kingdom's national sovereignty is encroached. And the UK has an obligation to its citizens to act invoke the right of self-defense. This matters. End of story. 2) Having a small population is not mutually exclusive with not mattering to the Brits. As far as economics insignificance, I think you couldn't be further from the truth. The Falklands are rich in oil and fisheries. In fact, the potential for oil production is one the reasons the Argentine junta ordered the invasion: <http://www.csmonitor.com/centennial/fpaper/covers/1982.swf> From April 5, 1982 "Oil. Argentina, like the rest of the world, is thirsty for oil. But Argentine oil-drilling has been disappointing. Waters around the Falklands, about 400 miles off the Argentine coast, may be rich in oil - perhaps richer than the North Sea fields between Britain and Norway. Eighteen months ago, Argentina advertised for oil prospectors to explore an area extending into the Falklands waters. Britain protested the move. Some experts believe the Falklands area contains about 2 billion barrels of oil, which would be worth about \$60 billion at current market prices." Again, what evidence do you have that Argentine invasion of the Falklands didn't matter to the Brits? And that they were "fooled into caring"?

seth (2008-12-21 06:49:49)

Patrik, here's a sample of what Thatcher said in her autobiography: "The significance of the Falklands war was enormous, both for Britain's self confidence, and for our standing in the World". Note: nothing about Britain's economy. As far as I can tell, fish and oil played no role in the British's government's decision-making or public speaking about the war.

Patrik (2008-12-21 16:13:54)

Seth, You are clearly moving the goal posts and evading my central point. Let us start from the beginning. If I understand correctly, your assertion is the following: The invasion of the Falklands did not really matter to the British public because the populace is small and they are ostensibly economically unimportant, but Thatcher, wanting to increase her popularity, made it seem as if the invasion mattered, by intentionally fooling the public with the creation of a 'bogeyman', an imaginary threat against which she could mobilize British military forces, i.e. the very non-imaginary Argentine military forces, where the act of responding militarily to this perceived threat would thereby fulfill her real goal, that is, increase her popularity and power. I refute this by noting that the Falklands were/are important to the UK as the Falklanders are/were English-speaking British citizens and the Falklands are rich in oil and fisheries. The first point is obvious and paramount: one cannot allow national sovereignty to be encroached upon. It is the Prime Minister's paramount responsibility to maintain intact that what is the United Kingdom and its overseas territories (Anguilla, Bermuda, British Antarctic Territory, British Virgin Islands, Cayman Islands, Falkland Islands, Gibraltar, Pitcairn Islands, Saint Helena, South Georgia and the South Sandwich Islands, Sovereign Base Areas of Akrotiri and Dhekelia, Turks and Caicos Islands). To put in plainly, Thatcher had an obligation to the UK and, more importantly, **to the Falklanders themselves**, to protect them from foreign invaders, in this case, the Argentine junta. There was no bogeyman. She did not create the Argentine invasion. She reacted appropriately and the public agreed. The second point I back up by an article written at the time noting the Argentine motive for resources. I don't think it is a stretch to expect the UK government to have been aware of these resources. But let's assume I am completely wrong, although your point is very weak. Let's assume that economically the Falklands are/were unimportant. This still does bolster your bogeyman hypothesis as my first point about national sovereignty above is paramount. You attempt to take Maggie's words to fit your own purposes ultimately undermine your argument i.e. that the Falklands affair didn't matter. Let's see what the entire quote is: The significance of the Falklands War was enormous, both for Britain's self-confidence and for our standing in the world. Since the Suez fiasco in 1956, British foreign policy had been one long retreat. The tacit assumption made by British and foreign governments alike was that our world role was doomed steadily to diminish. We had come to be seen by both friends and enemies as a nation which lacked the will and the capability to defend its interests in peace, let alone in war. **Victory in the Falklands changed that. Everywhere I went after the war, Britain's name meant something more than it had. The war also had real importance in relations between East and West: years later I was told by a Russian general that the Soviets had**

**been firmly convinced that we would not fight for the Falklands, and that if we did fight we would lose. We proved them wrong on both counts, and they did not forget the fact.** ... So not only was it (naturally) important to Britain to maintain national sovereignty, but it was just as important to maintain foreign policy credibility when we place this conflict in its context, the height of the Cold War\*. I ask you again: Again, what evidence do you have that Argentine invasion of the Falklands didn't matter to the Brits? That is, what overrides my national sovereignty argument? And, more importantly, that they were "fooled into caring"? And how were they fooled into caring? Lastly, in Maggie's place, what would you have done?

Tom in TX (2008-12-21 17:48:41)

Were the Argentine people likewise fooled by their leaders into thinking the Falklands were important to them?

seth (2008-12-22 21:45:11)

Patrik, yes, the British defense certainly made a difference to Falkland Islanders. Sure. But it was the average Brit who paid for that defense. The telling thing about Thatcher's account – and I've heard a rumor that these accounts tend to be self-serving – is how vacuous it is. How few specifics. A Russian general, huh? That's the best she can do? Britain had lost vast expanses before they managed to hold on to the Falklands. Thatcher is arguing it is better to lose 20-1 than 21-0. It's a hard argument to make. The big effect of the Falkland War, as far as the average Brit was concerned, was exceedingly simple: It got Thatcher reelected (or at least vastly increased the probability of that event). Before the war Thatcher's popularity was quite low. Quite likely her term would have been much shorter; she would have been replaced by a leader with much different policies. Needless to say the war was not sold on that basis. Unless that low popularity was based on something equally delusional, then – if that low popularity was a sign that Thatcher should go – then Brits truly paid a price for the Falklands War. A price that of course they weren't warned about. This is the sense in which they were fooled. To say what I would have done as PM would be, unfortunately, an exercise in fantasy. It's hard enough to explain what actually happened. I don't know enough about Argentina to comment on what happened there.

Patrik (2008-12-23 12:41:07)

Seth, You are now completely avoiding the central point and taking tangents leading you nowhere. *Patrik, yes, the British defense certainly made a difference to Falkland Islanders. Sure. But it was the average Brit who paid for that defense.* So what? When Pearl Harbor was bombed, the average American was already paying for its defense, then paid to rebuild PH, and then to attack Japan. That has nothing to do with your bogeyman assertion. *he telling thing about Thatcher's account is "and I've heard a rumor that these accounts tend to be self-serving" is how vacuous it is. How few specifics. A Russian general, huh? That's the best she can do?* Ah, I see. When YOU quote her to make your point, we should take her at her word. But when I quote her (from the very same piece) to bolster my point, we assume that she is disingenuous or even dishonest. Tsk tsk. *Britain had lost vast expanses before they managed to hold on to the Falklands. Thatcher is arguing it is better to lose 20-1 than 21-0. It's a hard argument to make.* Your argument makes no sense. Of course, to take your analogy, it is better to lose 20-1 than 21-0. Just b/c Britain had lost vast expanses in the past, they should simply give up? And abdicate its responsibility to both the UK and the Falklanders? My house has been robbed, I should not put bars up on the windows and arm myself, to prevent additional robberies? That is her point. Skipping a bit forward here. You write: *To say what I would have done as PM would be, unfortunately, an exercise in fantasy. It's hard enough to explain what actually happened.* You cannot place yourself in Maggie's shoes b/c you are not sure of what actually happened yet you claim to know what would have happened had there been no war. Non sequitur. *The big effect of the Falkland War, as far as the average Brit was concerned, was exceedingly simple: It got Thatcher reelected (or at least vastly increased the probability of that event). Before the war Thatcher's popularity was quite low. Quite likely her term would have been much shorter; she would have been replaced by a leader with much different policies.* Really? What would have happened, had she lost the war? Would she have been re-elected? And you know, in your heart of hearts, that she would not have been re-elected? You cannot know that. That is simply a guess. *Needless to say the war was not sold on that basis. What, according to you, was it sold on? Unless that low popularity was based on something equally delusional, then "if that low popularity was a sign that Thatcher should go" then Brits truly paid a price for the Falklands War. A price that of course they weren't warned about. This is the sense in which they were fooled.* I don't follow you at all. Please clarify.

seth (2008-12-24 02:37:34)

Patrik, thanks for your comments and questions but the time I can devote to this has run out.

Tom in TX (2008-12-24 09:33:05)

Maybe we can at least agree that the war did not have a significant effect on LDL cholesterol. 8-)

Tim Lazaro (2009-01-13 13:06:19)

Seth, Apparently you opened a can of worms here in your comparisons. It seems to me you could have picked simpler and clearer comparisons not politically hot ones. If you are going to talk about LDLs - talk about LDLs. I'm sure there are about a 100,000 or so political forums and blogs where you could argue about the issues you bring up. For example in my writings I compare LDLs to little dump trucks carrying particles of cholesterol in the bloodstream. HDLs try to scoop up errant cholesterol and return them to the liver for disposal. I think these are simple concepts to understand. The problem comes in when you have too many LDLs and not enough HDLs.

Seth's blog » Blog Archive » How Bad is LDL Cholesterol? (continued) (2009-01-22 22:55:08)

[...] How bad is LDL cholesterol? [...]

### **What's Wrong with Patients Sharing Information? (2008-12-16 22:43)**

A "surgeon/scientist" named Orac [1] complains that patients are sharing information on the effects of a drug (lithium) on their ALS (Lou Gehrig's disease). What are his objections? As best I can tell:

1. "This group testing lithium for ALS is no different than the desperate cancer patients trying out DCA, and it's subject to the same shortcomings and opportunities for bias and self-deception that were so apparent on Jim Tassano's DCA discussion boards." This is like the statistics professors who complained about plotting data because you might see a pattern that isn't there. Complaining that something isn't perfect isn't much of a criticism.
2. "The designers of this project [information sharing] are fooling themselves if they think an unblinded, patient-driven clinical trial will accomplish what they think it will, although they do exhibit appropriate caution." This isn't clear; it isn't clear what "what they think it will" means.
3. "There are no controls, only in essence historical controls (i.e., the "predicted course")." So? Historical controls aren't worthless. They are used all the time in experimental science (e.g. pre/post comparisons). B. F. Skinner was a big advocate of historical controls. If you were evaluating a new type of surgery, you'd use historical controls to help decide if the new way is better or worse than old ways.
4. "As hard as it is to believe, even for patients with ALS it is possible to make things worse. Lithium, for instance, is not a benign drug. It can cause neurological complications and diabetes insipidus." Surely the patients know this and have decided the possible benefits outweigh the risks. Again, pointing out that something's imperfect isn't much of an argument.
5. "Overall, when taken as a whole, it is far more likely that patients will be harmed by taking experimental or off-label drugs than significantly helped." Far more likely? No evidence is given for this claim.

I believe, contra Orac, that sites like [2]PatientsLikeMe.com are a wonderful idea, well worth exploring. As [3]Ben (short for Benedict) Casnocha says, it's a good idea to know the other side of the argument.

1. [http://scienceblogs.com/insolence/2008/12/patientled\\_clinical\\_trials\\_versus\\_clinic.php](http://scienceblogs.com/insolence/2008/12/patientled_clinical_trials_versus_clinic.php)
2. <http://www.patientslikeme.com/>
3. <http://ben.casnocha.com/>

---

Nathan Myers (2008-12-17 00:36:17)

There's a strong whiff of guild jealousy in Orac's protestations. To "accomplish what they think it will" can't mean anything but "maybe get better". What good could it possibly do them to get better if they aren't really certain *why* they got better? How dare they deprive some honest primary investigator of a control? Even if it works, in the end, they're just putting off the day when a patentable lithium-analog is approved for on-label use.

Aaron Blaisdell (2008-12-17 12:40:08)

I had an annual check up yesterday. My doctor is at an HMO (Kaiser Permanente). I told him about my dietary changes in response to having read Gary Taubes' book "Good Calories, Bad Calories" (which he had never heard of!), posts on this blog, and on Stephen's blog (<http://wholehealthsource.blogspot.com/>), etc. My dietary changes include: increased consumption of eggs, meat, dairy; decreased consumption of wheat and unsprouted/unsprouted grains and legumes and replacement with sprouted grains and non-gluten grains; replacement of vegetable oils with animal oils, such as butter and lard in my cooking; and taking high-vitamin cod liver oil and butter oil, ala Westin Price recommendations). He was very skeptical (except of the cod liver oil of which he approved) and cautioned me against making these dietary changes. I also asked him if he could request a fatty-acid test, but he declined because it was not a standard test of Kaiser's. I asked him why he disapproved of my dietary changes and he said that, while there are some papers that may show benefits of each of the changes I have made, there are just as many papers showing the opposite. BUT he claimed that he did not know of the scientific literature on diet and health. He said he only reads the medical literature. I wasn't aware of these literatures being separate! He apparently is not concerned or even interested in medical and nutritional science, even though he's a general practitioner whose primary responsibility is the health of his patients! Instead, he seemed comfortable having the party line handed down from the "officials" above, and not straying from the boundaries set by the AMA (and AHA, etc.). This is a huge problem with the medical community as I see it. The great thing about the internet is not only the availability of information, but also the ability of a conscientious person to take matters into their own hand to gather information for themselves, make their own decisions, and share that information (e.g., these blogs) with other interested people. Some doctors are threatened by this change in information access. But even worse in my opinion is that others are merely apathetic.

seth (2008-12-17 13:58:21)

Aaron, he knows little or nothing about nutrition but cautions you against making certain dietary changes. Yeah, just like Orac. He knows little or nothing about experimental design, but he cautions against a certain experimental design. As for the apathy (at least Orac isn't apathetic) a friend of mine had the same experience. He brought his doctor some data he had collected himself that was highly relevant to what to do about his problem. The doctor didn't care. Perhaps I should be happy that when I was a graduate student and showed my dermatologist that one of the medicines he had prescribed had no effect on my acne, he was irritated (rather than apathetic). Nathan, I think "accomplish what they think it will" might mean something like "help others decide whether or not to try lithium."

Tom (2008-12-18 14:19:12)

*he claimed that he did not know of the scientific literature on diet and health. He said he only reads the medical literature. I wasn't aware of these literatures being separate! He apparently is not concerned or even interested in medical and nutritional science, even though he's a general practitioner whose primary responsibility is the health of his patients!* Michael Eades, a physician, wrote a post about how to talk to your doctor about diet: <http://www.proteinpower.com/drmike/statins/talking-diet-your-doctor/> In it he explains that most doctors never read scientific papers and are probably not even capable of it. By "medical literature" your doctor is referring to case reports, which Eades says is what most practicing physicians are familiar with and capable of grasping. (He links to a case report to print and bring to your physician.) (BTW, good luck getting a

Kaiser MD to order any test that isn't absolutely necessary – doing so reduces his year-end bonus. He is well-incentivized not to indulge what he sees as your foolishness.)

Aaron Blaisdell (2008-12-18 20:04:04)

"(BTW, good luck getting a Kaiser MD to order any test that isn't absolutely necessary – doing so reduces his year-end bonus. He is well-incentivized not to indulge what he sees as your foolishness.)" Thanks Tom. My doctor actually voluntarily confessed to this. At least he's honest. Oh, and thanks for the link!

### **Interview with William Rubel, Food Historian (part 3) (2008-12-17 20:32)**

[1]William Rubel, a friend of mine, author of [2]The Magic of Fire and co-founder of the children's literary magazine [3]Stone Soup, is writing a history of bread.

RUBEL I think that, in terms of culture–human culture–it seems that rich people have liked purity. We've been smelting metals for a very long time and smelting metals is taking dirt and out of the dirt creating a refined silver or brass or copper, even gold. I know that gold exists in little pieces, but nonetheless, there's a lot of melting and purifying. So it just seems to me that logically once a culture had gold, once a culture had metal, the idea of purifying the grain to get white is not a huge conceptual leap.

White flour is a form of conspicuous consumption because you are keeping the endosperm–the starchy part–and throwing away the rest of it. And when you do it by grinding and sifting, and you leave an efficient system, you might throw away 75 % of the grain to get 25 %–the super white or 50 % of it that will be white and 50 % that you will throw away. You're not throwing it away into the trash can, but you'll feed it to a lower status person–the servants will get the rest of it–and of course you can also feed it to the pigs. But you would keep the white flour for yourself and make a lower status bread for servants and slaves. Historically the slaves were the ones who ground the flour. In the biblical period they did, and presumably before that as well. The earliest reference I've seen is in a book on cooking in Byzantium, I think about 800 AD, in Constantinople and someone is saying, "Oh the bread here is just white and fluffy like clouds. It's degenerate, awful bread."

ROBERTS You mean they did not like white bread at that point?

RUBEL This is a person who is criticizing it. He is saying that the white bread in the city, which is fluffy and white as clouds, is a sign of cultural decay. It's a bad thing. And that critique of white bread, which we have today–that you're throwing all the best parts away, that there's something almost morally wrong about eating white bread–is a very common critique. I think by someone named Tyson in the book called The Way to Health, I think, in the early 1600s . . . I read certainly in medical texts from the 1500s and early 1600s, people saying, "This white bread is essentially empty calories and it's a bread for courtiers," who are eating it because they are aping the social class above them, but that it's not really very healthy. In the 18th century when people in France, in particular, became concerned about having enough good to feed the general population, one concern was that Paris had a culture of white bread and there were often grain shortages because it takes, out of a bushel of grain, you only get half a bushel of white flour. It was an inefficient use of flour, so the government was trying to push more whole grain or kept bemoaning the fact that the peasants in Paris didn't want to eat this more whole grain flour. They felt that whole grain flour was better for workers–this is also a big motif in medical books of the 1500s and 1600s, that if you're a worker, if you're a laborer, you need to have a more whole grain bread. But if you're a student, if you're a person like us, who don't have calluses on our hands and just work the computer keyboard, then people like us don't need all that good value from the bread and white bread is more appropriate for us. They also recognized that there was more calories per unit–they sensed that it was denser calories, because they felt that someone who was very thin should eat white bread but somebody who was

fat should eat the more whole grain bread because they knew from being very close to their excrement—they were close to their shit since they shat into holes . . .

ROBERTS Chamber pots?

RUBEL Chamber pots, yes. So they knew if they ate something grainy it just went right through them. They thought that fat people should eat a more whole grain bread than white bread.

ROBERTS So you're saying that this preference for white bread and a reaction against this preference are both quite ancient?

RUBEL Yes, absolutely. That's right. Now the bread that you like that I make is a very dense bread and part of this idea of using the past to look at our own bread culture is to say, "Gee, what breads were there back then and what were they like?" The rich people have liked open crumb for a very long time and the medical books do say that the best breads have eyes, have air holes in them. On the other hand, the most common breads were fairly dense: rye bread and rye wheat bread or in England, breads just made with barley flour that could be fairly dense. But the old texts also often speak about the nice flavor of some of these dense breads. I find making bread, while you are a great fan of the dense bread and seem to respond to its flavor and . . .

ROBERTS Texture, too.

RUBEL Right. But I have a friend who's (I don't like to use that term foodie) like a gourmet—he likes to eat a lot, he's very focused on food, but has very definite ideas about what's good and what isn't good and is very concerned about what's good and not good. He just says, "William, when are you going to make a bread that's any good, when are you going to make a good bread?"

ROBERTS You're kidding. He says that now?

RUBEL Yes. He does not like the dense breads. He says they're not well made.

ROBERTS What is his complaint?

RUBEL That they're dense. Because density, or a lack of density, is a cultural attribute. Germans don't feel that a 100 % rye bread you see made and exported in those plastic, square loaves in plastic packages in the deli shop—and those obviously have no air holes—people in Germany are not saying, "Oh my god, this bread would be great if only it had air holes." It's a style of bread, it's a style and they appreciate.

ROBERTS You're saying that the preference for an airy bread is cultural.

RUBEL Preference for an airy bread is cultural. For example the high status white bread in the 1400s and the 1500s (probably also earlier than that) was a white bread that was made with a very dense dough, 50 % water to 50 % flour, which would be very dense. Using modern flour, your ciabatta, is 75 % water, maybe 78 % water, by weight of flour. If you have 100 pounds of flour, the baker will be adding 78 pounds of water. Whereas this other bread would have been made with 50 pounds of water. The more hydrated the dough is, there's some other factors involved, but the wetter the dough is, the easier it is for it to expand and make big air holes. All of this artisan bread that we like that has nice air holes—those are all yeast breads, so they're moving to very, very hydrated doughs relative to historic practices.

Even at the turn of the 20th century, a standard English bakery book said that 50 % water was the standard recipe. I have one book, a big English commercial bread book, the biggest book for bakers, by a man named Kirkland.

He traveled around continental Europe and he said he was quite surprised to find that in Holland they were making breads with more water than they do in England. They were not following that 50 % standard.

If you get back to 50 % water by weight, and then they worked it for a long time. There's an American biscuit called a beaten biscuit, where you work the dough in a mangle over and over again, for an hour. You just break down the gluten chains; you make a dough that is very elastic, very velvety. But it will never give you big air holes. What you're getting is lots of really tiny holes. They would work the dough with their feet or they would work it with a tool called the break, which was a stick attached by a pivot to the wall. The baker would work this stick over the dough (actually with his body weight he would sit on the stick, sort of bouncing on the dough) for a long, long time until it was, as we would say, overkneaded. You would also be oxidizing it. It would turn whiter as you worked it a lot. They would get a very white bread with a very soft interior. They did not want a crust on it, a dark crust, so they also baked it in an oven probably at about 250 degrees Fahrenheit, maybe even a little bit less.

ROBERTS Do you buy Thorsten Veblen's view of this, why people like white bread? You use the phrase "conspicuous consumption" from Veblen. Do you think that's pretty close to what's going on? People are trying to advertise their leisure time or their ability to pay. It's like having a fancy gadget today. It's a way of showing status.

RUBEL Yes. You buy imported butter. Most people's tables, especially in our social class—the people who are reading your blog—are filled with cultural signs. What salt do you use? Are you using Leslie salt in the blue container and the little umbrella or are you buying sea salt? Are you buying salt from France? What kind of cheese do you eat? If you don't eat Velveeta cheese, or some commercial American cheese, are you doing that entirely for flavor or is there some aspect to a little bit of showing off? Food is all about signs. Once you're not just eating to eat, you're saying a lot about who you are by . . .

ROBERTS Especially if you have guests, or tell other people what you eat.

RUBEL That's right. Exactly. When you have people over to dinner and have that special olive . . . And also, we develop cuisines that work together with the foods that we like. White bread works well if you're having a refined meal where the cook has spent a lot of effort to highlight ingredients or spices or herbs or whatever it is that is the highlight of that cuisine. White bread is more neutral than \_\_\_ or rye bread, which has a stronger flavor in of itself. Whole grain bread is giving you all that bran, which is filling and the bread's not the meal; the bread's the side dish. I think that there gets to be, also, confusion between bread as a meal and bread as a side dish. Even in the modern critique of white bread. Like, "white bread is bad for you, it has no roughage in it." But how much of it do you really eat? Does it make any difference? Or, it's empty calories." Well, okay, it's empty calories; so is having a Coca-Cola, obviously. Or one of those fancy vitamin drinks. We eat a lot of empty calories; your wine is empty calories.

ROBERTS Water is empty liquid.

RUBEL Water is certainly empty calories.

ROBERTS We've covered the main points. But if you have more time, I'd like to ask you one or two more questions. When you've been going into this history, what sort of things have surprised you or have been different than what you'd expected?

RUBEL There's a lot more variety. I found cornbread from France which apparently was a staple bread in southern France in the 18th century. I'm also finding that most of our ideas are just not right. We've fixed on this French bread that only uses water but in real life—and it's a high status French bread that we have fixed on—but in real life high status French people also liked bread that had fat in it. They had milk bread—breads made

with milk and a little bit of butter. There was more variety then, even at the rich person's table than we have now. I've been surprised—maybe not as surprised about them, but once again surprised and sort of disappointed or shocked to see how narrow-minded our own culture is in some respects.

ROBERTS I totally agree. I think that's such a great point. There's a story that Jane Jacobs tells that I keep retelling because it just comes up again and again. When she was a teenager, she went to a small town in rural North Carolina, maybe. She visited an aunt, and her aunt told her the story that when her aunt had come there, maybe 10 years ago, her aunt was assigned the task of building a church, or overseeing it. She told the villagers, "Hey let's build it out of stone." And the villagers said, "No, that's not possible." So they laughed at her. They had forgotten that it was possible to build buildings out of stone. You're saying that it's not just a small town—this isolated little town in rural South Carolina—it's our whole culture. We've forgotten all these ways to make bread.

RUBEL Yes, or we've rejected them. Because it's somebody else's bread. You go to a Mexican bakery and they have milk rolls.

ROBERTS They have what?

RUBEL They have bread that has milk in it. Or eggs or butter. We used to have Parker House rolls; that was a big American roll, and now our social group—we've rejected that. It's gone. And yet high status French people in the 18th century would have loved Parker House rolls and had breads that were very similar to that. I guess going back has reminded me of that.

ROBERTS Can I call it the new elitism?

RUBEL I don't think that's unfair. We have this particularly American variety of elitism, and I can't speak for our European cousins, where we don't recognize class in it. You go to a Mexican market and they're selling Wonderbread or the equivalent and you go to our market—I live in Santa Cruz—and where the professors go, and we don't have that bread at all. Or we have a weird industrialized version in Orowheat breads, which may be ostensibly whole grain but are actually industrialized products that make a whole grain bread so they can say that it's whole grain or say that it has nine grains in it but effectively they're really offering you something with the texture of a white bread.

We're elite without recognizing the class. Whereas in old books—cookbooks and books that talked about bread in the 18th century and the 17th century—they were very up front. This bread was for the owner, this bread was for the servant and this bread was for the farm worker, the lower status person. They saw the status in bread; they recognized that it was there. They lived in a more overtly hierarchical society. Not more overtly, but they recognized that it was hierarchical, whereas we tend not to recognize it, especially in America where we have this mythos that everybody can be anything we want. Obama can be president, yes, but the social system is not quite so open. And there are breads associated with that lack of openness.

ROBERTS Do you mean that our choice of breads is a reflection of a lack of openness?

RUBEL Yes. I think that if you do an anthropological study, in the greater Berkeley area, of social status and bread, you're going to find very clear correlations.

ROBERTS Yes. How dare we!

RUBEL And part of it is just based on cost. It's cheaper to buy a double packet of Wonderbread at Safeway even if you might want the other. On the other hand, there's reason why Wonderbread is a good bread for

many purposes.

ROBERTS Yes; I use it in my research. Thank you, William, that was wonderful.

### The Last Days of Old Beijing (2008-12-18 14:35)

I'm enjoying [1]The Last Days of Old Beijing: Life in the Vanishing Backstreets of a City Transformed by Michael Meyer, one of a few fun books I brought to China. (The others are [2]Traffic by Tom Vanderbilt and [3]The Corpse Walker by Liao Yiwu.) It's about living in a downtown hutong. What pleases me most is how good his Chinese must be (I want reassurance I can learn it) but I also like strange stuff like this:

[Watching TV in a friend's apartment, Spring Festival 2006.] The annual variety show paused from its singing and acrobatic performances to announce that China would send a pair of pandas to Taiwan as a measure of friendship. The program's five hundred million viewers could pick the animals' names by choosing from a list and sending a text message via cell phone.

"Who says we can't vote?" [his friend] laughed. . .

We ate and watched television until Unity and Wholeness were announced as winners of the name-the-panda election. (Taiwan's government would initially refuse the animals.)

What were the other candidate names, I wonder.

cato (2008-12-23 03:21:23)

i think the runners up were "invasion" and "formosa is ours!"

## Max Planck Institute Promotes Brothel (2008-12-18 21:33)

X

From [1]The Independent:

There were red faces on the editorial board of one of Germany's top scientific institutions, the Max Planck Institute, after it ran the text of a handbill for a Macau strip club on the front page of its latest journal. Editors had hoped to find an elegant Chinese poem to grace the cover of a special issue, focusing on China, of the MaxPlanckForschung journal, but instead of poetry they ran a text effectively proclaiming "Hot Housewives in action!" on the front of the third-quarter edition. Their "enchanted and coquettish performance" was highly recommended.

This is puzzling: Poems are in books, not on flyers. No way was this xeroxed from a book. Even I can see that. This will be their best-selling issue – maybe it was a mistake on purpose.

## My Theory of Human Evolution (fixing bike pumps) (2008-12-19 15:34)

The father of one of my Chinese tutors used to work at a coal mine (in an administrative position) but after his wife went away to care for her sick mother he wanted a job without night shifts to better care for his two children. He decided to make a business of fixing bicycle tire pumps. People who fixed bicycles were common but hardly anyone

fixed the pumps.

Was it hard to start such a business? No. There was a tradition in his small town of persons walking through neighborhoods announcing what they had to sell. Like ice cream trucks. Coal, fruit, baked goods, and other things were/are sold that way. (He preferred to buy his coal directly from the mine.) At first, he used his unaided voice, later he got an electric megaphone, now he has a recording.

I believe human language began like this. Language began and grew because it facilitated trade. Facilitating trade facilitated occupational specialization, the essential difference between humans and other animals. Words – single words, repeated many times – were the first advertising, the original Craig’s List. Again and again, you said the word of what you wanted or what you had to offer.

---

Seth’s blog » Blog Archive » My Theory of Human Evolution (directory) (2008-12-19 15:41:47)  
[...] fixing bike pumps single words help traders find each other [...]

Nathan Myers (2008-12-19 22:47:35)

Arguably it’s language itself that has been subject to intense natural selection, while humans as a species have been selected mainly to become better hosts for it. Those poor slobs, humans, now live or die by the language “skills” they host. They live in unpleasantly crowded places, eat mass-produced food, squint at screens and push buttons all day, and do whatever people they’ve never even met want.

### **Chocolate is Good For You (part 4) (2008-12-20 16:47)**

From the January 2008 [1]Journal of Nutrition:

In a cross-sectional study, we examined the relation between intake of 3 common foodstuffs that contain flavonoids (chocolate, wine, and tea) and cognitive performance. 2031 participants (74 y, 55 % women) recruited from the population-based Hordaland Health Study in Norway underwent cognitive testing. A cognitive test battery included the Kendrick Object Learning Test, Trail Making Test, part A (TMT-A), modified versions of the Digit Symbol Test, Block Design, Mini-Mental State Examination, and Controlled Oral Word Association Test. . . . Participants who consumed chocolate, wine, or tea had significantly better mean test scores and lower prevalence of poor cognitive performance than those who did not.

---

Caleb (2008-12-20 22:49:31)

Did they control for social class? Otherwise all this means is that consumption of chocolate, wine, and tea are markers of high social class, which correlates with high IQ. Which anyone who pays attention already knew without having to do a study. Chocolate is good for you, but trying to spin this research as supporting it is confusing the direction of causation.

seth (2008-12-21 00:02:53)

Caleb, if the research had found zero connection between chocolate & health, would that have been meaningless? If not, then a failure to find zero connection is meaningful.

Tristan (2009-04-15 05:26:59)

I suppose the problem is your headline "Chocolate is Good For You" - there is no justification for choosing that headline rather than "Good means Chocolate For You" You can draw any conclusion from any data if you want it hard enough and care little enough about actual science. This study shows correlation but you've fabricated causation on top of it.

Danny Byas (2010-10-08 00:22:46)

Was there a difference between black tea or milk added to tea? Also green tea? What tea was used in the test? Also red or white wine? Did results improve with higher concentrations of cocoa in the chocolate?

### **Are You Having Trouble Getting Grants? (2008-12-21 07:02)**

A few weeks before I left Berkeley, I ran into one of my psych-department colleagues in a supermarket. He said - this was before the financial crisis - that the grant outlook was terrible. The success rate for NIH grants was about 7 %. He had had two grants; now he expected to have none. "Self-experimentation is looking better and better," he said.

Today I got an email that began like this:

If your department's economic outlook is looking bleak, like the rest of our economy, then we have some help available for you! Regardless of the nation's economic condition, the federal, state, local, corporate and private foundation grant system in the US is quite healthy and can provide substantial supplemental relief to your budget woes. Grant money for equipment, training, vehicles and other needs is still available in substantial amounts and remains unaffected by the current economic crisis. Competition for this available funding is becoming more intense with more agencies than ever applying. You need an edge to win; we offer that edge!

CHIEF and 5.11 Tactical have teamed up for 2009 to offer our nationally recognized grant consultant, Kurt Bradley and his national grant writing seminars, for the affordable price of \$149.00. Kurt and 5.11 will be in Las Vegas, NV on January 6th and 7th to instruct public safety agencies how to capture their share of this money. Chief Grants has turned hundreds of departments into successful applicants and winners for these funds, assisting agencies, just like yours, in obtaining more than \$100 million dollars.

I was on the 5.11 Tactical mailing list because I had bought some pants that police officers often buy.

In *Systems of Survival*, Jane Jacobs wrote that there were two systems of morality, corresponding to two different ways of making a living: taking and trading. The first values loyalty more than honesty, the other values honesty more than loyalty. Police are firmly in the taking morality system, which pervades government. Science should value honesty, of course; but you can see that a dependence on grants pushes everyone involved toward a loyalty-based morality: If we tell the truth we might lose our grant. Modern science is indeed almost completely dependent on grants, which means results don't really matter. What really matters is getting the next grant. One reason my self-experimentation was effective was it didn't depend on grants. No matter what I found, no matter how strange or upsetting or impossible or weird the results might be, I could publish them and continue to investigate them.

---

Ben Hyde (2008-12-21 11:01:35)

Golly, did we read the same Systems of Survival?

Mike Kenny (2008-12-21 15:31:00)

i guess business people might fund some experimentation in order to actually get a working product they could sell. a problem there is if you're working to find out something so you can sell it then you might not care to share your findings because that would be a trade secret. i guess you want to be rewarded for your findings, but at the same time, there seems like there could be a problem of useful findings being held by only a few due to their interests.

seth (2008-12-21 17:30:58)

Ben, some of my info comes from a talk Jacobs gave about these ideas before she published the book. The talk was more straightforward – you could even say blunt – than the book. In the talk, the taking/trading distinction is very clear, less so in the book. Mike, honesty is important in business because it is important that people fulfill contracts: accurately describe what they are offering to trade and do what they say they are going to do (e.g., after being given money, hand over the product). Without honesty in that domain, transaction costs become high, mistrust sets in, and the whole trading system breaks down. I think something like that is the explanation for what Jacobs observed. I think Jacobs said something to that effect.

Mike Kenny (2008-12-21 18:45:02)

that makes sense. i think my main concern is slightly different—proprietary information—a hypothetical: you might have asked people to sign a non-disclosure agreement so they wouldn't talk about your shangri-la diet, then disclosed to them the diet for a price. you could have given the diet away for free to some people who signed a non-disclosure agreement for the sake of getting testimonials, and have a money-back policy to show you believe in your product. but if this happened, the scientific community might be shut out of learning the new insights, or slowed down in discovering them, possibly.

Patrik (2008-12-22 00:10:26)

*Science should value honesty, of course; but you can see that a dependence on grants pushes everyone involved toward a loyalty-based morality: If we tell the truth we might lose our grant. Modern science is indeed almost completely dependent on grants, which means results don't really matter. What really matters is getting the next grant.* Beautifully well-put and accurate. One thing you could have fleshed out a bit further is that such systems go hand-in-hand with groupthink orthodoxy. Now, let's put this observation into context. To wit, there is much more money to be 'made' in promoting 'global warming', than disputing. Therefore, a Popperian approach to proving global warming exists will never be funded.

Economics of science « Entitled to an Opinion (2009-01-05 22:42:54)

[...] Cheap-skate self-experimenter Seth Roberts shouldn't be worried about getting grants, but he's talking about them anyway here. Apparently even in these belt-tightening times there's still money to be had. What I find interesting about the post is his use of Jane Jacob's two moralities from Systems of Survival: the taking (aka guardian) based on loyalty and the trading based on honesty. Seth thinks that reliance on grants will make scientists more concerned with loyalty than honesty and afraid to publish results that Seth (who ain't afraid of no McCloskey) wouldn't think twice about. [...]

Are solo authors less cited? (2009-02-27 11:23:38)

[...] Consider 'Seth Roberts' self-experimentation strategy and Roberts's take regarding funding: One reason my self-experimentation was effective was it didn't depend on grants. No matter what I found, no matter how strange or upsetting or impossible or weird the results might be, I could publish them and continue to investigate them. [...]

tim backcat (2009-05-06 14:31:15)

Great information and usefull too. I need a grant and I need all the help I can get. I will be back soon as I have bookmarked your blog.

Making up rational-sounding stories, rebranding atheists, novelists playing god « Mike Kenny (2011-11-24 05:01:46)

### Careful with the Sushi (2008-12-22 01:10)

I once lost about 12 pounds by [1]eating lots of sushi. I didn't think was a good long-term idea, however, because sushi was expensive and might have too much mercury. Now Jeremy Piven, best known as Ari in Entourage, has found that eating lots of sushi can indeed raise your mercury levels a significant amount. According to [2]New York,

Dr. Carlon Coker went [3]on record with Entertainment Tonight to confirm that Piven has six times the amount of mercury in his system that a healthy person should have, apparently a result of Piven's insatiable appetite for sushi.

As a result he quit his role in David Mamet's Speed the Plow. [4]Mamet's response:

I talked to Jeremy on the phone, and he told me that he discovered that he had a very high level of mercury. So my understanding is that he is leaving show business to pursue a career as a thermometer.

What a jerk.

1. <http://repositories.cdlib.org/postprints/117/>

2. [http://nymag.com/daily/entertainment/2008/12/jeremy\\_pivens\\_craving\\_for\\_sush.html](http://nymag.com/daily/entertainment/2008/12/jeremy_pivens_craving_for_sush.html)

4. [http://nymag.com/daily/entertainment/2008/12/jeremy\\_piven\\_drives\\_a\\_stake\\_th.html](http://nymag.com/daily/entertainment/2008/12/jeremy_piven_drives_a_stake_th.html)

---

Aaron Blaisdell (2008-12-22 15:22:40)

LOL! That was a funny response! There's a good example of a spontaneous creative joke.

Nathan Myers (2008-12-22 21:15:30)

I doubt it was spontaneous. Probably he got it, ultimately, from whoever writes Letterman's or Leno's jokes.

John (2008-12-23 06:58:03)

More sushi for the rest of us? :-) <http://junkfoodscience.blogspot.com/2008/12/do-fish-fly.html>

Bryan (2008-12-23 11:18:19)

@Nathan Myers: Unlikely. Maybe you don't know Mamet, but he's no stranger to comedy. He doesn't need to be fed lines.

sfmike (2008-12-23 21:45:16)

I'd like to echo Seth's final "What a jerk" remark. Everything I've read by Mamet and about Mamet leads to that one, inescapable conclusion, from his brutal plays to his awful screenplays to his recent public neocon conversion. Yuck. And I'm thrilled to see "Dark Age Ahead" by Jane Jacobs on your "I Recommend" list. It's beyond depressing but it certainly is useful right now.

### **Life Imitates Art School (part 2) (2008-12-22 14:57)**

Tsinghua University includes an art school added six or seven years ago. An art school elsewhere in Beijing moved to the Tsinghua campus; a big building was built for them. Two of my Chinese teachers are art students. I told them about the [1]San Francisco art school where every department looks down on another department. This got a big laugh. The same thing happens in their school, they said. It is divided into fine arts and design. The fine arts students look down on the design students because the design students are working for money; the design students look down on the fine arts students because they aren't practical.

The more curious interaction is between the art students and the rest of the school. Students in the rest of Tsinghua, which resembles MIT, often ask the art students their score on the national exam that high school students take to get into college. It is incredibly difficult to get into Tsinghua by that route; maybe 1 in 10,000 is successful. Art students have lower scores on this test but must also pass a test of artistic ability. One of my teachers, who is now a graduate student, said she'd been asked her exam scores at least 10 times.Â Here is one context. My teacher has just helped another student with his bike.

Student who has just been helped: What's your major?

My teacher: Art.

Student: What was your score on the national test?

And she is big and strong, she said, so potential questioners may have been afraid of being hit. Other art students are asked more often.

1. <http://www.blog.sethroberts.net/2008/09/22/life-imitates-art-school/>

By which I mean journalism that involves doing an experiment. In [1] this example, two New York journalists measured reaction to two versions of strawberry milk. The low-rent version did surprisingly well.

A friend and I were once thinking of writing newspaper articles about parking illegally in various places in San Francisco and measuring how long until we got a ticket. News you can use.

1. [http://nymag.com/daily/food/2008/12/taste\\_test\\_momofukus\\_strawberr.html](http://nymag.com/daily/food/2008/12/taste_test_momofukus_strawberr.html)

---

Patrik (2008-12-22 20:42:11)

What would have been interesting is had they segmented out the experiment via target demographic. I suspect that the Nesquik stuff would have crushed Momofuku in Nesquik's demo i.e. five to 10 year olds. I also wonder if (I forgot the proper name for this phenomenon) the fact that liking cheap-y foods is just not cool\*, especially not amongst New York Mag readers, skewed the reporting of their preferences. That is to say, there is something nostalgic about the sickly sweet, artificially colored milk. — \*For the record, McDonald's pulls a great coke, and their fries are simply unbeatable. I don't care how sweet potato gastro-pub you wanna get.... :)

Ryan Holiday (2008-12-22 21:26:37)

I'd actually like to see the parking ticket story. I'm sure cops would immediately make it irrelevant by heavily ticketing those areas that took the longest to continue to use uncertainty as a deterrent. Of course, that would also make a decent follow up piece.

seth (2008-12-23 06:03:54)

Patrik, that's a great idea: taste test expensive food with little kids. Spy did an experiment where they had a gallery opening with art on the wall by little kids ("My Kid Could Paint That!").

## **The Twilight of Expertise (part 16: opticians) (2008-12-22 22:04)**

[1]These glasses can help everyone, not just the poor:

The wearer adjusts a dial on the syringe to add or reduce amount of fluid in the membrane, thus changing the power of the lens. When the wearer is happy with the strength of each lens the membrane is sealed by twisting a small screw, and the syringes removed. The principle is so simple, the team has discovered, that with very little guidance people are perfectly capable of creating glasses to their own prescription.

[Josh] Silver [a retired professor of physics] calls his flash of insight a "tremendous glimpse of the obvious" - namely that opticians weren't necessary to provide glasses

Speaking of not needing opticians and making glasses more affordable, a year ago I discovered by accident something extremely useful: Wearing one contact lens is better than wearing two.

Wearing just one contact lens, I get good distance vision from the lensed eye and good close-up vision from the unlensed eye. Wearing two contact lenses, I have poor close-up vision. Another benefit of one rather than two contact lenses is that one eye is contact-lens-free for a long time. And I go through contact lenses half as fast. I wear lenses that last one month so I switch monthly which eye has the lens.

No optician told me this. No optician has even figured this out, as far as I know.

1. <http://www.guardian.co.uk/society/2008/dec/22/diy-adjustable-glasses-josh-silver>

---

NE1 (2008-12-23 16:53:03)

Opticians used to deliberately give children "weak" prescriptions, to encourage the eye to self-correct. Until the research showed that any blurry image on the retina spurred growth (worsening the outcome continuously). So, not a great idea for everyone.

Nathan Myers (2008-12-23 17:58:54)

I've worn the same contact lenses for three years. The previous pair lasted ten years. (Hard lenses; the "gas permeable" technology has been perfected.) It's obvious why lens manufacturers promote disposable lenses, but it should be just as obvious why we're better off resisting them, even if you neglect (appalling) infection rates. My last optician, at a mall chain store, did suggest using two different strengths of lens, as an alternative to lenses and also reading glasses. She also offered two weak lenses, tuned for reading, along with driving glasses. What I'm using is two strong lenses along with reading glasses.

I find myself wearing the glasses most of the day. The advantage of reading glasses is that they're cheap. I go through two pair a year. Of course they're all made in China.

Peter (2008-12-25 18:54:06)

My optometrist knows about using only one contact lens, or different prescriptions for each, instead of using reading glasses.

### **100 Paper NY Times = 1 Heavy Textbook (2008-12-23 05:58)**

Alana Taylor, a journalism student at NYU, blogged about one of her classes:

Quigley [the teacher] tells us we have to remember to bring in the hard copy of the New York Times every week. I take a deep sigh. Every single journalism class at NYU has required me to bring the bulky newspaper. I don't understand why they don't let us access the online version, get our current events news from other outlets, or even use our NYT imes app on the iPhone. Bringing the New York Times pains me because I refuse to believe that it's the only source for credible news or Pulitzer Prize-winning journalism and it's a big waste of trees. . . I am taking the only old-but-new-but-still-old media class in the country.

Yeah. The same thing goes on all over campus where students are required to buy a heavy glossy textbook that costs about a semester of paper New York Times. As if the same info wasn't free on the Web.

Long ago, textbooks were a fantastic bargain because they cost so much less than private tutors. And private tutors disappeared.

After Taylor's unflattering piece, her thin-skinned professor, who had said "it's essential for journalists to blog", banned blogging about the class.

---

The Drunken Priest (2008-12-23 08:09:36)

More on antiquated journalism here: <http://timidscholar.wordpress.com/2008/12/09/the-press-release-contagion/>

NE1 (2008-12-23 16:49:19)

There may have been one course I took in college which required me to take the textbook to class: Chinese, where repetition was a large goal of the meetings. Most value adding classes these days definitely shouldn't require the physical presence of textbooks, but the collection of a coherent pedagogy at home can be more useful than a thousand wiki pages from a thousand authors. I can already get most of my textbooks electronically, but they really just aren't the same. With a book, for example, you can flip through at the correct prior-knowledge-adjusted rate until you find the page you know is there. It's not so easy currently with ebooks.

seth (2008-12-23 19:56:51)

NE1, yeah, the web is incoherent. But I agree with Taylor, any journalist should be able to find news on the web, no need to have the NY Times figure it out for you. Isn't journalism about news gathering? That's why this example is so telling. Likewise for many subjects. For example, isn't science about gathering info?

Andrew (2008-12-26 16:04:33)

I don't think you should be so down on textbooks. I like some textbooks a lot—not just my own, also other books such as Lohr's survey sampling book. Googling just doesn't give you the clear info you can get from a coherent book.

seth (2008-12-26 21:33:26)

Andrew, I like some textbooks a lot, too – for example, Calculus by Ralph Palmer Agnew. Feynman's Lectures on Physics were interesting (if problematic for teaching problem solving). But the textbooks I like are a tiny fraction of all textbooks. I think the replacement for heavy textbooks is careful selection of more focussed material. That's what I did when I taught intro psych. I didn't use a heavy textbook, I used a bunch of smaller books, such as Obedience by Milgram.

## **A Second Opinion: You've Been Poisoned by Your Doctor (2008-12-24 01:04)**

In a [1]wonderful profile of master diagnostician Dr. Thomas Bolte, this especially pleased me:

Many of the patients Bolte sees are victims of iatrogenic, or doctor-caused, illness. Simply put, they have been misdiagnosed, overmedicated to the point of sickness, or given treatment inappropriate to their conditions. On occasion, this has led to shouting matches with more conventional docs, like the dermatologist colleague who burst into Bolte's office one day and harangued him "in front of another patient" for telling the mom of an acne-ridden teen to stop feeding her child so much junk food. There's no evidence that diet has anything to do with acne, the dermatologist shouted. Bolte begged to differ and cited the literature. "The pharmaceutical industry has trained even doctors to believe that there's a pharmaceutical answer to everything," he says, shrugging.

A large fraction of Bolte's patients have been poisoned. They get better when the poison is stopped. The mother of a friend of mine was near death – so near that her children decided to put her in a hospice. By mistake her six or seven medicines were stopped. And she recovered! Her medicines were what had been killing her.

The technical term for such horrors is [2]drug interaction.

Thanks to Dave Lull.

## **Charles Nemeroff Under Scrutiny (2008-12-24 13:41)**

For most of its existence, there was no letters section in The New Yorker. A big mistake, which Spy pointed out and made fun of by running [1]Letters to the Editor of The New Yorker. The current version of The New Yorker has letters, of course, but no comments on the web. Another big mistake.

Because those comments can be incredibly good. In its Health Blog, the Wall Street Journal website recently posted [2]news about Charles Nemeroff, the Emory University psychiatry professor who failed to disclose about a million

dollars from drug companies. The news itself wasn't anything special but the comments told me important stuff I hadn't known:

- What his defenders say. (Not easily summarized.)
- The nature and quality of his research. "Regarding Dr. Nemeroff's contributions to science, although he has published many papers, a large proportion have dealt with the hypothesis that the adrenal hormone cortisol plays a major role in the etiology of depression. This hypothesis has its proponents, but has not gained widespread support from experimental or clinical data. Drugs designed to inhibit cortisol have been disappointing as treatments for depression. Hence, regardless of any ethical issues surrounding his career, his publications have been numerous, but with low impact on advancing science and on actual clinical outcomes. Actually, it's a sad commentary on how really difficult it is to understand the biology of mental illness that individuals such as Dr. Nemeroff who conduct rather mediocre scientific work are considered major contributors to the field." You can read a thousand outraged editorials and blog posts about Nemeroff and not find something this revealing. Without anonymity, it is very hard to say something like this.
- Complete refutation of one of Emory University's comments. "Emory said its review supports Nemeroff's contention his lectures weren't product specific. WHAT? I worked in pharma sales years ago specifically selling SSRIs. Nemeroff was WELL known for SPECIFICALLY selling Paxil in his presentations. He was GSK's Paxil hit man." So much for Emory's credibility.
- A surprising suggestion. "Disclosure alone is not going to do that. These are amounts of money that even if Nemeroff had properly disclosed would be unethical - it can't be right that a Prof is paid 300 K a year for a full time job and get 500 K in addition from drug companies - even IF it was disclosed. Patients will do well in asking their physician to post or tell them about such additional moneys - and should vote with their feet since there are many honest people, though less powerful, in the field as well."
- A comment on the real cost of people like Nemeroff. "Anon asks, 'Who among the bloggers is familiar with his work, conversant with his research, actually read his papers?' I have, and I don't trust much about what he says in any of his pharma-related articles. Indeed, I have challenged his findings in letters to the editor. The saddest part of this entire scenario (Nemeroff and others) is the wreckage they have strewn throughout our scientific literature in the past 10-15 years."

Supporting what I said about letters to the editor. The truth about Nemeroff's research (and by extension a vast swath of psychiatric research) was in the letters to the editor. But a letter to the editor is just one person – and usually these letters can't be anonymous. This discussion is many people, it's a discussion, it's anonymous, and it's easily available. The emotion expressed – because people can comment quickly and informally – makes the whole thing easy to read.

This is a wonderful age we are living in, that so much nuanced and well-informed comment is available. Never before, not even close. Merry Christmas!

### **The Benefits of Standing: The Clear Vial on the Right (2008-12-25 18:16)**

[1]This article says that a fat-digesting enzyme called lipase becomes inactive while sitting. The evidence, seen in the accompanying video, is extraordinary: a cloudy vial of blood (taken after a sitting meal) versus a much clearer vial of blood (taken from the same person after a standing meal.)

I found that a great increase in standing, lasting years, had no effect on my weight but [2]I slept much better. I ate standing up much more often.

1. [http://www.sciencedaily.com/videos/2008/0610-stand\\_up\\_for\\_your\\_health.htm](http://www.sciencedaily.com/videos/2008/0610-stand_up_for_your_health.htm)
2. <http://repositories.cdlib.org/postprints/117/>

---

Drew (2008-12-25 20:57:09)

Seth, your theories are fascinating- I am now trying out the Shangri-la diet (found out via Freakonomics). If I can prove to myself that the diet works then I will eagerly move on to your other ideas (Standing, Faces early in the morning, etc). Really cool, really original & bold stuff...keep up the good work. Drew, Chapel Hill, NC

Justin (2008-12-26 21:15:01)

Seth, thanks for linking to this article. I wonder are there any cultures that typically eat standing up? I would like to see a study on this.

Drew (2008-12-27 21:58:47)

Seth, I decided to give one legged standing a try today because I would very much like to improve my own sleep patterns- particularly getting deep sleep and feeling well rested the next morning. I would rank my quality of sleep at about a 70 at best on the scale of 0-100 even though I exercise 6 days a week and do meditation & yoga intermittently. There is usually a residual, lingering tiredness throughout the day. I have been trying to achieve better sleep in the last few months by weaning myself off caffeine. (Apparently caffeine prohibits you from reaching S4 sleep levels among other things) I have noticed a definite improvement in the quality of my sleep whenever I cut back (but not yet eliminating) my daily caffeine intake. If I increase coffee dosage from 12 oz to 16 oz or 24 oz my sleep will suffer no matter what time of day I drink it...I've never seen you mention caffeine intake in any of your posts- do you consume caffeine daily 'like approximately 90 % of Americans'?

seth (2008-12-29 05:32:06)

Yes, I drink modest amounts of green tea and eat small amounts of chocolate. Cutting out all caffeine – from what is a low level to begin with – made no noticeable difference in my sleep.

### **A Chinese Dinner Party (2008-12-26 23:26)**

Last week I went to a dinner party at a restaurant held by a non-Tsinghua professor. It was nice of him to invite me. I'd been to two similar dinner parties before and this one was so much more pleasant because the grad student sitting next to me translated what everyone was saying. Which was stuff about cigarettes, Beijing is now more expensive than Hong Kong, rumors of ranking battles, buying a house, driving drunk (you are amazed how you park and drive while drunk), for example.

Do I have delicate Western sensibilities? Everyone was served an extremely strong drink called bai jio, which is about 50 % alcohol. Not everyone had to drink it, except the three graduate students. Being the youngest, each of them had to go around the table toasting each of the rest of the guests. After each toast they had to do "bottoms up" – drink the whole tablespoon-sized glass. That's 11 bottoms-ups (or 9 since your fellow sufferers would allow you to cheat)! I couldn't toss down one glass of the stuff, and I'm a fan of soju (20 % alcohol). It is horribly strong. I drank one glass the whole evening and it was too much. The graduate students jockeyed for who would go last – they hated it. Why does this happen? I asked my translator. "We're entertainment," she said.

I suggested she replace the bai jio, which is colorless, with water. Amazingly this was a new idea. She did it (furtively) and the deception worked. Still, she was very happy when the dinner ended before she had finished all her toasts. Did you tell the other students? I asked. Not till later, she said. Too important. Next time, she said, she'd bring a water bottle and a can of Coke to allow for drinks with other colors.

The bai jio tradition gives a sad twist to a letter on Chinese human rights just published in [1]The New York Review of Books. The letter is signed by "hundreds of Chinese intellectuals" – many of them professors, no doubt. It contains the following:

We see the powerless in our society – the vulnerable groups, the people who have been suppressed and monitored, who have suffered cruelty and even torture, and who have had no adequate avenues for their protests, no courts to hear their pleas – becoming more militant . . .

Or more devious.

### **Chinese Takeout Beijing Style (2008-12-27 06:20)**

In the elevator in my apartment building I realized the student holding hot food had just had it delivered. She gave me the menu. The restaurant, I learned, is called Kyoto. It serves mainly Korean and Japanese food. Free delivery. The surprising part: There's no address. And it never closes, even on holidays.

An example of the general truth that there are many more kinds of restaurants (food-serving businesses) in Beijing than in America. Today I bought sugar-coated banana on a stick from a street vendor.

---

James (2008-12-27 06:31:43)

So the question is why? Overly harsh food standards laws?

seth (2008-12-27 07:18:50)

Not food standards law. There is much more diversity of many non-food products, too.

Tom in TX (2008-12-27 15:01:55)

Maybe because there are many more people in Beijing. Same reason you find more kinds of restaurants in NY city than in Podunk, TX. 8-)

seth (2008-12-27 15:56:58)

Yeah, density of people is surely part of the answer. But I think New York and lots of other cities have lots of areas just as dense as my area of Beijing yet I have never come across this form of food business. In Berkeley there is a new sushi place that is delivery only but they have a webpage, an address, and an obvious physical presence.

Patrik (2008-12-28 00:51:17)

Seth, You might enjoy this article on business and bureaucracy in China: <http://online.wsj.com/article/SB12296006-1127017921.html>

### **Voodoo Correlations in Social Neuroscience (2008-12-28 07:39)**

Few scientific papers arouse emotion in reviewers and editors but [1]this one – by my friend and [2]collaborator Hal Pashler and his colleagues – must have because they allowed the use of voodoo in the title instead of spurious. Here is part of the abstract:

The newly emerging field of Social Neuroscience has drawn much attention in recent years, with high-profile studies frequently reporting extremely high (e.g., >.8) correlations between behavioral and self-report measures of personality or emotion and measures of brain activation obtained using fMRI. We show that these correlations often exceed what is statistically possible . . . Social-neuroscience method sections rarely contain sufficient detail to ascertain how these correlations were obtained. We surveyed authors of 54 articles that reported findings of this kind to determine the details of their analyses. More than half acknowledged using a strategy that computes separate correlations for individual voxels, and reports means of just the subset of voxels exceeding chosen thresholds. We show how this non-independent analysis grossly inflates correlations, while yielding reassuring-looking scattergrams. This analysis technique was used to obtain the vast majority of the implausibly high correlations in our survey sample.

The papers shown to be misleading appeared in such journals as Science and Nature.

Justin (2008-12-28 08:31:53)

Another case of don't believe everything you read, even (especially) if it comes from a well-respected source. I wonder if anyone can give an example of a popular paper that has been found to have these spurious correlations?

Andrew (2008-12-28 12:28:21)

Science and Nature have a pretty random reviewing process. It's no surprise that bad stuff gets in. The authors of the cited article are doing a useful service by pointing this out. On an unrelated note, yes, I think it's tacky to use "voodoo" in the title of the article. I mean, why not just go all out and have a title such as "Voodoo correlations are a gyp"?

Kristie (2008-12-30 14:04:01)

Andrew: I totally agree with your evaluation of Science and Nature - especially when it comes to psychological research. I like to refer to them both as "The Journal of Irreproducible Results". In their quest for sexy science, they often publish psych research that is totally outrageous, and turns out to be totally unfounded, or irreproducible. For example, light behind the knees was shown to influence circadian rhythm, but with more stringent tests, there was actually no effect. [http://www.genomenewsnetwork.org/articles/08\\_02/bright\\_knees.shtml](http://www.genomenewsnetwork.org/articles/08_02/bright_knees.shtml) Because of the seriously questionable results I've read in these Journals, I no longer hold them in the high regard that many other scientists do. I've also vowed never to send a paper there as a first author. As for the voodoo reference, it's a colloquialism that's well-established. <http://en.wikipedia.org/wiki/Voodoo> [http://en.wikipedia.org/wiki/Voodoo\\_science](http://en.wikipedia.org/wiki/Voodoo_science) I think the idea that voodoo is referring to things that seem to appear magical - which is a ridiculous notion. Andrew, do you believe in magic? If you do, then I think you can be mocked, too. "Gyp" however, is a derogatory term for an ethnic group, and as such is a racial slur. I think the comparison is totally unfair.

Fritz (2009-01-10 01:58:30)

I loved the paper and the "voodoo" in its title. The authors did a great job in stimulating a public debate on the issue, which is sorely needed given the sensationalism with which some of the questionable findings were publicized. I wonder if Science is willing to publish the rest of the data. Were I a journalist, I would ask them at one of their next press conferences.

Geoff (2009-01-11 12:57:48)

I love this quote by James "Another case of don't believe everything you read, even (especially) if it comes from a well-respected source." when he is doing exactly that when reading an abstract from one paper. Ridiculous!

Christian Keyzers (2009-01-13 00:46:50)

See [www.bcn-nic.nl/replyVul.pdf](http://www.bcn-nic.nl/replyVul.pdf) for a reply from some of the authors

Ed Vul (2009-01-15 08:32:57)

For those interested, you can find our response to this reply here: <http://edvul.com/voodooorebuttal.php> Cheers, Ed.

Matthew Lieberman (2009-01-27 12:51:39)

Our invited reply [1][http://www.scn.ucla.edu/pdf/LiebermanBerkmanWager\(invitedreply\).pdf](http://www.scn.ucla.edu/pdf/LiebermanBerkmanWager(invitedreply).pdf)

1. <http://www.blog.sethroberts.net/>

Bill (2009-01-28 08:18:53)

I commend Vul and colleagues for raising awareness of statistical issues in fMRI analysis. However, as several strong rebuttals have begun to emerge and the merits of individual papers are being explored more closely, it is rapidly becoming clear that the Vul critique may have incorrectly targeted a good number of papers that conducted legitimate and valid analyses. The Vul paper seems to have totally ignored the a priori hypotheses and theoretical basis of the selected regions that drove the analysis of most of the papers they criticize. Further, as was well articulated in the recent response by Lieberman and colleagues ([http://www.scn.ucla.edu/pdf/LiebermanBerkmanWager\(invitedreply\).pdf](http://www.scn.ucla.edu/pdf/LiebermanBerkmanWager(invitedreply).pdf)), the Vul critique seems to have misconstrued the way most of the analyses were actually conducted. In other words, they appear to be accusing the authors of doing something they actually did not do. This is unfortunate.

seth (2009-01-28 10:05:54)

Bill, I found the Lieberman et al. reply too vague to be persuasive. It claims that some papers were falsely accused (they are accused of doing X but they did not do X) but no specific examples are given. Care to give an example of a falsely-accused paper?

Matt (2009-01-28 19:11:56)

If you read p. 3 in the paragraph that the footnote comes from, you'll see how everyone contacted runs their regressions. "When a whole-brain regression analysis is conducted, the goal is typically to identify regions of the brain whose activity shows a reliable non-zero correlation with another individual difference variable. A likelihood estimate that this correlation was produced in the absence of any true effect (e.g. a p-value) is computed for every voxel in the brain without any selection of voxels to test. This is the only inferential step in the procedure, and standard corrections for multiple tests are implemented to avoid false positive results. Subsequently, descriptive statistics (e.g. effect sizes) are reported on a subset of voxels or clusters. The descriptive statistics reported are not an additional inferential step, so there is no 'second analysis.' For any particular sample size, the t and r-values are merely re-descriptions of the p-values obtained in the one inferential step and provide no additional inferential information of their own." Each of the authors indicated they did this rather than the two inferential steps that Vul et al. describe. Vul et al. were under the mistaken impression that people were using the personality variable to choose voxels to test and then subsequently running a new inferential test on those selected voxels. Not true. We run the test on all voxels and then report those that are reliable along with descriptive statistics. Everyone knows that all the other brain regions were also tested but did not pass the threshold for significance. How could they have gotten this so wrong in their paper? Vul et al. asked multiple choice questions that did not allow researchers to explain what they were doing and because Vul et al. never told researchers why they were asking the questions, there was no way for the researchers to guess Vul et al.'s true purpose and realize that Vul et al.'s questions could not provide Vul with the answers they needed. They also never followed up with any of the authors to ask if they were properly characterizing the conducted research.

seth (2009-01-28 21:03:18)

Matt, you write "there is no 'second' analysis". I don't follow. You use the word "subset". It sounds like one analysis is done on all the data and then a second analysis is done on a "subset" of the data. Why this second analysis somehow doesn't count as "second" isn't clear. Sure, the first and second analyses aren't the same but that isn't the point. The point is that the selection of the subset increases the size of the reported correlation. Since you don't seem to dispute that I am not entirely clear what your point is. Vul et al go on and on about inflated – spuriously large, impossibly large – correlations. Not two inferential tests. And the procedure you have described does exactly that: inflates correlations. "standard corrections for multiple tests are implemented" – you make it sound so easy. Yet nobody does multiple corrections so why you write "corrections" instead of "correction" isn't clear. Which "standard correction" did you use?

Matt (2009-01-28 21:53:44)

A single test is run on each voxel in the brain (not on a subset). Let's say that's 40,000 tests. Each of those tests are computed independently. We get a p-value for each. That is the only inferential step that occurs. Two things then follow this. First, we have to report something in the journal manuscript itself. Convention for all of cognitive neuroscience (as well as most behavioral studies as well) is that tests that meet a significance threshold are reported and all other tests are assumed to have been computed but had p-values that did not meet the significance threshold (i.e. readers then know which clusters have p-values below the threshold and which have p-values above the threshold). For the tests that are reported, because their p-values were below some conventional level, you then have to decide what to report to describe the data. You might report means and standard deviations, you might report t or Z statistics, or you might report r or d. In each case, these are descriptive statistics rather than an additional inferential biased because it uses the same criteria again. Let's say we have 4 classrooms and you run t-tests comparing the heights of the students in each two classroom combination. Imagine that you find that classrooms 2 & 4 show a reliable difference from each other on height. You might then say "Of the combinations tested there was a significant difference between classrooms 2 & 4" and readers would assume there were no other significant differences. There's no selection bias here - just reporting of what's significant. Now are you allowed to tell readers what the average heights are in classrooms 2 & 4? Because Vul et al., say you can't, but of course you can and should. If you don't believe me, read Vul's other chapter with Kanwisher where he says that if you run a whole-brain contrast comparing responses to emotional faces to neutral faces, that you can't graph the results from significant clusters. Incidentally "corrections" was plural because there are multiple techniques that can be used for correcting. In any particular case, a research group does a single form of correction.

seth (2009-01-28 22:22:33)

Gee, Matt, you're still not denying that post-hoc selection of a subset inflates the correlations. Which – correct me if I'm wrong – was the main point of Vul et al. Along with the point that this inflation was not made clear in the published papers. I'm still curious: What correction for multiple tests did your research group use?

Matt (2009-01-28 22:49:43)

Actually, what I am denying is that there was any post-hoc selection of a subset of the data. Running multiple comparisons leads to inflated effect sizes but that has nothing to do with "post-hoc selection". And actually, the main point of their article was not that there is inflation but rather that this inflation is so great that the results should be considered worthless and likely spurious and also that the methods used to obtain the results are invalid and therefore the results themselves are invalid. These tests are run in order to identify regions where there are reliably non-zero correlations and they are a perfectly valid way of doing so. To report descriptive statistics is entirely valid as well. Since we seem to be talking past each other, let's consider one last example. Let's say I run my 40,000 independent tests on my 40,000 voxels. You would admit at this point there has been no "selection bias" inflating these tests, correct? You might have some large effects due to sampling fluctuations, but our Figure 1 shows that with normal fMRI sample sizes and appropriate correction for multiple comparisons, this is relatively rare (Vul's simulation was done assuming 10 subjects which is not representative of fMRI studies). Let's further assume that I submit my paper to the journal with a 200 page table that lists the p-value (along with descriptive statistics) for every voxel in the brain. Still no selection bias inflating these tests, correct? If you sorted this table by p-value we'd still be ok, right? Now the editor comes along and says "we can't have a 200 page table" so cut off everything with a p-value worse than \_\_\_ and add a note to indicate that all other voxels had p-values above that threshold. The voxels that remained would be no more inflated after this editorial decision than before -

its just a matter of convention for displaying data. This is what we all do and there is no "non-independence error" as Vul claims.

seth (2009-01-29 01:47:24)

Matt, could you post again the last part of your comment? It was cut off. What you call "selection bias" – computing a correlation using only voxels selected by looking at the data and thereby inflating the correlation – doesn't inflate "tests" it inflates correlations. Nor are "voxels" inflated (by "voxel" I guess you mean the correlation computed for just one voxel), it is the correlation computed over many voxels that is inflated. That's when you got into trouble – by computing a number that might be grossly inflated. Let's say I select a subset of free throw attempts where Michael Jordan missed. Then I compute his free throw percentage over only those free throws. It is 0 %. To report that 0 % as if it means something is . . . well, call it what you want. As far as I can tell, that is basically what you did.

john (2009-01-29 05:40:50)

Seth, "Let's say I select a subset of free throws where Michael Jordan missed. Then I compute his free throw percentage over only those free throws. It is 0 %. To report that 0 % as if it means something is . . . well, call it what you want. As far as I can tell, that is basically what you did." I may have missed something here, but isn't that what Matt is claiming that Vul has done? Isn't one of the strong arguments in the Lieberman paper that Ed Vul simply hand picked results from papers that would show the effect he wanted to show and ignored the others that didn't? In fact when Matt puts all the data in to the analysis there is no bias in the correlation coefficient at all.

Matt (2009-01-29 08:04:59)

Sorry for the typos (yes its the correlations that are inflated, but that's not what the test is testing - its testing for reliable non-zero relationships). Your Jordan analogy doesn't quite apply. That would assume that we are making claims about the average correlation in the brain but only reporting on a subset of voxels (and pretending they are all the voxels). We aren't making claims about how the brain as a whole or on average relates to personality - rather we are looking for which regions do correlate reliably and then providing descriptive statistics for those that do. To get the Jordan analogy right, the question would be "Are there certain days of the week when Jordan shoots a higher percentage than others?". We'd have him shoot 100 free throws each day of the week for say 10 weeks. So we'd have 1000 data points for each of the seven days of the week. We wouldn't care at all what his average across all days was, just how each day compares to each other. If his averages were 30 % on mondays, 90 % on fridays and 60 % on all other days, we would say something interesting is happening on mondays and fridays, report that test and the descriptives that go along with it (e.g. 90 %). Now if we reported that Jordan shoots 90 % on average because we claimed that fridays were the only days were looking at, we'd be in trouble, but nobody does that. Our question isn't the average, but rather, when is there something different from average going on.

Matt (2009-01-29 09:03:42)

So, we combine a significance threshold (i.e. p-values less than .005 or .001) with an extent threshold (i.e. there have to be at least 10 contiguous voxels that all have p-values less than the significance threshold). This is a standard procedure used throughout cognitive neuroscience for the past 15 years.

seth (2009-01-29 09:56:06)

Thanks, Matt.

'Voodoo Correlations in Social Neuroscience' « The Amazing World of Psychiatry: A Psychiatry Blog (2009-01-30 18:08:54)  
[...] Seths Blog article [...]

Justin (2010-01-01 05:14:28)

Hi Seth, Any chance of some constructive feedback on this video on the above study?  
[youtube=<http://www.youtube.com/watch?v=nMZvpVwfObE>] Regards Justin

seth (2010-01-01 07:13:34)

Justin, because I'm in China I can't get YouTube.

Matthew Lieberman (2010-03-24 13:16:13)

For anyone interested, there was a public debate on Voodoo Correlations last fall at the Society of Experimental Social Psychologists between Piotr Winkielman (one of the authors on the Voodoo paper) and myself (Matt Lieberman). The debate has been posted online. <http://www.scn.ucla.edu/Voodoo&Typell.html>

## **The Museum of Tap Water (part 2) (2008-12-28 14:55)**

As I [1]noted earlier, Beijing has a museum devoted to tap water – apparently the only one in the world. Another translation of its name is the Beijing Water Supply Museum. It was incredibly hard to find. None of a dozen people in the neighborhood knew where it was. It is on the grounds of the government company that supplies tap water. While I was there, there was only one other visitor, an American. Like me, he'd noticed it on Google Maps.

I loved it. One of the exhibits was called "10-Day Imperial Approval". Permission to start the water company (around 1910) was requested from the Emperor. Approval came in a lightning-fast ten days from the Emperor's mother on yellow paper. Only the Emperor, his father, and his mother were allowed to use yellow in decorative ways. The penalty for breaking this rule was death. In the early days of the water company, slips of paper gave you permission to collect your water in a bucket. A photo of an early president of the company (thin, young, shaved head, high-collar traditional shirt) made him look more like a dashing criminal than a captain of industry.

For anti-terrorist reasons, there was nothing about how the water was processed.

Museums are usually devoted to the rare, beautiful, and intricate, which why a museum of tap water sounds like a joke. When Paul Goldberger, the New Yorker's architecture critic, devotes [2]his best-buildings-of-the-year list to nine show-off buildings and an art exhibit – none of them advancing the art of making the houses and workplaces where we spend most of our lives – I am glad to see agreement that something is missing.

The other visitor was in Beijing to visit his sister, a high school exchange student, living with a family that speaks no English, who had checked the wrong box on her visa application and was unable to come home for Christmas. She was having a great time and now wanted to apply to a college with a [3]Flagship Program – you go to the American school for two years and then a Chinese school for the last two years. What a sea change! Americans treat another country as equal. Americans grasp that someone else might have something to teach us. At Berkeley a few years ago, the psychology department had a day-long get-together to discuss various issues. About a meeting about one of them, I suggested that we look at how other departments had handled it; maybe we could learn from them. Bad idea, I was told, they're supposed to copy us.

Stephen M (Ethesis) (2010-02-08 07:09:09)

Made me smile and sigh to read *maybe we could learn* and the response. A Dilbert moment for certain.

### **Corruption of Doctors by Drug Companies (2008-12-29 06:07)**

Several books about this have appeared recently and are reviewed by Marcia Angell [1]here. It's a good review, especially a good summary of the books, but I was really surprised by this:

Members of medical school faculties who conduct clinical trials should not accept any payments from drug companies except research support, and that support should have no strings attached, including control by drug companies over the design, interpretation, and publication of research results.

She expects a researcher who depends on drug companies for research support to be honest? Why? If you don't get favorable results your grant won't be renewed. Under this system it will be survival of the most corrupt. A reformer proposed this.

I think it's a lot like too much humanitarian aid. Supply free milk to a needy area for too long and you wipe out the local dairy industry. Judging from this stunning proposal, the drug companies have wiped out whole medical schools. The doctors who work in them are no longer capable of doing independent research. This is worse than corruption, it's enfeeblement.

1. <http://www.nybooks.com/articles/22237>

---

Pietr Hitzig (2008-12-29 09:09:00)

Furthermore, the pharmaceutical-medical school conglomeration suppresses new ideas that utilize treatment that does not enrich the drug companies. A decade ago, I found that the use of natural amino acid precursors could patially remit a fatal neurodegenerative condition. That I was having favorable results permeated the patients being studied at my local prestigious medical school. The investigators were furious that their patients were taking my treatment. They were concerned that this intervention threatened the study, the health of their patients was incidental. All attempts to reason with these professors were futile. They issued an ultimatum, "If you continue the precursor treatment we will cast you off, you will be dropped by our institution." Marcia Angell should call researchers by their proper name, "whores."

Andrew Gelman (2008-12-29 09:23:23)

Seth, In your quote, Angell writes "should." So it doesn't sound like she "expecftes a researcher . . . to be honest." She's just saying that's how it should be. On a slightly related note, I had a question years ago about something else that Angell wrote; see here: <http://www.stat.columbia.edu/~cook/movabletype/archives/2006/06/costs-and-benefits.html> I was not able to contact her to get her response.

seth (2008-12-29 13:42:22)

Pietr, this is an aspect of clinical trials I didn't know about. Patients in clinical trials are not allowed to seek other treatments? What was the amino acid precursor? and what was the neurodegenerative condition? How did the professors doing the study convey their incredible request?

Jacob (2009-03-08 22:22:54)

Pietr Hitzig, I read your posts and it makes me sick. You sit here and talk about what you did in the medical community when in reality all you did was kill people with your fen/phen protocol.

### A Self-Experimental Near-Miss (2008-12-29 22:55)

I am developing tests to measure how well my brain is working. Brief tests I can use daily. My experiences with flaxseed oil make me suspect that sometimes our brains work better and/or worse than usual for many hours or days at a time and this goes unnoticed. If these instances of better or worse function could be detected, maybe we could figure out their causes – and thereby improve how well our brains work by getting less bad stuff and more good stuff. In the case of flaxseed oil, I noticed that one morning my balance was much better than usual. I noticed this only because I was doing something unusual: putting on my shoes standing on one foot. I verified that observation with a better test of balance and later found that flaxseed oil improved my performance on several mental tests, such as speeded arithmetic.

One test I am using is a typing test: On each trial I type a random sequence of six letters four times. For example, if the sequence is "rksoen" I would type rksoenrksoenrksoenrksoen". At the moment the measure of performance is how fast I type the 24-letter sequence. Each session consists of ten trials.

Here are the results so far:

Each point is a mean over the ten trials; the error bars show standard errors. I was glad to see there was little sign of learning after the first few sessions. Having to correct for learning would make comparison of different days more difficult.

Because I am collecting a lot of data, I could look at these data more carefully. It took me a little while to do an

1516

analysis where I corrected for the difficulty of each string: Some will be easier to type than others. My first attempt at correction involved adding a factor for each letter: does the string contain an "a" (factor 1)? Does the string contain a "b" (factor 2)? And so on. This correction made a big difference: The residual mean square was almost cut in half (= sensitivity was doubled). After correcting for this, I got new estimates and standard errors for each test session:

Uh-oh! The new analysis revealed there had been something unusual about the second-to-last test session – my typing had been distinctly slower than usual. Something I ate? Unfortunately, by the time I did this analysis I could no longer remember what might have been different.

Ben Hyde (2008-12-30 10:18:10)

Other news on the difficulties of self experimentation: <http://xkcd.com/523/>

Ascription is an Anathema to any Enthusiasm › Never Learn (2008-12-30 10:29:58)

[...] Here's an interesting cognitive science puzzle. [...]

Justin (2008-12-30 21:01:07)

Sounds like a fairly complicated measure with the corrections involved. I have heard of a guy doing simple arithmetic selected at random to test his cognitive abilities. I just think it's so hard to measure because (1) you will get better at anything you keep doing even if it is typing random letters, and (2) trying to make tests unique inevitably means some tests will be more difficult than others. I don't know of any solution to this problem; it seems that until we can all have our own personal brain imaging equipment we will simply have to accept imperfect measures.

seth (2008-12-30 22:18:06)

Ben, thanks for the link. I hope to use it in my talks. Justin, my other test is a simple arithmetic test. Corrections make a big difference there, too. As for brain imaging, you might want to see my recent post on voodoo correlations.

Zack (2009-01-02 18:48:51)

I do sudoku puzzles with a special rule to make them harder, and I do three in one sitting to correct for any given puzzle being too hard or easy. (Actually, the special rule that I use is two rules: I do all the 1s first, then all the 2s, and so on. Within 1 number, I progress from left to right, going down the page. So first, I fill in any blank 1 in the upper-left square. Then I fill in any blank 1 in the upper-center square. Third, I fill in any blank 1 in the upper right square, and so on, until the ones are complete. Then I do all the 2s. And so on.) Using a given publisher, and staying within a given difficulty rank (I only do "hard" ones), a 'set' of three is a good self-test for how sharp my mind is. I suspect that some outside experiment would verify this. After a period of (what I will call) "burn in", of probably the first few hundred puzzles I ever did, I have stopped learning anything. I am not improving as time goes by. So now, on a good day, I can sit down and do three puzzles (subject to my handicapping rule, above) in 20 minutes or so. If there is something wrong with my mind (distracted, anxious, hungover, tired, etc.), I will make mistakes or take forever, or sometimes be unable to complete one. Sometimes I'll be stumped by a puzzle, but also know that I'm tired, or "off"—and I'll look at the same puzzle a different day and find it easy.

## The Missing Heritability of Height (2008-12-30 18:42)

In a special section of Nature on personal genomics, Brendan Maher [1]writes:

This year, three groups of researchers scoured the genomes of huge populations (the largest study looked at more than 30,000 people) for genetic variants associated with the height differences. More than 40 turned up.

But there was a problem: the variants had tiny effects. Altogether, they accounted for little more than 5 % of height's heritability — just 6 centimetres by the calculations above. Even though these genome-wide association studies (GWAS) turned up dozens of variants, they did "very little of the prediction that you [can] do just by asking people how tall their parents are", says Joel Hirschhorn at the Broad Institute in Cambridge, Massachusetts, who led one of the studies. . . .

There could be scarier and more intractable reasons for unaccounted-for heritability that are not even being discussed. "It's a possibility that there's something we just don't fundamentally understand," Kruglyak says. "That it's so different from what we're thinking about that we're not thinking about it yet."

Still the mystery continues to draw its sleuths, for Kruglyak as for many other basic-research scientists. "You have this clear, tangible phenomenon in which children resemble their parents," he says. "Despite what students get told in elementary-school science, we just don't know how that works."

I don't think it's so mysterious. My self-experimentation led me again and again to find unsuspected environmental causes for various problems. I believe the answer is this: The heritability estimates were overestimates. As one researcher put it, "Heritability estimates are basically what clusters in families, and environment clusters in families." Variations in environment make far more difference than variation in genes.

What the researchers "don't fundamentally understand," I believe, is their own tendency toward religious thinking

- the tendency, shared by all of us, to believe what we're told regardless of the (lack of) evidence for it. The notion that genes make a big difference in practice is one of those beliefs, repeated endlessly by genetics researchers (James Watson is fond of repeating it), that are supported by poor evidence at best. Obesity, it should be obvious, is an environmental disease if there ever was one. Yet Jeffrey Friedman, a researcher at Rockefeller University, is studying the [2]genetic basis of obesity.

Thanks to Dave Lull.

Oliver (2008-12-31 02:46:18)

This suddenly made me interested in how environmental factors affect height. Any links to further reading/studies on this topic? I'm a lot shorter than my two younger brothers, and I guess I'm curious as to why it turned out this way.

seth (2008-12-31 04:32:11)

this is a great article about how environment determines height: [http://www.newyorker.com/archive/2004/04/05/040405fa\\_fact](http://www.newyorker.com/archive/2004/04/05/040405fa_fact)

Oliver (2008-12-31 12:12:03)

Thanks!

drbganimalpharm.blogspot.com (2009-01-01 20:55:48)

Oliver, I've wondered the SAME thing since I'm the shortest among 4 siblings... It's the nutrition and Weston A Price (as well as the New Yorker article) distinguishes why. My parents were poor as my father was a surgery fellow and new to the U.S. when he arrived from Taiwan, shortly before my conception. I'm Asian but the 3rd and 4th siblings are 5'8" (and I'm only 5'4.5" and half-inches are emphasized \*hee\*). Grains diminish height - read some WAPF info. Something about the pro-inflammatory and pro-cortisol effects of grains and esp wheat create a metabolic dysregulation which degrades growth and height gains. We went wheat-free in our household in the last 6mos and our children have sprouted in height. -G

drbganimalpharm.blogspot.com (2009-01-01 20:56:14)

Sorry- I'm the oldest, first born of 4.

Patrik (2009-01-04 16:47:06)

*Obesity, it should be obvious, is an environmental disease if there ever was one. Yet Jeffrey Friedman, a researcher at Rockefeller University, is studying the genetic basis of obesity.* Bu-bu-but if obesity were an environmental disease, we couldn't absolve ourselves from personal responsibility. And I for one, won't stand for that! :) Good post.

## Beijing Shopping (photo mall) (2008-12-31 15:59)

To get a light meter (to measure the intensity of morning sunlight) I went to [1]Beijing Camera Equipment City ([2]official website). On the ground floor were 50-odd small shops. They sold the stuff in any camera store, except far more various: cameras, lenses, cases, tripods, flashes, and so on. Some specialized by brand (e.g., Canon), some by product (e.g., tripods). About 10 stores sold the light meter I wanted (Sekonic L-308S). One didn't have it in stock, but they could get it. How long would it take? Five minutes. That is, they would buy it from another vendor and resell it to me.

The sequence of prices (in yuan) I was quoted was 1450 ( \$212), 1300 (same vendor as 1450), 980, 950, 940, 930, 920 ( \$135). One vendor wouldn't sell it at 920, so perhaps that was a good price. Online I would have paid about \$170.

One store had a discontinued model. The meter in the box (Gossen) didn't match the box (Sekonic)! I would have gladly bought a Gossen but the manual in the box was for a Sekonic.

The second floor was . . . software. Fancy dresses (often wedding dresses), fancy dresses for children, costume jewelry, frames, colorful textiles, displays of the work of professional photographers. The smallest shop sold bags to carry home a fancy dress. All the photography-related stuff that ordinary photo shops don't carry.

2. <http://www.bjphoto.com.cn/>

---

Justin (2008-12-31 17:25:08)

Morning sunlight intensity...very interesting. Is this a new variable you are collecting? I would imagine that the more intense the sunlight, the easier it is to wake up and thus the better your day. Can't wait to hear how it correlates with your wakefulness, mental quickness, and mood.

#### The End of Newspapers As We Know Them (2009-01-01 19:29)

Michael Wolff, author of the excellent *Burn Rate*, [1]writes:

Throughout the Tribune worldâ€”the LA Times, the Chicago Tribune, the Hartford Courant, among othersâ€”everybody knows life as itâ€™s been has ended. . . . You have to understand that this is the most momentous, and transformative, time in the news businessâ€”as significant as this moment is to the automotive and financial industries. There will be, practically speaking, no newspaper industry after this is done. A nobody-gets-out-of-here-alive sort of thing.

A friend of mine who works for one of these newspapers said that the end has been coming for a long time. In the early 1990s, if I remember correctly, the audience started to shrink. At the time, and for a long time thereafter, this was ignored. Had the problem been recognized back then it might have been possible, given a lot of time to experiment, to find a solution, a way to survive much longer. But now it is too late.

1. <http://blog.newser.com/post/2008/12/09/THE-STORY-CANT-BE-TOLD.aspx>

---

mike kenny (2009-01-02 16:27:00)

why the heck do we tend not to act on these things? i don't mean to judge finance and newspaper people. i tend to be a fan of capitalism and tend to think that the market is the best you're going to get in judgments, but it's weird to think people are looking at numbers and saying, 'wow, the numbers aren't good, but let's just ignore them and see what happens,' then things fall apart. maybe people have a habit of procrastinating, in the hopes some answer will emerge, and maybe this is a decent strategy often, since it seems like it comes so naturally.

seth (2009-01-02 19:00:17)

It was much much easier to ignore them than to do something. To do something that might have been useful would have involved starting whole new projects. Getting people to work on those projects - of questionable career relevance - would have been incredibly hard given their apparently flimsy motivation.

Jarno Virtanen (2009-01-02 22:36:18)

I find the difficult thing about self-experimentation to be the problem of finding reliable tests of progress, especially in the case of mental performance. It's easy to measure something like weight or the quality of the sleep, but it's much more difficult to get a reliable measure of sustaining attention, for example. I'm not saying it should be easy and I guess reliable measurements of various aspects of mental performance would borderline making novel science. But I think many others like me are interested in doing self-experiments, but the difficulty is to find useful and reliable experiments.

seth (2009-01-03 04:15:16)

Jarno, I don't know what you mean by "reliable". There is error - variation, noise, whatever you want to call it - in everything. Whether the noise is small enough to detect interesting things is very hard to tell without actually trying it.

Jarno Virtanen (2009-01-08 22:34:27)

Hmh, maybe "reliable" was the wrong word. What I meant that it's difficult to come up with a metric for a complex behavior or problem in the first place. Coming up with a metric for something like sustaining attention or ability to direct attention seems somewhat difficult. Whatever simple metric one comes up with, there's always the doubt whether it actually measures the thing you're trying to affect with your experimentation. That said, I do understand that the value of self-experimentation comes from finding some effect, which sometimes isn't what you were looking for in the first place. (Or perhaps lack of effect sometimes.)

seth (2009-01-09 01:50:45)

Jarno, that sounds like me when I was a first-year graduate student. I'd think of some design, then think of the flaws in it. Then think of another design, think of the flaws in it. And on and on. That was naive. More reasonable was to do something and try to learn from it rather than try to predict the future without any data.

Jarno Virtanen (2009-01-09 02:12:05)

Yep, makes sense. :-)

## Folic Acid and Birth Defects (2009-01-02 20:23)

The researchers who discovered that too little folic acid causes birth defects haven't gotten a Nobel Prize (and probably never will) but they should, as [1]this article explains:

After 3 decades of epidemiologic research reporting an association between neural tube defects and maternal use of folic acid, public health organizations developed recommendations and supported interventions to increase folic acid intake among women of reproductive age. In 1992, the US Public Health Service recommended that all women of childbearing age who are capable of becoming pregnant should consume 400  $\mu\text{g}$  of folic acid daily.

. . . In 2005, after the National Campaign and mandatory fortification, approximately 33 % of women reported taking a daily supplement of folic acid, only a modest increase from the 25 % reported in 1995. However, median blood folate levels among women of childbearing age increased from 4.8 to 13.0 ng/mL between 1994 and 2000, with a more recent study reporting median blood folate levels at least 2 times the levels prior to fortification.

To evaluate the impact of this public health intervention, 4 study groups have conducted time trend analyses among the US population, and all have reported a decline of neural tube defects after the introduction of mandatory folic acid fortification. Specifically, these studies reported an 11 %–20 % reduction in occurrence of anencephaly and a 21 %–34 % reduction in occurrence of spina bifida when comparing pre-versus postfortification rates. Similarly, the occurrence of anencephaly and spina bifida was observed to reduce 38 % and 53 %, respectively, in Canada and 46 % and 51 %, respectively, in Chile following folic acid fortification.

[2]Here is the first article on the subject. As the dean of a school of public health put it, this discovery by itself justifies all the money ever spent on schools of public health.

2. <http://www.pubmedcentral.nih.gov/articlerender.fcgi?tool=pubmed&pubmedid=7448527>

---

Stephen M (Ethesis) (2009-01-03 19:39:23)

I've always considered it criminal how many OB/GYNs failed to prescribe folic acid, especially to mothers of Welsh decent.

## Does Innovation Require Markets? (2009-01-03 05:29)

Andrew Gelman [1]writes:

The [2]article [about economics professor David Galenson] then quotes art professor Michael Rushton as saying that in science or art, "innovation really requires a market." Huh? Wha?? Tell that to my friend Seth, who spent 10 years self-experimentation. Heck, tell that to the cave painters. Or check out the American Visionary Art Museum.

I agree. I was able to do self-experimentation for 10 years because I didn't have to sell, i.e., publish it. Not having to sell – I mean publish – it gave me the freedom to do and think whatever I wanted for as long as I wanted.

Innovation benefits not from markets but from subsidies, which provide time to experiment. In my case, I was a professor at Berkeley – subsidized by the State of California. I had tenure and free time. Sometimes the subsidies aren't obvious. Part of [3]my theory of human evolution is that gifts, ceremonies, holidays, fashion, and connoisseurs, not to mention love of art, subsidized artists and artisans by providing a desire for work that – in the absence of gifts, etc. – would be much harder to make a living from. Helping artists and artisans make a living helped them advance their technology. Cave paintings may have been part of a holiday observance – the artists took time off from hunting. Before trade, Thorstein Veblen's Instinct of Workmanship motivated innovation. Andrew himself built the table in the above photo for reasons that had nothing to do with markets.

But at least an economics professor is studying innovation. A few years ago in the Berkeley Public Library I picked up an introductory economics textbook. Six or seven hundred pages. Half a page on innovation!

1. <http://www.stat.columbia.edu/~cook/movabletype/archives/2008/08/the-statistics.html>

2. <http://www.nytimes.com/2008/08/04/arts/design/04pica.html>

3. <http://www.blog.sethroberts.net/2007/06/27/my-theory-of-human-evolution-directory/>

---

Andrew Gelman (2009-01-04 18:30:18)

Hi, Seth. You garbled the link to my blog. It should be this: <http://www.stat.columbia.edu/~cook/movabletype/archives/2008/08/the-statistics.html> But, yeah, the more I look at this, the more amazed I am that someone could say something so silly. I think one problem is the system of economists and economics journalists patting each other on the back. For example, for a silly quote by an economist about how economists are different from everyone else, see here: <http://www.stat.columbia.edu/~cook/movabletype/archives/2006/11/everyone-is-fun.html> As long as people get in the New York Times for saying such things—and reporters don't question them on this sort of thing—I expect we'll keep seeing it!

seth (2009-01-04 19:08:41)

Thanks for the correction. In the case of the "markets" quote, I think the guy who said it was reflecting the common belief among economists that markets are very powerful and can solve all sorts of problems. So it wasn't so much the person who said it being mistaken ("silly") as it was/is most of his profession – and if so "silly" is probably the wrong word. You were like the child in The Emperor Has No Clothes. As for the "economists are different" quote I disagree. What she said was true – economists do have different beliefs and starting points than anthropologists, sociologists, psychologists, etc. – and I think it's helpful to point out the differences.

Andrew Gelman (2009-01-05 19:23:32)

What was silly about the "economists are different" quote is that she basically said that economists are different because they think everyone is the same!

seth (2009-01-05 22:32:04)

Haha! You're right, she carefully distinguished her cohort (academics, who have big important cultural differences) from the cohort under study (who don't).

KevinH (2009-01-06 11:46:43)

I think it is silly to assume that innovation requires markets. A Crusoe economics thought experiment would certainly show that ole Robinson would be able to create something that he had no prior knowledge of (innovation) in response to his needs. I would think that a market usually defines voluntary relations between more than one party - so even though the market expresses needs, the fact that one has needs does not denote they exist in a market. Since Robinson would surely be able to create something in response to his own needs on a deserted island - innovation does not require markets - only needs. Regular Economists cannot properly model this with their mathematical functions, so they just state things as fact without proper backup.

Patrik (2009-01-06 23:39:07)

*Innovation benefits not from markets but from subsidies, which provide time to experiment. In my case, I was a professor at Berkeley – subsidized by the State of California. I had tenure and free time. You are subsidized by the taxpayers of the State of California, not the State of California.*

## Things That Work Much Better When Broken (part 2) (2009-01-04 04:55)

If six months ago you had told me such things existed I would have been very skeptical. But since then I have come across two examples. Example 1: [1]contact lenses. Forced during a trip to wear just one lens (leaving one eye without a lens), I realized my sight was much better than when I wore two. I had sharp vision both close and far away. And the unlensed eye got more oxygen than usual.

Example 2 I also discovered by accident. My bike lock no longer locks. It is hard to see this, so if I fake-lock my bike – which I got for free – it is still sufficiently protected. My bike lock is now much easier to use. No more worry about the key. No way it can become impossible to unlock, which has happened once in two months. (To any Tsinghua students reading this: Please don't steal my bike.)

1. <http://www.blog.sethroberts.net/2008/12/22/the-twilight-of-expertise-part-14-opticians/>

---

pd3 (2009-01-04 17:10:58)

as far as the one contact lens mistake/experiment, when it has happened to me I feel like my eyes feel strained, so I can't really do it for more than a couple of days.

Tom (2009-01-07 12:43:22)

If you're nearsighted (as I am) one can actually have LASIK done on one eye and be left with the ability to see distantly and read close-up at the same time. (I think they call this 'monovision.') I had assumed that this would be too risky to try, but your experience may make me reconsider this. If you continue to experiment with monovision, please keep posting about your experience.

## Tracking How Well My Brain is Working (2009-01-05 02:54)

From [1]my omega-3 results I got the idea that our brains may work better or worse without our noticing. I want to track how well my brain works not only to test the effects of different dietary fats (our brain is more than half fat) but also to allow the possibility of discovering new effects, both good and bad.

One test I am using is a typing test (early results [2]here). Another is an arithmetic test. I got the idea of using arithmetic from [3]Tim Lundeen. Like him, I found that the speed with which I could do simple arithmetic problems ( $8+0$ ,  $4*3$ ) was sensitive to the amount of omega-3 in my diet.

The arithmetic test involves doing 100 problems separated into 5 blocks of 20 each. There is little time between each problem. I type the last digit in the answer; e.g., if I see  $8*8$  I type 4. The possible answers are 1, 2, 3, 4, 7, 8, 9, and 0 so that I don't have to move my fingers off the keys. There is feedback after each block. I aim for 95 % correct.

This is my second use of an arithmetic test. The advantages of this one compared to several other tasks I have tried are:

- Portable. Only requires a laptop.
- Well-learned. So I should plateau (reach a steady speed) sooner than with a task I learn from scratch. When my speed is steady it will be easier to compare different conditions – no need to correct for learning.

- Uses eight fingers. Many tasks used by experimental psychologists have just two possible answers (yes/no). With eight possible answers there is less anticipation and less worry about repetitive strain injury.
- No data entry. The task is written in R, the language I use to analyze the data.
- Many measurements per minute. This allows me to correct for problem difficulty and get a standard error for each test session.

Here are early results.

In the test sessions after January 1, two sets of points are above the line – I was slower than expected, in other words. Both came from test sessions about an hour or so after I woke up. At the time of those sessions I felt fine – not tired, not groggy – and was a little surprised. This is a trivial example of what I am looking for: new environmental effects.

The bigger context of this research is that scientists know a lot about idea testing but almost nothing about idea generation – how to find new ideas worth testing. Maybe this research will teach me something about idea generation.

[4]A talk by Tim Lundeen about related stuff.

stephen (2009-01-05 22:15:25)

nice work seth. very interesting. what statistics packages do u prefer? i use excel, word, spss and a few online calculators.. also, have u ever used qualitative methods for self experimentation?

seth (2009-01-06 19:04:20)

The statistics package I use is R. It is open source. I'm not sure what qualitative methods are but almost all of my self-experimentation has involved numerical measurement so I guess the answer is no.

Seth's blog » Blog Archive » A Statistics Package in the News (2009-01-08 16:20:47)

[...] Tracking How Well My Brain is Working [...]

Joe (2009-01-08 19:47:01)

Would you mind posting your R code for the arithmetic task, Seth? It would be particularly interesting to see how you record reaction times in R. Is there a built-in function that provides ms accurate timing?

seth (2009-01-08 22:34:19)

Joe, it would be difficult to post the R code. There are 20-30 functions involved. I measure reaction times using Sys.time, which provides accuracy to about 1/60th of a second. Since there are about 100 measurements per session, that provides plenty of accuracy. I use getGraphicsEvent to detect a keystroke. Unfortunately getGraphicsEvent only works with Windows. If you have other questions I am happy to answer them. If you know how to use R, have a Windows computer, and promise to run yourself for several days, I will send you the R workspace. But there is nothing very interesting about the code, apart from what I just said.

Joe (2009-01-09 09:09:04)

Unfortunately, I use R on OSX. R in OSX does include getGraphicsEvent, but you're right that it doesn't appear to work. The example code in ?getGraphicsEvent throws up an X11 error. Anyhow, thanks for the offer to send the code, and for the info on how you collect RTs with R.

Seth's blog » Blog Archive » Hey, What Happened to My Brain? (part 1) (2009-07-17 09:55:25)

[...] I've blogged about this. The virtues of this test include: 1. Fast. Takes only a few minutes. 2. Portable. Requires only a laptop. 3. Many possible answers (1, 2, 3, etc.). This reduces anticipation errors. 4. Many numbers (reaction times) per test.Â This allows me to get a measure of variability for each session and can correct for the difficulty of the problem. Aspects with room for improvement include: 1. Speed/accuracy tradeoff. Accuracy isn't fixed. Depending on how accurate I want to be, I'll go faster or slower. (I aim for 95 % correct.) 2. No complex actions. The most enjoyable games have a motor-skill aspect that this task does not. [...]

## The Turning Point (2009-01-05 04:40)

A few months ago, the current-issue table of contents on the New Yorker website would mark web-available articles. [1]Now only articles not web-available are marked.

Still no reader comments. As misguided now as [2]the no-letters-to-the-editor policy used to be.

1. [http://www.newyorker.com/magazine/toc/2009/01/12/toc\\_20090105/?xrail](http://www.newyorker.com/magazine/toc/2009/01/12/toc_20090105/?xrail)

Andrew Gelman (2009-01-06 19:21:58)

In answer to your question about Krugman: 1. Perhaps he learned to write the way many of us did: by practicing a lot! 2. Krugman is an excellent writer but I think this is because he has a lot to say. I wouldn't call him an excellent writer in the way that, say, Michael Lewis is. What Krugman has to offer is some important ideas and the desire to promulgate these ideas. On an unrelated topic, see here for more on poisonous candy: [http://www.stat.columbia.edu/cook/movab-letype/archives/2005/05/weve-been-eat in.html](http://www.stat.columbia.edu/cook/movab-letype/archives/2005/05/weve-been-eat-in.html)

### Lipid Values after 2 Years on the Shangri-La Diet (2009-01-07 14:01)

Stephen Marsh has been doing the Shangri-La Diet for 2 years, taking about 6 tablespoons of ELOO (extra light olive oil) per day. He recently got an expanded set of blood tests done. Here are the results. (10-90 %ile mean 10 % and 90 % percentiles in the general population):

- LDL IIIa+b ( %). 10-90 %ile 13.6 – 43.0; Alert Value >20; SM = 17
- LDL IVb. 10-90 %ile 1.7-9.8; Alert Value >10; SM = .9
- HDL2b ( %). 10-90 %ile 7-30; Alert Value <10; SM = 29
- Apo B. 10-90 %ile 60-140; Alert Value >120; SM = 48
- Lp(a). 10-90 %ile 0-30; Alert Value >30; SM = 10
- Lp \_PLA2. 10-90 %ile 155-419; Alert Value >223; SM = 197
- Insulin. 10-90 %ile 3-25; Alert Value 12; SM = 9
- NT-proBNP. 10-90 %ile 5-125; Alert Value 450; SM = 14

- Cholesterol 134
- Triglycerides 51
- HDL 67
- LDL 57
- Glucose 86

Stephen added:

Two years after the weight loss, taking in what so many of these "experts" say is a dangerous level of fat as a dietary supplement, my bloodwork, especially the important markers, is very good. Bottom line is a low level of small LDL particles and a miniscule level of the dense, dangerous ones (below the reference range). On the HDL (the "bad" cholesterol) the particles are about half of the largest or non-dangerous kind.

---

Stephen M (Ethesis) (2009-01-07 19:23:43)

I've been on maintenance, more or less, for two years. I started SLD three years ago November 9, or about three years and two months as of January 9 ;) Seth skipped where I told him it was life changing and thank you. I'd really like to compare my lipid panel on the tests with one of the critics of SLD who claims it isn't safe. For more information: <http://www.bhline.com/testdescriptions>

Charles (2009-01-08 01:00:37)

Isn't HDL the "good" cholesterol...the one you want to be higher, if anything? LDL is generally described as the bad cholesterol, but the particle size, as you mention, is important. For me the most positive marker here is your Triglyceride/HDL ratio. Anything under 2.0 is considered very good, and yours is less than 1. That's amazingly good.

Pietr (2009-01-08 20:12:19)

I am two years after a cardiac stent. I have been taking with good effect standard lipid lowering therapy with a drop of the LDL to 100. Low but not low enough. The addition of Canola oil was associated with a further 30 percent decrease. That LDL level has been associated with remission of coronary artery stenosis. I have been lax with my Shangri-La protocol. This log encourages me to resume your protocol tomorrow. Can you post Stephens' pre-treatment LDL levels? I encourage others who may have pertinent data to send it to you and maybe send a copy to me as well. Got to go and take a slug of Canola. [phitz96@gmail.com](mailto:phitz96@gmail.com)

Confidence (2009-01-09 09:25:33)

Sigh. Those same experts came up with the "good" and "bad" cholesterol idea, What makes you think the numbers shown are actually good for the individual?

Stephen M (Ethesis) (2009-01-09 15:22:01)

The fluffy v. dense particles are tightly correlated to actual outcomes.

Stephen M (Ethesis) (2009-01-13 21:46:21)

Pietr, the LDL/HDL levels looked good, but triglycerides at top weight, pre-fish oil, were over 300. My two most recent tests were 50 and 51.

## The Shangri-La Diet Hedonic Shift (2009-01-08 05:47)

On the SLD forums, [1]Bennetta wrote:

I never noticed this before, but I used to eat as a way to thwart boredom. Nothing to do? Make some food! The odd thing here is finding myself doing a ton of other things when I would have otherwise been cooking or eating just to entertain myself. Now, instead of heading to the fridge when there's nothing to do, I clean, write letters to friends, or do whatever.

This change in behavior shows that the Shangri-La Diet makes food less pleasant. When we don't feel good (such as are bored), we look around for activities that will make us feel better. Eating is no longer one of those activities. This shift in the hedonic value of food – which happens because our set point becomes lower than our weight – painlessly keeps us from eating. Or if we do eat, we stop sooner.

[2]Michel Cabanac, a professor of physiology at Laval University, Quebec City, has studied how hedonic shifts control behavior in several areas, including thermoregulation and body weight regulation.

---

david (2009-01-08 08:05:00)

I noticed the same connection between boredom and food, but often it was boredom with some task I was supposed to be doing (i.e. work) and food was a way to avoid doing it. After doing SLD for a few weeks (sugar water version) and losing 20 lbs, food wasn't as attractive an alternative. A year or so after doing SLD I also stopped all caffeine, which I had previously consumed in the form of 2-3 espressos per day. The coffees were also an excuse for taking a break from less attractive but more mandatory activities. I never replaced the espressos with a decaf tea or any other beverage. I mostly just drink water with meals now and rarely in between. It appears I need less water because I'm not drinking all that caffeine. I guess now I just have to quit reading and posting comments on blogs and maybe I'll finally get some work done ;-)

Ben Hyde (2009-01-08 09:14:04)

While I had the same experience I would not, absolutely not, describe it as making the "food less pleasant." The pleasure remained. The appetite is what evaporated. I find I have to husband the appetite in service of the hedonic pleasure. I found the discovery of a distinction between appetite and hedonic desire/pleasures thought provoking. Particularly when you turn it back on the common presumption that fat people are suffering from a moral failing.

seth (2009-01-08 15:48:32)

Ben, my experience is that when I am less hungry, eating is less pleasant. Your experience is different? "The pleasure remained" – at the same intensity? When I am not hungry some aspects of eating are still pleasant, such as chewing.

Andrew Gelman (2009-01-08 17:23:24)

Seth: As a food lover, I gotta say that this sounds like a bug, not a feature! I enjoy eating and would prefer to continue to enjoy it. Conversely, you might as well say that, if you lost the ability to read books, that this would be good news because it would free up your time so you could spend more time on food...

Araglin (2009-01-09 16:27:55)

Seth, Is there an analogous way to make playing on the Internet less pleasurable? Is there an hours-logged-on-the-net satiation point that can be lowered in some way? Thanks, Araglin

seth (2009-01-10 07:12:21)

what a great question! my answer is I don't know.

## **A Statistics Package in the News (2009-01-08 16:15)**

I use R, the open-source version of S, several times/day. More often than I use Word. It works far better than S – fewer bugs, much cheaper (R is free) – and S worked a lot better than what it replaced (STATGRAPHICS). I was pleased to see a NY Times [1]article about it:

R has also quickly found a following because statisticians, engineers and scientists without computer programming skills find it easy to use.

"Easy to use" – haha! Non-statisticians and non-engineers don't find it easy to use, in my experience, but it's true that I found it easy to use. "R has a steep learning curve" some people say, twisting the meaning of "steep learning curve" (which should mean fast learning, since that's what a steep learning curve describes).

The popularity of R at universities could threaten SAS Institute, the privately held business software company that specializes in data analysis software. SAS, with more than \$2 billion in annual revenue, has been the preferred tool of scholars and corporate managers. . .SAS says it has noticed R's rising popularity at universities, despite educational discounts on its own software, but it dismisses the technology as being of interest to a limited set of people working on very hard tasks. "I think it addresses a niche market for high-end data analysts that want free, readily available code," said Anne H. Milley, director of technology product marketing at SAS. She adds, "We have customers who build engines for aircraft. I am happy they are not using freeware when I get on a jet."

Ah, "freeware." You may remember when "Made in Japan" was derogatory. Most psychology departments, including Berkeley, use SPSS (Statistical Package for the Social Sciences). Like SAS and its ten feet of manuals, it is horrible. One of my students wanted to make a scatterplot of her data. She went to the psych departmental statistics consultant (a psych grad student who had taken courses in the statistics department). The statistics consultant didn't know how to do this! A scatterplot! It's like Vladimir Nabokov's observation at Cornell and other schools of language professors who couldn't speak the language they taught. [2]Nothing But the Best describes a Julliard composition teacher who couldn't read music. To be a scientist and not be able to analyze your own data is pretty much the same thing. With R making a scatterplot is easy.

To me, the value of R is that it makes high-quality data analysis available to everyone – something very new in the history of mankind. R makes self-experimentation easier because it makes data analysis easier and allows you to learn more from the data you have collected (e.g., make better graphs). I also use it for data collection – [3]measuring how well my brain is working.

---

david (2009-01-08 16:40:12)

There's a difference between "freeware", "open source software", and "free software". The SAS marketing drone chose the derogatory "freeware" to describe something that it really open source software (and might even be free-as-in-freedom software). "freeware" usually describes those free binary programs for which the source is NOT available and which often install spyware on your computer. Free software is something completely different. See: <http://www.gnu.org/philosophy/categories.html> <http://oreilly.com/openbook/freedom/>

Aaron Blaisdell (2009-01-08 17:29:11)

As you well know from our collaboration, I have found R fairly difficult to learn, but then I've always had trouble learning to write code (the learning curve tends to be so shallow that I give up early). I find visually-driven interfaces much more intuitive and I pick them up very quickly (i.e., with a steep learning curve). JMP (pronounced 'jump') is a statistical and graphical program –used by engineers and computer scientists – that has a visually-driven interface (like windows) but allows for some programming of functions. I find it highly useful for data exploration. Perhaps ideally I would use R, but fortunately I can get some of the same benefits (e.g., data exploration) from JMP. I'm very glad, however, that you are so proficient with R! :)

TC (2009-01-09 00:16:27)

at least STATGRAPHICS was written in real APL

seth (2009-01-09 01:42:10)

yeah, before STATGRAPHICS I used APL and wrote APL functions for STATGRAPHICS. I still think it's weird that R doesn't have certain APL functions.

Pedlars (2009-01-09 03:15:15)

Love the debate!! I use R almost daily, well weekly for sure. I find the help forums useful to a point, but often feel intimidated by replies (I'm not a statistician but a user of data). I think one real problem with the R movement is support and validation. There are many ways to do the same/similar thing in R, but as the non-expert - which one do I use?!! and who do I go to to ask to get the most appropriate reply?? I use GenStat too this over comes the problem. it's free to use in teaching world wide and free for research in the developing world. With GenStat I can trust the tools and know it'll point me in the right direction - something very lacking in R. If you buy it, from memory it's lots cheaper than any product beginning with S...., but not free like R. But what is free anyway? it's expensive if I have to invest hours to do anything interesting in R, whereas with GenStat it takes minutes?

Steve Polilli (2009-01-09 12:53:08)

I'm in SAS marketing and just want to state for the record that we are not R or open source haters. I think the Times article was generally good but perhaps gave the impression that we believe the devil resides in R. For a more complete picture check out the response from Anne Milley who was quoted in the Times article. It's at <http://blogs.sas.com/sascom/>

Sol (2009-09-17 23:21:00)

While an economics student in university I had to pass an exam entirely on my knowledge of SAS. It was a bloody nightmare.

### **Kafkaesque Research Regulation (2009-01-08 23:32)**

From the [1]BMJ:

The local research ethics subcommittee, which comprised a pharmacist and layman with limited clinical experience, had concerns about possible drug interactions between amloride and other drugs being taken by the study participants and hyperkalaemia and requested resubmission. Although we pointed out that the pilot was identical to one limb of the amendment that it had already approved, in September 2007 the full committee rejected the application for the pilot to be considered as a study amendment. We therefore had to make new submissions to the local ethics committee, Medicines and Healthcare Products Regulatory Agency (MHRA), pharmacy, insurance company, research and development department, and the local (Wellcome Trust) clinical research facility.

In Spain it takes years to get approval. By the time you get approval someone else has published the study you wanted to do. A nightmarish research environment is one more reason that persons with health problems should do their own research: try to find solutions themselves. I started long-term self-experimentation because I knew that conventional sleep research would never – at least, in my lifetime – help me understand why I often woke up too early. A common problem, easy to measure – but conventional sleep research is nearly impossible.

Can it get worse? Yes, [2] in Russia.

1. [http://www.bmj.com/cgi/content/full/337/oct16\\_2/a1732?ijkey=b57d42e8532bc772fe6b31d459aebfeab4fcea6d&keytype=tf\\_ipsecsha](http://www.bmj.com/cgi/content/full/337/oct16_2/a1732?ijkey=b57d42e8532bc772fe6b31d459aebfeab4fcea6d&keytype=tf_ipsecsha)

## Beijing Shopping (the Beijing Zoo) (2009-01-10 14:53)

A Beijing friend of mine prefers to shop in Hong Kong, where clothes are cheaper than in Beijing. If you must shop for clothes in Beijing, she said, go to the Beijing Zoo. She meant a cluster of stores near the zoo.

When the movie Titanic came out, and I knew it cost a lot to make, I thought I'd lose money if I didn't buy a ticket to see it. For the first time since Titanic I had a similar feeling: At the Beijing Zoo prices were so low it felt like losing money if I didn't buy something.

On seven floors there were hundreds of shops, each crammed with some clothing item: dresses, scarves, shoes, jackets, pants, shirts, and so on. More shoes than anything else. (Few socks.) I wanted to buy shirts but the shirt selection was poor, consistent with the fact that the shirts I already have are from Malaysia, the Philippines, and Hong Kong. But because I could buy a \$6 shirt that would cost \$80 in America, I bought a few anyway. I was happier with the shoes I bought ( \$10 here, \$100 in America).

I love shopping (but alas dislike owning) and especially love Chinese shopping because the sticker price is often just a starting point. It is like adding spices to food. At the first shoe vendor, the quoted price for shoes I liked was \$40. I got up to leave. What's your lowest price? I asked. \$30. I started to leave. What's your price? she asked. What's your lowest price? I repeated. As I left, the price went down to \$20. That's your lowest price? I asked. Yes, she said, what's your price? That was helpful. With other vendors, I started at \$7 and gradually increased my offers to \$10, at which point they were accepted – but only if I was leaving. Sometimes the sticker price was the actual price. For a jacket advertised at about \$14 I paid about \$14, even though another stall a few feet away had the same thing. I went back and forth between the vendors and \$14 was the best I could do.

I hoped to buy a winter jacket but to my astonishment couldn't find one I liked. The student store at Tsinghua has about five winter jackets for sale and I would happily buy one of them ( \$50). Among hundreds and hundreds of men's winter jackets at Beijing Zoo I didn't see a single one I liked. Good excuse to return . . .

---

Andrew Gelman (2009-01-10 19:36:00)

"When the movie Titanic came out, and I knew it cost a lot to make, I thought I'd lose money if I didn't buy a ticket to see it." Say what?

seth (2009-01-11 05:33:30)

If an experience worth \$100 is available and you don't buy a \$1 ticket to see it, in a way you have lost \$99.

denshil (2009-01-13 01:40:24)

I love Beijing Zoo very much

### **Vaccine Safety: A Debate (2009-01-11 16:03)**

As I said [1]on Christmas Eve, thanks to Web comments and blogs, you can now hear many voices in a debate in a way you never could before. The New York Times has just added a vote-like recommendation feature to help sift through a large number of comments. (I hope they add a "sort by" feature to make the most popular comments easy to find.) People you could not usually hear from turn out to have enormously interesting and helpful things to say – again and again and again.

A new example is the debate over vaccine safety. A 2007 book called [2]The Vaccine Book: Making the Right Decision For Your Child by Robert Sears took a middle ground: A way that parents can space out vaccines. This seems to have offended Dr. Paul Offit, a vaccine inventor. With Charlotte Moser he wrote [3]a critique (may be gated) of the book, just published in Pediatrics, that is actually an attack on it. Would the critique be full of well-reasoned arguments? New facts? Nope. It reminds me of my surgeon [4]claiming that a certain surgery was beneficial and, when questioned, saying that of course evidence supported her claim but never producing any evidence. However, overstatement from doctors is nothing new. What's new is [5]the comments section on the critique (may be gated), which contains several fascinating observations.

From John Trainer, a family doctor:

[For Offit and Moser] to castigate [Sears] for offering information to the laity is to fall prey to the same mindset as the early church. By controlling access to the Bible, the leaders of the church exerted control over all.

From Corrinne Zoli, a Syracuse University researcher:

The vaccine debate plays out against a backdrop not only of facts vs. falsehoods, refereed vs. non-mainstream journals and studies, science vs. speculation, a complicated enough arena, but of conflicting cultural "facts," which may be equally important as the science. For instance, parental concerns over the safe cumulative levels of thimerosal (ethyl mercury) in vaccines were unwittingly validated by the American Academy of Pediatrics (AAP) and the U.S. Public Health Service and others recommending their removal (which largely occurred in 2001) even while these organizations were steadfast in public declarations of no causal link between the preservative and various neurotoxic or neuropathological

ill-effects. What did parents learn from this decision? Aside from the fact that the preservative had been long removed in many countries of the world (i.e., the UK and even Russia), or that infants may have received doses exceeding EPA recommendations, they learned that organizations designed to serve the public trust were contradictory in their words and deeds. . . . The larger "lesson learned" by parents was to fear the decision making processes of medical and public health institutions and to become critically engaged with them using whatever tools at one's disposal (i.e., online information, reading scientific studies, discussion groups, etc.).

Fifty years ago, when doctors wouldn't justify their claims, you couldn't do much about it. Few had access to medical libraries or the time to visit them. Now there is an enormous amount you can do. Water will simply flow around the rocks, such as Dr. Offit, who get in the way of better decisions.

This sort of open discussion is so helpful it should be standard scientific practice: allow your research to be commented on by anyone for anyone to read.

---

NE1 (2009-01-11 18:17:49)

Offit and Moser spend their 8 pages pointing out misinformation provided by Dr. Sears' book, when he claims to be acting as a neutral source. Nearly every paragraph has a citation. For example, when addressing Dr. Sears' implication that cow-derived vaccines could be a source of mad cow disease, he references a study in the UK showing there was no risk. One not similarly justified paragraph, for example, notes that Dr. Sears uses a fallacy of personal anecdotes in saying he hasn't seen many meningitis infections around. Unbelievable. There are more than 30 references. Their complaint is mostly that Dr. Sears is misinforming his readers. You are right that there is no new information. In particular though, the highlighted comments do nothing to refute the critique. The only place where the critique is inadequate is in quantifying the harm done by this alternative schedule. They do a poor job of putting a number on it, simply noting several diseases, say where waiting until 5 for influenza vaccine, has led to the hospitalization of X young children (ie, where such studies exist). But yes, they provide evidence against not just his misdirections and falsehoods, but concerning the thesis of the book. The justifications for not getting them, and even for simply delaying or spacing them are attacked. With references. I don't see where Dr. Offit is getting in the way of better decisions. He has identified a book full of misinformation, one that gives phantom support to anti-vaxxers. It actually appears that the fulltext has been made public. If any readers are interested in the references, my experience has been that the authors are always willing to send a pdf copy to polite emailers.

Cam (2009-01-11 23:03:53)

NE1, well said. Pretty much the only things that need to be adding: [http://newsimg.bbc.co.uk/media/images/45360000/gif/\\_45360950\\_meadles\\_cases\\_gr\\_226.gif](http://newsimg.bbc.co.uk/media/images/45360000/gif/_45360950_meadles_cases_gr_226.gif) "Take a bow, morons." -Ben Goldacre It is also worth mentioning that the 'parents of vaccine injured children' in the comments section of the paediatrics article, on the whole, have very little evidence for the title they claim. If there is no statistical link shown in large epidemiological studies between the harm they/their kids suffered and the vaccine they received, the best they can do is post hoc ergo propter hoc. And thar be dragons. If we ran things that way... there would be little point in doing science.

seth (2009-01-11 23:15:50)

Yes, unlike my surgeon, Offit and Moser give citations. The similarity is the overstatement. Offit and Moser claim to be giving a fair description – or at least that should be the purpose of all Pediatrics book reviews – when in fact it is an attack (less valuable) that can't be trusted to tell both sides. There is nothing interesting about such attacks or their one-sidedness; I only mentioned it to introduce the comments, which are interesting. But I agree with you – my post seems to imply that Offit and Moser don't have citations, which is wrong. I have corrected the post. Offit is getting in the way of better decisions by presenting an attack as a fair description. And, as an attack, it is a joke. "Sears never discusses the fact that mercury is present on the earth's surface," Offit and Moser write. Cam, large epidemiological studies are far from perfect. Gary Taubes wrote an article in the NY Times Sunday magazine about some of their problems.

Mark (2009-01-12 10:10:46)

If you get a mob of people looking in excruciating detail at anything they can come up with infinite amounts of "evidence." Look at the 9-11 "truthers," for instance. The medical establishment takes a more 50,000-foot view, and that's the way to go, I think. Are there any psychologists who study conspiracy buffs? To me there seem to be common qualities (but my interest is not great enough that care to try to categorize them myself). My gut feeling is that the anti-vaccine crowd has a lot in common with Kennedy assassination investigators, as well as the followers of this guy: <http://www.enterprisemission.com/>

pd3 (2009-01-12 15:36:15)

. . . . early church . . . bible. . . . wait, huhh??? I've heard this one before – - - transmitted even by religion professors. There is more to the story. Oral tradition was a central part of Jewish culture and the way teachings were passed on from century to century. Then came christ, then came the letters of St. Paul, then came various gospel accounts, then came the bible—along side that oral tradition that had existed forever. These bibles could be reproduced only through painstaking word by word transcription. And that caused just a few bibles. A problem which was exacerbated by the generally low levels of literacy. Moreover, the world's first "internets" a.k.a the printing press, was used to publish the bible—sparking the widespread distribution of the bible and, of course, literacy and other books.

Scott (2009-01-12 18:52:05)

*This sort of open discussion is so helpful it should be standard scientific practice: allow your research to be commented on by anyone for anyone to read.* [1] Sometimes this could be counterproductive, but still, it's a good point.

1. <http://livinlavidalocarb.blogspot.com/2005/06/diet-soda-study-results-are-absolutely.html>

Cam (2009-01-14 02:09:51)

Far from perfect but better than idle speculation about theoretical and unproven mechanisms...

Sharon (2009-01-18 20:13:23)

I recently came across your blog and have been reading along. I thought I would leave my first comment. I don't know what to say except that I have enjoyed reading. Nice blog. I will keep visiting this blog very often. Sharon <http://www.autoloans101.info>

bfg (2009-01-26 12:16:54)

Doctors don't even know what they are injecting into people. All the ingredients of vaccines do not appear on vaccine package inserts. Vaccines are not food and is not subject to different labelling laws than food is. This is called trade secret protection. Why is this a problem? An example: Peanut oil can be used as an ingredient in the vaccine adjuvant and does not have to appear on the label.

## How to Learn English (2009-01-13 12:48)

Pearl Alexander teaches English in Japan. She [1]blogged:

The typically unintelligible and extra-syllable-laden speaking tests delivered to me by the students had a lone girl who stood out with nearly perfect pronunciation, however quite imperfect grammar.

I was completely astonished. Was she taking extra classes outside of school? If so, why wasn't she delivering the typically rhetorical machine-gun speech like most of the juku students?

We got to the last question on her test: "What do you like to do in your free time?" She answered: "I often listen to music. I like Avril."

At Tsinghua University, I had a similar experience. One of a dozen art students giving presentations had much better English than the rest. Did you live in America? I asked him. No, he just watched a lot of English TV and movies. Tsinghua students watch a lot of Friends, not to mention Prison Break and Heroes.

I found a Chinese movie to watch (Together With You) but in one player there is no sound and in another the English subtitles don't appear! I listen to a lot of Chinese on my mp3 player but it is pretty boring. I should try to find some Chinese songs I like and get translations.

imsovain (2009-01-13 14:34:50)

In a similar but not identical vein, I would suggest going a step beyond passive listening, and I would suggest forcing yourself to speak Chinese at native speed. When I was in Korea learning Korean, my reading and writing skills quickly outpaced my ability to speak and understand spoken Korean. Then I came across a linguistic conjecture that the same "systems" that allow one to understand spoken language are involved in producing it and vice versa. So I took the audiotapes that accompanied my language textbooks, and repeated the dialogue at the same speed it was spoken. If I stumbled over my words or paused, I repeated the task. I also used the written text to double check whether I was hearing something correctly. I think the most interesting part of this is I really put very little emphasis on whether I understood what I was saying. I imagine you could do essentially the same thing with music, TV and movies. I'm not sure if the linguistic conjecture is necessarily true, and yeah it was pretty boring, but my spoken language production and comprehension improved dramatically.

mike kenny (2009-01-13 15:48:36)

this american girl who speaks fluent japanese says just about the same thing--she learned through music, basically. <http://www.youtube.com/watch?v=bLZbocCEUBo> &feature=channel\_page

Nathan Myers (2009-01-13 17:31:17)

In Copenhagen and Stockholm I noticed that older people (over 50) spoke English with a distinctly Swedish accent, but many younger people spoke English with a perfect American accent. Apparently they get American TV and movies without subtitles. Stranger, older Swedes have a distinctly Swedish gait, but younger people *walk* like Americans. This was not true in, e.g. France and Italy; French people, young and old, walk in French, Italians walk in Italian. I cannot account for the difference.

danimal (2011-06-16 20:56:10)

try KMplayer, it's really good for everything basically, haven't had 1 file it couldn't handle

### **Vaccine Safety: Is This the Best They Can Do? (2009-01-13 13:21)**

In the debate over vaccine safety, I'm not on either side. I am quite unsure whether vaccines with mercury caused autism, for example. I would be happy to read a decent book on the subject, no matter what the author believed.

Instead we have [1]a book by Dr. Paul Offit, who [2]wrote, criticizing another book about vaccines, that it "never discusses the fact that mercury is present on the earth's surface."

Sentences like that make me think vaccines are less safe than claimed by Dr. Offit.

1. <http://www.nytimes.com/2009/01/13/health/13auti.html?em>

2. <http://pediatrics.aappublications.org/cgi/content/full/123/1/e164>

---

Phyllis Wheeler (2009-01-13 19:14:08)

I have been reading a book by ANOTHER M.D. on the subject of autism and vaccines. This is Dr. Bryan Jepson, whose book *Changing the Course of Autism* was published in 2007. It is a comprehensive review of the studies that exist on the possible causes of autism. Jepson shows that there are plenty of holes in the methodologies used by those wanting to prove vaccines safe. However, he also says that vaccines haven't been proven to be the cause of autism at this time. Please take a look at my blog post at <http://www.phylliswheeler.com/CuringAutismBlog/?p=122>, which goes into much more detail.

Nathan Myers (2009-01-13 20:07:34)

It's certainly true that vaccination supporters are uncommonly bad at presenting a convincing, respectful case for the safety of vaccines. It's probably not that vaccines are especially unsafe – after all, most parents happily feed their kids any amount of artificial color, pesticides, and MacDonald's fries, and on that scale the vaccines seem well down in the noise level, and anyway less than posed by the pathogens they are meant to protect against. It's more a matter of arrogance. It doesn't take much for (what we might call) an anti-anti-vaxxer to start in on name-calling, or lying about the meaning of various studies, exposures, and numbers. When they act exactly like somebody trying to execute a coverup, it's hardly surprising when people conclude that's what's going on. Anti-anti-vaxxers might actually have the truth on their side, but they certainly deserve much of the blame for anybody harmed, either because of real, undelineated risks, or because of illness resulting from the distrust they have engendered through their arrogance.

seth (2009-01-13 20:43:12)

Nathan and Phyllis, thank you for your comments. I wouldn't say that Dr. Offit is "arrogant"; I don't know of any word that is a good description of the argument that it is relevant to vaccine safety that mercury exists on the Earth's surface. It isn't stupid or clueless because yes, the amount of mercury exposure from other sources is relevant. But since everybody in this debate, including Dr. Offit, knows that the amount of mercury a child got from mercury-preserved vaccines was much higher than from normal sources (such as food, air, and water) to bring up such a vague and unhelpful fact just puzzles me.

Ken (2009-01-13 23:16:35)

Over the years I have become more skeptical about modern western medicine. I have two nephews that have autism (one is

5 and the other 8). They both began autism before the age of 2 (after their vaccinations with thimerosal) and under different circumstances but modern medicines have no knowledge of cause or treatment. But through other experimental sources they have found some effective unsanctioned treatments with a gluten-free, dairy free diet. Pediatricians and autism specialists did not believe that they had any affect but we do have anecdotal/empirical but "unscientific" evidence that this has helped. The 5 year old has more than doubled his vocabulary and has more interest in interacting with people. The 8 year old had polyps in his throat that went undiagnosed for years (he's on medicare, so imagine that nightmare). After going on the diet the polyps receded, much to the bewilderment of his doctors. I also have a friend that for years dealt with chronic fatigue and loss of bone mass. Doctors prescribed either medication or surgery without having any knowledge of the root cause. After years of frustration they took a shot in the dark and consulted a chiropractor/holistic practitioner. I sounded hokey, but they rubbed certain items on her skin and tested reactions by feeling their arm resistance. They were skeptical but the practitioner told them to get a DNA test for Celiacs disease. And sure enough the DNA test came back positive. The medical community is skeptical of anything that hasn't been properly vetted (read: multimillion dollar study). Anecdotal evidence is throw off as unreliable at best and kookery more commonly. The medical/pharmaceutical community is very risk averse, probably due to the litigative environment, and can and will only treat very well known diseases and often only the symptoms. Along with this risk aversion is the protectionism of current methods and ideologies. It is unfortunate that medicine is just as susceptible to ideology as politics and religion despite their reliance on science. Western medicine has done a great deal to advance health, for sure, but the persistence of this type of ideology is counterproductive to the point of being discrediting.

### **The Power Law of Scientific Dismissiveness (2009-01-14 06:33)**

In my experience, scientists are much too dismissive, in the sense that most of them have a hard time fully appreciating other people's work. This dismissiveness follows a kind of power law: a few of them spend a large amount of time being dismissive (e.g., [1]David Freedman); a large number spend a small amount of time being dismissive. The really common form of dismissiveness goes like this (from [2]a JAMA abstract):

In this second article, we enumerate the major issues in judging the validity of these studies, framed as critical appraisal questions. Was the disease phenotype properly defined and accurately recorded by someone blind to the genetic information? Have any potential differences between disease and non-disease groups, particularly ethnicity, been properly addressed? . . . Was measurement of the genetic variants unbiased and accurate? [bold added]

This is the dismissiveness of dichotomization: division of studies into valid and invalid, proper and improper, unbiased and biased, accurate and inaccurate. As if it were that simple. Such dichotomization throws away a lot of information. It leads to such absurdities as [3]a meta-analysis of 2000 studies that decided that only 16 were worth inclusion. As if the rest contained no information of value. In the case of the term accurate the problem is easy to see. To draw a sharp line between accurate and inaccurate makes little sense and ignores the harder and more valuable question how accurate?

The average scientist is religious in many ways, and this is one of them. It is part of what might be called religious method: the dichotomization of persons into good and bad. An example is saying you are either going to heaven or to hell – nothing between.

---

Andrew Gelman (2009-01-14 07:18:14)

I don't think religious belief is necessarily about dividing people into good and bad. Certain beliefs—for example, the idea that we are all sinners and should learn to accept this—are highly consistent with good scientific practice, I believe.

son1 (2009-01-14 10:16:09)

Is it not also true, that some of this is dependent on what your (mental) model for capital-S Science is? That is to say, there might be some practices which, while bad on a paper-by-paper basis, are still good when considered for the culture of science as a whole. For example, being excessively dismissive of the results of others might lead me to reject papers which (actually) have value or worth. But if my opinion about science is that "it's vitally important not be *wrong*" (whatever that means), accompanied by a belief that most experiments will be performed over and over again, then an individual attitude of being excessively dismissive might not matter very much.

Nathan Myers (2009-01-14 13:24:59)

Scientists are, generally, extremely dismissive of one another's work, when they're not actively hostile. It's a badge of honor. A scientist seen to accept more than one hypothesis as a likely candidate is seen as soft-headed, and soon ignored. It would seem distinctly unfair to respect the contribution of any non-scientist, or of anyone from outside their own field, while treating their close colleagues so shabbily. They are right to fear being seen as soft-headed by others in their field. Having others habitually ignore your work is career death in science. It's no wonder scientists have internalized these rules. Elder scientists try to atone, a bit, by awarding Nobels to scientists who persevere extraordinarily and prevail, but for every Nobel there are a dozen (that we know of) equally deserving, and a thousand driven out of the field and their evidence buried. Despite all that, science does make slow, fitful progress. Some fields get tied in knots for a generation, or two; particle physics is in that state now. It's hard to see how it will find a way out of it.

dante lover (2009-01-14 14:58:45)

Dante Alighiere might have a little quibble with your metaphor

seth (2009-01-14 15:12:41)

son1, there's a difference between being cautious and being dismissive. You can be cautious without being dismissive. I'm not saying scientists are "excessively dismissive"; I'm saying they shouldn't be dismissive at all. To be dismissive is to draw a line. I'm not saying scientists draw a line in the wrong place, I'm saying it's a mistake to draw any line, that is, dichotomize. Also called black-and-white thinking.

Patrik (2009-01-14 15:32:37)

Good post. Couple things though. Modern science as we know it today, is anything but...science. Most of this so-called science is a religion and most of the so-called 'scientists' are nothing more than high priests toiling away at scripture. I think Taubes proved this conclusively when it comes to the 'science' of nutrition. This has been true since (and before) the days of Semmelweis. *The average scientist is religious in many ways, and this is one of them. It is part of what might be called religious method: the dichotomization of persons into good and bad. An example is saying you are either going to heaven or to hell â€” nothing between.* Seth, for accuracy's sake, religions DO have something in between: purgatory.

bennetta (2009-01-14 15:55:34)

When you consider the historical background that the scientific method grew out of, I think it's easy to see why scientists can often be so overzealous with the chopping block of dismissiveness. Once you consider one externally verifiable truth, however small it may seem, you have to consider other externally unverifiable ideas, like God. I don't think that science arose out of a hatred for religion, but I do think Protestantism and the scientific method were born in the same time period for a reason. There was a great need to, for lack of better words, just have someone cut the crap and tell the people what is, so

they can get by. Of course, the question remains as to whether this is still needed. Is overzealous dismissiveness a vestigial organ that should be done away with? That's a question for another discussion.

NE1 (2009-01-14 22:45:53)

You have focused in the past on the importance of idea generation, and I think we continue to (ahem) disagree there. For dismissing studies and concerning the meta-analysis, what do you think Tyler would say? I expect he would ask, "What is the relevant scarcity here?" and of course it is time not ideas. A blue ribbon panel of scientists doesn't have time to go through every single study ever published with a fine-toothed comb. They have justified to themselves and to readers their interest in several studies they think might be important or likely to be in error; now they can move forward and give them their full attention. Today's skeptic-blogs often remark that our brains are association-making machines, having evolved to problem-solve and form superstitions at the smallest darting shadow. Being a scientist requires wise application of this machine after winnowing the field with your analytical brain. That is what is happening here.

milieu (2009-01-17 08:43:59)

I agree a lot with this argument. I have observed the same change in behavior in me as I go 'deeper' into the scientific method of being extremely critical bordering on dismissive of other people's viewpoint while I started with what you called as the appreciative mindset. However, one thing I think the dismissive mindset might help is in allowing you to focus on the stream of ideas that you are interested in. There are so many questions to answer and everyone has a limited cognitive capacity. So by being dismissive, I may just be preventing myself from wasting my time in ideas where I might contribute little and can work with peace on what I am interested in.

## **Better Sleep, Fewer Colds (2009-01-15 14:13)**

In my [1]long self-experimentation paper I described how I stopped getting colds when my sleep improved due to more standing and morning light. It was easy to notice: Everyone around me was getting sick and I wasn't. In Beijing this winter the same thing happened: Lots of people around me got colds – a friend of mine was even hospitalized – but I didn't. This winter I continued to get lots of morning light – I cared enormously that my apartment was on the sunny side of the building – but in place of standing for 8 hours or more every day [2]I stood on one leg four times (left leg twice, right leg twice) until exhaustion.

Plenty of other evidence links better sleep with better immune function. The latest comes from the [3]Archives of Internal Medicine. In a survey-like experiment, researchers measured the sleep of subjects with a questionnaire for two weeks and then brought them to an isolation unit, exposed them to a cold virus, and waited to see if they developed a cold. Subjects who slept better were less likely to get a cold. It was a big effect: "Participants with less than 7 hours of sleep [per night] were 2.9 times more likely to develop a cold than those with 8 hours or more of sleep [per night]." I rarely sleep 7 hours but wake up feeling plenty rested, which suggests that my sleep is deeper than average.

Overall, I'm happy for the support of my findings. Better sleep has a three-fold benefit: you feel more rested (short term), you get colds less often (medium term), and your risk of heart disease goes down (long term). The morning sunlight I get corresponds to sitting outside in the shade for about two hours; the standing takes a total of about 40 minutes/day (with your leg bent most of the time). I usually watch a movie or TV at the same time and always look forward to it.

Thanks to David Cramer.

---

Nadav Manham (2009-01-16 06:09:48)

Hi Seth, Is there a way to prove that better sleep caused fewer colds rather than that more standing + sunlight themselves directly caused fewer colds? Nadav

seth (2009-01-16 11:16:36)

Two causal pathways (more sunlight -> better sleep -> fewer colds and more standing -> better sleep -> fewer colds) are supported by plenty of other evidence. The causal pathways more sunlight -> fewer colds and more standing -> fewer colds are supported by no evidence that is inconsistent with the first pathways.

Nadav Manham (2009-01-16 17:52:37)

Got it. Thanks, Seth.

VeganKitten (2009-01-16 19:51:31)

More/better quality sleep may decrease body fat and guard against diabetes, as well. See first + last posts in this thread for links: <http://boards.sethroberts.net/index.php?topic=6771.msg78886#msg78886> I'm sold... I just have to enforce my schedule.

Seth's blog » Blog Archive » Chinese Medicine and Sleep (2009-01-16 22:15:16)

[...] Better Sleep, Fewer Colds [...]

Nansen (2009-01-17 17:22:09)

The morning sunlight I get corresponds to sitting outside in the shade for about two hours Does "corresponds" mean you actually sit outside, or that you are using a fluorescent light that's equivalent in intensity? And, as a side issue, are you getting the "face time" within this two-hour period? Thank you.

seth (2009-01-19 00:49:44)

Yes, I actually sit outside. Sometimes I get face time during this period. It might be better to get it before this period.

## Chinese Medicine and Sleep (2009-01-16 22:15)

An American friend told me about one of his experiences with Chinese medicine – what is called in America "Traditional Chinese Medicine." He had some sort of infection that caused skin near his stomach to be damp. He tried many solutions. None worked. Then he went to a Chinese medicine doctor who prescribed certain herbs to be ingested. In a week he was better.

My take on this is that the herbs increased the sensitivity of his immune system, which then detected and got rid of the infection. Such infections are rare, of course, so rare I don't know their name. The existence of such an infection was a sign his immune system was working very poorly. I asked my friend about his sleep. His sleep was terrible. Highly irregular. It is telling that the Chinese doctor didn't tell him to improve his sleep, which would have vastly improved his health and reduced his future visits to the doctor.

It was a new idea to me that Chinese herbs – at least some of them – work by boosting the immune system. It makes sense: detection of some invaders should make you more sensitive to other invaders. One implication of this view is that it hardly matters which herb you take so long as it is new. My friend told another story in which his Chinese doctor changed the herbs every week or so, supporting this idea.

It was a new idea to my friend that bad sleep was causing his immune system to work poorly. My experience with colds, as mentioned [1]last post (when my sleep improved they disappeared), means that the fact that colds are "common" implies we are a nation of poor sleepers. And, indeed, [2]sleep problems are very common. A few years ago, I learned about a course about epidemics taught at the UC Berkeley School of Public Health. I knew the professor. I asked him if the course would cover environmental factors that cause the immune system to work better or worse. No, he said. Half the subject, ignored. Just as economists rarely study innovation and statisticians rarely study how data generates ideas.

More Supporting the idea that ingesting strange but harmless substances can improve immune functioning, I found [3]this in the latest issue of the Journal of Nutrition:

Caseins and whey proteins are the 2 major protein fractions of cow milk. Whey proteins are separated from casein curds during the cheese-making process. The major proteins present in bovine whey come from the mammary gland that secretes  $\beta$ -lactoglobulin ( $\beta$ -LG),  $\alpha$ -lactalbumin ( $\alpha$ -LA), and glycomacropeptide (GMP), and from serum, like IgG1 and IgG2, IgA, IgE, and IgM and albumin. Besides their use in functional foods, whey protein products, and more specifically whey protein-derived products, have been shown to be efficient in certain pathologies. For instance, whey proteins inhibited gastric ulcerative lesions induced by ethanol or indomethacin, inhibited chemical-induced malignancy in mice, improved bone loss of ovariectomized rats, and reduced hyperglycemia in type 2 diabetic patients (15). Moreover, in vitro and in vivo studies have demonstrated modulation of immune functions by several whey protein-derived products (6,7). As examples,  $\beta$ -LG, the most abundant protein in whey (55% of total whey proteins), stimulates the proliferation of murine spleen cells and lamina propria lymphocytes (8,9). It is also useful to stress that researchers have shown that probiotics expressing  $\beta$ -LG can be used to manage food allergy (10). The 2nd most abundant whey protein,  $\alpha$ -LA (15% of total whey proteins), modulates macrophage and B- and T-lymphocyte functions (11). Moreover, the  $\alpha$ -LA-derived peptide f51-53 directly affects neutrophils (12). The 3rd most abundant whey peptidic component, GMP, can affect immunity and attenuate inflammatory colitis in rats (6,13,14). At optimal concentrations, the other bioactive whey-derived proteins like Ig and lactoferrin present in whey protein extract (WPE) can also exert immune modulatory functions (6,7).

I didn't know this—that ingesting milk products had good effects on immune function. That probiotics can be used to manage food allergies isn't explained by the idea that foreign substances make the immune system more sensitive.

1. <http://www.blog.sethroberts.net/2009/01/15/better-sleep-fewer-colds/>

2. <http://www.blog.sethroberts.net/http://www.sleepfoundation.org>

3. <http://jn.nutrition.org/cgi/content/full/139/2/386>

spacenookie (2009-01-16 23:38:45)

In a similar vein, the "Damn Interesting" website did a nice article on Coley's Cancer-Killing Concoction which worked on the principle of stimulating the immune system to fight cancer.

Aaron Blaisdell (2009-01-17 10:20:19)

Health benefits derived from milk products is vastly increased when raw milk (i.e., non-pasteurized) is used. The Weston Price foundation (<http://www.westonaprice.org/>) describes this in detail. I've switched to consuming raw milk and cheese derived from raw milk every day. I also started drinking Kefir which contains a compliment of pro-biotics. One thing I've noticed is a great reduction in gas and sensitivity of the stomach.

seth (2009-01-17 10:58:06)

Very interesting. Raw milk obviously has more of what our immune system is designed to protect us against. Perhaps modern too-clean food tends to put our immune system to sleep. Just as modern conveniences may cause us to get too-little exercise.

mike kenny (2009-01-17 11:23:52)

hm, i wonder how shepherd versus farming cultures fared against colds, if shepherd cultures drank more milk.

mike kenny (2009-01-17 11:25:53)

milk also might put you to sleep, as has been discussed on this blog before, and kids tend to consume it. kids are notoriously sensitive to colds, so they'd maybe need something to help them bolster their immune system-sleep and introduction to novel stimuli to keep their immune system on its toes, both possibly provided by milk.

Tom (2009-01-17 15:54:35)

Seth, I don't have the link, but within the past year there has been interesting research that humans with tapeworms have fewer allergies. The researcher hypothesized that there is something in the tapeworm that suppresses immune response in the host to enable the tapeworm to stay unmolested. The host gets the benefit of reduced allergies to pollen, pet dander, etc. By self-experimentation, he found that a few tapeworms is the correct "dose" for maximum relief from allergies. More than that and he felt sluggish. He tried it on people who wanted to own cats but couldn't due to allergies - it worked, and at the end of the trial, most declined the drug that would kill the tapeworm!

Aaron Blaisdell (2009-01-17 17:06:29)

Seth, My understanding of the literature is that raw milk, like other naturally occurring foods, actually doesn't have more of what our immune system was designed to protect against. But raw milk can be collected under unsanitary conditions allowing the promotions of bacteria. Such contaminated milk has bacteria (foreign particles) that can be unsafe for humans. But the milk itself if not contaminated does not contain dangerous compounds that our immune system would try to take care of. Pasteurization kills bacteria and thus drastically reduces the potential for consuming contaminated milk. But we must be careful to distinguish between the natural constituents of the raw milk itself and foreign contaminants.

seth (2009-01-17 20:57:02)

Tom, thanks for reminding me of the tapeworm research. My interpretation is that the tapeworm was constantly excreting a small amount of foreign substances into the blood and this caused the action threshold of the immune system to be raised. So long-term exposure to foreign substances raises the threshold. Whereas the Chinese herbs, taken for less than a month are an short-term effect that lowers the threshold. Aaron, I meant that raw milk has a lot more live bacteria than pasteurized milk.

Suertes (2009-01-18 09:04:09)

Chinese customs recommend good sleep habits (early to bed, consistent and long) to deal with all sorts of low-level health problems that we lump together as 'heatiness'. Common colds are often attributed to heatiness as well. For instance, I have tended to sleep late, at 2-3 am most days, and I'm paying for it with an endless stream of mouth ulcers, which are another symptom of 'heatiness'. I guess what heatiness really means is a general reduction in one's immunity. So the custom squares

with your theory..

Mark (2009-01-18 20:43:12)

"He had some sort of infection that caused skin near his stomach to be damp." I think before one speaks about whether a certain treatment worked, and why, the first step is establishing whether a person really has a medical problem, or whether they are a psychosomatic nut case. "Some sort of infection"? "Damp stomach skin"? Let's get a real diagnosis first. Damp stomach skin is an non-existent condition.

seth (2009-01-19 07:35:20)

Mark, it was a red rash with discharge located near the belly button.

Cosinensis (2009-12-23 01:35:28)

For the treatment of sleep disorders, Chinese herbs can be quite effective. However, due to the high number of different herbs and different types of sleep disorder, it is quite difficult to find the right herb.

Andi Sidwell (2009-01-18 05:36:26)

I have a friend who's just switched to polyphasic sleep and is doing quite well with it. There's another blogger who tried it for 120+ days that you may be interested in, too: <http://www.stevepavlina.com/blog/2005/10/polyphasic-sleep/>

seth (2009-01-18 05:54:42)

Thanks, Andi. I hope a polyphasic sleeper will measure the effect of the sleep change on health.

Matt Goff (2009-01-19 02:47:02)

You might also be interested in taking a look at [1]<http://www.puredoxyk.com/>. The author of that site first did the 'uberman' schedule in 1999 for 6 months. Subsequently she says she has lived for 2+ years on an 'everyman' (a core sleep at night, with

naps during the day). She's written a book (available for download from Lulu.com) about her experiments/experiences and those of others she has talked to. That said, I don't see that she has specifically noted the effects on her health, certainly not any systematic way, except that it doesn't seem to have impacted her health in a negative way. Given some of your past comments on other subjects, you might also be interested in her response to an attack on Polyphasic sleep (see the right sidebar entry titled "An attack on polyphasic sleep")

1. <http://www.puredoxyk.com/>

Matt Goff (2009-01-21 01:17:20)

A follow up to what my previous comment. I purchased/downloaded the book and have now read it. I found it very informative and interesting and thought I would mention some things that seemed relevant/related to the content of this blog. She does discuss her health with respect to polyphasic sleep. She says she gets sick less often now than when she did when monophasic, though acknowledges that could be due to other changes she has made. She says she has not had a cold in over a year, though she doesn't link this directly to her sleep schedule. When she has gotten sick (or even felt her immune system ramping up to fight off illness) while on a polyphasic schedule, she has found a little extra sleep to be very restorative, much more so than when she was on a monophasic schedule. That is, it takes less sleep to have the same restorative effect as she would have gotten with extra sleep while on a monophasic schedule. Another thing I found interesting was one of the primary motivations she had for experimenting with the 20 minutes of sleep every 4 hours schedule in the first place (back in 1999) was severe insomnia and other significant sleep disorders that made sleeping very unpleasant. She was desperate and did not want to take drugs, so the suggestion of a friend to try the 'Da Vinci schedule' seemed worth trying. Her sleep problems pretty much went away when she adapted to the sleep schedule, and after she returned to a monophasic sleep schedule 6 months later, they did not return. Her theory is that making such a radical switch wipes the slate clean (so to speak) and rewrites one's sleep schedule in a strict (and stable) way. It was also interesting to note that when she planned to switch to a polyphasic schedule the second time, she offered to volunteer as a subject to sleep clinics and sleep-research department heads so they could investigate the adaptation process. She was surprised when none of them were interested.

### **Beijing Shopping (stuff easy to get in Beijing but not Berkeley) (2009-01-18 07:56)**

Jane Jacobs said that one measure of a healthy economy is the choice it provides. A healthy economy provides abundantly at affordable prices; an unhealthy economy does not. Another sign of economic health, she said, is innovation: A healthy economy includes a constant stream of new products – nothing lasts forever. People in Norway are far richer than people in China right now, but what will Norwegians do when the oil runs out?

In contrast, my Beijing shopping revealed that Chinese entrepreneurs have been able to develop products that the rest of the world will want to buy.

1. Electric bikes. They're everywhere in Beijing. They cost \$200- \$400 and a few cents per mile, far cheaper than gas. I would have brought one back to Berkeley but inability to fix it stopped me.

2. Keyboard covers for laptops. Transparent silicone plastic. Easy to clean. How did I live without one? These are a new product in Beijing, actually, but they are very cheap, about \$1. I can find them for sale on the internet for about \$15.

3. Cordless floor sweepers. They use a rotating brush to clean the floor instead of a air pump, as a vacuum cleaner does. That they are cordless makes them very easy to use. In Beijing they are obvious and attractive; I bought two and brought one back to Berkeley. In America I'd never seen them for sale but after I knew they existed I managed to find an unattractive one in Berkeley hidden deep in a hardware store. The price (about \$50) was roughly the same in Beijing and Berkeley, except the Beijing models are much nicer.

I don't think it's a coincidence that all three products are "environmental" broadly conceived. Beijing air is dirtier than Berkeley air; my keyboard cover and my floors get dirty a lot faster in Beijing than in Berkeley. I think they are a sign of hugely-important things to come – China inventing and selling the products we need for a cleaner world. It's been called [1]the next industrial revolution; a better name would be the second half of the industrial revolution in which we clean up the mess left by the first half. As Jane Jacobs often said, the problem is not too many people, the problem is the undone work.

1. <http://www.theatlantic.com/doc/199810/environment>

mike kenny (2009-01-18 13:24:53)

i wonder how much the differences in chinese to american culture have to do with contagion—one thing was popular early on and everyone adopted it and didn't look for an alternative.

Mark (2009-01-18 20:28:20)

Keyboard condoms are ubiquitous in Japan. They have them for popular mice designs also.

Mark (2009-01-18 20:34:36)

By the way, I've also seen the sweepers, but they aren't popular because they really only work well on carpet, and then only if you have expansive empty areas to accelerate them "up to speed." So in other words, Japanese living quarters aren't ideal for them. In Japan you may have little paths less than a meter wide snaking through your house, with furniture or boxes or other clutter taken up the rest of the room. Small electric vacuum cleaners are more practical for reaching under all this stuff.

Mark (2009-01-18 20:39:09)

On electric bikes, they're expensive in Japan compared to the normal kind, so they're not that popular, but every time I see one I wonder if it wouldn't be better to have lower gears on the bike. Japanese bikes are 1 gear most of the time (at most 2 or 3). This is great for getting a workout, but if it's a strain for someone, rather than an electric bike, how about a 5- or 10- or 15-speed bike? Maybe the market is older people for whom derailleurs are technologically too complex?

seth (2009-01-19 00:24:42)

Mark, my electric sweeper works great in my Berkeley apartment. As for electric bikes, in Beijing they are ridden by lots of young people.

david (2009-01-19 12:12:10)

Is this the laptop cover you're talking about? [http://cgi.ebay.com/universal-Notebook-laptop-Keyboardskin-cover-protector\\_W0QQitemZ250347842907QQcmdZViewItemQQptZPCA\\_Laptop\\_Accessories?hash=item250347842907&\\_trksid=p3286.c0.m14&\\_trkparms=72%3A1234|66%3A2|65%3A12|39%3A1|240%3A1318|301%3A1|293%3A1|294%3A50](http://cgi.ebay.com/universal-Notebook-laptop-Keyboardskin-cover-protector_W0QQitemZ250347842907QQcmdZViewItemQQptZPCA_Laptop_Accessories?hash=item250347842907&_trksid=p3286.c0.m14&_trkparms=72%3A1234|66%3A2|65%3A12|39%3A1|240%3A1318|301%3A1|293%3A1|294%3A50)

seth (2009-01-19 19:22:24)

yes, that's an example of the universal cover, which works fine.

Nathan Myers (2009-01-19 21:04:37)

Does this mean you're "back", or just in town for a visit?

## How Things Begin (sparkling tea) (2009-01-18 21:24)

Today, at the Fancy Food Show in San Francisco, I learned about [1]Golden Star White Jasmine Sparkling Tea, the most new interesting product at the show (out of thousands). I asked the CEO, Edward Carden, how it came to be. He said he was helping his parents move several years ago when he thought: Why isn't there a sophisticated non-alcoholic beverage? Like wine, but non-alcoholic. Starting with the best ingredients, what could they come up with? They could make stuff that tasted great, but there was an arbitrariness to it. Making a tea allowed them to connect with that heritage. Wine has a heritage, beer has a heritage, cheese has a heritage. They start by infusing tea leaves, then add sugar and microorganisms and ferment for a short time to develop complexity of flavor. The fermentation produces a small alcohol content. Call it a microwine. It was delicious.

1. <http://www.goldenstartea.com/>

---

Patrik (2009-01-20 22:10:04)

GSWJST looks tasty. It also appears to be a very, very sophisticated version of a tea-flavored soda.

Ben C (2010-01-05 11:58:45)

Sounds suspiciously like kombucha, which is a drink with a long history (and has been available at Whole Foods for at least a few years).

## How I Will Judge the Inauguration Speech (2009-01-19 20:15)

By this: Did he tell good stories? Did he tell stories that actually supported his points? This is hard to fake. It was easy for Dr. Eileen Consorti [1]to tell me that studies existed to support her surgery recommendation but – the hard part – she never supplied those studies, probably because they don't exist. Pronouncements are easy, stories hard. It's easy to say X and Y ("we will . . . this is a time of . . . ") but if X and Y are just wishful thinking it won't be easy to come up with a decent story – or any story – that supports them. If Obama understands how the world works, he should be able to tell stories that support his views.

Lyndon Johnson was a great politician and an excellent storyteller. Presidents since Johnson have been worse politicians and worse storytellers. Obama's current popularity may reflect something in us rather than something in him. Right after 9/11 George W. Bush enjoyed enormous popularity. His speeches at that time, at least those I heard, contained no stories, which I think revealed that he understood little or nothing about the situation. (I would have told stories about overreaction.) The dismal outcome was foreshadowed. His popularity at the time was due to [2]something in us, not something in him.

More The speech contained about one-quarter of a story. My expectations are hereby lowered.

[3]Lack of stories at a high school graduation.

---

Nathan Myers (2009-01-19 22:21:39)

Reagan told stories. He was a lousy president until he began to go senile, and began repudiating much of what he had stood for. His stories, as appealing as they were to many Americans, were very frequently the sort that would be called lies if we told them ourselves. What is a lie, after all, but an appealing story that misrepresents the facts? Bush's failures in storytelling reveal not that he couldn't come up with a decent story, but that he couldn't even be bothered to come up with a decent lie. That's contempt.

seth (2009-01-19 22:31:16)

What I remember about Reagan's stories is that they were often wrong, as you say, and simple-minded. Not my idea of good stories.

mike kenny (2009-01-20 12:30:06)

I suspect lots of people thought Reagan's stories were good stories. Given we can be slaves to confirmation bias, it seems one man's good story is another man's crap story. I suspect we go with what sounds right to us. Someone who is conservative and has perhaps his whole life looked for evidence of conservative stories being true, will easily believe Reagan, and likewise, someone who has been a life-long liberal will have gathered much evidence on the contrary. I don't think this is necessarily a bad thing though. Lawyers argue against each other, and it seems usually they are providing counter-narratives. If the legal system uses this approach to determine issues of grave importance, perhaps it's fine in government too. We craft plausible narratives and counter-narratives until one seems to win the debate as most people sign on to it, or something like that. I recently discussed [1]herenarratives in response to Robin Hanson asking me to give evidence favoring fiction as a good means of theorizing comparable to other theorizing.

1. <http://michaelkenny.blogspot.com/2009/01/evidence-of-fictions-possible.html>

david (2009-01-20 20:49:43)

I'd say Regan was a lousy president in that I don't agree with his policies, priorities, and values. However, he was an effective president in convincing people to go along with his agenda. I'm sure the story telling was part of that effectiveness. What's interesting about Obama is that he combines intellect, emotional maturity, and rhetorical ability in a way that's rare. Also, regarding stories, see George Lakoff's (linguistics professor at Berkeley) work on narratives and framing as an explanation of why progressives had been loosing elections they should have won. Obama seems especially good at reframing the debate...his inaugural speech did it repeatedly. I can't describe the relief I felt when I heard Robert Siegel refer to him as "President Obama" for the first time.

Patrik (2009-01-20 22:14:38)

*What I remember about Reagan's stories is that they were often wrong, as you say, and simple-minded. Not my idea of good stories. So, now tell us a story that supports your points of Reagan stories being wrong and simple-minded. Obama's current popularity may reflect something in us rather than something in him. Obama, nebulous? Taking on any form he wishes? Nah.....*

seth (2009-01-20 22:18:39)

Patrik, perhaps you could first tell a story that Reagan told that wasn't simple-minded.

Nathan Myers (2009-01-20 23:02:50)

... for extra points if it wasn't wrong too.

John S. (2009-01-21 02:35:13)

So Seth what did you think? I personally thought the speech was pretty insipid. I was watching the coverage on the NY Times website and saw people in the audience yawning. As to your comments to Patrik above, you (and some other commenters) made a claim. Patrik is asking you to back it up. Instead, you turn around and say no, you try to disprove our claim. Is Dr. Eileen Consorti reading this? Maybe what she should do is follow your example, and ask you to provide her with the data that disproves her surgery recommendation.

seth (2009-01-21 13:22:38)

I didn't like Obama's speech. Too predictable. It would be nice if he understood how the world works better than the rest of us, but apparently not. Philip Weiss didn't like it either - [1]he gave it a B- - but, obviously wishing it had been better, [2]he later raised the grade to B+/A-. Grade inflation. If I said " $2 + 2 = 4$ " and you said, "prove it" I would think you must have some special knowledge (or special delusion). It's what you knew, not what I knew, that would be interesting. So I would ask for a counterexample. In an article in The New Yorker, Veronica Geng called for regular Stanford-Binet testing of President Reagan. The data that makes me think Dr. Consorti is wrong are the results of the searches that both I and my mom (who specializes in this sort of literature search) did to find the studies Dr. Consorti claimed existed. We came up empty. Dr. Consorti had told me the studies would be easy to find.

1. <http://www.philipweiss.org/mondoweiss/2009/01/oracular-obama-spends-a-bit-of-political-capital-on-the-posttribal-future.html>

2. [http://feedproxy.google.com/~r/Mondoweiss\\_Posts/~3/Zv0ap33U09Q/i-was-wrong-about-obamas-speech-and-jack-r-oss-is-right.html](http://feedproxy.google.com/~r/Mondoweiss_Posts/~3/Zv0ap33U09Q/i-was-wrong-about-obamas-speech-and-jack-r-oss-is-right.html)

Patrik (2009-01-21 17:06:53)

*Patrik, perhaps you could first tell a story that Reagan told that wasn't simple-minded. Tsk tsk tsk. Seth, I am surprised at you. Your response is almost childlike, and not to mention very ironic. You won't follow your own advice!? Well, if that is the case so, you could have written this about yourself: It was easy for Seth Roberts to tell me that Reagan's stories were simple-minded and wrong but the hard part he never supplied any evidence for such an assertion, probably because it doesn't exist. Pronouncements are easy, stories hard. It's easy to say X and Y (we will . . . this is a time of . . . ) but if X and Y are just wishful thinking it won't be easy to come up with a decent story or any story that supports them.*

seth (2009-01-21 20:17:40)

Patrik, my paragraph about  $2 + 2 = 4$  has the evidence you asked for.

John S. (2009-01-22 04:33:03)

So you're saying the idea that Reagan was a dunce is self-evident, like  $2+2=4$ . So obvious that you don't have to provide any evidence for it. I'm sure that in Dr. Eileen Consorti's world, the idea that you need surgery for a small hernia is also self-evident. Maybe she read it in the New Yorker. Or is this all just a self-experiment in hypocrisy? If so, it seems to be a smashing success!

Patrik (2009-01-22 16:25:54)

Seth, You know full well that: *an article in The New Yorker, Veronica Geng called for regular Stanford-Binet testing of President Reagan.* is not the rhetorical equivalent to  $2 + 2 = 4$ . John S. poignantly check-mated you on your maddening hypocrisy, which I find a bit disheartening (your hypocrisy, that is) as I find your blog very interesting and find you willing to challenge many mainstream ideas, usually rationally. There are many things you and I do not agree on, which does not bother me in the least bit (and why I continue to read your blog), but you, hypocritically, not being able to overcome your severe political biases and rationally address the issue at hand is disappointing to say the very least. You also did the same here: <http://www.blog.sethroberts.net/2008/12/15/how-bad-is-ldl-cholesterol/>

John S. (2009-01-22 18:37:30)

You know, I'm not even saying that Reagan's stories weren't a bunch of lies. I just did a Google search on "Reagan's lies" and came up with a number of stories you could have mentioned when Patrik asked you. For example, Reagan is supposed to have claimed that he was a photographer in WWII and one of the first to photograph the Nazi concentration camps

- when the truth is that he never left Hollywood during the war. That's what it says on the internet at least, but maybe Patrik is able to debunk this. Perhaps Reagan never said this at all. I don't know. I don't believe everything I read on the internet, nor would I believe everything I read in the New Yorker (if I ever actually read it outside my dentist's waiting room). My guess is that because you perceive Patrik to be a conservative, you feel you can dismiss whatever he says. That's too bad, Seth, because I'm sure there are a lot of people who dismiss self-experimentation as a load of self-delusional crap, and would just as easily dismiss you and your ideas out of hand. What a disappointment to find feet of clay on one of my blog heroes.

seth (2009-01-23 12:01:43)

Nothing to do with politics. William Buckley, the noted conservative, told the following joke: What do you get when you combine Ronald Reagan and Marlon Brando? Answer: Rebel Without a Clue.

Patrik (2009-01-23 15:33:03)

*What a disappointment to find feet of clay on one of my blog heroes.* Could not have said it better myself. Your hypocrisy, evasiveness and unwillingness to address the issue speak volumes and disappoint us. Ultimately you are no different than those who claim **X is Y, sheesh, everyone knows that therefore I will not bother backing it up.** A variant of the ad populum and ad verecundiam fallacies.

Tom in TX (2009-01-27 15:12:21)

Seth, when did Buckley make this joke about Reagan? It would have a much different meaning in 2008 than in 1968.

Tom in TX (2009-01-27 15:24:59)

Since I started paying attention to politics (early 1970s), IMHO Reagan was easily the best President. All the others (Nixon, Ford, Carter, Bush, Clinton, Bush) are in a close race for last.

seth (2009-01-27 16:59:55)

The article that reported Buckley's joke appeared around 1990. So I guess the joke was made around 1985-1990.

christopher molineux (2009-03-09 20:45:15)

If you want to see some constructive analysis on the inauguration speech there's a pretty good piece at: <http://psworkbench.blogspot.com/> called "5 reasons why you shouldn't speak like Barack Obama"

## **Powdered Ice Cream (2009-01-20 18:12)**

At the Fancy Food Show, [1]Kriss Harvey, a pastry chef and frozen dessert solutions specialist, served me a spoonful of powdered chocolate ice cream, his invention. It looked like chocolate ice cream but it tasted unlike any ice cream (or any food) I've ever had. It was there and not there. It was in my mouth and then it was gone. It was the most ethereal food I've ever had.

We had been talking about [2]El Bulli, the Spanish restaurant of experimental food. Two friends of Mr. Harvey's had worked there one summer and had come back complaining about the food (rabbit ears) and the workload. Just because people will pay a lot for your unusual food doesn't mean you are advancing things, said Mr. Harvey. Maybe your food doesn't taste very good. He pointed to a certain now-forgotten fad among New York dessert chefs a few years ago. That's fashion, I said; it has a perfectly good purpose (to support experimentation). Then Mr. Harvey served me his powdered ice cream. Which was more memorable and impressive than anything I had at [3]Alinea, an American version of El Bulli.

1. <http://www.advancedgourmet.com/>
2. [http://en.wikipedia.org/wiki/El\\_Bulli](http://en.wikipedia.org/wiki/El_Bulli)
3. <http://www.alinea-restaurant.com/>

---

UncleLongHair (2010-10-17 05:18:28)

At the air and space museum in Washington DC you can get freeze dried ice cream, which is presumably something the astronauts brought with them into space (freeze dried to make it lightweight and non-perishable). I wonder if this is the same thing as Mr. Harvry's "powdered" ice cream? It sounds the same - it melts in your mouth in the most literal sense, once it hits saliva it disappears, leaving behind the creamy mouth feel of ice cream.

### **Unforgettable Drink at the Fancy Food Show (2009-01-20 23:20)**

Pistachio saffron milk. A just-released product from [1]Ajmera Innovations. Sort of a step up from pomegranate soda and a dozen other high-end drinks, just as pomegranate soda was a step up from Coke and Sprite.

1. <http://www.ajmerainnovations.com/>

---

Nirav (2009-01-23 13:14:39)

I just wanted to say thank you got the nice comment on our newest product. It seems that we got similar responses from many show guests.- Nirav

### **Probiotics and Your Immune System (2009-01-21 08:22)**

At the Fancy Food Show, five or six booths sold probiotic foods, usually yogurt. At each booth I asked what they could tell me about the health effects of probiotics. Mostly the question seemed to annoy them – especially the employees hired for the event.

But at the Oixos booth – Oixos is a Greek yogurt made by [1]Stonyfield Farm, an organic dairy in New Hampshire – Amy Plourde, a graphic designer at Stonyfield, told me that for a long time she was "always sick" with sinus infections, colds, and even mononucleosis. During that time, she ate yogurt once/week. When she started working at Stonyfield she began to eat yogurt once/day (6 oz. at breakfast) and her health got much better. Stonyfield yogurt has relatively high amounts of live bacteria. Their website has [2]a list of scientific papers about yogurt and the immune system.

My take is that our immune systems need a steady stream of foreign pathogens (e.g., bacteria) and pieces of pathogens (e.g., bacterial cell walls) to stay "awake". When your immune system is working properly you fight off all sorts of bacteria and viruses without noticing. When your immune system isn't working properly it overreacts (allergies) and takes too long to react (infectious diseases). [3]Weston Price found twelve communities eating traditional diets whose health was excellent. Their diets varied tremendously but one thing they had in common was daily consumption of

fermented foods, including cheese, kefir, sauerkraut, and fermented fish. This supports Amy's story right down to the dosage. If you don't eat fermented foods, you might use [4]hookworms, which excrete a steady stream of foreign substances into the blood. (Thanks, [5]Tom.) Hookworms definitely reduce allergy symptoms; I don't think anyone has asked if they reduce colds and other infections.

[6]The hygiene hypothesis.

---

Aaron Blaisdell (2009-01-21 21:17:28)

Very interesting. I started about a month ago to drink Kefir every evening after dinner and eat yogurt—from Stonyfields coincidentally, almost every morning for breakfast. I also started eating raw-milk cheese almost every day. My last cold was in October, 2008. During the winter break, many of my friends and family got the common cold, but not me. Over the last two weeks, both of my daughters were so sick with the cold that they had to stay home from day care. During that time, I had slight body aches and a slight disregulation of internal body temperature for two evenings in a row. Both nights, I went to bed earlier than usual and woke up feeling refreshed and healthy. After the second evening I was completely better again. I think I must have caught the cold from my family but fought it off very quickly and suffered only very minor symptoms. My experience is thus consistent with what Amy said. I have also, however, been taking 1/2 teaspoon daily of high-vitamin cod liver oil, 1/2 teaspoon daily of high vitamin butter oil (both a la recommendations of Weston Price to ensure adequate intake of fat soluble vitamins like A, D, and K2), and for the past two weeks 4,000 iu of vitamin D3. I've also been reducing the amount of wheat I consume, and try to only eat sprouted wheat when I do eat it at all. I do occasionally indulge in regular pizza, but only a couple of times per month. I've also switched to cooking with butter, coconut oil, or bacon grease instead of seed-based oils if I do any frying. Thus, the increase in probiotics may have something to do with my increased immunity, but these other factors may contribute as well. I generally have much higher energy levels than at any other time in my life, and my teeth feel very hard and strong (my next dental visit is next week and I'm curious as to what they will find). My skin also is very clear and healthy looking and feeling.

seth (2009-01-21 23:27:47)

Thanks for the details, Aaron.

Mike W (2009-01-22 08:38:36)

This reminds me of a news item I read a couple years back, some scientist's explanation of the purpose of the human appendix (sorry, no link). He said it isn't an accidental leftover of evolution, but rather a vital reservoir for bacteria and other foreign biostuff. As I recall, the basic idea was that in pre-civilized times diarrhea was a frequent, common human condition (due to illness and bad food). Purging the whole digestive tract like that leaves it barren of all the "helpful" bacteria it needs, but since the appendix is essentially a cul-de-sac, the gunk is still lurking there ready to re-seed the gut after the illness passes. In this hypothesis I think the purpose of the bacteria was for digestion, not immunity, but who knows.

Aaron Blaisdell (2009-01-22 11:25:27)

Mike, that's very interesting. The hypothesis is that the appendix contains the starter culture to replenish the gut's beneficial ecosystem.

BBrolley (2009-01-23 07:34:34)

Art Devaney, <http://www.arthurdevany.com>, the Evolutionary Fit guy, has a different take, not that I agree, but he's always admonishing No Dairy, for instance, this statement, from Jan 20th, "Remember, there are trade offs. The ability to digest lactose does not come free. The immune system still has to respond in new ways with the load of foreign proteins in dairy. Moderate cheese intake is fine, but you do out grow you need for dairy."

What Food Does Contain Probiotics? (2009-01-23 13:06:21)

Papin (2009-01-29 09:44:38)

I also had a positive experience with probiotic yogurt. Using the yogurt seemed to correlate with getting rid of a metal taste that had been plaguing me for over a week. For a few months I have read the debates that have surrounded your observations on the merits of samples in medicine and phycology, self-experimentation, on diets, on set points, and other difficult subjects. I appreciate them and I wish there were other scientists that would have the courage to follow your lead. In systems as complicated as humans it is often very difficult understand what matters and what doesn't, if there are any dependent variables or is everything interconnected. In these cases one may learn more from knowing many details about the subject than from having a large sample. Often, knowing what to investigate is hard and careful observation, useful. It is the return of the natural philosopher.

Ben Hyde (2009-02-01 12:19:20)

Why would eating the same industrially produced yogurt every single day was particularly challenging to the immune system?

seth (2009-02-01 13:44:41)

because it has lots of bacteria

Zeke's Awesome Eat's (2009-05-21 04:07:08)

Don't forget fatty acid balancing. While probiotics have helped my health a lot, what seems to have helped my allergies and immune system the most is keeping my omega6 intake minimal, and trying to eat as much omega 3 and EPA rich food as possible. It really helps to reduce overreactions and ailments associated with inflammation. (as do probiotics of course)

Colloidal Silver (2009-06-24 09:37:31)

Very interesting story. I usually take vitamins and natural supplements, but after reading this I will add more yogurt into my diet, especially probiotic yogurt.

George (2010-01-12 10:45:48)

The bacteria in yogurt are not "pathogens", wtf

## A Group Self-Experiment (2009-01-21 16:05)

[1]Health Month.

Thanks to JR Minkel.

## The Wisdom of the Rest of Us (2009-01-22 14:01)

[1]On Christmas Eve I wrote there was a lot to be learned from the web comments on newspaper articles and the like that anyone can post. My point was how wonderful this was. Now the New York Times has added a feature that allows the most popular comments to rise to the top (you "show" Readers' Recommendations) [2]as I hoped. [3]For example. Way to go!

You can also find comments that the "editors" (the sub-sub editors?) recommend (show Editors' Selections). They tend to be long and querulous. I don't think I'll be using that feature much but it is good to have it for when I want long and querulous.

Still no comments allowed on The New Yorker website.

## How Bad is LDL Cholesterol? (continued) (2009-01-22 22:50)

If LDL cholesterol level predicts heart disease then persons with low LDL should be better off than persons with high LDL. Here is what [1]some Norwegian doctors did:

They simply selected sequential patients with LDL cholesterol scores below 2.7mmol/l. . . . They ignored all people with LDL concentrations from 2.7 to 4.5mmol/l but did enroll all people with an LDL >4.5mmol . . . . So they then had two groups of people, those at catastrophic risk of LDL-blocked-arteries and those with [very] little LDL . . . They did the scheduled angiography and checked how many patients had >70 % blockage of at least two coronary arteries in each group.

Guess what: LDL cholesterol doesn't matter. They recruited 47 patients with low LDL-C, of whom 21 had significant CAD. They got 46 high LDL-C patients, of whom 24 turned out to have CAD.

Thanks to Dave Lull.

[2]How bad is LDL cholesterol?

1. <http://high-fat-nutrition.blogspot.com/2009/01/cholesterol-ldl-in-oslo.html>
2. <http://www.blog.sethroberts.net/2008/12/15/how-bad-is-ldl-cholesterol/>

---

Charles (2009-01-23 00:19:56)

Hyperlipid (to which you have linked for this post) is a wonderful site. Peter writes with humor, but really takes apart bad studies ruthlessly and skillfully. You can get a great education in physiology and nutrition just by reading the archives.

### **Webware For Self-Tracking (2009-01-23 06:41)**

Zume Life will help you keep a record of many things:

The Zume Life personal health management system is now open for public beta, on the Web and via an optional iPhone application. Zume Life allows you to record, monitor and understand all aspects of your health activities. No matter what illness(es) you are managing, for yourself or a family member, or what lifestyle changes you are attempting, Zume Life can help you. Use the Zume Life solution to track:

- Medications. Any and all, from Rx to supplements to chamomile tea
- Food. Keep a food journal, and track calories, carbs, and/or points
- Exercise. Keep an exercise journal, and track exercise type and duration (e.g. run 20 min)
- Symptoms. Anything from anxiety and mood, to sleep disturbance and wheezing
- Biometrics. All common measures such as weight, glucose, etc.
- Life journal. To jot down anything else ("saw my dietician today", "just had a great day", etc.)

Monitor your progress through charts and journals. Use the system directly on the Web, or with an optional "Zuri" iPhone application. Sign up at [1][www.zumelife.com](http://www.zumelife.com).

1. <http://www.zumelife.com/>

---

Austin (2009-01-26 19:02:55)

Have you ever thought of writing a how to guide on self experimentation? I know I would buy it. Just seeing how you go through the thought process and how you set up basic statistics would be awesome. Anyway I didn't find much on the web explaining how to do it.

seth (2009-01-26 20:36:12)

Austin, thanks for the suggestion. If you want to do it I suggest you study the 10 examples in my long paper on the subject: <http://repositories.cdlib.org/postprints/117/> The statistics are not a big deal. When the data is graphed it usually is clear what the right conclusion is.

Harry (2009-02-07 22:01:37)

I will need to check these out. Currently I use the exercise tracker at MedHelp.org. They have about 20 of these. Easy to use and free. [www.healthtrackers.com](http://www.healthtrackers.com)

## Butter: Bad or Good? (2009-01-23 06:57)

At the Fancy Food Show, I heard someone say that the better a food tastes the worse it is for you. "What's an example?" I asked. "Butter," he said. "It goes straight to your arteries."

What a choice. I have three pounds of very expensive butter in my freezer, purchased from an Amish farmer who raises grass-fed cows. I eat it as often as possible. I believe butter may have fat-soluble nutrients we need to be healthy, nutrients that are found in high concentration in growing plants (such as grass) but not in ordinary animal feed. In the Swiss Alps, in the 1930s, Weston Price found small communities that produced almost all the food they ate. Because of the altitude, they couldn't produce much. They did have grass-fed cows and prized the butter from those cows. They were in much better health, especially dental health, than their neighbors who ate mostly industrial food.

There was a time, long ago, when exactly the opposite of the overheard statement was true: The better a food tasted the better it was for you. Now it is complicated.

---

John (2009-01-23 09:47:52)

It seems to me the person you spoke with is not to be trusted in this matter. It seems that the complication is that the medical establishment has been pushing bogus ideas for the past 40 years or so. I use as much butter as I can. So there. :-)

Charles (2009-01-23 11:35:15)

â€œIt goes straight to your arteries.â€ Boy, I hope so. I'm thrilled to have all those beneficial fatty acids and essential vitamins flowing through my arteries. Stephan at WholeHealthSource had a great post last month describing the correlation between the rise in margarine consumption (and reduction in butter consumption) and a corresponding rise in coronary heart disease. <http://wholehealthsource.blogspot.com/2008/12/butter-margarine-and-heart-disease.html> Correlation is not causation, of course. But this isn't the only evidence that links a reduction in natural fats and an increase in industrial fats to negative health outcomes.

Patrik (2009-01-23 15:25:20)

Taubes demolished the butter-is-bad-for-you corollary to the low-fat-is-good-for-you misinformation cascade. The more butter and saturated fat I eat, the thinner I get.

Brody (2009-01-25 19:29:00)

Isn't the Fancy Food show awesome? I LOVE that event...of course, I eat way too much while there. Thankfully it's only every 2 years in the Bay Area.

seth (2009-01-25 20:45:00)

Looking at the pile of candy and inferior tea I brought home, I too am starting to be glad it's only every 2 years in the Bay Area. Until recently it was every year. On the other hand the last show was incredibly helpful to me, it changed my thinking about probiotics and fermented foods, as I will describe in later posts.

Stella (2009-03-18 18:04:57)

Hi Seth, butter is usually considered unhealthy for our body in general. However, we must know that there are various forms of butter, and among these forms only the refined or synthetic ones are the most harmful. Natural butter that you derive from milk directly is a rich source of vitamin A, and less harmful to blood vessels. On the other hand, synthetic butter usually

contains additional trans-fats making it harmful for blood vessels. Just clearing the air;-)

## Not the Same Study Section: How the Truth Comes Out (2009-01-24 09:07)

In the latest Vanity Fair is a brilliant piece of journalism, [1]Goodbye to All That: An Oral History of the Bush White House by Cullen Murphy and Todd Purdum. In a fun, easy-to-read format, it tells some basic truths I had never read before. Here are two examples:

Matthew Dowd, Bush's pollster and chief strategist for the 2004 presidential campaign: When Abu Ghraib happened, I was like, We've got to fire Rumsfeld. Like if we're the "accountability president," we haven't really done this. We don't veto any bills. We don't fire anybody. I was like, Well, this is a disaster, and we're going to hold some National Guard colonel responsible? This guy's got to get fired.

For an M.B.A. president, he got the M.B.A. 101 stuff down, which is, you know, you don't have to do everything. Let other people do it. But M.B.A. 201 is: Hold people accountable.

David Kuo, deputy director of the White House Office of Faith-Based and Community Initiatives: There's this idea that the Bush White House was dominated by religious conservatives and catered to the needs of religious conservatives. But what people miss is that religious conservatives and the Republican Party have always had a very uneasy relationship. The reality in the White House is if you look at the most senior staff you're seeing people who aren't personally religious and have no particular affection for people who are religious-right leaders. Now, at the end of the day, that's easy to understand, because most of the people who are religious-right leaders are not easy to like. It's that old Gandhi thing, right? I might actually be a Christian myself, except for the action of Christians.

And so in the political-affairs shop in particular, you saw a lot of people who just rolled their eyes at everyone from Rich Cizik, who is one of the heads of the National Association of Evangelicals, to James Dobson, to basically every religious-right leader that was out there, because they just found them annoying and insufferable. These guys were pains in the butt who had to be accommodated.

This is related to the Shangri-La Diet. In these two excerpts, the speakers were (a) close to the events they describe but (b) not so close they are in any danger from the people they tell the truth about.

In science the same thing happens. Saul Sternberg and I could tell [2]the truth about Ranjit Chandra's research not only because (a) we were fairly close to that research (which involved psychology, even though Chandra was a nutritionist) but also because (b) not being nutrition professors, Chandra couldn't harm us. Those closer to Chandra, professional nutritionists, had plenty of doubts as far as I could tell but were afraid to say them. Hal Pashler and I could [3]criticize a widely-accepted practice among cognitive modelers because (a) we were in the same general field, cognitive psychology, but (b) far enough away so that the people we criticized would never review our grants or our papers. (Except the critique itself, which they hated. After the first round of reviews, Hal and I requested new reviewers, saying it was inevitable that the people we criticized wouldn't like what we said.) Likewise, in the case of [4]voodoo correlations, Hal is (a) close enough to social neuroscience to understand the details of the research but (b) far enough away to criticize it without fear.

In the case of the Shangri-La Diet, I was (a) close enough to the field of nutrition that I could understand the research but (b) far enough away so that I could say what I thought without fear of reprisal. Nassim Taleb is in the same relation to the field he criticizes. Just as Saul Sternberg and I knew a lot about the outcome measure (psychological

tests) but were not nutritionists, Weston Price, a dentist, knew a lot about his outcome measure (dental health) but was not a nutritionist.

It's curious how rarely this need for insider/outsiders (inside in terms of knowledge, outside in terms of career) is pointed out. It's a big part of how science progresses, in small ways and large. Mendel and Darwin were well-educated amateurs, for example. Thorstein Veblen [5] wrote about it but I haven't read it anywhere else.

Tom (2009-01-24 10:30:20)

Brilliant, brilliant post, Seth. The elephant in the room. Fantastic.

Nadav Manham (2009-01-24 11:30:06)

I've always been struck at how many of the world's great skeptics and iconoclasts were either aristocrats (Montaigne, Russell), deliberately thrifty (Hume), or did their best work while earning a "normal" living (Einstein in the patent office, Spinoza as a lens grinder). In each case, their economic independence seems to have helped their intellectual independence.

DA (2009-01-24 12:46:34)

Jane Jacobs embodied this insider/outsider status. One could argue that Obama is an insider/outsider, too, though only time will tell how that influences his presidency.

mike kenny (2009-01-24 15:34:23)

nietzsche too, left university and wrote from the outside. wittgenstein wrote his tractatus while a soldier in world war i, iirc. should we get rid of peer-reviewed journals? put your stuff up on the web and let people criticize it that way, publicly. it seems a more rapid and multi-perspectival approach. not to discount experts—they can say whatever they would say as referees. does blogging damage journals since academics seem to be putting their ideas on the web anyway? 'oh, i read your paper, but you pretty much said everything on the web before hand.'

Stephen M (Ethesis) (2009-01-27 22:04:38)

I think you've hit something very profound with this post.

Duncan (2009-01-28 16:28:48)

'This kind of critical review paper, emphasizing the key unsolved problems, is common in quantum gravity, cosmology, and, I suspect, most other fields of science. Because this was not being done by any of the leaders of string theory, it was left to someone like me, **as a quasi "insider" who had the technical knowledge but not the sociological commitment** [bold mine], to take on that responsibility. And I had done so because of my own interest in string theory, which I was working on almost exclusively at the time. Nevertheless, some string theorists regarded this as a hostile act.' – Lee Smolin, from the *How Do You Fight Sociology?* chapter of his recent book *The Trouble With Physics*.

Alexis Gallagher (2009-02-02 12:31:49)

I agree this the idea of an insider/outsider is very powerful. Why is it not better appreciated? At least one reason is that there's no good word for it. The closest word is probably "whistleblower", but that is crucially different in its focus on ingroup malfeasance rather than groupthink or peer pressure. (I'd say much journalism on groups shares this misplaced focus, looking for conspiracies rather than folly.) "Insider/outsider" is pretty good coinage. But can we do better?

Alexis Gallagher (2009-03-25 13:03:33)

I thought you would be interested to note that the March 25th article on Freeman Dyson in the NY Times magazine refers to him as an "outsider-insider", with exactly the sense used here. The meme is spreading! (Or the coincidence is.)

seth (2009-03-26 08:48:04)

Thanks, Alexis! Very interesting.

Seth's blog » Blog Archive » What I'm Looking Forward to Reading (2009-07-28 09:43:28)

[...] In September, David Owen, a staff writer at The New Yorker, will publish *Green Metropolis: Why Living Smaller, Living Closer, and Driving Less are the Keys to Sustainability*. Or at least that's what the print says; the picture has a different subtitle. The book expands on this New Yorker article. Owen criticizes Michael Pollan and Amory Lovins, among others. Maybe this is an example of the insider/outsider advantage I've blogged about. Owen is not the New Yorker's environmental reporter; that would be Elizabeth Kolbert. So he can say anything, criticize anybody, without worrying about his ability to write more on the same subject. He can always go back to golf. Kolbert is not so free. In any case, Owen's book sounds better — less predictable — than Kolbert's book on a similar subject. A TV show on the subject. Owen on bridge. [...]

## **A Brilliant Business: Selling Soap Nuts Online (2009-01-25 12:16)**

I came across [1]Laundry Tree while trying to figure out what soap nuts are. Soap nuts grow on trees and contain a soap. You can use them in place of laundry detergent. Something I read linked to the Laundry Tree site because it had a good picture.

I clicked around the site and was very impressed.

- Attractive web design. Easy to navigate.
- Neither hard nor soft sell. It's plainly an e-tail site but it doesn't hit you over the head with that nor does it hide it.
- Signs of life. Unlike, say, [2]www.sethroberts.net, you can see that the home page has been updated recently.
- A friendly tone of voice.
- An interesting way to get visitors involved – a blogger's contest (which this post will not enter me in).
- Persuasive.

And that's just the website. None of the elements are rare yet the website itself stood way out from the zillions of websites I visit. I admire the whole business. It solves a real problem. It's unusual. It's very small. The owner puts little at risk, pays almost zero rent, and feels she's making the world a better place in her own almost-unique way. Very few businesses manage to hit all of these marks.

I'm sure I would admire Laundry Tree no matter what I did with my life. Being a professor is very far from being

a small business owner. But the self-experimentation I have done has a lot in common with Laundry Tree.

First, it began with trying to solve my own problems. I wanted to reduce acne, sleep better, lose weight. Laundry Tree began when the owner wanted a better way of doing laundry – no dyes, no harsh chemicals, not sudsy, and not expensive.

Second, it blends male and female tendencies. The data-analytic statistical-software number-crunching rigid-experiment side of self-experimentation is obviously male. The talk-about-my-problems side is obviously female. Likewise, Laundry Tree centers on a problem – choosing a good laundry detergent – that concerns women more than men. Yet constructing and maintaining a website is a kind of technical work that men seem to enjoy more than women. (Nowadays, I admit, it isn't very technical.)

A journalist friend of mine was given an assignment to write about self-experimentation but eventually turned it down when he couldn't find enough examples. I think the need to blend male and female tendencies is the main reason it is so rare. (At least publicly.) To get somewhere you really do have to make numerical measurements, enter the data, plot the data, and so on – stuff that, historically, men do far more than women. Yet to talk about your results you really do have to admit to everyone you have (or at least had) a problem, which men find much harder to do than women.

The [3]Quantified Self Meetup group is having a meeting this Tuesday (Jan 27) – two days from now – at the UC Berkeley School of Information, 6 pm. The dozen or so projects I've heard about related to this group always involve quantification but rarely experimentation. In my experience quantification without experimentation doesn't get very far but perhaps they will eventually learn this (or perhaps I'm wrong). Experimentation and quantification is more difficult than quantification alone but only a little more difficult. Perhaps the reason for lack of experimentation is that with quantification alone you stay safely on the male side of things but to add experimentation (to solve a personal problem) and talk about it you have to cross over to the female side.

1. <http://www.laundrytree.com/>
2. <http://www.blog.sethroberts.net/http://www.sethroberts.net>
3. <http://www.kk.org/quantifiedself/>

---

mike kenny (2009-01-25 13:11:14)

That's interesting—I tend to agree men are more analytical generally, and women more comfortable talking about problems. A possible explanation might be women point out problems they have and men try to solve them to impress women. Women might be, perhaps not consciously, testing, so to speak, who would be the best mate, since it would be good for a woman's evolutionary prospects to be selective, while men will perhaps tend to try to demonstrate their quality through clever solutions, but their main problem would be figuring out how to pass on their genes, from an evolutionary perspective, without much need for selectivity, since they can father man children and don't need to devote resources to individual children the way mothers tend to need to, it seems. I suppose men might be inclined to look for as many women with easy problems and low-standards as possible, and solve their problems to impress them and hopefully mate with them, whereas women might be looking for men who can solve tough problems and stick with them, to demonstrate their loyalty and provider abilities.

Lawrence Summers (2009-01-25 18:43:08)

"Second, it blends male and female tendencies. The data-analytic statistical-software number-crunching rigid-experiment side of self-experimentation is obviously male. The talk-about-my-problems side is obviously female. Likewise, Laun-

dry Tree centers on a problem â€” choosing a good laundry detergent â€” that concerns women more than men. Yet constructing and maintaining a website is a kind of technical work that men seem to enjoy more than women. (Nowadays, I admit, it isnâ€™t very technical.)” Goes along with my line of thinking! Unfortunately, they made me resign from Harvard for it.

Justin Wehr (2009-01-25 19:02:38)

Very interesting point, Seth. I have linked to this post and will add my thoughts to it in a post that will appear tomorrow morning on my blog.

sethl (2009-01-26 12:28:46)

Thanks, Justin. Here is a link: <http://wehrintheworld.blogspot.com/2009/01/seth-roberts-theory-for-why-self.html> I suppose Gretchen Rubin’s [1]Happiness Project is support for my ideas here. She has the “admit a problem” part down really well but doesn’t do anything along the lines of quantification, plotting numbers, data analysis, etc.

1. <http://www.happinessproject.typepad.com/>

Patrik (2009-01-26 12:57:15)

*No chemicals or unnatural substances are involved! ... They are 100 %, totally natural. They are organically grown and are chemical-free, ...* Not to pick on these folks, but this sort of false advertising: “Natural = good. Chemical = bad” is irritatingly never challenged. Since the process of cleaning clothing isn’t wholly mechanical, we know that there has to be some chemical interaction involved. And lo, there it is: *The outer shell of the soapnut contains saponin, a natural substance known for its ability to cleanse and wash.* Interesting how saponin is a “natural substance”, not a natural “chemical” or even “chemical substance”. Now, what bugs me is this insistence that something “natural” is inherently good and desirable. The oils from *Toxicodendron radicans* are certainly natural substances, but we generally try to avoid them, and would never wash our clothes with them. “Natural” is subjective and does not mean “good” or “desirable”. Natural substances or chemicals are not any better or any worse than unnatural ones.

## Jane Jacobs’ Influence (2009-01-26 08:02)

[1]Here is good summary:

The urban planning revolution began even as the Astodia road was first being scrutinised. If one were to mention a single event that kick-started the movement, it would be the publication in 1961 of Jane Jacobs’ book *The Death and Life of Great American Cities*, which took on the policies of Robert Moses, the man who transformed New York City. Town planners like Moses believed in making cities more liveable by executing big-ticket public works projects: expressways and bridges, parks and promenades, dams and waterworks, and massive public housing schemes. Whatever came in the way of these efforts was bulldozed without much consideration of value. The new way pioneered by Jacobs rejected this rationlist, top-down approach in favour of decentralisation, preserving and empowering communities, consulting locals rather than depending solely on appointed experts, and working on a small rather than gargantuan scale. This movement is now seen as a shift from modernist to post-modernist thinking. A modernist would view Astodia as a traffic bottleneck ghetto of mostly impoverished citizens, living in uncomfortably tiny habitations without good public utilities. A post-modernist would see it as a close-knit community dwelling in old structures, some of them finely crafted, practising a lifestyle that had developed organically down generations.

### More Great Food at the Fancy Food Show (2009-01-26 12:09)

- Or great packaging. [1]Agua de Piedra, a brand of mineral water, uses only the bottles that would otherwise be wasted when a glass-bottle manufacturer changes production from one color to another. Not only is this a great idea but it gives their bottles an attractive variation in color. I really liked the water, too.
- The [2]Pacari line of chocolates includes "raw" chocolate, that is, chocolate that is "minimally processed and unroasted to maintain the antioxidants and complex flavor profile of the cacao."
- I was surprised that there is a drink based on tumeric: [3]Sajen Jamu.
- One of the most interesting features of the show was the vast increase in the amount of cheese (all artisanal cheese) compared to all previous shows I attended, such as the show 2 years ago. Perhaps the best cheese I had was from [4]Quickes Traditional, a farm in the south of England. They make many kinds of cheddars.

### The Inuit Paradox (2009-01-26 22:33)

The [1]Inuit Paradox is that the Inuit eat lots of fat and hardly any vegetables or fruit yet are much healthier than groups who follow conventional dietary guidelines. In particular,

In the Nunavik villages in northern Quebec, adults over 40 get almost half their calories from native foods, says Dewailly, and they don't die of heart attacks at nearly the same rates as other Canadians or Americans. Their cardiac death rate is about half of ours, he says.

Likewise, the fact that Greenland Eskimos had very low rates of heart disease led to the discovery of the importance of omega-3 fatty acids. If you read anything on this subject you will come across the concept of "healthy fats". Sure, some fats are good for you, no doubt about it. Weston Price was the first of many to make this point. But is it the whole story? Attempts to reduce heart disease by giving people fish oil have had disappointing results. Perhaps they got the dose wrong. Or perhaps they missed something crucial. Here is what the Inuit eat:

Our meat was seal and walrus, marine mammals that live in cold water and have lots of fat. We used seal oil for our cooking and as a dipping sauce for food. We had moose, caribou, and reindeer. We hunted ducks, geese, and little land birds like quail, called ptarmigan. We caught crab and lots of fish—salmon, whitefish, tomcod, pike, and char. Our fish were cooked, dried, smoked, or frozen. We ate frozen raw whitefish, sliced thin. The elders liked stinkfish, fish buried in seal bags or cans in the tundra and left to ferment. And fermented seal flipper, they liked that too. [emphasis added]

In the rest of the article and in all discussions of the subject I have seen you won't find a word about fermented food. Yet I believe that was crucial. The fermented food had lots of harmless bacteria that caused the immune system to stay awake; heart disease is caused by infection too slowly fought off. Why do the French have low rates of heart disease? It's not only the wine, it's also the stinky cheese they eat. Why do the Japanese have low rates of heart disease? It's not only the fish, it's also the miso and natto. I'll be blogging more about this – stay tuned.

[2]A surprising effect of yogurt.

---

Tom (2009-01-26 23:10:32)

You will love Stephan's series on the Tokelauan islanders who, before becoming Westernized, got 50 % of their calories from saturated fat (coconut oil.) That's the highest for any population ever recorded, including the Masai tribe. Tokelauan rate of heart attack? 0.0 % <http://wholehealthsource.blogspot.com/2009/01/tokelau-island-migrant-study.html> *heart disease is caused by infection too slowly fought off.* Quite an assertion, Seth – source?

agl1 (2009-01-26 23:21:04)

"heart disease is caused by infection too slowly fought off" Heart disease is caused by inflammation from eating too much sugar, which explains why the French, Japanese and Eskimos don't get it as much as the Americans.

Nathan Myers (2009-01-27 02:25:45)

Bacteria don't just produce antigens. They produce vitamins, proteins, enzymes, mineral complexes. But we've all got a trillion bacteria in our guts already, more than the eukaryotic cells in the rest of our bodies. What's so special about the ones in rotten food?

Confidence (2009-01-27 05:19:23)

Your excitement is contagious, but this is hardly new: <http://www.google.com/search?hl=en&fkt=929&fsdt=5958&q=probiotics+and+immunity&btnG=Google+Search> Would you have been this excited about this discovery if you'd just read an article somewhere describing the positive role of probiotics on the immune system? Or does hearing it with your own ears via a self-experiment result in an endowment effect of sorts? What, exactly, is new about what you are stating?

seth (2009-01-27 07:16:59)

Confidence, meet Tom, agl1, and Nathan Myers. The notion that the Inuit – not to mention the French and the Japanese – have a low rate of heart disease because of the fermented food they eat is entirely new, as far as I know. Of course, the low rate of heart disease in the French is often attributed to wine, but wine is not a probiotic. Nor do researchers think it is the dead bacteria in wine that are the crucial element. Some have suggested it is the alcohol (because beer intake has similar correlations). More recently – Sunday on 60 Minutes – resveratrol, found in grapes, was claimed to be important. Nathan, the immune system must distinguish between the bacteria we have all the time and new bacteria, which can be dangerous. Fermented foods are a source of new bacteria. Inflammation is due to infection or at least foreign bacteria. Heart disease is often linked to infection. For example, it is correlated with gum disease. When I say "heart disease is due to infection too slowly fought off" I mean it as a hypothesis, not an established fact. It is plausible because heart disease is linked to infection. Obviously the faster you fight off an infection the less damage it does. Whether sugar has an effect on heart disease I don't know. But since when do the French have a low sugar intake?

Confidence (2009-01-27 07:51:40)

I see, you appear to be making two separate assertions: 1. Dead bacteria (and associated substances) improve the immune system 2. An improved immune system helps prevent heart attacks That combination is pretty novel. Thanks for the followup.

Tim (2009-01-27 10:21:17)

I have suffered from tendonitis at one place or another for years. While all have had explanations, it seems like I had more problems than most people. This made me think I may have a systemic problem countering inflammation. The posts and comments on omega-3 fats and inflammation were one of the reasons I started reading your blog a couple of months ago. I have also found some books on diet and inflammation. One of them (something like "The Anti-Inflammation Zone" by Sears, although I don't have it in front of me so that may not be quite right), talks about a ratio of a certain omega-6 fat to EPA (an omega-3 fat) as an indicator of inflammation. He recommends staying in the 1 to 3 range. What makes this applicable to your post is that he references a study of Greenlanders from the 1970s who were in the 0.5 range. While they had very low rates of heart disease, depression, and other inflammation-linked afflictions, apparently they had trouble fighting infection (a benefit of inflammation). The author also mentions clotting problems at low ratios (not specifically in relation that study, I think, but also mentioned in the article you linked to above). How about this hypothesis? The fats in their diet lead to low inflammation, which has the heart and other benefits. The probiotic foods stimulate the immune system, which helps balance their diet's difficulty fighting infection. Finally, on an unrelated note, I caught part of a nature documentary last month that said, "These baboons, like most primates, spend their early mornings grooming each other." I thought immediately of your morning faces.

Patrik (2009-01-27 11:28:19)

I am very skeptical of fermented foods-introduce-bacteria-that-keep-your- immune-system-awake hypothesis. (Why would my immune system be asleep?) Stephan has a lot to say about fermented foods and why/how they might be beneficial: <http://wholehealthsource.blogspot.com/search?q=fermented> 1. Pre-digestion of food 2. Eliminate anti-nutrients and toxins 3. Lower pH of certain foods making minerals more bioavailable 4. Probably most important: Provides Vitamin K2 — (this is a very interesting post and addresses natto and foie gras [http://wholehealthsource.blogspot.com/2008/06/vitamin-k2-menatetrenone-mk-4.h tml](http://wholehealthsource.blogspot.com/2008/06/vitamin-k2-menatetrenone-mk-4.html))

agl1 (2009-01-27 13:16:14)

The French have a lower sugar intake than the Americans because they very rarely drink fizzy drinks like Coke. Insulin resistance is the root cause of the inflammation. Also, Spain, Portugal and Italy also have low rates of heart disease, and they don't eat as much cheese as the French. There is a hypothesis that it is due to the sunshine.

Nathan Myers (2009-01-27 18:46:22)

So, rotted foods are favored by old people because young people have little difficulty finding bacteria they haven't already been seeded with? I suppose it's important for the bacteria to be killed in the stomach so they don't get established in the colon and necessitate finding yet other varieties. That seems to recommend eating rotted foods in small amounts, and not in a form in which the bacteria have already formed spores. If it's true, we should expect to see similar behavior in other long-lived mammals.

mike (2009-01-28 09:02:49)

I am partial to the idea that fermented foods have numerous health benefits. I would also think that this would be easy to measure on a wide scale: koreans eat kimchee (fermented cabbage) everyday, nearly every meal. Meanwhile, the youth are eating it much less. So, we'd expect to see very low rates of some diseases (and frequency of colds?), but increasing. Then again, there are a lot of other environmental factors increasing as well: stress, pollution, urbanization, social disconnection, etc., so maybe it is hard to isolate.

Clyde Adams III (2009-01-28 12:31:39)

On the supposed benefits of ingesting bacteria: "Eating dirt can be good for you - just ask babies" <http://iht.com/articles/2009/01/27/healthscience/snbabies.1-416618.php>

VesnaVK (2009-01-29 06:41:58)

The error is in considering this a "paradox." The current mainstream guidelines, as expressed by, for instance, the USDA Food Pyramid, are mistaken and ill-founded. As Taubes outlines in *Good Calories, Bad Calories*, a population's incidence of the major chronic diseases (diabetes, heart disease, cancer) and conditions (obesity) follows the introduction of sugar and starch as staples. The more processed, readily available, and cheap these are, the greater the incidence. This phenomenon can be seen over and over through reading centuries of records of explorers, missionaries, settlers, etc. Probiotics are undoubtedly beneficial, but the simplest answer to the Inuit's good health was this: they didn't live on foods that make humans sick. In 1935, the Canadian explorer Vilhjalmur Stefansson wrote a three-part article appearing in *Harper's Magazine* about his experiences living and eating with the Inuit, and his subsequent Harvard-sponsored experiments with a vegetation-free diet. It's a fascinating read. Google "vilhjalmur stefansson adventures in diet" to find the text online, or try this link: <http://www.biblelife.org/stefansson1.htm>

seth (2009-01-29 07:22:30)

VesnaVK, thanks for the link. I'm very glad to have it.

mgl (2009-01-29 09:01:01)

Just to back up VesnaVK, I cannot recommend the Stefansson articles highly enough. Stefansson is an engaging writer with a wry sense of humor, and his accounts of how he slowly came round to enjoying the Inuit diet of boiled fish and rotten fish are both entertaining and educational. His second and third articles relate his later experiences leading other Arctic expeditions and his famous year-long meat-only experimental diet. In both cases, he had to deal with entrenched popular and scientific prejudices which are not much different from what we see today.

seth (2009-01-29 10:00:54)

mgl, you will surely want to read my upcoming post on how Stefansson is a *bad* example.

bennetta (2009-01-29 11:39:58)

All I can say about this is this stuff ( <http://en.wikipedia.org/wiki/Rejuvelac> ) is one of my favorite things, ever. Back when I was a database administrator at Whole Foods, I used to drink it daily and never felt better. It's best when you have it on an empty stomach. I would really like to do some self experimentation with it, but am not sure how to start or even what to track.

Kirk (2009-01-30 21:34:00)

Have you seen this study? 'Cognitive performance among the elderly and dietary fish intake: the Hordaland Health Study', led by Eha Nurk. I found it at <http://www.ajcn.org/cgi/content/full/86/5/1470?maxtoshow=&HITS=10&hits=10&RESULTFORMAT=&author1=nurk%2C+eha&searchid=1&FIRSTINDEX=0&sortspec=relevance&resourcetype=HWCIT>. My wife was reading a summary of the study in a health/nutrition letter, which implied that the researchers were surprised that non-Omega-3-rich fish also were beneficial to the brain. Of course, I immediately thought of your premise in this thread and did a Wikipedia search to find that yes, Norwegians eat fermented fish (rakfish, sursild). Perhaps the detailed data for this study could be searched using a filter based upon whether food was fermented?

seth (2009-01-31 11:38:48)

Yes, I've seen that study. Thanks for reminding me of it.

SB (2009-02-05 06:00:48)

Have you considered fermented cod liver oil? <http://tinyurl.com/cck3gl>

Alex (2010-01-17 23:14:04)

Another explanation of the 'French Paradox' - their milk is mostly of type A2 - same for Spain, Switzerland, Italy, Asia, Africa and Japan. A1 (the bad stuff) is what we get in the US, UK, Australia, New Zealand and most of Scandinavia (Although A2 Corp in NZ makes only A2 milk). A1 intake correlates closely with incidence of heart disease and type 1 diabetes

## Interview with Leonard Mlodinow (part 1) (2009-01-28 11:35)

 Leonard Mlodinow's most recent book is [1]The Drunkard's Walk: How Randomness Rules Our Lives, which was a New York Times Notable Book of the Year. The first book of his that I read was [2]Feynman's Rainbow. It was so good I wrote him a fan letter. He came to talk at Berkeley in connection with [3]A Briefer History of Time (which he co-wrote with Stephen Hawking). After his talk I told him how much I had liked Feynman's Rainbow. Because I was a psychology professor he asked my opinion of the parts of The Drunkard's Walk that involved psychology. That's how we met.

ROBERTS You're a scientist but you also are a good writer and you appreciate the science—no one's telling you, "this is good and this is bad," you can figure it out for yourself. Is that fair? Is that accurate?

MLODINOW I hope so. As a scientist I like to think I have good taste in judging what is good science, at least. It's not always so easy to judge which directions are the ones that are going to be fruitful, obviously, but certainly in judging what's good science, or more importantly I think, in judging what science is crucial for the public to understand and how to make it exciting for them. That's one thing that I think a lot of scientists don't know how to do, which is how to look at from the point of view of a person who isn't a scientist and explain it in an interesting and amusing, entertaining and most of all exciting way. One of my pet peeves is that, among the general public, people think that science is dry and boring and done by nerds who wear accountant-type thick glasses and white coats. Really it's done by people who experience huge ups and downs and have as much passion for their subject as other professions that are considered more romantic, like artists.

ROBERTS Unlike other people who write about science, I think you're writing intellectual history. I mean, you're not saying, "Oh, this is a popular topic; this came up in the last ten years as a new popular topic I'm going to write a book about." You're writing about things like geometry and probability, which are ancient topics. That's really unusual. Am I right?

MLODINOW When I write about something, it's because that excites me and I see a relevance to our world today. When I wrote Euclid's Window about geometry, it was really about the idea of curved space and curved space is so important in modern physics and even in technology. If you look at, say, global positioning systems, you have to use Einstein's Theory of Gravitation which is based on curved space and I thought that no one really sat down before and explained, taking their time, what is curved space and what is un-curved space and how do we get that idea and where did it come from and looking at fascinating stories, so that's where Euclid's Window came from. In The Drunkard's Walk it was similar in the sense that there had been other books about probability or other books about statistics and other books about randomness, but I don't think there had been any book on all three of them, but what propelled me was the idea that not just to write about these concepts but the realization that they're very important in everyday life, and really the focus on everyday life and how these concepts can help us see it differently.

ROBERTS And it's better written than the other books, I have to say.

MLODINOW Thank you.

ROBERTS That's really important, I mean, what good is it to write a book if it's hard to read?

MLODINOW I think that's what I bring to this field, is both knowing the science and being able to write well,

and with a sense of humor.Â There are plenty of people who know the science and plenty of people out there who write well, but there are few who can do both.

rich (2009-02-07 18:26:45)

This is great, thanks! Interesting enough that I just read 'Feynman's Rainbow' and loved it.

### **Interview with Leonard Mlodinow (part 2) (2009-01-29 07:48)**

ROBERTS What other nonfiction writers do you like to read?

MLODINOW That's a good question. Strangely I've never thought about that. I can name novelists I repeatedly read, but most nonfiction writers that I like write to subjects of their own expertise, and I pick up nonfiction books based on what they are about more than on who wrote them.

ROBERTS Such as what? Which books?

MLODINOW For instance, Carl Sagan if you want to go back a little bit. I enjoyed several of his books; they tended to be, obviously, on astronomy or issues related. I also enjoyed Freakonomics, and I like Oliver Sacks's books on neuroscience. And Daniel Gilbert's book Stumbling on Happiness; I don't know if Gilbert will turn around now and write a book on geometry . . .

ROBERTS I don't think so.

MLODINOW . . . these authors write about their own field. Oh, I do enjoy Simon Winchester's books and he tends to branch out. I think he's a good writer.

ROBERTS Was he a professor? He might have been a PhD in geology.

MLODINOW I donâ€™t know.Â But I do believe he had a number of unsuccessful books before–I forget which was his first successful book . . .

ROBERTS The Professor and the Madman, I think.

MLODINOW The Professor and the Madman, right.Â His wife, I think, pushed him to write that.Â If I remember the story correctly, he wasnâ€™t initially going to write it. I think I am unusual in that Iâ€™m a science writer who writes in a variety of topics.Â I am finishing a new book with Stephen Hawking right now, called The Grand Design, on the origin of the universe, and of the apparent laws of nature.Â Then my next book is going to be on the unconscious mind.

ROBERTS A friend just asked me about a book on consciousness. She said, â€˜Well, what about this book by \_\_\_\_\_?â€™ (I donâ€™t want to say his name), and I said â€˜No, I donâ€™t like that.â€™ And she said, â€˜Well, what would you recommend?â€™ And I said, â€˜I donâ€™t think there are any good books on consciousness except the one my friend is writing.â€™

MLODINOW Well thank you; I hope to live up to that. Iâ€™ve found that there is a niche available in that field. There have been a lot of books but a lot of them have been case studies or peopleâ€™s individual pet theories about what consciousness is and I think that for someone like me from the outside, who yet has a scientific understanding, there is room for a good book there. And there probably is room every five or ten years for another one because it is a very fast moving field.

[1]Interview directory.

1. <http://www.blog.sethroberts.net/2009/01/29/leonard-mlodinow-interview-directory/>

---

Andy McKenzie (2009-01-29 14:07:35)

Seth, what about The Illusion of Conscious Will by Daniel Wegner? It touches on most of the major themes, focuses on research, etc.

seth (2009-01-29 15:54:27)

Andy, I looked at Wegner's book briefly on Google Books. It seemed to me poorly written. I didn't get very far so I can't say more than that. Thanks for the recommendation.

Seth's blog » Blog Archive » Leonard Mlodinow Interview Directory (2009-01-31 11:33:36)

[...] Interview with Leonard Mlodinow (part 2) [...]

## **What to Do about Beijing Air (2009-01-30 09:24)**

Beijing's dirty air is easily the worst thing about living there. You might think what to do about it is obvious. Many people do, including this man who wants to sell the expensive air filter he bought:

I remember the day IQair Sales Rep Justin Shuttleworth came to my place [in Beijing] to give me a demo. This guy has the easiest job in the world. All he does is come with his little air quality measuring device, show you how bad the air you are breathing is in your apartment (indoor air is sometimes worse than outdoor air for those who don't know), and as the minutes go by, you literally see the amount of particles in the air go down, until it's basically nil. This was the first time that I could actually smell the difference.

This is from an email list I'm on.

I got the same demo.Â But it had the opposite effect: It made me not want to buy the IQair filter.

The air coming out of the IQair filter was very clean, yes. But there was only so much it could do. More dirty air was always coming into my apartment and no matter how high (= noisy) they ran the machine the overall level of dirt was no more than cut by 2/3rds. I already had an air filter. The air it produced wasn't quite as clean as air from the IQair filter but it was still much much cleaner than the intake air. The IQair machine cost about 11,000 RMB. My filter had cost about 1,000 RMB. For 1,500 RMB I could buy a bigger version of what I already had, an air filter that cleaned twice as much air per minute as the IQair machine while producing roughly the same amount of noise. Its output was slightly dirtier than the output of the IQair machine but the overall cleaning effect – the reduction in dirt – was much greater. I ended up getting two of the 1,500 RMB filters.

I think of this demo when I hear someone talk about how this or that traditional diets is better than our modern diet. They make a simple point: People who eat the traditional diet are healthy, people who eat the modern diet are unhealthy. Just as the IQair demo guy has "the easiest job in the world." They inevitably conclude: Eat the traditional diet or at least closer to it. Just as the conclusion of the demo is supposed to be: Buy an IQair filter. It seems so simple.

But it isn't so simple. Eating the traditional diet isn't easy, just as the IQair filter isn't cheap. Maybe their abstraction – their description – of the traditional diet leaves out something important. Just as the IQair people do not measure cleaning power per decibel, which turns out to be what matters. (I traded air pollution for noise pollution. I wanted the best deal possible.)

If you read Good Calories Bad Calories you may remember the Canadian anthropologist Vilhjalmur Stefansson who spent many months with Eskimos eating what they ate. He came back and told the world "you can eat only meat." In [1]his conclusions and subsequent field experiment, he ignored the fact that the Eskimos ate a lot of fermented meat.

1. <http://www.biblelife.org/stefansson1.htm>

---

Will Croxford (2009-02-28 04:57:13)

Dear Seth, I live in Beijing and am just thinking about buying an air filter, your comments make a lot of sense, but can you tell me which air filter you bought, or any suggestions where to find out about cheaper air filters? If it's a super hot summer's day, you have all the windows closed and the air con on full blast, can your air filter(s) keep up? I see IQair have their own stores in Beijing now, and their website is conspicuous in its lack of price information. They seem to have their marketing to the Shunyi expat community worked out very clearly, perhaps they will have chronically asthmatic children on the next ad to really hammer home the fear factor. Otherwise, a certain exposure to bacteria is a good thing surely, if your IQair unit gets rid of all the bacteria at home, as soon as your young kids go outside their immune systems will be less prepared to deal with all

the bacteria on the street? Reminds me of the Japanese craze for sanitising everything which as far as I understood was not good for their general asthma levels. The other thing I wonder about is cleaning air conditioners. I got ours cleaned at home last summer. I got a guy who was recommended by the manufacturer but did not actually work for them (freelance fixer) and he came and took the cover off, sprayed some foam all over the filters and left that to soak in, then topped up the coolant one as some of it had leaked. But I don't know how to confirm what that foam was, or if it could have been an air pollutant in itself. How could I possibly know if he fobbed us off with the cheap foam version.. Just in case you have researched such a thing yourself. He charged 150RMB for both air cons which seemed cheap anyway. sorry to rabble on but thanks if you have any suggestions for the air filter, Sincerely, Will Croxford (Beijing resident)

seth (2009-02-28 10:39:39)

My air filters are from Yadu. You can get a low price on the Chinese amazon site but you need to be able to read Chinese. I got the cheap air filter (1000 RMB) at Carrefour; the more expensive one (1500 RMB) I got online. I know nothing about cleaning air conditioners, sorry. It isn't the bacteria in the air that worries me, it's all the combustion byproducts, which I'm sure are carcinogenic.

Will Croxford (2009-03-04 22:05:25)

Dear Seth, Thanks kindly for the reply. You will help my family and I to breathe more easily I should think - I can read Chinese so will check out the Amazon site. As far as I understand about air conditioners, the filters should be cleaned professionally once a year, I guess the foam stuff he used was the right thing. Best wishes, Will Croxford

mc (2009-03-27 15:44:19)

Which is why I usually rephrase that point as "You can eat mostly meat." They also ate a lot of organ meats; vitamin C and other vital things are present in liver, and I don't see how you can get on without that one. ;)

DirkT (2010-03-26 23:47:31)

Hi Seth, We actually purchased Yadu per your recommendation but recently purchased our 3rd unit from Alen air purifiers. I can honestly say there is a huge difference between Yadu and Alen (which is much better) but cant really say much about IQ cuz we can't afford it.

Dorothy Larson (2010-07-07 06:04:36)

I bought a Blueair purifier last week-I was desperate to breathe! [The cheap little Ya Du quit and they couldn't provide a new filter immediately] Obviously I was in a hurry-I am still concerned that they insisted they would not accept returns unless it mechanically wouldn't work. I have used Austin Air purifiers for years. They are excellent and offer thirty days return-no-questions-asked -which is reassuring when you are spending \$500. This Blueair has a polypropylene filter- {Austin Air uses hemp! } There is a faint weird smell from the supposedly clean air coming out of the purifier. Kinda plastic but vague-I wonder if anyone has any better ideas for an Air purifier or has ever heard of being allergic to the filters? I do think it is possible the damn thing has counterfeit filters-but who knows? and, how would you ever figure it out? Maybe two cheap Ya Du would be better?

### **John Updike, RIP (2009-01-30 10:30)**

I was 15 or so when I first read a John Updike novel. To my amazement, it was fun to read. The novels I'd read in English class, such as Oliver Twist, had never been fun to read. I read a lot more Updike and figured out he liked Nabokov. So I picked up Pnin. I loved Nabokov, it turned out. You could say Updike was an easy-listening version of Nabokov. He was the first person who taught me to enjoy literature. He was the bridge.

For a long time I read almost everything he wrote (except The Poorhouse Fair) but around S. I stopped. Maybe because I was watching more TV. I continued to read all his stuff in The New Yorker, but maybe it is fitting that, in his

entire career, the thing he said that I like best occurred on TV. In a [1]National Book Award acceptance speech (1998) he said, "A book is beautiful in its relation to the human hand, to the human eye, to the human brain, and to the human spirit."

1. [http://www.nationalbook.org/nbaacceptspeech\\_jupdikey\\_dcal.html](http://www.nationalbook.org/nbaacceptspeech_jupdikey_dcal.html)

---

Nansen (2009-01-31 16:50:56)

I wonder what your opinion is of the following sort of criticism (of Nabokov, and also of Updike), which seems to say "less art, please, for our sake": <http://www.slate.com/id/2000072/entry/1002666/>

seth (2009-01-31 22:34:00)

It's okay. I think Woods misses a lot. For example, he writes, "Nabokov imparts the idea that fictional narrative is, at its highest moments, a string of such details, a convoy of little visual perfection." I disagree. There was a lot more to it than that. Canto 3 of Pale Fire is about the death of the poet's daughter. Lolita is about unattainable love. Transparent Things is about mourning. Pnin is about a lonely professor.

### **Shangri-La Diet on Facebook (2009-01-30 23:57)**

An SLDer has created a [1]Facebook page for SLD. Sophie Loreenne vividly writes:

My own personal story I will post here. I have lost 7 lbs in 3 days. I am amazed that with so little effort on my part that it's actually working! The best part is that I'm no longer hungry. And trust me I was hungry all the time, by the time others have just started their first meal. I was on my 3rd meal.

I created this page to share with others my journey and to also create a support system for others.

Thanks, Sophie.

And thanks, Marian Lizzi, for telling me about this.

More Nassim Taleb has started a Facebook group called [2]Make Bankers Accountable – a "J'accuse" by Roubini and Taleb. Great idea. Thanks to Dave Lull.

## **Rotten Fish are Everywhere (2009-01-31 10:06)**

Somebody anonymous with [1]an amusingly-named blog became a vegan while working in a Thai restaurant:

Now here's something surprising: my bosses were interested in helping me be a vegan. "Oh, that silly white boy and his eating experiments," they'd say. Vang, the chef, learned to create delicious curry without fish sauce—learning how to dump plenty of salt and sugar into the coconut milk to compensate for the rotten fish. Plus, they introduced me the power of hot sauce, namely [2]Sriracha Sauce—a love affair that continues to this very day. . . .

One of my uncles, who is possibly a little retarded and probably a little mentally ill, says that hot sauce kills all the germs in your body (yes, he claims all of them), thus making it impossible to get sick.

No, it's the rotten fish that does that.

As in: when all you got is a hammer, all you see are nails? Looks like it to me too.

## **Interview with Leonard Mlodinow (part 3) (2009-01-31 11:32)**

ROBERTS I like to think that because you cover so many hundreds of years when you discuss geometry or probability that—and there's so many interesting characters and they have to be so brilliant to make a lasting contribution to those fields—that you're able to draw from a richer material than most writers. You have to be a very unusual person to make a lasting contribution to probability theory. [That came out wrong. You have to be a very unusual person to make a lasting contribution to any field.]

MLODINOW Right, well certainly mathematicians tend to be very unusual and colorful, odd sorts. That helps when you're writing a book about them. The physicist are maybe not quite as odd. My book Feynman's Rainbow was really about just one physicist and he was very colorful, so I got away with that. The work I do with Stephen Hawking is different in that sense—there's not that much history in those books. In our new book that we're doing, he doesn't want us to much history at all, so we're going to focus on the concepts.

ROBERTS . . . Let's start with your writing career. You seem to have been a good writer by the time you got your PhD because as I understand it, you were able to actually get a writing job after leaving Cal Tech. You must have been at a very high level by that time; you wrote a spec script for, what, Star Trek? Or some other show?

MLODINOW Well, my rise in Hollywood is a long and involved story, but yes, I did rise pretty quickly. After Cal Tech I went to the Max Planck Institute in Munich and then I came to Hollywood to make my way and in six months I was working at my first TV job, which was a really crappy show on cable, which was pretty new then—cable, I mean. And from there I worked by way up to network shows—I did comedies such as Night Court, the original Gary Shandling show and I wrote for dramas as well including MacGuyver and as you said, Star Trek: The Next Generation. That was a crazy period of life.

ROBERTS I got the impression that you already knew how to write really well by then.

MLODINOW I think that in a way . . . I guess there's two components to being able to write. One is your natural proclivity, I try not to say talent, but it's your voice or the way you express yourself. And the other is the craft part of it that you learn by doing. I think I always had a good sense of humor and maybe a way to say things colorfully or think in terms of dramatic or powerful situations and I guess that's the first part and served well. The other part is the things you learn as you go, such as what puts people to sleep or how to abandon what you think are good ideas but really aren't. That's a hard lesson to learn because it's difficult to let go of things you might like and to realize that it just doesn't belong or goes on too far or the idea that sometimes it's hard to recognize things that may be good but just don't belong there—that are tangents and they take away the dramatic thrust of where you're going and they really have to be cut even though they're good and you like them. You know, lessons like that, lessons about pacing—you learn by doing, by failing. You learn more about pacing, all sorts of technical aspects of writing, whether its fiction or nonfiction or TV or books; there are certain principles that you just learn by repeatedly doing and doing wrong and realizing, absorbing what went wrong and fixing it and you grow that way. In book writing you're able to do that a lot with rough drafts so a lot of your mistakes don't end up getting published—you know? TV writing can be so fast that often you don't see the problems with the script until you actually watch it on the air and then you go, "Next time I think I won't have that guy climbing the stairs for four minutes in the middle of the scene; I think five seconds is enough to get the idea across."

## 4.2 February

### Interview with Leonard Mlodinow (part 4) (2009-02-01 09:19)

ROBERTS You learned stuff from writing TV scripts that transferred into book writing?

MLODINOW Yes, I think you do. It's odd because there's in many ways very little similarity. Pacing, for instance, is very different on a TV show and when you're reading something but you do get a feeling for it and its importance. All those years of comedy writing certainly I think translate to having a real sense of humor, so there are certain things that do translate.

ROBERTS I think there's one remarkable thing that makes your books different from other books. Your books give the impression that they want to be entertaining—the author, you, is trying to meet the reader halfway. When you're writing a TV show, it's got to be entertaining because otherwise people won't want to watch it. They're not required to watch it to get a job or to get a good grade in their class; they're watching it because they enjoy it. So you've got to make it enjoyable. Whereas a lot of books written by professors seem to be saying, "Well, it's so important and you're going to read my book because this is an important book to read, so I'm not going to even try to make it interesting; I'm just going to do whatever I want." Your books are more reader-friendly in that sense.

MLODINOW I think that's true. A lot of people who are very serious about their topic have a hard time seeing why you need to make it interesting or knowing how to make it interesting for people who aren't automatically interested in that topic. To me that's one of the joys of writing. One of the satisfactions is when I go, "Wow, I made that really funny" or "I made that really interesting," and then I get excited by that.

ROBERTS That talent—it really helped you to have written for TV because it's kind of a fresh voice.

MLODINOW I think it helped to develop my voice, too, especially the comedy part, you know? And what my credits show is obviously a small part of what I write. For example at one point I was thinking that maybe I wanted to get on Leno or one of those late night comedy shows and we never really went that far with it, but I did spend some days writing stand up lines and pure joke writing to try to get some material together for my agent to show around. Probably very few other science writers have gone through an exercise such as that. That all, I think, contributes to being able to write with a sense of humor. Of course, you have to have a personality that gravitates in that direction in the first place.

Andrew Gelman (2009-02-01 15:36:45)

Seth, I hate to keep bugging you on this, but . . . when you say, "Your books give the impression that they want to be entertaining—the author, you, is trying to meet the reader halfway. . . . A lot of people who are very serious about their topic have a hard time seeing why you need to make it interesting," I think you're completely missing the point. Everybody wants to make their writing interesting and readable; it's just hard to do! As you and Mlodinow discuss, practice is important, talent is important, putting in the time is important. But it's not like people are writing badly on purpose!

seth (2009-02-02 00:47:47)

"Everybody wants to make their writing interesting and readable" and "It's not like people are writing badly on purpose!" Thorstein Veblen wrote a whole chapter in *The Theory of the Leisure Class* saying the opposite: Academics write badly on purpose to show how important they are. Other writers must grovel and try to please others; they need not, is the subtext of their awful prose. Just as certain women had really long fingernails to advertise how useless they were. Hood ornaments were yet another example of "conspicuous waste".

## **Beyond the Shangri-La Diet (2009-02-01 12:14)**

On the Shangri-La Diet forums is a [1]very interesting discussion:

It's a way of life when SLD is working, that is... And, to be honest, over the past few months it's not been working as much as it once did. Or, rather, it's has been working, but I only lose weight when SLD is strong. It was strong to start with and it's strong right now, but it's been 50 % or less in between.

My breakthrough came a week or two ago when I started to control my IBS with Colpermin tablets. That helped enormously because it stopped my stomach churning and grumbling so much. But the hot sugar water I was drinking didn't work 100 %. I could manage a few days of decent SLD, but then the hunger fell on me like a heavy weight and I would binge. They were small binges, because SLD was still working and I just couldn't eat a lot. But the total calorie intake was enough to stop me losing weight.

So, a few days ago I went back to basics. For me, that means back to those nose-clipped cans of Coke ☒ And strong SLD is back. To be brutally frank, I feel humiliated that Coke is the only thing that seems to produce conclusive results for me. Even Pepsi doesn't seem to work as well, or the various clones of Coke that (frankly) cost less ☒ I wish oil worked, or sugar water, I really do.

But there's something weird about Coke... We've speculated about it's stomach calming effects in other threads.

However, the fact is that I'm back in what I might call the SLD zone. It's a lovely place to be, but it's so terribly hard to describe. Today I ate one meal. And I'm fine. Tomorrow I go out for lunch, and I'm looking forward to it—a chance of have some nice food. But... that's the difference between strong SLD, and normality. I can wait for that nice food. It's just less important. I absolutely LOVE feeling this way. My life is my own.

Nose-clipped Coke worked much better than sugar water. Fascinating. When I did SLD – when I lost about 3 pounds/week drinking fructose water – I also started craving flavor. I started drinking tea and haven't stopped. I started chewing gum and haven't stopped. I became far more interested in supermarket samples, which are always flavorful. A later comment in that thread:

I once read a newspaper report about a woman who was going slowly blind through an eye disease. She heard about the raw food diet and tried for a few weeks, thinking it might help her. Her eyesight did marginally improve, but she decided she'd rather go blind than face any more raw foods.

Raw food has flavor, but it doesn't have complex flavors – that's why people ferment it, even when they don't need to preserve it. Compare cabbage with [2]kimchi, for example. Cooking food usually increases complexity of flavor. Coke has a very complex flavor. Sugar water has no flavor.

Why do we like unami-tasting foods? Why do we like sour-tasting foods? Why do we like complexity of flavor, including [3]unfamiliar complexity? I think the answer is these likes were built into us to because they caused us to eat more bacteria-laden food, which [4] kept our immune system functioning well. Just as a taste for salt causes us to eat more salt, which we need.

This story suggests that the desire for certain tastes (supplied by nose-clipped Coke but not sugar water) can be strong enough to interfere with weight loss. Future versions of SLD should take account of this

david (2009-02-01 12:48:55)

Very strange that nose clipped coke works for them and sugar water doesn't. I've started trying nose clipped breakfasts (yogurt or cereal) to maintain lost weight. It seems like yogurt works better than cereal (shredded wheat). My theory is that the shredded wheat has texture and that provides a hook for a small amount of learned association between calories and food. By that token, I would expect sugar water to work better than coke because the carbonation of coke would provide a hook.

Stephen M (Ethesis) (2009-02-06 21:00:45)

That whole area is interesting. I've tried nose clipped protein shakes and I got a rush of weight loss the first time, but generally I get less SLD effect than just taking olive oil in the middle of the night. I'm fascinated by the differences people report.

## **The Twilight of Expertise (medical doctors) (2009-02-01 22:01)**

Long ago the RAND Corporation ran [1]an experiment that found that additional medical spending provided no additional health benefit (except in a few cases). People who didn't like the implication that ordinary medical care was at least partly worthless could say that it was only at the margin that the benefits stopped. This was unlikely but possible. Now [2]a non-experimental study has found essentially the same thing:

To that end, Orszag has become intrigued by the work of Mitchell Seltzer, a hospital consultant in central New Jersey. Seltzer has collected large amounts of data from his clients on how various doctors treat patients, and his numbers present a very similar picture to the regional data. Seltzer told me that big-spending doctors typically explain their treatment by insisting they have sicker patients than their colleagues. In response he has made charts breaking down the costs of care into thin diagnostic categories,

like "respiratory-system diagnosis with ventilator support, severity: 4," in order to compare doctors who were treating the same ailment. The charts make the point clearly. Doctors who spent more " on extra tests or high-tech treatments, for instance " didn't get better results than their more conservative colleagues. In many cases, patients of the aggressive doctors stay sicker longer and die sooner because of the risks that come with invasive care.

Perhaps the doctors who ordered the high-tech treatments, when questioned about their efficacy, would have responded as [3]my surgeon did to a similar question about the surgery she recommended (and would make thousands of dollars from): The studies are easy to find, just use Google. (There were no studies.)

It's like the RAND study: Defenders of doctors will say that some of them didn't know what they were doing but the rest did. But that's the most doctor-friendly interpretation. A more realistic interpretation is that a large fraction of the profession doesn't care much about evidence. In everyday life, evidence is called feedback. If you are driving and you don't pay attention to and fix small deviations from the middle of the road, eventually you crash. You don't need a double-blind clinical trial not to crash your car – a lesson the average doctor, the average medical school professor, and the average Evidence-Based-Medicine advocate haven't learned.

1. <http://sciencethatmatters.com/archives/30>
2. [http://www.nytimes.com/2009/02/01/magazine/01Economy-t.html?\\_r=2&pagewanted=all](http://www.nytimes.com/2009/02/01/magazine/01Economy-t.html?_r=2&pagewanted=all)
3. <http://www.blog.sethroberts.net/2008/09/13/the-case-of-the-missing-evidence/>

---

retired urologist (2009-02-03 19:41:50)

You asked for my response regarding doctors' "disinterest in evidence" [1]here. I gave you my response earlier regarding your doctor's handling of your hernia problem. I said: "Dr. Consorti should have been more honest with you about her lack of evidence regarding hernia surgery." You replied, "This is unfair to Dr. Consorti. She honestly believed the evidence existed, I'm sure." You seem to be having trouble deciding which side you're on. Must be the olive oil (excuse me, the "evidence-based" olive oil). Regarding your question about "more evidence" surrounding the cheap shot Robin Hanson, whom you admire, took at the doctor who supposedly had a nurse fired for reporting him about his lack of handwashing: I did not want "more evidence"; I wanted "some" evidence. I do not consider gossip to be evidence. Don't misinterpret me: there's no doubt that doctors have been trained incorrectly when compared when other rationalists. There's no doubt that they waste a lot of public resources. There's no doubt that the system for training and managing them should change. However, your comment: "People who didn't like the implication that ordinary medical care was at least partly worthless could say that it was only at the margin that the benefits stopped," is inappropriate, and incorrect, since that is exactly what the study showed, and it is exactly how Robin Hanson presented it (see [2]here. Next you'll be telling me that psychology is a science, and that a "Rand Experiment" would document the great value of your field.

1. <http://www.blog.sethroberts.net/2008/09/13/the-case-of-the-missing-evidence/#comment-266735>
2. [http://www.overcomingbias.com/2007/05/rand\\_health\\_ins.html](http://www.overcomingbias.com/2007/05/rand_health_ins.html)

seth (2009-02-03 19:54:13)

Your view that what the fired nurse says is "gossip" while what a hospital administrator says is "evidence" indeed sheds light on these results. Experimental psychologists, unlike doctors, don't try to help people. They do research. Thank you for your comment.

retired urologist (2009-02-04 09:43:03)

Seth, Where did you get the idea that I felt "what a hospital administrator says is 'evidence'"? I know of no unbiased reason for you to present such as "my view". Robin Hanson has said that when involved in a disagreement, if the other party has far more experience and expertise in the subject, one should diligently re-examine his own position and yield, unless there is overwhelming support for one's position in the disagreement. I have such experience and expertise, as described [1]here; you and Hanson do not. The nurse story makes no sense in the real world, but has solid emotional appeal to anyone writing about the shortcomings of the medical profession. Why don't you take Mark's advice in his [2]comment, check out the story once and for all, and then write a post about the cognitive dissonance involved, wherever the chips fall? I think that would fall under the heading of "research", don't you?

1. <http://drchip.wordpress.com/2008/10/05/bias-on-the-hoof-hanson-and-ru-continued/>

2. <http://www.blog.sethroberts.net/2008/09/13/the-case-of-the-missing-evidence/#comment-261240>

seth (2009-02-04 10:49:12)

okay, what do you mean by "evidence" here?

retired urologist (2009-02-04 11:50:51)

By "evidence", I mean that which can reproducibly be used to prove or disprove something. First-hand, or eye-witness, accounts of an event are an example, even though they are not always accurate. In the "nurse story", you heard it from Hanson, Hanson heard it from his wife, and his wife heard it from the nurse. This is "hearsay" or "gossip", but certainly not evidence. The story does not report anything that the administrator said; in fact, mention of the administrator is an example of how third-hand misinformation is generated, since the administrator is not mentioned in Hanson's [1]original telling of the story, which goes: "A colleague of my wife was a nurse at a local hospital, and was assigned to see if doctors were washing their hands enough. She identified and reported the worst offender, whose patients were suffering as a result. That doctor had her fired; he still works there not washing his hands. Presumably other nurses assigned afterward learned their lesson." Another example of the loss of accuracy in far-removed "evidence" is your description of the doctor as a "surgeon", while Hanson described him only as a doctor. Calling him a surgeon makes the diminished hand-washing seem more malevolent, and makes your post seem more important to readers. Think of this as I would, having been involved in many employer/employee encounters in hospitals, both as Chief of Staff and as an owner. Would the nurse's boss put his/her own career in jeopardy by terminating an employee without due cause in order to assuage an arrogant doctor? Did this hospital have no policy for dealing with inept employees that involved counseling and second/third chances (all do)? Would the boss tell the nurse directly that she was being fired because of the report? Otherwise, did she just assume it on her own because it made a good story and absolved her of blame? Or did she make it up? If she knew that her story was factual, would she have taken no action against the hospital? Remember, this is not a back-woods facility; it's in a large metropolitan area. Is there such a nurse at all? What's her name? Now, look at the teller of the story as you heard it: the class Hanson teaches for part of his income has as its subject the inefficaciousness of the American medical system, and particularly of the doctors who provide the healthcare. Would there be any reason for bias there? Any tendency to want to pass along such a story without checking it out? After all, you did. Would it take some effort to find the truth behind this story? Yes, it would. But those who strive for rationality cannot pass along convenient unverified stories simply because it's too much trouble to find the truth. Pending further evidence, you and your readers should consider this story to be an ad hominem attack on doctors, a valueless and completely unnecessary one, since there is so much verifiable evidence that doctors are not doing a good job. Since you are a researcher in the field, I am confident that you will see the confirmation and intellectual attribution biases involved. Smart people are the best at defending their unconscious biases.

1. <http://www.overcomingbias.com/2007/10/doctors-kill.html>

seth (2009-02-04 17:27:12)

You want a first-hand account of a firing? The nurse was present when she was fired so her account is first-hand. I am completely puzzled as to what data you are looking for. Your definition "that which can be reproducibly be used to prove or disprove something" makes no sense to me. If you can give examples, that might make it clear what you mean.

retired urologist (2009-02-04 18:39:17)

Seth, I'm signing off. You are not what I thought.

Nathan Myers (2009-02-04 23:36:43)

I'm afraid I'm with *retired* here. Yes, evidence could be found of doctors' resistance to advisable procedure, and of misplaced administrative support for such resistance. Hanson's anecdote doesn't qualify, for the reasons *retired* generously explained at length. It qualifies, instead, as an illustration, of the sort used to lead off lifestyle magazine articles. Maybe it's true, maybe it's accurate, maybe it's not; it doesn't matter much, so nobody bothered to nail down the details that would be needed if it did matter. We have no idea who it was, or what hospital, or what doctor, and not even any attestation from anybody who does know, in confidence, and offers to vouch for the correctness of the details exposed. The problem is that it's easy to make stuff like this up, and if it's credited, there are plenty of people happy to make plenty of other things up. What we do have is death rates and infection rates that vary radically from one hospital to another. Death rates are hard to fake. Hanson's anecdote offers an illustration of how such disparities, and the negligence that creates them, could continue. I think you owe him an apology or three.

seth (2009-02-05 17:29:10)

Nathan, I'm impressed by the similarities in how two different doctors – Dr. Eileen Consorti, my surgeon, and retired urologist – reacted to simple questions about data. Similarity 1. Didn't answer the question. Consorti never provided the data she claimed existed. *retired* urologist never clearly explained what he meant by "evidence." Similarity 2. In response to these questions, implied there is something wrong with me for asking. Consorti called my interest in the effects of the proposed surgery "scientific" (that is, unnecessary); retired urologist said "you are not what I thought [in a bad direction]".

Nathan Myers (2009-02-05 19:44:38)

I thought he explained well the difference between anecdote and evidence, and how the one could be converted to the other – if indeed there is any truth in it – with a little investigative work. His disappointment that you couldn't seem to see the necessity of doing the extra work before citing it as evidence was manifest, not to say heartbreaking. Spend some time on [snopes.com](http://snopes.com) to see the range of falsehoods supported by anecdotes of exactly this character. If you're after something else, you have utterly failed to make yourself clear.

...many of them, maybe all of them, would be unlike anything you've ever seen. Thanks to my friend Carl Willat, you can now see [1]such a commercial.

Carl [2]makes commercials for a living but he made this one for fun. A labor of love. Not only did he (a) care about the product (Trader Joe's), he had (b) great skill and (c) complete freedom. I think this combination is extremely rare and is why this commercial is utterly different from all other commercials I've ever seen.

[3]My self-experimentation combined these three things, too. I studied (a) problems I cared a lot about (such as my poor sleep) with (b) the skills of a professional scientist and (c) total freedom. This combination, just as rare in science as in commercial art, explains to me why my self-experimentation seems so different than other research.

Nathan Myers (2009-02-03 20:39:01)

Speaking of TJ, those "**Airborne**" things featured in the video clip are a scam. The company was obliged to pay out \$millions, for fraud. The studies they cited on the label to support their claims turned out to be made up from whole cloth by the company founder. There's probably nothing wrong with whatever it says is in there, although it's probably nothing you don't get otherwise anyway. Given that the founder is a proven crook, there's every reason to guess that what the label says doesn't match the contents, if it would cost anything to keep them aligned. I don't know why TJ continues to stock them. What I really wonder about is the Buffalo Mozzarella. I hated giving that up, but how can we find out how much dioxin is in there?

Jenni Robinson (2009-03-03 15:34:50)

Just saying hi. I watched the commercial just now and loved it, and happened on your blog while googling Carl's name. Looking forward to doing some blog digging here! -Jenni

### **Interview with Leonard Mlodinow (part 5) (2009-02-03 10:53)**

ROBERTS I liked your line in The Drunkard's Walk about lotteries: "What would you think of a system where one person wins a million dollars; for hundreds of thousands of people nothing happens; and one person dies a violent death."

MLODINOW Would you participate?

ROBERTS Yes, would you participate? That was great.

MLODINOW Most people would, it turns out. But you can't quite phrase it that way.

ROBERTS I thought, "Well, you're not going to read that line in many descriptions of lotteries. That's just not the way the average professor of statistics would describe a lottery. But it's so much more interesting than the average way a lottery is described. I thought, "This is brilliant science writing. This person isn't just copying or popularizing."

MLODINOW That's a creativity that comes into writing as well as science. Science research takes a lot of creativity and the ability to look at things from a different angle and I think writing does, too. I think one of the things that sets this book apart from other books on probability is that sort of thing; I looked at a lottery and didn't just say "Here are your chances of winning and look how small they are," but I think I looked at it from a unique, somewhat amusing, surprising angle. That's where the work comes in writing the book, is to find those angles rather than just explaining things.

ROBERTS I think the average science writer would grasp that if you're going to write about the lottery, you're going to have to find some interesting stories, but I don't think they're going to be bold enough or creative enough to think of the way that I just said—the part I quoted. That's kind of a writer who's more sure of himself. You should be sure of yourself—you have all these credentials—you did all this stuff in science but I don't think the average writer is that confident. You know, Malcolm Gladwell tries to do this sort of thing. He does these slightly counter-intuitive ideas but it's less successful, I think.

MLODINOW An idea like that would have been hard for someone who isn't trained in the field; someone who is trained in the field I think would have confidence, if they thought of that idea, to use it. Also, that's

the two areas of confidence you need. You need confidence in the field, and you also need confidence as a writer. You build the latter by writing. Sometimes I'll write sections of the book or I'll go on for a while in a somewhat absurd-thinking-direction and I know enough now to know that it sometimes works and sometimes doesn't work. I think I know enough now to tell the difference.

When I was first writing, I was being a bit more hesitant about getting a wild idea and going there, thinking it was going to be silly and I'm going to embarrass myself. Then I learned, well, it's good to just do that and don't worry if you waste a day or two in that direction; you can just cut it and keep going but it's a good investment because sometimes it works and you get something really interesting. I also learned with time that I can tell the difference. If it really is silly and not working, I won't embarrass myself by leaving it in the manuscript; I will notice it and cut it and not fret over the lost day or two and I'll go on and write something else to take its place. Those are all lessons that you have to learn but it is interesting that you brought up the notion of confidence because I think that's something that you do learn as you write. It's really a dual lesson of confidence—that it's okay to go ahead and take chances with the writing—and the letting go of the possible wasted time you're going to have. So the confidence to know that you won't embarrass yourself because if it's really stupid, in the end you'll cut it and also that you're not going to fret over the wasted time are two lessons that I think you might not know your first time you're writing a book. In letting go, you have to be naked and just let yourself go and not worry about what you're saying and how it comes off.

ROBERTS And you know that you understand the subject. You know that there's not going to be some other person out there who's going to say, "This is all wrong." That's just not going to happen.

MLODINOW Right. You can make mistakes in details—everybody makes misstatements sometimes. There's so much in a book that it's hard not to have anything come about wrong. Even Stephen Hawking's *A Brief History of Time*, the original, gave the wrong relation at one point between wave length and energy for photons. He knows the difference, but unless you're a computer you do make errors, so another lesson you have to learn is not be too embarrassed if something does come out that is a detail that you get wrong. Obviously not an important concept you get wrong.

NNM (2009-02-03 14:05:42)

Great interview. Remember also another great source of confidence: feedback, especially from others. A good writer (or self-experimenter) learns that it's OK to invest in seemingly wild and embarrassing ideas because the world lets him know they are not wild and embarrassing after all.

Oliver (2009-02-03 15:21:15)

Haven't read Drunkard's Walk— do you know if that line about the lottery is reference to Borges' short story "The Lottery of Babylon"?

seth (2009-02-03 18:49:40)

I asked Len and he said no, it is not a reference to that story.

Oliver (2009-02-04 04:07:26)

Thanks for asking, Seth, and for these interviews. This particular book is definitely on my reading list- although I've studied probability theory I really want to learn how to explain notoriously "difficult" things to people without intimidating them. I've actually gotten worse at this over the years (a growing, nerdy tendency to confuse precision and clarity?) Any coincidental parallels aside I do recommend "Lottery", and just about anything by Borges. :)

Chris (2009-02-04 08:18:55)

While I'm personally a big fan of fermented food taste/cost-wise, you do need to be careful before you chomp down all the fermented chinese goodies. In Japan, Korea, China and India, the incidence of stomach cancer is fare higher than in the west. When Asians move to the US, their stomach cancer rates also drop (although heart disease rises). Some claim that this is due to fermented food or pickled foods. Some links: [http://books.google.com/books?id=7LYHFGLJQNQC&pg=PA295&lpg=PA295&dq=fermented+stomach+cancer&source=web&ots=YQT74TZVX0&sig=iuSfq-mpM9uxPovw3W-ILKAoRsU&hl=en&sa=X&oi=book\\_result&resnum=2&ct=result](http://books.google.com/books?id=7LYHFGLJQNQC&pg=PA295&lpg=PA295&dq=fermented+stomach+cancer&source=web&ots=YQT74TZVX0&sig=iuSfq-mpM9uxPovw3W-ILKAoRsU&hl=en&sa=X&oi=book_result&resnum=2&ct=result) <http://www.rtbh.net/Content.aspx?Section=cancernews&DocumentID=37721> I happen to live in Japan and eat lots of Natto. The health care system does accommodate for this though. Almost everyone over 30 gets a stomach ultrasound annually and barium esophageal/stomach scans every other year. In the US, men only get ultrasounds if they're about to go on Oprah to talk about their baby.

I ain't eatin no tapeworm, man.

Drinking Water: Rain or City? « Eudaimonia Farm (2009-02-28 11:56:18)

[...] In writing a preliminary version of this to a friend, they asked if I was concerned about acid rain. Eh, not so much. Even if I were, I think that it'd also be a problem for my city water source, because acid rain frees heavy metals from the soil and Alto Pass water comes from a big pond. In any case, I'm going to include a little bit of limestone in the water

to make it a little more basic, because acidic water tends to have more soluble heavy metals and pesticides. As mentioned above, I may also have to add a little bit of chlorine to my water to kill any bacteria in it, but I'm going to wait on that. I want to test the water first and not introduce chlorine if I don't have to. Or I may just rely on the hygiene hypothesis... [...]

## **Interview with Leonard Mlodinow (part 6) (2009-02-04 17:47)**

ROBERTS Did you write in high school or in college?

MLODINOW I started writing in third grade for my school librarian. All I remember about that was they were short stories about dinosaurs and she claimed to love them and that gave me lots of encouragement. I used to love writing little stories; I didn't do that in college very much, I do believe I did in high school. In college I was just too busy- I had three majors and also got my master's degree, and I was only there three and a half years.

ROBERTS I didn't know that. Where did you go to college?

MLODINOW To Brandeis University.

ROBERTS What were your three majors and master's degrees?

MLODINOW Chemistry, physics and math.

ROBERTS What was the master's degree?

MLODINOW In physics.

ROBERTS In three and a half years you got a master's degree?

MLODINOW Yes. I took about double the normal course load. I had to get special permission for that. In the end I was one course short; I had to choose between the master's and the chemistry. I think I made the wrong choice, I chose the master's, so I ended up with a double major but I did every chemistry course for a major except one.

ROBERTS Why did you do this?

MLODINOW I didn't do this to try and break records; I was tremendously interested in things and if I saw a course I liked I wanted to take it. I was like the cliché of a kid in a candy store stuffing his face. I was stuffing my face with knowledge.

ROBERTS Why didn't you stay longer? Why three and a half years? Why not four and a half years?

MLODINOW Normal is four years and I took a semester off to live in to Israel during the Yom Kippur war, so that made it three and a half. I didn't think about staying an extra year. I went on to graduate school next so I didn't leave school. And I'm still doing that-that's what I do by writing books is just learn things and then write about them.

ROBERTS Yes, I know what you mean. Why did you choose physics rather than math or chemistry?

MLODINOW Chemistry was my love; chemistry and math since I was little and I had the cliché chemistry

1588

set in the basement—blew up myself, burned myself, burned down the house (well, caught the house on fire) and all sorts of things and I thought “I will be a chemist” from the age of, I don’t know, ten. When I got to college what happened was more and more I realized there wasn’t enough math in the chemistry for me so I started out with a math and a chemistry major and I thought the math was so Mickey Mouse in chemistry that I added . . . I learned about physics while I was in Israel in the kibbutz—I talked about that experience in Feynman’s Rainbow—and came back and added the physics and ended up in physics. I’ve always loved math but was not excited by pure math where you’re just exploring mathematics or its own sake. I always liked the applications. When I started learning about curved space it was not because the idea that Euclidian geometry isn’t the only one that excited me. It was the idea that physical space might not satisfy Euclidean axioms that really excited me. That was my proclivity in that direction.

[...] Interview with Leonard Mlodinow (part 6) [...]

## **Bill Gates Completely Wrong (2009-02-05 17:59)**

In a [1]Time article about the future of journalism – the problem of course is that it is free online – Walter Isaacson writes:

Others smarter than we were had avoided that trap. For example, when Bill Gates noticed in 1976 that hobbyists were freely sharing Altair BASIC, a code he and his colleagues had written, he sent an open letter to members of the Homebrew Computer Club telling them to stop. “One thing you do is prevent good software from being written,” he railed. “Who can afford to do professional work for nothing?”

Many people do professional work for nothing: the creators of open-source software, for one. Not to mention bloggers who write about their professional expertise (such as me) or my friend [2]Carl Willat (who made a commercial for nothing). Many book writers do professional work (in the sense that what they write is based on their profession) for next to nothing.

According to [3]my theory of human evolution before occupational specialization came hobbies – skilled work done for nothing. The mental tendencies that led us to do hobbies are still within us

Jim N (2009-02-06 14:04:06)

Interesting to think about software and Open Source in comparison to journalism. I want to point one thing out, though, about Open Source. Though many Open Source projects are open to, and receive input from, a wide variety of contributors, most of the huge Open Source projects, like Linux, are being developed by paid, professional coders employed to do so by large corporations. Why? Because it is in the interest of the corporations to do so. Yet, they return their contributions to the public (usually under some sort of Open Source license), where anyone can use them. Point is, it's possible that in the future people will make money being journalists, but that their incomes will not depend on restricting access to the works they create. You can "give away" your work, and still make money from it.

Cliff Styles (2009-02-10 16:31:48)

Well, but Gates' question remains: who can afford to do professional work for nothing? Such producers still have to eat and pay the rent. One can choose to give away some part of what one produces, but not all. You may do a lot of work for free (including this blog, for which I am grateful), but you certainly don't do ALL of your professional work for free. One question I have is this: in Gates' world a man can love his work and simultaneously get paid for it, whereas in the free software world, one will never be paid for work one loves because someone is already doing it for free. So doesn't it follow that in the free software world, programmers have to do work they detest so they can give away the stuff they love doing? I guess that's not so far from the real world, is it? It's great for the consumer, but is it really all that wonderful for the producer?

I felt a burst of joy when I logged in and saw for the first time the new digital edition of The New Yorker. It looks good and it works. The ads are still there – good, the magazine needs the revenue. The simulation of page-turning has a calming effect. You can easily print stuff to read later – while waiting for BART, say. You can easily go from the table of contents to the articles. You can easily look in back issues.

In Beijing I read The New Yorker online (the free stuff). Mail from America to China is so slow and error-prone it was pointless to have stuff forwarded. It felt fine. Sure, I couldn't read some of the articles but there was plenty of other stuff to read. My subscription felt worthless. Now it doesn't.

Maybe magazines aren't dead.

More When I tried to read an article, big problems arose. 1. It wouldn't work with Firefox, no matter how many times I reopened it. 2. After reading several pages with internet Explorer, it got into a state with two pages superimposed, making the whole screen unreadable. I couldn't fix it. I gave up and went to the paper version.

## Why Blog? Ask American Idol (2009-02-06 11:29)

From David Osmond, a failed contestant on American Idol: "I wish I had the opportunity to share what's inside of me."

I think that's exactly the driving force behind blogging.

I used to teach introductory psychology. Large lecture class. I found I could often put whatever I was thinking about in the morning into my lecture. Blogging is easier.

More [1]Jonathan Schwarz puts it like this: We have "desperation to express what our existence is like. Sometimes this comes out literally as singing, sometimes metaphorically."

1. <http://www.tinyrevolution.com/mt/archives/002845.html>

---

Cyan (2009-02-13 07:40:38)

Not all people feel a desperation to express what their existence is like. I certainly don't. (In fact, I almost didn't bother to post this fact about what my existence is like, but then I realized that selection bias would automatically tend to screen out individuals like me from making such comments. Down with selection bias!)

## Interview with Leonard Mlodinow (part 7) (2009-02-07 06:42)

ROBERTS What happened in graduate school? What areas of physics did you pursue?

MLODINOW I worked for a fellow who did mathematical physics, which are mathematical techniques or mathematical underpinnings of physics. There were very few spots for theorists at Berkeley and I was very happy to get one of them. This fellow was probably the smartest one in the department and very picky about his students so I was happy to be able to have him as an advisor.

ROBERTS What was his name?

MLODINOW Eyvind Wichmann.

ROBERTS So that was in your first year of graduate school? You impressed him enough to have him take you on as a student?

MLODINOW I think at the end of the first year, yes.

ROBERTS What happened in the first year?

MLODINOW It may have been the second year; I don't remember now. I took his course in quantum field theory and then I became his TA in his quantum mechanics course.

ROBERTS He didn't have many students, right?

MLODINOW No. He would have, at any given time, probably average one or two over the years. He was there for probably 30 years and may have had probably less than 30 students. Since they stay a few years that makes sense but he probably had 15 students; I'm just guessing in terms of who I at least had heard of.

ROBERTS What happened to the students before and after you—his students before and after you? The one before you and the one after you—do you know what they're doing now?

MLODINOW Yes. There were the ones with me who graduated before and after. One of them is a very good friend—Mark Hillery—who's a professor in Hunter College in New York and very well known in quantum information theory. He graduated just before me . . .

ROBERTS With the same advisor.

MLODINOW Yes, and the one who graduated just after me I think is a professor in Indiana or Kentucky or somewhere over there.

But it was quite a great class. Two of the other theory students are big leaders in string theory now, Joe Polchinsky and Andy Strominger. One post doc, Steven Chu, has a Nobel prize [and a White House appointment]. There were quite a lot of good young people around there at the time.

ROBERTS Yes, I'm trying to get a sense of what your career would have been like if you hadn't gone into writing.

MLODINOW I imagine I would be professor at some school, who knows where. One of the things that I always cared about is where I live, so one of the downsides in academia is that you could be really good in your field and still end up in Peoria; nothing against Peoria but it just wasn't my choice of where to live. You don't get to choose where you're live; you get chosen by these places. Even Santa Barbara; I don't know how happy I would be there, even though it's a great school, very good in physics but I've always liked Chicago, New York, Boston—big cities—Los Angeles, the Bay Area, really big metropolitan areas with ethnic components and a lot going on.

ROBERTS Yes, I feel the same way. My mother went to Berkeley because she wanted to be at a big school near a big city.

MLODINOW How happy I would be in Kentucky or Georgia or Minnesota, maybe, though you don't know. One thing I learned from Gilbert's book is you don't necessarily know really what would make you happy. My German girlfriend at the time was telling me that, too—Right now you think you need to be in a big city, but you may find other things in life later, your family, that you focus on. Certainly I'm here and I'm very focused on my kids but still what do we like to do? We like to go into the Chinese parts of town and explore restaurants or the Mexican neighborhoods and look around or Vietnamese Town. We've got a lot of it here in Los Angeles and we like to go and find a new noodle shop.

[1]Interview directory.

## Interview with Leonard Mlodinow (part 8) (2009-02-08 07:26)

MLODINOW How happy I would be in Kentucky or Georgia or Minnesota, maybe, though you don't know. One thing I learned from Gilbert's book is you don't necessarily know really what would make you happy. My German girlfriend at the time was telling me that, too: "Right now you think you need to be in a big city, but you may find other things in life later, your family, that you focus on." Certainly I'm here and I'm very focused on my kids but still what do we like to do? We like to go into the Chinese parts of town and explore restaurants or the Mexican neighborhoods and look around or Vietnamese Town. We've got a lot of it here in Los Angeles and we like to go and find a new noodle shop.

ROBERTS Yes, I'm exactly like you. I love doing that sort of thing.

MLODINOW Yes, that's why we're friends.

ROBERTS I admire you; I'm glad that you're willing to be friends with me. What were you doing at the World Trade Center on 9/11? Speaking of living in cities.

MLODINOW My kids went to school at the schools that were a block or two away from the World Trade Center and I would take the subway right at the World Trade Center back to Uptown, a few minutes Uptown to where I work, which was just on the border of the Village on Broadway and I happened to be standing under the building and saw the first plane come in, fly over me and fly into the building. It's a long story what happened after that. I was hit with debris and injured. It's a long story because my ex-wife was living two blocks below the Trade Center and just had surgery, my son was at the school there and I was trying to find them, get together, and I got caught in the collapse and trapped and it's a long story, but that's a book in itself.

ROBERTS It led to your leaving New York, right?

MLODINOW It did, because, in the end, without going into the details, my son—who was in kindergarten—saw the whole thing, saw people jumping off the building, had to actually flee for his life when the Trade Center collapsed and went for about five or six hours thinking that I was dead because the last place I was seen was standing under the World Trade Center building and we didn't find each other until about 2:00 in the afternoon. That just caused psychological difficulties for him to live in the City as we were. I had shared custody with my ex-wife and I wanted to move into the suburbs and she didn't want to do that and our compromise, since we continued to share custody, was to move back out here to California just to get him away from the City. And it was a great move because his problems diminished dramatically in just a week after we got here, or two weeks, I don't remember, but just very shortly. Maybe it was a month.

ROBERTS How old was he?

MLODINOW I think 9/11 was his third day of kindergarten, something like that.

ROBERTS By then you'd already written *Euclid's Window*?

MLODINOW I had written *Euclid's Window*, so it wasn't just, "Oh, I'm going to go out and write, it's pie in the sky," I had written *Euclid's Window* and I think had written Feynman's *Rainbow* but it wasn't out yet, if I remember. The first book I wrote when I came here was the book with Hawking, *A Briefer History of Time*. I had stuff I knew I could do and it's all worked out very well and I'm much happier so that shows you that if you are a high paid executive somewhere maybe you'll have an even happier life if you would be not a high paid executive somewhere else and you just don't realize it.

ROBERTS Well, it's kind of amazing that this happened to you—this 9/11 thing happened to you—and in your book at the end, the last chapter is about the effects of random events on people's life stories. But you don't tell the story about yourself.

MLODINOW I had many stories I could have told about myself in the book, about how random events impact you, how things that you think are going to be good turn out later in hindsight not to have been so good or things that you think are going to be bad turn out in hindsight to have been good. How things that you think make a big effect on you have very little effect and how things that you hardly imagine would have an effect on you, like having an extra sip of a cup of coffee in the morning, can have a big effect on you, because, let's say you're three seconds past where the big crash was—the car crash on your way to work—or something like that, that you could have been hit if you hadn't had that coffee, or whatever. I have many ironic situations I can pinpoint in my life that I could have told them about but what I decided instead to do—I don't think I'm that interesting—was to find very famous people, Bruce Willis, Bill Gates and people everyone knows and a lot of people care about, and talk about how these events changed their lives. I thought that would be more interesting.. I tried to minimize the stories from my life although I picked a few dramatic events, I think maybe three or four that I do talk about—I'm not afraid to talk about it, it's just that in many cases unless the event itself is very interesting. If it's a mundane, small thing that happened that caused a big change in my life, I think it's more interesting. If it's a mundane, small thing that happened to Bruce Willis that caused a big change in his life, it made him a star, so that's why I chose those examples.

[...] Interview with Leonard Mlodinow (part 8) [...]

### **Aaron Blaisdell Recommends (2009-02-08 23:36)**

I like to think that [1]Aaron Blaisdell, a friend of mine who is a psychology professor at UCLA, has been influenced by what he has read on this blog. Maybe not. In any case, he has an interesting story to tell:

I noticed an increase in energy when I began taking fish oil capsules about a year ago, but it seemed to fade after the birth of our second child (and thus a large drop in amount of sleep at night).

In early November I began taking 1/4 teaspoon each of high-vitamin cod liver oil and high-vitamin butter oil (a la Weston Price's findings) purchased from Green Pastures. I noticed a large increase in energy and alertness afterward that continues to this day. I didn't start incorporating raw milk, cheese made from raw milk, yogurt, and kefir in my diet until late December. What I've noticed the most after incorporating fermented dairy into my diet was the drop in the amount of gas I produce and in how good my stomach feels. I used to frequently get a little bit of indigestion or an "empty stomach" feeling, even a few hours after a meal. That is, my stomach would churn, make noises, and sometimes I'd have light cramps in my stomach or intestines. Since taking the lactofermented dairy all of those symptoms have virtually disappeared. In fact, my GI track has never felt so good!

I've also been eating more kimchi and fermented tofu over the last few weeks, but haven't noticed any additional benefits likely because the effects on my health are already at ceiling. I also have switched from regular whole wheat bread to sprouted wheat bread, which I eat only in moderation (about a slice every day or two). Thus, my consumption of grains, particularly wheat, is way down compared to a few months ago.

In January I also started taking about 4k IU of Vitamin D3 (after reading discussions on the topic of Vitamin D deficiency at Stephen's blog, [2]Wholehealthsource.blogspot.com).

I also have noticed beginning in January that my skin looks very supple and clear. My visual acuity has always been better than 20/20 (all of my family but me need glasses), but also since January I've noticed my eyesight to be even more keen than ever. And my libido has increased as well. I really should keep a journal documenting all of my dietary and health changes. But with a 5-month old and a 3-year old at home, it's enough just to try to stay on top of my work!

Seth's blog » Blog Archive » Genes Or Environment . . . Or Environment? (2009-07-14 06:29:32)

[...] I don't know any reason to think this is an unusual case. Aaron Blaisdell told me a story that shows its relevance to human health. Aaron is unusually sensitive to sunlight. Until recently, he could only spend 5 or 10 minutes in the sun before it became unpleasant. The condition is genetic. His mother has it; her father had it. It's called Erythropoietic Protoporphyria. It is autosomal-dominant. Scientists even know where the gene is. That's where the understanding of most scientists stops. A genetic condition. Recently, however, Aaron drastically changed his diet with great results, as noted earlier. At the same time as the dietary changes, his sun sensitivity got much better. He can now stay in the sun for an hour or more without discomfort. This is a gene-environment interaction, of course, but of a particular sort: The genetic effect showed there was something wrong with the environment, just as it did in DeCoursey's experiment. [...]

## Interview with Leonard Mlodinow (part 9) (2009-02-09 23:05)

ROBERTS I see. The smaller the event, the bigger the outcome, the better the story. The more famous the person happens to be . . .

MLODINOW The idea that Bruce Willis decides to visit his girlfriend in Los Angeles leads to the Diehard series is interesting. It's a more interesting idea than the fact that I'm on my way to the mailbox to mail a letter

turning down a fellowship to Germany when I bump in—literally cross paths at the mailbox, when I was in school—with the lady from the fellowship office whoâ€™s appalled that Iâ€™m not taking this fellowship that is so hard to get and makes me go talk to my advisor about it. I literally had the envelope in hand turning it down and it was the last day for deciding. I go to my advisor whom Iâ€™m sure will agree with me that itâ€™s a stupid thing to leave Berkeley and go to Germany for a year on this fellowship and he convinced me to do it. That completely changed my life. Had I not bumped into this lady, had I not had an extra sip or had I had two extra sips instead of one of my coffee, we would not have crossed paths, literally, at the mailbox. Itâ€™s a really bizarre thing and . . .

ROBERTS You mean your advisor convinced you to take the fellowship?

MLODINOW He convinced me to take the fellowship and go and I hadnâ€™t even considered it, I just thought, â€˜Well here I am in graduate school, I have to get through and to go on something that could be just a lark in Germany . . .â€™ But I ended up meeting a woman I fell in love with, learning the language, loving Europe, staying there for years. Many, many things in my life changed; it was really a life changing experience and I think it broadened my horizons quite a bit also, living abroad. It just changes your whole view of the world. All that wouldnâ€™t have happened if I hadnâ€™t literally crossed paths on campus with this lady. To make the story weirder, I had heard about the fellowship a month earlier or six weeks earlier, I donâ€™t remember, but just ignored it and by chance the night before had come across the letter and thought, â€˜Oh I shouldnâ€™t be impolite, I should tell them whether Iâ€™m taking it or not; someone else might be waiting for this.â€™ Thatâ€™s why I wrote the letter and was walking to the mailbox that next day. If anything, had I found the letter a day earlier and sent it out or not found the letter on my desk or not bumped into her or any of those things wouldnâ€™t have happened, I would not have had these experiences.

ROBERTS I think different events have different potentials for change—you could say they have different life-changing potency. If you spend an hour doing the events with the big life-changing potencies youâ€™re going to be in a lot better position than if you spend an hour doing the dead events, the events that are unlikely to change your life. I think your example plays into what I think because I think traveling is one of the events that has high life-changing potency.

MLODINOW Yes, thatâ€™s true.

ROBERTS And why that is, I think, is sort of interesting. You refer to something you call the Normal Accident Theory of life—what is that?

MLODINOW The Normal Accident Theory of accidents. The Theory of Normal Accidents is the theory that in a complex system you canâ€™t prevent accidents; they will happen and you need to account for them, you need to plan for them and you should stop—well, I shouldnâ€™t say stop—but you should give up the idea of zero tolerance and certainly try to minimize them. You also have to look at implications of when they occur because they will occur and in a very complex system there are always going to be events that on their own—or even in certain other combinations—are unremarkable and yet together in certain combinations can cause huge catastrophes.

One example is the story that I just told, meeting the lady at the mailbox. If you want to consider that—I donâ€™t want to say that it was a catastrophe—but it was on a big event which is the life-changing event of going and the little things that caused it that are normally totally unremarkable such as straightening out my desk, which caused me to find the letter. Taking the letter to the mailbox on my way to work and a number of other things that were minor and on their own not noteworthy conspired to have me collide with this lady at that time and end up in Germany. The nuclear reactor on Three Mile Island or the space shuttle or Chernobyl, these are complex systems that are so complicated that little events can conspire to cause a big event which can be a big tragic event. After those big events—after 9/11, after Pearl Harbor—we go back and we find the little events that made the big event happen and we blame people for not having avoided them. The question in the Normal Accident Theory is whether

thatâ€™s really wise because you canâ€™t know ahead of time what those un-noteworthy events will mean what or will cause what. Finding the actual events and tracing the path of tragedy doesnâ€™t really tell you a lot because there are a million possible paths which could have happened.Â You couldn't have worried about all of them.Â And only one of them, which is really not distinguishable from the others, a priori, is the one that led to the catastrophe. Itâ€™s all about trying to understand that—thatâ€™s the Normal Accident Theory.

I think in life, as I just said, I think that a lot of unremarkable, un-noteworthy events happen to push you this way or that, give you different opportunities or cause things to happen in your life that have the potential to cause major changes in life. Itâ€™s as much that sort of thing than your actual planning and conniving on how to get ahead causes you to get where you are.

[...] Interview with Leonard Mlodinow (part 9) [...]

## **Standing, Sleep, and Stereotype Threat (2009-02-10 07:04)**

Part of my [1]long self-experimentation paper was about a connection between standing and sleep. If I stood a lot (more than 8 hours), I slept better.

Why might this be? I argued that if you use sleep to maintain muscles, you will begin to need sleep to maintain muscles. (And the more you use a muscle, the more maintenance it needs. Thus the stand/sleep connection.) Catherine Johnson describes [2]here a parallel process: Because men opened doors for her (in college), she began to need them to open doors for her. In situations where she was stereotypically expected to be weak, she actually became weaker (mentally).

However much sense this makes it is not part of conventional thinking. Should we fight against germs by killing them? Of course, says the conventional problem solver. The notion that germs might keep us strong isn't part of the discussion. Let me be more explicit: If you make everything clean you may begin to need everything clean. The overwhelming evidence for the [3]hygiene hypothesis shows that this line of thinking is reasonable.

So that's three examples of a general principle, an advanced version of "use it or lose it".

If you think this is somehow obvious, let me ask: What about terrorism? Should we simply try to eliminate it? Or is the question of how to respond more complex?

1. <http://repositories.cdlib.org/postprints/117/>

2. <http://kitchentablemath.blogspot.com/2009/01/stereotype-threat-redux.html>

3. [http://en.wikipedia.org/wiki/Hygiene\\_hypothesis](http://en.wikipedia.org/wiki/Hygiene_hypothesis)

---

Aaron Blaisdell (2009-02-10 08:40:59)

In terms of terrorists, they have only made Israel stronger, exactly analogous (homologous?) to your germ-health theory. I'd also phrase the theory "whatever doesn't kill us will only make us stronger." About fulfilling the prophesy, as in the woman who claims to have become dependent on men opening doors for her, the same hypothesis has been put forth to account for differences between men and women in things like math. Women aren't expected to be able to do well at math, and lo and behold, more often than not they don't. While that's currently changing (I hope!) in our societies' educational system, there's a lot of inertia to overcome. Also fitting this theory, girls are supposed to be afraid and say "eek!" at spiders, snakes, mice, etc. I've often thought that girls aren't inherently predisposed to be more afraid of creepy crawlies (that's the technical term) than are boys, but that our culture reinforces such behavior and so girls "buy into" it. They receive positive social feedback early in life for exhibiting such squeamishness.

Nathan Myers (2009-02-10 17:02:30)

One word: smallpox.

Navanit (2009-02-11 05:46:06)

"Fluctuat nec mergitur" - fluctuates but does not sink. This is an excellent insight and intimately related to Nassim Taleb's Black Swan principal. In general, accepting or encouraging short-term volatility ("use it") will increase robustness against the unexpected. On the other hand, trying to minimize volatility will increase the risk of unexpected, kurtotic, collapse. Humans have a natural tendency to prefer the latter, unless forced to do the former due to environmental constraints (forced to exercise by hunting fugitive game). It takes conscious effort to introduce a little acute stress now again to improve our overall robustness when the real thing hits.

milieu (2009-02-11 08:24:37)

I agree with the hygiene hypothesis but encouraging peaceful and (maybe vocal) public dissent should be better for the long term stability of the organism. Terrorists can be considered like the common virus etc but wait what if the virus is potentially able to lead to death. Israel has become stronger by fighting boldly against terrorists but then what if in the future some of those terrorists get hold of a WMD?

milieu (2009-02-11 10:18:57)

BTW I saw a study on perhaps a related problem. Dunno if you have seen it already. The Irony Of Harmony: Why Positive Interactions May Sometimes Be Negative <http://www.sciencedaily.com/releases/2009/02/090202175047.htm>

A.B> (2009-02-11 13:05:12)

C-Section The more you use it, the more you need it. In the future, humanity might become entirely dependent on it to reproduce.

Chris B. (2009-02-17 21:11:46)

"Israel has become stronger by fighting boldly against terrorists but then what if in the future some of those terrorists get hold of a WMD?" God forbid it should happen, but a society that, like Israel, has fought against terrorism at the cost of hundreds or thousands of lives would be better able to survive a massive attack killing tens of thousands than one that hadn't suffered previously. I hate to be critical of the U.S., 'cos they are so often unfairly slagged, but it seems to me that Britain handled the 60,000 dead of Blitz better than U.S. did the 3000 dead of 9/11. Still, if 1930s Britain had suffered a similar attack in peacetime it might have been equally traumatic. By the worst raids came, they were hardened. It's worth noting that the earliest bombing raids of the war (Rotterdam, Coventry, or, even before the war, Guernica) are the ones that have remained burned in the historic memory, the later ones less so. (OK, not the late, ultra-massive raids on Germany and Japan, or the atomic bombs, but they were really at a different level of destructiveness.)

## Interview with Leonard Mlodinow (part 10) (2009-02-11 13:51)

ROBERTS What did you think of *The Black Swan* on the same topic?

MLODINOW It's on the topic of how little things can cause big changes, you mean, and . . .

ROBERTS And how poorly we understand what really matters.

MLODINOW I haven't read the book from beginning to end so it's hard to comment on that.

ROBERTS What about his previous book? There are similar ideas in the two books.

MLODINOW I didn't really notice that book when I started writing *Drunkard's Walk*; I wasn't aware of the book. I had looked-in the library-gone through tons of books that seemed somehow related to randomness and somehow that one didn't stand out to me. Sometime later it came out in paperback and it got very popular. Then I rediscovered it, and yes, I agree with a lot of what he says in that first book, but I still never read it from cover to cover. I'm not the type who feels compulsive about reading everything that's been written on the subject that I'm writing on.

ROBERTS Yes. I always think of his book as being about these very long-tailed distributions-not only about that, but they play a large role-whereas you didn't mention long-tailed distributions in your book.

MLODINOW Not explicitly, but I did talk about that idea and certainly the idea that not everything follows a normal distribution and how important it is to note that, for instance in Hollywood-Hollywood box office receipts. But I think *The Black Swan* was exclusively about that, so in that sense it was a different topic.

[For readers who don't know what that is, if you're talking about the probability of events occurring-let's say you're talking about the probability of a movie making a certain amount of money-there may be a mean amount of money that a movie makes or that a movie of that type makes. Then there will be fluctuations around it; some movies will make more, some movies will make less. The normal distribution is a distribution of the revenues that would follow a bell curve and the long-tailed distribution differs. One of the important respects that it differs in is that it has a lot more results that are far from the average that you would expect in a normal distribution. So if the average movie makes \$1,000,000 or to be more realistic let's say the average movie makes \$50,000,000 and if it was normally distributed you would have, depending on the variance, but let's just say you would have a certain number that make 40 or would make 60 and another small number would make 30 or 70 and you have a very small number indeed-probably practically zero-that would make \$500,000,000. In Hollywood the way it really works is there are more that differ that far from the median than you would have if it were a normal distribution. That's what they call a long-tailed distribution-the number of occurrences that are far from the average is much higher than you would expect with the normal distribution. - LM]

So that applies in many areas of life as well. I think that translated into what we were just talking about, it means that these little minor incidents can have major effects on you. It's not all kind of pushed toward the mean effect, which is just going into my office and doing more physics.

ROBERTS Yes, I think that if you take the different things that have happened to you and you measured their effect, the effects will have a power-law distribution. A tiny number will have a huge effect and . . .

MLODINOW Yes.

Hi Seth, sorry for this unrelated comment but your blog contains some spam links which I believe have been added without your consent or knowledge. I believe this problem affects Wordpress blogs running on Dreamhost. More info here: <http://boxofjack.com/articles/2009/02/09/spam-links-injected-into-wordpress-2-7/>

Stephen M (Ethesis) (2009-02-12 20:19:11)  
well noted.

seth (2009-02-13 17:08:51)

Yes, Seth. If. Not all doctors are immoral, ignorant drug peddling whores. While our training has certain glaring deficiencies, and as humans we are subject to confirmation bias and other forms of fallacious thinking(see you hernia story), M.D.s in general mean well, and few would ever accept a bribe in treating a patient. I read your blog regularly, and enjoy it. You clearly have biases of your own as well, but I take these into account when reading your work Of note, I am on week one of my shangri-la self experiment. if it works\_

Preston McAfee (2009-11-02 21:46:57)

There has been an update to this story: <http://www.mcafee.cc/Bin/NSSP.html>

## The Comforts of the Umami Hypothesis (2009-02-12 23:30)

What a difference an idea makes. A few weeks ago I came up with the idea that evolution shaped us to like umami taste, sour taste, and complex flavors so that we will eat more harmless-bacteria-laden food, which improves immune function. (I pompously call this the umami hypothesis.) It seemed so likely to be true that I started eating more fermented foods: miso, kimchi, yogurt, buttermilk, smelly cheese, and wine. To avoid stomach cancer and high blood pressure, I later cut back on miso, kimchi, and smelly cheese.

There have been other changes, too:

- After buying meat or fish, I don't try to get home quickly to put it in the fridge
- I don't worry that eggs have been in the fridge for 3 weeks
- When buying eggs and other perishables, I don't try to get the freshest
- I don't worry about leaving milk out

Bacteria and viruses from other humans pose a threat. This is why we find fecal matter so offensive. It's why hand-washing by doctors matters. But I believe plant-grown and dirt-grown bacteria are harmless because the substrates are so different than conditions inside our bodies. As for meat-, fish-, and dairy-grown bacteria, I don't think they are very dangerous. Has anyone gotten food poisoning from yogurt? I keep in mind [1]how much stinky fish the Eskimos ate. Maybe I should do some controlled rotting experiments – leave meat at room temperature for varying lengths of time before cooking and eating it.

1. <http://www.biblelife.org/stefansson1.htm>

---

Oliver (2009-02-13 03:14:12)

I'm trying to brainstorm fermented foods that are neither potentially harmful in the ways you've identified nor in my personal case. I have a casein allergy, so no yogurt. (at the moment!) Asian Flush syndrome makes wine inconvenient– a small amount makes me turn red and my head pound. Probiotics are something I haven't been able to investigate enough. All the widely available and affordable live culture products seem to be yogurt-based. What you say about bacteria in different ecologies makes sense. My naive generalization would go like this: the strains that are usually harmful are ones that thrive in living animal tissue, whether parasitic or symbiotic. The bacteria that do well in dirt, plants, or decaying matter probably won't pose as much a threat to live humans. And then there are bacteria that seem to be wholly beneficial. I am saying this with very little knowledge of microbiology, of course, but this would be my first guess.

Oliver (2009-02-13 05:29:57)

Ah, Ignore my rant on different substrates of bacteria. I didn't realized\* you had covered that. I'm glad I wasn't too far off, though. \*For some reason the browser on my phone (where I was reading this before) cut out a chunk of the last paragraph, so the post ended with "dirt-grown bacteria are harmless..." I was reading it through Google Reader for mobile, which sometimes

does weird things with webpages.

Aaron Brown (2009-02-13 06:25:34)

"unami" -> "umami"

Tom Moertel (2009-02-13 08:16:44)

Seth, could you comment a bit more about the risks of miso, kimchi, and smelly cheese? (Re: "To avoid stomach cancer and high blood pressure, I later cut back on miso, kimchi, and smelly cheese.") Thanks! Cheers, Tom

seth (2009-02-13 14:12:18)

Stomach cancer is high in Japan and South Korea, where lots of miso and kimchi is eaten. Miso and cheese are high in salt, which raises blood pressure. After I started eating lots of miso and cheese my blood pressure appeared to go up about 10 points and when I cut back it went down about 10 points. The causality isn't as clear as that might sound but that's what happened.

seth (2009-02-14 09:53:31)

OOPS! (unami rather than umami). Thanks, Aaron.

Heidi 555 (2009-02-14 11:06:20)

Seth, I very much resonate with your umami hypothesis and tend to crave those kinds of foods. Just wanted to add wild mushrooms to your hypothesis. They have a wide variety of unami flavors and many are well documented as being amazing for the immune system. If you would be interested in experimenting with them, I would be happy to send you some dried mushrooms or fresh when they are in season. Also, there are lots of good naturally fermented vegetables available at health food stores, and it is pretty simple to ferment your own. Nutritional yeast and brewers yeast, kombucha (a fermented tea drink from microorganisms), rejuvelac (a sprouted grain drink) might be other good things to try. In addition to the rejuvelac, I think Ann Wigmore would make fermented cheeses out of sprouted nuts. I also love umeboshi plums but they are really salty. Bee pollen is naturally fermented with bee saliva, as well as raw honey.

Seth's blog » Blog Archive » Pagophagia and the Umami Hypothesis (2009-02-16 12:20:34)

[...] The Comforts of the Umami Hypothesis [...]

kathy w. (2009-02-19 21:37:57)

aged cheeses can raise blood pressure in some people, due to the tyramine content. so, ironically, can aged meats. from wiki: Tyramine is an amine which causes elevated blood pressure and tachycardia by displacing norepinephrine from storage vesicles. Tyramine is generally produced by decarboxylation of the amino acid tyrosine during fermentation of food products. All protein-rich foods which have been matured will contain more tyramine depending on the temperature and how long they have been stored. Properly refrigerated foods will not be affected.

seth (2009-02-19 22:09:24)

Kathy, I didn't know that. Thanks. My blood pressure did go down after I stopped eating the aged cheese.

Tom in TX (2009-02-20 09:23:58)

Not just high BP. Some people get migraine headaches from tyramine foods - aged cheese, wine, processed meats, and a lot of fermented foods. YMMV.

imsovain (2009-02-20 09:26:40)

Which cheeses are considered stinky?

Fermentation (not alcoholic....) of food. | CST Free Weight Exercises By Scott Sonnon (2009-04-28 00:18:00)

[...] Anyway one of his recent theories is the Umami Hypothesis. the idea that evolution shaped us to like umami taste, sour taste, and complex flavors so that we will eat more harmless-bacteria-laden food, which improves immune function. (I pompously call this the umami hypothesis.) It seemed so likely to be true that I started eating more fermented foods: miso, kimchi, yogurt, buttermilk, smelly cheese, and wine. The Umami Hypothesis | Lost Wanderer (2009-07-27 18:51:05)

[...] Seth Roberts has proposed an interesting hypothesis, that humans like complex tastes (umami) because we evolved to like the taste of bacteria in food. He believes that bacteria from natural pickling is harmless, and actually improves our immune function. As reported in Conditioning Research, Roberts points out that explorer Vihjalmur Stefansson reported that Eskimos ate lots of bacteria fermented fish, which he also grew to enjoy. Supporting this theory, Conditioning Research also tells of a University of Michigan paleontologist, Dan Fisher, who butchered a draft horse and cached the meat in a stock pond. The lactobacilli in the water pickled the meat, which it emitted a slightly sour odor that put off scavengers when it floated to the surface. Fisher cut and ate the meat from February until summer to prove its safety, showing how hunter gatherers might have once stored their large animal kills. As I blogged in an earlier post, fermented foods also are known to be good sources of vitamin K2. ## Interview with Leonard Mlodinow (part 11) (2009-02-15 08:39)

ROBERTS I think that if you take the different things that happened to you and you measured their effect, the effects will have a power-law distribution. A tiny number will have a huge effect . . .

MLODINOW Yes.

ROBERTS . . . and a large number will have very little effect. But I guess you could shift the slope of that power-law distribution if you were smart. My research with rats has involved measuring how long they hold the bar down when they press the bar and it turns out that has a power-law distribution.

MLODINOW That's interesting. Why is it that they hold it down with a power-law distribution rather than, let's

say, a normal distribution?

ROBERTS Why? I think itâ€™s because the way the cerebellum is constructed. I think it has to do with . . . the brain is a network and itâ€™s much easier to get a power-law distribution out of a network than out of a non-network and itâ€™s revealing of the mechanism that produces the bar presses. Itâ€™s revealing that it comes from a very networked structure and a little bit more than that, too. Itâ€™s not only networked, itâ€™s also chain reacting and it sheds some light on the mechanism thatâ€™s producing the bar presses and that mechanism is not so far from what we see in the cerebellum, which has these incredible density of neurons, highly interconnected neurons. So thatâ€™s the connection.

MLODINOW Interesting.

ROBERTS Thatâ€™s the best I can say as to the why. Clearly evolution designed the brain to solve the problems that animals encounter and why does the cerebellum have the structure it does? Because this power-law distribution is a good idea. Normal distribution is probably too conservative, whereas the power-law distribution is . . . every now and then itâ€™s searching much more widely.

MLODINOW Searching for . . . to see if holding it down less or more amount of time will have any effect, so the power-law you will have some of those explorations into holding it down not long or extra long and therefore sometimes discover something new, rather than really more narrow . . . in a narrow band holding it down a certain number of milliseconds or whatever.

ROBERTS I would guess that the brain has been shaped to produce the power-law distribution in those operations and I think thereâ€™s probably other patterns of variability in other aspects of behavior but this is the one we measured.

## Pagophagia and the Umami Hypothesis (2009-02-16 12:20)

[1]Pagophagia is an eating disorder where you chew a lot of ice. A friend of mine had it. After she discovered she loved crunching ice cubes, she started going through several trays of ice cubes per day. A trip to Russia, where ice cubes were unavailable, was highly unpleasant. Eventually my friend learned that pagophagia is caused by iron deficiency. When she started eating more iron, her ice craving went away.

Why do we work this way? The evolutionary reason, I think, is that in the ancient world where this tendency evolved, a desire to crunch something was usually satisfied by crunching bones. After you discovered how pleasant it was to crunch bones, you sought them out. Bone marrow is high in iron. Crunching those sought-out bones increased your iron intake.

The [2]umami hypothesis says that we like umami tastes, sour tastes and complex flavors so that we will consume more harmless-bacteria-laden food (which keeps our immune system on its toes). In the ancient environment where these tendencies evolved, in other words, a desire to eat food with these characteristics led us to eat bacteria-laden food. At the Fancy Food Show, I met a maker of [3]sparkling tea who was unable to get enough complexity without using bacteria.

Just as a person with pagophagia chews ice, most of us do one or more of these:

- add monosodium glutamate (e.g., Accent) for umami taste
- add vinegar for sourness (I put a few drops of vinegar in coffee-like drinks)
- add many spices for complexity

The result, I suspect, is that most of us have immune systems with plenty of room for improvement. I [4]stopped getting easy-to-notice colds when I started sleeping better so the high frequency of reported colds (the average American adult gets [5]about three per year) may be a sign that this is true.

Tom Moertel (2009-02-16 14:14:34)

I suspect that that human preferences were fairly well optimized to guide pre-civilization humans toward good health. If humans need Y for optimal health, we would expect natural selection to have developed preferences that led to sufficient Y intake. One such preference might be a taste for Y, itself. Given that Y might be expensive for the body to measure directly,

however, selection-based optimization would likely have found some easy-to-measure X to serve as a reliable marker for Y. If you consider a similar optimization process to have been performed for all the myriad Ys that our bodies need, it's reasonable to conclude that we humans crave a lot of related Xs as a result. Fast forward to today. With agriculture, we have introduced many "new" foods, some of which do not preserve the traditional X-and-Y relationships our pre-civilization bodies expect. Further, with modern food science, we can figure out what any particular X is, manufacture it in isolation, and sprinkle it into all sorts of unrelated foods. All of a sudden, those foods become a whole lot more crave-worthy, but our bodies' natural preferences become a whole lot less reliable (or a whole lot more manipulable, depending on your cynicism level). It's an interesting situation, this X for Y thing, one that raises some fascinating research questions. For example, can market research lead us to better eating? Go to the supermarket, buy popular junk food, and examine the ingredients for possible X markers. If we consider those Xs to be the most-strongly craved (as revealed by marketing and sales optimization), they might point to the Ys we most strongly need. For each potential X, figure out what Y it indicated in pre-civilization times, and eat more of that. That's interesting stuff. I think you're on to something here, Seth.

Aaron Blaisdell (2009-02-16 22:04:48)

This disconnect between marker X and required nutrient Y reminds me of work showing how rats (and mice) with an electrode placed in their hypothalamus will work to exhaustion to press a lever that results in a delivery of stimulation of the hypothalamus. This is called brain reward stimulation.

Seth's blog » Blog Archive » Where Does Umami Come From? (2009-07-03 17:27:03)

[...] As previously blogged, the evolutionary reason we like umami taste may be so that we'll eat more bacteria-laden food. This makes sense only if bacteria-laden food would have been the main source of umami. Nowadays, you can get umami from MSG. What about before MSG? [...]

## **Salt, Fermented Food, and Black-and-White Speak (2009-02-17 09:20)**

In an informative [1]op-ed piece in the New York Times, Michael Alderman, an epidemiologist, questions a government campaign to reduce salt in processed food. His piece raises two (wildly different) questions.

1. Several studies have correlated less salt with worse health. Why? Alderman writes:

Nine [observational] studies, looking at a total of more than 100,000 participants who consume as much sodium as New Yorkers do, have had mixed results. In four of them, reduced dietary salt was associated with an increased incidence of death and disability from heart attacks and strokes. In one that focused on obese people, more salt was associated with increased cardiovascular mortality. And in the remaining four, no association between salt and health was seen.

And in the one experimental study that Alderman knows of, "the group that adhered to a lower sodium diet actually suffered significantly more cardiovascular deaths and hospitalizations than did the one assigned to the higher sodium diet."

Those are useful facts. Alderman gives a few possible explanations. Here's another one: Several popular fermented foods, including sauerkraut, buttermilk, miso, and cheese, are high in salt, and [2]fermented foods protect against heart disease. I haven't read the experimental study Alderman describes but it is unlikely that the two groups in that study ate food that was the same in every way except for salt content. What probably happened is that one group was

instructed to choose a low-salt diet and the other group wasn't. The low-salt group ate less salt in part by avoiding high-salt fermented foods (such as cheese).

2. Alderman writes:

[Observational] research can justify action only when multiple studies produce consistent, robust findings across a wide range of circumstances, as the research on tobacco and lung and cardiovascular health has done.

The puzzle is why he writes like this, which I find irritating. Most of the editorial is good, which makes this lapse especially interesting. I call this black-and-white speak, talking as if something complex was black and white and – always associated with this – people on one side are better than people on the other side. In my professional life, I hear black-and-white speak from some statisticians, who divide analyses into "correct" and "incorrect." According to them you should analyze your data by following a set of black-and-white rules. Here is a less-irritating version of Alderman's statement:

Successful public health campaigns have been built on observational studies but in the best-known case – the danger of smoking – the findings were consistent and robust across a wide range of circumstances.

See: no need to moralize. Alderman's statement, of course, is just one example of something very common.

[3]Ben Casnocha on another example of moralizing in the Times.

1. <http://www.nytimes.com/2009/02/06/opinion/06alderman.html?ref=opinion>
2. <http://www.blog.sethroberts.net/2009/01/26/the-inuit-paradox/>

Mike Kenny (2009-02-17 12:09:56)

Doesn't salt have anti-biotic properties–meat used to be preserved by being salted rather than frozen. Does the intersection of salt and fermentation do anything special, I wonder? Salt and fermentation seem at cross purposes to an extent. Does the salt kill or weaken bad bacteria from fermentation and allow your immune system to sample it, producing a process like vaccination which uses destroyed viruses?

Nathan Myers (2009-02-17 19:36:04)

I suppose that brine-adapted bacteria tend not to be human pathogens, because humans aren't especially briny.

Andrew Gelman (2009-02-17 20:05:57)

I don't know that moralizing is so bad. Your blog is full of moralizing–and I mean that in a good way. As for Casnocha's comment: he seems to have a different economic philosophy than the person who wrote the passage that he criticizes. But this seems more like a difference of perspective. Casnocha is moralizing too (which isn't a bad thing). P.S. The fermented food thing is interesting too, but too far from any of my expertise to comment on. I'm glad you're stirring things up in this field.

seth (2009-02-17 20:33:41)

Andrew, maybe it's a certain kind of moralizing I don't like. I agree with you that it is actually a good thing to say this is good and that is bad, as you often do in your blog. But saying it in a way that implies that anyone who disagrees with you is a bad person or stupid or something like that – that I don't like and think is unhelpful. The black and white aspect comes into it with false certainty: The statement is too strong as if the issue is really clear when it isn't. As if there is less room for disagreement than there actually is. For example, to say a certain graph is bad for reasons X, Y, and Z – that's fine. That's really helpful. But to say a certain graph is wrong – as you have never done, as far as I know – isn't helpful at all. It implies that there are black-and-white rules about making graphs. That's an unhelpful implication because making graphs is too complicated for that. Statements like that discourage thinking and encourage blind obedience.

Darkhorse (2009-02-18 09:02:26)

Seth, I like the respect that you show for the point of view of others. In my own drive to keep growing, to keep learning, I've learned that a closed mind is great at action, but not at listening. An open mind leaves a chance for someone to drop a worthwhile idea in it.

### **The Unfortunate Saveur 100 (2009-02-17 11:04)**

Every year Saveur magazine has a list of 100 "favorite people, places, and things." [1]This year's list is the "home cook edition" – meaning related to home cooking. Only one entry is about fermented food: making wine vinegar, which takes 2 months.

Given that there are hundreds of fermented foods, many much easier to make, this is unfortunate – just as bad as Paul Goldberger, the New Yorker's architecture critic, ignoring green buildings on his list of the [2]top ten buildings of 2008. (A museum with a garden on its roof doesn't count. Green building is about better houses and businesses.)

1. <http://www.saveur.com/article/Our-Favorite-Foods/The-2009-Saveur-100>

2. <http://www.newyorker.com/online/blogs/tny/2008/12/paul-goldberger-architectures.html>

### **Interview with Leonard Mlodinow (part 12) (2009-02-18 08:46)**

ROBERTS I have some questions about details of the book. What was the hardest part of writing the book? . . . there were no hard parts?

MLODINOW Well, I'm thinking about it and also thinking about how I interpret the word "hard." Usually "hard" would mean that you're struggling with it and I'm not sure I exactly struggled with any particular part, in a sense of . . . with all the negative connotations of the word "struggle," where I'm unsure of victory and battling and becoming exhausted and fear for my life.

I guess the part that comes to mind that I had the most doubts about whether I could get through it was the structure of the book because it weaves together three areas that are historically not that smoothly tied together—probability, statistics and the random processes. Or one united subject, like geometry, that you can see the fairly linear development and here it was more intertwined strands. I did have some trouble at first seeing the segue both in concept and

tone of the book, from probability to statistics and at the end when Iâ€™m talking more about random processes and very specifically about peoplesâ€™ lives. To make that a smooth transition so it doesnâ€™t seem like two books, a book on the concepts and another book on peoplesâ€™ lives. There was a lot about peoplesâ€™ lives in the earlier parts, too, but in the latter parts of the book, I had less and less actual mathematical concepts and almost solely psychology and sociology and discussion of peoplesâ€™ lives. Figuring out exactly how to do thatâ€”I do remember struggling with that partâ€”I guess that was the hardest part, I would say.

One other difficult thing was that I went backâ€”when I was talking about the Central Limit Theorem and the Law of Large Numbersâ€”I went back and looked at the very specific work that was done by DeMoivre, Laplace, Gauss etc.Â That was difficult because what they actually did is not in the form that is often attributed to them today.Â I went back and tried to disentangle what they actually showed and tried to figure out what they were thinking, rather than just talking about the modern form of the theorem in textbooks and attributing it to them.

ROBERTS I see.

MLODINOW That took a lot of effort to figure out. I actually went back and found some of the original calculations.

ROBERTS In a library somewhere? In a manuscript?

MLODINOW Theyâ€™re in academic booksâ€”there are several academic books, so I found some academic books (academic press books, I mean) that presented their actual calculations. I went through those in order to figure out and explain the differences between what they actually did and what the offshoot of their work looks like today.

## The Staggering Greatness of Homemade Yogurt (2009-02-18 23:16)

I don't like that title but it's true. As I will explain in a later post you can't trust commercial yogurt makers to provide much bacteria in their yogurt – they actually seem scared of the stuff. So I made yogurt myself. It turned out a lot better than I expected.

I had made yogurt dozens of times. This time, however, I wanted to get as much bacteria as possible so I incubated it about 24 hours instead of about 6 hours. It came out far more sour (due to lactic acid) than ever before. But it wasn't just really sour (like vinegar); it also had complexity of flavor, creaminess, and a pleasant consistency. It was more sour (tart and tangy are the conventional terms) than any yogurt I've ever had. I couldn't eat a bowl of it; I had to eat it with other food. This may be why commercial yogurt is mild: So you will/can eat more of it at one time.

The yogurt I made is essentially a condiment, although it can be mixed with fruit. It improves almost anything: soup, meat, fish, fruit, string beans, scrambled eggs. (Because almost nothing we eat is sour and almost nothing we eat is creamy.) It is better than other common condiments, such as mustard and chutney, because of its creaminess. It is also far cheaper than other condiments. A small bottle of mustard might cost \$3. The same volume of homemade yogurt would cost about 10 cents. (You might need twice or three times as much yogurt to get the same effect.) It is far easier to make than other condiments. And, above all, I suspect it is [1]infinitely better for your health. Mustard has few bacteria. If you complexify and sour your food with mustard, you are essentially [2]chewing ice.

Because of subsidies, milk in California is extremely cheap. Ordinary milk, to me, is nearly worthless; I never buy it. Now, with little effort, this very cheap product that I have completely ignored is the source of something like liquid gold – at least, if you like good-tasting food and health.

Recipe. I took a gallon of whole milk, mixed it with 2 cups of powdered milk, heated it at about 200 degrees F. for 10-20 minutes (I'm unsure if this step is necessary), cooled it down to 130 degrees F., added 1/2 cup of starter (from other yogurt), and then incubated it in my oven at about 110 degrees F. for about a day. I divided the mixture into four glass containers. Although the lowest possible setting on the oven is "WARM", which was too hot, the thermostat actually works at lower temperatures. I set it below WARM and used a room thermometer to adjust the setting so that the temperature was about 110 degrees. (The photo above is not mine, incidentally. My yogurt is no longer photogenic.)

Thanks to Saul Sternberg for help with the recipe.

1. <http://www.blog.sethroberts.net/2009/01/21/probiotics-and-your-immune-system/>

---

Nathan (2009-02-18 23:48:51)

Given your interest in fermented foods, have you ever read or looked at Bill Mollison's "The Permaculture Book of Ferment and Human Nutrition"? It's pretty expensive (and hard to find), but given your interests, I imagine it'd be worthwhile.

Jeremy (2009-02-19 04:01:35)

Why do you add the powdered milk? For extra creaminess, or some other reason?

Kirk (2009-02-19 07:36:25)

I started making yogurt two weeks ago, motivated by wanting to avoid intestinal problems due to eating lactose. An internet-source says that store-purchased yogurt typically contains lactose because it is cultured 4-6 hours, while a 24-hour period will cause the lactose to be eaten by the good bacteria. The recipes that I read say to heat to 180 degrees, then cool to 108-112. I tried using the oven but I must not have been adjusting the heat appropriately. Other yogurt makers recommend using a picnic cooler, which is what I use now: put the jar(s) to incubate in the picnic cooler and add a few containers of hot tap water, close the lid, and go find something else to do for 12 to 24 hours.

SB (2009-02-19 07:43:18)

I tried using the store bought yogurt as starters and was disappointed with the results. Finally, through some friends I got some starter from an Indian family. They have been making yogurt using a starter brought from India over 25 years ago!!

seth (2009-02-19 08:15:59)

Jeremy, the powdered milk makes it thicker. It might speed up fermentation by reducing the distance between lactose molecules.

Caleb (2009-02-19 08:34:09)

Mustard probably isn't the best condiment to bag on. IIRC, it's a strong anti-inflammatory, one of the other pillars of good health. Barbecue sauce would be much worthy of your scorn. Good post though, I'll have to try this. Does fermenting the yogurt longer reduce the overall sugar count as the bacteria eat the lactose, or is converted into some other type of sugar? I've noticed store bought yogurt doesn't seem to have any less carbs than you'd expect from concentrated milk. Here's my favorite way to use yogurt: top some pumpkin with it. Mix vanilla (no sugar added) into the yogurt, then mix the yogurt into the pumpkin. Add one of those pumpkin pie spice blends. Finally mix in and top with shaved coconut. It's absolutely heavenly.

Stuart Buck (2009-02-19 10:50:49)

Heating the milk beforehand kills off any "bad" bacteria that will turn it into spoiled milk after sitting out overnight. So I've read. I don't think it's necessary to heat it quite that long, though. I've made yogurt at home many times, and I just heat up the milk on the stove to the point where little plumes of steam start to rise from the milk, and then immediately remove from the heat and let it cool. That works for me. In addition, I've read that it's good to let the milk cool to 110 or 115 to prevent it from killing any of the good yogurt bacteria from the heat.

seth (2009-02-19 13:01:46)

Caleb, yes, the bacteria eat the lactose and produce lactic acid. Stuart, another supposed reason to heat the yogurt is to denature the proteins. What happens when I don't heat it I would like to find out.

Tom in TX (2009-02-19 14:48:06)

My wife made yogurt using an electric heat pad as the heat source. I think she may have heated it on the stove first, but I am not sure. She said she got the recipe from one of the Tightwad Gazette books. Or you could probably google for it.

Heather McD (Heather Eats Almond Butter) (2009-02-19 14:57:27)

Seth, I've made homemade yogurt too, but I couldn't get it to work in the oven. I tried replacing my oven light with a 100 watt bulb, but that did not keep it warm enough. The next time, I tried setting my oven on it's lowest temp with the door propped open, but it got too hot, and I ended up with a big pot of custard. Enter my Costco HeatDish: <http://heathereatsalmondbutter.com/2008/12/11/yogurt-success/> Too bad I almost burnt the house down. :)

Socktopi (2009-02-20 02:47:04)

I love (soy) yogurt, but what's with the mustard-hatred? Mustard is made from Brassica seeds and often colored with turmeric. Like many seeds (flax et al), it's a great tasting source of Omega fats. It probably aids digestion and is thought to increase metabolism. The seeds have been used medicinally since Hippocrates, and are mentioned in the New Testament. How is good yogurt a substitute for mustard? I could see it as a substitute for mayonnaise - (all right-thinking people agree mayonnaise is gross). But no-one is going to put yogurt on their tofu-dog.

seth (2009-02-20 08:17:58)

The yogurt I made is strong enough to substitute for mustard on a hot dog, I think. It did a great job improving some Mexican blood sausage. From this <http://www.indiacurry.com/nprofiles/mustardseedoil.htm> you can see that mustard has too much omega-6 to be a good source of omega-3. Anyway, I don't think mustard is a significant source of omega-3 in anyone's diet; we eat it in tiny amounts. I'm not saying mustard is bad; I'm saying strong yogurt is much better.

bennetta (2009-02-20 16:55:25)

Bacteria IS good for you. It's just a few select nasties and human/animal borne germs that are bad for you. I'd also like to suggest that environment can also turn friendly bacteria into a killer. E-Coli is a great example. It naturally exists in your colon and serves a very important purpose there, but can kill you if it gets in the wrong location. One of the primary reasons (if not THE primary reason) why coat hanger abortions are so dangerous is because a woman's uterine wall is extremely close to the large intestine. A coat hanger is usually straight, while the uterus is not. If you puncture that wall, you expose your reproductive system to normally harmless bacteria that will set up shop in a place they shouldn't and kill you. Similarly, your E-Coli may be your best friend, but your best friend's E-Coli could be your worst enemy and kill you. In college (UC Davis), I remember taking a class called the History of Infectious Diseases where the benefits of bacteria, but also the detriments of living in an environment absent of bacteria, were discussed. A lot of the problems we have with diseases could be avoided by changing our attitude toward bacteria. Although it is probably a necessary evil, antibiotic-resistant, flesh eating Staph infections (a normally harmless bacteria) thrive in hospitals because they are often overly-sterile environments. Most interestingly, however, a constant, low-level exposure to bacteria can be a tremendous benefit to your immune system. That yogurt you're eating doesn't just contain bacteria, but is a microscopic ecosystem in-and-of-itself. It also often contains harmless (to us) viruses that live off of that bacteria, called bacteriophages. By eating yogurt, you not only strengthen your immune system, you provide your gut and oral cavity with a nice supply of bacteria predators that, unlike antibiotics, will adapt to the bacteria as it changes genetically. I can't help but think that we evolved to take advantage of this. My theory is that this is what the bitter palate is for. It's essentially our bacteria detector/regulator. Fermented foods are often bitter. We naturally like bitter foods. They're a unique taste and, I think, fascinate our palate. We find them interesting and fun. But our palate can only take so much, so we must enjoy bitterness in moderation. This encourages us to ingest bacteria without having too much. Of course, I'm not encouraging us all to eat filthy food, but amusingly, at the end of our last lecture, our professor said "OK guys, now what's the moral of the story? The next time you drop your sandwich on the floor, wait a few minutes before picking it up."

Tom (2009-02-21 16:22:00)

Seth, Stephan has a new post you'll like: <http://wholehealthsource.blogspot.com/2009/01/how-to-eat-grains.html>

seth (2009-02-21 23:19:43)

Tom, thanks, that's a very interesting post. Benetta, I'm not so sure we usually like bitter tastes (except in alcoholic drinks). What are some examples of fermented foods that are bitter?

Seth's blog » Blog Archive » A Yogurt Experiment: Effect of Preheating (2009-02-23 09:06:02)

[...] The Staggering Greatness of Homemade Yogurt [...]

bennetta (2009-02-23 10:49:48)

"Benetta, I'm not so sure we usually like bitter tastes (except in alcoholic drinks). What are some examples of fermented foods that are bitter? " Yeast extract (marmite/vegemite, for example), miso, and vegetable krauts are all fermented foods with bitter undertones, while kombucha and rejuvelac (raw, fermented, sprouted grain drinks) are two fermented, nonalcoholic drinks that come to mind. Most acidophilus cultures also tend to be bitter.

Vesna (2009-03-11 04:35:09)

One thing that worries me, for your sake, is your inclusion of powdered milk. That potentially offsets the benefits of the great bacteria in your homemade yogurt with the hazards of oxidized cholesterol I suggest a search for "damaged cholesterol powdered milk" to look into what has been said about this. Most commercial yogurts (also nonfat and low-fat dairy products) contain powdered milk (it is not required to be listed separately from the fluid milk on the label) for added body. It is one way commercial yogurt makers get the stiff body that Americans are used to in yogurt. This consistency is not typical of European yogurt, which is more of a thick drink rather than a spoonable custard. The natural, "Greek-style" yogurt I've seen gets its thickness by being strained of some of its whey. (Tasty, but on the other hand, the whey is also good for you. Have you considered using a dry starter culture rather than starting with commercial, prepared yogurt? These are available at some natural food stores and online through places like New England Cheesemaking. I haven't used it, but supposedly it makes homemade yogurt with a lot more body and general oomph than using prepared yogurt does. I'm curious as to your thoughts on this.

seth (2009-03-11 10:01:09)

Thanks for the warning about damaged cholesterol. Left out of your calculations is this: The powdered milk contains lactose. The bacteria need lactose. More lactose, more bacteria. Which is the whole point - getting a lot of bacteria. I get my starter from my previous batches of yogurt. How much body and oomph my yogurt has depends heavily on how long I preheat it and how long I let it incubate. I can get plenty of both if I preheat it long enough and let it incubate long enough.

Vesna (2009-03-11 17:52:21)

Thanks for your response and for your additional info about your method. I understand you to be saying that the powdered milk is to boost the bacteria, not to add body. But now the question is: Is it a good tradeoff to add an ingredient that can potentially hurt you, in order to increase the amount of a beneficial ingredient? I am eager to learn your thoughts.

ventana (2010-01-01 16:52:55)

I've been playing around with yogurt making recently, using a few different high end plain yogurts as a starter. They don't have any problem getting thick enough without any added powdered milk, but they are milder in flavor than what I started with. Cook times have been 8 hours & 12 hrs. I boiled the milk first, thinking it was a sterility issue. The batch I'm working on now I just got hot, so will see. Sure is fun, though.

seth (2010-01-01 17:41:14)

They are milder in flavor because you're not fermenting them long enough. Try 16 hours or 24 hours. There is no need to boil

the milk first.

Sid Savara (2010-02-05 15:31:29)

Hi Seth, Recently began making my own home made yogurt and tried your suggestion putting it in soup - excellent! One question - my dad told me that doing this means I'm killing off all that bacteria I have carefully grown and kept alive in my yogurt. To test this, I used a meat thermometer to check my soup temp and it's about 140 degrees when I eat it. I assume this means I am killing off all my probiotics. Is that a concern of yours at all, whether putting it in the soup is killing off the bacteria and nullifying some (if not all) of the effects ? =) I am a beginner to this, still learning, so I'm not looking to criticize - I'm looking to learn more information, and that's why I'm asking.

seth (2010-02-05 18:00:30)

No, I'm not worried about killing the yogurt bacteria. First, because I doubt that 140 degrees kills them, second, because I believe dead bacteria are also useful, and third, because I eat yogurt by itself.

O. Herne (2010-03-31 10:38:43)

Help, I made whey and curds for the first time. I used organic milk from an aseptic carton and it would not separate in the home, which was very cool. I placed it in my car in a chest on a few warm days and it separated. I placed the separated mixture in the refrigerator without draining. The mixture had no odor, but both the curds and whey taste bitter. I don't know what either should taste like. Should I toss and start over? Is it useful for purposes other than consumption. Thanks

Diana Henretty (2010-05-14 11:34:47)

Try adding 2 T. of honey and 2 T. of vanilla to a quart of milk before bringing it to a boil, it makes the best yogurt. I taught at Head Start and every 6 weeks got strep throat. After eating 2 cups of yogurt a day, I no longer got strep throat, even though I was exposed to it constantly. The older Salton makers with the 5 cups servings are great, you can find them at thrift stores and yard sales for about \$2, so keep looking.

Roxanne (2010-11-22 08:57:10)

I make my own yogurt using the yogourmet yogurt maker and starter. I normally ferment mine for 24 hours but last time I forgot about it and it fermented for 32 hours. The consistency and taste is great but I'm worried that I may have killed the probiotics in the yogurt and it won't "work" anymore. Do you have any info on this?

Seth Roberts (2010-11-22 09:05:29)

I've never tried to use yogurt fermented for 32 hours as starter, so I don't know the answer.

Seth Roberts (2010-11-22 09:08:05)

Incidentally, I never use powdered milk any more. I can get great thickness by using a yogurt maker and a small amount of starter (e.g., 2 teaspoons)

## **The Power of Amateur Content (2009-02-19 22:25)**

[1]Clay Shirky writes:

Publishers have been telling each other for years that eventually people will tire of being able to produce and share amateur content, rather than just consuming professional content, but the users don't seem

to have gotten that memo.

True. I have never heard a book publisher or editor notice that almost all important books have been written by amateurs. Charles Darwin didn't write books for a living. Nor did Thomas Paine. Nor did Betty Friedan. I think this is why books have been so influential.

1. <http://freakonomics.blogs.nytimes.com/2009/02/18/blnk/>

---

Aaron Blaisdell (2009-02-20 08:17:07)

Writing is an odd profession, if one can call it that. It's like calling driving a car a profession. Sure there are professional car drivers (racing, taxi drivers I suppose, etc.), but a great majority of people in modern civilization can drive. It's a part of many of our daily lives. The same with writing. Darwin may not have been a prolific book publisher (though he published more than just "On the Origin of Species..." But, he corresponded with people all his life through letter writing, he kept extensive journals and documentation of his observations (these are quite fascinating by the way), etc. So do many of us. I am not a professional writer, but I publish lots of professional writing. So although I can see how the Clay is directing his commentary to the book publishing industry, I think the amateur-professional division is not very meaningful when applied to writing. Cooking may be another example. There are many, many wonderful amateur cooks in the sense that they cook very well, even if it's just for themselves, friends, and family. The amateur-professional distinction is more important when applied to fields that involve lots of training (or on-the-job learning) like engineering, medicine, science, law, carpentry, architecture, perhaps pro-sports-though of course there are always exceptions even here.

Pete (2009-02-23 09:59:01)

I think you're missing the point. Darwin was a scientist, and what he wrote had value not because of his writing skills, but because of the content. Betty Friedan of course was a housewife, but could have been a professional writer, which was kind of the point. "No man but a blockhead ever wrote except for money." -Samuel Johnson

### **Shades of Homeopathy! Peanut Allergy Cured . . . With Peanuts (2009-02-20 07:14)**

Doctors at Addenbrooke's hospital in Cambridge gave four children tiny doses of peanut flour every day, gradually increasing the dose until now they can eat ten or more nuts a day.

Previously the children would have risked anaphylactic shock or even death if they accidentally ate even a trace amount of peanut.

The team say this is the first time that so-called desensitization treatment has been successful.

From the [1]Telegraph. Notes: 1. No blinding. 2. No control group. 3. Started small (with 4 patients), now doing a larger study (18 patients). 4. Jewish kids in Israel have a 10-fold lower rate of peanut allergies than Jewish kids in the UK, according to [2]a 2008 study. In Israel, peanuts are eaten at an earlier age.

Thanks to Oskar Pearson.

## **Interview with Leonard Mlodinow (part 13) (2009-02-21 09:44)**

ROBERTS Did the psychology stuff grow and grow? Did you add more and more than you expected?

MLODINOW Yes. As I was putting a lot of it in the end I would find other studies that really belonged earlier that I would discover, so I would go back and rewrite the earlier parts to incorporate those studies; that became a very fun part of the book, though. That was maybe the most fun, all the psychology studies that I dug out at the end.

ROBERTS How did it happen? You knew that you wanted to include some psychology and then it turned out to be more interesting than you expected?

MLODINOW In the second half of the book when I was talking more and more about viewing life as a random process that we're going through and applying the concepts of randomness to what we're seeing in life, I would just naturally come upon these psychology studies.

ROBERTS What fraction of the psychology you read was in the book? I was impressed that you talked about psychology studies that were really good, whereas most of them aren't. You did a good job of selection and from teaching I know that you have to read a lot of stuff that isn't good in order to find the good stuff.

MLODINOW What you see in the book is probably a quarter of the stuff that I read or that I thought of putting in the book. In the psychology studies maybe half of them made it into the book and I think I was good at filtering before I even read by following trails of one study leading to other studies and using either textbooks or compilation conference reports to figure out what would be good and what wouldn't be so good.

I'm talking about half of the studies where I actually bothered to copy the papers; there are other ones, countless studies, where I would get to the abstract and dismiss it after reading the abstract or one page. That I have no way of counting, that's just constant; maybe ten times as many. But the ones that I actually got to where I made copies . . . if I like something I will print it out because I just can't read dozens of pages on the screen and plus I like to sit in caf s and carry it around. I guess I could bring my laptop but I tend to print them out. About half of the ones I bothered to print out I put in the book and then there were countless ones that I just dismissed.

ROBERTS Yes, I see what you mean. How did the book's structure differ from your original proposal? Did the structure change very much?

MLODINOW Yes; I don't remember exactly, but it did. The first chapter was not there in the proposal; the proposal started with chapter two. Then I realized that I needed an introductory chapter to really set the stage for why we're interested in these things so for introductory chapter, which is applications to life, I start by analyzing certain situations in life that I think are surprising that people misinterpret; I thought that was a good lead-in as to why we care about this. Then I went into other chapters about developing the ideas of randomness and a lot of that was similar to the proposal although I put in less about Brownian motion and the actual drunkard's walk itself than I think it had in there. The last several chapters, I extended the discussion about life; I think the middle part of the book is fairly similar to the proposal but the beginning and the end I expanded greatly on discussions of the everyday world and applications; the psychology was not in the original proposal nearly at the level that it was in the final book.

ROBERTS Yes, I see what you mean.

MLODINOW . . . again, as I start talking about events in the world around us and looking at the psychological components—and I dealt with that, I greatly expanded that part—they were fascinating studies and I was just so interested I just kept putting more and more into the book.

[...] Interview with Leonard Mlodinow (part 13) [...]

### **Yay for Dambisa Moyo! (2009-02-21 23:53)**

Many years ago I wrote to the editors of Spy suggesting they do an article about what happened to the money raised by Live Aid. Dambisa Moyo, an African-born economist/author of a book called [1]Dead Aid, has followed up my suggestion. In [2]an interview, she said this:

MOYO Forty years ago, China was poorer than many African countries. Yes, they have money today, but where did that money come from? They built that, they worked very hard to create a situation where they are not dependent on aid.

SOLOMON What do you think has held back Africans?

MOYO I believe it's largely aid. You get the corruption — historically, leaders have stolen the money without penalty — and you get the dependency, which kills entrepreneurship. You also disenfranchise African citizens, because the government is beholden to foreign donors and not accountable to its people.

Too bad she wasn't asked what she thought of Jeffrey Sachs or Bill Gates. As Jane Jacobs once said, it's a curious thing: you can't help something unless you love it.

More In [3]another interview, Moyo asks, relative to Bono and Africa, how would Americans feel "if Amy Winehouse started to give the US government advice about the credit crunch? And was listened to?"

1. <http://www.deadaid.org/deadaid.html>

2. <http://www.nytimes.com/2009/02/22/magazine/22wwln-q4-t.html?ref=magazine>

3. <http://www.guardian.co.uk/society/2009/feb/19/dambisa-moyo-dead-aid-africa>

---

Scott (2009-02-22 15:05:49)

re: Bono and Africa, does being a rock star mean he can't study a topic and provide insight? If Amy Winehouse studied the issues and had something intelligent to say about the credit crunch why would we want to exclude her ideas because of her primary profession? I suppose that would be like asking an academic psychologist to come up with a new biologically based theory for dieting... (in other words, that seemed like an un-Seth comment)

seth (2009-02-22 15:30:22)

My professional expertise – my area of experimental psychology is animal learning – is exactly why I thought of a theory of weight control that nutritionists hadn't thought of. They don't know about associative learning, whereas associative learning is the main topic of my field. Bono is an easy target, as I tried to say. For that reason it is less than ideal to pick on him – I agree with you there.

Andrew Gelman (2009-02-23 20:29:50)

Seth, 1. I'm not saying you're wrong, but, on the other hand, I love free money, and I think I spend it wisely. 2. I thought Bono's big thing was debt forgiveness, which is quite a different thing from aid, no? Also, I think the China/Africa comparison is a little silly. Why not compare to Japan and Korea, both of which thrived on U.S. aid?

seth (2009-02-23 20:47:47)

Andrew, thanks for your comments. I hope to get the book and say something more nuanced about this.

J. Sayegh (2009-02-27 12:39:18)

It is quite easy to say stop aid when one is outside the country and doing quite well for oneself. Dambisa Moyo holds a PhD in Economics from Oxford University and a Masters from Harvard. Now not all Africans are so "blessed" as to have the funds to study at these top universities and then spout useless nonsense. While I do agree that Africa needs more open export markets, Africa is not the only continent that obtain aid from Bretton Woods (World Bank, IMF, WTO) group. The aid that goes to Africa is nominal at best. Aid is not the problem, our leaders are. Our leaders go to international summits and instead of putting Africa's interest forward, they go shopping, or worse (see photo). Ms. Moyo's answer to what has held Africa back was to say " : I believe it's largely aid. You get the corruption " historically, leaders have stolen the money without penalty " and you get the dependency, which kills entrepreneurship. You also disenfranchise African citizens, because the government is beholden to foreign donors and not accountable to its people. To Ms. Moyo I say: And whose fault is that? We get the leaders we deserve. If we were to put in competent and capable leaders and demand accountability, our leaders would be beholden to us. Massive aid was given to European countries after the War but the leaders knew that their first obligation was to their people. African leaders seem to have no such obligation. To put it simply, if you are given \$5.00 for the purpose of buying your mom a gift, and then you spend the money on yourself, the \$5.00 is not the problem, you are. You have not used it for its intended purpose. Do you now turn around and blame the person who gave you the \$5.00? Does your mom now blame that person as well? Here is another example (my apologies to the Ghanaians): Ghana won its independence in 1957, the same year as Malaysia. In the 1950s both countries were on an economic par - equally poor and equally dependent on the export of

raw materials. Today, Ghanaians get by on an average of about \$300 per year, while Malaysians earn over \$3,000. Ghana is still exporting raw products like cocoa and gold, Malaysia makes its own cars and boasts skyscrapers that rival anything in New York or London. The development of one product - palm oil - tells part of the story. Ghana grows and processes the rich red oil to make soap and cooking. Malaysia - which imported its first palm oil trees from west Africa in the 1950s - has not only become the largest palm oil producer in the world, but has also developed a high-tech industry which makes sophisticated chemicals and food additives from the raw berries. The recently retired Prime Minister of Malaysia Dr Mahathir Mohamad puts it best: "Political stability is extremely important. Without political stability there can be no economic development. People are not going to put money into a place where there is no certainty". The Malaysian state had established a solid framework of laws that allowed entrepreneurs to flourish. And the lack of such institutional framework is Africa's problem, not aid. The New York Times question: Why didn't you get a bond issue going in your native Zambia or other African countries? Ms. Moyo's reply: Many politicians seem to have a lazy muscle. Issuing a bond would require that the president and the cabinet ministers go out and market their country. Why would they do that when they can just call up the World Bank and say, "Can I please have some money?" To Ms. Moyo I say: And pray tell who would buy bonds in a country that is not stable? This is business, not philanthropy. Buying bonds require security something that most of our governments seem to be unable or unwilling to provide.

seth (2009-02-27 17:05:46)

A related question is: Who would buy a car from a company that may soon go out of business?

E. Aboyeji (2009-03-06 09:22:48)

God bless My Saygeh: I actually wrote a two paged article about this woman in my college paper. Like I have been saying. Her general conclusion is in order: Aid has not helped Africa. However to suggest that the entire problem with Africa is aid is complete nonsense. Even worse to now suggest the Bond thing is stupidity. She said it herself that bonds are not forgiving of political instability. You mess up once, they dry up. So imagine what that would mean for African countries. No doubt the time for her ideas is NOT now. We need to be weaned off aid no doubt. The question we should be answering is how

### **Waltz With Bashir (2009-02-22 15:02)**

I loved [1]Waltz With Bashir, Oscar-nominated for Best Foreign Language Film, and was surprised to realize that Ari Folman, its director . . . I had met. In San Francisco, about four years ago, there was a conference for documentary filmmakers trying to get distribution of their film. I went with a friend of mine. I happened to meet [2]Sarah Kapoor there; we both watched an hour of a five-hour series about love ([3]The Material that Love is Made Of). I was blown away. A brilliant hour of TV. The particular hour we saw was about a 10-year-old boy in love with a girl. Each hour was about a different situation. Afterwards I met the filmmaker (Folman). Brilliant, I said. He said it got really dark. Later he was giving away DVDs of the series but somehow I missed getting one. I tried to contact him by email but his in-box was full.

I hope that the success of Waltz will renew interest in that old series. I would love to see the rest of it.

## Shangri-La Diet Quote of the Day (2009-02-22 20:29)

From the[1] I Hate My Message Board forums:

I honestly couldn't care less if it makes sense or not. The book is a good read [thanks!] and the science behind it seems sound. But, honestly, none of that matters to me. Whatever the reason, this plan works. Period. If it turned out that extra-light olive oil was made out of ground up kitty cats, I'd still follow the plan. If I wasn't losing weight, I'd STILL do it, just because of the enormous positive impact it's had on my life. I was addicted to food. Now I'm not. It's extraordinary.

1. <http://www.ihatemymessageboard.com/forum/index.php?showtopic=31712&view=findpost&p=557915>

---

Kerry (2009-02-23 08:20:16)

Hi Seth! I'm one of the people who started everyone talking about your diet plan at the "I Hate My Message Board" boards. We've got several people trying it, and two people blogging about their experiences now. Stay tuned and keep reading over there! It's been two weeks now and I'm still doing well - 9 lbs. down, thus far. Thanks so much for your book!

seth (2009-02-23 08:35:14)

Thanks, Kerry. It takes two people to make a book: writer and reader.

Jaimie (2009-02-23 18:57:06)

Ha! That's my quote. :) I meant every word. Except, maybe, for the ground-up kitty cat part. It really has been fantastic, though. Thanks, Seth!

Scott NZ (2009-03-02 01:46:34)

Hi Seth, I have just started the SLD and am starting to notice my reduced hunger, especially in the evenings. I was wondering if you have heard of anyone coming off antidepressants like myself have been able to lose weight (its so damn hard normally). Thanks :)

seth (2009-03-02 08:21:55)

No, Scott, I haven't heard of that. So maybe you're the first!

Noelle Ray (2009-05-04 14:43:56)

Hi! I read your book a few years ago and loved it. It really helped my appetite, but it made me sick (the sugar and/or the oil). I read somewhere else that protein powder mixed with a 3-4 cups water does the same thing (you have to sip it for an hour-not gulp it down-starting an hour after your last meal and you can't eat for an hour after you stop drinking it). I bought one that has stevia as the sweetener because I don't like artificial sweeteners. Anyway, the only reason I tried it was because I had read your book and it made sense. Oh my goodness!! I am so happy! My appetite is GONE (just like when I drank the oil or sugar) but I don't feel sick. It seems like you mentioned in your book that you were going to try egg whites. Did you ever try? I wonder if protein isolate by itself would work. I HATE being hungry all the time, so thanks so much for your great discovery. Even if I

don't lose weight, I would still do it because I like the feeling of control. P.S. I love your comments about fermented food. Have you ever tried Cortido? It is a Mexican Sauerkraut. I got the recipe from one of my favorite books–Nourishing Traditions.

Tom in TX (2009-05-06 07:48:24)

NR, what flavor of protein powder do you use? Do you have your nose clipped shut or just drink it regularly?

### **A Yogurt Experiment: Effect of Preheating (2009-02-23 09:05)**

All yogurt recipes I've seen say you should preheat the milk before adding starter (= yogurt with live culture). Reasons vary. Some say it denatures the milk protein; others say it kills bacteria that might compete with the starter bacteria.

It was easy to measure the effect of preheating. I make yogurt using about a gallon of milk at a time, divided into four trays. I preheated two trays for 20 minutes and did not preheat the other two, leaving them at room temperature. After that I treated all four trays the same.

The photo above shows the results after incubation for 36 hours. The clumpy yogurt was preheated, the smooth yogurt was not. There was not a vast difference in taste. For most purposes clumpy is better so I will preheat in the future.

I was impressed that the experiment was fast, easy, safe, cheap, and conclusive, showing a large and lasting effect of a 20-minute treatment that had no visible effect. After the heated milk cooled, it looked the same as the unheated milk.

[1]The value of homemade yogurt.

1. <http://www.blog.sethroberts.net/2009/02/18/the-staggering-greatness-of-homemade-yogurt/>

---

Scott (2009-02-23 11:31:40)

In case you need/want more ideas/recipes for fermented foods, this is a book I was given by a chef in the family. For a "cookbook" it has a fair amount of additional information about fermentation and live-culture foods. [http://www.amazon.com/Wild-Fermentation-Flavor-Nutrition-Live-Culture/dp/1931498237/ref=sr\\_11\\_1?ie=UTF8&qid=1235413740&sr=11-1](http://www.amazon.com/Wild-Fermentation-Flavor-Nutrition-Live-Culture/dp/1931498237/ref=sr_11_1?ie=UTF8&qid=1235413740&sr=11-1)

Joe (2009-02-23 15:55:37)

Why is clumpy yogurt better? Purely aesthetically, I find the yogurt on the left to be more appealing.

karky (2009-02-24 05:23:30)

is it clumpy because more whey separated out, making the yogurt thicker? I stirred the whey back in when I made mine.

seth (2009-02-24 08:15:02)

no it is clumpy because denaturing the proteins makes it easier for a network of protein bonds to form.

marc (2009-02-26 10:07:43)

Thanks for posting about the experiment. Do you have an idea about the temperature the milk reached after 20 minutes? I usually heat the milk until it reaches close to 200 degrees. I'm wondering if heating it to 120 degrees would be enough. My understanding is that that 115-120 is the temperature that allows the bacteria to reproduce faster. My guess was that your watery yogurt (at room temperature) just didn't have enough bacteria, although it should have been less bitter than the solid ones if true.

seth (2009-02-26 10:54:05)

I think the milk got over 200 degrees. Heating to such high temperatures is believed to kill, not increase, bacteria. On the other hand the two sets were not at exactly the same temperature when I added the starter - the heated one was about 10 degrees warmer - so that might have increased the bacteria in the preheated one.

karky (2009-02-27 12:16:17)

when I made mine, I brought the milk to just barely boiling, then let it cool on the stove to 120° which I measured with my candy thermometer, then mixed in my starter. I got some liquid on top after fermenting for about 7-8 hours, which my recipe said was whey. I just stirred it back in, but the recipe said drain and save for other uses. All of the recipes I looked at said to barely boil the milk and turn off right when it starts to bubble. I wonder if these recipes aren't from back when milk was fresh from the cow, not the store.

### **Good Advice From Tim Hartford (2009-02-23 23:15)**

In case you are not a long-time reader, I will repeat my advice as to how to enjoy the thrill of the lottery without the fool's bet. Choose your numbers, but don't buy a ticket. You'll win almost every week - the fear that your number might actually come up is an adrenaline rush to beat them all.

From his Undercover Economist [1] advice column. Another example of the same thing: If (first) I buy and use Product A and then (second) see a commercial for Product A it makes me happy. Whereas the conventional order - (first) see a commercial for Product A and then (second) buy and use Product A - is generally disappointing, just like the lottery.

Both Hartford's example and mine are cases where what we are told (implicitly) is exactly wrong. Does buying a lottery ticket make you happy? No, not buying one will make you happy.

In Hartford's example and mine it is the average consumer who is gullible and makes the whole thing work – without people who play the lottery, you couldn't take Hartford's advice. Scientists are no less gullible. Self-experimentation, like Hartford's advice, takes advantage of that gullibility. Because scientists essentially play the lottery in their research – devote considerable resources (their careers) to looking for discoveries in one specific way (scientists are hemmed in by many rules, which also slow them down) – this leaves a great deal to be discovered by research that doesn't cost a lot and can be done quickly. All of my interesting self-experimental discoveries have involved treatments that conventional scientists couldn't study because their research has to be expensive. Could a conventional scientist study the effect of seeing faces in the morning? No, because you couldn't get funding. And all research must require funding. (Research without funding is low status.) In practice, this means you can't take risks and you can't do very much. Like the lottery, this is a poor bet.

1. <http://blogs.ft.com/undercover/2009/02/dear-economist-can-you-help-me-win-the-lottery/>

---

Bill Goodwin (2009-02-24 18:04:57)

I shudder just thinking about this. Roughly once a month, I succumb to temptation and buy a pair of lottery tickets. \$20 a year is a bargain for the chance to speculate what I'll do with my winnings. Playing the lottery without the ticket? Sheer terror. Re purchasing a product first: not sure how it's related. After all, aren't you just as likely to purchase product A, discover it's a piece of crap, and then get pissed off every time you see a commercial for it? Conversely, I get enormous satisfaction from targeted advertising that actually offers me services and products I find valuable. For instance, a number of top tech blogs so consistently feature useful advertisers, I'll browse the ads intentionally. Similarly, but to a lesser degree, the advertisers on HARO have become the main reason I open Shankman's daily emails.

Bill Goodwin (2009-02-24 18:05:51)

P.S. I hate to say it, but the Google Ads here were sorely disappointing...

Nathan Myers (2009-02-25 18:03:12)

## **Interview with Leonard Mlodinow (part 14) (2009-02-24 23:18)**

MLODINOW As I start talking about events in the world around us and looking at the psychological components—and I dealt with that, I greatly expanded that part—they were fascinating studies and I was just so interested I just kept putting more and more into the book.

ROBERTS Yes, that's when you decided to ask me for help. "Oh, I wasn't planning on this." How did you learn about the lottery winner who won twice—the Canadian?

MLODINOW It was in a book somewhere, an academic book. A lot of those interesting stories came from academic papers or books.

ROBERTS That's interesting.

MLODINOW Sometimes I'll find something in the newspaper that was really interesting and I would track it down but a lot of it was in academic research. I don't know why they found it.

ROBERTS Yes, who knows where they got it, but that's where you got it. How did you learn about the Girl Named Florida stuff? Some professor told you?

MLODINOW My friend Mark Hillery that I mentioned from Berkeley.

ROBERTS A physics professor.

MLODINOW He heard it somewhere... It wasn't quite this problem but then I kind of tweaked it and made it the Girl Named Florida Problem. That's a great problem for the book.

ROBERTS Yes, I loved that. So he got it from some physicist . . .

MLODINOW I'm not sure; probably. I took a few days to figure out how to make it into this problem; I don't remember exactly the problem he told me but I tweaked it into this problem. Just to show you how much work goes into the book, I even spent a whole afternoon deciding on the name Florida. I went back into the records—I needed a rare name—and I looked up different names and tried to find one that would be colorful, interesting, but that was rarely used, and I wanted to know the percentage that it was used; I dug up percentages of names. Everything in the book . . . if you read it, it might just sound like, "Oh, you know" . . .

Not a thing is just tossed out there. Or very little; there's an amazing amount of thought and work that goes behind every little detail.

ROBERTS That's a very memorable detail I must say. I like it better than the Monty Hall Problem.

MLODINOW I do, too. I think it's interesting; I found in the reactions to the book that the Monty Hall Problem has gotten more press and in some ways more reactions, which I found interesting given that it has been talked about before and this problem was completely new. I think this problem is in some ways even more striking than the Monty Hall Problem, more counterintuitive and more difficult to believe and certainly closer to something you might actually encounter. And yet I've gotten a lot more response based on the Monty Hall Problem and a few places have said that I gave the best explanation they've seen. I think the New York Times review said that, too. The New York Times did mention the Girl Named Florida Problem and said that they still find it hard to believe even though they followed the explanation.

ROBERTS I thought your explanation of the Girl Named Florida problem was very clear.

[1]Interview directory.

1. <http://www.blog.sethroberts.net/2009/01/29/leonard-mlodinow-interview-directory/>

Sean (2009-08-16 22:43:53)

I am very familiar with the Girl Named Florida problem – I have read Mlodinow's book and other sources that cited it. I agree with the answer, though I don't really find the explanation all that satisfying either in Mlodinow's book or on other websites. I came up with my own explanation that arrives at the same result and works better for me. I'm hoping that my alternate explanation will help others to understand the problem and the result. As Mlodinow explains, the key to solving many difficult problems in probability is ensuring that you arrive at the correct sample space. Usually in confusing problems like this one, there are multiple "filters" on a larger sample space that must be applied to screen out irrelevant outcomes. The order in which these filters are applied doesn't really matter from a mathematical standpoint, but it can make a huge difference in whether the explanation helps to clear up the confusion. In this problem, I think this is a key factor and for me (and I'm guessing many others) it helps to apply the filters in a different order than that chosen by Mlodinow. Mlodinow's explanation starts with an original sample of all families with children. This is reduced to all families with two children, then all families with two children one of whom is a girl, then to all families with two children one of whom is a girl named Florida. Now here is my approach. Start with all families with two children. In this particular problem it was useful for me to think of the family as being represented by a particular set of parents rather than a particular set of children. The reason is that the child's name is an attribute that tells you more about the parents than the child since they are the ones who chose it. So let's then reduce the set of all parents of two children to the set of all parents of two children for whom the name Florida ranks in their top 2 favorite names for girls. Further dissecting this set we observe that there are twice as many families with a boy and a girl than there are families with two girls. (This should be obvious since it just involves counting the four possible outcomes, discarding the two boy families, and looking at the proportion of the remaining possible outcomes: BG, GB, GG). Now, all of the GG families will have at least one Florida. I'll assume as Mlodinow did that the number parents who chose to name both of their girls Florida is immaterial. For the families with only one girl, it depends on whether Florida was the parents' first choice or second choice. Let's assume that this is a 50/50 split. It now should be clear that a girl named Florida with one sibling is equally likely to have a sister as she is to have a brother. Not only do I find my own explanation easier to follow. I think it provides some additional subtle insights that were missing in Mlodinow's answer: (1) By focusing on parents preferences, it is more clear that the random distribution of names is between, but perhaps not within families. The chances that two girls will both be named Florida in the same family is probably much less than the probability of one girl named Florida squared. (2) When you use my approach, another important assumption becomes evident. Are parents more likely to give the first child or the second child an unusual name? A hidden assumption in Mlodinow's solution is that parents are equally likely grant an unusual name to the first and second born. With my approach, this assumption is more exposed. This is probably a very testable assumption, though I have no idea whether it is true or not. I wouldn't be surprised if the evidence showed a bias one way or the other greatly altering the result.

JeffJo (2012-01-14 14:21:36)

I've developed an analogy for these kinds of probability problems by generalizing a paradox used by Joseph Bertrand, in 1889, to illustrate how \*NOT\* to solve probability problems. I believe Professor Mlodinow referred to it in his book; most treatments of problems like this do. And it's ironic, since most will use that incorrect solution for the Two Child Problem Assume there is a set of circumstances that can arise through random means. For lack of a better word, I will call the set of circumstances a box; but games shows, and families of two, work as well. Then, assume that there is a quality of these boxes that can take on exactly two values, representing symmetric but opposite sides of that quality. I will call them Value 1 and Value 2, or V1 and V2 for short. All boxes will have one of these values, but some have both. Because they are symmetric, the probability that a random box has either one, but not both, is the same. Call this probability P, and note that it must be less than 1/2. We can deduce that the probability that a random box has just one value is 2P, and the probability that it has both values is (1-2P). Bertrand used actual boxes. Each held two coins; one held two gold coins, one held two silver, and one held one of each color. The values were "the box holds at least one gold coin" and "the box holds at least one silver coin." Since one of the three boxes holds only gold coins,  $P=1/3$ . Now suppose I pick a random box, and after examining it without letting you see, I tell you that it has V1. What is the probability that it does not have V2? You might be tempted to say it is  $P/(P+(1-2P))=P/(1-P)$ , which is the ratio of boxes with just V1 to all that have V1. But if you give that answer, you also say the same probability is  $P/(1-P)$  if I were to tell you it had V2, and ask for the probability it doesn't have V1. And if the probability of one value is

$P/(1-P)$  regardless of what value I tell you it has, the probability is  $P/(1-P)$  even if I don't tell you about a value. But we have already deduced that probability is  $2P$ , so we have a paradox; specifically, a more general form of Bertrand's Box Paradox. In Bertrand's specific example, one coin was withdrawn and its color observed. Since two of the three boxes are still possible, you might be tempted to say the chances are even that the remaining coin is gold. But since you will always remove a gold coin this way from a box with two, but one half of the time from a box with one of each, the chances are  $2P=2/3$ . The Monty Hall Problem is an example of a generalized Box problem, identical to Bertrand's actual example, although the quality that makes it so is a bit unintuitive. The boxes - the set of circumstances - are the events that lead up to you being offered a chance to switch doors. The quality is which of the two doors you didn't choose have goats; each game must have at least one goat in those doors, and some have two. The host reveals one of these values to you by opening a door without the car. And you want to switch if the game has just one value. Most people think the chances the switching will win is  $(1/3)/(1-1/3)=1/2$ . Bertrand's answer of  $2P=2/3$  says that you do better by switching. The two-child problem is another example. The boxes are two-child families, and the quality is whether the family includes boys and/or girls. Since, of the four possibilities, exactly one has only girls,  $P=1/4$ . Your incomplete memory of these genders reveals one value to you. The incorrect answer to the question "what are the chances both are the gender you recall" is not  $(1/4)/(1-1/4)=1/3$ , it is  $2*(1/4)=1/2$ . That's right,  $1/2$ . Professor Mlodinow's answer,  $1/3$ , is wrong. It would be correct if, for families of one boy and one girl, you could never remember that one was a boy. Since you can't assume that,  $1/3$  can't be right. And the reason his Florida answer seems unintuitive, is it does not allow you to remember a girl named Mary, or a boy named Indiana, if they have a sister named Florida.

### **"I Started Eating More Fermented Food..." (2009-02-26 20:37)**

[1]Tucker Max, who got great results from [2]flaxseed oil, wondered what would happen if he ate more fermented food. He emailed me:

I have been reading your posts about bacteria in food, so I decided to try it on my own. I HATE Roquefort and other stinky cheeses, and I am not about to eat fermented meat, so the best thing I could find in Whole Foods was [3]Kombucha tea. It is basically normal tea, with bacteria cultures growing in it. Sounds weird I know, but it actually tastes pretty good, especially the ones with natural fruit juices added. It has a sparkly, almost champagne-like taste feel in your mouth. It takes a little getting used to, but I really like it now. I like GT's brand the best, but I think there are others.

Anyway, after a week of drinking two bottles a day, I have noticed these changes:

1. My stool is...well, better. In every way. More regular, more solid, and something else very unusual—I only have to wipe once. For most of my life, I have to wipe twice, or sometimes three times, which I assumed was normal. But this week, the stool comes out and leaves virtually nothing behind. At least nothing that is showing up on the toilet paper. I am not sure what this means as I am not a poop expert, but I think it means my stool is "healthier" for lack of a better word.
2. I have more energy. Aside from subjectively feeling it, I can see the difference in my workout logs, just in this past week I've gone up more weight on exercises than I normally do.
3. I am feeling overall better. This could very well be placebo effect/confirmation bias as it is a very subjective measurement, but I just feel better. I feel generally healthier, if that makes sense.
4. But, I am having trouble sleeping. I feel like I am getting less sleep, not much, maybe 30 minutes less. I don't know if this is due to increased energy because it might be anxiety —we are about to sell my movie, and it's an anxious time in my life, so the cause may have nothing to do with the tea.

Right now, I think kombucha tea greatly improves my health and I am going to keep taking it to see if there are anymore changes or if this persists. This stuff I buy is not cheap, like \$4 a bottle [ \$3/bottle in one Berkeley store], but I am going to keep drinking at least two a day, I like it that much. Plus, once you get used to the taste and texture, it's really delicious.

The brand he bought is [4]GT'S. I'll comment on this in a later post – but I'll say now that eating much more fermented food didn't have any noticeable effect on my sleep.

---

Aaron Blaisdell (2009-02-27 12:41:54)

I've noticed generally the same effects after incorporating goat-milk kefir, yogurt, and raw-milk cheeses into my daily diet. I also tend to feel less sleepy at night time. I used to feel the need to turn the light out and go to sleep by about 10:30pm and wake up at around 6:30-7:15am (I don't use an alarm clock; I just let myself naturally awaken). Since I started using the lactofermented foods, I find I don't feel sleepy enough to go to sleep until between 11-11:30pm, but I still wake up at about the same time and feel refreshed and rested (usually, since my 6-month old still sleeps in our room, I'm sometimes awakened at 2-3am by her and have difficulty falling back to sleep afterward). Let's just say that babies are NOT conducive to regular peaceful sleep!

david (2009-02-28 01:27:22)

I wonder about consuming lots of the same thing over time. I started eating yogurt (with live bacteria...White Mountain Bulgarian) and noticed improvements in my ability to digest dairy. I was eating a quart a week, perhaps too much, especially given my sensitivity to dairy. After a few months, I started developing a rash. It occurred to me that the new element in my diet was the yogurt, so I stopped and the rash started to subside. I'll give it a little longer and will probably start eating yogurt again with a little more moderation. I may also try rotating various fermented foods.

Hap (2009-02-28 17:07:25)

While I can't attest for sure to the exact cause, I do get the same "clean as a whistle" effect from, I believe, organic brown rice. Now I know how dogs feel when – after taking care of business – they scratch the dirt, then trot off all frisky-like. It seems to me that this is the way Nature intended it. She's not known for inelegant designs.

## **Interview with Leonard Mlodinow (part 15) (2009-02-27 12:33)**

ROBERTSÂ How is it possible that Cal Tech's basketball team was considered better than UCLA's basketball team in the 1950s? That was the part I was amazed at.

MLODINOW At least the early part of the decade.Â That was harder to understand than the Girl Named Florida Problem. I think in those days basketball was nothing–imagine saying that the Cal Tech curling team is better than the UCLA curling team. Since nobody really cares about curling it's just a quaint fact that someone at Cal Tech, probably in the faculty, would care about curling well enough to organize a team. Maybe I'm exaggerating a

little bit, but in the 50s I think it was a much different sport and a much different sports world. Not to belittle their team; I think they had some really good players from the looks of it and maybe Cal Tech cared more about recruiting players for sports than they do today. Maybe our world in general is a little looser about things and you could invest the time to play sports more even if you were at a high-powered place like Cal Tech; not to be as pressured-to just study. I guess it was just a different world in some ways-a nice world-back then that could happen. Now college basketball is just a huge and money generating industry that no one would allow a school like Cal Tech-by allow it I don't mean that there's some individual disallowing it but the world will not allow, it's not loose enough to allow, a school that's not completely focused on that sport to have a good team in that sport. Everything is too high-powered today.

ROBERTS Yes. Of all the things in your book, that was the most staggering.

MLODINOW You should see the movie Quantum Hoops; it's a documentary about the Cal Tech basketball team. I recommend it.

ROBERTS I didn't know there was such a movie.

MLODINOW It's on DVD; I'm thinking it must be available from NetFlix.

ROBERTS Yes, I'll get it.

MLODINOW It's very amusing-it is for me because of my connection to Cal Tech-but I think for the general public, it's a very amusing film.

ROBERTS We were talking about unexpected things. If you looked at the Cal Tech basketball team, if you just looked at basketball in the 1950s, you would think, "Well, Cal Tech-that's as it should be." But then all of the sudden, 20 years later, it's so very different.

MLODINOW I think in those days it was more like a club, like a sport, like what you think of as a kid's fun activity and now the athletes for basketball are heavily recruited and bribed in one way or another, and the huge amounts of money at stake for the school for them. It's a totally different calculus and it's sad in a way, isn't it? I think everything is like that today.

ROBERTS I guess what I'm saying is that there was something-you're in the 1950s, it's 1956-very few people saw that there was something hidden in basketball that could lead to what it became.

MLODINOW And if you were the superstar of that time you also didn't get the rewards of what became today and it's a little bit late for you now, right? I know in the bathroom in the Cal Tech cafeteria there was a framed article about him, I can't remember his name, one of the superstars of the 50s who was one of the best basketball players to ever live-I think they claim that even today-who basically probably never even made a living from it, or not a good living.

ROBERTS Yes, that kind of brings us back to the very beginning. I feel like somehow the times have changed and people are smarter. Now you can make a living from what you're doing. You're writing this very entertaining intellectual history; finally there's a market for it. Finally people are smart enough to be at your level so that you can write a book that you respect but you can get a wide enough audience.

MLODINOW Are you saying that in the 50s that couldn't have been done? I don't know.

ROBERTS Well, nobody did it; let's put it that way.

MLODINOW No, nobody did it. I don't know why.

ROBERTS As I said before we started recording, you're the first person to ever do this. Will you be the last? I don't know but you're the first. You're the first person to write intellectual histories that actually are popular and that people want to read, that they're not forced to read by their teachers. It's not just a tiny group of people reading them. Professors of course write them but they're not well written and it's just their job to write them; they get a salary from the government to write those books. You're not getting any salary. You're an entrepreneur and it's just so different. Your books have to be popular or your job goes away. It's just a different level of competence; your books are just infinitely more accessible, infinitely better than a professor would normally write. A professor is subsidized and that's what is basically comes down to. Practically everybody who writes about science is subsidized but you're not.

When the TV show The Simpson came along I would talk about IQ scores in my class and I talk about the fact that they had been rising and so forth. And I say, "Well you know there is evidence that people are getting smarter and one example is The Simpsons; this is at a higher level than other TV shows that came before it." Now maybe that's not so important, how intelligent is an animated show, but I think what you're doing is very important and I think it may be a sign of increased intelligence. There's enough of a market now for what you're doing. There wasn't before.

MLODINOW I'm certainly glad that there is and that people appreciate the way I put things.

ROBERTS I'm glad because that means you can do so much more of it.

MLODINOW Yes, and I look forward to that. It's a great privilege to be able to do that.

ROBERTS When I was a freshman at Cal Tech I was always looking for books like yours but they just didn't exist. So I ended up reading The New Yorker for my intellectual history. That was very narrow; they never did a good job of covering science. They never talked about geometry or DeMoivre, Laplace, or Gauss. They didn't cover those people. But those people are important. But you do; finally we have someone. It's great.

---

NE1 (2009-02-27 15:13:47)

These days, Caltech is the preferred moniker, to distance CIT from Cal Poly.

Stephen M (Ethesis) (2009-02-28 20:49:18)

Interesting on numbers and such. BTW, a segue back to your Taubes series ... It's "Do We Really Know What Makes Us Healthy?", by Gary Taubes, all about the problems built into epidemiological studies, and it's online at <http://crab.rutgers.edu/mbravo/prospective.pdf> . It's fourteen pages long, and worth every minute of the time it takes to read it, in my opinion. Here's one brief sample: "Smoking and lung cancer is the emblematic success story of chronic-disease epidemiology. But lung cancer was a rare disease before cigarettes became widespread, and the association between smoking and lung cancer was striking: heavy smokers had a 2,000 to 3,000 percent the risk of those who had never smoked. This

made smoking a 'turkey shoot,' says Greenland of U.C.L.A., compared with the associations epidemiologists have struggled with ever since, which fall into the tens of a percent range. The good news is that such small associations, even if causal, can be considered relatively meaningless for a single individual." Taubes devotes a lot of space, usefully, to the problem of "healthy-user bias" – the fact that people "who faithfully engage in activities that are good for them – taking a drug as prescribed, for instance, or eating what they believe is a healthy diet – are fundamentally different from those who don't." So, for example, there was the Coronary Drug Project, which found that not only did those who took their prescribed drugs faithfully cut their risk of heart-disease almost by half, this was also true of those who took their placebo faithfully. Also online is Sue Hughes' two-page summary of the Taubes article, titled "New York Times Magazine focuses on pitfalls of epidemiological trials," at <http://www.theheart.org/article/813719.do>.

Nansen (2009-03-01 14:11:47)

I'm curious about Mlodinow's teaching style, and also the popularity of his courses at Cal Tech.

Sean McCloskey (2009-08-17 08:40:23)

I remain in the camp that believes the explanation to this problem is wrong!!!! Here is my analagous problem. Imagine sex is determined by casting a die. Odd is girl, even is boy. Q: What is the probability that a pair of dice thrown will result in two odd numbers if at least one lands on an odd number? A:  $1/3$  Now imagine a 1000-sided die. Let the number 999 represent the name Florida. Q: What is the probability that a pair of dice thrown will result in two odd numbers if at least one lands on the number 999? A:  $999 / 1999$ . To see this, draw a table with  $x = 1$  to 1000 on the horizontal axis and  $y = 1$  to 1000 on the vertical axis. Now just count down the column 999 and across the row 999, and add up the outcomes representing the intersection of two odd numbers. As faces of the die are removed (representing the increasing popularity of the name), the probability slowly approaches the limit  $1/3$ . But of course, no name occurs with frequency 0.5, so any time a name is given, the probability is much closer to  $1/2$  than it is to  $1/3$ . This is where Mlodinow went wrong. He explains that the fact that Florida is a rare name is the key to this problem when in fact you get essentially the same result even with the most popular name in the U.S. Even the most popular names for children occur with a frequency of about 1 in 150 to 1 in 170 (ignoring sex). So let's say you have a 170-sided die. Even numbers represent boys, odd represent girls, and the number 169 represents the name Emma which was the most popular girls name in the U.S. in 2008. What are the odds that a family with two children has two girls, if one of their children is named Emma. (I'm ignoring the possibility of boys named Emma). The answer is  $119/339$  or very close to  $1/2$ . So the relative popularity of a particular name is somewhat irrelevant. The real reason for the dramatic difference between the two problems (the one resulting in probability  $1/3$  and the one approximating  $1/2$ ) is that the basic building blocks of the sample has changed. Instead of a sample consisting of families, when a name is given to a particular child we are now looking at a sample consisting of individual children. So the frequency of girls is always about one half, but the frequency of two-children families with girls is about  $3/4$ . When the families with two children are looked at more closely, we see that  $2/3$  have one girl and  $1/3$  have two girls, but this fact tells us something about the distribution of characteristics among families, not among girls.

Stephen Dunn (2009-10-01 18:50:57)

Mlodinow's error is in the last phrase of the sentence in the second full paragraph on p. 113: "That leaves us with just (boy, girl-F), (girl-F, boy), (girl-NF, girl-F), and (girl-F, girl-NF), which are, to a very good approximation, equally likely." In fact, the odds for (B, GF) and (GF, B) are  $1/3$  each, while the odds for (GNF,GF) and (GF, GNF) are  $1/6$  each. Let's look at it step-by-step. First, we are told that a woman is pregnant with fraternal twins. There are four equally likely outcomes: (B,B), (B,G), (G,B), and (G,G). So the odds that both twins are girls is  $1/4$ . Second, we are told that at least one of the twins is a girl. There are now three equally likely outcomes: (B,G), (G,B), and (G,G). So the odds that both twins are girls is  $1/3$ . Third, we are told that some girls are named Florida, but we don't yet know how many girls are so named. Let's assume for a moment that half of all girls are named Florida. (B,G) thus has two equally likely outcomes: (B,GF) and (B,GNF). Each is thus 50 % of  $1/3$ , or  $1/6$  likely. Similarly, (G,B) has two equally likely outcomes, (GF,B) and (GNF,B), each of which has a 50 % of  $1/3$ , or  $1/6$  chance of happening. (G,G) has four equally likely outcomes, (GF,GF), (GF,GNF), (GNF,GF), and (GNF,GNF), each of which is 25 % of  $1/3$ , or  $1/12$  likely to occur. Fourth, we are told that at least one of the twins is a girl named Florida. (B,G) can thus only be (B,GF) and has a  $1/3$  chance of being the outcome. Similarly,(G,B) can only be (GF,B), and has a  $1/3$  chance of being the outcome. (G,G) can thus only be (GF,GF), (GF,GNF), or (GNF,GF), each of which has a 33 % of  $1/3$ , or  $1/9$  chance of happening. Finally, we are told that

Florida is a very rare name, and nobody (except maybe George Foreman) is going to name both twin girls Florida. So, (G,G) can now be only (GF,GNF) or (GNF,GF) each of which has a 50 % of 1/3, or 1/6, chance of happening. The 1/3 chance that both twins are girls has not changed because of any additional information. Simple, eh?

### **Practical Philosophy and American Idol (2009-02-27 15:21)**

You've probably heard of the [1]unexpected hanging paradox in which a man is ordered to be hanged during a certain week but must not know in advance the day of his hanging. The last possible day is Saturday. He must be hanged before Saturday because if he's not hanged by then he will know that he is going to be hanged on Saturday. By the same logic he can't be hanged on Friday . . . and so on. Yet he is hung on Wednesday.

American Idol producers have a similar problem during recent eliminations: There must be suspense. From six guys and six girls one guy, one girl, and one runner-up will be selected. This week, the first person selected, out of two girls and a guy, was a girl. This meant that at the next step – one person chosen from one girl and one guy – the guy would be selected because if the girl was selected, the remaining girls would have no chance. Making the remaining portion of the program much less interesting. As an [2]EW.com commenter put it:

There was no suspense in the Kris Allen/Megan Corkey stand-off last nite. Allison had already gone through & if Megan had it would automatically eliminate the rest of the females. Wasn't going to happen halfway through the show. That's what they call a 'gimme'.

The [3]Wikipedia article on the paradox gives no practical applications.

Lost Backpacker (2009-08-14 02:23:02)

Bring it on Simon, he is so cutting sometimes but great to watch better than Paula.

### **What One Economist Has Learned From the Financial Crisis (2009-02-28 10:50)**

Three things, he said:

1. Finance professors have all been working for hedge funds. Their research has been about how to price derivatives and options. In other areas of economics, the research topics are much broader and include policy questions.
2. Macroeconomics hasn't made progress since the 1930s.

3. Recommendations what to do about the crisis, even from economics professors, are based on very little they learned in graduate school. They hardly differ from opinions. Listening to his colleagues' recommendations, he thought they would be backed up by something solid. They weren't.

Macroeconomics took a wrong turn when it accepted Keynesianism as official dogma. It is not surprising that the discipline has not made progress.

### **Will Like vs. Might Love vs. Might Hate (2009-02-28 21:54)**

What to watch? Entertainment Weekly has a feature called [1]Critical Mass: Ratings of 7 critics are averaged. Those averages are the critical response that most interests me. [2]Rotten Tomatoes also computes averages over critics. It uses a 0-100 scale. In recent months, my favorite movie was Gran Torino, which rated 80 at Rotten Tomatoes (quite good). Slumdog Millionaire, which I also liked, got a 94 (very high).

Is an average the best way to summarize several reviews? People vary a lot in their likes and dislikes – what if I'm looking for a movie I might like a lot? Then the maximum (best) review might be a better summary measure; if the maximum is high, it means that someone liked the movie a lot. A score of 94 means that almost every critic liked Slumdog Millionaire, but the more common score of 80 is ambiguous: Were most critics a bit lukewarm or was wild enthusiasm mixed with dislike? Given that we have an enormous choice of movies – especially on Rotten Tomatoes – I might want to find five movies that someone was wildly enthusiastic about and read their reviews. Movies that everyone likes (e.g., 94 rating) are rare.

Another possibility is that I'm going to the movies with several friends and I just want to make sure no one is going to hate the chosen movie. Then I'd probably want to see the minimum ratings, not the average ratings.

So: different questions, wildly different "averages". I have never heard a statistician or textbook make this point except trivially (if you want the "middle" number choose the median, a textbook might say). The possibility of "averages" wildly different from the mean or median is important because averaging is at the heart of how medical and other health treatments are evaluated. The standard evaluation method in this domain is to compare the mean of two groups – one treated, one untreated (or perhaps the two groups get two different treatments).

If there is time to administer only one treatment, then we probably do want the treatment most likely to help. But if there are many treatments available and there is time to administer more than one treatment – if the first one fails, try another, and so on – then it is not nearly so obvious that we want the treatment with the best mean score. Given big differences from person to person, we might want to know what treatments worked really well with someone. Conversely, if we are studying side effects, we might want to know which of two treatments was more likely to have extremely bad outcomes. We would certainly prefer a summary like the minimum (worst) to a summary like the median or mean.

Outside of emergency rooms, there is usually both a wide range of treatment choice and plenty of time to try more than one. For example, you want to lower your blood pressure. This is why medical experts who deride "anecdotal evidence" are like people trying to speak a language they don't know – and don't realize they don't know. (Their cluelessness is enshrined in a saying: [3]the plural of anecdote is not data.) In such situations, extreme outcomes, even if rare, become far more important than averages. You want to avoid the extremely bad (even if rare) outcomes, such as [4]antidepressants that cause suicide. And if a small fraction of people respond extremely well to a treatment that leaves most people unchanged, you want to know that, too. Non-experts grasp this, I think. This is why they are legitimately interested in anecdotal evidence, which does a better job than means or medians of highlighting extremes. It is the medical experts, who have read the textbooks but fail to understand their limitations, whose understanding has considerable room for improvement.

Igor Carron (2009-03-01 04:15:43)

Seth, What you are describing for the movies is what is known as recommender systems. They are a huge interest in the machine learning community. One of the prime example being the current netflix competition (<http://www.netflixprize.com/>) where the best minds can do better than 10 % of the original netflix: <http://www.netflixprize.com//leaderboard> A transfer into the treatment process is a very interesting idea. Igor.

Which "average" matters? It depends... « Joseph Sinatra (2009-03-01 08:21:09)

[...] Seth Roberts puts it a different way (speaking in the context of health and medical treatments). If there is time to administer only one treatment, then we probably do want the treatment most likely to help. But if there are many treatments available and there is time to administer more than one treatment "if the first one fails, try another, and so on" then it is not nearly so obvious that we want the treatment with the best mean score. Given big differences from person to person, we might want to know what treatments worked really well with someone. Conversely, if we are studying side effects, we might want to know which of two treatments was more likely to have extremely bad outcomes. We would certainly prefer a summary like the minimum (worst) to a summary like the median or mean. [...]

Vince (2009-03-01 15:33:55)

Metacritic shows you the rating for every review, in addition to the average rating. You can see, for instance, that Gran Torino (average rating 72 out of 100) didn't get any ratings over 91 from the 34 reviews, while Benjamin Button (average = 70) got seven 100's. They also have user ratings, which could be more informative than reviewer ratings, but it's harder to get a sense of their distribution because there are more of them and they aren't organized as well.

## 4.3 March

### Nose-Clipping Works (2009-03-01 09:25)

From [1]Igor Carron's blog, which is usually about [2]compressive sensing:

Since mid-December, I have lost about nineteen pounds (8.5 kg) by following some of the results of the self-experimentation of Seth Roberts, a professor at Berkeley . . . What did it take to do this ? For me, just one thing: a \$4 nose clip that I put on my nose every time I eat. That's it. No exercise. I eat what I usually eat although now in a rather lower amount (not because I am starving myself but because I feel full earlier). The weight loss was pretty steep at the beginning. Putting a nose clip has some social cost though and when I eat out with friends or through the Christmas food, I lose it. . . . I can now see abs that I had not seen for the past twenty years.

## Down With Weak Yogurt! (2009-03-01 22:28)

Many years ago, in a rowboat on a Swedish lake, I heard the following joke:

Q. Why is American beer like making love in a rowboat?

A. Because it's f-ing near water!

Having had lots of [1]homemade yogurt recently, I now feel the same way about store-bought yogurt, a pale imitation of homemade: Who are you kidding!

1. <http://www.blog.sethroberts.net/2009/02/18/the-staggering-greatness-of-homemade-yogurt/>

---

Dan (2009-03-02 08:36:54)

Seth, speaking of beer, I've been wondering, does your theory of fermentation extend to alcohol and tobacco? Do you think that the studies showing that moderate alcohol consumption is healthy are a reflection, at least in part, to ingesting the fermented grains (or grape juice)? What about fermented chewing tobacco (Skoal, Copenhagen, etc. are all fermented, as opposed to the Swedish chewing tobacco, i.e., "snus")?

Mark (2009-03-02 12:05:40)

An old joke that makes less and less sense these days! I'd say the median American beer is much more flavorful than the median English or German beer, although probably less flavorful than the median Belgian. The craft brew movement has made the USA into a wonderful place to be a beer drinker.

seth (2009-03-02 12:57:23)

Dan, yes, I think that the fermented portion of wine and beer is likely to be the portion that causes the health benefits. I don't know of any studies of the health effects of fermented chewing tobacco. Mark, yes an old joke that doesn't make much sense any more. There was a whole booth at Slow Food Nation with about a hundred American microbrews.

Dan (2009-03-03 09:05:58)

Well, you likely won't find studies on chewing tobacco. As a side note, I've read (I think it was in the WSJ a couple years back) that chewing tobacco actually is several orders of magnitude safer than smoking, and that tobacco companies are fully aware of this (they funded the studies), but that they're hamstrung by the FDA and trial lawyers from making the studies known. Basically, they can't even hint that chewing tobacco is either a safer alternative to smoking or a means to wean oneself off of cigarettes, for fear of lawsuits, despite the fact that it's far, far safer.

## Another Benefit of Fermentation: Better Extraction of Nutrients (2009-03-02 13:31)

[1]Whole Health Source says:

Healthy grain-based African cultures typically soaked, ground and fermented their grains before cooking, creating a sour porridge that's nutritionally superior to unfermented grains. . . .These traditional food

processing techniques [soaking and fermentation] have a very important effect on grains and legumes that brings them closer in line with the "paleolithic" foods our bodies are designed to digest. They reduce or eliminate toxins such as lectins and tannins, greatly reduce anti-nutrients such as phytic acid and protease inhibitors, and improve vitamin content and amino acid profile. Fermentation is particularly effective in this regard.

For me the key word is sour ("sour porridge") – another example of how our enjoyment of umami- sour- and complex-flavored foods drew us toward fermented food.

A [2]paper showing that some types of fermentation increase iron and zinc digestion.

Thanks to Justin Owings and [3]Tom.

Justin Wehr (2009-03-02 18:42:54)

Seth, I am very interested in this fermented food thing and the theories behind it. One thing I wish you would address though is the relationship of botulism to fermented food. I know nothing about it other than what's written in the wikipedia page on fermented food: Alaska, despite its small population, has witnessed a steady increase of cases of botulism since 1985. It has more cases of botulism than anywhere else in the United States of America.[9] This is caused by the traditional Eskimo practice of allowing animal products such as whole fish, fish heads, walrus, sea lion and whale flippers, beaver tails, seal oil, birds, etc., to ferment for an extended period of time before being consumed. The risk is exacerbated when a plastic container is used for this purpose instead of the old-fashioned method, a grass-lined hole, as the botulinum bacteria thrive in the anaerobic conditions created by the plastic.

seth (2009-03-02 23:28:23)

The increase in cases of botulism is obviously not due to an increase in Eskimo population or the same number of Eskimos eating more fermented food – it is an ancient practice, not a new one. It sounds like it is due to a change in how the food is fermented – old way versus new way.

"Writing poems helps brain cope with emotional turmoil, say scientists": <http://www.telegraph.co.uk/culture/culture-renews/4630043/AAAS-Writing-poems-helps-brain-cope-with-emotional-turmoil-say-scientists.html>

### **Why Self-Experimentation? (2009-03-04 08:04)**

One reason for self-experimentation is very simple: To learn about the effects of a drug you are taking. Is it helping? The medical literature is unlikely to be unbiased. Someone heavily involved in producing that literature [1] wrote anonymously in the BMJ:

I also do a lot of ghost writing. Sometimes I report good quality studies to which I am proud to contribute, albeit anonymously. Yet, too often, I write so called reviews, amounting to mere panegyrics of the discussed drugs, or I report poorly designed and implemented "epidemiologic" studies, bearing gross biases. Many of the (paid) signing authors of these papers do not read the manuscript, let alone provide feedback. I am surprised at how easily such papers are accepted by some journals and how rarely their flaws are challenged.

Given the financial interests at stake, I do not see what recommendations or regulations will put an end to such long debated [meaning long-criticized] practices.

My first self-experimentation to have unexpected results involved an acne drug. I discovered it was ineffective – might have even been making things worse. Yet it was a standard treatment for acne. My dermatologist was surprised I had bothered to collect the data. "Why did you do that?" he asked.

To do useful self-experimentation here isn't complicated. The main thing you would do would be to measure the problem before and while you take the drug. Before you take the drug, you'd want to measure the problem long enough so that you had some idea of what would happen if you didn't take the drug.

If you've done this, I'd like to hear about it.

1. [http://www.bmj.com/cgi/content/full/338/feb24\\_1/b764](http://www.bmj.com/cgi/content/full/338/feb24_1/b764)

---

Daniel Lemire (2009-03-04 14:48:04)

I was discussing self-experimentation with a colleague recently ([http://en.wikipedia.org/wiki/SÃ©bastien\\_Paquet](http://en.wikipedia.org/wiki/SÃ©bastien_Paquet)) and he told me that he wrote his thesis by self-experimentation. (His Ph.D. was in Computer Science... though it was not very typical.) His goal was to measure the impact that blogging has on a career and his research. On purpose, he became highly connected. Of course, this is contrary to the scientific method: you can't be your own object of study. Yet, it worked well enough for him. My own research (databases) is not a very good area for self-experimentation. However, for things like social networks, where researchers are currently struggling due to the lack of a convenient methodology, it could be that self-experimentation could help a lot.

### **More Benefits of Fermented Foods? (2009-03-05 00:59)**

At a regular dental checkout a few days ago, I was told my gums were in excellent shape – better than the previous checkup. The only difference between the two checkups I can think of is that now, but not then, I've been eating lots of fermented foods. My gums clearly got a lot better after I started drinking flaxseed oil (went from reddish to pinkish). Now apparently they have improved again.

After the checkup I went to Whole Foods to buy kombucha. The person behind me in the checkout line was also buying kombucha. She had learned about it from her friends. "You drink it because your friends drink it?" I asked. No, she likes how it makes her feel. It gives her more energy. "Does any other drink do that?" I asked. She pointed to the coffee she was also buying: Coffee has the same effect, she said. Since kombucha is made from tea, it certainly contains caffeine. On the other hand, I noticed an increase in energy after I started eating more fermented foods that contained no caffeine, such as stinky cheese, wine, yogurt, and kimchi.

---

Igor Carron (2009-03-05 01:48:24)

Seth, That cheese ain't stinky if you have a nose clip on :-)

John (2009-03-05 11:16:20)

I think coffee beans are fermented at some point in their life cycle too. I have no idea if they count as fermented though.

Ashish (2009-03-05 15:56:08)

1) Do you think that the flaxseed benefit to your gums was from the oil's nutritional content (and therefore might also be available from consuming ground flaxseed - a little easier to take), or from the contact of the oil directly to your gums? 2) I've heard that taking testosterone shots (as one example), helps men have "more energy." Yet we know that for most people, the long term side effects of such shots are very negative. How can/should we test for long term side effects of fermented products? E.g. too much kimchi is hard on the stomach, as you may already have noted. -ashish ps thanks for an always informative and wonderfully thought-provoking blog.

seth (2009-03-05 16:48:30)

Ashish, flaxseed oil helped my gums because omega-3 is a precursor of an anti-inflammatory signalling molecule. How can we test for long-term side effects? By looking at the health of people who eat a lot of it. E.g., long-term health of Koreans says

something about the dangers of kimchi.

Riz Din (2009-03-07 12:27:04)

I recently read this article about soy, which also includes a spot of interesting discussion about fermentation: "the Chinese discovered that soy is made edible by fermentation" as are many other foods, and not just those of plant origin. In his own brilliant essay, "Fermented Beans and Western Taste", Mintz cites Geoffrey Campbell-Platt's surprising point that "something like one-third of all the food eaten on earth today has been treated by some kind of fermentation".  
[http://entertainment.timesonline.co.uk/tol/arts\\_and\\_entertainment/the\\_tls/article5843750.ece](http://entertainment.timesonline.co.uk/tol/arts_and_entertainment/the_tls/article5843750.ece)

### **"I Started Eating More Fermented Food..." (continued) (2009-03-05 22:13)**

[1]Previously: Tucker Max found that drinking two bottles per day of kombucha for a a week had several easy-to-notice unexpected benefits.

I have some comments:

1. The best thing about these observations is how simple the change is: two bottles/day of a readily available kombucha brand. Very easy to duplicate – let's not worry about matching Tucker's weight, etc.
2. The speed with which the changes were noticed (within a week) makes the whole thing even easier to try to

duplicate.

3. Kombucha was not one of the fermented foods from which I drew my conclusions about fermented foods. Bacteria are so varied that the notion that all fermentation bacteria have somehow the same effect isn't easy to believe. But since the prediction about fermented foods (they are highly beneficial) turned out to be true maybe there is something to this.

4. My idea that we like umami tastes, sour tastes, and complex flavors so that we will eat more bacteria-laden food (which nowadays would be fermented food) is saying that we need plenty of these foods. Why else would evolution have tried so hard to make us eat them? The implication is they should be part of every diet, like Vitamin C. When someone deficient in any vitamin begins eating that vitamin, the deficiency symptoms go away very quickly, within a few weeks, usually. The changes are easy to notice. So the details of what Tucker observed - the speed and size of the improvements - support my general idea that there is a widespread deficiency here that can be easily fixed.

5. I used to make kombucha. I'm going to start again.

1. <http://www.blog.sethroberts.net/2009/02/26/i-started-eating-more-fermented-food/>

---

Darrin Thompson (2009-03-06 07:32:03)

Do you think this is true of any homemade vinegar? Admittedly I have zero experience but it strikes me as tea flavored slightly active vinegar. The tea flavor would be improved by the temporary presence of alcohol.

Justin (2009-03-06 08:26:31)

If you wouldn't mind sharing, how do you make Kombucha tea?

seth (2009-03-06 09:29:51)

you put kombucha culture in a tea-sugar mixture, leave at room temperature.

Heidi 555 (2009-03-10 14:26:18)

A Beekeeper has had an amazing experience with kombucha: "I'd been afflicted with a skin ailment since my youth. There's no know cure. Modern medicine can relieve the symptoms. But the drugs used have more long term side effects that are worse than any benefits. Well, within 24 hours, the itching associated with the irritated skin disappeared. Within three days, the slight swelling associated with the irritated skin also disappeared. Within a month, 99 % of the irritated areas disappeared. During that time, I lost joint pain that had plagued me for a decade, commercial beekeeping is rough on the back and joints. I regained full movement in my right shoulder. And a sense of wellness replaced what ever biologically stressed out condition I thought was normal. Once you're over 50, some of the things lost along the way become more apparent. Hair texture, intestinal fortitude, urinary function, energy level, and sexual prowess all decrease. And weight increases. Using kombucha, a probiotic, has reversed my losses to that of a man 10 to 15 years younger. And I've lost some weight. Before using it, I felt old. After using it, I feel alive. Using kombucha has been the most phenomenal physiological experience of my life." He also writes about using probiotics with honeybees. From: <http://www.bwrangler.com/npro.htm>

## Polyphasic Sleep (2009-03-06 23:32)

I heard about polyphasic sleep – such as sleeping 20 minutes every 3 hours – many years ago. But now I can learn about it in much more detail – and with much more suspense. [1]For example:

[Before starting] Having always been a night-owl, and never having a sleep pattern that fits with others, I feel drawn to try it. I foresee a problem in that I have always felt that I need 8 hours of sleep per day, but on the other hand I can stay up until 5 am without a problem when I am mentally engaged, so it has seemed to me for quite some time that a 28 or 29 hour day is what my system is tuned for. . . . I can feel it energizing me already.

[Day 15] Yesterday was a disaster. Sleep is a funny thing - sleep deprivation had been accumulating and I wasn't really noticing it. I was just happy to be awake and productive so many hours in a day that I ignored the weird feeling in my head, just going with it, thinking I would adjust and it would be all ok. Well yesterday morning I blew up at my SO for a ridiculous reason. . . . What went wrong? I was following all the sleep patterns pretty much to the letter.

More examples listed [2]here.

1. <http://polyphasium.blogspot.com/>
2. [http://en.wikipedia.org/wiki/Polyphasic\\_sleep](http://en.wikipedia.org/wiki/Polyphasic_sleep)

---

Justin (2009-03-07 08:32:42)

Have you seen Steve Pavlina's experiments with polyphasic sleep? There's an index of his experiment here: <http://www.stevepavlina.com/blog/2005/10/polyphasic-sleep/> Here's a comment that sums up duration/type of polyphasic sleep pursued by Pavlina from one of the last days he did it:

Just as a reminder (and for my newest readers), my default polyphasic sleeping pattern involves napping for 20 minutes roughly every 4 hours for a total of 6 naps every 24 hours. I started this sleep schedule on October 20, 2005, so I've been going for over 4 months now. It feels like it's been much longer though.

Laris Kreslins (2009-03-28 12:22:56)

Hello, Regarding "Polyphasic Sleep" you might find my new app I just made for the iPhone called SNOOZEBOT. It's a snooze button whenever you need one. Here's the link to the iTunes store if you're interested. <http://bit.ly/snoozebot> or just search the iTunes store for: Snoozebot You can basically set up various sleep sessions. The custom button can only go up to 60 minutes, but that seems to fit well for 20-30 sessions.

Aximilation (2009-06-16 11:24:48)

I have a blog documenting how polyphasic sleep fits into my lifestyle, I have done it for nearly three years, and do not view it as a short term experiment as many of the blogs on the net are about. Feel free to come by and send me a message, good luck if you decide to give it a go!

## Hey, What Happened to My Brain? (part 1) (2009-03-07 21:30)

For a few months, I've been measuring how well my brain is working using arithmetic problems. Each test session includes 100 simple problems ( $3+4$ ,  $7-0$ ,  $4*8$ ) divided into 5 blocks of 20. I type the last digit of the answer as quickly as possible. I got the idea from [1]Tim Lundeen, who got better on a similar task when he increased his DHA intake. My performance on an earlier version of this task was [2]improved by flaxseed oil.

I've blogged [3]about this. The virtues of this test include: 1. Fast. Takes only a few minutes. 2. Portable. Requires only a laptop. 3. Many possible answers (1, 2, 3, etc.). This reduces anticipation errors. 4. Many numbers (reaction times) per test. This allows me to get a measure of variability for each session and can correct for the difficulty of the problem. Aspects with room for improvement include: 1. Speed/accuracy tradeoff. Accuracy isn't fixed. Depending on how accurate I want to be, I'll go faster or slower. (I aim for 95 % correct.) 2. No complex actions. The most enjoyable games have a motor-skill aspect that this task does not.

Here's the data so far.

The big gap happened because I moved from Beijing to Berkeley. The most fascinating result, of course, is the sudden drop on February 2. Here is a close-up.

The drop was easy to notice. All of a sudden I was faster (and only slightly less accurate). The first test with better performance took place while my landlady, who lives upstairs, was practicing piano. Usually it's quiet when I test myself. My first thought was that the music had caused the improvement. But it persisted so long after the music had stopped that the music couldn't be the cause.

Part 2: I think I know what caused it. But there is a big problem with my explanation.

david (2009-03-08 00:13:53)

There's some joke to be made here involving the stereotype of the Chinese being good at math...hey, wait, didn't you say that the Chinese language made math easier and that you've been learning Chinese?

Austin (2009-03-09 01:40:14)

Haven't you failed to account for the possibility that you're getting better at this? This seems like an easily trainable exercise. People who have to do arithmetic frequently are often better at it: for instance, waiters in Germany don't use cash registers to calculate bills, and they are extremely fast, while even extremely intelligent mathematicians can be slow at common arithmetic because they don't do it frequently.

Austin (2009-03-09 01:41:18)

Note that you don't improve at all during your move, despite the fact that you were likely taking DHA still. This bolsters my hypothesis.

seth (2009-03-09 14:25:05)

The first graph shows that I had stopped improving when the sudden drop occurred.

Seth's blog » Blog Archive » Poorly Made in China (2009-07-17 10:54:17)

[...] The subtitle of Paul Midler's book is "An Insider's Account of the Tactics Behind China's Production Game." Midler is an American who helps American and European companies get stuff made in China. The book is about how, in a dozen ways, Chinese manufacturers manage to make manufacturing deals more profitable to them at the expense of their customer — and, often, the ultimate consumer. Most of the book is about what happens to an unnamed American company that imports "telephone numbers" of beauty products. One problem is "quality fade." The product slowly gets worse until the importer objects. For example, at one point the fragrance put in liquid soap was changed. Instead of different fragrances for products with different labels, almond was used in every case. So a product labeled Aloe Vera smelled of almond. (I discovered I couldn't trust flaxseed oil made in China.) [...]

## Language and Netbooks (2009-03-08 08:36)

I believe [1]language evolved because it facilitated trade. If you wanted X, being able to say "X?" made it a thousand times easier to find someone with excess X. This efficiency required prior language learning, of course. Language learning happened in the background, so to speak, then paid off in the foreground by making one of human life's biggest tasks (trading) much easier.

After reading [2]this excellent article about netbooks, I realized they're like language. All sorts of tasks become much easier for your computer if the heavy lifting is done by a server. You no longer need Word or Photoshop, for example. Just as using language to trade required prior language learning, using netbooks this way requires prior software development.

## Lie to Me (2009-03-08 21:54)

The [1]new TV show – I like it. It is based on the work of [2]Paul Ekman, a psychologist who lives in Berkeley. It is a new sort of reality show. It isn't a 50 % reality show (as most reality shows are), it is a 10 % reality show. Perhaps 10 % of the show involves discussion and illustration of actual research. You learn about it painlessly.

When I was in college, I tried to learn about stuff by finding fun-to-read books on the subject. Genetics, for example. TV was worthless. Educational TV (opera concerts, televised lectures) was dreary and ordinary TV was completely non-educational. Since then, the gap between educational TV and ordinary TV has narrowed a lot: the History Channel, the

Food Channel, the Weather Channel, not to mention Frontline, are moderately entertaining and Top Chef and Survivor are mildly educational. But it is still easy to put all these shows on one side or other of the education/entertainment divide.

Lie to Me bridges the gap. Although meant to be seen as entertaining, it's undeniably educational. I wish there was an entertaining show I could watch to learn Chinese. There isn't even an entertaining book!

PS (2009-03-08 22:15:14)

I've been in Taiwan for 11 years. I've found soap operas to be really good for learning Chinese. They mainly focus on relationship, work, money and everyday problems - lots of repetition and useful phrases and words in easy to follow narratives. Radio call in shows on personal problems are great, too. I don't know about China, but in Taiwan all TV shows have Chinese subtitles [to promote literacy and for those who speak Taiwanese better than Mandarin] - so you can also speed up your reading and train your brain to hold the unknown phrases flashed on screen long enough to note them down to look up later. As for entertaining books, well, it depends on what you find fun, but I think the dictionary at [zhongwen.com](http://zhongwen.com) would interest you - available both online and on paper.

Matt Goff (2009-03-08 23:06:52)

You might be interested in a language game called "Where are your keys?" which is purported to make it relatively easy (and fast) to gain fluency in a language. There's not much information about it currently available, but there is a podcast interview with one of the creators available here: [1]<http://www.mythic-cartography.org/2009/03/04/episode-23-where-are-your-keys-an-interview-with-evan-gardner/>

1. <http://www.mythic-cartography.org/2009/03/04/episode-23-where-are-your-keys-an-interview-with-evan-gardner/>

Tom in TX (2009-03-08 23:45:39)

The article says at the end of section 4: ===== I said, 'Look, Clinton's got this way of rolling his eyes along with a certain expression, and what it conveys is "I'm a bad boy." I don't think it's a good thing. I could teach him how not to do that in two to three hours.' ===== So it is possible to learn how to fool a face-reader? Maybe we should not take this \_too\_ seriously. Or maybe it will result in a really good episode of Lie To Me. 8-)

Oliver (2009-03-11 20:04:02)

Thanks for writing about this! I had only heard it mentioned in passing, and I dismissed it as just "another crime drama I don't have time to watch". In terms of creating effective educational/entertaining TV, the challenge, I think, is relative to the subject matter. For instance, why haven't people been able to come up with ways to entertain while educating about math. Most entertaining shows throw around jargon, mystify, or even worse, give people the false impression that they understand what's going on—enough to dismiss mathematics but not enough to appreciate it. There is the PBS show NUMB3RS, which does an okay job. Still, I hear people dismiss it seemingly it contains math.

Nancy Ciaccia (2009-04-03 21:14:02)

I've downloaded all the Lie To Me episodes and I've never had the desire to do so before now. This show rocks! The right actors were put in place perfectly – Tim Roth is fantastic and so is Kelli Williams is a favorite (I've tried to catch all her movies and TV series). Brandon Hines (I'd love to hear him sing on the show!) and Monica Raymund are believable and well chosen. But the episode on April 1st had too much drama between the main characters – the ex-wife, the argument between Ria and Eli, then there is Jillian's husband's issues (which has been a good side story but not with all the other downfalls of the characters) and then add in the main story line and all of it gets jumbled. If it proceeds like this I will not continue with what I thought would be my favorite ever series. The writers blew it on that episode or they just decided to throw everything in the scrip and it didn't fly smoothly or well.

## Hey, What Happened to My Brain? (part 2) (2009-03-09 21:54)

As I [1]blogged earlier, my arithmetic performance suddenly improved about a month ago (close-up above). How fast the change: On February 2 at 8 am I took the test; my scores were roughly the same as they had been the past month. At 2 pm the same day, I took the test again and was about 50 msec faster. (In reaction-time experiments, a surprising 50-msec effect is huge.) I remained faster for at least several weeks. Comparing the last 30 sessions before the shift to the first 30 sessions after the shift,  $t(38) = 11$ ,  $p = \text{extremely small}$ . In an experiment, comparing treatment and baseline,  $t > 3$  is very good and  $t > 4$  is extremely good.

What might have caused this?

I moved to Beijing in October. Eventually I ran out of the [2]Spectrum Organic flaxseed oil I'd brought with me and started drinking a Beijing brand called [3]Joyful Organic. When I returned to Berkeley I brought a few bottles of it with me and continued to drink it. In late January I ran out; the evening of January 29 I started drinking Spectrum Organic again. Four days later my arithmetic scores sharply improved.

It's really plausible that the improvement was due to the change in flaxseed oils. Flaxseed oil had made a difference (versus nothing) [4]with a very similar task. A few weeks before the shift, a friend had asked how I knew if my Chinese flaxseed oil was good; I'd said I'd find out when I switched back to Spectrum Organic.

But why was the improvement delayed four days? I started studying flaxseed oil because one evening I took several capsules and the next morning noticed my balance was better. And if the improvement is going to take that long, why would it happen so sharply after the delay? I can't even begin to answer these questions.

---

Aaron Blaisdell (2009-03-10 07:42:18)

Interesting observations. Perhaps when you initially noticed an effect the day after taking capsules, it was because you're body was in an omega-3 FA deficient state and the effect could be seen immediately. When you recently switched back to the Spectrum brand, your body probably wasn't in a deficient state. In fact, you may have had enough omega-3 FA in your system to prevent the rapid utilization of each daily dose. Perhaps over the course of four days after switching back to the Spectrum brand, the reserves in your body gradually increased. Just some speculation.

Todd Hargrove (2009-03-10 10:48:35)

Seth, Just curious, why flax seed oil and not fish oil. Does flax seed deliver anything that fish oil does not deliver better?

bennetta (2009-03-10 11:36:11)

I had something similar happen with flax. I experienced some pretty severe cognitive difficulties a few years ago when attempting grad school. As you can imagine, the entire episode was not pleasant, especially when my doctor told me that I had attention deficit disorder and promptly put me on stimulants. After a few months of enduring meds that didn't really do anything except dry out my mouth, give me the jitters, and stifle my creativity, I decided to consult an old friend at my former workplace, the local Whole Foods. A licensed pharmacist and practitioner of Chinese medicine, he recommended that I try flax seed oil. The problem was gone within a few days. My doctor originally attributed my condition to school. Undiagnosed folks with ADD often develop coping mechanisms that fail at a later stage in their lives, often as adults. In my case, according to my doctor, the stress of school caused my ADD to become unmanageable. To be honest, I'm not sure if I have ADD (I'm not sure I care) or if I was just Omega-3 deficient at the time. I've always had a pretty oil-heavy (the good kind) diet, but school forced me to cut some pretty severe corners out of my daily rituals. As far as the delay goes- this is going to sound kind of funny, but I think I can explain it. You know when you take a multivitamin and pee funny colors? Have you ever taken a multivitamin and not peed funny colors? I have. I remember once taking vitamin C tablets for three days and not experiencing the florescent pee. My poor body was sucking up everything it could and building up its reserves. I think something similar may be going on in your case. Side note: Interestingly, my herbalist friend also suggested that eating papaya enzymes (usually a digestive aid) specifically on an empty stomach could help. Apparently, when you eat them in this fashion, the enzymes that would normally help break down food in your stomach go to work in your bloodstream, instead. I'm not sure if they helped me, cognitively, but they did make me feel great.

mike (2009-03-10 21:24:44)

I read this a couple times, but don't understand why switching BACK to spectrum organic would cause the drop. Unless there a corresponding increase in times when you switched to the Chinese brand.

Chris (2009-03-10 21:38:18)

I'd suggest that it's independent of flax seed oil but rather a result of your move. First, the drop in reaction time coincides with roughly the same amount of time it takes to overcome jetlag. Second, the cognitive load in berkeley is probably lower than in China (no unfamiliar accents, all english, more familiar faces/surroundings). So your attention was probably seeking more stimulation/challenge in berkeley while it was satiated by all the 'new' stuff in beijing.

seth (2009-03-10 22:28:28)

Todd, why not fish oil? because the first time I took fish oil I got a headache. Flax oil has been less trouble. I'll study fish oil eventually. mike, was there "a corresponding increase in times when I switched to the Chinese brand"? I don't know because I wasn't doing this test at the time. But, as you say, my explanation predicts such an increase. bennetta, your explanation makes sense. perhaps for reasons of gravity the lower parts of my body soaked up the omega-3 first. Still it is puzzling that the very first time I took flaxseed oil - much less than what I take now - it had an immediate effect. Perhaps the brain can go quickly from zero -> some deficiency but only after the rest of the body is satisfied does it go from some deficiency -> no deficiency.

seth (2009-03-13 15:53:28)

posted for someone else: The last sentence of the previous comment (‘‘Perhaps the brain can go quickly!’’) sounds related to Bruce Ames’s triage hypothesis for the allocation of scarce micronutrients: <http://www.pnas.org/content/103/47/17589.abstract?ck=nck>

### Hey, What Happened to My Brain? (part 3) (2009-03-11 07:51)

The data I posted that showed [1] a sudden improvement in my arithmetic ability is among the most interesting data I’ve ever collected. Not because it revealed something wildly new – I was already sure flaxseed oil helped – but because it revealed something intriguing and new (the time course of the improvement is puzzling).

I collected the data in an unusual way – watchful waiting. I didn’t do an experiment, the way experimental psychology data is usually collected. I didn’t do a survey, the way epidemiological data is collected. In the emphasis on one person it resembles a case report in medical journals – but I didn’t have a problem to be solved and the data is far more numerical and systematic than the data in a case report.

And this rarely-used scientific method paid off. Hmm. I think the scientific methods currently taught have a big weakness: They focus almost entirely on idea testing, whereas idea generation is just as important. Tools that work well for idea testing work poorly for idea generation. The effect of this imbalance – a kind of nutritional deficiency in intellectual diet – is that scientists don’t do a good job of coming up with new ideas.

What should scientists be doing? I would like to find out. My watchful-waiting data collection is/was part of trying to find out. That it paid off pretty quickly is a good sign. It’s the third step in a long process. Step 1. When I was a grad student, my acne self-experimentation led me to realize that one of my prescribed medicines didn’t work – a surprising and useful new idea. Step 2: Later self-experiments had the same effect: Generated surprising and useful ideas. At a much higher rate than my conventional experiments. Why? Perhaps because it involves cheap frequent tests of something important. Step 3: Arrange such a situation – cheap frequent tests of something important – and see what happens.

1. <http://www.blog.sethroberts.net/2009/03/07/hey-what-happened-to-my-brain-part-1/>

---

Aaron Blaisdell (2009-03-11 11:27:26)

Some of my research involves understanding causal cognition in rats. The very nature of this research precludes self experimentation (unless I were a rat!). But, I find talking to people from very diverse disciplines to be very helpful in the idea generation stage of my research. I was just at the Eastern Psychological Association meeting in Pittsburgh, and visiting a group of philosophers at Carnegie Mellon University to talk about my rat work. These philosophers are causal interventionists (e.g., Peter Spirtes, David Danks, Clark Glymour), but there was also a philosopher who does rat experiments to understand exploratory behaviors. I met with these folk and we had an extremely enriching and invigorating discussion. I came back to UCLA with a bag full of new ideas with very interesting and profound (in my mind) implications. I’ve had the same reaction discussing my work with evolutionary anthropologists and ethologists (e.g., Rob Boyd, Clark Barret, Dan Fessler, and Joan Silk) at UCLA’s anthropology department. And in talking with ethologists and psychologists at UC Davis. These sources of ideas are a bit more conventional than the use of self experimentation, but still widely unpracticed by many practitioners of science who

stick close to their circle of like-minded colleagues.

Nathan Myers (2009-03-11 18:49:29)

Competent idea testing takes so much time and trouble that most of us are bubbling over with way more ideas than can ever be tested. The problem is to narrow the field to the few that are actually in our own field, and that we can afford to test, and to figure out ways to (afford to) test them. Finding ways to make such testing cheaper and quicker goes a long way to helping use up ideas. A clearinghouse for ideas each of us can't afford to test right just yet would eliminate any such shortage easily.

How do you generate new ideas? « Joseph Sinatra (2009-03-12 16:08:38)

[...] How do you generate new ideas? 13 03 2009 The always thought-provoking Seth Roberts recently posted on a puzzle he was wondering about. He hasn't quite figured out the answer yet but he did conclude a few things about science and methodology: I think the scientific methods currently taught have a big weakness: They focus almost entirely on idea testing, whereas idea generation is just as important. Tools that work well for idea testing work poorly for idea generation. The effect of this imbalance "a kind of nutritional deficiency in intellectual diet" is that scientists don't do a good job of coming up with new ideas. [...]

Michael Van Cise (2009-03-14 07:27:20)

Reading Gary Taubes, Good Calories, Bad Calories, has caused me to think about scientific research and the scientific method in new ways. Taubes spends a lot of time discussing the flaws of scientific study and how testing ideas, if the researcher is convinced he is correct, leads to misinterpreting the research. I think your point about the scientific method being terrible for idea generation is excellent. Certainly research and scientific method is important, but a way to stimulate creativity would be incredibly valuable too.

### **Antibiotic Foods? (2009-03-11 20:04)**

Just as there are probiotic foods – that encourage digestive bacteria – perhaps there are antibiotic foods that kill them off. Stacy Ashworth writes:

The flip side of the good-bacteria-stimulates-the-immune-system theory must be that bacteria-killing-foods-weaken-the-immune-system theory. Could this be why I come down with a cold within a day or so of indulging junk food cravings, food that is chock full of bacteria-killing preservatives? . . . I'm also looking at food preservatives in a new light: if they are added to food to kill bacteria to keep the food fresher, then I suppose it stands to reason that they are also going to kill off some of the immune-system enhancing bacteria in my body.

Do some popular foods kill a significant amount of internal bacteria? I don't know.

I'm sure you need to eat lots of bacteria to stimulate your immune system; the ones already in your body are not recognized as new. New bacteria must come from outside. Then the problem with preservatives is not that they kill bacteria in our bodies but that they have made the preserved food unusually low in bacteria.

Chris (2009-03-12 01:07:30)

Then there's stuff like garlic....it's shown to be an antioibotic in a test tube and widely claimed to be a natural antibiotic/antiviral. Health gurus encourage taking it raw at the first sign of illness. Preservatives are also generally equal to antioxidants. Spoilage=oxidation for many foods/fats. Lots of vitamins are added to serve as a preservative cause of the antioxidant value. If antioxidants are really good for health then....this becomes a complex question. Of course, recent studies say that high doses of vitamin E and other antioxidants actually hurt survival.

SB (2009-03-12 06:36:16)

Turmeric is supposed to be a potent antibiotic, and is commonly used in Indian dishes, especially those with meat. <http://www.oller.net/turmeric.htm> So why does turmeric pickle? [http://www.associatedcontent.com/article/66548/pickling\\_can\\_be\\_a\\_great\\_way\\_to\\_preserve.html](http://www.associatedcontent.com/article/66548/pickling_can_be_a_great_way_to_preserve.html)

seth (2009-03-12 07:24:48)

Chris, that's a good point.

Austism (2009-03-12 14:46:02)

I'm currently looking into using gum that uses Xylitol as a sweetener. It's supposed to reduce cavities and prevent ear infections. They say it has something to do with it preventing bacteria from latching on and growing in the mouth.

Melissa (2009-03-13 02:57:45)

Re:Chris, I remember reading in a book that the preservatives in cereals were tied to decreases in stomach cancer in the U.S. But at the same time Americans started eating mass-produced breakfast cereal, we stopped eating so much salted meat. I think salt is a major issue with fermented foods. Koreans eat tons of fermented foods and have high stomach cancer rates, probably because of the salt. which leads back to the original subject of this post: it's interesting that Koreans pickle with tons of spices that are thought to kill bacteria.

Janice (2009-04-08 09:07:15)

@ Autism. I thought I would offer that I have been chewing a nicotine gum for four months now (can't seem to get off it) that uses Xylitol as a sweetener. I've filled 2 new cavities since I quit smoking. I'm just saying, for what it's worth :)

Edison (2009-09-23 18:08:42)

You shouldn't think of bacteria as stimulating the immune system. Where your body senses bacteria, it attempts to kill it, or has learned to ignore it - it's just a very difficult thing to do within the digestive tract. The bacteria there are symbiotic simply because they eat what we eat (as 60 % of our fecal matter tends to be dead bacteria) and prevent more harmful but slow-replicating bacteria (i.e. yeasts) from spreading in their place. Most of our bodies have learned to ignore those bacteria, and the whole 'probiotic' craze really has more to do with increasing bacteria, which increase stinky digestive gases like methane, which displace free-radical gases (think Oxygen) that cause genetic damage when left to their whims. Eating antibiotic foods is actually helpful with sufferers of Irritable Bowel Syndrome, various forms of arthritis - especially rheumatoid and Ankylosing Spondilitis, those with Celiac disease, and possibly other autoimmune diseases simply because it kills off bacteria that certain individuals' immune systems - with certain genetic predispositions - overreact to, like allergens. I mentioned those diseases because they are all related to bacteria such as Klebsiella, which when killed the body has less to react to. What kills the bacteria? Starvation - avoiding ingestion of glutens and starches reduces these bacteria's numbers, leading to prolonged reduction of symptoms in people with IBS and AS. Just google "IBS diet". Eating probiotics to displace free radicals is not as proactive a means at preventing cancer as consistently ingesting vitamin/phytochemical-antioxidants that make the free radicals disappear and serve your cells in the mean time. "Fish oil/flax seed/fish + antioxidants/phytochemicals from vegetables/fruits + starch-free/gluten-free/lactose-free/low-salt/low-sugar" as a generalization is a fairly similar diet to the people of the Ryukyu islands - those with the longest average life expectancy on earth, albeit they ate many sweet potatoes.

Trinity James (2010-06-16 23:51:57)  
free radicals are dangerous because they can cause cancer.’,

### **Great Moments in Magazine Journalism (2009-03-12 19:02)**

In his Entertainment Weekly [1]TV Watch synopsis of Tuesday's American Idol, Michael Slezak wrote:

Can we all raise our lighters in unison for the most convincing rocker chick to ever grace the Idol stage? Yes, it's Allison Iraheta, who took "Give in to Me," a completely obscure album track from Jackson's Dangerous album and delivered it with such passion and confidence, I felt like I should call Ticketmaster and let them retroactively charge my credit card a couple hundred bucks just for the privilege of hearing her.

That's a critique. Which I agree with. I can't imagine reading something like this in print – it's too heartfelt about something too small – but online, it is possible.

1. [http://www.ew.com/ew/article/0,,20007164\\_20171835\\_20264813,00.html?xid=rss-feed-tvwatch-%27American+Idol%27+recap%3A+This+is+thriller+night!](http://www.ew.com/ew/article/0,,20007164_20171835_20264813,00.html?xid=rss-feed-tvwatch-%27American+Idol%27+recap%3A+This+is+thriller+night!)

---

Andrew Gelman (2009-03-13 20:41:51)

Try reading some old Joe Queenan stuff. His magazine articles (turned into books) have zillions of bits that are much better than this.

### **Oral Health, Heart Disease, and Fermented Foods (2009-03-12 22:24)**

From the abstract of a [1]2007 paper about oral health and heart disease:

The high prevalence of cardiovascular diseases (CVD) and infections of the mouth has led to the hypothesis that these disease entities [are] connected. Oral biofilms contain numerous micro-organisms with more than 700 identified species. . . . These micro-organisms cause dental caries and periodontal disease of which the majority of humans suffer during their life. Oral bacteria are presumed to gain access to the blood circulation and are postulated to trigger systemic reactions by up-regulating a variety of cytokines and inflammatory mediators. Infection and inflammation play a role also in atherogenesis. Furthermore, traces of oral micro-organisms, such as the gram-negative anaerobic bacterium *Porphyromonas gingivalis*, have been detected in atheroma plaques. This bacterium seems to be potentially atherogenic in animal models. Epidemiologic data have shown a statistical association between periodontal disease and coronary heart disease and stroke. In a meta-analysis, the odds ratio increase for CVD in persons with periodontal disease was almost 20 %. Poor oral health also seems to be associated with all-cause mortality.

Emphasis added. As I [2]blogged earlier, during my last trip to the dentist I was told my gums were in great shape, better than the previous visit – and the only intentional change since the previous visit was a huge increase (a factor of 50?) in how much fermented food I eat. So perhaps fermented foods improve oral health. A reason to suspect that fermented foods reduce heart disease is that Eskimos, with very low rates of heart disease, eat lots of fermented food. If both these ideas are true – fermented foods improve gum health and reduce heart disease – it would explain the observed correlation between gum disease and heart disease.

A vast number of people believe that sugar and refined flour are bad for us. In large amounts, sure, because they cause so much dysregulation (e.g., high blood sugar) and in ditto foods cause obesity. But what about average amounts? Here I'm not so sure. The shift to a diet high in sugar and refined flours has usually happened at the same time as a shift away from traditional diets. In other words, the increase in sugar and flour wasn't the only change. I suspect there was usually a great reduction in fermented foods at the same time. Maybe the reduction in fermented foods caused the trouble rather than the increase in sugar and flour. The reduction in fermented foods is almost always ignored - for example, by Weston Price and John Yudkin (author of *Sweet and Dangerous*).

[3]Probiotics and oral health. [4]An experiment about probiotics and oral health.

James (2009-03-12 23:39:46)

ISTR a study linking poor oral health and some problem during pregnancy. Wine and beer are both fermented, do they have any benefit or does the fact the fermentation kills the bacteria negate it?

Riz Din (2009-03-13 06:11:00)

Hi Seth, your comment about shifting diet patterns potentially obscuring the effects of a high sugar/refined carb diet reminds me of the basic *ceteris paribus* assumption in economics, which means 'all other things being equal', or which I define as a 'an impossibly fantastical state of affairs that can never exist in reality'. Going back to the refined sugars/carbs story, I guess this is something that can and has been tested in experiments but in terms of public understanding the risk must surely be skewed toward a potential over emphasis of this factor in negative health outcomes and obesity, simply because of the potential for a spurious correlation.

Justin (2009-03-13 06:42:35)

I saw a potentially relevant article on saliva and bacteria in CNN recently: <http://www.cnn.com/2009/HEALTH/03/03/saliva.spit.survey/index.html?iref=mpstoryview> A quote:

Since people have different eating habits in different places, you might think an American's saliva might look a lot different from, say, a South African's. But a new study published in the journal *Genome Research* finds that bacteria in saliva may not be as related to environment and diet as you might think. In fact, researchers found that the human salivary microbiome – that is, the community of bacteria in saliva – does not vary greatly between different geographic locations. That means your saliva is just as different from your neighbor's as someone's on the other side of the planet. ... Americans in particular have a lot of amylase in their saliva because their diets are full of starch: chips, rice and baked potatoes. But the Pygmies of central Africa, for example, eat mostly game

animals, honey and fruit. They have relatively little amylase in their saliva. Dominy and colleagues found these differences at the genetic level, meaning natural selection has favored large quantities of amylase in populations with starchy diets. But there is also evidence that amylase levels can rise and fall within an individual's lifetime. A study on college students in Ghana, who typically eat a lot of meat at the university, found that students who had grown up eating traditional starchy Ghanaian home-cooked meals had lower levels of amylase after attending the school.

Aaron Blaisdell (2009-03-13 10:58:38)

I wonder if using antiseptic mouthwash (e.g., Listerine TM) reduces the effects of probiotics on oral health.

Riz Din (2009-03-13 11:20:11)

Re the kombucha, there's an interesting article on the drink over at the Economist's sister magazine, Intelligent Life: <http://www.moreintelligentlife.com/story/kombucha-diy-elixir-life>

Peter Andrews (2009-04-09 13:49:18)

Many fermented foods are high in vitamin K2. I wouldn't be surprised if that would effect periodontal health.

## Umami Burger (2009-03-13 20:17)

A new restaurant with the excellent name Umami Burger has just opened in Los Angeles. According to [1]The Foodinista, the food is as good as the name:

An attractive space with an attractive clientele. The tightly edited menu consists of 10 burgers, and a few sides including fries and a market salad. But, weâ€™re told at 12:45 pm on a Tuesday afternoon, theyâ€™ve run out of buns. . . . amazing homemade ketchup . . . TheÂ beef patties on all of the above, really flavorful and just plain GOOD. I donâ€™t know how they can make such a great burger and charge so little. . . . Iâ€™m telling you, the burgers are great.

[2]Review by Jonathan Gold.

Thanks to Tucker Max.

1. <http://thefoodinista.wordpress.com/2009/02/17/first-bite-umami-burger/>

2. <http://www.laweekly.com/2009-03-12/eat-drink/the-fifth-element>

Aaron Blaisdell (2009-03-15 20:50:24)

I LOVE burgers. And this place isn't too far from my home, probably a 15-20 min drive. I'll definitely try it in the near future. Seth, if you are going to be in LA in the near future let me know and we can venture there together. It seems like a good place to celebrate our paper going into press.

Patrik (2009-03-17 22:39:33)

If you haven't already, get a Father's Office burger (Santa Monica and Culver City). Very high in umami cuz they use dry-aged beef. That burger will change your life. BTW that is the original burger copied by wannabe gastro-pubs all over Southern California and beyond.

Aaron Blaisdell (2009-03-18 08:30:57)

Man, I LOVE Father's Office for both the burgers and the brew! Umami and fermented beverage at the same joint! I just wish they were open for lunch more days a week (currently only Friday and Saturday I think).

Michael (2009-10-30 15:43:01)

Father's Office burger owns Umami burger. Umami is good and has a nice variety, but none of em are as good as the classic Fathers Office Burger. Plus, they serve beer.

## Bees and Fermented Foods (2009-03-14 11:18)

I became interested in fermented foods less than two months ago but I'm sure I'll be eating plenty of them for the rest of my life. The benefits have been very clear and – not that it matters – the intellectual case is strong. Being new to it, I have wondered how my ideas and habits might evolve.

I got a glimpse of a possible future from a [1]comment on this blog by Heidi. She linked to a page about [2]kombucha and probiotics and bee-keeping and later sent me a link to a [3]discussion of using probiotics to keep bees healthy. A discussant named Tim Hall said this:

I once scratched open my index finger, and somehow caught an MRSA [Methicillin-resistant Staphylococcus aureus] infection so bad I was in the hospital for a week. This incident completely changed my perspective on chemical culture. Now not a day goes by that I don't ingest some form of live cultured food...most of it I culture myself.

I make kefir on a daily basis. Kombucha I have not tried since I avoid caffeine. I also make my own sauerkraut, kimchi, koji, miso and koji pickles (and of course mead).

Hmm. I have never made kefir, but it's not hard to make. I hadn't even heard of [4]koji, which is a kind of fermented rice.

---

Tom Moertel (2009-03-15 13:25:41)

I started making kefir about two weeks ago, and I can confirm that it's easy to make. Drop a few tablespoons of kefir "grains" into a clean jar, add a quart of milk, and let it rest at room temperature. The next day, strain out the grains, and you've got a quart of kefir. That's it. I can also tell you that kefir tastes great. Think buttermilk but with a more complex range of bacterial-culture flavors and a hint of fresh-baked bread in the finish. There's also a faint effervescence and, if you hunt for it, a subtle alcohol bite. It's marvelous stuff. If kefir is what "probiotics" taste like, I don't think I'm going to have any trouble getting my recommended daily allowance. ;-)

seth (2009-03-15 16:12:58)

Tom, very interesting. Thanks for the detailed directions. Where did you get the kefir "grains"?

Aaron Blaisdell (2009-03-15 20:48:52)

I've been buying a goat-milk kefir made by Redwood Hill Farm (in California) sold at Whole Foods for the past couple of months. It's great tangy stuff and has done wonders for my GI system, but at \$6.99 per quart I'm ready to start making my own (starting from raw cow's milk). I already have the quart-sized mason jar but need to kefir grains. So, I second Seth's question: "where did you get the kefir grains?". Also, do you seal the jar while it's fermenting or should it be open to the air?

bennetta (2009-03-16 12:03:33)

My roommate, who suffers from moderate to severe stomach ulcers, heart burn, and other digestive problems had a serious kefir habit. It apparently did wonders for his numerous digestive issues. He claimed it coated his stomach, soothing his ulcers and heart burn while taming his overzealous stomach acids. Unfortunately, it also did wonders to his waist line and he stopped after gaining 10 lbs in two weeks from the stuff. Kefir's great, but also very high in calories, usually much higher than yogurt. One rather small serving can have something like 300 calories. Anyway, proceed with caution!

Aaron Blaisdell (2009-03-16 17:16:47)

Interesting. Since switching to eating a lot more milk products, particularly raw milk, raw-milk cheese, kefir, and yogurt, my weight hasn't changed by my waistline has decreased by one belt-notch. Of course, the increase in consumption of these items corresponded with a decrease in the consumption of grains (bread, pasta, rice, chips, etc.) which may explain the drop in waist circumference.

## **Where Does Umami Come From? (2009-03-15 23:24)**

As [1]previously blogged, the evolutionary reason we like umami taste may be so that we'll eat more bacteria-laden food. This makes sense only if bacteria-laden food would have been the main source of umami. Nowadays, you can get umami from MSG. What about before MSG?

The [2]Umami Information Center sent me a free booklet called Umami The World – a better title than Umami: An Introduction. Umami taste is mainly supplied by glutamic acid, a protein building block. My assumption was that glutamic acid is usually a protein breakdown product. Bacteria feed on protein, leaving a pile of bricks – glutamic acid among them. Was this correct? Or could you get umami taste without bacteria?

You can, but in most cases you don't. In Japanese cooking, a potent source of umami is [3]konbu, a type of seaweed. Perhaps because konbu produces so much umami and so little else that umami was discovered by a Japanese scientist. Umami flavorings are used in many other cuisines but the source is usually fermented food. In many Asian countries, umami comes from fermented fish sauce and fermented bean products (e.g., miso, soy sauce). In Chinese cooking, umami comes from a condiment called jiang, which is made from fermented grain, meat, or fish. In Western cuisines,

cured pork is often used as a flavoring agent. "The curing process liberates more of the glutamic acid content of the meat." Curing takes place at room temperature, which means bacteria grow. "Much of the food of ancient Rome was routinely seasoned with a sauce [that] was made from salted fish, fermented and strained. . . The polar Eskimo people traditionally fermented a small portion of their harvest of fish." Tomatoes and shitake mushrooms are non-fermented sources of umami.

A telling comment in the book is that umami usually comes from sauces (e.g., fish sauce) or liquids (e.g., dashi, bouillon). Cooks use sauces and liquids to add what is missing. The presence of umami in so many sauces – as if sauces have been devised or selected to be high in umami – suggests that ordinary foods don't have much umami. A table of glutamate concentration says that parmesan cheese has 1700 mg/100 g whereas several vegetables – tomatoes (246 mg/100 g), green pea (106), onion (51), spinach (48), potato (10) – and meats – beef (10), chicken (22), pork (9) – have much less.

The breakdown process I imagined is spelled out: "During the ripening of cheese, proteins are broken down progressively into smaller polypeptides and individual amino acids. Large increases in free amino acid content also occur during the curing of ham." Surely the same will be true during room temperature aging of any protein source. Beef is routinely aged at room temperature for about a week to give it a "meaty" flavor (not from the umami book but from [4]here).

Jill (2009-03-16 08:21:48)

The chapter on Escoffier in Jonah Lehrer's *Proust Was a Neuroscientist* also deals with umami, although not with a specific focus on fermented food.

### **Ode to Trader Joe's: Update (2009-03-17 10:47)**

A month ago, as I [1]blogged, my friend [2]Carl Willat posted on YouTube a video he'd made titled "[3]If I Made A Commercial For Trader Joe's". It has now received several hundred thousand views. I asked Carl for an update. He replied:

This video has received a better reaction than anything I've done in quite a long time. Of course part of this is just YouTube, where suddenly you can know what people think of your commercial, through the comments they leave and how many views you get. In the past commercials were just sent out into the ether and you never really heard any firsthand audience reaction. But some of my old commercials are on YouTube and none of them has this many hits. Even [4]Christmas Kisses, which people really seem to like, has maybe 28,000 views in two years. And people aren't posting it to their blogs or Facebook

pages, as far as I know. Â So something is different about this one. Â To a large extent it's trading on the goodwill people already have for Trader Joe's. Â People just love that store. Â And the spot is subversive, which makes it more fun. Â But I think the main difference is the fact that it's heartfelt, in that it reflects my actual feelings about Trader Joe's, both positive and negative, and a lot of people can relate to those feelings. Â You can't do that in a real ad because there's an agency and a client that only want to say positive things about the product, and it has to be part of their overall strategy and so forth, which is fine, and I've certainly done my share of ads like that. But it's hard to get genuine human feeling into traditional advertising, which is a shame, human feeling being the only thing people really care about.

The viewing history:

The spike happened after [5]mention on Boing Boing.

I think Carl's commercial is very important as a glimpse of the future. Long ago, only the powerful could speak to a mass audience – and they couldn't tell the truth, for fear of losing their power. Then cheap books came along. Instantly a much larger group of people could speak to a mass audience – and, having little to lose, they could tell the truth. The truth, being rare, was an advantage. When science was young and many scientists were amateurs – Darwin, Mendel – they could tell the truth. As science became a job, a source of income and status that you could lose, scientists lost the ability to say what they really thought. For example, [6]David Healy lost a job because he told the truth about anti-depressants. Self-experimentation is a way around this problem because, [7]as I've said, no matter how crazy my conclusions I can keep doing it. I don't need a grant so I don't need to worry about offending grant givers.

Because TV commercials are a source of money and status (for ad agencies and marketing execs), they too have great difficulty being truthful. After watching Carl's commercial I watched a [8]Coke commercial that used the same music. The Coke commercial now struck me as horrible – flat and insincere. (Yet expensive.) Given the choice between an official statement – namely, the commercials you see on TV – and a personal one – a commercial like Carl's – everyone will not only prefer to watch the personal statement but will also be more persuaded by it. Win-win. So it is in the self-interest of any company that makes a product that somebody loves to stop making the usual insincere stuff and start finding people who love their products and help them express it.

Nathan Myers (2009-03-17 15:35:10)

I discovered why TJ's always drops the products you like best. If something spends much of its time out of stock, sometimes just because it's popular, then to TJ management that counts as poor sales, and they drop it. Sometimes, as with the pomegranate/cherry juice they dropped last year, they sell product X coupled with less popular products Y and Z (e.g. pomegranate/cranberry and pomegranate/blueberry juice). X sells out in a week, and a month later they order more X/Y/Z, but X never sells more than Y. I think TJ doesn't remedy this sort of thing because they have a policy of turning over their selection by 20 % per year, and anything that generates sales disparities makes it easier to choose victims. "Airborne" cold prevention pills, featured in the ad, remain a fraud. TJ's toilet paper rolls, by the way, recently got 7 % narrower without changing price.

## Uncharitable (2009-03-18 21:26)

[1]Uncharitable: How Restraints on Nonprofits Undermine Their Potential by Dan Pallotta is more a howl than a book. I enjoyed opening it at random, reading a few pages, agreeing with the author that the current situation is idiotic, and then going back to whatever I was doing. It is too repetitive to read sequentially but read in bits it makes a lot of sense. His big point is that nonprofits are forced to operate under weird moralistic constraints that do no one any good – and I'm sure he's right. The main benefit of those moralistic constraints – no one must profit from charity! for example – is that the moralizers feel good. The charities are badly damaged. And the charities are self-destructive, too. After Pallotta's company ran highly successful 3-day Breast Cancer walks for several years, the Avon Products Foundation, which benefited from these walks, decided they could do better themselves. After a year (2002) in which Pallott's company raised \$140 million, Avon themselves ran a similar event for four years (2003-2006) during which they raised about \$60 million/year.

1. <http://www.uncharitable.net/>

---

ChristianK (2009-03-19 07:24:23)

Without any constraints Walmart would probably register itself as charity as a way to pay less taxes. You need to write a law in a way to prevent companies like Walmart to register themselves as charity to get the benefits that charities get without providing the good. If an charity doesn't want to operate under the rules for charities it can register as LLC. Now the law makers think that not every organization has to be a LLC and gives organization that don't want to make profits some benefits while structuring the system in a way that the average LLC doesn't get those benefits. Organizations like Walmart pay lawyers to find every loophole in the rules that allow them to maximize the benefits that they get. Do you want to create rules after which government officials decide on a case by case basis whether the company provides enough good to be a charity? Does Google provide enough good? Maybe a charity provides good in a way that government officials don't understand? Maybe they practice political speech contrary to the governments interests? Writing good laws is hard. How would you write the

laws? Would you simply remove the distinction between LLC and nonprofit?

NE1 (2009-03-21 16:04:34)

There are a lot of interesting people out there whose views about Aid I don't quite grok yet. Surely I don't understand non-profits too, but I know I have some pretty strong views about reform for a certain number of them. What is not clear from this post or the first couple on uncharitable.net is the numbers. If Pallot's company raised \$140M in one year, and Avon raised \$40 x 4, then a) is this a worse outcome (I suspect this is an easy yes) and b) how much did Avon get from Pallot's company? My worry is for the deadweight loss of the marketing company (absent any other abstract benefit like publicizing an issue) subtracts from other charities. I'm sure this is a typical concern addressed in the book.

### **The Singapore Borders and the Power of Books (2009-03-19 15:37)**

Around 1996, Borders opened a bookstore in Singapore. With about 50,000 books, it was much larger than any existing bookstore on the island. Freight cost about \$1/book, a big improvement over the shipping costs if you bought a book online. Singapore, of course, is a very crowded place. Space was precious. You couldn't own a lot of books because you didn't have much space. One result was books were sold shrink-wrapped. The Borders books, however, were not shrink-wrapped. A great bookstore is like a great library – but only if the books aren't shrink-wrapped. The first customers in the Singapore Borders would bring a book to the front desk and ask for the shrink-wrapped copy. But there was no shrink-wrapped copy.

Singapore newspapers started editorializing about how to behave in the new bookstore: Careful with the books. Handle them gently. They were trying to acclimate their readers to non-shrink-wrapped books. Why did editorial writers throw their weight behind a new business? Bruce Quinnell, the head of Borders at the time, thinks it is because they thought the new bookstore was such a wonderful thing. Thousands and thousands of books that had never before been on that island. Books are a commercial product but no other commercial product would inspire such a response.

The Singapore Borders was a huge success, at one point leading the entire chain in sales, and as far as I know is still thriving.

---

Perry (2009-06-04 22:55:09)

Borders is in trouble. Sold its Singapore operations to some Australian business. Nowadays Singaporeans go Amazon to buy books online or via OpenTrolley Bookstore. <http://www.amazon.com> <http://opentrolley.com.sg>

### **Bill of Attainder (2009-03-19 16:19)**

From [1]the AP:

Denouncing a "squandering of the people's money," lawmakers voted decisively Thursday to impose a 90 percent tax on millions of dollars in employee bonuses paid by troubled insurance giant AIG and other bailed-out companies.

Excuse me? Doesn't the Constitution [2]outlaw this?

1. <http://finance.yahoo.com/news/House-passes-bill-taxing-AIG-apf-14693850.html>

2. [http://en.wikipedia.org/wiki/Bill\\_of\\_attainder](http://en.wikipedia.org/wiki/Bill_of_attainder)

---

Ed (2009-03-19 17:03:07)

Seth, the constitution hasn't been worth the parchment it's printed on since 2000.... I feel sorry for all of those poor fools that though the new administration would change that.

David Lynch (2009-03-19 18:27:41)

I saw some discussion of this a few days ago. From the article you linked: "The bill would impose a 90 percent tax on bonuses given to employees with family incomes above \$250,000 at American International Group and other companies that have received at least \$5 billion in government bailout money. It would apply to any such bonuses issued since Dec. 31." So, they're just taxing bonuses at any company who received a certain threshold of bailout money, not just AIG. The supreme court has previously been okay with new taxes created after the financial year in question. A bill of attainder is a bill that declares someone guilty of a crime and punishes them, all without a trial. So a law declaring everyone who received a bonus guilty of fraud and confiscating the money? Unconstitutional. This approach? Fine. It's a silly legal system, but it's the one we've

got. And I can't feel too bad about the outcome. I'm not terribly sympathetic towards investment banking executives whose companies had to be massively bailed out because they ran it into the ground.

tfl: The Flatiron Life » Blog Archive » Bill of Attainder (2009-03-19 18:39:01)  
[...] I was going to write this exact post, but Dr. Seth Roberts beat me to it. [...]

David Lynch (2009-03-19 18:54:49)  
There's a nice bit of [1]analysis by Laurence Tribe, a law professor.

1. [http://politics.theatlantic.com/2009/03/laurence\\_tribe\\_is\\_taxing\\_aig\\_legal.php](http://politics.theatlantic.com/2009/03/laurence_tribe_is_taxing_aig_legal.php)

peter (2009-03-19 21:04:52)  
it's not a bill of attainder; the power to tax is the power to destroy. (altho there may be some other Constitutional provision re taxes that prevents this )

Tom in TX (2009-03-20 05:16:50)  
It is also an ex post facto law. And an interference with contracts. The comments from Laurence Tribe are interesting, and he is a well-known legal scholar. But I think his comments illustrate one of the big problems we have in the USA. The lawyer looks at the Constitution and says, How can I get around this? Very few people think of the Constitution as being something that contains wisdom and guidance. There are some very good reasons that a government should not be allowed to pass a law punishing a person without due process (bill of attainder), or making an act a crime after the fact (ex post facto), or interfering with contracts between individuals. Of course they start by aiming the law at people for whom we don't have a lot of sympathy. When they come after you, the precedent will have already been set.

bennetta (2009-03-20 10:14:00)  
It's legal. The government does this sort of thing all the time with income taxes. For example, in 2008, many of us received "stimulus" checks. Technically, this was a reduction of the amount the government was to collect from our paychecks the year before. This can go either way. Just as the government can refund us part of the money we owed in 2007 in 2008, they can penalize us in 2009 on our 2009 and 2008 taxes, as is the case here.

Joe (2009-03-20 15:22:37)  
Ed's got the basic idea right but the dates wrong. The Constitution's been ignored for much longer than that. 90 years ago people realized that it would take a Constitutional Amendment to ban one intoxicant but just a few years later decided that one was no longer necessary to ban others.

SB (2009-03-20 17:20:40)

Tom in TX (2009-03-24 13:47:12)  
And Laurence Tribe is having second thoughts: <http://theplumline.whorunsgov.com/economy/law-professor-who-advised-obama-say-s-house-aig-bill-may-be-unconstitutional/>

Michael Van Cise (2009-03-24 20:30:22)  
I certainly defer to whatever professor Tribe has to say on the topic, but as I understand things, the Constitution merely prohibits voiding contracts. (Bills of Attainder actually deal with criminal acts - not civil/financial matters) The contract clause

is closer to what's going on here [http://en.wikipedia.org/wiki/Contract\\_Clause](http://en.wikipedia.org/wiki/Contract_Clause). But, taxing someone on their earnings in no way interferes with the contract itself, so I would argue that what Congress did was entirely constitutional.

The Shangri-La Diet in Japan (2009-03-21 05:49)

To my shock and pleasure, the Japanese translation of The Shangri-La Diet is [1] #2 on Amazon Japan – at least, a few seconds ago. Yesterday a Japanese TV show ran an hour-long segment about it.

Thanks to Gen Taguchi, who not only told me about this but recommended the book to a Japanese publisher and oversaw the translation.

1. [http://www.amazon.co.jp/%E3%82%B7%E3%83%A3%E3%83%B3%E3%82%B0%E3%83%AA%E3%83%A9%E3%83%BB%E3%83%80%E3%82%A4%E3%82%A8%E3%83%83%E3%83%88~%E5%85%A8%E7%B1%B3%E3%83%99%E3%82%B9%E3%83%88%E3%82%BB%E3%83%A9%E3%83%BC~%E3%80%8C%E9%A3%9F%E4%BA%8B%E5%88%B6%E9%99%90%E3%80%8D%E3%81%AA%E3%81%97~%E3%80%8C%E9%81%8B%E5%8B%95%E3%80%8D%E3%81%A%E3%81%97~%E3%81%AE%E9%AD%94%E6%B3%95%E3%81%AE%E3%83%80%E3%82%A4%E3%82%A8%E3%83%83%E3%83%88~%E3%82%BB%E3%82%B9%E3%83%BB%E3%83%AD%E3%83%90%E3%83%BC%E3%83%84/dp/4894513056/ref=sr\\_1\\_1?ie=UTF8&s=books&qid=1237638393&sr=8-1](http://www.amazon.co.jp/%E3%82%B7%E3%83%A3%E3%83%B3%E3%82%B0%E3%83%AA%E3%83%A9%E3%83%BB%E3%83%80%E3%82%A4%E3%82%A8%E3%83%83%E3%83%88~%E5%85%A8%E7%B1%B3%E3%83%99%E3%82%B9%E3%83%88%E3%82%BB%E3%83%A9%E3%83%BC~%E3%80%8C%E9%A3%9F%E4%BA%8B%E5%88%B6%E9%99%90%E3%80%8D%E3%81%AA%E3%81%97~%E3%80%8C%E9%81%8B%E5%8B%95%E3%80%8D%E3%81%A%E3%81%97~%E3%81%AE%E9%AD%94%E6%B3%95%E3%81%AE%E3%83%80%E3%82%A4%E3%82%A8%E3%83%83%E3%83%88~%E3%82%BB%E3%82%B9%E3%83%BB%E3%83%AD%E3%83%90%E3%83%BC%E3%83%84/dp/4894513056/ref=sr_1_1?ie=UTF8&s=books&qid=1237638393&sr=8-1)

---

Tom in TX (2009-03-21 10:39:58)

The cover looks a lot more enthusiastic than the English edition. 8-) Can someone translate it for us?

Timothy Beneke (2009-03-21 11:34:23)

Cool! And somehow intuitive...

Sheila Buff (2009-03-22 11:49:14)

Hi Seth- Congrats on the Japanese edition! Tom's description of the cover as enthusiastic is perfect. Looks like you'll now be able to say you're an international best-selling author. Sheila

Chris (2009-03-23 02:43:15)

Here's a rough translation of the bigger text...my reading sucks but here's something: New York Times Bestseller! Once a day is even ok! Can be done wherever you are! The Shangri-La Diet A combination of head and heart Seth Roberts (other names) On the insert below: -All the blogs endorse it -No food rules -No need to struggle with it -No rebound! Dessert, dinner, lunch, it's all okay.

## No Way Out (2009-03-21 06:42)

From my obsessions. In an airport restaurant, I noticed the free condiments. Mustard, ketchup, sweet relish: all three sour, complex. We are a [1]nation of ice-chewers.

## Bacteria and Learning? (2009-03-22 07:01)

Do bacteria-laden foods improve learning? A [1]recent study:

The ability of dietary manipulation to influence learning and behavior is well recognized and almost exclusively interpreted as direct effects of dietary constituents on the central nervous system. The role of dietary modification on gut bacterial populations and the possibility of such microbial population shifts related to learning and behavior is poorly understood. The purpose of this study was to examine whether shifts in bacterial diversity due to dietary manipulation could be correlated with changes in memory and learning. Five week old male CF1 mice were randomly assigned to receive standard rodent chow (PP diet) or chow containing 50 % [raw] lean ground beef (BD diet) for 3 months. As a measure of memory and learning, both groups were trained and tested on a hole-board open field apparatus. Following behavioral testing, all mice were sacrificed and colonic stool samples collected and analyzed by automated rRNA intergenic spacer analysis (ARISA) and bacterial tag-encoded FLX amplicon pyrosequencing (bTEFAP) approach for microbial diversity. Results demonstrated significantly higher bacterial diversity in the beef supplemented diet group according to ARISA and bTEFAP. Compared to the PP diet, the BD diet fed mice displayed improved working ( $P = 0.0008$ ) and reference memory ( $P < 0.0001$ ). The BD diet fed animals also displayed slower speed ( $P < 0.0001$ ) in seeking food as well as reduced anxiety level in the first day of testing ( $P = 0.0004$ ). In conclusion, we observed a correlation between dietary induced shifts in bacteria diversity and animal behavior that may indicate a role for gut bacterial diversity in memory and learning.

Previous studies had found that changes in diet changed behavior. This article says that changes in diet can produce changes in bacterial diversity and these bacterial changes might have caused the behavior changes.

Eventually I will stop eating lots of fermented food and see what happens. Perhaps [2]my arithmetic scores will get worse.

2. <http://www.blog.sethroberts.net/2009/03/07/hey-what-happened-to-my-brain-part-1/>

---

Melissa (2009-03-22 09:25:56)

Ugh, maybe it's because they were eating real whole food instead of manmade dried crud.

mc (2009-03-27 16:28:41)

I agree with Melissa, the two groups are too far apart to make a judgement about microbes making you smarter. If one was cooked beef and one was raw beef, okay, maybe - but even then with cooked, you'd get less nutritional density vs. raw. I love it when I can poke holes in a study just by looking at what is probably a summary of the abstract.

## Happiness, SLD-related (2009-03-22 15:06)

This [1]blog entry made me happy. Maybe I will start a blog where I write in Chinese.

## Autism and Digestive Problems (2009-03-22 22:36)

A [1]new study in Pediatrics has a brief but useful summary of the evidence linking autism and digestive problems. [2]Here's one study. [3]Here's a review, with this abstract:

Recent publications describing upper gastrointestinal abnormalities and ileocolitis have focused attention on gastrointestinal function and morphology in [autistic] children. High prevalence of histologic abnormalities in the esophagus, stomach, small intestine and colon, and dysfunction of liver conjugation capacity and intestinal permeability were reported. Three surveys conducted in the United States described high prevalence of gastrointestinal symptoms in children with autistic disorder.

There is also evidence that [4]immune dysfunction is associated with autism.

I believe that [5]few people in America eat enough bacteria – in practice, this means not enough fermented food – and that this causes digestive and immune problems. A vast number of people will say, "of course, good food is really important, bad food causes X, Y, and Z" – where X, Y, and Z can be practically anything. The difference between my views and theirs is the prescription: They inevitably think that people should eat more fresh unprocessed food. (Usually fruits and vegetables, for some curious reason.) Fermented food, of course, is not fresh and not unprocessed.

david (2009-03-23 06:04:24)

Yes, but when someone like Pollan talks about processed food, he means some "process" that was invented in the last 50-75 years that usually involves splitting corn into its component parts and turning it into something that will fool your body into thinking it's good for you. Fermented food has been part of humans' diets long enough for some co-evolution to take place.

PJ Eby (2009-03-23 15:44:30)

"Raw" is also not inconsistent with fermented or bacteria laden food. See e.g. [http://en.wikipedia.org/wiki/Aajonus\\_Vonderplanitz](http://en.wikipedia.org/wiki/Aajonus_Vonderplanitz) – a major supporter of the hygiene hypothesis, and whose books include recipes for fermenting raw meat in your refrigerator... as well as many more tasty raw recipes, including many that use unrefrigerated eggs. I eat most of my meats raw (although not fermented) and I don't refrigerate my eggs. (But I don't just get them from the grocery store, either.)

Probiotic Foods (2009-08-13 20:31:12)

What's your view on supplementing the diet with probiotics to acquire the 'good bacteria' needed for efficient digestion?

### **Plagiarism in Chinese Academia (2009-03-23 15:09)**

I was glad to read [1]this article in the Christian Science Monitor about an attempt to reduce plagiarism among Chinese professors.

The latest fraud to rock Chinese academia centers on He Haibo, an associate professor of pharmacology at the prestigious Zhejiang University. [Not very prestigious, since I haven't heard of it.] He now admits to copying or making up material he submitted in eight papers to international journals and has been fired, along with the head of his research institute. The affair has drawn particular attention because a world-renowned expert in traditional Chinese medicine, Li Lianda, lent his name as coauthor to one of the fraudulent papers. His tenure will not be renewed when his contract expires soon, the president of Zhejiang University has said.

The Beijing Sport University, one of three sport universities in the world, is near my university. It has a Ph.D. program. To get a Ph.D. you must submit three books! As one of their graduate students told me, no way you can do that without plagiarism. He had noticed that a book by one of his professors was simply a copy of another book.

This paragraph, however, amused me:

Stearns [a Yale professor who taught at Beijing University] says that he and his colleagues at Yale "do not believe letters of recommendation from Chinese professors, for we know that many of them are written by the students themselves," and merely signed by their teachers.

He thinks letters from Berkeley are different? My system for writing letters of recommendation was more nuanced, after I learned that students had great trouble writing these letters. I met with the student and we wrote it together. This had two great advantages: 1. It showed the student in the best possible (i.e., truthful) light. 2. It was easy. Trying to write a good letter by myself was tough.

Thanks to Sheila Buff.

1. <http://www.csmonitor.com/2009/0323/p01s01-woap.html?page=1>

---

Confidence (2009-03-23 22:26:15)

Wouldn't that be against Berkeley's honor code? But you're right, I see this happening almost everywhere now, including recommendation letters for MBA programs. I don't think it was that prevalent only a few years back, the practice seems to have taken off recently. Don't most of the top schools go around claiming that the recommendation letter is one of the most important aspects of the application?

### **Truth in Advertising (2009-03-24 09:50)**

Scott Johnson has been doing the Shangri-La Diet for 20 days. He [1]reports:

I hit the number that has been on my Driver's License for the past ten (or more!) years.

He started at 237, has lost 12 pounds.

1. <http://boards.sethroberts.net/index.php?topic=6907.msg82806#msg82806>

---

Scott P. johnson (2009-03-25 13:55:30)

Seth, Thanks for the mention. Also, thanks for the research and mental connections that went into this crazy wonderful Shangri-La thing. You Rock! Scott P. Johnson

### **JAMA Editors Go Nuts (2009-03-24 23:28)**

Emory University professor [1]Charles "Disgraced" Nemeroff was, you should remember, a respected psychiatric researcher. One of the most respected. What this says about academic psychiatry – and perhaps all academic medicine – is scary to think about.

Now comes a second episode along these lines: JAMA editors attack Jonathan Leo, a professor at Lincoln Memorial University, for daring to publish an article pointing out an undisclosed conflict of interest – exactly Nemeroff's problem. In the most self-righteous [2]editorial I have ever read, Catherine DeAngelis, JAMA's Editor in Chief, and Phil Fontanarosa, the Deputy Executive Editor,

- say that Leo should not have contacted the New York Times
- "A telephone conversation intended to inform Leo that his actions were inappropriate transformed into an argumentative discussion as Leo continued to refuse to acknowledge any problem with his actions."

- tell Leo to never submit anything to JAMA due to "his apparent lack of confidence in and regard for" the publication
- "We felt an obligation to notify the dean of Leo's institution . . . We sought the dean's assistance in resolving the issue . . . "
- "Our tone in these interactions was strong and emphatic . . . seriously . . . responsibility . . . fair process . . . integrity of science . . . We regret . . . "
- make it more difficult to report future conflicts of interest

To make sure everyone understood this wasn't temporary insanity, Catherine DeAngelis made similar comments to the [3]Wall Street Journal:

â€œThis guy is a nobody and a nothingâ€ she said of Leo. â€œHe is trying to make a name for himself. Please call me about something important.â€ She added that Leo â€œshould be spending time with his students instead of doing this.â€

Yes, nothing is less important than an unreported conflict of interest in JAMA.

The JAMA editorial, published a week after the WSJ article, claims that DeAngelis didn't call Leo "a nobody and a nothing" but since the WSJ has not fixed the supposed error I conclude that the editorial claim of quote fabrication is wrong – not to mention highly implausible.

In their editorial, the JAMA editors write that "a rush to judgment [that is, Leo pointing out the conflict of interest himself rather than deferring to them] . . . rarely sheds light or advances medical discourse." Au contraire. This "rush to judgment" has shed a hugely unflattering light on the very powerful doctors who run JAMA – and thus an hugely unflattering light on a culture in which such people, like Nemeroff, gain great power.

---

Michele (2009-03-29 23:16:05)

The editor of JAMA should step down after such editorial.

Seth's blog » Blog Archive » JAMA Editors Continue to Display Staggeringly Poor Judgment (2009-07-22 23:03:13)

[...] In an earlier post I called a certain JAMA editorial "the most self-righteous editorial I have ever read." Perhaps the authors reluctantly agreed; the editorial, which used to be here, is gone. Since I quoted from it, you can still see what I was talking about. The BMJ has an article about the disappearance, which includes this: The BMJ sent emails to JAMA's editor, Catherine DeAngelis, and the journal's media relations office asking about the disappearance of the March editorial. The BMJ also asked whether Dr DeAngelis could explain why the new July editorial had toned down the policy outlined in the March editorial. The response from a JAMA spokeswoman was "no comment." [...]

## Organize by Function (2009-03-25 22:33)

Andrew Gelman [1] makes an excellent suggestion:

At the airport they have different terminals for different airlines, with flights leaving from all over the place. Why not have a simpler system, where all the flights to Chicago leave from one section of the airport, all the flights to L.A. leave from another section, and so forth?

Flight as commodity. He adds:

Imagine a bookstore where the books were arranged by publisher and you had to look at the Random House books, then the Knopf books. etc.

A big bookstore in Beijing called Bookstore City is organized like this. On the other hand, the last 20 years of American retail have seen the rise of the opposite of Andrew's suggestion: Whole stores devoted to one brand, such as Apple or Nike or Samsung.

Some Beijing stores (or collections of stores) are hyper-organized-by-function. An electronics mall near me contains dozens of booths, each with a big selection in a narrow niche, such as laptop cleaning products, videocams, computer cables, laptop bags, disk drives, and so on. Whereas an electronics superstore might sell ten different laptop bags, the laptop-bag booth probably had 60 different ones. Not so different from the [2]Beijing Zoo. This is why I love shopping in Beijing. It really is a shopper's paradise.

Sellers want brands so that they can charge more (and perhaps feel better about themselves). Buyers, unless they want to show off, want commodities for low cost and convenience. Nobody brags about what airline they flew. Until airlines start giving away cool t-shirts and tote bags, Andrew's idea makes sense.

1. [http://www.stat.columbia.edu/~cook/movabletype/archives/2009/03/the\\_airport\\_and.html](http://www.stat.columbia.edu/~cook/movabletype/archives/2009/03/the_airport_and.html)

2. <http://www.blog.sethroberts.net/2009/01/10/beijing-shopping-clothes-at-beijing-zoo/>

---

Peter (2009-03-26 08:52:41)

There are cases where this is done, such as at the commuter terminal at San Diego's airport, which is nothing but flights to Los Angeles, or the international terminals in some airports. Those make sense because of the different needs of those classes of fliers—international flights need customs areas, duty-free, etc. and commuters need different baggage handling and quick entry/exit. But in the general case, this makes little sense: unlike at a store where I'm deciding between brands, virtually nobody makes a decision about which flight to take while standing at the gate. The three most common things you do are walk to the gate from which your flight leaves, walk from the gate to the outside, and walk between gates in order to transfer between flights. Since flight legs tend to be on the same airline, that makes a lot of sense. Also, there are a lot of potential destinations, and understanding how destinations would map onto the topology of the airport wouldn't exactly be intuitive.

Patrik (2009-03-26 16:40:21)

*Nobody brags about what airline they flew.* Whaaaaat? People do it all the time. I know people who say things like: "I never fly an American airline if I can help it. I only fly X or Z." Especially if they fly business or first-class. A friend of mine was telling me how cool a recent Virgin flight was, and how it cost more than the identical Southwest flight, but was soooo worth it.

James (2009-03-30 02:07:26)

Some clothing stores (maybe just department stores) organise their clothes by brand. I think London's peripheral surface train stations only have trains to the part of the country they're closest to. Rail is commodity though, but everyone I know has opinions on which airlines they prefer for better service.

### What Did Eskimos Eat? (2009-03-26 11:10)

In the early 1900s, the anthropologist/explorer [1]Vilhjalmur Stefansson, after living with Eskimos for a long time, returned to tell Americans what he had learned about nutrition. Eskimos ate meat almost exclusively, he said, which contradicted the usual emphasis, then as now, on diversity and fruits and vegetables. Yet Eskimos were healthy. Eskimo diet became even more fascinating when it was realized they had very low rates of heart disease – much lower than Danes, for example. In the 1970s, two Danish doctors, Bang and Dyerberg, found that Eskimos had large amounts of omega-3 fats in their blood, much more than Danes; that was the beginning of the current interest in omega-3 and the idea that fish and fish oil are "heart-healthy".

As I pointed out [2]earlier, discussions of the Eskimo diet have ignored the fermented food they ate. Here's what Stefansson said [3]in 1935:

I like fermented (therefore slightly acid) whale oil with my fish as well as ever I liked mixed vinegar and olive oil with a salad. . . .

There were several grades of decayed fish. The August catch had been protected by blubber from animals but not from heat and was outright rotten. The September catch was mildly decayed. The October and later catches had been frozen immediately and were fresh. There was less of the August fish than of any other and, for that reason among the rest, it was a delicacy - eaten sometimes as a snack between meals, sometimes as a kind of dessert and always frozen, raw. . . .

[At first, Stefansson didn't want to eat decayed fish.] While it is good form [in America] to eat decayed milk products and decayed game [well, well], it is very bad form to eat decayed fish. . . . If it is almost a mark of social distinction to be able to eat strong cheeses with a straight face and smelly birds with relish, why is it necessarily a low taste to be fond of decaying fish? On that basis of philosophy, though with several qualms, I tried the rotten fish one day, and if memory serves, liked it better than my first taste of Camembert. During the next weeks I became fond of rotten fish.

So Eskimos ate fermented whale oil and a lot of rotten fish. ("A lot" because if they didn't eat a lot of it, Stefansson wouldn't have felt pressure to eat it.) I had no idea that Americans used to eat decayed game.

1. [http://en.wikipedia.org/wiki/Vilhjalmur\\_Stefansson](http://en.wikipedia.org/wiki/Vilhjalmur_Stefansson)

2. <http://www.blog.sethroberts.net/2009/01/26/the-inuit-paradox/>

3. <http://www.biblelife.org/stefansson1.htm>

Aaron Blaisdell (2009-03-26 11:48:50)

About a month ago I began taking 1/2 teaspoon of fermented cod liver oil each day along with my 1/2 teaspoon of butter oil (both from Green Pastures). At first it was a bit yucky and difficult to get down without a chaser (e.g., some strong coffee). But now I don't find the taste unpleasant, nor do I need to immediately cover up the taste in my mouth with a chaser. Actually, I sort of like it! It's a great way to get fat soluble vitamins A and D as well as some omega 3s (DHA and EPA). The butter oil provides some vitamin K2 as well, along with some CLA and other stuff that Weston Price wrote about. I think, by the way, that Weston Price should get the first Nobel Prize in nutrition. He was WAY ahead of his time, and still very underappreciated.

seth (2009-03-26 13:19:38)

A Nobel Prize in nutrition is a great idea.

Tom (2009-03-26 16:44:53)

Wow, that "decayed game" reference is fascinating! The closest thing surviving in the culture is "aged" beef...and we find it much better than the fresh variety. I agree about the Nutrition Nobel, but fear it would go to Ancel Keys and the like. Hell, they'd give it to Suzanne Somers before Weston Price!

Patrik (2009-03-26 16:47:54)

@Seth People still eat "decayed" game. They only call it "aged". <http://www.honest-food.net/blog1/2008/11/27/on-hanging-pheasants/> I also mentioned the dry-aged (perhaps more accurately referred to as dry-decayed) beef used in hamburgers at Father's Office here: <http://www.blog.sethroberts.net/2009/03/13/umami-burger/> #comment-280113 It dovetails right into your umami hypothesis.

Patrik (2009-03-26 16:49:09)

@Aaron Blaisdell I also supplement with fermented cod liver oil and butter oil — but I cannot say I have noticed any sort of difference since taking them.

Tom (2009-03-26 19:10:15)

I thought about getting the Green Pastures butter oil for my Vitamin K, but I couldn't shake the suspicion that I would be buying a bottle of exorbitantly-overpriced ghee. If that's all it is (and I can't imagine why they wouldn't say so, if it's not), I'd rather just get Anchor Butter from NZ and save the \$. (How can Green Pastures get away with selling that stuff without giving any indication of what's in it????) Anyway, I went with Carlson's K-2 capsules.

Melissa (2009-03-27 03:09:15)

We eat fermented herring here in Sweden. It's called surströmming and when my housemates ate it, we had to be very careful to open it outside and dispose of any waste quickly because if we left bones overnight the smell would take days to get rid of. Doesn't taste as bad as it smells though...but it's not exactly a regular part of my diet.

Aaron Blaisdell (2009-03-27 07:10:43)

@ Patrick, I noticed a big improvement in a number of dimensions of my health and well-being when I began making nutritional adjustments about a year ago, but especially 6-months ago when I began taking high-vitamin cod liver oil and butter oil. Seth blogged about it about a month ago. I haven't noticed any change since switching from the regular high-vitamin cod liver oil to the fermented kind, however. Perhaps I'm already at a ceiling effect and I've been taking a lot of fermented dairy (cheese, yogurt, kefir) daily.

Sheila Buff (2009-03-27 12:40:55)

Fermented fish is also a delicacy in Iceland, as in Sweden. I've read that it's also a delicacy in the South Pacific, though I don't recall any specifics—perhaps Samoa? Don't know how widespread fermented fish is across Polynesian culture. The ancient Romans were very fond of something called garum, which was a sauce made from fermented fish guts. Perhaps any culture that eats a lot of seafood will also have fermented fish in its cuisine? Does anyone know if Japanese cuisine uses fermented

fish? How about southeast Asia, leaving aside nam pla? Others? Perhaps isolated islands such as Shetlands, Falklands?

Aaron Blaisdell (2009-03-27 13:36:43)

Sheila, I believe a lot of Asian fish sauces are fermented, as are soy sauces. This of course applies to the traditional sauces, not their poor imitations commercially available in supermarkets.

EAT: Fermented Foods « STRETCH EXERCISE EAT (2009-05-06 14:30:39)

[...] \*Seth Roberts, the UC Berkeley professor has been chronicling his self-experiments with fermented / bacteria rich food on his blog. He reports lots of positive results. Professor Roberts chronicles experiments with fermented meat. There is an interesting post about the Eskimo delicacy of rotten/fermented fish. Also, see this National Geographic article discussing the possibility of our ancient ancestors fermenting mammoth meat in ponds. The article points out that, Daniel Fisher, University of Michigan professor of Ecology and Evolutionary Biology, used this method to preserve and eat a draft horse over an extended period of time. [...]

Luke (2009-05-29 06:01:33)

Just to let you know: Yes. The Japanese do eat fermented (rotten) fish. It was in fact the original form of Sushi if I remember correctly. Fish would be stored with fermented rice for a long time, then eaten. The rice was discarded and not eaten. It is still a delicacy I believe. I also think that in some parts of Malaysia or Thailand they eat fermented fish. Obviously there will be a lot of similarities of diet and crossover from culture to culture in that area. Thinking about it.... I'm sure in Korea they eat some fermented fish as well.

The Umami Hypothesis | Lost Wanderer (2009-07-28 12:44:04)

[...] Seth Roberts has proposed an interesting hypothesis, that humans like complex tastes (umami) because we evolved to like the taste of bacteria in food. He believes that bacteria from natural pickling is harmless, and actually improves our immune function. As reported in Conditioning Research, Roberts points out that explorer Vihjalmur Stefansson reported that Eskimos ate lots of bacteria fermented fish, which he also grew to enjoy. Supporting this theory, Conditioning Research also tells of a University of Michigan paleontologist, Dan Fisher, who butchered a draft horse and cached the meat in a stock pond. The lactobacilli in the water pickled the meat, which it emitted a slightly sour odor that put off scavengers when it floated to the surface. Fisher cut and ate the meat from February until midsummer to prove its safety, showing how hunter gatherers might have once stored their large animal kills. As I blogged in an earlier post, fermented foods also are known to be good sources of vitamin K2. Social bookmarksSubscribeBlinklistBloglinesBlogmarksDiggdel.icio.usFacebookFurlMagnooliaNewsVineRedditStumbleUponTechnorati [...]

gwern (2011-01-15 11:40:16)

> There were several grades of decayed fish. The August catch had been protected by logs from animals but not from heat and was outright rotten. 'by logs' > 'by logs'? But where would Eskimo get wood logs to cover up their fish? Luke: I'm sure they do. If nothing else, the pervasiveness of kimchi probably means there are dishes where one tosses in some fish into the kimchi fermentation jars.

John H (2011-12-06 04:15:50)

There are no trees on the north coast of Alaska, but stray logs from logging operations further south frequently wash up on their beaches, and would have done in 1935. I'm not convinced that "logs" == "logs" though.

seth (2009-03-27 22:21:31)

Thanks, Catherine. I have just been trying to get a copy of that book.

### **Hanging Birds (2009-03-26 19:54)**

In the comments, [1]Patrik links to [2]a fascinating post about "hanging game birds" – that is, hanging them at low temperatures (such as 50 degrees) for several days to improve their flavor. I especially liked this quote from Brillat-Savarin:

The peak is reached when the pheasant begins to decompose; its aroma develops, and mixes with an oil which in order to form must undergo a certain amount of fermentation.

Yet another example of more bacteria, better flavor. I can't find my copy of Brillat-Savarin but in Harold McGee's *On Food and Cooking* I found this (p. 144):

Despite the contribution that aging can make to meat quality, the modern meat industry generally avoids it, since it means tying up its assets in cold storage and losing about 20 % of the meat's weight to evaporation and laborious trimming of the dried, rancid, sometimes moldy surface.

Okay, I am taking those short ribs I bought today out of the freezer. If people knew that well-aged beef is healthier, as I believe, this meat-industry practice might change. There should be a recommended daily allowance of bacteria. A few billion, perhaps? Bacteria count would be included in the nutrition label. Because the numbers would be so large, everyone would learn scientific notation.

1. <http://www.blog.sethroberts.net/2009/03/26/what-did-eskimos-eat/#comment-284202>
2. <http://www.honest-food.net/blog1/2008/11/27/on-hanging-pheasants/>

---

Peter (2009-03-26 20:52:34)

Jeffrey Steingarten, who has written a food column for Vogue magazine for years, wrote a column about aged beef that was quite interesting. I believe it's in one of his collections of columns ("The Man Who Ate Everything" or "It Must've Been Something I Ate", not sure which). He ends up aging beef in his refrigerator, and though people around him warn of certain death from bacteria, if I recall correctly he was pretty happy with the results.

KenF (2009-03-26 21:27:26)

Don't eat it if it doesn't have a beard. I heard something like that once about aged beef.

seth (2009-03-26 22:21:14)

KenF, what does "don't eat it if it doesn't have a beard" mean? Peter, thanks for the reference. I will now put those short ribs in my fridge.

Jason Coyen (2009-03-27 07:34:30)

There is a scene in the book/movie Shogun, which centers on hanging a pheasant outside for several days, so it develops a "gamey flavor". Supposedly hung by its tail, until it falls on its own (due to the decomposition). It doesn't end well for the Japanese servant who moves the bird because they don't like the smell. Obviously a fictional account, but the author thought it was a plausible action anyway.

Jason Coyne (2009-03-27 07:50:20)

Here is a magazine article talking about the practice of hanging game birds for a few days outside (or weeks in the winter) [http://www.tpwmagazine.com/archive/2005/nov/ed\\_3/](http://www.tpwmagazine.com/archive/2005/nov/ed_3/)

Caleb (2009-03-27 07:57:31)

I assume the "beard" is mold?

KenF (2009-03-27 10:53:25)

Yeah. I couldn't find a reference online. I think it might have been a radio report I heard. This was a while ago, several years I believe. Anyway, they were talking about some steakhouse and how they aged their meat, and the beard was the mold that grew on the meat that they had to cut off. That is what made it taste good. But it wasn't ready until it had a beard.

Drew (2009-03-27 16:59:21)

Could beef today have different bacteria though (ie greater presence of E. Coli)? I'd be surprised if beef slaughtered by hand in 1900 and beef slaughtered in an industrial facility in 2008 have exactly the same bacterial content. Maybe not true, but something to think about.

Patrik (2009-03-28 19:11:13)

@Drew You are making two comparisons here, not one: 1900 vs. 2008 Hand-slaughtered vs. industrial facility My guess, on a per capita basis, in industrial facilities, there is less e. coli today, than in 1900. Remember, it was Sinclair's "The Jungle" (1906) that prompted much of today's food safety regulation. *According to Sinclair, he originally intended to expose "the inferno of exploitation [of the typical American factory worker at the turn of the 20th Century]," [3] but the reading public instead fixated on food safety as the novel's most pressing issue. In fact, Sinclair bitterly admitted his celebrity rose, "not because the public cared anything about the workers, but simply because the public did not want to eat tubercular beef" [3]. Sinclair's account of workers' falling into rendering tanks and being ground, along with animal parts, into "Durham's Pure Beef Lard", gripped public attention. The morbidity of the working conditions, as well as the exploitation of children and women alike that Sinclair exposed showed the corruption taking place inside the meat packing factories. Foreign sales of American meat fell by*

one-half. In order to calm public outrage and demonstrate the cleanliness of their meat, the major meat packers lobbied the Federal government to pass legislation paying for additional inspection and certification of meat packaged in the United States. [4] Their efforts, coupled with the public outcry, led to the passage of the **Meat Inspection Act and the Pure Food and Drug Act of 1906, which established the Food and Drug Administration.**

## A Shangri-La Diet Skeptic's Log (2009-03-27 09:38)

From the [1]Shangri-La Diet Forums:

I chanced upon the book on sale at Barnes and Noble for \$4.98. I pored over the book with a slice of stratta, one chocolate lava cake, and a large Green Tea Frappuccino. I was smirking as I read it, in disbelief – it sounded ridiculous!! . . . I've been on different diets since 2003. I weighed 137.5 lbs at my heaviest in 2006. The lowest I've been was 126 lb in 4/2004. For New Year 2008 I resolved to take a break from caring about my wt. I wanted to see how big would I actually get if I do nothing - I canceled the GYM (saved \$100/month) and ate all the food I wanted anytime. . . I was happy as a lark and actually shed some weight without even trying. . . My weight settled between 128-130 lb. New Year 2009 came and a coworker asked what diet I was planning to be on. She also informed me of the company's drive, inviting employees to a health challenge: . . . For every pound you lose, Pound For Pound will donate 10¢ to Feeding America . . . A sucker for "causes", I committed to lose 7 lb. I have been procrastinating ever since - it's not that easy to get back on track and start working-out again. I couldn't give up Belgian Chocolates or Nutella Crepes. . . The first thing I do when I wake up is pop a truffle or 4 in my mouth. (isn't that gross?) . . . I do the same at night, before eating my lunch or dinner etc. There's nothing quite like it - the texture of different truffles, the smell, etc., especially after having no food for at least 2 hours. I eat my dessert before my meal. When I read this book, I thought - this can't be true. Lose your appetite without even trying? Let's see... 3/18/2009 I cleaned up my dusty Tanita scale, replaced the batteries & weighed myself. It registered 128.5 lb . . . 3/26/2009 It's not really time to weigh in or measure but yesterday my belt had to be re-adjusted down a notch. Results WT= 123.5 lb Body Measurement of parts with losses (inches): Waist = -.5; Abs = -.5; Hips -.5 ; Under Bra -.5 Total lost = 2 inches. I guess it works. I only have 2 lb more to go for the Pound for Pound Challenge. Have I changed my eating habits? I'd say I'm eating a lot less chocolates (by far). I'm so motivated to lose more wt. I have already shared the news at work, of course. This is by far the easiest diet I've ever been on with the quickest results.

It's like a weight-loss ad come to humorous life.

---

Oleksandr Krulik (2009-03-27 11:12:33)

i just did a quick search and it says that it basically suppresses appetite. it's not even really a diet. i don't like any diets that make you not eat when your body needs you to eat...but hey, you can try it. it says that you'll find out in a day or two if it works for you. if you want to stop eating so much, then just eat healthier, leaner/cleaner. if you eat less of the simple carbs, then your body won't have so many sugar highs/lows and you won't crave food to get that sugar high again.

Tom in TX (2009-03-29 15:12:12)

The Shangri-La Diet is such a strange idea. I wonder who could have thought of such a thing? ;-)

Diet (2009-06-17 23:50:46)

Poor Shangri-La, must have fed up by following such a wide varieties of dieting. Its good to know that one can shed weight without a dieting program from her experience. The aspects of Shangri-La diet is entirely different from other dieting. Isn't it?

Ariann (2009-07-07 17:45:02)

This principle of oil can be found in the 1961 book, "Calories Don't Count" by Dr. Herman Taller. The testimonials found in this book seem to say the same things, so maybe it really works..

### **Natto Shopping (2009-03-28 05:01)**

After re-reading [1]this post, written before my current fermented-food craze, I decided to see if I could buy natto (fermented soybeans) in Berkeley. At Whole Foods, they didn't know what it was. Nor did they sell it. At Berkeley Bowl, which Saveur magazine recently seemed to say was the best food market in America, they told me it was in Aisle 3. I looked and looked and couldn't find it. Okay, frozen natto is in Aisle 7, I was told. There was a surprisingly large selection, maybe 10 choices. Frozen natto comes in one-serving plastic containers bundled into packages of two or three that look like this:

That's a two-container bundle. One serving is about \$1.

[2]Introduction to natto.

1. <http://www.blog.sethroberts.net/2007/12/21/more-natto-please/>

2. <http://www.jafra.gr.jp/eng/sumi.html>

---

Seth's blog » Blog Archive » Natto Shopping (continued) (2009-03-30 18:18:22)

[...] Natto Shopping [...]

Joey Williams (2009-04-20 19:37:01)

Thank you so much for your insightful tip. I tried several time to find Natto at Berkeley Bowl but none turned up. After reading your post I went straight-away and found one with out cornsyrup nor msg.

oslo (2009-04-21 23:50:39)

I'm crazy for natto. As far as I understand it, in the US, all natto imported from Japan is frozen, in those little individual boxes. I never bought it because ecologically it's so lousy, so it always made sense to eat locally available/easily makeable fermented foods- sauerkraut, kombucha, kefir. Natto is tricky to make at home. Then lo and behold the receptionist at my dentist's office told me there is an outfit in western MA who makes it (and miso) and ships mail order. It's the only domestic source I know of. Kendall Foods. Only answers the phone on Mondays (brilliant!) : 413 238 5928.

seth (2009-04-22 05:29:36)

thanks, Oslo, that's good to know. I was surprised to see that natto in Cambridge was a lot cheaper than natto in Berkeley, even though Cambridge is further from Japan. There is someone making natto near Berkeley whom I will soon interview on my blog.

Colleen (2010-02-04 18:07:36)

Hi! From the first time I tasted natto I loved it; which highly amused the owners of the Japanese market where I tried it in a sushi roll. Americans weren't supposed to like it. I bought it there for years and then they went out of business. I haven't been able to find it anywhere in New York...in fact when I ask for it in local Asian and Korean markets they don't even know what it is. Do you have any addresses in the USA where I can order it? Thanks! :D

seth (2010-02-04 18:35:44)

try Japan Traditional Foods: <http://www.gourmet-natto.com/>

Ellen (2011-06-18 20:44:50)

I have not been able to find natto that does not have high fructose corn syrup in it. Even the organic one I bought at the local market had it. Any idea where to order it?

Seth Roberts (2011-06-19 18:45:13)

nice try, spammer. Natto never contains high fructose corn syrup. Correction: sometimes it does.

Maggie (2012-01-23 11:39:55)

Seth, where can I purchase natto by mail or phone? I'm in North Carolina.

Seth Roberts (2012-01-23 11:52:43)

I don't know. I've never done that. Is there a Whole Foods near you? they might have it.

## **Do They Eat Dogs? (2009-03-28 15:08)**

From [1]a post about life in Taiwan:

Donâ€™t they eat dogs and other odd stuff like snakes?

No.Â They donâ€™t eat dogs.

I think a small fraction of restaurants in Beijing serve dog, but I never encountered one and I never saw dog meat for sale. In Seoul, however, they obviously eat dogs. I saw dog meat for sale in a traditional market. The dogs were alive (as many animals are in Asian "wet markets"). I later saw a booklet aimed at visitors to Korea that dismissed dog-eating as some sort of urban legend.

1. <http://www.neatorama.com/2009/03/24/not-in-kansas-anymore/>

---

Kevin Miller (2009-03-28 17:55:14)

I'm guessing that you don't read Chinese. There's a big ethnic Korean population in Beijing and many of the Korean restaurants feature dog meat, and quite a few have names that include something like 大狗肉王 [big dog meat king] (see: <http://www.jaxxg.com/images/shiguo.jpg> – don't know if it's Beijing or not. My Chinese friends would tend to eat it in the summer – I think it might be "cold" which most meats are not, but I might have that wrong – and would love to take me to places where I'd have to eat it. I didn't have a problem with it. You probably just have nicer friends than I do. There's also a fascinating movie – <http://www.answers.com/topic/kala-shi-tiao-gou> – about a family's travails with an illegal dog, that ends

up with the dog still not found and the family's son in jail. It then had a page of text that said that they found the dog, but didn't say anything about the son's fate. I'm guessing that that was added after audience previews. Every time I come there are more and more dogs, so I'm guessing that before \*too\* long there will be a categorical shift from "animal" to "pet" for these creatures. But China is a fairly tolerant place, so it may not be too quick or categorical.

Andrew Gelman (2009-03-28 18:32:14)  
Man bites dog, that's news.

seth (2009-03-29 18:33:46)

Thanks, Kevin. I don't read Chinese, you are right. I knew about those restaurants just barely; I didn't know they were all Korean. I went to five or six Korean restaurants in Beijing and had food that was a lot different than any Korean food I ever had before – such as mushrooms wrapped in ham and covered with sweet/sour sauce – but no dog.

Timothy Beneke (2009-03-29 22:59:24)

I was served dog, along with other meat, by my host in Xian in central China; it tasted a bit like beef... And in Shanghai, at a decent restaurant, I was offered snake and turned it down... Staying on the Beijing U campus I kept noticing all these Pekingese dogs that people had for pets, which I initially regarded as curious, until after about 4 days I realized that I was in Peking and it made sense that people would have Pekingese dogs... Duh — maybe it was the jet lag...

Patrik (2009-03-30 17:19:23)

It is pretty clear that they DO eat dogs in Taiwan. Not necessarily a lot, but when you pass a law forbidding it, it tells you something. BTW anyone know if this is a spoof or not? <http://www.puppybeef.com/index.php>

Dave Russell (2009-06-14 23:22:36)

I am a Brit living in Korea. My experience (of 10 months) shows me Koreans do eat dogs. Near my school there are three Restaurants I know of; my neighbours, who I don't like, were having Bosintang (the Korean name for dog soup) at the weekend. Many of my teachers eat it. They also know that the dogs are usually tortured first, before they are killed in order to improve the flavour. This leads me to assume Koreans have, generally a low sense of morality - if not then more people would be trying to stop this. My school also keeps four dogs - or rather a staff member who lives on site, does. It is acceptable, in Korean minds, to keep dogs for food on school ground. Last week, I saw an old man drag a large pointer type dog, along the road, its back legs broken or maimed. Many kids were watching - some were shocked, most were indifferent. As were the Police whom I stopped and to whom, I pointed the man out to. Don't let anybody tell you Korea is a progressive, modern country. Judging by what I have seen, it most definitely is not.

## **How Things Begin (I Got Uggs! update) (2009-03-28 22:40)**

[1]A year ago I wrote how the website [2]I Got Uggs! began. Since then it has done well. I interviewed the proprietor recently.

Since our previous conversation about I Got Uggs! (April 2008), what's happened with the site?

A lot more page views. On average, approximately 6,000 more. I've also increased revenue greatly by adding some revenue producing advertising. When we last spoke I was only using Google AdSense, but now I'm using three more sources.

How did you increase page views?

The first thing I did was change some keywords in my heading. For example, I added the words "Buy UGG

Boots on Sale". By doing that alone I got an increase of almost 2,000 hits overnight. The second thing I did was join three affiliate programs: Amazon Associates, Chitika, and ShareASale. When someone buys a pair of UGG boots from the site, I get between 7 and 10 % commission. Furthermore, I get money from other websites that want to place an advertisement on the site, and I charge them a monthly fee based on the number of page views using a formula I found on the 'net. Now since, I changed the keywords, if you type "uggs" or "ugg boots" into Google, I Got UGGs! is on the first page or number 1.

What were page views before the increases?

I was getting an average of 1,800 page views per day in September and early October. That number went to close to 4,000 page views per day on October 4, and then to averaging 6,000 page views per day beginning October 5.

You get significant income from both I Got Uggs! and [3]I Got Converse!?

I'm getting more from I Got Uggs, but it's going down as the weather gets warmer, but I Got Converse is going up everyday. I Got Uggs is showing some seasonal changes in terms of the income stream, but I'm praying that I Got Converse will eventually pick up the full slack.

You hired an assistant so you would have time to write a book. What does your assistant do? What do you pay him/her? How did you hire him/her?

She currently scans pictures, looks for pictures in the tabloids, and proofreads for me, in addition to other things like going to the post office and make 99 cent latte runs to the Dunkin' Donuts on 8th avenue. More importantly, I'm training her to do the postings for both sites.

I pay her \$10 per hour and she works about ten hours per week. She's actually a Landmark [High School] student [where he teaches]. Despite being a straight A student, she wrote a paper on wanting to be a personal assistant as a career goal. Another teacher told me about her, so I offered her the opportunity to try it out. Thank God, she's awesome and she loves it! She's actually my 5th assistant. The others didn't work out for various reasons.

You still have your teaching job, right?

Yes, I'm still teaching, but I'm looking to do the blogs and writing full-time after this school year ends. At the most, I plan on teaching part-time at a college, but not full-time anymore.

1. <http://www.blog.sethroberts.net/2008/04/04/how-things-begin-i-got-uggs/>

2. <http://www.igotuggs.com/>

3. <http://www.igotconverse.com/>

---

bennetta (2009-03-30 09:57:57)

If you are looking to get out of the UC system and/or are looking for a new school to teach at, this may sound odd, but the junior college up here in Santa Rosa might be a pretty good option. It is recognized as one of the top ten junior colleges in the country and pay is allegedly competitive to what you'd see elsewhere in the state. I've known more than one instructor who preferred teaching there over anywhere in the UC or state system. Many of the professors are UC transfers and teach classes that are on par or more difficult than what you'd see at that level. From my experience, many of the classes I took

there were actually better than what I took at UC Davis. It's a good gig if you're just looking to teach a few classes part time.

### **The Nutrition Lesson Hidden in a Bowl of Miso Soup (2009-03-29 18:26)**

Tyler Cowen is the only person I know who talks about the great value of travel. Schools should teach it, he says. I agree. If you've read *The Shangri-La Diet*, you may remember the turning point was a visit to Paris when I inexplicably lost my appetite. You don't know that my belief in fermented food – to be healthy, we need to eat lots of fermented food – also began with foreign travel: A trip to Japan.

When I got back to Berkeley from Beijing a few months ago, I looked around my kitchen: What should I make? I came up blank. Huh? I couldn't understand why I couldn't think of anything. (In Beijing I had never cooked.) The first few days back in Berkeley I made grilled fish. The Aquatic Ape Hypothesis. Then I went to the Fancy Food Show in San Francisco. At a Japanese food booth, including miso soup packets, I suddenly remembered: For my last nine months in Berkeley, after a trip to Japan in January 2008, I'd been eating a lot of miso soup. Every day. Which I'd never done before. Nine months was long enough to block out what I'd cooked before January 2008 yet short enough to be forgotten after three months in China.

Why did I start eating so much miso soup? In a Tokyo supermarket I had noticed they sold a lot of miso paste. Maybe there were ten types for sale. When I got home from Japan, that experience inspired me to buy a tub of miso paste. I'd add one or two tablespoons to a few cups of water, along with vegetables and thinly-sliced meat (plus vinegar and hot sauce). It was so delicious and easy that I started making miso soup every day. I went through five or six tubs of miso.

The miracle was how easy it was – that one ingredient (miso) should so easily produce such a delicious result. No one spice will do that. Garlic alone won't do that. Ginger alone won't do that. One ingredient was so compelling, pulled me so far from my previous cooking that I completely forgot about it after a three-month absence. During

those nine months, while I was eating all that miso soup, I didn't wonder why miso made such a difference. But when I finally thought of the umami hypothesis – we like umami, sour, and complex flavors so that we will eat more bacteria-laden food; bacteria tend to produce those flavors – all of sudden it made sense. Miso was so tasty because it was fermented. It was so tasty because it was so missing.

---

Ryan Holiday (2009-03-29 22:12:53)

This is sort of like Taleb's belief that scientists should spend more time going to parties if they want to chance upon new things to research.

Dennis Mangan (2009-03-30 06:26:28)

Seth, I've been following your posts on your belief that eating more fermented food is healthy. It may be, but IMO you're overgeneralizing about bacteria and the immune system. If umami has anything to do with bacteria, what about the repugnance we feel toward feces? Most biologists will tell you that we evolved that repugnance because feces is nearly 2/3 bacteria by weight; it's filled with chemicals produced by microbes that have quite descriptive names, like putrescine. Also, the immune system: is there really any evidence that it needs to be stimulated constantly? The gut's immune system secretes IgA, the purpose of which is to keep bacteria away from the gut lining and out of the body. Overactive immune systems are the source of problems, not health, e.g. autism appears to be a case of that, so does depression, lupus, etc. I've seen some of your commenters mention keeping eggs at room temperature; ordinarily, the inside of an egg should be sterile, so it's hard to see what aging will do, and the outside can contain pathogenic bacteria, like *Salmonella* spp. In short, it doesn't appear to me that you have made a case for your theory. You need to distinguish between pathogenic and beneficial bacteria, that umami has anything to do with bacteria, and you need to show that stimulating the immune system in general is a good thing.

seth (2009-03-30 10:04:06)

Thanks, Dennis. Re feces: the bacteria we need to be afraid of (and avoid) are those that can grow inside us. The bacteria of feces obviously fit that description – thus our repugnance makes perfect sense. The bacteria we don't need to be afraid of are those that can't grow inside us. With few exceptions, the bacteria that grow on plants and dead meat fit this description. Optimized for those conditions, they cannot handle the much different conditions inside the body. Re why stimulating the immune system is a good thing. Lots of studies show that various probiotics improve health. Here are 3 observations that made me see the broad generalization: 1. A woman who started eating yogurt everyday had her overall health greatly improve at the same time. 2. A friend was unable to get rid of a skin infection until he started taking Chinese herbs. 3. The beneficial effect of tapeworms on hay fever and asthma. In each case, introduction of (harmless) foreign substances likely to stimulate the immune system apparently improved its function. The evidence for the hygiene hypothesis is another sort of evidence that supports this point.

Caleb (2009-03-30 10:16:04)

Regarding over reactive immune systems, I've heard it theorized that they're a weak immune systems way of overcompensating. Since it is slow to mobilize and has less chance to fight off infections, it can't afford to take as many risks and responds to more false positives, and does so with greater damage and inflammation. This can contribute to allergies and autoimmune disorders. The sad thing is that since the weak immune system is too slow to respond, most viruses can reproduce to critical mass where they divide faster than the weak immune system can suppress them, so the overreaction is often in vain. A strong immune system on the other hand is confident enough in its ability to quickly kill off real threats before they hit critical mass, so it doesn't need to overreact to every potential threat.

Caroline (2009-03-30 11:12:20)

I have a question about the Shangri-La Diet. I'm taking the sugar water once a day (1 T in a teacup of hot water). Is it ok to exercise right before I take it? As long as I'm drinking sugar water, I figure I can at least multi-task and let it restore my glycogen after a hard workout. Do you foresee any negative effects? Thank you very much!! :)

seth (2009-03-30 11:59:26)

Caroline, yes, okay to exercise before you take it. Caleb, yes, I agree. I think slow response and overresponse go together, which explains why the same treatment could make the immune system (a) better at fighting off ordinary bugs and (b) less likely to overrespond (allergies).

How to detox (2009-03-30 23:58:34)

Your experience of miso is very facinating, but I found the discussion on bacteria even more so. I understand our repugnance towards feces but never understood exactly why - now it all makes sense. I will be shopping for some miso myself later this week - it's something I really want to try now. Kym

anon (2009-03-31 05:10:17)

Before taking sugar water to lose weight, you might want to check with your doctor to see if you're diabetic.

Phuong Le (2009-03-31 21:12:16)

Miso tastes good because it is salty.

Burrue! (2011-03-31 09:02:54)

Great thought! Thanks

### **Natto Shopping (continued) (2009-03-30 18:18)**

I found some natto not made in Japan. It is from [1]Japanese Traditional Foods, in Sebastopol, California. It comes in one-serving containers with tiny shoyu and mustard packets, just like [2]frozen natto. It costs more - 50 % more - than the frozen stuff, to my surprise. Since Japanese Traditional Foods was founded in 2006, and the Japanese natto makers are huge, I suppose it makes sense. It tastes almost the same as frozen natto, although I plan to do side by side comparisons just for fun.

The package had a curious statement:

Natto is a fermented food product, so it is best to consume it as soon as possible.

Huh? I think this is basically false: the fermented bacteria prevent other bacteria from growing. Sure, you can over-ferment but that won't happen soon. Just as you can leave cheese at room temperature for quite a while, nothing bad will happen.

1. <http://www.gourmet-natto.com/default.html>

2. <http://www.blog.sethroberts.net/2009/03/28/natto-shopping/>

BambooLarry (2009-03-30 22:09:53)

Seth, If you want Natto, you can go to Yao-ya san Market, a small Japanese Market in El Cerrito, CA on San Pablo. BambooLarry

Caroline (2009-03-31 03:38:31)

Seth- Thanks for the response! I'm glad, that makes the two hour slot super easy to fit into my schedule! I read the Shangri-La Diet book a couple years ago, and remember the basic stuff. I took oil last time and was very successful. I'm taking the sugar water this time (no opportunity to buy the oil for a couple weeks). I don't have a lot of weight to lose - about 10 pounds. I've never been overweight, but I've gained these 10 extra pounds because of bad eating habits and just wanna nip it in the bud! My question: How much sugar (tablespoons) in how many liters of water would you recommend? I exercise regularly, which curbs my appetite right after, but I'm afraid it might make me hungrier in the long run. How much sugar water would you recommend to be "not hungry - Shangri-La style"? Thank you! P.S. I WISH I had a book to answer my own questions, but I'm in Romania and can't order one...too expensive, not enough money, and it may not even get to me for weeks and weeks. Thank you so very much, again. :)

seth (2009-03-31 07:27:40)

Caroline, you can check out [boards.shangriladiet.com](http://boards.shangriladiet.com) to see details of how the diet is done by various people and with what results.

Patrik (2009-03-31 09:16:18)

*Huh? I think this is basically false: the fermented bacteria prevent other bacteria from growing. Sure, you can overferment but that won't happen soon. Just as you can leave cheese at room temperature for quite a while, nothing bad will happen. You are half-right when you say: the fermented bacteria prevent other bacteria from growing. The bacteria (or micro-organisms/fungi such as yeast) are not fermented – they do the fermenting. Taking wine for example, generally, you kill off everything living in the must via addition of sulfur, after which you add your desired yeast. The yeast then ferment by digesting the sugars in the must thereby generating alcohol, which ironically kills them off. As we used to joke when making wine, in a sense, the yeast are killed by their own shit, which we consume. :) BTW I think you like this article on PREbiotics (not PRObiotics). <http://online.wsj.com/article/SB123846243487972081.html> We've all heard of healthy bacteria called probiotics, commonly found in yogurts and dietary supplements. A new wave of products now include prebiotics, dietary ingredients intended either to help increase levels of good bacteria naturally found in the body, or to be used in combination with probiotics to improve their efficacy. Scientists say prebiotics do increase levels of good bacteria in the gut, and some research has linked their consumption to health benefits. However, I remain skeptical. This appears to be the latest food marketing angle backed by ostensible "scientific" evidence. Although, perhaps the supposed symbiotic relationship between humans and bacteria may be more important than I assume as tangential to this discussion is the hypothesis that we have incorporated bacteria in our DNA via some lateral mechanism. [http://whyfiles.org/shorties/079bact\\_gene/](http://whyfiles.org/shorties/079bact_gene/)*

Patrik (2009-03-31 09:19:40)

*Huh? I think this is basically false: the fermented bacteria prevent other bacteria from growing. Maybe what this is arguing is actually congruent with your hypothesis. Perhaps they mean to say that it is best to consume natto immediately, before the bacteria die (via a mechanism as described above in my wine example) or run out of food, as to reap the supposed benefits of these supposed beneficial bacteria.*

seth (2009-03-31 11:34:46)

Presumably they fermented it the optimal amount. The longer it sits, the further it gets from that ideal state. That is an interpretation that makes sense. In the fridge, the bacteria aren't likely to die.

Chris (2009-04-02 18:22:23)

In Japan, natto is sold refrigerated not frozen and has a sell by date usually of about 5 days from the current date...I wonder if freezing kills bacteria.

seth (2009-04-02 19:02:05)

Chris, I suspect dead bacteria are as almost as helpful as live bacteria, at least for natto. I don't think the immune system can discriminate alive from dead. For other benefits of fermentation perhaps alive are better.

Leah C (2010-01-26 01:40:00)

I just really want to find natto in a recyclable plastic tub. I hate throwing away styrofoam all the time. Back on the East coast I had a friend who knew of a local grower and it came with about three helpings in a plastic tub that could be washed out easily w some hot water.

## 4.4 April

### "Baffling" Link Between Autism and Vinyl Floors (2009-04-01 09:25)

From [1]Scientific American:

Children who live in homes with vinyl floors, which can emit chemicals called [2]phthalates, are more likely to have autism, according to research by Swedish and U.S. scientists published Monday.

The study of Swedish children is among the first to find an apparent connection between an environmental chemical and [3]autism.

The scientists were surprised by their finding, calling it "far from conclusive." Because their research was not designed to focus on autism, they recommend further study of larger numbers of children to see whether the link can be confirmed. . . .

The researchers found four environmental factors associated with autism: vinyl flooring, the mother's [4]smoking, family economic problems and condensation on windows, which indicates poor ventilation.

Here, in a nutshell, are several of the weaknesses with the way epidemiology is currently practiced. I doubt there is anything to this, but who knows? It deserves further investigation. Here's what could have been better:

1. The researchers did dozens of statistical tests but did not correct for the number of tests. This means there will be a high rate of false positives. The researchers appear to not quite understand this. They don't need "further study of larger numbers" of subjects – they simply need studies of different populations. The sample size isn't the problem; the statistical test corrects for that. It is the researchers' failure to correct for number of tests that makes this evidence so weak.

2. They did their dozens of tests on highly correlated variables. This is like buying two of something you only need one of. A big waste. That they measured something as specific as vinyl flooring implies they gave a long questionnaire to their subjects. Perhaps there were 100 questions. Answers to those questions are likely to be highly correlated. Expensive homes tend to be different in several ways from cheaper homes. The presence/absence of vinyl flooring is likely to be correlated with family economic conditions and condensation on windows (more expensive = better ventilation). The researchers could have used factor analysis or principal components analysis to boil down their long questionnaire into a small number of factors – like 4. So instead of doing 100 tests, they could have done 4 much stronger tests. Then, if there was an unexpected correlation, there would be a good reason to take it seriously.

Someone quoted later in the article gets it completely wrong:

Dr. Philip Landrigan, a pediatrician who is director of the Children's Environmental Health Center at Mount Sinai School of Medicine, called the results "intriguing, but in my mind preliminary because they are based on very small numbers."

Nope. Statistical tests correct for sample size. This is like an astronomer saying the sun revolves around the earth. In this article this happens twice.

Scientists who don't know statistics « BC in OC (2009-04-01 17:13:59)

[...] Scientists who don't know statistics Posted on April 2, 2009 by bryan Seth Roberts catches a fundamental mistake, repeated twice, in a Scientific American article. So neither the researches conducting the studies realized this, nor the article author. [...]

Andrew Gelman (2009-04-01 18:16:34)

It's a bit strange that they'd use a pediatrician as a spokesman about epidemiology. First off, the reporter shouldn't be thinking of a doctor—even the "director of the Children's Environmental Health Center—as an expert on epidemiology. Second, the pediatrician should've known better and referred the reporter to a statistical expert.

seth (2009-04-02 06:47:00)

Dr. Landrigan is an epidemiologist. "Dr. Philip Landrigan has long played an important role in advancing the field of pediatric environmental health—first as an officer in the U.S. Public Health Service, then as an epidemiologist with the Centers for Disease Control and Prevention, senior advisor on children's health to the Environmental Protection Agency and, most recently, director of the Mount Sinai Center for Children's Health and the Environment, which was established in 1998 as the first of eight such national research centers."

Andrew Gelman (2009-04-02 11:49:25)

"Advancing the field of pediatric environmental health" isn't the same as actually doing epidemiology, though. It can't be a good sign that his primary identification is "pediatrician" rather than "epidemiologist."

seth (2009-04-02 14:21:54)

That he was called a "pediatrician" is just a bad mistake by the journalist.

"Figures can lie and liars can figure." | brianfrank.ca (2009-04-04 16:04:23)

[...] For example, um, the alleged link between autism and vaccine— which isn't even correlative but nevertheless generated a vocal social movement. (But with the vaccine ruled out, hey maybe there's a link between autism and vinyl floors...) [...]

â€œBafflingâ€ Link Between Autism and Vinyl Floors via Seth's blog | Murphy Educational Consulting LLC (2009-04-08 12:28:47)

[...] I particularly enjoyed a recent post titled "'Baffling' Link between Autism and Vinyl Floors". In fact I loved it so much that

I sent the link to all of my nerdy statistics loving friends. At first, it seems like an amazing break through... Scientific America writes that: "Children who live in homes with vinyl floors, which can emit chemicals called phthalates, are more likely to have autism, according to research by Swedish and U.S. scientists published Monday. [...]"

## Coconut Oil and Alzheimer's Disease (2009-04-01 17:49)

I [1]recently blogged about the discovery of Dr. Mary Newport, a Florida doctor, that her husband's Alzheimer's got better when he ate coconut oil. Dr. Newport now has [2]a website devoted to the subject.

1. <http://www.blog.sethroberts.net/2008/12/01/self-experimentation-on-someone-else-alzheimers-disease/>
2. <http://www.coconutketones.com/>

---

Andrew Gelman (2009-04-01 18:17:34)

Seth: Why are you so quick to believe this and so skeptical of the report (in your previous blog entry) on vinyl flooring?

Confidence (2009-04-01 19:15:04)

Thank you very much for this link. But good point by Dr. Gelman :).

seth (2009-04-02 06:42:39)

In this case the evidence is far better, in three ways. 1. There is substantial outside reason to believe the results. 2. The data come from something like an experiment rather than a survey. 3. The false positive problem isn't present.

Darkhorse (2009-04-03 11:06:20)

My husband, 54, had begun showing troubling signs of MCI about three years ago. An economist and mathematician, his increasing incidences of errors in calculations, and sometimes misunderstanding what others were talking about were definitely not like him at all. I was secretly very worried, and insisted on cognitive testing. Oddly, though, he scored very high in every area, including IQ and cognitive reaction. After showing him your December 2008 post about Steve Newport's results, we agreed to try a judicious regimen of daily coconut oil, starting in January 2009. Within two weeks I could see improvements, and today we both agree that something is very much changed. I can see that his mental acuity is back normal, and he never forgets an appointment. I am very grateful to you for this, and for the link to this new website, which I shall be watching very carefully. Thank you for your always finely crafted, intelligent and thought provoking blog.

seth (2009-04-03 14:02:39)

You're welcome, Darkhorse, that's great! MCI = mild cognitive impairment?

Worried (2009-09-16 19:52:19)

Sure, sure. I've researched the entire Internet for the curative powers of coconut oil for Alzheimer's (my mother suffers it) and NOTHING. How can the entire world be spinning the story of a "fact" about which there's NO EVIDENCE? I'm very glad for Dr. Newport and her husband, but PLEASE TREAT SERIOUS ISSUES SERIOUSLY! We've come a long way (or haven't we?) since the old times of snake oil! So many months later, where is at least ONE MORE CASE of an Alzheimer's patient who has benefitted from coconut? PLEASE!

seth (2009-09-16 20:16:11)

I suggest you contact Dr. Newport about this.

E. Smith (2009-10-16 11:21:38)

Can the coconut oil/MCT oil mixture be put in a cup of coffee, or will the heat destroy its effectiveness?

Rick H (2009-11-29 11:49:00)

Snake oil helped the chinese who were hewing a railroad bed out of the rocky mountains. Dr. Newport is serious about coconut oil-so I am. There is no big money in coconut oil so don't expect the drug companies to get excited. The largest, best test starts with a single anecdote. If you think it wont work for you, you are correct-this is the negative placebo effect. Most medicine needs faith for good results. I tried coconut oil but found diarrhea to be a problem. Any suggestions on Diarrhea from all that oil?

seth (2009-11-29 14:53:10)

Diarrhea and oil: timing matters. I have found that if I take flaxseed oil just before bedtime, diarrhea is much less of a problem than if I take the same amount in the morning.

ladyjanegrey (2010-01-11 12:16:13)

Regarding diarrhea and oil: I have heard that coconut oil should be introduced slowly into one's diet, because it is an anti-fungal, I believe, and likely to cause die-off. Perhaps starting with a small amount and gradually increasing would help. Or, I would imagine that it would be easier on the stomach if taken with something else, such as spread on bread.

Ladybugbritches (2010-02-13 09:20:35)

I say, Give it a try, What have ya got to lose? Your Mind?? My Mom has Alzheimers, I just bought a jar of virgin coconut oil and I plan to give it to her (and my dad, caretaker) for Valentine's day. I hope it helps her.

pam (2010-03-11 08:49:31)

I started this with my father who is well beyond MCI - a combination of smoking and drinking to excess in earlier years, 17 meds for COPD and congestive heart failure, etc. Although he's not the Mensa thinker he was in his 50's, at 89, his is much more alert, happier, and his well-being has been enhanced. If I had known about this earlier, I would have done it years ago. He gets a tablespoon in his cheese grits in the morning, plus another tablespoon in the evening, usually in Tang or in some juice. Yes, it sits on the top, and you have to stir it in, or heat the juice a little. (Yes, and no comments re: cheese grits - at this age, you feed them what they will eat, LOL)

Eneida (2010-04-13 10:38:38)

After Mom learned about Mary Newport 's discovery in a Tampa newspaper article last year, we began the diet for my Dad (age 88) and suffering from vascular dementia . Two weeks after using the Extra Virgin Coconut oil he got up from bed and was back into his normal functions , going to the bathroom by himself and doing much better. After a month my Dad began remembering family members as normal and getting (mentally) more clear. After six months in the coconut oil , MCT and Omega 3 diet my Dad can remember and says his prayers and is more sociable. We do not give him any food containing vegetable oils, mayonaise, margarine, etc ... The main ingredient we use in food preparation is Coconut (coconut milk, coconut oil, MCT oil) also extra virgin olive oil and the Omega 3, three times a day. He hasnt have a set back since he got in this diet and he no longer needs to use diappers. It has been a tremendous brake for Mom who is the main care taker...The doctor has said that my Dad has came back to who he was before. My Dad is hypersensitive to medications so he is mostly on supplements and vitamins. We give him alternative medicine for all his conditions and he is responding real well. Now all the family uses the Coconut diet as a regular diet since it is so healthy...

Luz (2010-04-13 11:32:36)

For those that get diarrhea with Coconut we found that using it with vitamin D supplement helped to balance the problem. My Dad used to get constipated using vitamin D, so now he can use those supplements without any problems. My

father is also allergic to dairy products and doesn't go out as much anymore to expose to sun rays, so Vitamin D supplement is good for him. Also it seems that as we get older the absorption of this vitamin sometimes slows down as well. <http://ods.od.nih.gov/factsheets/vitamind.asp> [http://1stholistic.com/nutrition/hol\\_nutr-toxic-dosages.htm](http://1stholistic.com/nutrition/hol_nutr-toxic-dosages.htm) We do not want to impose this coconut diet to anyone but just offer testimony of the benefits we experienced. Scientific or not, we have been on this diet for about a year now, and Coconut did not seem to hurt anyone in my family, so we continue using it with much faith and hope as we got positive results. My Dad suffered advanced Dementia and he is doing a lot better now. He is back to his family life and normal functions and that is what we care about. Sorry to hear that some people did not get positive results, it is important to follow the diet by also eliminating saturated fats, vegetable oils, margarine and mayonnaise. Also we have used coconut along with MCT oil, Omega 3 or fish to get good results. We are also into organic foods and natural medicine. I have found studies showing the benefits of coconut. Also there are statistics on countries that use coconut and fish in their diets and the low rates of certain diseases. We need to remember that science does not always hold all the answers. I found these web sites hope they can help: <http://www.ncbi.nlm.nih.gov/pubmed/14608053?dopt=Abstract> <http://www.dailynews.lk/2007/06/09/fea06.asp> <http://www.apccsec.org/truth.html> We know how frustrating it could get, best wishes for those who are fighting against Alzheimers and Dementia. Keep the hope ...

Marley (2010-07-06 16:16:25)

I gave my mom some coconut oil I had in my cupboard right after reading Mary Newport's article. Does it matter if it's virgin, or refined coconut oil? I had the refined, for high heat cooking. It has little to no scent or taste. Does the refining process affect the MCTs? The next day, we bought virgin organic at the health food store, thinking that the product should be in its most raw form, but she can't stand the smell, or taste. (Funny thing - she loves coconut!) We began this three days ago, and I do see some mild improvement. Her mood has been good, and she is a bit more fluid in her vocabulary. I am hopeful. Thanks for this blog.

Sylvia (2010-07-10 18:39:49)

I just bought some virgin coconut oil today at Whole Foods. Started mom out with 1 tablespoon in the morning and one on the evening. I also ordered some MCT oil (gold) over the internet. Mom has dementia that has progressed in the last 6 months especially after she had a fall 3 weeks ago. One of her Dr's gave her Aricept awhile ago which made her violently ill so I am all for anything that is natural. I will keep posting here as to her progress to let everyone know.

Bill (2010-08-03 12:16:40)

Word of caution to those who subscribe to the mainstream medicine mantra and dismiss the "anecdotal" and the un-"scientifically proven" theories outside the norm in mainstream medicine - your habits and your beliefs may lead you to an early grave. Why is it that people tout taking Coconut Oil from nature and created by God, not man, as extremely harmful due to some diarrhea or some other minor side effect that might occur - and becoming violently ill or dying from prescription drugs is of little concern? or stacking drug on top of drug on top of drug into an elderly person's daily regimen is acceptable when everyone knows there is no scientific study done on any multi-layered therapy like that where you have a cholesterol med, sleep aid, mental health pill, anxiety pill, 4 different pills for side effects and who knows what else? Come on people - these are human beings who have families and friends and deserve to be treated as such - not filled with pharmaceutical drugs and left to die at whatever pace they might die at. Thanks Seth! Keep up the good work.

Allison Williams Hill (2010-12-01 08:04:29)

I have been living in the Caribbean (BVI) for over 15 years with my husband who has been diagnosed with senile dementia. There are other people in the same situation here as well as with Alzheimer's. I wonder how far they've looked for evidence. I use coconut oil and rotate it with others in cooking (pancakes, eggs) but not stirred in cereal. I'll try this and see if there is any change. We live near a transformer the government swears is not doing any harm. I documented the energy levels. Have taken precautionary measures when I knew its danger and put physical remedies in place. We are in the process of relocating.

ted (2011-06-22 10:36:37)

Where do people think drug company's get drugs from? Guess what! most come from plant sources!

## China and Electric Cars (2009-04-01 22:28)

According to the [1]New York Times,

Chinese leaders have adopted a plan aimed at turning the country into one of the leading producers of hybrid and all-electric vehicles within three years, and making it the world leader in electric cars and buses after that.

Since I live in Beijing, I am glad to hear this. The story omits an important detail. Every day in Beijing, dozens of electric bikes zoom by me as I ride my non-electric bike. There are 30 or 40 models available, average price about \$300. This means when battery makers make car batteries, they will build on a wealth of experience derived from making millions of bike batteries. This isn't China with cheap labor, as Americans usually imagine the situation; this is China with more experienced labor. It isn't obvious that American car makers can ever catch up.

The article continues:

Electric vehicles may do little to clear [China's] smog-darkened sky . . . . China gets three-fourths of its electricity from coal, which produces more soot and more greenhouse gases than other fuels. A report by McKinsey & Company last autumn estimated that replacing a gasoline-powered car with a similar-size electric car in China would reduce greenhouse emissions by only 19 percent. It would reduce urban pollution, however, by shifting the source of smog from car exhaust pipes to power plants, which are often located outside cities.

Please. It is far easier to clean the output of a few hundred power plants than a few hundred million cars.

The United States Department of Energy has its own \$25 billion program to develop electric-powered cars and improve battery technology, and will receive another \$2 billion for battery development as part of the economic stimulus program enacted by Congress.

I think it's too late. If the \$25 billion were used for rebates to encourage electric car buying, as the Chinese government is doing, that might work, but there aren't any decent American-made electric cars to be bought.

In [2]related news, Tsinghua University (above all an engineering school) undergraduates who come to America for graduate school now account for more American-trained Ph.D.'s than any American school. In case you think that American engineers are better trained than Chinese ones.

---

1. [http://www.nytimes.com/2009/04/02/business/global/02electric.html?\\_r=1&ref=global-home](http://www.nytimes.com/2009/04/02/business/global/02electric.html?_r=1&ref=global-home)

2. [http://www.sciencemag.org/cgi/content/full/321/5886/185?sa\\_campaign=Email/snt](http://www.sciencemag.org/cgi/content/full/321/5886/185?sa_campaign=Email/snt)

Nadav Manham (2009-04-02 00:26:41)

Seth, Do you have a sense of whether Tsinghua undergraduates who come to America for graduate school tend to stay in America (or wish they could) or return to China to pursue their careers?

Helen (2009-04-02 01:14:20)

As a student major in vehicle making, I think there is a long period before the electric cars in widely use, especially in China.

david (2009-04-02 05:26:30)

> Please. It is far easier to clean the output of a few hundred power plants than a few hundred million cars. Also, plugin-hybrids and electric cars are typically charged over night during off-peak times, so they improve the efficiency of the power plants.

NE1 (2009-04-02 07:15:21)

Your last sentence is a non-sequitur. I might draw from your interesting fact that Tsinghua is big, and maybe that it produces more reliable graduates than other Chinese institutions. If individual elite schools accepted more from Tsinghua than a particular large elite American school, then I would start to reconsider. It's obviously tough to tell though, because of visa stuff.

seth (2009-04-02 09:21:27)

Nadav, I think Chinese students who get Ph.D.'s in America are becoming more likely to return to China (comparing now with 10 years ago, say) because of more opportunities to do research and better business opportunities. NE1, I think elite American grad schools do accept more Tsinghua students than students from any particular elite American school. More Tsinghua students than MIT students, for example. I am trying to say that there is no great difference in the formal education received by the best Chinese engineers and the best American engineers.

## **Fermented Food and Athlete's Foot (2009-04-02 19:52)**

A few weeks ago I went away for a 3-day weekend. It was my first trip away from home since I became enamored of fermented food. I did not plan well and took along only 2 cups of yogurt.

When I got home – and resumed my usual high fermented-food intake – I seemed to have a very mild cold. That was unusual; I almost never get detectable colds. Even more unusual was that I had a small case of athlete's foot. Uh-oh. I planned to put some anti-fungal cream. I forgot, however. The next day, to my surprise, my athlete's foot was almost gone. The following days it cleared up completely.

I had not had athlete's foot for a long time. In the past, however, it did not go away by itself. I had had to use antifungal cream. Now, apparently, my immune system was working much better.

My interpretation is that during that weekend away, my immune function took a sudden dip. Perhaps part of the reason was that I did not sleep as well as usual but I suspect most of the reason was the decrease in my fermented-food intake.

Whatever the reason I got athlete's foot that weekend, the fact that it went away without any special treatment suggests that all that anti-fungal cream in the drugstore implies that many Americans have suboptimal immune function. The [1]Wikipedia entry for athlete's foot says nothing about good immune function as a means of prevention. As if the hundred-odd people who wrote the article had no idea that what happened to me – it went away on its own – could happen. We are in the pre-John-Snow era here. The most basic practical point about athlete's foot – you won't get it if your immune system is working well – isn't widely understood.

If you read Example 5 of my [2]long self-experimentation paper, you will see that I used to get ordinary colds at

an ordinary rate but after I started sleeping much better they stopped. Which points to the same conclusion as the incident I described here: A large fraction of Americans have suboptimal immune function. Some people will say: "Of course!" But they will go on to say, "The average American eats so much junk!" And I think that's wrong. I think the problem is 1. Poor sleep. 2. Too little fermented food. The self-confident nutritionista will never mention either one.

1. [http://en.wikipedia.org/wiki/Athlete%27s\\_foot](http://en.wikipedia.org/wiki/Athlete%27s_foot)

2. <http://repositories.cdlib.org/postprints/117/>

---

Gian (2009-04-03 03:23:46)

If your immune system can not withstand 3-day lack of yogurt then the immune system was not optimal to begin with. Suggest cut out flax seeds.

SB (2009-04-03 07:33:51)

I would be very worried if my immune system was so dependent on fermented food intake. Maybe you need to slowly cut back on the amount and frequency going forward.

seth (2009-04-03 08:33:03)

SB, you seem to be saying that your immune system doesn't depend on fermented food intake. How do you know that?

SB (2009-04-03 09:36:44)

I am thinking that frequency and amount of fermented food intake should be random - similar to exercise frequency and intensity as described by Arthur De Vany (Evolutionary Fitness).

seth (2009-04-03 10:54:49)

I see. Thanks for explaining that.

Aaron (2009-04-03 15:10:41)

I would like to make a comment that you may be jumping the gun on a weak immune system and athlete's foot. While my immune system is quick to respond to other illnesses- i have been- in the past- subject to getting fungal problems on my feet. Here is a list of reasons why problems could have occurred: 1: old shoes— fungus has had a chance to gain a foothold. 2: wearing the same sock and shoes all day when you are active. (more sweating- the fungus likes warm areas of low oxygen) —wearing tight shoes or socks would possibly be a problem! 3: have you changed the type of soap you wash with

Aaron (2009-04-03 15:11:44)

noticed that certain soaps that dry my feet out make it more likely for a fungal infection to gain a foothold- so i have to be careful about what products I use. 4: how much do you sweat? I'm positive that people who sweat more have a higher risk of athlete's foot. the question is, would you have this problem if you were barefoot?

Aaron (2009-04-03 15:12:58)

5: immune system dysfunction:

bob (2009-04-03 15:14:49)

As an aside, i have also noticed that my chance of athlete's foot has actually gone up (!!) when I've consumed a lot of fermented products (natto, alcohol, probiotic supplements)

## Ask Google: "Easiest Way to Lose Weight" (2009-04-02 20:01)

If you google "easiest way to lose weight" the first entry is [1]this. The people have spoken.

Thanks to [2]Buttercup.

## Human Evolution: The Curious Case of To Have (2009-04-03 14:25)

A year ago, in a Berkeley Starbucks, I met a linguistics professor in town for a conference. I asked him how he thought language began. He dismissed the question: We will never know, he said. Speculations on the question are pseudo-science. [1]Johanna Nichols and I taught a graduate seminar about the evolution of language and I will admit that none of the papers we read were impressive.

All were by linguists and all looked at language and nothing else. If you look more widely at how humans differ from our closest ancestors the question of how language evolved becomes easier. It's one of many changes that pulled in the same direction: the rise of occupational specialization and trading. Language began because it made trading much easier. Language – single words – made it much easier for the two sides of a trade to find each other.

Single words are still used this way. In any business district, you will see single words on signs that advertise what a business has for sale (e.g., "doughnuts"). Long ago, of course, there were no signs: People just said words in the hope of finding someone who wanted what they had or had what they wanted.

This theory implies that possession (who has what?) was the very first topic of conversation. This theory is supported by the fact that the verb to have plays a remarkably central role in English: I have written, I had a good time, I had had a fair amount, I have to reach. You might think to be would be more important, but it isn't. This pattern suggests that to have was one of the very first verbs, maybe the first.

Chinese has no tense markers (I go yesterday, I go today, I go tomorrow) but again possession appears to have been present close to the beginning of the language. Here is how you negate a verb in Chinese:

to have and other "state" verbs: with mei

all other verbs: with bu

[2]The more irregular a verb, the older it is likely to be. (Thanks to Navanit Arakeri for the link.)

[3]Earlier post about the evolution of language.

---

Tom (2009-04-03 17:56:30)

I wonder if trade was the first application...it seems rather advanced. Wouldn't a possible order be: - shriek of danger (alert rest of group) - variations on the above, associated with particular kinds of threats - extensions to add direction to or location of threat then adapting the above for hunting: - particular sounds associated with coordinating attacks by the group ie, wouldn't language evolve to enable the behavior below before trading of goods? <http://www.youtube.com/watch?v=A1WBs74W4ik>

seth (2009-04-03 18:38:45)

Tom, your scenario would apply to hundreds of species. Hundreds of species have alarm vocalizations.

Michael Van Cise (2009-04-04 08:22:18)

Did you hear about Bonnie the Orangutan who spontaneously started whistling? <http://www.npr.org/templates/story/story.php?storyId=100875176> The story suggests that some think this phenomenon may provide some insight into the beginnings of language.

JR Minkel (2009-04-04 14:49:35)

I've wondered when and why written prices came about - e.g., the thing above and behind the counter at McDonald's. I assume it was so customers could be more confident a merchant was charging everybody the same price.

KenF (2009-04-04 19:29:43)

Linguists' abhorrence of this topic is famous and longstanding, to quote wikipedia: [http://en.wikipedia.org/wiki/Origin\\_of\\_language](http://en.wikipedia.org/wiki/Origin_of_language) The question of language origins seemed inaccessible to methodical approaches, and in 1866 the Linguistic Society of Paris famously banned all discussion of the origin of language, deeming it to be an unanswerable problem.

Aaron Blaisdell (2009-04-05 09:08:43)

Seth, I never noticed that "mei" (the correct pin yin spelling of the word, you spelled it as "mai" - it is pronounced as "may") is only used to negate "you" (to have), and all other verbs in Mandarin are negated with "bu". Q: "Ni You, mei you che fan?" = "Have you eaten yet?" (note that "mei you" is pronounced as "mayo" as in "tuna on rye, hold the mayo"). A: "you" = I have. "mei you" = I haven't. Q: "Ni Shi, bu shi da xue lao shi" = "Are you a college professor?". A: "Shi" = I am. "Bu shi" = I am not. It's also interesting that many languages such as French (and other Latin-based languages?) express feelings and states of being with an ownership verb. Such as "I have hunger", "I have 34 years" (instead of I am 34 years old).

seth (2009-04-05 10:16:12)

Thanks for the spelling correction, Aaron. My observation about mei and bu comes from my Chinese textbook. I once called your house and asked for you. "Mei you" said the woman who answered the phone.

Seth's blog » Blog Archive » My Theory of Human Evolution (directory) (2009-04-05 13:42:01)

[...] the curious case of to have to have is different from other verbs, which supports the idea that language was first used to tell who has what [...]

Patrik (2009-04-05 20:10:27)

Literally speaking, the verb "to have/possess" does not exist in Hungarian. One has to use the verb for "to be/to exist" and apply the proper possessive suffix. For example: Van blogom . Translated: I have a blog. Literally translated: It exists/is blog-my.

Aaron Blaisdell (2009-04-06 09:47:18)  
Patrik, How Zen!

Nathan Myers (2009-04-06 15:21:04)

This could be a fun notion to speculate about, but (1) it's not subject to experiment, and (2) it's \_particularly\_ not subject to self-experiment. No one has any sound reason to pay attention to what you say about it, and anyone else caught up in it is the least likely to have anything interesting to say. This is your blog, and you can write about whatever you like, but as it gets less interesting, it gets harder to justify time to read it. I have my own cranks.

seth (2009-04-06 20:10:04)

Nathan, this particular data is tied in with many other data that support my ideas about human evolution, which I've blogged about many times. You seem to be saying because I'm not a linguist "no one has any sound reason to pay attention" but I think you're wrong: I think linguists should be interested in how data outside linguistics – from my many other posts on human evolution – can shed light on how language began. This is the sort of thing that a non-linguist is more likely to do than a linguist.

Nathan Myers (2009-04-07 15:43:11)

That came out more combative than I intended. My contention that nobody has any reason to pay attention to such speculations is *not* because you're not a linguist. Rather, it's simply because nobody – not me, not a linguist, and not you – can have anything useful to say about the origin of human language. It's not subject to any sort of verification. All our historical evidence, including any irregularities in treatment of "to have", is many, many linguistic generations removed from language's origins. There's just been plenty of time for all echoes of the origins to wash away and be replaced by modern substitutions, and for those to wash away and be replaced again. I don't know what extra-linguistic data you mean.

seth (2009-04-07 18:56:11)

Nathan, you can find a directory of the extra-linguistic data here: <http://www.blog.sethroberts.net/category/human-evolution/my-theory-of-human-evolution-directory/> "It's not subject to any sort of verification." I think you're overlooking something. There's a principle of inference: If two rare events might have the same cause, they probably do. Lightning doesn't strike twice in one place for different reasons. Humans differ in a dozen different ways from all other species. In other words, ten thousand species, including our closest relatives, are one way; humans are another way. Language is just one example of human exceptionalism. The dozen different ways that humans differ from all other animals, if they might have the same explanation, they probably do have the same explanation. So the explanation for the origin of language should be consistent, if possible, with the explanation of the many other ways humans differ. That's a test.

Nathan Myers (2009-04-07 20:49:15)

I've read some of the pages you linked. Specialization is a very late, perhaps even civilized development. Our own recent ancestors, almost in living memory, spun, wove, and sewed their own clothes. Ā-tzi the Iceman, 5300 years ago, made his own arrows and participated directly in smelting copper, yet roamed the hills like a shepherd. You have to go back to *Homo erectus* – more than a million years – to discover what differences set humanity on its exceptional course, and then somehow distinguish those from others that arose *because* we were different. If *H. erectus* had speech, then speech happened far too long ago to relate to any detail in present human behavior. If speech came later, then it's a downline consequence of human exceptionalism. Anyway, it's absurd to conjecture that a dozen defining differences arose spontaneously at the same time. One or two distinguished us, and the rest are consequences or incidentals. Speech cannot be among the one or two, because the rest (e.g. upright posture) cannot be consequents of it. American libertarians insist that free markets are not an invention, but arise spontaneously as a necessary consequence of natural laws. You're drifting dangerously close to their orbit. Yes, it's interesting that commerce is an example of an activity that can make use of subgrammatical language, but that's no basis for a theory of language origin.

seth (2009-04-08 10:30:53)

"Specialization is a very late, perhaps even civilized development." Hmm. What do you mean by "very late"? And how do you know? I'm not saying that "a dozen defining differences arose spontaneously at the same time." I'm saying, and apparently you agree, that they combine to make a coherent story.

Duncan (2009-04-08 11:15:50)

This reminds me of the language-learning game "Where Are Your Keys?" devised by Evan Gardner. As I understand it, the language learner has to use signing and the objects to hand to get from the teacher how to name things and talk about their ownership and possession (hence the game's name). One of the first challenges is to persuade the teacher to hand over (or swap) something of his. Gardner claims this play makes for very rapid language acquisition, which seems to chime with your theory. "Where Are Your Keys?" sounds fascinating but seems to have only a very few converts. The only information I have about it is from the podcast below: <http://www.mythic-cartography.org/2009/03/04/episode-23-where-are-your-keys-a-n-interview-with-evan-gardner/>

evan gardner (2009-04-25 03:27:06)

Where Are Your Keys? only has a few converts because I have only told a few people about it. It is a game that I made up by watching how the most effective teachers teach. The subject matter is not that important. The important thing is that certain learning/teaching techniques work, so why not use the most effective techniques as much of the time as possible... and why not train the students to use the same techniques on the teacher not only to more effectively "fish" for the target information but to simultaneously show the teacher their (the student's) current level of mastery both in the target subject as well as the teaching methodology. In that way you train fluent students who are at the same time teachers in training. That is the quick answer of Where Are Your Keys? As to the learning of a language... SPEED is the most important uniting concept. 1. Speed to acquire the target information ( a new language), 2. Speed to acquire faster more effective learning tools to exponentially increase the learning itself. If you are going to learn a language then learn it as fast as possible. In order the learning and teaching of languages should proceed in this order... Limit the number of nouns. 10 nouns should teach you any language. (choose your nouns well) Agree on hand signs for each of the nouns. Agree on hand signs for the following words in this order. ( I use American Sign Language (ASL) and Pidgin Signed English (PSE) because you might as well learn two languages at the same time. Give each participant an object... This object or prop from the 10 nouns is now that persons (ownership). I, you, he, she, it, we, you all, they mine, yours, his, hers, its, ours, your alls, theirs want, have, give, take I want your rock. you want my food? you want me give you my food? then you give me your rock. If this is the fastest way to learn an language they why wouldn't it be the foundation, the origin, the "needs gap" solution to all our problems? I want what you have! Small kids begin to practice their understanding of abstract language very early. They hold up and object (usually that is clearly NOT theirs) and ask "MINE?" This question is usually linked to an object that they want or at least like. Origin of language? At least it is the origin of each persons' relationship with language. If you are in a language class of any kind and they do not cover "want, have, give, take" in the first few classes (some languages are harder to deal with than others and need some set up to get to this point) either ask or leave and find someone else who will tell you. Then go back to class and try to talk the teacher out of items that are "HIS" or "HERS" You may have to trade something of "YOURS"

seth (2009-04-25 04:08:04)

Thanks, Evan, that's very interesting. I suppose the game should be called "I Want Your Keys". Animals have a sense of possession. If you try to take a dog's food away from it it will bite you. why the hand signs? where do they come in?

evan gardner (2009-05-12 18:38:04)

The first step of the game could very well be called "I want your keys". But the game is called "where are your keys?" because that simple question is the next step or level in fluency progressing from "what" and "who" and "which" questions to "where" and "when" and "how" questions. A fast fluency level probing question in any language is "Where are your keys?" By the answer I know almost exactly how fluent a person is. The hand signs are important to the speed of language transition. If a student is gesturing "yes" but is voicing "no" then I know two things... First, that the student isn't sure of the correct language. Second, I know that the student means what they are signing and not what is coming out of their mouth. It is a strange

phenomenon but almost 100 % accurate. We call this technique "your lips say no but your body says yes." So watch for the persons body language, not their verbal language... if you know how to read body language (sign language) you will gather more of the true communication and less of the noise.

seth (2009-05-12 19:03:38)

Thanks, Evan. That's brilliant.

Sol (2009-09-12 10:47:11)

very interesting. This topic fascinates me: I love observing how my 2 year old son acquires language and I have noticed that possession for him is of utter importance. Still it was a sad day for me when he learned to say: "mine"...

Sophie Jaworsy (2009-10-30 17:41:41)

I love how your statements are shown. Lovely! Sincerely, Sophie Jaworsky

AppoiGetype (2010-06-28 15:15:57)

### **Nobel-Prize Cluelessness (stomach ulcers) (2009-04-03 17:44)**

Wherein the Nobel Prize is given for discoveries that are misleading. From [1]a New Scientist article about medical self-experimentation:

Junior doctor Barry Marshall was sure the medical establishment was wrong about the cause of stomach ulcers. The received wisdom was that they were caused primarily by lifestyle factors, but Marshall and pathologist Robin Warren were sure that the bacterium *Helicobacter pylori* was to blame.

It turned out that *Helicobacter pylori* was present in half the stomachs in the world – only a tiny fraction of which developed ulcers. So much for causation. Marshall and Warren did not consider that lifestyle factors might cause immune efficiency to go down, leading to increased growth of the bacterium. In a famous example of self-experimentation, Marshall ingested a giant amount of the supposedly dangerous bacterium – but, uh-oh, didn't get an ulcer.

Thanks to JR Minkel.

1. <http://www.newscientist.com/article/dn16735-eight-scientists-who-became-their-own-guinea-pigs.html?page=2>

---

Dennis Mangan (2009-04-04 07:07:24)

The article said that he was infected and got "gastritis, which can eventually lead to ulcers." Also, stomach ulcers are treated with antibiotics. It's like saying that *S. aureus* doesn't cause infections because it resides on lots of people's skin and nasal tracts. Doesn't follow. Few bacteria cause outright illness with no other factors involved.

seth (2009-04-04 08:36:10)

Dennis, I'm afraid I don't understand your point. If ulcers are in fact a sign of an immune system working poorly, they would be better treated with treatments that boost the immune system.

Dennis Mangan (2009-04-04 09:20:04)

Seth, originally I had trouble understanding your own point. I understand you to be saying that the real cause of ulcers is a poorly functioning immune system. What I'm trying to say is that it is perfectly reasonable to state that *H. pylori* causes ulcers, just as it is reasonable to state that rhinoviruses cause colds, even though perhaps only people with run-down immune systems get either one.

Todd Hargrove (2009-04-04 09:28:40)

I believe Robert Sapolsky discusses this in his book *Why Zebras Don't get Ulcers*. I believe the conclusion is that *Helicobacter* is a necessary but not sufficient condition to get ulcers. And that Marshall deserved some credit for changing some minds. On a related point, Stephan at Wholehealthsource and Peter at Hyperlipid have each recently discussed the fact that *Helicobacter* and other bacteria in the body may feast and grow on hydrogen - a bacterial byproduct of poor digestion in the gut. For example, see <http://wholehealthsource.blogspot.com/2009/02/sugar-hydrogen-bacteria-and.htm>

seth (2009-04-04 09:50:40)

Dennis, thanks for explaining that. You are right, that is how causation talk often goes. But it is misleading. If 100 % of people were infected with *Helicobacter pylori*, would it still make sense to say the bacterium causes ulcers? Well, no.

JR Minkel (2009-04-04 09:55:20)

Seth, I actually didn't realize how complicated the Marshall story was. Then I started reading this: <http://www.csicop.org/si/2004-11/bacteria.html> Seems like a textbook example of the oversimplification of scientific history.

Dennis Mangan (2009-04-04 13:01:40)

Seth, I hate to belabor this point, but probably the great majority of infectious illnesses have at least something to do with a compromised immune system. For example, zinc supplementation has been shown to dramatically decrease incidence of the flu, because zinc strengthens immunity. But one would not want to say therefore that the influenza virus does not cause the flu. An immune system at 100 % functioning might be able to stop almost any infection, but that doesn't mean that microbes aren't the cause of illnesses. Likewise, only 20 % of lifelong smokers develop lung cancer, probably because their immune systems don't eliminate cancerous cells. Therefore cigarettes don't cause lung cancer? Likewise, many people are carriers of *Staphylococcus aureus*, which causes boils among other things, just as many carry *H. pylori*. No matter how many people don't get boils, *S. aureus* still causes them, just as *H. pylori* causes ulcers. Does anyone besides yourself believe that the Nobel Prize was given to these men by mistake?

JR Minkel (2009-04-04 14:35:12)

It sounds like this debate turns on what we mean by "infection." I think when we use that term it generally means the out of control growth of some microorganism. Same with cancer. We may have pre-cancerous cells sprinkled here and there in our bodies but until they start growing into potentially life-threatening tumors we wouldn't diagnose it as cancer.

seth (2009-04-04 14:57:11)

Dennis, I have never heard anyone else make this point, no. If I simply posted what everyone already knew - or at least agreed with - it wouldn't be a very interesting blog.

Nathan Myers (2009-04-06 15:26:30)

It seems worth noting here that the Spanish Flu that killed millions early in the last century (and which incidentally, started in the midwest U.S., and spread by U.S. military deployment), hit hardest those with the strongest immune systems.

How dangerous is it to use recycled bacon grease for frying fish, meat, etc. on a strict low cholesterol diet? (2009-04-08 21:45:04)

Barry Marshall did not give himself an ulcer « A Fistful of Science (2009-04-10 12:10:12)

[...] Seth Roberts goes so far as to say the bacterium is not even the cause of stomach ulcers: Marshall and Warren did not consider that lifestyle factors might cause immune efficiency to go down, leading to increased growth of the bacterium. [...]

Seth's blog » Blog Archive » Does H. Pylori Cause Stomach Ulcers? (2009-09-10 16:34:26)

[...] In a previous post I said that the Nobel Prize to Barry Marshall and Robin Warren — for supposedly showing that H. pylori causes stomach ulcers — was a mistake. Because half the world has the bug in their stomach, and only a tiny fraction of them get ulcers, the true cause of those ulcers lies elsewhere, probably with an impaired immune system. Marshall famously drank a flask full of H. pylori and didn't get an ulcer, yet took this to support his theory. A classic example of self-deception. Recently Lam Shiu-kum, a former dean of medicine at the University of Hong Kong, was convicted of a giant fraud. He siphoning millions of dollars of medical fees into his own pocket: Dr Lam, 66, brought a 39 year association with the university, his alma mater, to an abrupt end in March 2007 when the investigation into billing irregularities began. He is a distinguished gastroenterologist who conducted pioneering research into chemoprevention of stomach cancer through the eradication of *Helicobacter pylori*. His team also conducted the first double blind, controlled study into curing peptic ulcers by H pylori eradication. [...]

Seb (2010-11-20 09:09:26)

Seth: I dont understand your last point, you can watch thieves in every area and that doesnt mean that everyone that works in that area is a thief. For your information the presence of a pathogen is not directly related to the physiological expression of a disease, but if a pathogen is the cause of a disease its absolutely necessary their presence in the body (known as infection), other factors that affect the development of the disease are the pathogenicity (in the H.pylori case the presence or absence of virulent factors that allows the bacteria to be more aggressive with the host, such as CagA, VacA, flagellin, etc) that will depend on the genotype or specific strain that is infecting the host (*Helicobacter* is known for modify its genome sequence very often), and the multiplicity of infection, that means that a sudden rise of the number of bacteria could provoke the symptoms of the disease, but if this amount remains low you could live infected for ever without notice their presence. The most important finding of Warren and Marshall was that *Helicobacter* is the cause of a acute gastritis with a decrease of the gastric pH (that is not normal for a gastritis) and that bacteria could survive in the gastric environment (until that moment was assumed that acid was responsible for destroying every ingested bacteria). I have to say that the host immune status is also very relevant in th development of the gastric ulcers, but even if your immune system is reduced the therapy with antibiotics could erase the symptoms and this could happen only by killing the bacteria, so, ulcers must have a bacterial origin. Unfortunately, with the extensive use of antibiotics and the constant modification of *Helicobacter pylori* genome, the bacteria has become more resistant to the traditional antibiotics, making necessary to use new antibiotics or look for new strategies to attack the bacteria. Sorry if i my message was too long, but i considered necessary to clarify some points that are very important to understand the H. pylori infection and their consequences to the host. Greetings Seb

Seth Roberts (2010-11-20 13:50:32)

Seb, thank you for your comment. I believe that ulcers are due to a poorly-functioning immune system and that it will be much safer and cost-effective to improve immune function (by eating fermented foods) than to search for new drugs that kill h. pylori or new strategies that focus on it. The big correlation is ulcers/bad immune function; the small correlation is ulcers/h. pylori infection.

Seb (2010-11-22 02:22:08)

Seth, in patients with compromised immune system (AIDS for example) H.pylori has bever been a major pathogen, this has risen the hypothesis that a robust immunity could be necessary for the conversion between an asymptomatic and an ulcer phenotype. In some models the presence of anibodies could even result in a enhanced colonization. Try to read "Helicobacter pylori in the 21st century" by Sutton and Mitchell. This bacteria is definitely different from the rest, and thats the main reason why they have been living inside us during so many years. Greetings

bananabender (2011-11-03 05:56:02)

The 1949 Nobel Prize awarded for the use of lobotomies to treat mental illness (despite no real evidence). So the H. pylori theory isn't the first bit of junk science to win a Nobel. I had a stomach ulcer without the presence of H. pylori. Ulcers are unknown in populations that don't eat refined carbohydrates. They also heal very rapidly on very low carbohydrate diets (<20g/day) regardless of the presence of H. pylori.

### **Fermented Good = Antibiotic Bad? (2009-04-05 10:36)**

If our bodies need a constant supply of bacteria-rich food to be healthy, as I have argued here many times, antibiotics – which kill the bacteria we already have – should be bad for us. [1] Maybe so:

A team of researchers at the University of Michigan Medical School gave mice allergies by pretreating the animals with an antibiotic. The experiment provides support to studies hinting at a connection between antibiotic use and asthma. These epidemiological studies show increased rates of asthma wherever antibiotic use is common.

Asthma cases in the United States climbed 75 percent from 1980 to 1994.

So ignored are fermented foods (the easy way to get bacteria-rich foods), that an author of the study does not mention them:

To avoid the role that antibiotics may play in allergy and asthma, Mr. Huffnagle suggests people watch what they eat in the weeks following a course of antibiotics.

Avoid junk food, he said. Earlier studies on rats showed that animals fed a kind of junk-food diet had far different gut flora than animals fed well-balanced meals of rat chow. [This doesn't make his point, since it isn't clear that different = worse.]

He suggests the Mediterranean diet – with lots of fruits, vegetables, whole grains, nuts, beans, seeds, and olive oil, and low to moderate amounts of wine – may be protective of your gut flora. Countries where this heart-healthy diet is consumed also have lower levels of asthma and allergies, he said.

The Mediterranean-diet advice makes more sense than the junk-food advice. But again, we should ask: Have we properly described "the Mediterranean diet"? That is, what people in "countries where this heart-healthy diet is consumed" actually eat? As with [2] the Inuit Paradox, I suspect the fermented foods they eat, such as yogurt, are ignored. If high consumption of fermented foods does reduce asthma and allergies then asthma and allergies should be low in Japan because of miso and natto.

Thanks to Oskar Pearson.

MasterGrape (2009-04-05 12:54:39)

This isn't strictly related to the post, but I consume ridiculous amounts of wine and have felt much healthier since I started doing that. I grow the grapes and make the wine myself so I know it's very natural. My dad drinks a lot of this wine too. He has not gotten a noticeable cold since we started drinking our own wine. I have had less allergy problems and I have only gotten two colds in the past four years, both on occasions when I was traveling (and didn't have access to my wine). I think this is probably coincidence or a placebo or willful ignorance or something. But I thought I'd share. I should probably mention that my mom also drinks a reasonable amount of the wine, but she is still constantly sick.

seth (2009-04-05 13:09:23)

That's closely connected! I don't think anyone expects wine to prevent colds so I don't see how it could be a placebo effect. As for your mom being sick, I'd bet she drinks a lot less wine than you and your father. I think wine is a good source of bacteria but not a great one.

Patrik (2009-04-05 20:03:41)

@seth What makes you think that wine has any bacteria? As I noted here: <http://www.blog.sethroberts.net/2009/03/30/natto-shopping-continued/> #comment-286176 *Taking wine for example, generally, you kill off everything living in the must via addition of sulfur, after which you add your desired yeast. The yeast then ferment by digesting the sugars in the must thereby generating alcohol, which ironically kills them off. As we used to joke when making wine, in a sense, the yeast are killed by their own shit, which we consume. :)*

seth (2009-04-05 21:20:30)

Patrik, wine has lots of dead bacteria. I don't think the immune system cares if the bacteria are alive or dead, so long as they are whole.

MasterGrape (2009-04-05 22:57:25)

Additionally, some wines are made with natural yeasts (although most of what I drink has yeast added). I also use very minimal levels of sulfites. The yeasts I do add tend to just beat the crap out of the naturally occurring fermenting agents. There's a certain point where one yeast population will explode and decimate competing yeasts. And then yes, they choke themselves out. But a small amount of bacteria are still around and kicking which is one way wine can go bad. I think that one of the reasons to complete a malolactic fermentation (and also one reason to fine and filter) is to prevent the few remaining bacteria from starting up again after bottling. I'm under the impression that wine that goes vinegary is almost always the result of bacteria coming back from the brink and producing volatile acids as a byproduct. But I'm really fuzzy on a lot of the science. And it's interesting that dead bacteria might protect gut flora as well or better than live bacteria. Like an inoculation?

seth (2009-04-05 23:43:49)

somebody did a study where yogurt with dead bacteria was just as helpful as yogurt with live bacteria.

Ashish (2009-04-06 08:17:49)

Four weeks into my Latin American backpacking trip, I've enjoyed perfect digestive health, even while sampling all manner of street food. That's got to be some kind of record - it definitely is a record for me. And I attribute it to the (Trader Joe's brand) probiotic-acidophilus pills I started taking just a few weeks before departing the US, upon the advice of this blog. Thanks, Seth!

Alex (2009-04-06 09:07:05)

My 5 year-old son has had mild to moderate asthma and eczema since he was an infant. The asthma presents as a night-time cough. We completely eliminated both the asthma and eczema symptoms by giving him a daily probiotic drink. Our pediatrician dismissed this by saying he had likely "grown out of it." However, whenever he has taken a course of antibiotics, the symptoms immediately reappear. I have always been curious if his condition was precipitated by the I.V. antibiotics his mother had to take late in her pregnancy with him. This study [http://ajrcm.atsjournals.org/cgi/content/abstract/166/6/827?ijkey=d8be8904020279b8ebff11e0e6e8bce2a9e39cdd&keytype=tf\\_ipsecsha](http://ajrcm.atsjournals.org/cgi/content/abstract/166/6/827?ijkey=d8be8904020279b8ebff11e0e6e8bce2a9e39cdd&keytype=tf_ipsecsha) suggests there is a link.

[...] Fermented Good = Antibiotic Bad? [...]

Patrik (2009-04-06 13:40:43)

@seth I definitely enjoy your intellectual curiosity - you have a tendency to be the proverbial bull in the china shop, which is great. However, I think you need to balance, or perhaps, "tune" your hypotheses a bit as you often seem to ignore the underlying mechanisms necessary for your hypotheses to make sense. That said, Semmelweis didn't know the mechanism (germ theory) for his groundbreaking discovery and perhaps, in your case, pondering the mechanism (how bacteria interact with your immune system) limits intellectual creativity and problem-solving. Interesting. I need to ponder this some more. *Patrik, wine has lots of dead bacteria.* I don't think it does have "lots" of "whole" dead bacteria. My experience and intuition tell me it has very little, since after destroying all life in the must via sulfur and then having the yeast produce alcohol (intentionally) makes for a very harsh environment for bacteria. My guess is that the alcohol physically denatures bacteria ergo why alcohol is used as an antiseptic. BTW Cochrane and Harpending of "10,000 year explosion" posit that we have evolved to drink beer b/c of its bacteria destroying properties. (An excellent book, you should get a copy ASAP, they generate thousands of interesting ideas and hypotheses directly opposed to the conventional anthropological "wisdom". Seth, you of all people, need to read this book.) *I don't think the immune system cares if the bacteria are alive or dead, so long as they are whole.* No way. Which is more disgusting/malodorous fresh dog shit or dried dog shit?

Patrik (2009-04-06 14:05:07)

If we assume that fermented foods are beneficial to our health, my shoot-from-the-hip guess is not that they provide more bacteria (which is for some unknown reason is desirable according to Seth's hypothesis) than non-fermented, but that they contain less bacteria. And not only do they contain less, my guess is that the benefits, if any, stem from mechanisms such as (<http://www.blog.sethroberts.net/2009/01/26/the-inuit-paradox/> #comment-264706): 1. Pre-digestion of food 2. Elimination of anti-nutrients and toxins such as phytic acid 3. Lower pH of certain foods making minerals more bioavailable 4. Probably most important: Provides Vitamin K2 (this is a very interesting post and addresses natto and foie gras <http://wholehealthsource.blogspot.com/2008/06/vitamin-k2-menatetrenone-mk-4.html>) Interesting post on fermenting rice: <http://wholehealthsource.blogspot.com/2009/04/new-way-to-soak-brown-rice.html> In the 2008 paper "Effects of soaking, germination and fermentation on phytic acid, total and in vitro soluble zinc in brown rice", Dr. Robert J. Hamer's group found that soaking alone didn't have much of an effect on phytic acid in brown rice. However, fermentation was highly effective at degrading it. What I didn't realize the first time I read the paper is that they fermented intact brown rice rather than grinding it. This wasn't clear from the description in the methods section but I confirmed it by e-mail with the lead author Dr. Jianfen Liang. The method they used is very simple: 1. Soak brown rice in dechlorinated water for 24 hours at room temperature without changing the water. Reserve 10 % of the soaking liquid (should keep for a long time in the fridge). Discard the rest of the soaking liquid; cook the rice in fresh water. 2. The next time you make brown rice, use the same procedure as above, but add the soaking liquid you reserved from the last batch to the rest of the soaking water. 3. Repeat the cycle. The process will gradually improve until 96 % or more of the phytic acid is degraded at 24 hours. This process probably depends on two factors: fermentation acidifies the soaking medium, which activates the phytase (phytic acid-degrading enzyme) already present in the rice; and it also cultivates microorganisms that produce their own phytase. I would guess the latter factor is the more important one, because brown rice doesn't contain much phytase.

Steve Parker, M.D. (2009-04-06 19:00:10)

Alex, the Mediterranean diet is associated with improved control of asthma. For details, see my healthy lifestyle blog post: <http://advancedmediterraneandiet.com/blog/?p=59> Dr. Roberts, most iterations of the traditional Mediterranean diet do mention yogurt, a fermented food. The leading proponent of the Mediterranean diet in the Western world is Oldways Preservation Trust. Here's their version of the Mediterranean diet: [http://oldwayspt.org/med\\_pyramid.html](http://oldwayspt.org/med_pyramid.html) -Steve

Chris (2009-04-09 01:44:49)

Japan actually has very high allergy rates and people do go very far to try to combat them. Around this time of year, you'll see a good percentage of people walking around wearing surgical masks to try to fight against pollen allergies. Incidentally, the popu-

lar press/stores recommend eating lots of yogurt during this time of year and plenty of new yogurt brands get launched during allergy season. Natto comes up occasionally but I've never seen miso mentioned. See: <http://whatjapanthinks.com/tag/hay-fever/> and although it's in Japanese you can see an amazing writeup in pictures of how well different recommended remedies act on allergens: <http://d.hatena.ne.jp/fromdusktildawn/20090406/p1> The Japanese also love cleanliness (think bidet toilets) so that could still satisfy your hypothesis but typical levels of dietary natto/miso aren't enough.

Patrik (2009-04-09 17:30:05)

*Incidentally, the popular press/stores recommend eating lots of yogurt during this time of year and plenty of new yogurt brands get launched during allergy season.* Seems odd and probably ill-advised seeing as Asians in general lack the genetic capacity to metabolize lactose as adults.

hotoynoodle (2009-05-02 09:44:16)

actually, most of the lactose is consumed in the fermentation process. those who suffer from intolerance generally can eat yogurt with no ill effects.

### **Scary Effect of Food Irradiation (2009-04-06 12:12)**

Continuing the theme that wiping out bacteria – as [1]antibiotics do – might be a bad thing, here is a [2]mysterious development:

The new study arose from a mysterious affliction of pregnant cats. A company testing the effects on growth and development in cats using diets that had been irradiated reported that some cats developed severe neurological dysfunction, including movement disorders, vision loss and paralysis. Taken off the diet, the cats recovered slowly, but eventually all lost functions were restored.

"After being on the diet for three to four months, the pregnant cats started to develop progressive neurological disease," says Duncan, a professor of medical sciences at the UW-Madison School of Veterinary Medicine and an authority on demyelinating diseases. "Cats put back on a normal diet recovered. It's a very puzzling demyelinating disease."

Do Americans have [3]bacteriophobia? I believe we need to eat plenty of bacteria-rich food for best health (the [4]umami hypothesis). If so, then irradiating food is like taking all the vitamins out of it. Of course, food irradiation is big business. From [5]a list of FAQs:

#### **4. Does eating irradiated food present long-term health risks?**

No. Federal government and other scientists reviewed several hundred studies on the effects of food irradiation before reaching conclusions about the general safety of the treatment. In order to make recommendations specifically about poultry irradiation, U.S. Food and Drug Administration scientists reviewed findings from additional relevant studies.

Independent scientific committees in Denmark, Sweden, United Kingdom and Canada also have reaffirmed the safety of food irradiation. In addition, food irradiation has received official international endorsement from the World Health Organizations and the International Atomic Energy Agency.

The International Atomic Energy Agency. It's an interesting methodological question: Is Diet X (irradiated food) "safe" because it is no worse than Diet Y (ordinary food)? What if Diet Y isn't safe?

Duncan, the researcher quoted above, said this:

"We think it is extremely unlikely that [irradiated food] could become a human health problem," Duncan explains. "We think [what happened to the cats] is species specific."

Hmm. If you don't understand what causes the effect, how can you make strong claims about it? I think food with too-few bacteria is already a human health problem.

Thanks to Peter Spero.

Nathan Myers (2009-04-06 19:32:46)

No amount of testing can demonstrate that irradiation is safe in general. If it could be demonstrated for one particular foodstuff (say, kiwi fruit) that wouldn't tell you anything about papayas or beef jerky, or even about kiwi grown with different pesticides. If irradiated food is killing cats, that's an enormous problem, \_particularly \_ if the problem is neurological. Psychoactive drugs are routinely tested in cats because cat brains respond to chemicals more like ours than rats' do.

Cat Chic (2009-04-08 07:35:27)

Wow. This is scary stuff. This is why I only eat organic type food when possible. Food today in general has to be about the worst at any time period. If it is killing cats, amazing. What is it doing to us?

### **Shangri-La Diet on Good Morning America (2009-04-06 22:58)**

[1]Karina Smirnoff, a world-champion dancer on Dancing With the Stars, told Us Weekly that she controls her weight by "taking a tablespoon of olive oil on an empty stomach," which is her mom's advice. "On an empty stomach" - I wish I'd thought of that way of putting the between-meal requirement. Good Morning America mentions it [2]here - quick, go to the "keeping bodies ballroom ready" segment, which will only be available for a few days.

SLD hasn't been translated into Russian. A case of independent discovery?

Thanks to Joyce Cohen.

### **The Hygiene Hypothesis (2009-04-07 22:31)**

[1]Here is a nice review of the hygiene hypothesis, proposed in 1989 by David Strachan. The hygiene hypothesis is that the increases in childhood allergies and asthma in rich countries were due to decreases in "infection in early childhood, transmitted by contact with unhygienic older siblings or acquired prenatally." It was inspired by the observation that allergies and asthma were less common in larger families.

In the original, it was infections that were the crucial thing you got from older siblings. This idea ran into trouble when actual measurements of number infections did not show the expected inverse correlation:

When a composite index of exposure was generated by combining histories of illness due to measles, mumps, rubella, varicella, and pertussis, the tendency was for a slightly higher risk of allergic disease in children with multiple infections.

Also bad for the infection idea is that vaccination for measles didn't protect against hay fever or eczema.

It looks to my perhaps-biased eyes that it is dirt (= harmless foreign proteins and bacteria) exposure that matters, not exposure to human infectious agents. Living on a farm helps. Plainly you get dirty living on a farm and exposed to animal viruses and bacteria – but that you get human infectious agents from pigs and cows is unlikely. (In technical terms, they aren't vectors.) Older brothers are more protective than older sisters. Boys are dirtier than girls; it isn't obvious they are more infectious. Dogs are more protective than cats. Again, dogs are obviously dirtier than cats but the notion that they are more infectious – few infectious agents cross the species barrier – is less obvious.

An emphasis on dirt rather than human-infectious agents is more compatible with my belief in the vast importance of ingesting bacteria-laden food.

1. [http://thorax.bmj.com/cgi/reprint/55/suppl\\_1/S2.pdf](http://thorax.bmj.com/cgi/reprint/55/suppl_1/S2.pdf)

---

Vish (2009-04-08 06:49:45)

Im under the impression that the current version of Hygience hypothesis focuses on (the lack of) parasitic worm infections - viruses and bacerial infections are still common in the West, but not worms. This is highly correlated with the absence of dirt, of course.

Caleb (2009-04-08 08:27:45)

I remember reading that children who grew up in a household with two pets, say a cat and a dog, had significantly lower incidence of allergies and asthma.

Aaron Blaisdell (2009-04-08 10:11:29)

Let's hear it for digging for earthworms and catching crayfish. Two of my most favorite activities as a small child. I also caught a lot of smelly garter snakes and sticky toads and frogs. My older daughter loves to play in the sand at the park. I have been encouraging her to do so and give her as much opportunity as possible. She loves play dough, too, though I don't think she'll contact many germs through that.

### **History Repeating Itself: Fear of Bacteria (2009-04-08 11:37)**

In the late 1800s in the United States, babies started developing scurvy; there was a veritable plague. It turned out that the vast majority of victims were being fed milk that had been heat treated (as suggested by Pasteur) to control bacterial disease. Pasteurization was effective against bacteria, but it destroyed the Vitamin C.

From a [1]history of nutrition. Now children are probably getting all sorts of immune disorders, such as hay fever, for the same core reason: fear of bacteria.

1. [http://library.med.utah.edu/NetBiochem/nutrition/lect1/4\\_2.html](http://library.med.utah.edu/NetBiochem/nutrition/lect1/4_2.html)

---

Scott (2009-04-08 12:00:27)

Depending how long "withholding" bacteria from the children was needed to cause an immune disorder a convenience sample could be a study of the rates of immune disorders in the population of children who had some illness as an infant (e.g. I had open-heart surgery) that are now well as adults. In my case I was kept away from bacterias, viruses, illnesses etc for the first 2 years as I had a diminished ability to fight off diseases due to the heart defect. If the hypothesis is correct these children would likely have higher rates of immune disorders (unrelated to the specific childhood illness) than the general population. I have quite a few airborne allergies (trees/grasses etc) which would be anecdotal supporting evidence, but so does my sister who did not have a significant childhood illness so maybe it is purely environmental/parenting...

seth (2009-04-08 20:23:18)

Scott, the sad fact is that almost all children, probably including your sister, are kept away from harmless bacteria, which are in fermented food above all. I mean, the amount of harmless bacteria that would enter your body by eating fermented food daily would dwarf all other sources. Your deprivation may have been only slightly more than your sister's. Unless she regularly ate

fermented food growing up – but I’m guessing she didn’t.

### **The Hygiene Hypothesis (continued) (2009-04-08 16:52)**

In this [1]NY Times Op-Ed, Jessica Snyder, author of [2]Good Germs, Bad Germs, agrees with my comments about the hygiene hypothesis:

In 1989, an epidemiologist in Britain, David Strachan, observed that babies born into households with lots of siblings were less likely than other babies to develop allergies and asthma. The same proved true of babies who spent significant time in day care. Dr. Strachan hypothesized that the protection came from experiencing an abundance of childhood illnesses.

Dr. Strachan’s original hygiene hypothesis got a lot of press. . . . Less publicized was the decade-long string of follow-up studies that disproved a link between illnesses and protection from inflammatory disorders like allergies and asthma. If anything, studies showed, early illness made matters worse. . . . Still, Dr. Strachan’s original observation was confirmed – as a group, babies in large families and day care are less likely to develop allergies and asthma than are children born into smaller families and kept at home. The same protective effect can be seen in children born on farms and in areas without public sanitation.

But the link isn’t disease-causing germs. It’s early and ample exposure to harmless bacteria – especially the kinds encountered living close to the land and around livestock and other young children. In other words, dirt, dung and diapers. Just as disease-causing microbes clearly bring on inflammation, harmless microorganisms appear to exert a calming effect on the immune system.

No mention of fermented food.

Thanks to Michael Bowerman.

### **The Wisdom of the Five-Year-Old Picky Eater (2009-04-09 10:49)**

Children are notoriously picky eaters. Could they be trying to tell us (adults) something? Such as how bad our diet is?

Alex Combs, a stay-at-home dad and equity trader who lives near Philadelphia, has a five-year-old son whom Alex describes as "a picky eater."

His son will not eat rice, potatoes, and pasta. He will eat small amounts of meat.

Yet his son will eat pickles, balsamic vinegar, and old/stinky cheese (but not regular cheese).

This is a fair description of what I eat! No simple carbs, some meat, plenty of fermented foods. While lots of people advocate low-carb diets, only a few, including me, advocate large amounts of fermented food. His son's counter-intuitive liking for such gourmet "adult" foods as pickles, balsamic vinegar, and old cheeses, all high in bacteria, puts the picky eating of children in a whole new light. They're not picky – they're smart.

---

Anonymous Coward (2009-04-09 12:42:40)

Have you ever considered adding red wine to your list of fermented foods? Wine undergoes multiple fermentations, primary and secondary, with different bacteria. Some of the products of fermentations are left behind (fining or gravity settling, with racking off of the wine) but some remain in the wine as bottled and shipped. There have always been anecdotes about the healthy qualities of drinking wine, in individuals and in populations.

Todd Hargrove (2009-04-09 13:17:56)

This kid seems like an outlier to me. As a father of a two year old, my observation is that kids like sugar, fruit, crackers, pasta, cereal, white bread, white rice. The simpler the carbs the better. Lots of bland food. I don't see kids eating lots of stinky cheese, saurkraut, kim chee etc. I think many of their preferences are maladaptive in a modern environment. I'm not around that many kids though, so I'm interested in what others see.

Nathan Myers (2009-04-09 14:19:20)

My son will only eat peanut butter and raspberry jam sandwiches, broccoli, tofu, and box mac-and-cheese. What was your point again?

Patrik (2009-04-09 15:35:05)

*His son's counter-intuitive liking for such gourmet "adult" foods as pickles, balsamic vinegar, and old cheeses, all high in bacteria, @Seth One, your fundamental assumption that fermented foods are high in bacteria, living or dead, is very, very*

much to open to debate. In fact, my guess is that, in general, fermented foods are low in bacteria – precisely because they are fermented. We use micro-organisms to kill off/out-compete bacteria to make foods safer for us to eat. We use fermentation to preserve(!) foods like vinegar, pickles, stinky cheese FROM bacteria, ergo spoilage. Two, assuming that your assumption above IS correct: fermented foods are high in bacteria - it is still very much questionable if bacteria from these fermented foods are beneficial to our health. Three, you have no mechanism to explain the second assumption. While I like and appreciate your intellectual creativity (I read this blog and frequently comment) — you exhibit a certain amount intellectual sloppiness that does not behoove you. And you continue duck me here: <http://www.blog.sethroberts.net/2009/04/05/fermented-good-antibiotic-bad/> #comment-288257 *puts the picky eating of children in a whole new light. Theyâ€™re not picky â€” theyâ€™re smart.* Suffice to say, that child above is very atypical of 5 year-olds. Most children at that age prefer much more bland foods. Which might be an evolutionary adaptation for avoiding natural toxins (strong-tasting foods) that young, developing nervous systems can't handle.

Patrik (2009-04-09 15:40:10)

To illustrate my point above – beer, one of the earliest fermented foods, is designed to kill bacteria. [http://www.beer-brewing.com/beer-brewing/beer\\_spoilage\\_organisms/bacteria.htm](http://www.beer-brewing.com/beer-brewing/beer_spoilage_organisms/bacteria.htm) *Beer is a poor and rather hostile environment for most microorganisms. Its ethanol concentration and low pH is lower than most bacteria can tolerate for growth. Furthermore, the high carbon dioxide concentration and extremely low oxygen content makes beer a near to anaerobic medium. Beer also contains bitter hop compounds, which are toxic. Only a few bacteria are able to grow under such inhospitable conditions and are able to spoil beer. These bacteria include both Gram-positive and Gram-negative species as listed in Table 19.2. Gram Positive Bacteria Gram-positive bacteria are generally regarded as the most threatening contaminants in the brewery because of their rapid growth rate and tolerance to high temperatures and low pH conditions. Most hazardous microorganisms are those belonging to the genera Lactobacillus and Pediococcus and are often referred to as lactic acid bacteria because of their propensity to produce lactic acid from simple sugars. Gram Negative Bacteria Important Gram-negative contaminants in the context of beer brewing are acetic acid bacteria, Zymomonas spp., Pectinatus spp., and various Enterobacteriaceae. Several members of this group not only distort the fermentation process or produce undesired by-products but also have been reported to survive the fermentation process and to transfer into the finished product.*

Ben Casnocha (2009-04-09 20:58:28)

I've been told – no idea if it's true – that kids are picky eaters because more of their taste buds are intact and thus they have a more discriminating taste. As you age you burn taste buds.

Tom (2009-04-10 10:41:35)

I think it's an interesting idea. It makes a lot of sense that we would evolve to find anti-nutrients repulsive. (I remember being forced to sit at the dinner table until I had finished my lima beans, because they were supposed to be so healthful. Now we know that they're crammed with phytic acid and lectins, making it difficult for us to absorb nutrients from other foods we ingest.)

Andrew Gelman (2009-04-10 22:35:34)

Seth, You're a great guy, but sometimes you say things that are just ridiculous, and this is one of them. Not everything in life has to fit your theory. I hope that, having talked to some parents about what foods kids like—which I'm pretty sure will convince you that you're way way wrong on this one—you'll think back on many of the other events that have appeared to you to be confirming examples of your theory. That said, perhaps it's not so horrible that you are too credulous about your own theories. This credulity motivates you to take the theories more seriously, which motivates you to try to test them. And you are certainly willing to accept contrary evidence and change your beliefs, if the evidence is strong enough. In this case, unless you think that candy and ice cream are the basis of a balanced diet, I think you'll have to be more careful about generalizing from a single five-year-old!

KenF (2009-04-11 09:40:31)

My 4 year-old is the opposite, of course. Just bread and rice and oatmeal every day. Recently he's been eating some meat, turkey bacon and canned sardines.

Patrik (2009-04-11 12:56:15)

@Andrew Gelman I agree. Like I said above, Seth very admirably demonstrates a great amount of intellectual creativity, but which comes at the not insignificant price of intellectual sloppiness i.e. the painfully obvious confirmation bias manifesting itself in the post above. Ironic given Seth's statistical training.

Aaron Blaisdell (2009-04-12 08:56:53)

My daughter also will only eat simple or refined carbs, pasta, white bread, rice, chocolate, candy, crackers, and candy. I've been somewhat successful in getting her to eat eggs, meatballs, and yogurt, but it takes a lot of effort. From what I see among all of the other kids at her daycare, her preferences are the norm. Seth that kid you discuss in your post is a huge outlier.

James (2009-04-14 00:56:26)

<http://wholehealthsource.blogspot.com/2009/03/reversing-tooth-decay.html> by reducing grains and increasing Vit D, calcium and phytase. The next post notes fermenting brown rice increases phytase. The other entries seem interesting as well.

Confidence (2009-04-14 11:26:27)

Seth, In addition to the confirmation bias that Patrick and Dr. Gelman talk about, it's very clear that you are very, very quick to generalize your results to the broader population. Your results may be far less applicable outside your own body than you think. You do provoke me to think though. And for that I'm grateful. .

Confidence (2009-04-14 11:34:30)

Oh, and Alex Comb probably needs to think about getting his son tested for Zinc deficiency. Low Zinc status impacts the ability to taste and smell well, resulting in the individual preferring highly flavorful, spicy food to cross the threshold. I'd do that first before getting excited about him being a sample in a new theory about fermented foods. Though his son is probably perfectly fine.

Seth's blog » Blog Archive » Pets and Fermented Food (2009-04-17 04:48:17)

[...] The Wisdom of the Five-Year-Old Picky Eater [...]

Lux (2009-05-10 07:53:36)

1 kid = anecdote 1 anecdote  $\neq$  data

seth (2009-05-10 09:09:13)

anecdote  $\neq$  data? Treating the world as black and white (data = good, anecdote = bad) doesn't make it so.

Charles (2009-05-10 13:52:59)

What some of you fundamentalists are calling "intellectual sloppiness" seems to me to be more like committed curiosity. I would argue that while a more rigorous approach is appropriate for, say, making public policy, Seth ain't doing that. I'm thinking you aren't getting the point of self-experimentation.

## **Rejuvenation Company (interview) (2009-04-10 05:47)**

I sampled four brands of kombucha available in Berkeley; my favorite was from [1]Rejuvenation Company. They are in Emeryville, which is close to where I live. "Can I visit your manufacturing facility?" I asked. The answer was no, but they were happy to be interviewed. So I interviewed Chris Campagna and Jerry Campagna, who are the company's two employees. Before the interview I discovered they also made the rejuvelac I'd bought after a reader of this blog [2]recommended it ("When I was a database administrator at Whole Foods, I used to drink it daily and never felt better"). Those are their two products: kombucha and rejuvelac.

How did your company begin?

It was started in 1983 in San Francisco by Dennis Campagna [Jerry's brother, Chris's uncle]. He was a health-food fanatic, a die-hard vegetarian, and a hippie. Now retired. He is ten years older than Jerry, but , Jerry says, looks younger.] At the beginning, he sold several health-food juices, such as carrot juice and wheat grass juice, but he also sold Rejuvelac. That was the part of the product line that's lasted. He made them in a shared kitchen. Back then, there were dozens of small health food stores in San Francisco. It was a one-man show. Dennis drove around to them.

What's [3]rejuvelac?

A fermented grain drink. We use wheat. You sprout wheat berries with water,Â ferment them for a while, then strain out the wheat berries. We're the only company we know of that sells it.

Why do your products say "Keep Refrigerated"?

The Health Department wanted it. For years and years, they sat store shelves, not refrigerated.

When did you start making kombucha?

Five years ago. Dennis added it to his product line. It took a few years to catch on. He'd been making it for himself for years – making it, drinking it, giving it to friends. We're tiny players in the kombucha market. [4]Synergy is the big player. Maybe there are 10-15 manufacturers around the country, it's hard to know the exact number. There's no Kombucha Manufacturers Association.Â Some commercial kombuchas are pasteurized; look on their websites to find out which ones. [[5]Kombucha Wonder Drink is pasteurized.] Our kombucha isn't pasteurized.

How has the business changed?

It used to be lots of mom-and-pop stores. The people who owned the store ran it. They recommended stuff to their customers. The customer would come in with a health problem, the owner would say, "Why don't you try this?" Now Whole Food dominates. The emphasis has changed. The buyers want to know: Will it sell? As opposed to true quality. Nowadays, the main way we spread is that someone buys our products on a trip to San Francisco and goes home and sends us email: Where can we get it? We say: If you really want it, go to your store manager and tell him. You have a tremendous amount of clout. They listen to you. It often works out that we get a store out of that deal. We don't do internet sales.

Over the last five years, our sales have grown a lot. Five years ago, we were mostly in San Francisco, mostly in small stores. Around 20-30 small stores. Now we're in roughly 100-120 stores. It's hard to have a store locator on our website because distributors don't want to tell us who they deal with. [Their [6]store locator page.] In the Bay Area, we're sold at Whole Foods, Berkeley Bowl, Rainbow Grocery, plus smaller stores. In Santa Cruz, at Staff of Life. We're moving into Whole Foods in Los Angeles, Seattle, and Portland. Pretty soon you should be able to get it in any Whole Foods on the West Coast.

What do your customers say?

A year ago, we got a phone call from a woman in San Francisco. I'm moving to Utah, where can I buy your product? Eight years earlier, she'd been sick. [Digestive problems, apparently.] Her doctor had given her antibiotics. She didn't get better. She was given more antibiotics. Still didn't get better. This went on for several months. She couldn't eat anything. Even baby food would make her gaseous. She was turning ashen, suffering from malnutrition. Then she got a small bottle of rejuvelac. Just 30 minutes after drinking it, she felt a little better. She'd been drinking

it regularly for eight years, didn't want to be without it.

stephen (2009-04-10 07:19:18)

hey seth i've been subscribed to your blog for a few months now and always enjoy your posts. i came across this today, thought you might find it interesting: <http://www.ted.com/talks/view/id/509>

Caleb (2009-04-10 08:59:55)

I'd have to recommend the Kombucha from Synergy, it's got 2g of naturally occurring sugar compared to 12g from rejuvenation. I'm not sure what it is, but between the carbonation, sour tinge, and the bite from the ginger, it tastes really sweet to me. I really wish the store wouldn't refrigerate it though so it'd be more carbonated and fermented when I got it. BTW, thanks for educating me about the importance of fermented foods. I've started eating them with every meal. I didn't even get close to getting sick this winter and my allergies are sharply reduced this spring. It's really improved my quality of life.

seth (2009-04-10 10:48:04)

You're welcome, Caleb. What are the fermented foods you eat?

Heather McD (Heather Eats Almond Butter) (2009-04-11 16:09:48)

Seth, My husband forwarded this post to me and has been telling me all about your posts on fermented foods. What are your thoughts on tempeh and miso? I am soy intolerant, but for some reason I can eat both of these. Someone told me it has something to do with them being fermented. Do you recommend eating either?

bennetta (2009-04-14 10:31:29)

My precious Rejuvelac! I wish it was easier to find. I recently found that the grocery store down the street from my house (Community Market in Santa Rosa) sells it. After a six year break, I've become re-addicted. This stuff is amazing. I only wish it was more readily available.

## **To (Not) Catch A Thief (2009-04-14 15:07)**

This [1]short article about Edward Skyler, Deputy Mayor of New York, mentions four times (headline, led, body, final quote) that he tackled a mugger. I have a similar story. Had I known it was so interesting . . .

I was in Paris – same trip that inspired the Shangri-La Diet. It had been raining, the streets were wet. I heard a shout: Stop that man! A man came running toward me. I tried to stop him but I slipped on the cobblestones and fell in front of him. Perfect tackle. Lying on the ground, he asked: Why did you do that? Nobody came. He got up and ran off.

As I walked away a woman came up to me. "Are you okay?" she asked. A man said to me, "That was unusual what you did." I felt really good for an hour or so.

I was stunned how good I felt. I had accomplished nothing – the thief wasn't caught. Nor was there any obvious reason I should care what two bystanders thought of me.

The lesson I drew was this. Praise alone won't make you happy. Accomplishment alone won't make you happy. But their combination – praise for a genuine accomplishment, however small – is enormously potent. If I'm right, a teacher has enormous power to help his students by praising them for what they do right.

1. [http://www.nytimes.com/2009/04/10/nyregion/10skyler.html?\\_r=1&hp=&pagewanted=all](http://www.nytimes.com/2009/04/10/nyregion/10skyler.html?_r=1&hp=&pagewanted=all)

---

david (2009-04-14 19:15:44)

The corollary is true in both cases. Blame, ridicule, and judgment, even from strangers, can cause great suffering and teachers have enormous power to harm by criticizing them for what they do wrong.

seth (2009-04-14 19:42:46)

Yeah, David, I agree. I originally wrote a longer version of the post where I said just that.

Timothy Beneke (2009-04-15 08:20:12)

All the happiness research suggests that doing something that helps others causes happiness long after the activity; whereas doing something that gives you pleasure has a quick drop-off – the pleasure tends to end with the activity. I once had a wonderful, religious person, Huston Smith, say to me, "God bless you for that," with great earnestness. Even though I am not religious, I was amazed at how good it made me feel. I think the feeling of well being that comes from praise from a religious figure must be powerful. Or in Catholicism, taking communion, which can only be done with a "cleansed soul" after confession, must be amazing...

### **Another Reason to Eat Fermented Foods (2009-04-15 03:49)**

To protect against *C. difficile* infection:

What is so frightening about *C. difficile* is that it is often spurred by antibiotics. The drugs wipe out the targeted illness, like a urinary tract or upper respiratory infection, but they also kill off large portions of the healthy bacteria that normally live in the digestive tract. If a person [who has just taken antibiotics] comes into contact with *C. difficile*, or already has it, the disruption to the beneficial bacteria creates an opportunity for the harmful bacteria to flourish.

The [1]NY Times article doesn't mention fermented foods.

Thanks to Ashish Mukharji.

1. [http://www.nytimes.com/2009/04/14/health/14well.html?\\_r=2&em](http://www.nytimes.com/2009/04/14/health/14well.html?_r=2&em)

## Shangri-La Diet: Before and After (2009-04-15 04:22)

Karky lost 100 pounds. [1]Here are before and after pics. I like how [2]one person put it: "A to the M to the A to the ZING!"

## Dead Food = Always the Same (2009-04-15 05:23)

If you have two hammers, how many nails do you see?

I'm in Boston. I had planned to give up fermented foods during this trip and see what happened. Too hard, it turned out. Sitting in a diner, I wondered: where can I get kombucha? The diner sold a bunch of bottled drinks: juice and soft drinks. Foods that taste exactly the same each time, which I call ditto foods and which I believe caused the obesity epidemic. (Because their taste – actually, their smell – is so uniform, a very strong smell-calorie association can build up, making them very tasty and very fattening. Ditto foods are the laser beams of food.) I realized these drinks were exactly the opposite of what I wanted. Fermented foods, because they involve growing bacteria, are inherently more variable than other foods. It is hard to keep constant from batch to batch everything that affects bacterial growth.

Funny thing: the growth in childhood asthma and allergies, now called [1]an epidemic, started at roughly the same time as the obesity epidemic – around 1980. Around 1980, people started to eat a lot more fast food, snack food, and microwaved food (from packages). All ditto foods. All bacteria-free. In home cooking, I think fewer precautions are taken to wipe out all bacteria. You eat what you've made soon after cooking, whereas factory food might be eaten weeks or months after production. So factory food has preservatives – and I think the result is overkill, just like antibiotics.

Looking at the food I could buy in Boston was like looking at a post-apocalyptic landscape. Dead food everywhere. Supermarkets, diners, fancy restaurants. Dead food is uniform food; food manufacturers had bludgeoned their products into uniformity. At a [2]Cordon Bleu cooking school, judging from promotional literature, not a word is said about fermented food. In advanced-thinking Cambridge, which you might think would support fermented foods, I found only two stores that sold kefir and only three that sold kombucha. Many people complain about what they call "processed food" but the actual problem is food not processed enough (by bacteria). A better complaint would be about dead food.

I suspect fermented foods are avoided by commercial food makers not only because they are more variable than other food and contain scary bacteria, but also because they are more expensive to make: They require more space and time. The stuff must sit somewhere, taking up space, for days or even weeks, while it ferments. At home, it's easy: You make it and put it somewhere, and go away and do something else. In a factory devoted to making food, there is nothing else to do and no free space. The monoculture problem.

1. <http://content.nejm.org/cgi/content/full/355/21/2226>

2. <http://www.bostonculinaryarts.com/>

---

david (2009-04-15 06:29:43)

You'll like this article: [http://seedmagazine.com/content/article/the\\_body\\_politic/](http://seedmagazine.com/content/article/the_body_politic/) (mentioned just now on /.: <http://science.slashdot.org/article.pl?sid=09/04/15/0252219>). David

SB (2009-04-15 08:54:25)

From the NYT article you posted earlier: The public health community has been sounding the alarm for years about the overuse of antibiotics and the emergence of "superbugs". Maybe this epidemic is more due to dead food than overuse of antibiotics.

Caleb (2009-04-15 09:25:56)

In answer to the earlier question of what fermented foods I've added to my diet; I have about 8oz of Brown Cow yogurt w/ breakfast, 8oz Kombucha w/ lunch, and 6oz of Kiefer w/ dinner. Occasionally I'll have red wine w/ dinner instead. I also use raw aged cheese pretty liberally on my scrambled eggs and when I have a salad. I was having sauerkraut with sausage, but got sick of its flavor. I'm starting to get a craving for it again though so I plan to try out the Bubbies brand next time I go shopping. I haven't tried natto or other soy products because I'm leery of possible hormonal disruption by the estrogens. I imagine there's a ceiling on the immune benefit anyway, which would be a real good experiment for someone to study. Test at what level of bacterial ingestion the infection rate of subjects exposed to a cold virus levels off.

Ethan (2009-04-15 09:37:25)

Do you happen to remember which stores sold kombucha and kefir?

Aaron Blaisdell (2009-04-15 10:40:47)

@ Caleb, Sounds like a similar inclusion of fermented food to my own. I drink wine or occasionally beer with dinner just about every evening, a glass of Kefir every evening after dinner, Stony Field plain yogurt every morning, and raw-milk cheese with every lunch. This morning I bought my first bottle of Kombucha (from GT). The bottle says "Don't Shake!" and I notice there is sediment (bacteria I presume) that has settled at the bottom of the bottle. Is it important to NOT drink the sediment or is it harmless, or better yet the effective part of the microbes?

Dennis Mangan (2009-04-15 17:31:17)

"Dead Food=Always the Same" Yes, no pathogenic bacteria that will kill you!

seth (2009-04-15 19:13:29)

Ethan, I got kombucha and kefir at Harvest and Whole Food markets.

Gary Wolf (2009-04-15 23:17:19)

You might enjoy this quote from Tracy Kidder's biography of Paul Farmer: "...Farmer's childhood was good preparation for a traveling life. Like all his siblings, he emerged from the Bayou's waters with what he called "a very compliant GI system." Farmer is a doctor who works in Haiti (and now elsewhere) and a specialist in infectious disease. He credits his good stomach with plentiful childhood exposure to bacteria in food and water. This association is more respected now, but even a few years ago when he made it would have been considered something of a myth. Of course, he is no ignoramus...

Igor Carron (2009-04-16 07:56:43)

Seth, I tried Kombucha and found it to be extremely close in taste to apple cider that one can buy in France. Cider is fermented and not as expensive as Kombucha. FYI. Igor.

Stephen M (Ethesis) (2009-04-16 19:06:07)

Dead food is a great line. I find myself getting more and more active yogurt (vs. the bland cultured puddings that masquerade as yogurt).

clarke (2009-04-17 03:48:02)

sheep's milk yoghurt might be considered more efficacious than cow's milk yoghurt, no matter how live or active, since sheep have yet to be manipulated into producing milk throughout the year, unlike cows.

Melissa (2009-04-20 13:49:42)

I think you would enjoy Sweden. Pickled and fermented fish is readily available at every grocery store, though it seems young people are consuming it less. But wow...the diversity of fermented milk. I had trouble figuring out all the different kinds when I came here. Russian-style kefir is just the tip of the iceberg. I think you'd like IÄngfil, which comes from the far north of Sweden and has a ropy stretchy slimy weird consistency. [http://www3.arla.se/Default\\_\\_\\_17791.aspx?SelectedMenuItem=17375](http://www3.arla.se/Default___17791.aspx?SelectedMenuItem=17375) Seems like everyone does the probiotic thing here. There is even some sort of fermented oatmeal drink called Proviva developed in Finland with L299 strain.

## **Brainwashing in High Places: Genes and Disease (2009-04-16 03:15)**

From [1]an article by Nicholas Wade in the NY Times:

Since the human genome was decoded in 2003, researchers have been developing a powerful method for comparing the genomes of patients and healthy people, with the hope of pinpointing the DNA changes responsible for common diseases.

This method, called a genomewide association study, . . . has been disappointing in that the kind of genetic variation it detects has turned out to explain surprisingly little of the genetic links to most diseases.

Wade means the genetic variation is surprisingly poor at distinguishing healthy people and sick people. That is the empirical result.

Unlike the rare diseases caused by a change affecting only one gene, common diseases like cancer and diabetes are caused by a set of several genetic variations in each person.

This is the faith-based statement. Wade knows this how? What about the possibility that cancer and diabetes are caused by environmental differences? That there are consistent environmental differences (e.g., dietary differences) between those who get cancer and those who don't?

I know of no evidence that common diseases like cancer and diabetes are caused by several genetic variations in each person. I know of a lot of evidence that they are caused by the wrong environment – lung cancer caused by smoking, for example.

Preachers say: If you do X, you will go to heaven. In other words, do something that helps me (the preacher) now and you will benefit later. It has been an effective argument. This is what the geneticists have been doing. They say to granting agencies – who believe what they read in the NY Times – if you give us money now we will find the genetic basis of Disease X. Just as there was no clear reason to believe the preachers' claims, there was no clear reason to

believe the geneticists' predictions. Which unfortunately for them can be shown to be wrong.

The success of my self-experimentation at solving common problems led me to think the environment is more powerful than NY Times readers, or at least NY Times reporters, had been led to believe. Good news for people with problems but bad news for scientists who want large grants. My research was essentially free.

1. [http://www.nytimes.com/2009/04/16/health/research/16gene.html?\\_r=1&hp](http://www.nytimes.com/2009/04/16/health/research/16gene.html?_r=1&hp)

[...] Brainwashing in High Places: Genetics and Disease [...]

Tom (2009-04-16 09:23:40)

Fantastic post. Worth the additional effort, I think, to email it to the Times as a letter to the editor.

seth (2009-04-16 11:21:01)

Thanks, Tom. I'll email it to the Times, good idea.

Gian (2009-04-16 22:03:07)

Some breast cancers are known to be related to mutation on BRCA genes. I have a personal interest in the question. Could you be more specific and tell us the enviornmental contribution (esp dietary) to breast cancer. One is probably Vitamin-D. Others I dont know.

Joseph (2009-04-17 11:27:49)

I think David Shenk parallels some of your thinking about genes. <http://geniusblog.davidshenk.com/> He wonders about genius but many of your conclusions about how genes work are similar.

Seth's blog » Blog Archive » My Theory of Human Evolution (bells) (2009-04-18 02:29:09)

[...] Brainwashing in High Places: Genes and Disease [...]

## Principles of Experimental Design (2009-04-16 04:05)

In [1]this 10-minute talk I discuss what I think are the two main principles of experimental design:

1. Something is better than nothing. You learn more from doing something than from thinking about what to do.
2. When you do something, do the smallest easiest thing that will help, that will tell you something you don't know.

Grad students often fail to understand Principle 1: They worry too much about what to do. Early in grad school, that was my big mistake. Professors often fail to understand Principle 2: They do something more complex than necessary. Failure is much more likely than they realize. [2]My previous post was about such a failure (using genes to predict disease). When I was an assistant professor, I often made this mistake.

1. <http://aether.com/archives/stop-worrying-and-start-experimenting.html>
2. <http://www.blog.sethroberts.net/2009/04/16/brainwashing-in-high-places-genetics-and-disease/>

---

Aaron Blaisdell (2009-04-16 08:01:04)

Makes sense. In grad school I had what some would call an overbearing mentor. I called him an enthusiastic and impatient workaholic that expected the same of his students. I thrived in that environment and after four years in grad school earned my Ph.D. and accumulated 12 publications. Regarding the second principle, I learned that in grad school, too. In fact, one of our favorite phrases to kick around lab meetings when we were discussing experimental designs was KISS (Keep It Simple, Stupid). Most of my most successful and profound experiments used very simple designs. Some of my most spectacular failures used quite complex designs. The simple designs generated the biggest surprises, as well. To this day I adhere to these principles and try to entrain them in my own students. The one drawback with Principle 1 is that I sometimes have jumped too soon-so to speak. That is, I wanted to do something but it turned out I should have given a little more thought to the problem and solution space before doing something that was not optimal or had some methodological flaws. Nevertheless, I have benefited more than been harmed by the use of the first principle. The second one has almost always been helpful.

mike kenny (2009-04-19 18:18:56)

what about trying out many new things at once, like when you went to paris or beijing. those seemed like fruitful enterprise, and didn't seem like 'the smallest, easiest thing.' going to those places seemed to expose you to lots of strange stimuli, and new things happened to you, which you then sought explanations for. this to my inexperienced mind seems like a very valuable approach, as long as you don't do anything that could lead to non-trivial risks of serious harm. one could try to eliminate stimuli to see if effects remain, to isolate the actual causes. but perhaps there is a serious flaw in this thinking?

seth (2009-04-19 21:14:49)

Mike, going to Paris is a good way to get new ideas but it isn't doing an experiment. Experiments are usually done to test ideas, not generate them.

Mike Kenny (2009-04-21 13:07:03)

what if i were to take a bunch of different supplements at once to see if i notice anything new happening to me. i'm impatient, so i don't do one supplement at a time, but a whole host of them, while being cautious not to poison myself in any known way. i then observe what happens to me-say i get a dry mouth and i sleep an extra hour a night. i then remove half of the supplements to see if the results remain, and they do. i then divide the supplements i am taking into half again and see if the results remain, and they don't, so i take the half i had just stopped taking, et c. would this constitute a reasonable experiment? i've heard warnings about testing multiple things at once, and have wondered if the above example is included or is different. :)

seth (2009-04-21 20:18:25)

Mike, the sort of thing you propose works only in people's dreams, as far as I know. Things just aren't that simple.

mike kenny (2009-04-22 14:49:39)

thanks-i defer to you on this given your experience-is there a particular difficulty that emerges from such an approach? just thinking about it, and not having much experience with experimentation in general, i have trouble coming up with a serious problem with it.

seth (2009-04-22 20:04:20)

here are two possible difficulties: 1. it will be hard to take so many supplements. 2. the effects won't be clear.

The Principles of the Principles of Experimental Design « Anthny (2009-05-11 20:42:15)

[...] Seth Roberts gives what he thinks are the two main principles of experimental design: [...]

Learn by Doing, Then by Thinking | the Justin Owings page (2011-07-25 09:40:37)

[...] Roberts' goes on to apply these ideas to graduate students and professors, when he notes, "Grad students ... worry too much about what to do. Professors often ... do something more complex than necessary." [...]

### **Judith Krug, RIP (2009-04-16 04:23)**

[1]Judith Krug (1940-2009) was a librarian who defended libraries with objectionable books:

The importance of her work was made clear [to her] when she read "And Tango Makes Three" to her granddaughter's class.

The book is often the target of censors because it's about two male penguins who "adopt" an unclaimed egg.

When she was finished, a girl she later learned was being raised by two women stood and clapped her hands.

---

david (2009-04-17 06:25:12)

Inspired by Seth's endorsement, I bought a few bottles of Kombucha. My 5 year old daughter loves it and keeps asking for it (though she has trouble remembering what it's called). My 8 year old daughter took a drink (normally she won't even try new things, but this was Mystic Mango so looked like orange juice) but made a disgusted grimace.

Evelyn (2009-04-17 14:55:19)

I came across a book on probiotic foods: [http://www.gutinsight.com/the\\_book.asp](http://www.gutinsight.com/the_book.asp) I thought you might enjoy looking it over. I came across it from the comments to the NYTimes article on making yogurt at home.

### **Sitting is Bad, New Research Suggests (2009-04-17 05:22)**

From [1]a new study:

We prospectively examined sitting time and mortality in a representative sample of 17,013 Canadians 18-90 yr of age. [They were divided into five groups based on] daily amount of sitting time (almost none of the time, one fourth of the time, half of the time, three fourths of the time, almost all of the time . . . . Participants were followed prospectively for an average of 12.0 yr for the ascertainment of mortality status. RESULTS:: There were 1832 deaths (759 of cardiovascular disease (CVD) and 547 of cancer) during 204,732 person-yr of follow-up. After adjustment for potential confounders, there was a progressively higher risk of mortality across higher levels of sitting time from all causes (hazard ratios (HR): 1.00, 1.00, 1.11, 1.36, 1.54; P for trend <0.0001) and CVD (HR:1.00, 1.01, 1.22, 1.47, 1.54; P for trend <0.0001) but not cancer.

I am pleased to see no problem with sitting one-fourth of the time. The CVD/cancer difference suggests the two diseases have different causes – which is consistent with cancer being due to environmental chemicals (e.g., cigarette smoke) and age (cancer risk goes up as the fourth power of age).

[2]Related research from the same lab. [3]My self-experimentation about standing. [4]My one-legged standing (which I still do and am still studying).

Thanks to Dave Lull.

david (2009-04-17 06:21:18)

I have this image of you standing on one leg with your nose clipped drinking a mix of Kombucha and flaxseed oil with one hand and taking a math quiz on your laptop with the other ;-)

seth (2009-04-17 08:21:06)

True. I spend a lot of time doing weird stuff.

Nansen (2009-04-17 15:01:20)

@ david you left out looking at a mirror for an hour around sunrise.

Caleb (2009-04-18 05:17:51)

IIRC, it appears sitting inhibits lipase production. Lipase is the hormone that transports fat out of the fat cells so your other cells can get energy, and it's production is also inhibited by insulin. People w/ low lipase production over eat because there cells aren't getting the energy they want and send the message that their starving.

### **The Fate of Laura (continued) (2009-04-17 20:17)**

Vladimir Nabokov's final, unfinished novel, The Original of Laura, [1]will be published November 3. Fortunately no one was hired to finish it.

In a Berkeley bookstore, many years ago, Brian Boyd said he'd read Laura at the request of Nabokov's wife and son. What do you think? they asked. It's not going to make a difference, Boyd told them.

[2]The fate of [3]Laura.

### **My Theory of Human Evolution (bells) (2009-04-18 02:29)**

According to [1]my theory of human evolution, art evolved as a way to advance material science. Because we enjoy art we paid for it, which helped artists develop better control of materials.

According to Dorothy Hosler, author of [2]The Sounds and Colors of Power: The Sacred Metallurgical Technology of Ancient West Mexico,

Metallic sounding instruments, especially bells, were used in rituals that offered protection in war, that celebrated creation, fertility, and regeneration, and that figured in concepts of the sacred rituals, in short, that created a universe through song, through the sound of bells, and through reflective golden and silvery colors.

In Mexico, she is saying, advanced metallurgy was first used to make bells. So here is an example. Rituals, too, I argue, evolved because they provided a desire for "nice" stuff – the fine printing of Christmas cards, the fine clothes of priests – which helped state-of-the-art artisans improve.

Here was a way to support science/technology that worked. Whereas the current system gives us [3]delusional ideas about genes.

## What about Multivitamins? (2009-04-19 03:33)

A recent [1] large study concluded:

After a median follow-up of 8.0 and 7.9 years in the clinical trial and observational study cohorts, respectively, the Women's Health Initiative study provided convincing evidence that multivitamin use has little or no influence on the risk of common cancers, CVD, or total mortality in postmenopausal women.

I think this supports what I've been saying. In this blog I've emphasized two deficiencies in the American diet:

- Not enough omega-3
- Not enough fermented food

Neither is reduced by a multivitamin pill. As far as I can tell, when either one is fixed with something resembling an optimal dose, there are easy-to-notice benefits. Before I started making these points, there were plenty of reasons to think these are major deficiencies. For example, the Aquatic Ape Hypothesis suggested that we might need more omega-3 than we usually get. The Umami Hypothesis suggested we need a lot more fermented food than we usually eat. In contrast, I can't think of a single reason to think that Americans suffer from major vitamin deficiencies. I take a multivitamin pill but I'd stop long before I'd give up flaxseed oil or fermented foods.

1. <http://archinte.ama-assn.org/cgi/reprint/169/3/294>

---

Darkhorse (2009-04-19 06:26:54)

That is rather depressing for women. However, multivitamins may help us live longer. This study in the American Journal of Clinical Nutrition, published in February, 2008, provides the first epidemiologic evidence that multivitamin use is associated with longer telomere length among women. A little comfort. <http://www.ajcn.org:80/cgi/content/abstract/ajcn.2008.26986v1>

Stephen M (Ethesis) (2009-04-19 19:02:29)

For comparison, criminals have more than a third less problems in jail if they are given vitamins. Some interesting things seem to be developing.

sunraig (2009-04-20 07:57:52)

For further comparison dark skin people have greater Vitamin D3 deficiency living in northern climates, which might explain cancer and other difference between racial groups.

Tom in TX (2009-04-20 08:36:02)

Once again, I need a translator. 8-) What does this mean in layman's terms? "After a median follow-up of 8.0 and 7.9 years in the clinical trial and observational study cohorts,..." Were the subjects of the study given a multivitamin to take for 8 years?

seth (2009-04-20 10:07:33)

Tom, yes, they took a multivitamin for 8 years. Some were instructed to take the pill, others decided by themselves to take it.

## Food Expiration Dates: Reversal of Fortune (2009-04-19 20:15)

At a store today I saw two containers of [1]Siggis "Icelandic style" yogurt I wanted. One said "best by 4/27/09"; the other said "best by 5/18/09". To my shock I realized the older one was better. It had more bacteria.

The opposite of what we're supposed to think.

Expired food – don't throw it out, give it to me.

1. <http://skyr.com/>

---

Chris (2009-04-19 20:45:43)

Wouldn't you also get similar 'living food' effects by just leaving your food out unrefrigerated for a while before consumption? For times when you can't get to a whole foods like on business trips, it might be a good way to get your bacteria...buy the food that 'drips' the most (cheeseburger, soup, cole slaw etc.) and leave it out.

Confidence (2009-04-19 21:08:19)

By "better" do you mean tastier, more wholesome and things along those lines?

Ashish (2009-04-19 21:54:58)

I'm enjoying my first ever home made (from paste, not packet) bowl of miso soup - I can just feel those bacteria multiplying!

Ashish (2009-04-19 21:57:34)

I thought you were making your own yogurt - as I plan to do. What does this store bought yogurt offer that home made does not? On a related note, you've given us so many recommendations over the months ... do you maintain a central list of preferred fermented foodstuffs and brands? Thanks.

seth (2009-04-19 22:01:06)

Ashish, you're right, homemade is much better. I'm away from home, that's why I'm eating store-bought yogurt. This particular brand is unusually strong.

seth (2009-04-20 04:49:25)

Confidence, by "better" I mean healthier. I eat yogurt for the bacteria - the more bacteria the better. Chris, yes, I believe I can improve food by leaving it unrefrigerated, and I've been doing that.

Confidence (2009-04-20 22:49:10)

Is variety of bacteria an important part of your hypothesis? I ask because, the process of pickling, which is an anaerobic fermentation process as well, is done specifically to preserve food by making the food hostile to (other) forms of bacteria. Thus the food after pickling, contains fewer variety of bacteria than before, but a higher volume of the fermenting bacteria (I'm guessing). I'm not yet sure if even the fermenting bacteria is left behind after pickling. I can think of fermentation/pickling as a self-limiting process that stops when the acids produced kill of most of the fermenting bacteria themselves (this is similar to what Patrick says). But that's a different matter; for now I'm interested in your thoughts on variety vs. volume.

seth (2009-04-21 04:41:28)

"Is variety of bacteria important?" I don't know. I'm sure quantity matters.

Patrik (2009-04-21 17:02:56)

*Is variety of bacteria important? I don't know. I'm sure quantity matters.* @seth How is that you don't know if variety is important, but are sure that quantity matters?

## Steve Levitt and John List Teach Experimentation to MBA Students (2009-04-21 03:49)

From the [1]Financial Times:

"The level of experimentation [at big businesses such as United Airlines] is abysmal," says Prof List. "These firms do not take full advantage of feedback opportunities they're presented with. After seeing example after example, we sat down and said, 'We have to try to do something to stop this.' One change we could make is to teach 75 to 100 of the best MBA students in the world how to think about feedback opportunities and how to think about designing their own field experiments to learn something that can make their company better."

The two economists decided to team up to develop a course for [University of Chicago] Booth [Business School] students on "Using Experiments in Firms" - the first time either had taught at the business school.

This is an interesting middle ground between conventional science (done by professors) and what I have done a lot of (self-experimentation to solve my own problems - e.g., sleep better). I'm (a) trying to solve my own problems and (b) it's not a job. Conventional scientists are (a) trying to solve other people's problems and (b) it is a job. The MBA students will be taught experimentation that involves their own problems - well, their own company's problems - and it is a job.

One important effect of this course, if the whole idea catches on, could be a cultural shift: A growing belief that experimentation is good and that failure to experiment is bad. Some of my first self-experiments involved acne. I was a grad student. When I told my dermatologist what I'd done - my results showed that a medicine he'd prescribed didn't work - he looked unhappy. "Why did you do that?" he asked.

The Levitt/List course has a Martin-Luther-esque ring to it. Science: Not just for other people.

Thanks to Nadav Manham.

1. [http://www.ft.com/cms/s/0/3c4bbd46-2d44-11de-8710-00144feabdc0.html?nclick\\_check=1](http://www.ft.com/cms/s/0/3c4bbd46-2d44-11de-8710-00144feabdc0.html?nclick_check=1)

---

Nansen (2009-04-22 16:44:23)

Evidently, the Booth School hasn't yet heard that "Martin-Luther-esque ring" - they have password-protected the syllabus for the course "Using Experiments in Firms." Do you happen to have any information about the syllabus?

seth (2009-04-22 20:08:11)

No I don't have information about the syllabus. It's a good question; maybe I will try to get a copy.

## Ancient Non-Nutritional Wisdom: Morning Dance (2009-04-21 07:32)

From the latest episode of The Amazing Race:

[PHIL:] In this detour, teams have to choose between two ways that the people of Guilin [China] express themselves artistically. The choice: choreography or calligraphy. In choreography, teams must join in a popular exercise in Guilin: dancing. They'll make their way to the central island, join a group of locals performing their morning dance routine, and learn the dance.

Emphasis added. The dancing, done in pairs, provides plenty of morning face-to-face contact, just what [1]I think everyone needs for good mood regulation.

On the Tsinghua campus, I saw morning groups practicing aikido, which doesn't provide as much face-to-face contact. The Guilin dancing is perfect. Also good is that it's done outside. The sunlight will give the light-sensitive circadian oscillator a big push. Faces push a face-sensitive circadian oscillator.

There is one region of China whose residents are known for being laid back and happy. I wonder: Is it Guilin?

1. <http://repositories.cdlib.org/postprints/117/>

---

Kevin Miller (2009-04-21 09:07:25)

Morning dancing is widespread all over China, including Beijing. If you go to any park in the morning, you'll see groups of (mostly older) people doing both ballroom dancing and folk dancing, along with tai qi and all sorts of other activities. I don't know the Qinghua campus very well, but I bet there's some place where people do dancing in the mornings.

Jim N. (2009-04-22 13:31:22)

Would standing in a packed Subway car constitute face-to-face contact. I wonder. New Yorkers are great at not looking each other in the eye, while standing 18 inches apart.

seth (2009-04-22 20:06:40)

Jim, I tried that for about 10 seconds. It's impossible. I even tried starting conversations on the subway. That too was impossible.

Chris (2009-04-24 04:40:36)

Yes, near Tsinghua the Summer Palace has quite a few groups dancing in various styles if you go early enough.

### **Trying to Buy Expired Food (2009-04-22 20:19)**

I couldn't resist. Shopping for kefir, I found a bottle two weeks past its sell-by date. Being the only person in the world who [1]believes expired food is better than non-expired food, I thought it would be fun to see if I could get a discount. After all, it's going to be thrown away.

Nope. "I'd rather not sell it to you," said the store manager. "We can get a refund for these." He apologized, took it, and I had to buy a non-expired bottle.

1. <http://www.blog.sethroberts.net/2009/04/19/food-expiration-dates-reversal-of-fortune/>

---

Dennis Mangan (2009-04-23 06:49:47)

Seth, if your theory about fermented foods is correct, you might also consider what washing the skin with soap could do to the immune system. Every part of the skin has a characteristic microbial flora, which differs according to area, e.g. the feet have a different bacterial population than the lower back. Presumably these bacteria interact with the immune system, and killing them off every day with soap could have deleterious health effects.

bennetta (2009-04-23 11:34:12)

There are legal reasons for this. Grocers can be held liable for knowingly selling an expired product to a customer, if the customer becomes sick from that expired product.

Tom in TX (2009-04-23 12:52:19)

Maybe you should have asked the grocer if you could shop-lift the expired items. 8-)

Heidi 555 (2009-04-23 13:30:58)

There are discount stores near where I live that sell a lot of products that are close to the expiration date or sometimes well past the date. Plus once the date has passed the price drops to almost nothing. I regularly buy organic yogurt, cottage cheese, and cream for 25 or 50 cents. I have no idea why these places thrive on expired products while other places aren't allowed to sell them. Seth (or anyone else who knows), how do you know what foods might develop "bad" bacteria that could make you really sick or even kill you? I have no problem with aged fermented or cultured products. But leaving regular food out to age makes me nervous.

Chris Highcock (2009-04-27 09:54:06)

I came across something interesting about fermentation in the latest National Geographical. The cover story is about the discovery of a baby mammoth in Siberia. Although when found it was free of the ice it hadn't decayed. On examination it was found that it had been "pickled" just through being in the water and thus preserved. This was noticed by one of the researchers who noticed the pickled smell as he was doing the dissection. It reminded him of experiments that he had done to see whether primitive hunter gatherers could have preserved meat in this way. He submerged meat in a pool of water and found it was naturally pickled by the bacteria present. Hence his theory that hunters could have killed large prey (mammoths) and then preserved / fermented / pickled the meat for a long period after: I'd advise looking at the magazine, but it is covered here: <http://amandainmaine.wordpress.com/2009/04/21/a-near-perfect-frozen-mammoth-resurfaces-after-40000-years/> *Tikhonov knew that no one would be more excited by the find than Dan Fisher, an American colleague at the University of Michigan. Fisher is a soft-spoken, 59-year-old paleontologist with a bristly white beard and clear green eyes who has devoted much of the past 30 years to understanding the lives of Pleistocene mammoths and mastodons, combining fossil studies with some very hands-on experimental research. Curious to know how Paleolithic hunters managed to store mammoth meat without spoilage, **Fisher butchered a draft horse using stone tools he'd knapped himself, then cached the meat in a stock pond. Naturally preserved by microbes called lactobacilli in the water, the flesh emitted a faintly sour, pickled odor that put off scavengers even when it floated to the surface. To test its palatability, Fisher cut and ate steaks from the meat every two weeks from February until high summer,** demonstrating that mammoth hunters might have stored their kills in the same way. Also <http://www.ns.umich.edu/htdocs/releases/story.php?id=7099> Another intriguing question is how Lyuba avoided decomposition and destruction. Undoubtedly she was frozen in permafrost for most of the time between her death and discovery, but Fisher and Buigues determined that the carcass lay on the riverbank for nearly a year before the reindeer herders stumbled upon it. "That means that this baby mammoth, flesh and all, sat out on the side of the river all of the Arctic summer of 2006, which would have subjected the carcass to 24-hour-a-day sunlight, elevated temperatures and exposure to bacteria and scavengers," Fisher said. "So why is it preserved as well as it is?" Based on previous experiments aimed at understanding how Paleolithic hunters stored meat from large animal kills, Fisher believes Lyuba was naturally pickled in lactic acid produced by*

*microbes called lactobacilli. The pickling would have protected her body from decomposition, and the sour smell likely deterred scavengers.*

Seth's blog » Blog Archive » Effect of Animal Fat on Sleep (more) (2009-10-31 18:01:46)

[...] Yesterday at a Carrefour I watched a pig being cut up. The butcher cut off the skin (with a thick layer of fat) and tossed it into a section of the display of pork for sale. I could buy the part of the pig I valued most for an incredibly low price (about 25 cents/pound). All other pork cost more. That's how much Chinese shoppers wanted it. No one rushed to buy the newly-cut piece of skin. It reminded me of New York where I tried to buy food past its expiration date, ordinarily considered worthless. [...]

Jazi yechezkel zilber (2011-12-03 10:35:36)

My grandfather story He once forgot a bottle of milk (natural, non pasturised) for two weeks, and found it covered with "all kind of colors", but he drank it nonetheless, Surprisingly, he felt afterwards, much much better....

### **Trouble in Mouse Animal-Model Land (2009-04-23 03:34)**

Most drugs are first tested on animals, often on "animal models" of the human disease at which the drug is aimed. This 2008 [1]Nature article reveals that in at least one case, the animal model is flawed in a way no one really understands:

In the case of ALS, close to a dozen different drugs have been reported to prolong lifespan in the SOD1 mouse, yet have subsequently failed to show benefit in ALS patients. In the most recent and spectacular of these failures, the antibiotic minocycline, which had seemed modestly effective in four separate ALS mouse studies since 2002, was found last year to have worsened symptoms in a clinical trial of more than 400 patients.

I think that "close to a dozen" means about 12 in a row, rather than 12 out of 500. The article is vague about this. A defender of the mouse model said this:

As for the failed clinical trial of minocycline, Friedlander suggests that the drug may have been given to patients at too high a dose "and a lower dose might well have been effective. "In my mind, that was a flawed study," he says.

Not much of a defense.

That realization is spreading: some researchers are coming to believe that tests in mouse models of other neurodegenerative conditions such as Alzheimer's and Huntington's may have been performed with less than optimal rigor. The problem could in principle apply "to any mouse model study, for any disease", says Karen Duff of Columbia University in New York, who developed a popular Alzheimer's mouse model.

"Less than optimal rigor"? Oh no. Many scientists seem to believe that every problem is due to failure to follow some rules they read in a book somewhere. They have no actual experience testing this belief (which I'm sure is false – the world is a lot more complicated than as described in their textbooks); they just feel good criticizing someone else's work like that. In this case, the complaints include "small sample sizes, no randomization of treatment and control groups, and [no] blinded evaluations of outcomes." Very conventional criticisms.

Here's a possibility no one quoted in the article seems to realize: The studies were too rigorous, in the sense that the two groups (treatment and control) were too similar prior to getting the treatment. These studies always try to reduce noise. A big source of noise, for example, is genetic variability. The less variability in your study, however, the less likely your finding will generalize, that is, be true in other situations. The Heisenberg Uncertainty Principle of experimental design. Not in any textbook I've seen.

In the 1920s and 30s, a professor in the UC Berkeley psychology department named Robert Tryon tried to breed rats for intelligence. His measure of intelligence was how fast they learned a maze. After several generations of selective breeding he derived two strains of rats, Maze Bright and Maze Dull, which differed considerably in how fast they learned the maze. But the maze-learning differences between these two groups didn't generalize to other learning tasks; whatever they were bred for appeared to be highly specific to maze learning. The measure of intelligence lacked enough variation. It was too rigorous.

When an animal model fails, self-experimentation looks better. With self-experimentation you hope to generalize from one human to other humans, rather from one genetically-narrow group of mice to humans.

Thanks to Gary Wolf.

---

Andy M (2009-04-23 07:32:19)

But are you going to try untested drugs on yourself? It seems to me that there is at least \*some\* value in animal models.

Andrew Gelman (2009-04-23 08:38:08)

Seth: Paul Rosenbaum wrote an article in which he discussed the benefits of having a wide range of cases in your treatment and control groups. However, I disagree with your statement about treatment and control groups being too similar. The ideal study would have a large amount of variation in treatment and control groups, but with random assignment so that the two groups are, on average, similar. You can use a method such as blocking or pairing to reduce noise; this is not in conflict with the goal of generalizability. These are really two different issues.

Gary Wolf (2009-04-23 15:02:51)

Thanks for your perspective on this, Seth. In response to Andy M.'s comment above: yes, that's right, the criticism here doesn't apply to all uses of mice or other animals in research. Howard Florey ran his crucial test on using penicillin to cure bacterial infection in living mammals using only 8 mice. All were given a big dose of streptococci, four got penicillin injections. Untreated mice were dead overnight; three of the others survived. A large increase in confidence obtained. To get to Seth's point, though, look how "poorly" this experiment was designed. No randomization, no double blinding, no repeat trials; just a crappy little home brew test of an idea that helped significantly to get the ball rolling to save millions (well, tens of millions) of lives. I really think this is an important point. There isn't a "gold standard" for scientific truth in the sense of a standard experimental design that will settle all questions. There is a step by step process of confidence building. Reducing statistical "noise" in an experiment carries a cost. When you are as ignorant of the underlying biology as we are (not a criticism of the scientists personally, this is a general ignorance) about ALS, the real problems may not come from conventional errors in experimental design... That's the point, at least, as I take it.

Gary Wolf (2009-04-23 15:04:38)

Quick add-on: I don't mean to imply this was Florey's only test! Just that you can acquire big news from experiments that don't meet the "gold-standard," and then go on to answer the questions that emerge by doing more experiments... hope that was clear.

seth (2009-04-23 19:26:34)

Andy M, yeah, I agree, self-experimentation won't replace testing drugs on animals. I'm saying that the conventional view that animal models are good and self-experimentation is bad isn't supported by these particular facts. Andrew, the psychologists I know don't like the two-group (control and experimental) design you and Rosenbaum describe. They prefer a design in which each subject is his own control. You compare the same subject with and without the treatment. In the within-subject design, you are not penalized for increasing subject-to-subject variation, the way you are in a between-subject design, where the control group and the treatment group consist of different subjects. Because the "ideal study" you describe has lots of between group variation, it is less than ideal for detecting a difference between the groups.

Riz (2009-04-24 05:08:39)

Hi Seth, Just wanted to thank you for inspiring me to practice self-experimentation. I am half-way through 30 days of restricting calories, trying to be as self-examining as possible. I'm dumping the basic recordings of this experiment on this blog: <http://thirtydaysdown.blogspot.com/> I'm averaging about 650 calories a day and have learned that the hunger sensation is easily tamed but coping with the mental effects of low blood sugar is difficult and I may be eating more sugar than I did before the diet started. By adding a bit of sugar to my tea and eating dry apricots through the day I am almost 100 % fine until evening meal time. I was going to use a tablespoon of oil a day to dampen my hunger but my body seems to be coping just fine - that said, this is more of a crash course experiment versus a longer term weight loss programme. The other big observation so far is that while the blanket advice is to increase consumption of fruit and vegetables I find the former far less effective in terms of satiety and have steered away from almost all fruit over the period (except the magic dried apricots!). I'm enjoying your next adventure in the realm of fermented foods and look forward to the findings. Just a shame I can't find natto so easily here in the UK. All the best, Riz.

Andrew Gelman (2009-04-24 13:37:04)

Seth: I guess I was not clear in my comment. The design you advocate is a special case of the standard blocking or pairing design that I describe; in this case the blocks are individual mice that are each given multiple treatments. My point was that your statement that "the two groups (treatment and control) were too similar prior to getting the treatment" is a separate issue from generalizability. You can have the two groups be very similar (for example, by reusing your experimental subjects, as you suggest in your comment) and still have wide variation within group. There is no "Heisenberg Uncertainty Principle" here.

seth (2009-04-24 18:44:52)

Thanks, Andrew. I agree that some designs are better than others. But I disagree that there is no Uncertainty Principle. In your example - the within-subject design - where you seem to say no price is paid for wide variation in subjects, there is indeed a price because it is likely that there is nonzero treatment x subject interaction, which inflates the error term. The greater the subject-to-subject variation, the greater the inflation of the error term. The Uncertainty Principle also applies to the treatment. The more precisely the treatment is repeated from one subject to the next the clearer any difference will be (because "treatment error" is minimized) but the less well you can generalize to other treatments. Herb Clark, a psych professor at Stanford, made similar points in a well-known-to-psychologists verbal-learning paper about 30 years ago. He explained the difference between a random and a fixed effect. It's another example of what I'm talking about.

Shirley Aronson-Unger (2009-04-25 13:50:20)

A new article worth reading related to self and individual experimentation is: [http://seedmagazine.com/content/article/the\\_unraveling\\_of\\_homogeny/](http://seedmagazine.com/content/article/the_unraveling_of_homogeny/) "The Unraveling of Homogeny New Ideas / by David Naylor / April 9, 2009 Testing mice as individuals instead of one and the same may cut down on experimental errors and lead to significantly cheaper, more efficient drug testing."

## Would You Rather Have Lice or Eat Yogurt? (2009-04-24 05:01)

Research on mice shows that those carrying the most lice had calmer immune systems than uninfested rodents, and they [the researchers, not the mice!] said their finding may have implications for studying the causes of asthma and allergies in people.

From [1]Reuters. The [2]research paper. The data analysis is much better than usual. Among its strengths are: 1. Graphs of main points. 2. Transformation of variables. 3. Principal components analysis.

This study is more evidence that a high level of foreign substances in our body to which the immune system responds is beneficial. The researchers say nothing about fermented foods, which are an easy and easy-to-control way to ingest such substances. It's hard to vary your dose of lice but easy to vary how much yogurt you eat.

Thanks to Oskar Pearson.

2. <http://www.biomedcentral.com/content/pdf/1741-7007-7-16.pdf>

---

Justin (2009-04-24 06:03:13)

I keep getting this strong sense that there is a connection here between [1]fasting/low-carb diets and consuming fermented foods/exposure to foreign substances: all three of these approaches seem to put our bodies into a state of readiness or alert or perhaps "defense mode" the impact of which is exhibited in any number of improved health markers. With regard to fasting, [2]From your blog post on meal skipping and the Mattson/Johnson/Laub work (2006):

Since May 2003 we have experimented with alternate day calorie restriction, one day consuming 20-50 % of estimated daily caloric requirement and the next day ad lib eating, and have observed health benefits starting in as little as 2 weeks, including insulin resistance, asthma, seasonal allergies, infectious diseases of viral, bacterial and fungal origin (viral URI, recurrent bacterial tonsillitis, chronic sinusitis, periodontal disease), autoimmune disorder (rheumatoid arthritis), osteoarthritis, symptoms due to CNS inflammatory lesions (Tourette's, Meniere's) cardiac arrhythmias (PVCs, atrial fibrillation), menopause related hot flashes. We hypothesize that other many conditions would be delayed, prevented or improved, including Alzheimer's, Parkinson's, multiple sclerosis, brain injury due to thrombotic stroke atherosclerosis, NIDDM, congestive heart failure.

The low-carb connection is that the [3]metabolic pathways while fasted are (apparently) the same as when on a low-carb diet.

2. <http://www.blog.sethroberts.net/2006/06/22/meal-skipping-good-or-bad/>

3. <http://www.justinowings.com/b/index.php/me/metabolic-pathways-while-fasted-and-keto>

david (2009-04-24 07:00:16)

I hate to nit pick, but at some point wouldn't the open sores from the scratching the louse bites outweigh any advantage to the immune system?

NE1 (2009-04-24 20:27:38)

Gold star for David! A similar idea brings us to Reiter's Syndrome, or "reactive arthritis", which has untreated STI's as a possible cause. There are examples in biology of organisms that have been appropriated by our bodies: mitochondria might be from ancient prokaryotes, and surely much of the flora in our gut is useful.

david (2009-04-25 21:05:29)

Actually, I just wanted to fit the words "nit pick" into my reply and that lousy point was the best I could do. The only reason I'm posting this reply is because I forgot to work "lousy" into the previous one. Btw., getting rid of hair lice is damned hard (my daughter came home from school with them last year). I assume that for most of human history people spent a lot of time hosting lice. Up until my daughter got them I had used the words "nit pick" with no appreciation for what that really entailed. The way we use "nit pick" is backwards in that it implies excessive criticism. If someone really does go to the effort of picking nits for you, you would really appreciate what they're doing on your behalf.

## **The Yogurt Prize: Who Gets It Most Wrong? (2009-04-24 18:12)**

A vast scientific literature shows the positive effects of probiotic foods such as yogurt and natto. What book most completely ignores that literature?

Practically all popular nutrition books ignore it, but some more egregiously than others. (Just as in Animal Farm, some animals were more equal than others.) I've decided to give the Yogurt Prize to the worst offender.

The first winner of the prize, I am pleased to announce, to be held until an even worse example comes along, is [1]The Wellness Encyclopedia of Food & Nutrition: How to Buy, Store, and Prepare Every Variety of Fresh Food (1992) by Sheldon Margen and the editors of the University of California Berkeley Wellness Letter. The Wellness Letter has

an advisory board of Berkeley professors. The book has the UC Berkeley stamp of approval. Although it has five pages on yogurt – contradicting the title – the book treats yogurt as the nutritional equivalent of milk, which is so clearly false.

The citation reads: "For putting its ignorance not only in the text but in the title of the book; for reflecting the ignorance of not just one person but a whole team of writers; for being created under an advisory board of distinguished professors; and for carrying the stamp of a world-renowned research university."

NE1 (2009-04-24 20:20:33)

Why do you think there is a societal aversion to eating out of dumpsters? Say, even behind a restaurant? You've made many posts on this fermentation hypothesis, but I'm not sure I remember you mentioning once that there is a limit to the idea. If you've ever eaten rotten food and involuntarily puked soon afterward, you know this upper limit.

seth (2009-04-24 20:36:15)

NE1, long ago people thought white bread was better than non-white bread, white rice better than brown rice. I don't worry much about "societal aversions".

Aaron Blaisdell (2009-04-25 02:42:50)

Actually, white bread and rice ARE better (maybe I should say less worse) than their whole-grain counterparts IF the whole grain versions are not treated appropriately before consumption. Stephen has many posts at his WholeHealthSource blog discussing how important it is to sprout and/or ferment whole grains to make them nutritious. It turns out that refining flour and rice by removing most of the exterior of the grain—although removing most or all of the vitamins and minerals—does get rid of the phytic acid (an antivitamin if you will) that is so problematic for human digestion and absorption of nutrients. But fitting with your hypothesis, it turns out that the best way to consume grains is to not only soak or sprout them but also to lactoferment them (e.g., with some yogurt or kefir).

Caleb (2009-04-25 07:36:53)

The lectins concentrated in the bran of grain is also bad for you. They can damage the intestinal lining, get into the blood, trigger off inflammation, and are likely candidates for binding to insulin and leptin receptors, inducing insulin and leptin resistance, the first stages in metabolic syndrome and obesity. Breaking down the lectins is one of the reason traditional societies ferment grains before eating them. If the grains haven't been soaked, sprouted and/or fermented though you're actually better off with the bran removed.

Kirk (2009-04-25 08:14:38)

Have you come across any books which are outstanding in their discussion of probiotics? I think there could be two categories; one written for those with a scientific mind, and another written for the general public.

seth (2009-04-25 08:45:07)

Caleb, what about the Japanese who got beriberi because they ate white rice instead of brown rice? Kirk, no I haven't. I agree, that's a more interesting question.

Caleb (2009-04-25 09:25:23)

Beriberi is due to thiamine deficiency. If you're poor and don't have a better source of B1 like meat, then yes, you're better off with brown rice. Won't change that the phytic acid and lectins are still going to do bad things to you. In rice's defense, if you're going to have a grain, it seems to have the lowest level of anti nutrients. Wheat appears to be the worst.

### Live Food at Google? Nope (2009-04-24 21:55)

I ate lunch in the cafeteria of Google New York. Being monomaniacal, I was struck by the absence of fermented food. No kombucha, kefir, kimchi, pickles, wine, beer, natto, strong cheese, sauerkraut. Not even yogurt! (Of course there was vinegar at the salad bar and perhaps the meat was aged.) The absence was especially glaring given so much conventionally-healthy food: raw food, twenty kinds of vegetables, fruit, fish, diet sodas, gazpacho, sugar-free jello . . . I am sorry to predict those talented Googlers will be sicker than necessary.

[1]Previous visit.

1. <http://www.blog.sethroberts.net/2008/04/09/in-the-google-cafeteria/>

---

Tom Swirly (2009-04-24 22:09:28)

Hah! We DO have kombucha! :-D (and there's sometimes kimchi) But I do agree, more fermented food needed!

Peter (2009-04-25 01:52:41)

there used to be plenty of kombucha at the Mountain View headquarters, but not sure it survived all the cuts.

Bingxing (2009-04-25 16:34:15)

^\_^ Funny to find out about your interesting blog and all I should have asked you what you thought about that Green Tea Frappuccino???

Nathan Myers (2009-04-27 12:56:20)

Bread is fermented. Cheese is fermented. (The distinction "strong" strikes me as special pleading. Anyway, no feta? No gorgonzola? Really?) Greek olives are fermented. Pizza ingredients are mostly fermented. Soy sauce is often fermented, particularly the better brands likely used there. No pickles? Really? How about salami? Chocolate? Black tea?

bennetta (2009-04-27 13:22:46)

Hey Seth, This is unrelated, but I was out shopping last weekend and ran across this: <http://www.pulmuonewildwood.com/> Wildwood organics now offers several new probiotic foods, including hummus, tofu, and tempeh. The hummus is great if you like that sort of thing- I haven't tried the others. Anyway, I thought you might be interested.

seth (2009-04-27 18:14:04)

Nathan, by "fermented food" I don't mean food that has been even a little fermented. If I did then most of the food would qualify, especially the meat, which has been aged. I mean food that has been fermented a lot. I don't remember seeing any pickles.

Peter Norvig (2009-04-29 01:03:55)

Kombucha, Kimche, pickles, and strong cheese are all common in Mountain View.

### **Jane Jacobs and Collapse (continued) (2009-04-25 19:58)**

[1]A year ago I speculated why Jane Jacobs didn't like Jared Diamond's Collapse. Now, rereading The Economy of Cities, I have a better idea. Here's what Jacobs says on p. 118:

Once a society has developed its economy appreciably, any serious stagnation [of economic development] becomes appallingly destructive to the environment. Common sequels in the past have been deforestation, complete destruction of wild life, loss of soil fertility and lowering of water tables. In the United States, lack of progress in dealing with wastes, and overdependence on automobiles – both evidence of arrested development – are becoming very destructive of water, air, and land.

In other words, Jacobs says that the ecological disasters described in Collapse were due to economic stagnation. In a stagnant economy, problems pile up without being solved. A common problem is too much reliance on one thing. In a healthy economy, new goods and services are constantly produced, often to solve problems created by old goods and services. In a stagnant economy, this doesn't happen. A rich economy can be just as stagnant as a poor one.

Diamond understood none of this. Not even close. Instead he proposed twelve reasons for the collapses he studied. They included "overhunting," "overfishing," and "population growth"; the complete list is [2]here.

Jacobs's point applies very broadly. Why do Americans pay so much for relatively poor health care? Because the healthcare industry has been stagnant. There is too much reliance on drugs but nothing is being done about it. Non-drug solutions are not being slowly developed. (Alternative medicine, with its religious and dogmatic overtones, is no solution.) The healthcare industry is too resistant to change. Why is the American car industry collapsing? It was stagnant – too resistant to new ways of doing things. The statistician [3]W. Edwards Deming tried to interest American manufacturers in higher-quality ways of making cars, but failed. Then he went to Japan, where he succeeded. The newspaper industry is collapsing because it too has been stagnant. Its current problems started several years before the internet. Instead of trying to solve them, newspaper publishers continued to rake in high profits. Nothing lasts forever, Jacobs was fond of saying.

1. <http://www.blog.sethroberts.net/2008/04/12/jane-jacobs-and-collapse/>

---

Raghu (2009-04-26 04:52:18)

Economics stagnation appears to be a blanket explanation. It is the meta reason for every case of collapse, whereas Diamond seems to suggest final cause explanations, or the modus operandi of collapse. There might even be cases where any amount of economic activity cannot overcome a catastrophic problem like, say, climate change.

JLD (2009-04-26 11:26:12)

Jacobs argument may be debatable against Diamond theory of collapse but it goes head on against Joseph Tainter inferred cause for collapse: Collapse comes from diminishing marginal returns on increase in complexity, i.e. the very "remedy" suggested by Jacobs. See "The Collapse of Complex Societies" <http://www.cambridge.org/us/catalogue/catalogue.asp?isbn=9780521386739>  
[http://p2pfoundation.net/Collapse\\_of\\_Complex\\_Societies](http://p2pfoundation.net/Collapse_of_Complex_Societies)

thekingofcheap (2009-04-27 08:13:04)

The "stagnant economy" theory might better be labeled "entrenched interests." As Jacobs points out in her own book, a once vibrant economy in the US produced street cars and trains that were the envy of the world. Now, the technology is even better and trains would solve many many problems, yet urban planning decisions are still made from the automotive paradigm. Why? The Gramsci in me posits that entrenched interests will do their best to shape culture and society to their worldview. Perhaps in Greenland the men with social status refused to compromise that status for the sake of cultural adaptation and the society's survival. It's not too difficult to imagine. Diamond paints them as clinging to their Scandinavian value system, but who actually insisted on clinging?

seth (2009-04-27 09:16:39)

thinkingofcheap, Jacobs sees entrenched interests as the basic problem in advanced economies, yes. People in power don't want anything new to come along that will threaten their power. But anything that causes stagnation, not just entrenched interests, will cause problems to build up without being solved.

Evelyn (2009-04-27 09:27:02)

Have you read *Thinking in Systems* by Donella H. Meadows? It's thought provoking, and talks about how we focus on events when talking about systems, and sometimes about flows, but often forget stocks. I think you'd like it.

Nathan Myers (2009-04-27 12:37:08)

Why assume either/or? Deforestation can happen in a vibrant economy, and can destroy a vibrant economy. Post-destruction, the deforestation may get worse. Diamond explains what happened in Japan: it wasn't economic vibrancy that saved them, it was a totalitarian dictatorship that enforced commands throughout the society that were fundamentally, if temporarily, incompatible with economic activity. It was, and could not have been, in the immediate economic interest of *anyone* in that society to do what was needed. Stagnancy isn't a cause of anything. It's a symptom. ("Oh, look how lazy all these patients are! If they'd just get busy, they'd be fine.")

## **Omega-3 and Prostate Cancer (2009-04-28 04:18)**

From [1] a new study:

Men who eat salmon and other fish high in omega-3 fatty acids on a regular basis have a decreased risk for developing advanced prostate cancer, new research suggests.

The association was most pronounced among men believed to have a genetic predisposition for developing aggressive prostate cancer.

Men in the study who ate one or more servings of fatty fish a week were found to have a 63 % lower risk for developing aggressive prostate cancer than men who reported never eating fish, study co-researcher John S. Witte, PhD, tells WebMD.

The study is not the first to find that men who eat fatty fish have a lower risk for the most deadly forms of prostate cancer. But Witte says clinical trials are needed to show that eating foods high in omega-3 fatty acids actually lower risk of aggressive prostate cancer.

"Needed"? Or is this like a Grammy winner thanking God in his acceptance speech? That is, ritualistic. I prefer this way of making the point:

Roswell Park Cancer Institute President and professor of oncology Donald Trump, MD, tells WebMD that there is enough evidence suggesting a protective role for omega-3 against prostate cancer to justify a large trial studying whether eating a diet rich in omega-3s – or even taking omega-3 supplements – can actually lower risk of prostate cancer.

Someday an astute person will write a paper called "How accurate are clinical trials?"

The protective power of fish oil is supported by the very low rate of prostate cancer in Japan – 15 times lower than in America, according to [2] this.

Thanks to Peter Spero.

1. <http://www.webmd.com/prostate-cancer/news/20090324/fatty-fish-may-cut-prostate-cancer-risk>

2. <http://www.jafra.gr.jp/eng/sumi.html>

John (2009-04-28 06:24:10)

Someone has written an article similar to "How accurate are clinical trials?" See [1] Contradicted and Initially Stronger Effects in Highly Cited Clinical Research by John P. A. Ioannidis or his more sensationally titled popular summary "Why Most Published Research Findings are False" published in Chance magazine.

1. <http://jama.ama-assn.org/cgi/content/abstract/294/2/218>

Gian (2009-04-29 01:57:12)

The rate of prostate cancer in India is 34 times less than US (see <http://3quarksdaily.blogs.com/3quarksdaily/2005/12/empty.html>) and most Indians eat very little fish or fish oil How do people that eat no fish get omega-3?

seth (2009-04-29 07:27:05)

There is omega-3 in grass-fed meat and in plants. But I would agree that the India fact suggests that there are promoters of prostate cancer in the Western diet.

Gian (2009-04-29 22:36:55)

Rapeseed oil is actually widely consumed in India. This oil has 2:1 ratio of short-chain omega-6/omega-3 fats. In India strong correlation is found between oil consumption and metabolic disorders. The relevant research has not been done but I believe that these disorders are more among the people that consume oils other than rapeseed.

Nathan Myers (2009-05-21 15:12:29)

Rapeseed oil is similar to canola, aside from containing "erucic acid", which Wikipedia says is an omega-9 oil that rats have trouble digesting. Apparently breeding rapeseed to taste less bitter damaged the process for making omega-9, so lacking it is promoted as a feature.

Omega 3 y cancer de prostata (2009-10-27 13:52:19)

[...] Enlace a la fuente del estudio. [...]

Sam (2010-01-14 12:49:54)

clinical trials are needed for fish oil. Maybe even for fish - if it's not the fish but something associated with fish happening in Japan. Just like the ill fated beta carotene cancer trials, fish may be awesome for you but fish oil could increase your risk. I remember when this stuff happened. Nary a peep out of mainstream media. <http://www.google.ca/search?hl=en&q=%22beta+carotene%22+cancer+smokers&btnG=Search&meta=&aq=o&oq=http://www.cancerhelp.org.uk/about-cancer/cancer-questions/vitamin-supplement-s-smoking-and-lung-cancer-risk> » In this study 18 % more lung cancers developed in the » people taking the alpha tocopherol and beta carotene pills. but ... but ... ANTIOXIDANTS ARE GOOD FOR YOU !!! Add the recent results showing vitamin C and E supplements block some of the body's adaptive responses to exercise. This kind of thing is one reason I'm skeptical of the vitamin D hoopla going on now.

## **Eczema, Nighttime Cough, Antibiotics, and Fermented Food (2009-04-29 03:45)**

When Alex Comb's son was an infant, he had pretty bad eczema. (Eczema is a reddish dry skin rash.) He also had a nighttime cough, a dry cough that started and stopped throughout the night. The cough lasted months. It turned out he was allergic to carragenen. The cough was mostly, but not entirely, eliminated by avoiding carragenen. Sometimes there were flareups.

When the son was 2 years old, he had a mild case of eczema. Doctors wanted to give him steroids. Alex started researching the causes of eczema and how to alleviate it. He came across research on the hygiene hypothesis. In a forum, he read that some people had tried probiotics for eczema with some success. Research on the subject had had mixed results but it seemed worth a try.

So Alex and his wife gave his son [1]DanActive (a probiotic dairy drink) every day for over a year. After a week or so, he noticed improvement. The nighttime cough completely went away. The eczema went away 95 %. This isn't a use of DanActive I could find on their website.

When his son was 3 yrs old, Alex and his wife stopped the DanActive. They assumed his immune system was better. He had gotten tired of drinking it all the time. He drank it less. His diet got broader too; he started eating yogurt. He never really stopped drinking it, he just drank it less.

A few months ago, the son started a 10-day course of antibiotics for a nasal discharge. A few days later, the nighttime coughing mysteriously resumed. It lasted at least 5 nights, and ended around the same time the antibiotics did. It was an asthmatic cough rather than a respiratory infection cough. An asthmatic cough is much drier and shorter.

A few weeks ago, the son was put on antibiotics for an abscessed tooth. Two or three days after antibiotics started, the asthmatic cough started again. Was it the antibiotics? He had not been drinking the DanActive so Alex and his wife started giving it to him again. They gave him the antibiotics earlier in the day and the DanActive before he went to bed. The very first night they did this the cough went away. They kept doing that and the cough stayed away. He has had no cough since then.

What's telling is the clarity of the correlations. They support the idea that we have a large need for bacteria-laden foods.

1. <http://www.danactive.com/>

Carol (2009-04-29 04:54:23)

What I find interesting here is the relatively small amount of probiotic material required to show an improvement in symptoms in this example. Makes me wonder what the optimum amount would be in general, and if there is some benefit to the timing just prior to sleep.

seth (2009-04-29 13:10:26)

I think the tiny amount needed to show benefit indicates that the deprivation is great. If an engine has no oil, even a little oil produces a big improvement.

Chris49 (2009-05-08 13:10:48)

Seth, have you considered probiotic supplementation? I generally supplement during and after an anti-biotic regimen but am now quite curious about daily doses. Would also be curious about your take on pill-form probiotics vs. dietary changes. Full disclosure: I work for a company that distributes (but does not manufacture) probiotics from 15+ companies, along with a wide variety of nutritional supplements.

Dr Mike Matthews (2009-05-21 03:03:58)

Carol:- The idea is that the probiotics are cultures of friendly bacteria that then reproduce rapidly and colonise the gut. You only need a few to get the process going. The Hygiene Hypothesis makes great sense in the mysteries surrounding allergies and the overcleanliness of the modern world has given us a problem. As my father-in-law used to say "let them eat mud". They might get all sorts of other problems but less allergies I hope that helps

Mike A (2010-03-17 02:04:34)

I am so glad I found this blog. My daughter has had the coughing fits for 24 months (she's 5 1/2 yo). Inhalers, several doctors, and on nothing help. She routinely coughed until vomiting. After one 10 hour coughing fit I reached my limit and scoured the web. After putting in her whole medical history as search qualifiers I found this. The prior eczema and antibiotics were key indicators. After 3 days of drinking 1 probiotic shake a day, she showed very marked improvement. After 1 week, no symptoms. This is a girl who's been unable to run and play for 2 years. Who woke up coughing and gagging most nights. After 6 weeks of the same regimen, she still shows no symptoms and is running and playing full blast. The pulmonary specialist discounts the results we've seen as a fluke . . . we'll see. Previously my daughter's lung capacity was measured at 47 % of expected.

JohnG (2010-08-23 11:26:13)

Hey y'all, I stumbled across something a while back that you might be interested in. I've been suffering from allergies, allergic asthma, and exercise induced asthma for most of my life. I've taken some form of fast acting inhaler since I was about 14 (I'm now 44). I didn't take anything before that because the doctors attributed my breathing problems to simple allergies. I began taking steroidal inhalers approximately 18 years ago. The steroid inhalers worked well at first and allowed me to continue my passion of jogging. Then, over the course of a couple of years, I could no longer jog during the colder months. This progressively got worse over the years to the point I had to take 4 fast acting inhaler puffs during exercise and even that wasn't working well at all. Finally, after nearly going to the hospital after one particularly bad bout of exercise induced asthma, I went back to the internet in research. Before this, I had tried everything under the sun. I tried Vitamin D; it didn't work, but it did help my nasal allergies somewhat. I tried low carb dieting, and just like Dr. Lutz of "Life Without Bread" said, it made asthma worse while it practically cured my nasal allergies. I also tried the Dr. Sears approach of taking as much as 7.5g of EPA/DHA a day; no change at all in the exercise induced asthma. During this research, however, I re-reviewed the probiotic slant and found the Helminth story and all the trials that were going on in pubmed for them. With that logic in hand, I set about to find a probiotic that worked. I tried yogurt, kefir, fermented cabbage, and buttermilk to no avail. I then tried store bought probiotics one by one. I tried The Maker's Diet probiotic and it didn't help; but I do think it helped make a 20 year long wart go away. I also tried all forms of probiotics on the market; even LGG. Nothing. Finally, one day I bought this super high dose probiotic and took it along with a L. Sporogenes/bacillus coagulans. Voila, three days later I could really feel the difference during exercise. I continued that for 10 days. By the 10th day, I didn't have to hit my inhaler at all during exercise. Wow! First, I had to decide which probiotic did the trick. I didn't want to spend a ton on that high dose probiotic, so I stuck with the Bacillus Coagulans and it continued working normally. So, I found my probiotic. Now, I needed to verify it wasn't placebo. A close cousin to exercise induced asthma is the phenomenon of waking up sneezing and then promptly getting an asthma attack/or closure after that. I went off my bacillus coagulans that I had been on for 14 days. By the second day, I noticed a little difference. By the third day, I had to hit my inhaler during the workout. By the 10th day (bacillus coagulans supposedly lives in your intestines 7 days), I was full-blown back to having to use 4 inhaler puffs and it wasn't doing the trick. This was test phase one. I then went back on the bacillus coagulans for 10 days. The same process repeated itself. The nightly asthma attacks abated after about 4 days and the same no-puff needed during exercise continued as well. I then went back off the bacillus coagulans for 10 days. I got the asthma back at day 3. I've now been back on 5 billion CFU's of bacillus coagulans (duraflora) for 18 days. I don't have to use my inhaler for exercise. I can feel the asthma come on very slightly and then go away. I'll be curious to see if the success of this treatment continues through the toughest time of the year for me (the fall). The only side effect I've noticed is a sticky feeling in my hands that comes and goes along with a little itching on my nose, eyes, and ears that is not bad. I'd love to see if anyone else sees similar results. JohnG

Tom Bedford (2010-09-12 14:15:01)

Hello, Came across your blog. I am interested in finding out what kind of probiotic you used ( name, manufacture etc ). Thanks.  
Tom

JohnG (2010-12-08 10:02:39)

I used Source Naturals Dura Flora which is 5 billion CFU's of Bacillus Coagulans; formerly known as Lactobacillus Sporogenes.

## Sleep and the Immune System (2009-04-29 08:25)

[1]When I started to sleep better (due to standing and morning light), my health improved: I stopped getting colds. There was plenty of pre-existing evidence linking better sleep and better immune function; [2]a new study connects the two even more strongly.

1. <http://repositories.cdlib.org/postprints/117/>

2. <http://www.biomedcentral.com/1471-2148/9/8>

---

david (2009-04-29 12:10:29)

Perhaps getting more sleep could be as important as or even more important than compulsive hand washing as a means of preventing/slowing the swine flu pandemic.

seth (2009-04-29 12:52:25)

yeah, plus eating more fermented foods.

Patrik (2009-04-29 22:38:25)

Read TS Wiley's Lights Out: Sleep, Sugar and Survival. <http://www.amazon.com/Lights-Out-Sleep-Sugar-Survival/dp/0671038680> She makes a strong case for sleep being the keystone to good health. Not only more sleep, but better sleep. She recommends we sleep in pitch darkness.

Evelyn (2009-04-30 08:00:15)

I came across this article on Vitamin D and influenza: <http://www.medicalnewstoday.com/articles/51913.php> What do you think of it?

Tiziano (2009-05-02 13:45:50)

Good sleep is definitely vital for improving the immune system. If you're interested, in this post you can find more about some natural immune system boosters: <http://zenplease.com/immune-system-boosters/>

Corinna Mayer (2009-05-03 11:31:15)

Professor Roberts, What do you mean by "standing and light" in terms of sleep promotion? Thank you, Corinna Mayer

seth (2009-05-04 10:36:30)

Corinna, in the link <http://repositories.cdlib.org/postprints/117/> you will find what I meant by standing and light.

Timothy Beneke (2009-05-05 08:02:02)

A recent study found that the French slept more, about 9 hours a night, than anyone else in the industrialized world. Nutritionists have long been puzzled by why the French, who eat so many "bad fats," have such good longevity and less heart disease than their diet might predict. Could it be the sleep?

## Parasites and Allergies (2009-04-30 02:20)

In 1973, a NIH parasitologist named Eric Ottesen discovered a high rate of worm infection on the tiny island of Mauke. He gave the islanders an anti-parasite drug. Nineteen years later, he did [1]another survey of worm infection.

Compared with 19 years ago, Ottesen found, there was much less filarial infection on Mauke. Only 16 percent of the population harbored the microscopic worms, as opposed to 35 percent on his first visit. The reduction resulted primarily from treating the islanders with the antiparasite drug diethylcarbamazine, which Ottesen had initiated during his earlier visit. And what about allergies? There's no question that there was a heck of a lot more allergy out there this time, says Ottesen. Nineteen years ago barely 3 percent of the people had allergies. This time it was at least 15 percent. The complaints ranged from eczema to hay fever and asthma to food allergies. What's more, the dominant problem was one nobody had even heard of 19 years earlier: octopus allergy. It's the number one offender, says Ottesen. People are breaking out in rashes, hives, swelling of the throat. Yet octopus is nothing new to them—they were eating it when we were there before.

Ottesen believes there is something specific to parasites that makes them protective. I suspect this is another example of the protective effects of bacteria and bacteria-like chemicals, which I believe may come from both food and parasites. Another possibility is that the antiparasite drug killed bacteria. Nothing is said about obesity; I wonder how their diet changed over the 19 years. A switch from homemade (nonsterile) food to factory (sterile) food may be part of the problem.

1. <http://discovermagazine.com/1993/sep/ofparasitesandpo264/?searchterm=mauke>

---

Marc (2009-04-30 05:16:15)

But 19 years is a long time. What about other environmental factors? Pollution? Allergies have increased around the world and I doubt that it's related to parasites in most places.

Tom (2009-04-30 08:53:24)

Interesting post. Some other possibilities are that wheat and casein intakes may have risen over that time (more processed foods). (Or maybe Vitamin D intake fell, but that seems less plausible.) <http://drbganimalpharm.blogspot.com/search?q=allergy>

Walter (2009-04-30 14:09:27)

Seth, Great blog! Here is some research testing hookworm infestation and allergies:<http://research.nottingham.ac.uk/Vision/display.aspx?id=1177&pid=213> I believe there are clinics in Europe where they 'implant' hookworms to reduce or eliminate your allergies but I do not have a link. I seem to remember 50 worms were too much but 20 seems to work. Walter

Nathan Myers (2009-04-30 14:24:05)

The simpler hypothesis is that diethylcarbamazine itself damages the immune system. Do we have any contrary evidence?

seth (2009-05-01 08:53:08)

Nathan, I don't know of any outside evidence for or against your "simpler" hypothesis. There is plenty of outside evidence for the explanation I propose.

### Too-Effective Way to Lose Weight? (2009-05-01 03:41)

[1]Paul Rozin, a professor of psychology at Penn, found that people are reluctant to drink from a glass that contained a plastic cockroach. What would happen if people ate from a plate with a drawing of an insect?

Piatti sporchi = dirty plates. From a 2008 [2]food design competition in Turin. (English description [3]here.) The plates have pictures of a fly, a hair, a beetle, and a lipstick smudge. In a mass-market version, you could have a choice of insect sizes to control the amount of repulsion.

The competition was open to anyone. Most of the 50-odd entries were from students; a few were from professionals. This entry was from [4]Sayonara Rush Design.

Thanks to Francesca Zampollo.

## How Could They Know? The Case of Healthy Gums (2009-05-02 04:16)

During my last dental exam, a month ago, I was told my gums were in excellent shape. Clearly better than my previous visit. The obvious difference between the two visits is that I now eat lots of fermented food. At the previous visit, my gums were in better shape than a few years ago. They suddenly improved when I started drinking a few tablespoons of flaxseed oil every day. [1]Tyler Cowen is the poster child for that effect. After a lifetime of being told to brush and floss more – which I did, and which helped a little but not a lot – it now turns out, at least for me, that the secret of healthy gums is: 1. Eat fermented foods. 2. Consume omega-3. These two guidelines are not only a lot easier than frequent brushing and flossing but have a lot of other benefits, unlike brushing and flossing.

Dentistry is ancient and there are millions of dentists, but apparently the profession has never figured this out. This isn't surprising – how could they figure it out? – but it is an example of a general truth about how things get better. (Or why they don't get better – if only dentists and dental-school professors are allowed to do dental research.) In The Economy of Cities, Jane Jacobs makes this point. For a long time, Jacobs says, farming was a low-yield profession. Then crop rotation schemes, tractors, cheap fertilizer, high-yield seeds, and dozens of other labor-saving yield-increasing inventions came along. Farmers didn't invent tractors. They didn't invent any of the improvements. They were busy farming. Just as dentists are busy doing dentistry and dental-school professors are busy studying conventional ways of improving gum health.

Jacobs also writes about the sterility of large organizations – their inability to come up with new goods and services. On the face of it, large organizations, such as large companies, are powerful. Yes, they can be efficient but they can't be creative, due to what Jacobs calls "the infertility of captive divisions of labor." In a large organization, you get paid for doing X. You can't start doing X+Y, where Y is helpful to another part of the company, because you don't get paid for doing Y. A nutrition professor might become aware of the anti-inflammatory effects of flaxseed oil but wouldn't study its effects on gum health. That's not what nutrition professors do. So neither dentists nor dental-school professors nor nutrition professors could discover the effects I discovered. They were trapped by organizational lines, by divisions of labor, that I was free of.

Hire a [2]San Diego orthodontist for advanced dental procedures.[3]

Eric (2009-05-02 13:25:46)

Wouldn't this argument suggest that people using mouthwash would experience poorer gum health? An alcohol mouthwash "sterilizes" the bacterial plaque.

Nansen (2009-05-02 16:33:57)

I know skepticism can be too easy, but isn't it possible that the fermented food replaced something else in your diet that happened to be bad for your gums?

Chris (2009-05-03 14:14:35)

<http://www.ncbi.nlm.nih.gov/pubmed/19405829?dopt=Abstract> This is a study of gum health while on a stone age diet. As far as I can tell from the abstract it looks like there were more bacteria in the mouth but the gums got healthier.

seth (2009-05-04 10:49:21)

Eric, I think my gums were red due to immune system overreaction. Because of too little bacteria everywhere in my body, not just my mouth. Nansen, the fermented food didn't replace anything except the use of spices. Eating 300 calories of fermented food probably made me eat 300 calories less overall, but no foods were eliminated, I just ate less of everything else.

Patrik (2009-05-04 23:59:49)

My bet is on omega-3. Or simply fat in general. I too had a Tyler Cowen-esque experience after eating Paleo/Hyperlipid. Many others in the Paleo community report the same. My "fermented food" consumption has stayed the same pre-Paleo and presently - almost indistinguishable from zero.

Aaron Blaisdell (2009-05-05 06:03:45)

Eric, I had the same thought, so I stopped using mouthwash now that I've moved closer to the paleo diet. I still eat some grains, but try to avoid wheat and whole grains if they haven't been sprouted or fermented. I also eat chocolate and ice cream a little bit and drink coffee every day, and wine or beer with my dinner. But I try to end my lunch and dinner with raw cheese because cheese has been shown to be beneficial to the enamel. I'll see at my next dentist visit in September whether I did the right thing.

Patrik (2009-05-05 10:49:35)

@Aaron Blaisdell This is a great (albeit not inexpensive) supplier of raw cheese and grassfed butter. <http://www.pastureland.coop/buy/direct> I have never had better butter (alliteration was accidental) in my life.

Aaron Blaisdell (2009-05-06 08:07:14)

@Patrick Thanks for the link. I recently bought some excellent raw cheese and grassfed butter from a vendor at my local farmer's market (Culver City, CA). It's operated by a funny French guy wearing an Australian bush huntsman's hat (he looks a bit like Crocodile Dundee). The butter is the best I've ever had and it comes from New Zealand. It is so yellow (I assume due to its high vitamin content) and creamy. I sometimes place a small sample in my mouth and take great pleasure in how it slowly melts, releasing rich flavors. It's as good as any fine, soft cheese.

wgl (2009-05-27 07:19:29)

Sorry, but you and your reference are wrong about farmers inventing tractors. I grew up on a dryland wheat farm. Innovation was a part of daily life. Dad and Uncles were always looking for a better way to do things. A friend of Dad's, needing a bigger tractor, took the front wheels off two tractors, hooked the front of one to the reinforced hitch of the other, making a pivot point. He used the hydraulics of the front one to steer, and linked the throttles together. Friends asked him to build one for them, so he built a jig. On the farm, we were always fixing things, trying new ways. Technology was a significant part of daily life. "Busy Farming" means fixing things, making them better. I would be willing to bet that the actual inventors of tractors grew up on farms. To say "They didn't invent any of the improvements" is just flat wrong.

seth (2009-05-27 09:05:55)

wgi, thanks for your comment but I fear you are missing the point. I agree, someone close to farming realized that farmers could benefit from tractors. Yes, farmers made small improvements in farming. Jane Jacobs's point was that the really big improvements, such as tractors, never began with farmers. To invent tractors you had to invent engines, and tires, and so on...farmers never did that. A farmer might have taken the last tiny step but couldn't have taken that step without a vast amount of invention by non-farmers.

Farmers Didn't Invent Tractors. They Were Busy Farming. | Bookmarks (2009-05-28 17:09:39)

[...] Excerpt `$(function() { $(" #startbox").html("There's a cliché in innovation / entrepreneurship which says, "Scratch your own itch." That is, solve problems that you know really well. Choose markets you know really well. But a lot of innovation doesn't come from the people who know the industry the best. That's because the closer you are to how something works now, the harder it is to imagine a new and better way of doing things. In pondering why millions of dentists haven't been able to figure out that flaxseed oil helps your gums, Seth Roberts channels Jane Jacobs in this excellent observation: For a long time, Jacobs says, farming was a low-yield profession. Then crop rotation schemes, tractors, cheap fertilizer, high-yield seeds, and dozens of other labor-saving yield-increasing inventions came along. Farmers didn't invent tractors. They didn't invent any of the improvements. They were busy farming. Just as dentists are busy doing dentistry and dental-school professors are busy studying conventional ways of improving gum health. Jacobs also writes about the sterility of large organizations — their inability to come up with new goods and services. Morris G (2011-03-13 19:53:25)

Seth I discovered the connection between gum disease (similar to yours it seems) and nutrition but my conclusions are different. Following my GP's advice I moved my USDA diet to one with less meat, more legumes etc and suffered a marked worsening of gums plus other aging bio-markers which I did not recognize at the time. So I moved gradually in the opposite direction, eliminated all grains & legumes and now (1 year on) about 75 % of energy comes from fats. For reasons I will not go into, I believe root of the problem was inflammation of the gut and consequent inflammation of connective tissues (gums, joints). My caloric intake has slowly increased by almost 50 % while maintaining a BMI of 23. This makes no sense from the conventional understanding of metabolism but I trust my observations (many improvements) over theory. It is possible that my experience is a transient phenomenon, but time will tell and so far it's holding.

Seth Roberts (2011-03-13 20:41:57)

Morris, that's a fascinating and revealing story. Thanks for your comment. Perhaps your gums and other things have gotten

better because you have reduced pro-inflammatory molecules (such as omega-6) in your food. Omega-3 is anti-inflammatory. Grains have much more omega-6 than other foods. I don't think gut inflammation causes inflammation elsewhere but it is an indication of too much pro-inflammatory signalling and/or too-little anti-inflammatory signalling in the whole body- in other words, it is a sign of a whole system out of balance.

## Less of a Foodie (2009-05-04 10:43)

Two weeks ago I was in New York City. I have been there many times. For the first time, I was unexcited by the prospect of eating in the city's fascinating restaurants. I think it's all the fermented food I eat (at least two servings per day). All of it has complex flavors; all the New York restaurant food I liked had complex flavors. I am no longer complex-flavor-deprived.

---

Chris (2009-05-05 14:00:28)

More on the benefits of bacteria: Probiotics may be able to help you keep fit and slim [http://www.eurekalert.org/pub\\_releases/2009-05/uoc-pmb050509.php](http://www.eurekalert.org/pub_releases/2009-05/uoc-pmb050509.php)

oslo (2009-05-09 03:55:47)

next time you are in new york, try HANGAWI : korean vegetarian. They know how to ferment. Though at home japanese eat lots of fermented foods, miso and a bit of pickle is as far as it usually goes in japanese restaurants. Exported and restaurant -wise, korean is the ticket, because generally anything you order comes with a major spread of pickled things. Come to think of it... maybe that's one of the reasons why korean-americans often tend to be notably chubby - because they aren't getting enough kimchee!

seth (2009-05-09 15:15:36)

thanks for the recommendation. My first nice meal in New York this latest trip was at a Korean restaurant. There's something about Korean food . . . I've been to Hangawi, but not in several years.

Seth's blog » Blog Archive » Why Do Children Pick Their Nose? (2009-08-13 09:30:19)

[...] Do kids who eat more fermented food eat less snot? As I posted earlier, since I started eating lots of fermented food, my desire for fancy restaurant food has gone way down. [...]

Seth's blog » Blog Archive » Why Do Cats Lick Themselves? (2009-09-03 18:10:51)

[...] Perhaps cats lick themselves to ingest more foreign bacteria and dirt, which they need to be healthy. Test of this proposal: Feed a cat more fermented food, it should lick itself less. (Just as I became less of a foodie when I ate more fermented food.) [...]

## Department of Self-Congratulation (The New Yorker) (2009-05-05 22:03)

The May 4, 2009 issue of The New Yorker contains three readers' letters, no doubt selected from a much larger number. They begin like this:

Ian Frazier, in his hilarious sendup . . .

Jill Lepore's richly detailed article . . .

Anthony Lane's sensitive and nuanced review . . .

### **How to Cook Hamburger: Let it Rot First (2009-05-06 07:50)**

Before cooking some hamburgers, I mixed spices into the meat. I have done this countless times. For the first time, I thought: I need to add spices because the meat isn't rotten enough. Properly rotted meat would need salt but not other flavoring.

---

david (2009-05-06 08:09:13)

Man, I'm glad I'm a vegetarian.

James (2009-05-06 09:10:52)

I believe we carnivores call this 'aging' rather than rotting - has a better ring to it. Amazing how many people love aged beef but are repulsed by the actuality behind what that phrase really means.

Darrin Thompson (2009-05-06 09:39:40)

I was taught in school that spices were valued to cover the awful rotten tastes. Not that I'm saying it must be true, but you could be jumping to the conclusion a tad early. Historically weren't spices practically legal tender? Maybe I know nothing.

Tim Ozenne (2009-05-06 13:51:26)

How to know when meat is optimally rotted, but not yet dangerous?

Tom Cook (2009-06-02 01:54:46)

In meat retailing circles this would be referred to as 'hung' meat. Deserving customers will ask for a piece of well hung rib of beef or filet steak but to be honest I have never been asked for hung ground mince beef. Tim - the feel and overall smell of the mince would be the telling factor regarding its continued shelf life. Mince will become somewhat slimy/sticky to the touch and will smell..

## **The South Asian Paradox (2009-05-06 10:39)**

Urban vegetarians in South Asia have high rates of heart disease in spite of low rates of obesity and low LDL levels. I learned about it [1]here.

1. <http://www.thepaleodiet.com/articles/Hunter-Gatherer%20Mayo.pdf>

---

Ashish (2009-05-06 23:13:04)

What are the approved ways to cook meat? Not grilling, I gather (from the article).

v (2009-05-08 12:39:58)

Aren't Indian's genetically predisposed to heart disease, diabetes.

Gian (2009-05-11 02:06:46)

I am an urban south asian (though not a vegetarian one). I think that high rate of disease in urban india is more due to large consumption of pufa-rich vegetable oils.

seth (2009-05-11 05:32:24)

Gian, that's plausible. See The Israeli Paradox: <http://www.blog.sethroberts.net/2007/02/02/the-israeli-paradox/>

## **The Fantasy of Fresh (2009-05-06 17:25)**

From Fresh: A Perishable History (2009) by Susanne Freidberg, p. 3:

Of all the qualities we seek in food, freshness best satisfies all these modern appetites. It offers both proof of our progress and an antidotes to the ills that progress brings.

Oops. A better title would have been Fresh: History of a Delusion.

---

david (2009-05-06 19:56:50)

I think you're getting carried away with the rotten food thing. In some cases, "aged" foods have properties that are beneficial and I'm sure that for a variety of cultural and economic reasons people eat far less aged food now and have an aesthetic aversion to even slight spoilage of any food that we couldn't have afforded in the past, but there are limits to what the human digestive can deal with. Just as there is a reason that humans have a taste for fermented foods, there is also a reason we have an aversion to spoiled food. I've never had food poisoning myself but from what I hear it's among the the most painful kinds of illnesses you can have. I think to make this case you have to pick specific foods that are better aged and demonstrate the benefits (and acknowledge that certain other foods either have no benefits if eaten aged or should be avoided if they are spoiled). You made the case with omega-3s and your self-experimentation using the balance and math tests. With fermented foods, I haven't seen in your blog posts the empirical evidence to back it up the claim that they are beneficial. It does sound plausible that we need fermented food and since you posted about it I've started drinking kombucha and would say that my digestive tract seems happier than it's ever been, but I don't keep any kind of diary that would give me good data to back up the claim. I think one clear weakness of self-experimentation is that it will miss long term effects (good and ill) of some practices. For example, perhaps eating enough fermented food substantially lowers your risk of colon cancer. Self-experimentation can't address that question at all.

seth (2009-05-07 05:15:02)

David, thanks for your comments. When you talk about missing a lower risk of colon cancer, you are describing a weakness of all experimentation, not just self-experimentation. As for the dangers of "spoiled" food, what about the dangers of heart disease? (Not to mention allergies, autoimmune diseases, and the common cold.) Which should we care more about? The Eskimos, with very low rates of heart disease, eat/ate lots of "spoiled" fish. Long ago many people thought white bread and white rice were better (cleaner, purer) than whole-wheat bread and brown rice.

david (2009-05-07 07:00:21)

I agree with your general point: It seems plausible that for some kinds of foods prepared and handled in certain ways, it's possible to eat and derive health benefits from food that would be considered spoiled by our standards. But from your posts it sounds like you're saying "all spoiled food is good, in fact better than, fresh food." I suspect the truth is more nuanced: that some foods, prepared and handled properly, offer benefits when eaten aged that they don't when eaten fresh (and likewise offer benefits when eaten fresh that they don't when eaten aged...the Eskimos would have eaten fresh as well as ripe fish). Other foods, should be avoided when either under or over-ripe. You would need to study the traditional methods of food preparation of various cultures to recover these technologies.

seth (2009-05-07 10:17:58)

There's a long way from fresh to spoiled. I'm certainly not saying "all spoiled food is good"; rather that we are often too close to the fresh end of the spectrum in what we eat. Maybe in 50 years my views will be seen as similar to the idea that brown rice (harder to store) is better than white rice (easier to store), just as food allowed to age is closer to spoiling than fresh food. I agree that some food really is best fresh - vitamin C for example degrades with time.

Rob (2009-05-07 18:44:34)

I wonder if the author in the quote from the post above would consider some of the fermented foods which Seth advocates as "fresh"? A natural yogurt would likely be considered fresh when compared to irradiated, hermetically sealed mylar packet of go'gurt. I also think that a call for fresh food is 100 % compatible with Seth's views on healthy intake of bacteria. Compared with canned peas, fresh peas for the farmers market will give your gut much more of the good stuff. Nor, do I think that spoiled and fermented are synonyms – fermentation is a food preservation strategy.

### **The Experts Speak: Nutrition (2009-05-07 05:47)**

I have nothing against a paleolithic diet, but I think its advocates, like many experts, are overconfident. It's not easy to know which features of a diet that varies in 20 ways from modern diets are the crucial ones. I came across [1]this while reading about paleolithic diets:

The general gist of eating like a caveman – namely, focusing on foods in their whole, natural state, is not going to get much argument. "It comes down to the advice your mother gave you," says Leonard [William Leonard, chair of the anthropology department at Northwestern University]. "Eat a balanced diet and a diversity of foods."

I beg to differ.

1. Whole, natural state. I find flaxseed oil very helpful. It supplies omega-3 missing from my diet, but presumably present in diets that contained lots of seafood or vegetation-fed meat. Flaxseed oil is not food in a whole and natural state.
2. Whole, natural state. I find fermented food very helpful. Bacteria break down food, making it less whole. Modern food of all sorts is unnaturally low in bacteria (due to refrigeration, food safety laws, shelf-life requirements, etc.), just as modern meat is unnaturally low in omega-3. Fermented food is unnaturally high in bacteria, correcting the deficit.
3. The advice your mother gave you. Traditional diets, yes, what your mom thinks, no. When I was growing up we ate margarine instead of butter – poor choice. We had skim milk, not whole milk – poor choice. The absence of butter and whole milk is, if Weston Price is right, why my teeth are slightly crooked. We ate almost no fermented food – very poor choice. (Which I suspect is why I had mild allergies.) We rarely ate fish – poor choice. And yet we didn't have a TV – very good, very unusual choice. Even my mom, who thought for herself far more than most moms, had serious misconceptions about nutrition. Given the epidemic of childhood obesity, not to mention less visible increases in autism, allergies, and ADHD, I am very skeptical that the average kid's mom knows what to eat.
4. Eat a balanced diet. Plenty of communities in excellent health eat diets that American experts would describe as not balanced at all – no fruit for example, or too much dairy. Eskimos and the Swiss in isolated villages studied by Weston Price are two examples. Price found that a wide range of diets, most violating one or more popular nutritional precepts, produced excellent health.
5. A diversity of foods. Several healthy communities studied by Price did not eat a wide range of foods. The human diet became a lot more diverse around the time of the "[2]broad-spectrum revolution" – broad-spectrum meaning wider range of food. Around that time human height decreased. Apparently the new, more diverse diet was less healthy than the old diet. An anthropology professor might know this.

The title of this post comes from the book *The Experts Speak* which is full of examples of how experts were wildly

1754

wrong.

You should research out fruitarianism :) <http://www.youtube.com/watch?v=PKeMgcLnV9s>

James Hanley (2009-05-08 11:41:49)

*a wide range of diets, most violating one or more popular nutritional precepts, produced excellent health.* Humans are omnivores, after all, so it's not too shocking to find we're adapted to a variety of different diets.

bennetta (2009-05-08 14:05:51)

Seth, I find it interesting that you mention the Eskimo diet. My roommate, who is an Alaskan native (and spends 3-6 months of the year there) often brings it up when discussing food we eat. She has noted that the Alaskan Eskimo diet is similar to what we consider to be the classic "low carb/Atkins" diet, with one exception: fermented food, which American low carb diets lack. Atkins/low carb diets are infamous for causing digestive problems, foul breath, and equally bad body odor. Eskimos do not have digestive problems or foul breath. Why? We think it's because Eskimos eat rotten fish. I was curious about what you might have to say about this.

seth (2009-05-08 20:22:54)

Bennetta, that's fascinating. Certainly lack of fermented food can cause digestive problems, that's very clear. I will add bad breath and body odor to the list of things possibly caused by not enough fermented food. It makes a lot of sense that eating fermented fish would improve digestion of fish thus reducing body odor caused by incomplete digestion. (I believe that Asians often think that Americans, who never eat rotten meat, smell of meat.) In [1]an earlier post I drew attention to the rotten fish that Eskimos eat.

[...] Random Links L Paleolithic Diet:Â Why today's "paleolithic diet" may not match that of yesteryear.Â [...]

Andrew (2009-05-29 07:45:08)

The quote at the top is reasonable. Of course there will be exceptions and you've done a good job of highlighting some of them. But these are not the norm. One of the main problems with the typical Western diet these days though is that it's unbalanced, lacking adequate fruit and vegetables and very little food is eaten in its whole and natural state.

## **Fermentation Basics: Using Yogurt (2009-05-07 08:12)**

Brent Pottenger writes:

In place of mayonnaise, my brother started using plain yogurt to make tuna salad. In the process, he learned, "For some reason, the tuna tastes better after sitting in the refrigerator for a day or two." Tuna salad made with yogurt is tolerable when freshly made, but it definitely gets much better as it ages.

Now, when I make smoothies, I blend the fruit and the yogurt, then I let the smoothie sit for some hours, minimally, before I drink it.

---

Tom (2009-05-07 12:40:06)

I wonder if this is part of why leftovers so often taste better?

seth (2009-05-07 15:24:51)

Tom, good point. I have often wondered why leftovers taste better. I used to think that during the first meal you learned the flavor-calorie association. But maybe it is simply fermentation. If so, leftovers should taste better even if you didn't taste them originally. That is, they should taste better on Tuesday whether or not you tasted them on Monday.

Dennis Mangan (2009-05-07 20:10:32)

There's no way that tuna sitting in the fridge for 2 days or a smoothie left out for a few hours will have any significant amount of bacteria. Seth, please check out some microbiology before you make these statements. The tuna is sterile in the can and needs to be seeded with bacteria - the right kind, hopefully, assuming that one knows what that is - and left at 37 Celsius for quite some time before you'd find the billions needed for your thesis. Likewise the smoothie will have minimal bacteria when

prepared plus everything is cold to begin with presumably. Leftovers at refrigerator temperature will not breed bacteria in a day or 2; that's why they invented refrigerators.

seth (2009-05-07 21:50:32)

Dennis, many people take several hours to put leftovers away – a difference that suggests another test: Do the leftovers taste better if they are left out longer before being refrigerated?

Dennis Mangan (2009-05-07 22:32:42)

Seth, maybe. In any case I realize my comment sounds rather harsh - my apologies. It's just that with your idea regarding fermented food, you're not distinguishing between bacterial species, which surely would be important, and numbers, likewise. For instance, you mentioned wine in other posts - most of the microbes there will be fungi, not even in the same kingdom as bacteria; yogurt will have lactobacilli, rotten meat probably a combination of gram pos and neg, and so on. Also, leftovers are going from a completely sterile state due to cooking - where's the bacteria coming from?

seth (2009-05-07 23:02:34)

Dennis, the human immune system is sensitive to many things much different than bacteria – viruses, for example. So the type of bacteria is unlikely to matter. As for the sterile cooked food, bacteria come from the air. Think of sourdough, supposedly easier to make in the San Francisco Bay Area than other places because of the air. It's also possible I'm wrong, that leftovers taste so good for some other reason. But since it is a huge effect by scientific standards – how much better leftovers taste – and mysterious, it is certainly worth study.

JohnN (2009-05-10 12:41:51)

I want to echo Dennis' comment. Of the two forms of fermentations, saccharolytic and proteolytic, only the former is recognized as beneficial while the latter is pathogenic. It is certainly worth study to prevent "attribute substitution". Cooks know that food - braised or confit dishes in particular, tastes much better after given sometime for flavor to commingle so there is an alternative explanation.

seth (2009-05-10 12:57:00)

JohnN, proteolytic fermentation is "pathogenic"? What do you mean by that? And what do you base that on? I have been unable to figure out what you are saying. I managed to find that some venoms contain proteolytic enzymes but not more than that. I agree that meat fermentation is more dangerous than fermentation of milk and other sugar-containing foods.

Aaron Blaisdell (2009-05-08 06:50:04)

It's good to see that they have corvids (crows, ravens, magpies, and the like) on campus. Perhaps if I join you for a sabbatical there sometime I can study crow cognition without having to set up an animal lab.

Jeanne (2009-05-15 07:44:37)

Is that a magpie? Is it enrolled at the University? (Corvids are smart birds!)

### **Mosquitoes Praise Fermented Food (2009-05-09 04:44)**

[1]A new study in PLoS Pathogen has found that mosquitoes benefit from bacteria-laden food. The bacteria stimulate their immune system and protect them against the malaria parasite. From the abstract:

Malaria-transmitting mosquitoes are continuously exposed to microbes . . . Global transcription profiling of septic and [microbe-free] aseptic mosquitoes [made aseptic with antibiotics] identified a significant

subset of immune genes that were mostly up-regulated by the mosquito's microbial flora . . . Microbe-free aseptic mosquitoes displayed an increased susceptibility to Plasmodium infection while co-feeding mosquitoes with bacteria and P. falciparum gametocytes resulted in lower than normal infection levels. Infection analyses suggest the bacteria-mediated anti-Plasmodium effect is mediated by the mosquitoes' antimicrobial immune responses, plausibly through activation of basal immunity.

Another view of this study is that it is more evidence of the dangers of antibiotics: They weakened the immune system. As you may know, and as I was told recently by a pediatrician, doctors "hand out antibiotics like candy."

Thanks to Janet Rosenbaum.

Riz (2009-05-09 12:23:13)

Hi Seth, I thought you might be interested in this piece of research regarding potential obesity prevention in pregnant women ... from probiotics of course! <http://www.medicalnewstoday.com/articles/149235.php> Also, I was just wondering whether jars of fish and other foods in brine, oil and vinegar count as fermented foods, along with pickles?

seth (2009-05-09 21:59:26)

do jars of fish, etc., in brine, oil, and vinegar count as fermented foods? Not brine, which inhibits bacteria, but basically any food at room temperature will accumulate more bacteria than the same food stored cold. I suspect however there are vast differences in the potency of fermented foods – some are far more beneficial than others. Although cooking kills bacteria, the dead bacteria may still be recognized as "strange" by the immune system and thus keep it awake.

Kirk (2009-05-10 05:41:27)

Huffnagle in The Probiotics Revolution says that the metabolic byproducts of probiotics provide a health benefit, even if the food has been heated enough to kill the bacteria. One study he mentioned used three groups; the first received cold yogurt with live bacteria, the second received that same bacteria which had previously been heated, and the third received unfermented milk. 'Live bacteria produced the most benefits; unfermented milk gave the least. But the heated yogurt fell somewhere in between.' He labels these byproducts 'metabiotics'.

Mark (2009-05-11 13:41:14)

Doctors hand out antibiotics like candy because patients relentlessly demand them. It can wear out even the most well-intentioned doctor. It's especially severe in pediatrics, where every genius parent believes he or she can diagnose an ear infection better than the doctor.

seth (2009-05-28 20:38:53)

"Because patients relentlessly demand them"? Sounds like bad doctoring. Abdication of responsibility.

### **Academic Horror Story (Reed College) (2009-05-09 16:20)**

In Malcolm Gladwell's Outliers, Reed College, my alma mater, gets some very bad publicity. An extremely smart student named Chris Langan chose Reed over the University of Chicago, which thirty years later he calls "a huge mistake."

While he was at Reed, his mom failed to fill out a form to renew his scholarship. Here's what Langan told Gladwell:

At some point, it came to my attention that my scholarship had not been renewed. So I went to the office to ask why, and they told me, Well, no one sent us the financial statement, and we allocated all the scholarship money and it's all gone, so I'm afraid you don't have a scholarship anymore. That was the style of the place. They simply didn't care. They didn't give a shit about their students. There was no counseling, no mentoring, nothing.

Losing his scholarship did Langan enormous damage. He never finished college. According to Gladwell, Langan is wrong.

Langan talks about dealing with Reed . . . as if [it] were some kind of vast and unyielding government bureaucracy. But colleges, particularly small liberal arts colleges like Reed, tend not to be rigid bureaucracies. [No examples given.] . . . Would [the physicist Robert] Oppenheimer [supposedly more persuasive than Langan] have lost his scholarship at Reed? . . . Of course not.

That is the myth of the small liberal arts college, yes. But how true is the myth – at least in the case of Reed?

About seven years ago, I returned to Reed to give a talk. I had some spare time so I decided to visit Reed's best-known course, a survey of Western Civilization that is required of all freshman and sophomores. I hadn't had to take it because I entered Reed as a junior. I wondered what it was about. I found it. The large lecture hall was almost empty. Maybe there were 15 students; the enrollment must have been about 400. A young professor was giving a staggeringly boring lecture about some Greek classic.

Later I asked a Reed student why attendance was so low. She said that in the very beginning, fall semester (it was now spring semester), attendance was high but the students quickly realized the lectures weren't helpful and stopped coming. The lecturer, I realized, didn't care about the students. He didn't have tenure and was trying to impress an older professor I'd seen in the audience who might influence whether he got tenure.

I've told Reed professors this story. They did not explain why a required course, really the required course, supposedly the centerpiece of a Reed education, was/is so poorly taught.

I think Langan's story and the Western Civ story are two examples of how most colleges, including small liberal arts colleges, are not run for the benefit of students. I imagine the Reed professors I spoke to understood this; but it was unspeakable. I think the result is a power-law distribution of damage: A large fraction of students suffer small bad things (such as a lecture that's a waste of time and tuition) and a small fraction of students (such as Langan) suffer nightmarishly-bad treatment.

[1]For Whom Do Colleges Exist?

[2]The !Golden Rule and Reed College.

---

1. <http://www.blog.sethroberts.net/2007/03/31/for-whom-do-colleges-exist/>

2. <http://www.blog.sethroberts.net/2007/04/07/golden-rule-and-reed-college/>

Lauren Rosenthal (2009-05-09 19:38:47)

I went to the U. of Chicago, poor Langan, Chicago is no different from Reed, probably worse. Complete contempt for the undergrads.

Anthony (2009-05-09 23:32:11)

I like the idea of a power-law distribution of damage. I wonder if Langan was actually damaged by not finishing college. My guess is that a large percentage of wage benefits attributed to college are selection effects. If you took 100 people about to go to university, and then had 50 of them not go to university but instead do other useful things with their time, in 25 years which group would have the higher mean and median net worths? I wonder ... The university I went to for my undergrad focused mostly on research. Teaching undergrads seemed a distant second (or third, or ...) in priorities, despite lip service. It was very big, and so suffered from a lack of sense of community. I was as an atom floating in the academic void, and I have virtually no sense of loyalty or fondness for the place now (their alumni fundraising letters were to no avail). Professors and classes ran the gamut, from big lecture halls with boring lecturers who could barely speak English (typically in 1st or 2nd year), to small, intimate seminars with good teachers. In retrospect, it would have made much more sense to have researched the options available much more before selecting a university. At the time, I partially blamed myself for not liking the (boring, unintelligible, and so on) lectures.

C. Bailey (2009-05-28 19:24:22)

I go to Reed College, and I consider it incredibly valuable and find this to be a very biased presentation of the academic situation at Reed. Humanities is a required course, and many students enjoy it—I personally went to nearly all the hum lectures. It's true that attendance drops off second semester in the spring, but I have a few comments on this matter: 1) Reed tends to take a sink-or-swim approach to academics. It takes risks on who it admits, meaning that there are a lot of freshmen who realize they are not up to the academic rigors of Reed, or who have to learn to get their shit together. So hum is not the pinnacle of education at Reed—rather it is an introductory class with a group of students with vast interests, some of whom will stay at Reed, some of whom will not. 2) I would say that hum is far from the centerpiece of the Reed education—hum is getting your feet wet. The centerpiece of the Reed education is writing an undergraduate thesis. Which is a much more personalized experience. 3) There are other aspects of hum that are much more personal, primarily in the conference section. For example, paper conferences where you would sit down with your professor and discuss how you could have improved your paper for an hour. 4) When you are in introductory classes, you have to make more of an effort to get individualized attention even at a liberal arts college just by nature of the fact that professors are more invested in students they have a lasting relationship with and know well. I have also found professors at Reed to be nothing but accessible and accommodating. One professor let me work in his lab last semester. Another regularly sends me links to webpages of people who do research I might be interested in doing in graduate school. Another invited me over to his house to spend Christmas with his family when I got caught in a snow storm. I can drop by their office to ask academic questions or share a journal article that I find interesting whenever their door is open. My professors work incredibly hard solely because they love to teach and bend over backwards to benefit their students. Hell, in my introductory chemistry class, my professor knew all 150 of our names.

seth (2009-05-28 20:27:17)

Your professors "love to teach"? I'd love to hear details that back this up. My guess is some of your teachers like to teach. In a recent fund-raising letter, the president of Reed asked for money so that professors could . . . spend less time in the classroom. The details you did give – about memorizing names, for example – don't strike me as revealing love of teaching. I don't follow your point #4.

Seth's blog » Blog Archive » Why One Student Loves Tsinghua University (2009-06-28 21:08:28)

[...] After reading my post about Reed College's horrible treatment of Chris Langan, a friend of mine who is a student at Tsinghua University wrote this: I feel so lucky that we have lots of brilliant scholars who are at the same time good teachers. Many of them do care about undergraduates and give good advice. I don't know which education system for undergrads [Tsinghua's or Reed's] is best, for colleges that do poorly in educating undergrads [like Reed] may produce students who are more independent. But being educated here, I have to say I love Tsinghua and its teachers a lot. [...]

ACOOFRAGRANTGOLDBALL (2010-03-18 16:41:59)

I like this discussion. I'm a Reddie as well- hi C. Bailey. I get point #4. From my experience, professors, in the sciences only, tended not to be as open to me as a freshman as they have been to me as an upperclassman. Not to get the material at hand- I've experienced both faces of the Reed College education that have been mentioned: A not student-oriented lecture and course agenda, a side of Reed which I'll call regard as an institutional orientation- this aspect can also be thought of as a disciplinarian agenda- and an aspect of Reed focused strongly on the process of students raging through the material which is supported through conferences with students and professors. It really seems like Reed can function as a do or die kind of process. But let us not forget that this isn't just at the advantage of the students. There is a common discursive which simply sees the academic mode, lazily (no offense C. Bailey) summarized as do or die, as a beneficial and positive processes: It is to the benefit of the students to face the challenges of Reed education- it is preparatory and advantageous for future serious scholars. Reed supports this claim through it's common propaganda of giving students the life of the mind, a challenging education, an education that allows smart kids to really go down the rabbit hole of their dreams (that's what she said). Now when have we found the institutional doors of knowledge and truth to ever not be linked to mechanisms of power? Not to be linked to homeostatic visions of a political unit? While individuals may see the benefit of going through a rigorous intellectual process, while individuals enjoy having fun as intellectuals, there is truly more going on here than can be summed up by Reed College positivism. That said, all of my professors at Reed have always taken the time to explain and discuss presented information above and beyond office hours. Got a question about a concept at 6:00 pm? I can shoot a prof and email- I could get an explanation, further readings, etc. So honestly, there does seem validity to C's point regarding the care the professors put in to teaching material.

ACOOFRAGRANTGOLDBALL (2010-03-23 06:14:29)

(Revision of Previous Post) I like this discussion. I'm a Reddie as well- hi C. Bailey. I get point #4. From my experience, professors, in the sciences only, tended not to be as open to me as a freshman as they have been to me as an upperclassman. Not to forget the material at hand- I've experienced both faces of the Reed College education that have been mentioned: A not student-oriented lecture and course agenda, a side of Reed which I'll call regard as an institutional orientation- this aspect can also be thought of as a disciplinarian agenda. Then there is the aspect of Reed focused strongly on the process of students raging through the material. This is supported through conferences with students and professors. It really seems like Reed can function as a do or die kind of process. But let us not forget that this isn't just at the advantage of the students. There is a common discursive which simply sees the academic mode, lazily (no offense C. Bailey) imbedded in the phrase do or die, as a beneficial and positive processes: It is to the benefit of the students to face the challenges of Reed education- it is preparatory and advantageous for serious future scholars. Reed supports this claim through its common propaganda of giving students the life of the mind, a challenging education, an education that allows smart kids to really go down the rabbit hole of their dreams (that's what she said). Now, when have we found the institutional doors of knowledge and truth to ever not be linked to mechanisms of power? Not to be linked to homeostatic visions of society? While individuals may see the benefit of going through a rigorous intellectual process, while individuals enjoy having fun as intellectuals, there is truly more going on here than can be summed up by Reed College positivism. That said, all of my professors at Reed have always taken the time to explain and discuss information presented in class above and beyond class and office hours. Got a question about a concept at 6:00 pm? I can shoot a prof an email and could expect an explanation, further readings, etc. If not that, I'm free to stop by their office with either lots of welcome of future scheduling. So honestly, there does seem validity to C's point regarding the care the professors put in to teaching material.

## **The Good Scots Diet (2009-05-09 19:10)**

The Spring 2009 issue of Wise Traditions, a quarterly sent by the Weston A Price Foundation to its members, has an article by Katherine Czapp about traditional Scottish food. They too ate fermented food (pp. 56-7):

Farmers who grew their own oats but sent them to the local mill . . . received in return a bag of "sids" -

the inner husks of the oats . . . From these sids, an ancient Celtic dish called "sowans" (or sowens) was made.

The sids were soaked in water for approximately one week (or even more) until they were well-soured.

Sowans takes more than week to make. Presumably the ancient Celts discovered this method of souring by accident and kept doing it because the result tasted good. It's an example of how, in the right situation, what tastes good guides us to a good diet.

---

Charles (2009-05-10 13:45:10)

Okay, you've got me going on this whole fermented foods thing now. Here are a couple of interesting links: From Applied Environmental Microbiology: "Administration of different Lactobacillus strains in fermented oatmeal soup: in vivo colonization of human intestinal mucosa and effect on the indigenous flora." <http://www.pubmedcentral.nih.gov/articlerender.fcgi?artid=202048> And a recipe for oatmeal fermented by adding miso and leaving it overnight: South River Porridge 1 cup rolled oats 2 cups water 2 teaspoons light miso (see note below) Cook oatmeal in the evening 5-10 min., or until water is absorbed. (Do not use salt in the cooking.) Let oatmeal cool down to body temperature and then stir miso thoroughly into the warm cereal. Cover and let sit overnight at room temperature (about 70Â°). Reheat in the morning (without boiling) and serve. Without imparting a noticeable taste of its own, the enzymatic power of the miso will liquefy the cereal, unlocking its essential nutrition, creating a wholesome sweet taste as it ferments overnight. <http://www.southernrivermiso.com/store/pg/18-Porridge-Grain-Milk.html>

Charles (2009-05-10 14:31:53)

Also: "A lactic acid-fermented oat gruel increases non-haem iron absorption from a phytate-rich meal in healthy women of childbearing age" <http://tinyurl.com/qm2kec>

Riz (2009-05-11 05:08:46)

Until recently I'd only ever known one way of eating porridge: hot and made with milk. Then I started learning about all its history and all the different ways of making it and serving it up. It's amazing stuff. The classic piece of history is that Scottish folk traditionally cooked up a large batch of porridge of oats (in water), added a bit of salt, and poured it in to a kitchen draw. Once set, slices could be cut and it would be eaten right through the week. I found this difficult to believe but after some research, I'm sure it's true. I'm still to add salt, but it's actually quite nice eaten cold. You can use quick oats or regular (better GI), add maybe half as much water as you would milk (maybe mix in some raisins or nuts), and leave it overnight. It turns slightly jelly like, but is actually quite nice. Instead of water, try adding orange juice...I tried it once with pure Tropicana tropical juice and it tasted like a pudding! (Of course, if you don't like the idea of water, just use cold milk and leave it overnight). ps - Seth, thanks for answering my earlier question re foods stored in brine etc.

### **The Wisdom of the One-Year-Old Picky Eater (2009-05-10 06:59)**

From a parent's account of her autistic son in *Recovering Autistic Children* (2006) edited by Stephen Edelson and Bernard Rimland, p. 79:

James took matters into his own hands at about the time of his first birthday, and started refusing milk except in the form of yogurt or cheese.

The parents, alas, did not draw any conclusions from this.

marmolillo (2009-05-10 13:01:46)

I have been reading for quite long time your interesting articles about fermented food. And I am really surprised you do not even have mentioned the works of Nobel Prize winner Ilya Ilyich Mechnikov. [http://en.wikipedia.org/wiki/Ilya\\_Ilyich\\_Mechnikov](http://en.wikipedia.org/wiki/Ilya_Ilyich_Mechnikov) They usually mention his opinions about fermented food like something weird from a great physicists. But he told the same things you are speaking about.

Wilbur (2009-05-11 06:44:47)

If the wisdom of picky eaters is to be our standard, then McDonald's french fries must be the healthiest food on the planet. I've known several brats who would eat nothing else.

seth (2009-05-11 07:43:17)

maybe they needed more fat? The brain - and kids have growing brains - is more than half fat.

Andrew Gelman (2009-05-11 12:59:19)

Seth, Please take a look at the many many comments on your earlier entry on this topic. Suffice it to say that your experience with kids is limited, and I recommend you defer to your commenters (including myself) on this one. Self experimentation is fine, but this is a case where a bit of observation would help.

Mark (2009-05-11 13:38:13)

I think there is something to the way that kids eat, but I think you also are perhaps making a little too much out of it. My wife is a pediatrician. Many of the kids she sees only want to eat "white foods" - white bread, pasta, butter, sugar, french fries, etc. In general, kids are way more interested in bland and inoffensive tastes than complicated tastes. This makes sense evolutionarily - a bland, inoffensive food is almost certainly less likely to be dangerous. It probably takes great hunger or a real leap of faith for a human being "in nature" to try a wild new taste. Here's an anecdote about a different autistic picky eater for your consideration. He ended up in the hospital as something of a medical mystery. After a couple of weeks of brain-racking by the doctors, they realized he had scurvy. After checking with the parents on his diet, sure enough, he refused anything containing vitamin C.

peter (2009-05-11 14:05:33)

[http://en.wikipedia.org/wiki/Fermentation\\_%28food%29#Risks\\_of\\_consuming\\_fermented\\_foods](http://en.wikipedia.org/wiki/Fermentation_%28food%29#Risks_of_consuming_fermented_foods) Risks of consuming fermented foods Alaska, despite its small population, has witnessed a steady increase of cases of botulism since 1985. It has more cases of botulism than anywhere else in the United States of America.[9] This is caused by the traditional Eskimo practice of allowing animal products such as whole fish, fish heads, walrus, sea lion and whale flippers, beaver tails, seal oil, birds, etc., to ferment for an extended period of time before being consumed. The risk is exacerbated when a plastic container is used for this purpose instead of the old-fashioned method, a grass-lined hole, as the botulinum bacteria thrive in the anaerobic conditions created by the plastic.

seth (2009-05-11 14:09:32)

Peter, yes, that is why I always use glass containers. Mark and Andrew, I am saying there is something to be learned from the way kids eat. Including the way one kid eats. Of course, put in the wrong environment, kids will choose a crummy diet. Likewise, rats, put in the wrong environment, will get fat. But Richter showed that if rats are given access to a certain large set of foods, they will pick out a healthy diet. This isn't a great surprise but it is worth remembering. Presumably humans have similar tendencies. Yes, kids like candy, yes, they will eat too much candy if they can, but why humans like sweet foods isn't obvious at all – and maybe it is worth wondering about. Young children give us a glimpse of food preferences less affected by experts and culture than adults.

Ted (2009-05-12 14:24:49)

Your two theories of SLD and 'wisdom' are colliding here.

Patrik (2009-05-13 15:44:55)

*I am saying there is something to be learned from the way kids eat. Including the way one kid eats. Of course, put in the wrong environment, kids will choose a crummy diet.* Er, put in the best environment kids will choose a crummy diet. Not only kids, but adults are somewhat prone to this as well. Take me, for example. I don't buy chocolates and sweets anymore. Why? Because I have a tendency to inhale all of these the second I get home. Solution: don't buy them in the first place. This episode we are currently experiencing on this blog is reminiscent of when we discussed the Aquatic Ape theory. You, a very intelligent individual, eschewed all reason to bolster your pet theory. Now, I am not saying fermented food may not be healthy. It certainly may. However, you lack any sort of coherent logical framework within which to make your argument. *Young children give us a glimpse of food preferences less affected by experts and culture than adults.* You're right. The millions and millions of dollars spent by the likes of Nabisco, General Foods etc etc have no effect on children's preferences. None at all.

Les Jones (2009-06-02 11:51:59)

I have a three year old and a four year old. If children naturally eat healthy foods then ice cream, cake, cookies, and candy must be health food. "*Peter, yes, that is why I always use glass containers.*" Which would have the same anaerobic conditions as plastic containers.

seth (2009-06-02 11:58:25)

Les, everyone agrees that children, like adults, like pets, are sometimes drawn to unhealthy food. My point is more subtle: when children reject a food it may be because it's unhealthy. Not because "oh yeah children are picky eaters". My ideas come into play when children reject foods. I am saying that instead of dismissing such rejections they should be mulled over. Could the rejected food be unhealthy in a non-obvious way?

Aaron Blaisdell (2009-06-03 07:57:23)

I wonder why my daughter rejects sprouted sourdough bread but requests white bread? I thought the latter had some serious health issues, but the former largely removed the antinutrients? Just finding examples that don't fit the rejection hypothesis.

seth (2009-06-03 09:50:42)

perhaps the white bread has added vitamins. Thiamine, for example.

Aaron Blaisdell (2009-06-04 10:17:12)

Perhaps, but it seems like grasping at straws to me. What we really need are controlled studies that give the same type of bread to children, one with and one without added vitamins such as Thiamine, and see which one (if any) they develop a preference for over time.

Seth's blog » Blog Archive » The Wisdom of Young Picky Eaters (2009-07-10 09:50:25)

[...] The Wisdom of the One-Year-Old Picky Eater. The Wisdom of the Five-Year-Old Picky Eater. [...]

Quercki (2009-07-14 10:50:24)

My oldest child was an adventurous eater who would eat anything except peanut butter or apple juice. The rest of our family loves peanut butter. It turns out that peanut butter is actually bad for her: she has a stone-forming metabolic kidney disorder, and peanut butter is high in the precursors that form the stones. None of the rest of us have this disorder, so peanut butter is good for us. I haven't found out if apple juice has anything harmful for her in it yet. Another child is a typical "white diet" kid, but I think that is because that child has very sensitive skin including the taste buds.

### **Antibiotics Associated with Later Infection (2009-05-10 20:35)**

[1]A 2005 study by David Margolis, a dermatology professor at Penn, and others, found that acne patients given long-term antibiotic treatment, which often lasts more than 6 months, were more than twice as likely to have an upper respiratory tract infection during the year after treatment began than acne patients not given antibiotics.

Does this correlation reflect causality? Two additional analyses suggest it does:

1. Perhaps acne patients who get antibiotics are more likely to see a doctor than those who don't. However, a study of patients diagnosed with high blood pressure, which also requires relatively frequent doctor visits, had the same risk of upper respiratory tract infections as acne patients not given antibiotics.
2. [2]A later study found that the contacts of acne patients (such as their family) are more likely to have upper respiratory tract infections if the acne patient has such an infection – as you'd expect from contagion. But it makes no difference to these contacts if the acne patient was given antibiotics or not. This means that acne patients given antibiotics do not live in more infection-prone surroundings than acne patients not given antibiotics.

Bottom line: Support for the idea that the bacteria in our body help us stay healthy.

### **How Things Begin (Japan Traditional Foods) (2009-05-12 07:36)**

I eat natto (fermented soybeans) once/day. Most of the natto I see in stores is from Japan (soybeans from America) but I found one local source: [1]Japan Traditional Foods, in Sepastopol, California. Like [2]many people I believe traditional diets are far healthier than modern ones. How can such diets, now almost extinct in rich countries, become popular again? To learn more about this, I interviewed the owner of Japan Traditional Foods, Minami Satoh.

How did your company begin?

I started it in 2006. We started to produce product in November 2008. So far natto is our only product. I went to business school at the [3]Thunderbird School of Global Management, a private business school in Arizona, and graduated in 1983. After that, I worked for DuPont in Japan, but I wanted to work in the US. At DuPont, I did marketing of Teflon and Silverstone (a sister brand of Teflon). Then I worked for my father's company selling wholesale steel pipe and tubes. I was successful but felt it was boring. I thought food would be more interesting. I acquired a small natto-making company (Yaguchi Foods ) in Japan in 2004 or 2005. The owner had died. His relatives sold it to me.

In 2004, I came to America to meet Malcolm Clark. He's the great-grandson of Dr. Clark, who is very famous in Japan. Malcolm Clark was responsible for introducing shitake mushrooms to America. He owns Gourmet Mushrooms in Sebastopol and lives in Occidental. Natto is an unusual food, like shitake mushrooms. I thought he could give me good advice about how to start making natto or other possibilities. That's why the company is in Sebastopol. When I met Clark, he was thinking of retiring. I bought a stake in Gourmet Mushrooms; now Gourmet Mushrooms helps Japan Traditional Foods sell natto. I moved here in June 2008 to manage this company.

Why natto?

Americans already eat tofu, soy sauce, miso, edamame, and soy milk – but no natto. Natto is more nutritious than the other forms of soy that we currently eat. It's more nutritious because of fermentation. It has more vitamins. A enzyme found in natto called nattokinase dissolves blood clots. In Japan natto is a traditional health food. It is usually eaten at breakfast.

How is natto made?

You boil the soybeans in a steam basket. Spray with bacillus. Put the soybeans in a paper cup. Put the cups in a fermentation container for 20-24 hours. Take them out and put in packages. Then give to the distributor. If you ferment more than 20 hours, natto bacillus start to eat themselves, which produces ammonia. Most companies stop fermenting at that point to avoid ammonia. If fermented longer, it may smell of ammonia. Japanese accept this, but Americans may not.

How big is Japan Traditional Foods?

One person plus myself. I hired someone from my natto company in Japan. He makes artisanal natto. He handcrafts it.. We put it in the paper cups by hand.

How did you get distribution?

It wasn't hard. There are two distributors, one for Los Angeles, the other for San Francisco. They specialize in Japanese markets. Now it's in close to 30 stores, including Korean and Chinese stores. The Los Angeles distributor wanted to sell his stuff in New York but the shipping costs would have been too high. This summer we will start going to farmer's markets. We'll have a booth there to sell and sample. The goal is to educate and share recipes. We'll be at the San Rafael Sunday market and the Ferry Building Tuesday lunchtime market. It's a kind of test. We're talking to distributors about getting the product into non-Japanese grocery stores, such as Berkeley Bowl and Whole Foods. From the farmer's markets we hope to get feedback to improve the packaging, size, and recipes. We want to find the best ways to make the Western market receptive to natto. For example, we can sample it in different ways. In Japan, the most popular way to eat it is over rice with finely chopped green onions, often at breakfast. I've come up with many different recipes: with rice or bagel or lettuce or crackers. With different sauces and toppings.

What were the hard parts?

It was difficult to find a good temperature control system here; I had to import it from Japan. I also needed a big steam cooker, which I had to import. This was hard because it is prohibited to export them from Japan to other countries.

Your promotional leaflet says "stir natto more than twenty times" before eating it. Why?

We do not have any valid research on this. But somebody says stirring natto creates the "Fifth Taste" we call "umami." Somebody else said that it gets the natto bacillus awake again with oxygen because the bacillus was sleeping in the refrigerator.

---

Joe Coughlin (2009-05-12 10:25:09)

I'm absolutely fascinated by your theories on fermented food, Seth. Intinctively they feel right to me too so last week I bought some Miso and Sauerkraut. To my suprise, I'm really enjoying the Umami-ness of Miso. Once concern I have is buying the right stuff with all its fermented-goodness intact. For example, in the UK it's actually easier to buy non-fermented Sauerkraut, that uses vinegar, than fermented-Sauerkraut. Often, unless a product uses the word 'fermented' on the label you might be getting the wrong stuff. Likewise with Natto. In the UK it seems much easier to buy dried Natto snacks (eg: <http://www.japancentre.com/?cmd=itm &cid= &id=2788>). Any idea if the process of 'drying' a product kills the bacteria? Keep up the good work.

seth (2009-05-12 10:46:32)

Thanks, Joe. Yeah, drying a product probably kills the bacteria. I think dead bacteria are probably helpful too – the immune system can't distinguish live from dead – but the drying process may also cause the bacteria to crumble into tiny bits which the immune system wouldn't notice. Certainly dead bacteria can't help your digestion.

david (2009-05-12 12:50:08)

I've had the same reaction as Joe's "instinctively feel right" regarding the fermented food benefits. About a year ago I hadn't had any yogurt or fermented food for several years and happened to try some non-sugary plain yogurt from a local producer whose label promises lots of live bacteria. I suddenly craved yogurt and ate a jar a week for several months. But then I started getting a rash (I suspect due to the dairy in the yogurt) and stopped eating it (and the rash did go away). When you posted about Kombucha and other fermented foods I was reminded of my craving for yogurt. With Omega-3s you provided a number of effects that you noticed (e.g. gum health, improved balance, improved performance on certain tests, longer sleep if taken before bed). I'm surprised that you haven't listed anything similar for fermented food (or perhaps I didn't notice it). Some of these I could duplicate. I've been drinking 16 oz of Kombucha most days for the past two weeks or so and also made some miso soup and have continued to eat soy yogurt. I can say that my digestive system seems to be calmer than it's ever been before. Also drinking a bottle of Kombucha instead of breakfast satisfies any hunger even though the Kombucha has only 30 calories. But generally, I don't quantify enough of my daily life to notice effects with the accuracy and confidence that you can. When I read about the effects of Kombucha, the claims are so sweeping that they're implausible. Have you noticed any short-term effects or do you have ideas of things that could be measured before and after starting a high fermented food diet? Thanks, David

Ted (2009-05-12 14:16:15)

Interesting, shitake mushrooms are an ingredient of many kimchis.

Patrik (2009-05-12 14:16:39)

*the immune system can't distinguish live from dead* @Seth Nonsense. Where do you get this from?

Patrik (2009-05-12 14:58:56)

@Seth [http://www.sciencedirect.com/science?\\_ob=ArticleURL & \\_udi=B6TD0-3W2T4R5-K & \\_user=10 & \\_rdoc=1 & \\_fmt= & \\_orig=search & \\_sort=d &view=c & \\_acct=C000050221 & \\_version=1 & \\_urlVersion=0 & \\_userid=10 &md5=aa7670d043a56393999242bafdd95084](http://www.sciencedirect.com/science?_ob=ArticleURL&_udi=B6TD0-3W2T4R5-K&_user=10&_rdoc=1&_fmt=&_orig=search&_sort=d&view=c&_acct=C000050221&_version=1&_urlVersion=0&_userid=10&md5=aa7670d043a56393999242bafdd95084) **"Injection of live but not dead bacteria induces a wave of IL-12 and subsequently, IFN- $\gamma$  production.** Surprisingly, in vitro, both live and dead bacteria elicit IL-12 from macrophages. Better understanding of how macrophages distinguish live from dead bacteria would help explain this difference and possibly bypass the need for live vaccines against intracellular bacteria." <http://www.meningitisuk.org/research/previous-projects.htm> Live meningococcal bacteria were found to be poorly phagocytosed by dendritic cells compared to killed bacteria **and the special messenger molecules (cytokines) produced by dendritic cells in response to live and dead bacteria were quite different.** Unexpectedly, the live bacteria stimulated more IL12 required for a good immune response and less IL10, a cytokine thought to inhibit the immune response. This finding is important for developing dead whole bacteria vaccines which are made using the whole bacterium rather than purified components of it, and for understanding how live bacteria in the host affect the immune response.

Patrik (2009-05-13 13:31:04)

@Seth Why do you continue to duck my comments? Confirmation bias much? This is quite disappointing.

Confidence (2009-05-16 08:37:07)

@Patrik, Blog comments are singularly ill-adapted for discussing complex topics. It may be better if you email Seth directly regarding specific topics. I've noticed plenty of bloggers often only reply to the easiest and most lowest-common-denominator comments. It's a time-management and resource issue. I have yet to find a platform for such discussions that beats email. I do agree with many of your points and would like to see them addressed, but I know both you and Seth will have difficulties digging even one more level deeper on these concepts if you try to do it via blog comments.

anna (2009-08-31 19:25:49)

Do you know where I could purchase, or would you blog about how to make, gluten-free natto? Many thanks

seth (2009-08-31 19:37:19)

Anna, soybeans do not contain gluten. All natto is gluten-free.

anna (2009-09-06 18:54:26)

Thanks for responding, Seth. I know natto itself is gluten-free but I tried to buy a container of natto recently, after hearing about it for the first time, and every different brand I picked up had wheat listed as an ingredient in the soy sauce. Those of us who are gluten intolerant can't handle even a little wheat in soy sauce. I wonder if natto with gluten free soy sauce is out there somewhere.... thanks again

seth (2009-09-06 20:41:27)

Anna, the soy sauce is in a sealed packet that comes with the natto. If you want to avoid it, just throw the packet away.

anna (2009-09-08 11:37:01)

Oh, I didn't realize that. I'll go back and buy some. Thanks

### **The Dose-Response Revolution and Fermented Food (2009-05-12 19:01)**

Edward Calabrese, a toxicology professor at the University of Massachusetts, has pointed to the existence of U-shaped dose-response functions in a great many cases. Chemicals harmful at high doses are helpful at low dose, a phenomenon called hormesis. He reviews the evidence [1]here and [2]here. I didn't know that a low dose of dioxin reduces tumors. Nor did I know that a low dose of saccharine likewise reduces tumors.

The theory behind hormesis is that a damage-repair system is stimulated by the toxin. This isn't far from my idea that the average American's immune system is woefully understimulated, with many bad consequences (allergies, cancer, etc.), due to too-sterile food. If the rats or whatever used in the hormesis studies – probably fed sterile lab chow – were given immune system stimulation (e.g., from fermented food), the hormesis effect might disappear.

Thanks to JR Minkel.

Sam (2009-05-12 22:21:56)

Hormesis? This sounds like exactly the same idea as homœopathie. In homœopathie, you give the subject a medicine which creates exactly the same symptoms as the subject suffers from, just in a very very low dose.

Glen Raphael (2009-05-12 22:22:02)

Low doses of radiation are good for biological life too. Some studies here: [http://en.wikipedia.org/wiki/Radiation\\_hormesis](http://en.wikipedia.org/wiki/Radiation_hormesis)  
We know that most substances which are dangerous in large amounts (say, arsenic) are beneficial in smaller amounts. It's even true with things we think of as necessary and good for you such as water: too little and you die of thirst, but too much and you drown. There's a U-shaped or inverted-U-shaped dose-response curve for almost everything people have studied and we don't yet really know *why* this is, though there are some half-baked, untested theories about it. The logical application of that principle to the question of bacteria in the diet would be to assume that that, too, has an inverted-U-shape dose-response curve. The notion of hormesis implies there's some *optimum* nonzero amount of bacteria in the diet to achieve maximally beneficial health effects and if you consume less *or more* than that amount it will be less beneficial. And if you take way too much it might hurt or kill you. Even if it's clear that *some* bacteria in the diet is much better than *no* bacteria in the diet, it does not logically follow that more still is better, or that stuff past its "sell-by date" is better for you than "fresher" food. Determining the optimum amount of bacteria in the diet seems like an empirical question rather than something you could answer on principle. Might we all be better off eating natto/miso/kombucha once a week than once a day?

seth (2009-05-13 08:45:37)

Sam, you're right. The phenomenon of hormesis supports homeopathy. Glen, when I stop eating fermented food or eat much less of it the effects seem to wear off in about a day. Along the same lines, I met a woman whose health greatly improved when she switched from eating yogurt once/week to once/day. This observations support a once/day rule over a once/week rule.

Patrik (2009-05-13 13:29:35)

An accurate way to think about hormesis is exercise. Too little is bad. Too much is just as bad. The optimal is somewhere in the middle.

Ted (2009-05-14 16:27:08)

No, it doesn't support homeopathy at all. Homeopathy so dilutes things as to be a fanciful belief in magic powers that water somehow remembers what was once in it.

simon (2009-05-14 17:43:31)

Yes, in hormesis you have an optimal dose at a value where there is still enough to have an effect, whereas in homeopathy you have a crazy theory of the optimal dose being at a value low enough not to have any molecules left. Unfortunately, the reflexive tendency to associate hormesis with homeopathy has probably resulted in it receiving much less attention than it deserves. I doubt the damage-repair system would be stimulated by benign bacteria though.

Igor Carron (2009-05-15 00:54:16)

Seth, I second Glen's answer. Additional insight into this issue is the battle between different groups on whether radiation hormesis exists. At stake is an issue of very large economic consequences. See, if this hypothesis is not verified then any level of radiation is harmful and therefore regulations are working to reduce any radiation output to zero (as they should), a cost

that no society can really bear (there is natural radiation everywhere). If the hypothesis is true, then the linear hypothesis is wrong at very very low dose and regulations need to take that into account so as to not burden technologies that in fact are doing no harm when there are releasing very very low doses. However, if the latter is true, the journalistic treatment on any information linked to nuclear subjects cannot really be unbiased: Fear backed up by so called specialists always sells. Igor.

VADIM (2009-05-23 18:52:27)

“Hormesis with Ionizing Radiation” presented evidence of increased vigor in plants, bacteria, invertebrates and vertebrates. Most physiologic reactions in living cells are stimulated by low doses of ionizing radiation. This evidence of radiogenic metabolism (metabolism promoted by ionizing radiation) includes enzyme induction, photosynthesis, respiration and growth. Radiation hormesis in immunity decreases infection and premature death in radiation exposed populations. Increased immune competence is a major factor in the increased average life-span of populations exposed to low-dose irradiation. This article is very accurate and it is demonstrated here [radiationhormesis.com](http://radiationhormesis.com)

Due to fermented foods, my overall health is better. 4. Due to learning about hormesis, I don't worry about a small amount of air pollution. [...]

## **The Twilight of Expertise (psoriasis treatment) (2009-05-13 16:42)**

From [1]BBC News:

A specialist light treatment for psoriasis is just as effective and safe when given at home as in hospital, say Dutch researchers. Phototherapy using UVB light is rarely used in the UK because of limited availability and the number of hospital visits required. But a study of 200 patients found the same results with home treatment. . . .

One reason that the treatment is usually done in hospital is because most dermatologists believe that home phototherapy is inferior and that it carries more risks. In the latest study, patients with psoriasis from 14 hospital dermatology departments were randomly assigned to receive either home UVB phototherapy or hospital-based treatment. Home treatment was equivalent to hospital therapy both in terms of safety and the effectiveness of clearing the condition. And those treated at home reported a significantly lower burden of treatment and were more satisfied.

There was a time when blood-glucose testing (for diabetes) was only done in laboratories, with blood drawn in doctors' offices or hospitals.

Psoriasis gives me a very itchy feeling. the itch only goes away when i use corticosteroids. i am looking for a natural treatment for this disease.

## Measuring My Brain Function: One-Finger Typing (2009-05-14 16:09)

Noticing that flaxseed oil improved my balance led me to [1]measure its effects on other tests of brain function. It also made me wonder what else in my life affected how well my brain works. Eventually I measured the mental effects of flaxseed oil with four tests, but each had problems:

1. Balance. Time-consuming (15 minutes for one daily test), not portable.
2. Memory search.Â Anticipation errors, speed-accuracy tradeoff.
3. Arithmetic. Speed-accuracy tradeoff.
4. Digit span. Insensitive.

"Speed-accuracy tradeoff" means it was easy to go faster and make more errors. It wasn't easy to keep the error rate constant. If I got faster, there were two possible explanations: (a) brain working better or (b) shift on the speed-accuracy tradeoff function. The balance and digit span tests had other weaknesses. Only the balance test was enjoyable.

I'm still doing the arithmetic test, which has been highly informative. However, I want to regularly do at least two tests to provide a check on each other and to allow test comparison (which is more sensitive?). I tried a test that involved typing random strings of letters several times but as I got faster I started to make many mistakes.

I have recently started doing a test that consists of one-fingered typing of a five-letter string. There are 30 possible five-letter strings. Each trial I see one of them and type it as fast as possible. 15 trials = one test. Takes three minutes.

I am doing one-finger rather than regular typing because I hope one-finger typing will be more accurate, very close to 100 %. With the error rate always near zero, I won't have to worry about speed-accuracy tradeoff. Another reason is the need for skilled movement and hand-eye coordination. [2]Doing this sort of task can be enjoyable. One-finger typing (unlike regular typing) is skilled movement with hand-eye coordination; maybe it will be fun.

I restricted the number of possible letter strings to 30 to make learning easier. Yet 30 is too large to cause the anticipation errors I might make if there were only a few strings.

Here are early results.

So far so good. Accuracy is high. On any trial, it isn't easy to go faster, so speed-accuracy tradeoff is less of a problem. Even better, it's vaguely enjoyable. Doing the task is a little like having a cup of tea. A pleasant break. There's no need to do the test four times/day; I just want to.

Ted (2009-05-14 16:23:20)

Since this post is loosely related to self-experimentation I'll post this. I thought of you today watching the Discovery Science channel show on jellyfish. I looked up the incident on Wiki for you: In 1964, Dr. Jack Barnes confirmed the cause of the syndrome to be due to a small box jelly, the Irukandji jellyfish (*Carukia barnesi*). In order to prove that the jellyfish was the cause of the syndrome, he captured one and deliberately stung himself, his son, and a local lifeguard, and observed the symptoms.[3] [http://en.wikipedia.org/wiki/Irukandji\\_syndrome](http://en.wikipedia.org/wiki/Irukandji_syndrome)

### Probiotics and Resistance to Illness (2009-05-14 22:44)

A [1]2005 study compared workers who did and did not consume a daily straw of probiotic liquid. During the 3-month study, workers who got the probiotics were sick half as often as those who didn't. Here are details:

262 employees at TetraPak in Sweden (day-workers and three-shift-workers) that were healthy at study start were randomised in a double-blind fashion to receive either a daily dose of 100,000,000 Colony Forming Units of *L. reuteri* or placebo for 80 days. The study products were administered with a drinking straw. 181 subjects complied with the study protocol, 94 were randomised to receive *L. reuteri* and 87 received placebo. In the placebo group 26.4 % reported sick-leave for the defined causes during the study as compared with 10.6 % in the *L. reuteri* group ( $p < 0.01$ ). The frequency of sick-days was 0.9 % in the placebo group and 0.4 % in the *L. reuteri* group ( $p < 0.01$ ). Among the 53 shift-workers, 33 % in the placebo group reported sick during the study period as compared with none in the *L. reuteri* group ( $p < 0.005$ ).

The paper gives no reason to think the probiotic dose was optimal. (How the dose was chosen isn't explained.) A larger dose might have had a bigger effect.

When science writers tell about the "miracle" of antibiotics, they tell stories like this one, from *The Probiotics Revolution* (2007) by Gary Huffnagle with Sarah Wernick:

When my daughter was five, she pricked her left hand on a rosebud thorn in our garden. . . . The next day she ran a fever. . . . Doctors diagnosed an acute bacterial infection. Half a century ago, a child might have died from such an infection. But my daughter received antibiotics. After a day of intravenous treatment, she was better. . . . Antibiotics are true miracle drugs.

What goes unnoticed in these "miracle" accounts is the possibility that the person got so sick because their immune system wasn't working well. (It wasn't working well, I propose, because the infected person didn't get enough bacteria in their food.) A child gets sick from an ordinary plant scratch? That child's immune system has a lot of room for improvement. Huffnagle and Wernick say nothing about this. Dr. Huffnagle is a professor of internal medicine, microbiology, and immunology at the University of Michigan. If the child of such a parent – well-off, well-educated, health-conscious, specializing in immunology – has a weak immune system, and the parent doesn't realize this is possible, there is enormous room for improvement. *The Probiotics Revolution* is 90 % filler but the 10 % substance makes it worth skimming.

1. <http://www.ehjournal.net/content/pdf/1476-069X-4-25.pdf>

---

Kirk (2009-05-15 04:48:32)

'The Probiotics Revolution is 90 % filler' was my impression also. Some of the useful 10 % included: (a) study of probiotics is in its infancy (which is why the book is full of 'probiotics hold promise to solve . . .' statements) (b) about a dozen well-designed experiments are discussed . . . more, please, I'd like to see a book filled with discussions about hundreds of experiments (c) dead bacteria still produce benefits . . . why? there appear to be two theories: (1) dead bacteria adhere to the lining of the gastrointestinal tract thus crowding out harmful competitors or (2) the metabolic byproducts of fermentation have benefits. I'm looking forward to seeing this one resolved. Many studies are listed at the end of the book, but, unfortunately, as a layman, I have no access to many of them, since most are behind a pay wall. I suspect that much of the funding comes from the private sector looking for a magic bullet of probiotics which can be packaged and sold. I wonder if there actually is an ideal combination of specific bacteria, or is it just that the internal system needs to be challenged by a certain amount on a regular basis? Also, and this is more of a general gripe with the marketplace, why can't Dannon Activia and similar products be produced without added sugar or fructose syrup?

Aaron Blaisdell (2009-05-15 07:58:59)

Kirk said "Why can't Dannon Activia and similar products be produced without added sugar or fructose syrup?" Well, obviously they can be, but the companies choose to add these junk ingredients because the mainstream American will not select such products to consume without the additional sweeteners. Dannon's first priority is to sell as many of their products as possible. Fortunately, there is a growing availability of pure cultured products at alternative sources such as Whole Foods, Trader Joes, and at some Farmer's Markets and other whole-food outlets. I suspect such outlets are not available equally across the US, though.

Ted (2009-05-15 08:12:49)

If the book is 90 % fluff, how about a Seth Roberts book that's only 10 % fluff! Are you planning a second book and immune theories? I'll pre-order right now!

Ted (2009-05-15 08:48:16)

Seems like studies on Lactobacillus reuteri are pretty easy to come by... L reuteri improved colicky symptoms in breastfed infants within 1 week of treatment... <http://pediatrics.aappublications.org/cgi/reprint/119/1/e124> What's missing here is a riddle for Seth to solve like he did with 'Set Points' in rat studies that were anomalies. There's no paradigm to shift.

Zeke's Awesome Eat's (2009-05-21 03:55:25)

Does it mention why L. reuteri was chosen? Why not L. bulgaricus or good old fashioned L. acidophilus?

## **Fermentation Festival Tomorrow Near Sonoma (2009-05-15 11:02)**

[1]Freestone Fermentation Festival.

If you are going and live near Berkeley, could I get a ride?

Thanks to Mariah Isley.

1. <http://www.freestonefermentationfestival.com/>

---

bennetta (2009-05-15 16:19:20)

Holy smokes. That's about 20 minutes away from me. Now I have something to do tomorrow.

## **How Fast Do We Rot? (2009-05-16 05:49)**

Not as fast as we used to. A friend of mine, who went to college at MIT around 1980, had a classmate who was the son of an undertaker. His dad had told him that when he (the dad) had entered the business, you had to work fast. Bodies would start to smell quickly. But now - around 1980 - that was no longer necessary. You could wait a lot longer before they smelled bad.

Which I take to mean that around 1980 the average old person, where this classmate came from, had a lot less bacteria in their body than around 1960. All that concern about "the safety of the food supply" – preservatives, yes, but also sterilization, freezing, sell-by dates, food handling rules, food safety officers, and microwave food – seems to have had an effect. From 1960 to 1980 there was a big shift from homemade food to factory-made and restaurant-made food. The uniformity of the new food caused the obesity epidemic, I believe; its sterility<sup>Â</sup> caused a great increase in allergies and asthma, not to mention a bunch of other disorders.

Speaking of sell-by dates, at a Japanese grocery store recently I wanted to buy some [1]Yakult. At check-out, it was pointed out to me that it was one day past its sell-by date. Half price. I bought two.

1. <http://www.yakultusa.com/>

---

Dennis Mangan (2009-05-16 07:39:45)

Maybe they didn't have big refrigerators when the dad started undertaking.

david (2009-05-16 08:08:15)

Presumably you could test this idea with lab animals. Their life spans are short enough that you could feed one group sterile food and another with a probiotics-rich diet. Then measure how long it takes their bodies to decompose after death.

Eric (2009-05-18 04:39:02)

Also might have to do about the high(er) level of anti-oxidants and preservatives in our modern food. See: <http://bestwellnessconsultant.com/2008/09/23/1996-mcdonalds-hamburger-karen-hanrahan-best-of-mother-earth.aspx>  
<http://www.youtube.com/watch?v=knJHfVQL8JE> (don't like the Super Size Me doc/movie but it shows this weird hamburger behaviour ;-)

Jeremy (2009-05-18 05:04:50)

I believe that this claim may be an urban legend. Note the source: "A friend of mine, who went to college at MIT around 1980, had a classmate who was the son of an undertaker." See also: <http://message.snopes.com/showthread.php?t=4503>

Aaron Blaisdell (2009-05-18 07:48:05)

@David, Yup, this is one question that can not easily be addressed through self-experimentation.

Smith (2009-05-19 11:20:01)

I just saw a Bill Nye where he said the reason we decay more slowly is the high levels of formaldehyde that we are absorbing while alive from our environment. He mentioned that there is even formaldehyde in some toothpaste.

Eric Garner (2009-05-19 11:36:47)

If this were true there might be references to it in forensic science journals. Since state of decay is used to estimate how long someone has been dead, someone would have noticed that it takes longer nowadays. I just spent 15 min searching pubmed (hardly an exhaustive search, i know) and didn't find any reference in forensic journals to support this. Has anyone else espoused anything other than third hand anecdotal evidence that supports whether this is even true, regardless of cause?

Marsha Keeffer (2009-05-19 13:05:13)

The book 'Stiff' discusses a university that leaves corpses outside to measure the speed of decay...among other things. Fascinating, if macabre, reading.

meehawl (2009-05-19 15:07:54)

Or maybe after decades inhaling the known carcinogenic toxin formaldehyde, the mortician had managed to fix most of his nasal sensory cells, accelerating the normal age-related loss of smell sensation. Also, habituation probably plays a big role here.

Mike Dedmon (2009-05-19 15:46:34)

I seem to remember that Air Conditioning really became common in the late 70's early 80's. Before then, it was a luxury. I wonder how much that played into it? We take it for granted that most buildings / homes that we inhabit today have these "luxuries".

ucsd (2009-05-19 16:24:02)

Confirmation Bias

Theo Bee (2009-05-19 19:09:30)

Could be all the antibiotics we take reduce our guts flora and fauna

Mathias (2009-05-19 19:51:19)

@ Marsha: It's for real, and its called 'the body farm' AKA University of Tennessee Forensic Anthropology Research Facility.

Tyler (2009-05-19 21:45:07)

I've been looking for the source, and I was unable to find it, but I once read that American soldiers in Vietnam witnessed vastly different decomposition rates between Vietnamese corpses and American ones. This particular source attributed the difference to the chemicals, plastics, preservatives and other inorganic matter that now fills up so much of our "food." Ask a vet.

Bestatterweblog (2009-05-19 23:48:28)

Verwesen Leichen heute langsamer?... Leser Bernd ist im Web über einen Artikel gestolpert, der ungefähr so beginnt: "Ein Freund von mir der um 1980 das College besuchte, hatte einen Klassenkameraden, der Sohn eines Bestatters war..." Im weiteren Verlauf des (englischen) Textes geht es ...

Chuck (2009-05-20 04:33:20)

Can I drink Yakult after the expiration date? The "best if used by" date indicates that after the specified date, the number of bacteria found in Yakult will likely decrease below 8 billion per bottle. To enjoy Yakult at its premium, we strongly recommend keeping the product chilled and to discard after the expiration date.

dar (2009-05-20 14:20:29)

It's due to the ubiquity of Aspartame in many foods . The stuff turns into formaldehyde when ingested. [pls go to [www.sweetpoison.com](http://www.sweetpoison.com) or do a search at [www.mercola.com](http://www.mercola.com) for the details] -crematorium workers swear that they can tell if the dearly departed was a diet soda drinker-the burn takes that much longer

Internists (2009-05-21 22:30:44)

2cents.. The big problem is that yakult has 80 % more sugar than soda. For example, Coca-Cola has 10 grams of sugar per 100 grams of drink whereas Yakult has 18 grams sugar per 100 grams of drink.

elaine (2009-05-23 05:53:52)

steer clear of aspartamine check your food labels for this additive, it is proved to be contra indicative to the human bodies normal functioning and should be banned. It is in EVERYTHING it is man made.

John Lewis (2009-05-27 10:03:00)

Seth, Hello from Houston! I'm co-authoring a blog with my pickle circle and would like to link to your blog and a few stories if I may. And I'm not up to speed on the legal/respectful details of linking and blogging, so feel free to explain exactly how you'd like to be referenced. We're trying to relearn what our grandparents didn't get to teach us and you've done lots of good and accessible work to this end. Thanks for what you do, please keep it up!

Jeff I (2011-03-15 00:00:13)

the human body will rot down completely to a skeleton in about a week, depending on weather conditions, temperature, humidity, etc

Preserve This | Let it all hang out. (2011-11-09 21:13:23)

## **When Did the New York Times Start Asking Abusive Questions? (2009-05-17 05:48)**

"Increasingly, the biggest companies," writes New York Times reporter Michael Moss, "that supply Americans with processed food cannot guarantee the safety of their ingredients." To Moss, safe means sterile. I believe the opposite but [1]the whole article leaves something to be desired. It focuses on Banquet frozen pot pies, made by ConAgra. A ConAgra spokesperson is asked a when-did-you-stop-beating-your-wife question:

Pressed to say whether the meals are safe to eat if consumers disregard the instructions or make an error, Stephanie Childs, a company spokeswoman, said, "Our goal is to provide the consumer with as safe a product as possible, and we are doing everything within our ability to provide a safe product to them."

Pressed to answer an unanswerable but fear-inducing question . . .

1. <http://www.nytimes.com/2009/05/15/business/15ingredients.html?hpw=&pagewanted=all>

---

david (2009-05-17 09:11:18)

If you buy vegetables from the produce section, you know that you can eat them raw but need to wash them first. If you buy a frozen pot pie that contains only vegetables, you might assume that you can eat it un- or partially cooked since it contains only vegetables. In fact, you must cook it thoroughly to be sure you kill salmonella etc. It's understandable that the consumer would assume that a product containing only frozen vegetables wouldn't need to be thoroughly cooked. If you made the same thing at home and didn't thoroughly cook it, you'd be ok.

Ted (2009-05-18 09:15:49)

Even you Seth can't recommend eating salmonella or e coli.

Ben Hyde (2009-05-18 11:06:17)

Ted - I suspect the answer is "all things in moderation" :) - ben

## **Probiotics Reduce Postpartum Obesity (2009-05-17 09:07)**

From [1]Science Daily:

"The results of our study, the first to demonstrate the impact of probiotics-supplemented dietary counselling on adiposity, were encouraging," said Kirsi Laitinen, a nutritionist and senior lecturer at the University of Turku in Finland who presented her findings on May 7 at the European Congress on Obesity. "The women who got the probiotics [during pregnancy and until the women stopped breast feeding] fared best. One year after childbirth, they had the lowest levels of central obesity as well as the lowest body fat percentage."

That's a unusual way to look at the data. Most studies of weight control look at weight change so as to adjust for individual differences. Maybe pre-pregnancy weights were not available.

Thanks to Dave Lull.

Larry O (2009-05-18 21:22:30)

Have you heard of Epicor? It is a fermented yeast product feed to livestock under the Diamond V XPC label. It has some interesting history. <http://www.diamondv.com/> Humans are taking this as a supplement. <http://www.imminst.org/forum/index.php?s-howtopic=17713&hl=epicor&st=0> I've never tried it but I wonder if you could comment on the science behind this. Is this a probiotic?

Tom in TX (2009-05-19 07:18:17)

I have been taking EpiCor for a couple of years. It started as a supplement for livestock. The company found out that the factory workers got sick less than the office workers. So they started producing it for humans, too. I watched the webinar at <http://www.vrp.com/webinar/epicor/index.aspx> It has a lot of info, but I don't think they are exactly sure how it works yet.

Jeanne (2009-05-19 08:41:24)

There were some problems with this study. <http://junkfoodscience.blogspot.com/2009/05/science-says-isnt-always-what-science.html>

## **What Causes Asthma? Not What the Tovers Think (2009-05-20 07:07)**

From Joyce Cohen's [1]The Hunt column:

For reasons unknown, Florida didn't agree with little Noah Tovar. Since his toddler years, Noah, now 7, had suffered terribly from asthma. His parents, Jari and Selene Tovar, moved their family several times, trying to escape the mold or pollen or whatever it was that caused his breathing problems. Nothing helped much.

Noah's parents didn't know, I can tell, about a [2]1992 study of childhood asthma and allergies in Germany. Maybe childhood asthma is caused by air pollution, the researchers thought. Let's test that idea by comparing a clean West German city (Munich) with a dirty East German one (Leipzig). Here's one of the results:

The lifetime prevalence of asthma diagnosed by a doctor was 7.3 % (72) in Leipzig and 9.3 % (435) in Munich.

Less asthma in the dirty city! It wasn't a significant difference but similar differences, such as hay fever and rhinitis (runny nose), were in the same direction and significant. Hay fever was much rarer in Leipzig.

Noah's asthma cleared up, to his parents' surprise, on a trip to New York. So the family moved to New York.

Even though "everyone was under the impression that New York would cause him more distress, it was just the opposite," Mrs. Tovar said. "Not one doctor nor myself can explain what it is."

Mrs. Tovar's doctors are badly out of date. The hygiene hypothesis has been around since the 1990s, supported by plenty of data that, like the German study, shows that childhood allergies are better in dirtier environments. Noah is better in New York because New York air is dirtier than Florida air – that's the obvious explanation.

In *The Probiotic Revolution* (2007) by Gary Huffnagle with Sarah Wernick, which I've [3]mentioned earlier, Dr. Huffnagle, a professor of immunology at the University of Michigan, describes a self-experiment he did:

Could probiotics relieve something as tenacious as my lifelong allergies and asthma? I decided to take a probiotic supplement and make a few simple changes to my diet to my diet, just to see what happened. Yogurt became my new breakfast and my new bedtime snack. I also upped my intake of fruits and vegetables. Whenever possible, I substituted whole grains for processed ones. And I tried to cut back on sugar. [Why he made the non-probiotic changes is not explained. In another part of the book he says he also increased his spice intake.] No big deal.

Because I doubted this little experiment would work, I didn't mention it to anyone, not even my wife. And I didn't bother to record my allergy symptoms. . . My "aha" moment came after about a month: I'd spent the evening writing a grant proposal, a box of tissues at my side. After all these years, I knew to be prepared for the inevitable sneezing and runny nose caused by my mold allergies, which kicked up at night. But when I finished working and cleared the table, I realized I hadn't touched the tissues. And as I looked back on the previous month, I could see other changes. This wasn't my first sneeze-free evening; I hadn't needed my asthma inhaler for several months. To my astonishment, the experiment had been a great success.

This is a great and helpful story. Only after I read it did I realize I'd had a similar experience. I've never had serious allergies but I used to sneeze now and then in my apartment and my nose would run a lot; I went through more than one box of Kleenex in a month. Maybe 4 in one morning. In January, I made just one change: I started to eat lots more fermented foods (yogurt, kimchi, kefir, etc.). My sneezing and Kleenex use are now almost zero.

The Tovars can live wherever they want, I'm sure, if they feed their son plenty of fermented food.

[4]Previous post about childhood allergies and fermented food.

More After the column appeared, someone wrote to the Tovars:

Funny, same thing happened to me. I moved from England where I had chronic asthma, to New York City where I had none. Stayed in NY for twenty years asthma free, then moved back to England with my wife for the last ten years and my asthma has returned all the time I've been back.

---

karky (2009-05-21 03:30:28)

I got asthma when I was 15, we moved to Corpus Christi, TX. There is a Dow Chemical Plant near there. I have had it ever since. My worst symptoms until last spring were in Ft. Smith, AR. They were almost non-existent in the Dallas/Ft. Worth, TX area, Jacksonville, FL, and Atlanta, GA; and my symptoms were pretty mild here in MI. However, when I started SLD 2 years ago, and started taking digestive enzymes to combat bloating/nausea, my asthma symptoms almost completely disappeared. I was ecstatic. But then I had the worst asthma of my life last spring. I was still taking the digestive enzymes. This spring, my symptoms are very mild, but I have added a daily kefir drink to the mix.

NE1 (2009-05-21 03:52:32)

It takes on the order of 1 month to become fed up with your allergy symptoms. Another month of treatment, and that's allergy season right there. It's too bad he didn't write his symptoms down so that we could know more surely about the effectiveness. The anecdote at the end (I'll just spell it out) also suggests environmental asthma as opposed to any hygiene hypothesis.

karky (2009-05-22 05:29:56)

I have been thinking about this article all day yesterday, and I wonder if the child's symptoms disappeared when they moved to New York City because the trigger doesn't grow too much in the city. Like hay. Or ragweed.

Aaron Blaisdell (2009-05-22 07:15:04)

@ Karky, That's my take on this anecdote as well. I had just about the same experience, moving from south Florida where I had strong allergies every year to Stony Brook, Long Island for college. Stony Brook is way out on LI, not near NYC so it has very clean air coming off the ocean and lots of vegetation—but not the same vegetation as south Florida obviously. My allergies were just about completely gone after that move.

Access Hypnotherapy (2009-10-23 01:58:43)

My son has asthma and for many years now, we have been going along to see various doctors to help him, especially in autumn (fall). A friend of mine recently suggested that we try using a dehumidifier in his room. Now I didn't think his room was at all damp, but we thought "hell, what have we got to lose". So we used it in his room for three hours a day (while he was out at school). His asthma has improved by about 75 %. Now I know that this may not work for everyone, because everyone's triggers are different, but in our son's case, he seems to be sensitive to the level of dampness in the air, and while we, his parents, think his room is perfectly ok, the damp air which we don't even notice, is setting him off.

### **Learning To Read Chinese (2009-05-21 09:05)**

I have tried a dozen-odd ways of learning Chinese. Few of them have worked very well . . . except one: the book [1] Learning Chinese Characters (2007) by Alison Matthews and Laurence Matthews. The subtitle is "a revolutionary new way to learn and remember the 800 most basic Chinese characters" and I agree, if revolutionary means "a lot better than other methods". The method is simple:

1. Break combination characters – almost all Chinese characters are combinations of a few hundred simpler characters – into components.
2. The simplest components, not divisible into others, are associated with a picture that conveys the meaning. Someone pitching a baseball, for example, when outlined makes the character for nine.
3. Devise a brief story, a little picture, to help you remember that the components together mean what they mean. For example, the characters for white and ladle put together in one character mean of. The story is something like: "Look at that white ladle. It's the special ladle of Chef Thomas. The book is full of drawings to help visualize the stories.

I enjoy reading it. Partly for the feeling of accomplishment – I can tell I am actually learning the characters much faster than before – and partly because the combinations are intriguing.

The book I have says "Volume One" so I eagerly await later volumes to read more of what these two writers, who are not identified, have to say. I never saw it in Beijing; I came across it in a Barnes & Noble or Borders.

1. <http://www.amazon.com/Tuttle-Learning-Chinese-Characters-Revolutionary/dp/080483816X/sethrobertand-20>

---

Oliver (2009-05-22 01:42:05)

I remember doing this for Hiragana in Japanese class. A classmate of mine had this book with cheesy suggestions for associations. They weren't working for me, so I made up my own—usually something lascivious or bizarrely memorable. At first I was going to ask if this works only for traditional characters. Then I realized that we're not dealing with radicals—the stories you can make up are arbitrary. So perhaps it works even better with simplified, since the shapes are easier?

Nathan Myers (2009-05-22 16:56:09)

It adds to the misunderstanding when you call the script you're learning "Chinese". It's a writing system for Mandarin, the official tongue of Beijing, Taiwan, and Singapore, so you're learning the Mandarin syllabary. Shanghainese, Cantonese, and

dozens of other Chinese languages spoken by upwards of a billion Chinese people have no, or poor, representation in this script. You may have been told that it's not a syllabary, but a system of ideograms. Many native Mandarin speakers have been taught that, and believe it. It's false. A Shanghai speaker who reads Mandarin is bilingual. The symbols really do represent sounds. Therefore, it's also wrong to say "the characters for 'white' and 'ladle'", because those characters don't represent those concepts, but only the sounds used in Mandarin to express the words for those concepts. We aren't tempted to make the mistake in English, because only "a" and "l" are written with one letter, but with a syllabary, any one-syllable word may be confused with the symbol that spells it. What makes it more confusing is that Mandarin has only about 1200 spoken syllables, but many more symbols, so by convention words that sound the same must often be written with different symbols.

Eugene (2009-05-23 09:39:54)

This system sounds very similar to James Heisig's [1]*Remembering the Kanji* and *Remembering the Hanzi*.

1. <http://kanji.koohii.com/>

marmolillo (2009-05-23 13:42:46)

The idea of making relations, as strange as possible, was developed by magician Harry Loraine: [http://en.wikipedia.org/wiki/Harry\\_Lorayne](http://en.wikipedia.org/wiki/Harry_Lorayne) He suggest you make the weirdest possible relation between the symbols, and then it is much easier to remember. He was famous for his unusual capability to remember things, and he always said it was just plain technique. He had a chapter about learning languages in his bestseller book *The Memory Book*.

Judy (2009-09-26 19:01:50)

i have been learning english for many years. but unfortunately the ways for learning new words seems doesn't work for me. i tried again, but still didn't have big progress. after i read the book called "how to remember the GRE vocabulary in 17 days", by Yang Peng who is a teacher in New Oriental School, and "selectness of GRE vocabulary " by Yu Min Hong who is the president of New Oriental School, Beijing. after read those books i learnt much faster than before. the second book teach me how to learn and remember words. such as: "canvas" â€œwe can think canvas consists of a can and a vase. the first book teaches me which way is the best for us to learn new words in very short time. and we need to repeat them according to the forgetting curve which discovered by H.Ebbinghaus. if we learn everything following thie rule. the effecton will be better. maybe learning new languages has common way ?

Kevin Miller (2010-03-17 08:25:05)

oh, and I would be remiss if I didn't put a plug in for Wenlin.com, by your Berkeley colleagues, which can also generate flashcards and do much more, including giving you "just so" stories about why characters are written as they are, which I find to be a very useful elaboration aid to learning.

## **Yogurt Popularizer Dies: Note How Old He Was (2009-05-21 09:49)**

Daniel Carasso, who popularized yogurt worldwide via the Dannon brand, died on Sunday. He was 103. From [1]the obituary in the NY Times:

In 1916 his father took the family back to Spain, where he [the father] became disturbed by the high incidence of intestinal disorders, especially among children. Isaac Carasso [Daniel's father] began studying the work of Elie Metchnikoff, the Russian microbiologist who believed that human life could be extended by introducing lactic-acid bacilli, found in yogurt and sour milk, into the digestive system. Using cultures developed at the Pasteur Institute in Paris, Isaac began producing Danone. . . in 1941 the arrival of the Nazis forced [Daniel Carasso] to flee to the United States. There he formed a partnership with two family friends, Joe Metzger, a Swiss-born Spanish businessman, and his son Juan, whose flair for marketing

would make Dannon a household name in the United States. . .The little company operated at a loss until 1947, when, in a concession to the American sweet tooth, strawberry jam was added to the yogurt. Sales took off, new flavors were added to the product line, and Dannon yogurt made the leap from specialty product to snack food and dessert.

Thanks to Marian Lizzi.

---

david (2009-05-21 11:56:59)

Does the added sugar found in many yogurts reduce the effectiveness of the probiotics? I assume plain yogurt = good; sugary yogurt = bad, but I don't know why I think that. I also assume all those yogurts in tubes are less good as yogurt than regular yogurt and that frozen yogurt is just ice cream with a fancy name, but I realize those are all just assumptions. Aside from the fact that sugar adds empty calories and promotes tooth decay, is there anything wrong with it in yogurt?

Fred (2009-05-21 14:08:48)

wow! 103 years is a pretty respectable age. I think I should eat more yogurt even if my wife can't eat any dairy products.

Ben Hyde (2009-05-21 15:29:53)

"He was 103" ... leads me to recall: <http://www.youtube.com/watch?v=M6-50poqaIE>

### **Worm Therapy (2009-05-23 09:30)**

One reason I believe we are vastly bacteria-deprived (and thus greatly benefit from fermented foods) is the efficacy of hookworm therapy: Hookworm parasites can reduce autoimmune diseases. Hookworms, like fermented foods, stimulate the immune system in a chronic, harmless, low-level way. [1]Here is a good introduction to the subject:

Musician Scott Richards and artist Debora Wade are two Bay Area patients on the hookworm treatment. Richards and Wade both suffer from an inflammatory bowel disease called Crohn's. When faced with using a parasite as therapy, both patients felt they had nothing to lose. . . . Both Richards and Wade say they didn't have to wait long to feel relief. Richards [described] waking up and the pain suddenly gone. For Wade, she needed to be reinfected, but today said she can eat foods that patients with Crohn's could never eat: pizza & Thai food for example.

[2]Related story.

2. <http://cbs5.com/health/hookworm.treatment.therapy.2.1015341.html>

Jasper Lawrence (2009-06-11 08:52:18)

I was a subject of the news piece you link to and the founder of the first company offering helminthic therapy. Strictly speaking it is not worm therapy, helminthic therapy is the correct term. Your readers searching using the correct term will find much more information. thanks, Jasper Lawrence

Jasper Lawrence (2009-06-11 08:55:22)

oh, and if you like self-experimentation you will like my description of infecting myself with hookworm to put my asthma into remission by going to Cameroon. <http://www.kuro5hin.org/story/2006/4/30/91945/8971> and a more recent article I wrote there advocating the therapeutic use of benign organisms. <http://www.kuro5hin.org/story/2009/3/16/3408/66053>

Crohns Disease (2009-07-08 04:38:01)

I'm very afraid about crohn's disease. I have some symptoms in abdominal pain, often in the lower right area, and diarrhea. Should I go to see the doctor? Please help.

worm therapy (2012-01-07 04:26:13)

If you don't know if you have Crohn's obviously you should ask a doctor. For those who have Crohns here is a post about the efficacy of the treatment I wrote after reading dozens of patient blogs. <http://www.hookwormdiary.com/2011/12/29/a-cure-for-crohns-disease-and-ulcerative-colitis/>

Seth Roberts (2012-01-07 13:18:55)

Worm Therapy, what about using SCD (Specific Carbohydrate Diet) with Crohn's? Lot easier than infecting yourself with worms.

### **Kimchi Power? (2009-05-24 06:49)**

From a Korean father's recent email to his daughter:

It is reported that the [swine] flu is spreading in Queens area, except for the Korean-American concentrated area.Â The reason is that kimchi bacteria kills swine flu bacteria. Kimchi is now very popular in China. Please have [Grandchild 1] and [Grandchild 2] eat kimchi.

Can anyone reading this tell me if swine flu is less of a problem in the Korean part of Queens than in other parts?

I hope so. I eat kimchi every meal and use the big glass bottles it comes in to make kombucha. Kimchi is indeed popular in my section of Beijing but I thought it was because of the Korean students. There are so many the neighborhood is called Koreatown. There is even a North Korean restaurant! Beijing is close to Korea – which is good, because I love Korean food.

Thanks to Paul Sas.

---

michael vassar (2009-05-24 08:48:18)

Flu is a virus that infects lungs and sinuses, not a bacteria in the GI track, so the details, at least, are nonsense.

NE1 (2009-05-24 12:24:58)

Of course, there are reasonable mechanisms with which kimchi could protect you from infection. Seth's working hypothesis is fairly popular recently. OTOH, this sounds like a clear example of "old persons' bias". Surely the old ways of our homeland are best; please make sure the youngin's remember them (and us). Data would be nice, though.

Dave (2009-05-24 15:39:17)

Seth, does cooking or heating fermented foods kill the beneficial bacteria?

seth (2009-05-24 16:07:05)

Dave, yes, cooking kills bacteria. What difference that makes is a harder question. Dead bacteria won't help you digest your food. But dead bacteria, even in fragments, might well stimulate your immune system, just as dead viruses do.

Chris (2009-05-24 22:26:51)

According to <http://flutracker.rhizalabs.com/>, South Korea has 21 confirmed H1N1 cases and Japan (which also eats more Kimchi than the west along with natto) 388. Interestingly both countries are reactly more strongly than the western countries in closing schools, barring travel, etc...so the countries themselves don't seem to believe that kimchi is the answer. Of course, the data probably reflects the ability to detect the virus rather than the prevalence of it. The interesting question is whether the survival rate for the chronically ill (diabetes, immune deficiencies, etc.) with H1N1 is higher in Korea/Japan than in the US/Western Europe/Canada. The health care systems are basically equally advanced but the diets are varied.

Dave (2009-05-25 07:25:29)

So I shouldn't heat up my sauerkraut or put my kimchi in with a hot bowl of soup if I want live bacteria?

Patrik (2009-05-25 16:08:01)

This is a classic case of "Old Wives' Tales of the Old Country". We, Hungarians, are just as likely to do this as any other immigrant group.

Staypuff.net » Field trip canceled. (2009-09-03 19:36:36)

[...] Already, a few school children have already come down with H1N1, and I believe some schools have either delayed the start of semester or haven't even opened their doors yet. There's also a few stories going around the blogosphere of teachers who have also been quarantined due to traveling overseas (Chosun Bimbo for one). Of course their Korean counterparts, who have also traveled overseas, are not required to be kept in quarantine, no doubt a lifetime consumption of kimchi will ensure they pose no threat to the general community. [...]

MikeK (2009-11-04 00:41:03)

michael vassar has no idea what he's talking about. First of all you need to consume ripe kimchi. How will you know if it's ripe? It will be very soft and have a strong smell. I am proof kimchi works for flus and colds. As a kid I ate plenty of ripe kimchi. If you stopped consuming ripe kimchi I would eventually catch the cold or flu. I only had 3 flu in my life and a few colds. If it's just raw kimchi it won't do much it MUST be ripe, that's when there's load of friendly bacteria.

Mai (2012-04-09 16:53:56)

To say that the bacteria in Kimchi affects only the GI tract and therefore cannot help with respiratory viruses is ludicrous. The body is a whole, not separate, distinct regions. The GI tract is where the majority of elimination occurs. A healthy GI tract is vital for proper elimination of the body's contaminants. Kimchi = healthy GI tract. And obviously with people saying both the avian flu and swine flu probably originated in Asia, there will be a higher percentage of people sick with both those types despite their diets, just as antibiotics are not 100 % effective. What would be more interesting would be the rates of exposure vs. the rates of infection amongst people who eat kimchi and people who do not. You cannot dismiss the old ways just because they don't fit with your current beliefs. Those beliefs lasted centuries because they probably worked for more people than you can fathom.

### **Addiction Transfer: Food to Alcohol (2009-05-24 07:24)**

The last scene of the movie Clean and Sober shows a smoke-filled AA meeting. Recovering alcoholics smoke a lot. Likewise, alcoholism is a big problem among those who've gotten gastric bypass surgery. Just as alcohol addiction can become cigarette addiction, food addiction can become alcohol addiction:

According to psychologist Melodie Moorehead . . . at least thirty percent of gastric bypass patients will transfer addictions from overeating to another compulsive behavior. . . . The same problems and life challenges are there [but] overeating is no longer a viable coping mechanism. [Addictions to] gambling, shopping and sex have begun to surface in these patients but most alarming is the addiction to alcoholism.

[1]Source. While writing The Shangri-La Diet, I spoke to William Jacobs, an addiction researcher at the University of Florida. No one becomes addicted to sugar water, he said. Only flavored sugar water, such as Pepsi. More generally, only foods that taste exactly the same time. Which strongly implicates flavor-calorie learning in food addiction. I think I understand that; what I don't understand is why some people doing the Shangri-La Diet said the diet made it easier for them to stop smoking or drinking coffee.

Via [2]CalorieLab.

ElJovenWarren (2009-05-25 19:24:49)

Seth : "why some people doing the Shangri-La Diet said the diet made it easier for them to stop smoking or drinking coffee." I started the Shangri-la diet two weeks ago, and my schedule to take the oil and the sugar water is during the afternoon in the office and late night. I work from 9am to 6pm The time i used to drink more coffee was by the afternoons, specially after lunch. This time i now using for drinking the water and the oil. I need 1 1/2 hour to take the water, so i have very little time to drink coffee, if i want to wait the necessary hour pre and post flavor. That's why i am drinking less coffee. Regards from Argentina

bennetta (2009-05-26 13:27:34)

SLD helped me quit smoking. I wouldn't even argue that it was more effective as a way to quit smoking than it was as a way to lose weight. I attribute it to the following factors: 1) When people decide to lose weight, they don't decide to just lose weight. Usually, it's an overhaul of your entire life- a decision to be healthier. Smoking and weight loss are two parts of the overall package. 2) Smoking and snacking shared the same space in my head. They were both idle activities, or things I did when I had nothing else to do. If you eat to waste time, SLD will mess with your idle time. While you might think that you would smoke more to pick up for the time spent eating, in fact, the opposite is true- you'll end up smoking less. 1) SLD forces you to have a clean palate and smoking is really disgusting with a clean palate.

laney (2009-05-26 15:16:56)

When I did SLD, I actually wound up sleeping better and having a great reduction in my anxiety. I think that it has something to do with the blood brain barrier and the ease at which the fatty acids are able to get to the brain (without food in the stomach before or after) and SLD helping to rebuild the brain. I think it also made me smarter. The other thing about the oil is that it's a delivery system for nutrients, so your body doesn't have to work so hard, thus putting less stress on your mind/body. Though it didn't help me lose weight, so I stopped. But remembering this, I might start again. It had so many other benefits.

### **Delicious: Roasted Salted Flax Seeds (2009-05-24 10:51)**

At the Fancy Food Show in January, I told Stephanie Stober, the owner of [1]Flax USA, about [2]my omega-3 research (which used flaxseed oil). In return she gave me some of her products, including a package of [3]roasted lightly-salted flax seeds. It stayed in my refrigerator until yesterday when I tried some it for the first time. My god, so good! (And so healthy.) I could barely keep from finishing the (2 oz.) package. I finished it today.

1. <http://www.flaxusa.com/index.cfm>

2. <http://www.blog.sethroberts.net/category/nutrition/omega-3/omega-3-directory/>

3. <http://www.commark.com/flaxusa/template.cfm?page=detailview&pnum=3135&new=no&listpage=listview>

---

sjar (2009-05-24 15:31:23)

But I was under the impression that the seeds had to be ground for full benefit - and were best cold, not heated? Help

Zeke (2009-05-26 02:50:00)

I second sjar's concerns. Doesn't heating the flax seeds cause the lipids to form unhealthy oxides and peroxides? I was also under the impression that mastication was not able to break open a significant number of flax seeds for fat absorption.

seth (2009-05-26 15:34:46)

I think you're focusing on the negative too much. Sure, ground flax seeds are probably more easily digested. But how much more easily? If whole seeds provide 70 % of the benefit provided by ground seeds, I don't think that's worth worrying about. On the other hand I agree it's a good question to ask. I could compare the effects of whole seed with ground seeds and flaxseed oil on the various brain tests I do; that would be a way to answer these questions.

### **How the Truth Comes Out (continued) (2009-05-25 03:43)**

In [1]a previous post I wrote about the need for independence – safety from retaliation – to tell the truth. Here is Jane Jacobs's brush with this fact of life, from a 2006 interview in Urban Design magazine:

I got a grant from the Rockefeller Foundation [to write her first book]; well, apparently, rumor quickly reached Harvard and MIT that I had this grant, and they had started something called the "joint urban design center," something like that. So, I was invited up there to have lunch at Harvard by, I think it was Martin Meier at the time, and I forget who the MIT one was, but the three of us had lunch, so they had worked out what I had to spend my time on. (I had no connection with them, they just heard somebody had a grant, and they would try to recommend . . . ) What I was to do was to make out a question [a survey], and spend my time on questioning people who lived in middle income housing projects, to see what they liked about them and what they didn't like, and that was to be my book on the city!

Well, I was so glad that I was not a graduate student there, I felt so sorry for anybody who was caught in that trap and had to do that kind of junk, and so I thanked them very much for their interest and left them. Oh my god! I was out of there, because I could hardly wait to leave this behind: disgusting, absolutely disgusting! And that's what their interest in cities was, just junk like that....and different people trying to further their own career by roping in other people. And it was not to really find out things.

If the Harvard and MIT profs had said to Jacobs, "can we help you?" that would have been one thing. Under the guise of being helpful they said the opposite: Here's how you can help us.

IndianGirl (2009-05-25 10:01:42)

There is a cartoon/manga about you and Shangrila diet here: <http://calorielab.com/news/2008/09/30/japans-top-4-diets-plus-1/>

### **The Naysayers (2009-05-25 20:19)**

Jane Jacobs called them [1]squelchers: People in powerful positions who say no to new ideas. The effect of such people is that problems remain unsolved.

What about scientists? On the face of it, research is about discovering new ideas. If you're a non-scientist, you

might even think that is the whole point of research. Certainly that is why it is supported with tax dollars – taxpayers hope research will improve health, for example. But quite a few researchers don't see it that way.

In London, a group called [2]Business in the Community is creating "[3]toolkits" to help companies improve employee health. One toolkit is about [4]emotional resilience. An early draft of that toolkit contained this passage:

Heart attacks and other ischemic cardiovascular diseases can be created by stressful office dynamics that come from the top.Â Even one year of working under a manager with poor leadership skills can raise the risk of acute myocardial infarction, unstable angina, cardiac death, or ischemic heart disease death by a significant 24 %, while four years under the same stressful conditions produces a 39 % elevated risk of ischemic heart disease events.

The data are from Nyberg A, et al., "Managerial leadership and ischaemic heart disease among employees: the Swedish WOLF study" *Occup Environ Med* 2008. At a meeting to discuss this toolkit, attended by representatives of large companies and a few academics, the academics objected to this passage. The study was methodologically flawed, they said. "But what if it's true?" the non-academics said. The passage was removed.

On The Larry King Show a few years ago I heard a prominent woman psychiatrist (Nancy Andreassen or Kay Jamison) say that it was a good time, if there ever was one, to have a mental illness because it was a golden age of psychiatric research. Researchers, she said, were making one breakthrough after another. Nobody asked her, why, if that was so, was bipolar disorder still being treated with lithium? That's 50 years old. Why hasn't research come up with something better? [5]Two psychiatric researchers believe it is because research proposals to test new treatments are turned down due to what the critics call inadequate methodological purity. For example, you're supposed to do such studies with patients who have only bipolar disorder, although comorbidity is common.

This is the behavior produced by what academics ([6]admirably!) call "critical thinking": ignoring what is valuable or promising in a rush to point out what is imperfect.

[7]Something is better than nothing.

Peter Smith (2009-05-26 05:02:33)

the odd part is, the guy committed some serious moral crimes, at a minimum, and seemingly a few on the books. sexual coercion? i'm far from perfect, too, but can't say i'm feeling all that sorry for the Trini Lovemeister..

Andrew Gelman (2009-05-26 06:01:25)

On the upside, the job probably doesn't pay very well, in which case she didn't have that much to gain!

Elisa (2009-06-02 14:02:08)

Why do so many people view "tattling" as more morally reprehensible than sexual harassment?

Kevin Lahey (2009-06-09 19:41:40)

I presume that the real offense is not 'tattling', but is in actively campaigning for an honor like this, rather than letting the chips fall where they may. And, c'mon, lying about orchestrating a whisper campaign against a 79-year-old Nobel laureate is pretty reprehensible behavior on any scale.

Sol Kawage (2009-09-04 12:35:21)

what a bitch.

## **The Opposite of Naysayers (2009-05-26 18:19)**

In library school, future librarians are taught the saying "every book a reader, every reader a book." They are not taught – by example or otherwise – to point out the flaws in books. Nor are they taught to impose their own preferences on those who come to them for help. Professors – who are in the same business, the spread of knowledge – could learn something from this. [1]John Taylor Gatto has pointed out that the same teenagers who are disruptive in class are well-behaved in libraries.

[2]The Naysayers.

1. <http://www.johntaylorgatto.com/>

2. <http://www.blog.sethroberts.net/2009/05/25/the-naysayers/>

---

david (2009-05-26 20:11:12)

I think this blog proves your point (though it might seem at first to contradict it) about the typical attitude of librarians (read the about page): <http://awfullibrarybooks.wordpress.com/>

Daniel Lemire (2009-05-26 20:20:51)

Fascinating point. However, librarians are very selective as to what they will allow in their libraries.

## **Can Probiotics Prevent Asthma? (2009-05-26 18:56)**

From a [1]UCSF press release:

In the first effort of its kind in the United States, researchers at the University of California, San Francisco have launched a study to determine whether giving active probiotic supplements to infants can delay or prevent asthma in children.

The intervention is a novel method for the primary prevention of asthma with enormous potential to have a public health impact, said Michael Cabana, MD, chief of the Department of General Pediatrics at UCSF Children's Hospital and principal investigator for the study. There currently are no known ways to prevent asthma, he said.

“It would be a great thing to be able to prevent asthma,” Cabana said. “We believe that using probiotics is a safe and effective way to do that.”

The press release is from May 2006; the three-year study should be almost finished.

Thanks to Steve Hansen.

1. <http://news.ucsf.edu/releases/ucsf-study-to-examine-whether-probiotics-can-prevent-asthma-in-children/>

---

Kirsten (2009-05-27 05:05:20)

I've been interested to read your series of posts on probiotics, especially in light of my own recent experience and reading. Recently, my doctor diagnosed me with leaky gut syndrome, caused by an overgrowth of yeast in my digestive system. While I'm a seemingly healthy 35-year old, this seems to explain a whole constellation of small issues—everything from persistent breakouts to strong reactions to certain medications (mold-based antibiotics, steroids, and birth control pills.) I'm now on an anti-yeast diet and an anti-fungal medication. Anyway, in reading about yeast overgrowth, I was shocked to realize how common the causes are. In healthy people, there's an equilibrium between the good bacteria in your body and harmless amounts of candida yeast. However, things like antibiotics, stress, excess consumption of white flour/white sugar; excess consumption of alcohol or caffeine can drive down or kill off good bacteria. Yeast is apparently opportunistic, and will take the opportunity to fill that space. At some point (and on this, I'm a bit hazy) it turns from harmless to parasitic—for instance, growing through the intestine walls in search of food (hence the leaky gut), and the resulting dis-equilibrium has been linked to everything from asthma to fibromyalgia. (Also, sugar cravings, since yeast eat sugar; mood swings; persistent weight gain or resistance to weight loss. In my case, I've lost more than 8 pounds since starting on the anti-yeast protocol one week ago.) Below you linked probiotics to less post-partum weight gain. Apparently, the presence of progesterone is a trigger for yeast—meaning that it finds it easier to get a foothold during pregnancy. All this to say that when I read your posts on probiotics, the flip side of that (to me) is yeast. A big part of the anti-yeast protocol (once you've killed off much of it, which can take months—my relatively mild anti-yeast program involves at least two months of diligent eating and medication) has to do with replenishing all of the good bacteria in your digestive tract—and making sure to keep doing it so the yeast doesn't grow back. People I've read say yeast overgrowth is rampant....and of course that makes sense in a society full of anti-biotics but very few probiotics.

How Do You Prevent Asthma (2009-06-26 20:20:43)

## **Microwaves and Microbes (2009-05-27 20:56)**

[1]Here is an interesting article about the danger of microwaved food:

Comparing the blood chemistry of people after eating food cooked in conventional and microwave ovens, a dismayed Hertel explained that "blood cholesterol levels are less influenced by cholesterol content of the food than by stress factors." . . .

So was the blood chemistry of consumers. These abrupt measurable changes included a decrease in high-density lipoprotein (good cholesterol) and a sharp rise in low-density lipoprotein (bad cholesterol) levels following the consumption of microwaved food.

The two researchers also discovered marked declines in the number of red blood cells that carry oxygen to the tissues and collect carbon dioxide, as well as in white blood cells that fight infections.

The researchers say these bad effects happen because microwave heating makes cells "easy prey for viruses, fungi and other micro-organisms." The author adds, "bad bugs are everywhere."

Whereas I believe the opposite: The problem with microwaved food, when there is one, is that it is too sterile. The article later reports an experiment in which E. coli. grew much faster on microwaved milk than conventionally heated milk. I interpret that to mean the microwaved milk was more sterile: less competition for the E. coli.

Note I don't mean to say don't use your microwave. I use mine all the time to heat water and defrost stuff. It's the experimental data and their interpretation that interested me

1. [http://www.alive.com/153a1a2.php?text\\_page=1](http://www.alive.com/153a1a2.php?text_page=1)

Darrin Thompson (2009-05-28 06:29:25)

I was with you until you took away my microwave. Here I must draw the line.

seth (2009-05-28 07:03:48)

Darrin I didn't mean it that way and I have added a note to make that clear.

Aaron Blaisdell (2009-05-28 07:18:03)

I use my microwave "gently". That is, rather than heating foods until they are piping hot, I use just enough time to get them warm. This, I hope, dampens the negative impact of microwaving food. The microwave oven is such a convenient way to warm up food at the office. At home, I've taken to heating more of my food in the oven, toaster oven, or on the stove.

Willy (2009-05-28 11:18:18)

Are there any other proven risks of microwave cooking?. A physicist friend told me there is none, but a web search gives lots of scare websites. Thanks

Anthony (2009-05-29 05:00:09)

@Willy, Yes, if you eat microwaved food that is really hot, it can burn your mouth. Also, there are some questions about the safety of plastics and microwave ovens. The consensus seems to be to only use "microwave safe" containers (there might be labeling laws on this, depending on your country), and not allow plastic wrap to come into contact with food while being microwaved (which includes fluids splattering while being heated).

Willy (2009-05-29 06:03:33)

Thanks Anthony. What do you think about this article (I don't like Mercola but it is a good list of all the scare about MW ovens) <http://www.mercola.com/article/microwave/hazards.htm>

James (2009-05-29 10:46:53)

Lots of fast food is microwaved before serving.

Anthony (2009-05-30 02:22:07)

@Willy, I have no idea - I'm not a microwave oven expert. I don't microwave much, because I can heat things up quickly and they tend to taste better on the stove top in a pan. I even heat up milk using the stove top, which is actually not much slower than a microwave.

Nick (2012-03-04 18:47:57)

Would this mean that consuming dead bacteria would not trigger an immune response?

## **The Death of Advertising? No Way (2009-05-28 06:48)**

[1]James Fallows wonders if the decline of newspapers is one effect of a much larger trend: the decline of advertising. He quotes a reader:

The real problem is, advertising is dying. It's just pulling down newspapers along the way. Next up: TV, radio, and Google.

Advertising isn't cost-effective, the reader says. This is becoming increasingly clear. Companies can no longer justify the expense.

I would bet a lot of money this is wrong. Advertising isn't dying; it is moving to a more differentiated personalized form, as has happened in dozens of industries. Jane Jacobs wrote about this in *The Economy of Cities*: the historical flow is from artisanal production to mass production to differentiated production. An example is software. Long ago, programs were written by individuals: artisanal production. Then came software produced by large companies, such as Microsoft: mass production. Now we are entering the age of highly individualized software. The usual term is open source but open source software is enormously customizable. For example, some Tsinghua students made a version of Firefox specifically for Tsinghua students. Internet Explorer will never be as easily customized as Firefox. Which means, according to history, IE is doomed.

Fallows's reader is wrong for another reason: The central role of advertising in human evolution. Language was the first advertising. Single words served to say (a) you had something to trade and (b) you wanted something. This is how and why language began – it facilitated trade. Language was so successful as advertising that lots of other uses evolved on top of that use, just as newspapers and magazines do a lot besides carry advertisements. Human evolution, in my view, is the story of how we became occupational specialists; by increasing trade, advertising was central to that. In the form of language, it's been a huge force pushing evolution for the last 100,000-odd years. Given that longevity, the probability it will disappear in the next 100 years is very low.

The language evolution theory makes a prediction. Words can easily be used (a) to announce you have something ("toothpaste!") and (b) to ask for something ("toothpaste?"). The first is [2]push advertising; the second is pull advertising. We don't hear much about pull advertising. But the current imbalance – huge amounts spent on one, almost nothing on the other – doesn't make sense. Historically, both work. We use language both ways, including a lot of pull advertising. Surely most people say what they want ("I'm hungry") more often than they say what they have to trade for it. (In China, some peddlers, such as [3]the father of a friend of mine, do spend their day saying what they are selling.)

Based on history, I predict the imbalance will be corrected; pull advertising will become much more important. Not a brilliant prediction because it is already happening. Searching online for something you want, e.g. via Google, is a form of pull advertising. Guru.com, where you post a job you want done and wait for bids, is another example. An example that doesn't yet exist is a free concierge-by-phone service. You call them, they help you buy something.

3. <http://www.blog.sethroberts.net/2008/12/19/my-theory-of-human-evolution-fixing-bike-pumps/>

---

bennetta (2009-05-28 13:48:42)

Seth, This reminds me very much of Walter Benjamin. If I recall, (the class was several years ago) about 70 years ago, he predicted the advent of the internet and blogging by analyzing the industrial development of books in *The Work of Art in the Age of Mechanical Reproduction*. In their early days, books were works of art created by scribes, extremely expensive and nearly impossible for the common individual to obtain. With the advent of the printing press came massive publishing houses, mass producing copies of books for those who were interested. Benjamin theorized that the natural evolution of this was to individualize production, basically describing the internet. scribe => publishing house => internet In industrial terms, it means: artisan production (one "authentic work," no duplicate copies) => centralized production (one "authentic" work, many duplicates mass produced) => decentralized production (there are no authentic or duplicate copies) For advertising, it means: "book" => "book!" => "book?" "book!" And in terms of flow of information, it translates to: simple => top down => bottom up + top down Newspapers aren't the only organizations in decline. The recording industry and video rental industry are also struggling, thanks to new methods of communicating goods like Netflix and iTunes. The

recording industry is doubly hit, as even individual artists don't really need them anymore. If you want to get your name out there as a musician, just make your own page on Myspace and watch the numbers fly. A few friends of mine were able to tour Europe that way. A side effect of this, I think, is also an influx of variety and wider spread of wealth. For example, instead of having 5 or 6 sponsored superstars/multimillionaires touring the world, now you have several thousand regular stars making a decent living and doing what you want. At least this appears to have been true for my friends. Advertising will never die, but industries that cannot or fail to adapt to this new environment will fail. By refusing to adapt to the internet, the RIAA essentially dug its own grave. Does this sound accurate?

Mike Kenny (2009-05-28 19:05:05)

Craigslist seems like a great example of the pull advertising. Google and others on the internet are trying to interpret our search requests as indirect pull advertising (looking at baby names? You might be interested in this ad for cribs).

seth (2009-05-28 19:31:22)

benetta, when I was a grad student I hired someone to make the graphs in my scientific publications. Now I make my own publication-quality graphs using R. Another example of a job disappearing is the disappearance of milkmen. I think that's basically what's happening to the recording industry. They are no longer needed to connect A (data, milk) and B (publication, milk drinker).

Scot (2009-05-30 10:14:12)

Then there is the scalper. S/he walks around the venue asking for tickets (pull) but actually wants to sell (push).

Alex (2009-09-30 04:42:07)

Advertising is surely moving from one medium to another. Calling it dying cannot suit and its transformation for sure.

Data Deduplication (2011-07-06 02:39:40)

Google and others on the internet are trying to interpret our search requests as indirect pull advertising (looking at baby names? You might be interested in this ad for cribs).

## **The American Health Paradox: What Causes It? (2009-05-29 08:29)**

Americans spend more on health care than people in 29 other rich countries but [1]our health is near the bottom of the list. Shouldn't more money buy better health? This is the American health paradox. What causes it?

In the latest issue of The New Yorker, Atul Gawande, in [2]an excellent article, tries to find out how the money is wasted. He visits a small Texas town where he finds an entrepreneurial attitude among doctors – a tendency to order more tests and do more procedures because doing so will generate more revenue. (A weakness that [3]my own surgeon may have succumbed to.) Gawande does his best to figure out how things could be better but comes up short. He finds better systems of care – but they seem to be losing rather than winning. I think Gawande is too close to the problem he is writing about to see the really large forces at work.

In The Economy of Cities, Jane Jacobs pointed out that Marx got it wrong: The fundamental conflict in society isn't between owners and workers, it's between those who benefit from the status quo and those who benefit from change. There are plenty of owners and workers on both sides. The balance – or rather imbalance – of power determines what happens. The more powerful the status quo, the less change. Lack of change means lack of innovation; lack of innovation means that problems build up unsolved.

If the status quo is powerful enough, the problems get worse and worse, remaining unsolved – until the whole thing collapses. (This is what Jared Diamond failed to understand in Collapse.)

product; the resources to make that product run out (Jacobs often pointed out that nothing lasts forever), often suddenly; and the whole city dies. Manchester (cloth) and Detroit (cars) are modern examples. Was the current financial crisis due to reckless lending? Not really. That was an opportunistic infection. It was due to a problem building up unsolved: lack of affordable housing, which was due to lack of innovation in the housing industry. Lack of real solutions made room for a phony solution that, funny coincidence, benefited the powerful: rip off poor people by lending them too much money. (A new form of predatory lending that took advantage of the human tendency toward speculative bubbles.) Just like resource depletion, the phony solution worked and worked and worked, until, all of a sudden, it stopped working and the whole giant structure fell down, hurting the poor and powerful alike.

The cause of the American health paradox is American inequality. America is more unequal than other countries. Everywhere, in every country, the powerful prefer the status quo but in America the rich and elite are especially powerful relative to the poor, so the status quo is especially entrenched and innovation [4]especially well-squelched. America has a lot of health problems building up unsolved. Perhaps the most obvious is obesity, which affects the poor far more than the rich. The further the rich from the poor – that is, the more inequality – the more the rich can ignore it. And they have: The healthcare establishment's record on prevention and treatment of obesity is terrible. Staggeringly bad. In one tiny example, when I proposed a rat experiment to test an idea behind the Shangri-La Diet, I was denied permission by the UC Berkeley Animal Care and Use Committee: My idea couldn't possibly be true, I was told. Had there been plenty of poor people on the committee, instead of none, I think the outcome would have been different. Problems such as depression, allergies, autoimmune disorders, and autism are likewise building up with no real progress being made. An example of a real solution is home glucose monitoring for diabetes. This came from outside the healthcare establishment – from Richard Bernstein, an engineer with diabetes.

Although *The Economy of Cities* was published in 1969, it has not received the attention it deserves. Lots of well-read people dislike inequality, and the connection between inequality and poor health has been documented many times, especially by [5]Richard Wilkinson, but the Jacobian point that more inequality means less innovation means problems stacking up unsolved is not widely appreciated. In a whole book about the badness of inequality (*Inequality Matters*, 2005), I didn't see this point made even once. In his *New Yorker* article, Gawande fails to understand Jacobs's point that [6]farmers didn't invent tractors; the big improvements to American (and world) health are not going to come from doctors or anyone now powerful in healthcare. They are too wedded to the status quo. (Notice that [7]this recent innovation in affordable housing, the nano home, comes from a car company – an Indian one.) Gawande, being a doctor, surrounded by the powerful at Harvard (where he teaches), is in a poor position to figure this out. Where will the big improvements in health actually arise? From people who benefit from change. A reasonable healthcare policy would try to empower them.

Charles (2009-05-29 09:59:28)

Great essay, Seth. It really ties together a lot of the things you've been discussing over the past few months.

Anthony (2009-05-29 10:40:15)

I was with you until this part: "Was the current financial crisis due to reckless lending? Not really. That was an opportunistic infection. It was due to a problem building up unsolved: lack of affordable housing, which was due to lack of innovation in the housing industry. Lack of real solutions made room for a phony solution that, funny coincidence, benefited the powerful: rip off poor people by lending them too much money." IMO the housing bubble was basically a transformation of the NASDAQ (tech) bubble into the housing market. Easy borrowing was mostly engineered by the Federal Reserve in an attempt to prevent a recession (encourage economic growth). I.e., it was \*innovation\* on the part of the ruling class aimed at solving their own problems that caused the problem. To the extent it was specifically about housing, you're right that it was abetted by government policies aimed at increasing "affordability", but these in turn were innovations to again solve the same problem: how to maintain or increase their own power by ingratiating themselves with certain constituents and so on. That is to say, lots of problems are caused by \*too much\* innovation to solve problems (problems such as "How do I increase short-term profit?" or "How do I get elected again?") by people who will stand to benefit against an often larger group who will stand to lose, where the second group's losses are too diffuse or obscured to adequately motivate sufficient counter-actions.

seth (2009-05-29 11:34:46)

Well, yes, there is innovation in crime, innovations in gaming the system, as well as innovation that solves real systemic problems, such as poor health or lack of decent housing. I completely agree.

Darrin Thompson (2009-05-29 13:28:37)

I think you are painting with too broad a brush. I thought that one of the key points of Jacobs in the Economy of Cities is that cities are the most important economic unit to reason about; problems in cities are concrete; they are actionable; with study and leadership and effort they can be solved. There are economic entities that are too large to reason about or fix, like regions and nations. Solve problems at the city level was what I got out of reading it. When you criticize the American health care system it's like you are criticizing California. It's epically gigantic and you come to conclusions like "inequality is the root problem." Nobody is going to fix health care any more than they are going to fix the state of Florida. I have three kids with autism and I had a pediatrician who was completely bought into mainstream dogma. All she could do for us was miss the initial diagnosis (by years, tragic), prescribe antibiotics like candy, and berate us for not wanting to vaccinate our kids who were constantly suffering cold symptoms. We left her for a very pragmatic doctor with extensive autism experience. Our kids have improved a great deal in both language and behavior with her help. One is reading even. No clue about the story mind you, but he likes the words. There are pockets of innovation within the monster that is the whole of health care. It's not a whole and can't be addressed as a whole. Those pockets are separate entities and need to be understood as separate. That leads to far more actionable stuff like promoting self-experimentation and pragmatism. Another pocket of innovation you might care about... You might add to your catalog of current events, that a few doctors are discovering the "lean" quality movement. There is a lot of literature coming out and the results of applying it are often positive in terms of cost and mortality. If that idea manages to spread it could take out a big part of "inequality" in its wake. Anyway, all my blathering to say, I think you missed the root cause, and this inequality you speak of is a false dichotomy.

seth (2009-05-29 13:47:30)

Darrin, I don't grasp your main point. What is the "root cause" that I missed? Jacobs really did say what I have her saying. Look on pp. 248-9.

April (2009-05-29 16:27:34)

Lots of thought provoking points in here Seth. I think some of them though are worth pulling apart just a bit. I think there are a number of things that cause our "high spending" "relatively poor health" paradox. Much of our relatively poor health relates to lifestyle factors more than health system or healthcare problems - poor diet, and lack of exercise being the leading contributors. You suggest that we'd be doing more about these problems if we were a less unequal society - it's an interesting

hypothesis. I don't believe though that the more equal societies in Europe have been much more active or successful than we have in this arena. It's turning out to be very hard to change peoples' behavior in desirable way. On your point about the narrow range of criteria for allocation of research funding you see in the US - I'm sure you are right, that it is too narrow. From talking to researchers who have sought funding in the US and in Europe though (again, more equal societies) - I have heard only that research funding there is even more conservative...tending to fund research that looks at the same range of questions, uses the same methodologies over and over. Outside of the box researchers often move over here for this reason. On innovation - my sense is that the very pluralistic, and decentralized, US health system probably generates significantly more innovation than other OECD countries. Unfortunately because of our funding system, almost all innovation is focused on new drug or treatments or new ways of delivering care that can generate higher revenue for the provider/ innovators, not save anyone money. India, as you've mentioned, is an engine for generating innovations to bring costs down precisely because 85-90 % of payment is out of pocket. When patients pay out of pocket, they tend to do more research on prices - when able. So, bringing down costs is a real market advantage.

Adam (2009-05-31 16:12:22)

Seth: \*There is a growing appreciation of small homes/living spaces. Affordability and sustainability are motivating factors, but some of these homes are just plain cool. No reason small can't be stylish. \*Scroll through the shackitecture page at <http://www.dinosaursandrobots.com/search/label/shackitecture> or try gorilla designs post Katrina work at <http://gorilladesign.org/>. For the uber trendy there is the luxury steel cabin on stilts <http://www.oskaarchitects.com/Projects/3-8/Delta-Shelter>. -Adam

Darrin Thompson (2009-06-01 06:11:14)

Not my best attempt at arguing. My tone sounds like the opposite of I love your writing when in face, I love your writing. Ok, having slept on this, I think I can explain myself. The American health care system is a work place. In that way it's like any other real estate brokerage, factory, software shop, or retail store. It's a system that does work and makes some money and spends some money. The thing about most workplaces, and this is world wide, is most are completely broken with regard to quality of work produced. They are 19th century in terms of efficiency at best. That's true worldwide, even Japan. Japan has world famous pockets of quality but they are poorly understood and from what I've seen they don't represent the state of the nation. Focusing specifically on America, what I've seen is management recognizes that there are problems with quality, and things cost too much, but they hold tight to the reins of power and behave in a lot of incompetent ways. They encourage everyone to "do their best" and motivate and set up processes which need to be complied with, blah blah. And here it sounds like I agree with you, but I think this is just a symptom and not the root cause. Most people in the whole world have never even seen a workplace that understands how to build quality into whatever they do. Even fewer have worked in one and could actually understand what they see in a quality minded workplace. Quality, when you sit down to study it, is beautifully counter-intuitive, highly experimental, rigorous, and respects the humanity of all it's participants. What's even more pertinent here, is that quality provides a back door where management begins to gracefully relinquish power. So the root cause, as I see it, is that Americans' view of quality is distorted from reality. A few anecdotes from clueless business press writers about "the Japanese" is about where most of us stand. There are a few pockets in the Medical industry where people are discovering that they can push costs lower than they thought and reduce medical errors and of course deaths a lot lower than they thought at the same time. Finding and promoting those stories seems like something that can be done to address the true root cause of the American paradox. And what if Americans just spent less on medical care and nothing else changed? Wouldn't we just be as bad as anyone else, unremarkable? Sounds like there's a ton of waste to be eliminated.

Stephen M (Ethesis) (2009-06-02 21:15:37)

I've really enjoyed looking at Ikea's small living spaces designs. If nothing else, for the SF (science fiction) applications and considerations. But there is a world of innovation out there that is still yet to be done.

Seth's blog » Blog Archive » Flaxseed Oil and Better Shaving (2009-06-27 22:31:45)

[...] It's very difficult to get flaxseed oil in Europe (bottled oil simply is not available). I have recommended flax to my colleagues also plagued by red necks to no avail: they are elite in two ways, white collar elite (working for Bain) and dietary elite (as Italians,

which supposedly have the best and healthiest food ever), so it fits with your reasoning that they are very change-averse. In fact, a manager told me that my taking softgels during the day is “inappropriate” and “disturbing” colleagues. [...]

Seth's blog » Blog Archive » Ben Casnocha on China (2009-11-03 05:02:53)

[...] I fail to see any substantial America-specific increase. Due to the Internet, free speech has certainly increased but that has almost nothing to do with how America is governed. Free speech has increased everywhere with Internet access. Due to the increased cost of health care in America (an increased percentage of per capita income), worsening health (e.g., the obesity epidemic), and stagnation in the development of better treatments (e.g., for bipolar disorder) and better prevention, I'd say freedom in America has declined because poor health is imprisoning. Obesity, for example, is profoundly imprisoning. Cross-national comparisons show that America has a uniquely poor health-care system given American wealth. Given the concentration in America of support for health research (money and prestige), America is especially responsible for the lack of progress. And when people as smart as Atul Gawande fail to see the great stagnation in health care, it's hard to imagine those in power doing something about it. So which country is better governed? [...]

## Human Sonar and Self-Experimentation (2009-05-30 06:28)

[1]This fascinating article by Daniel Kish, a blind psychologist, describes how he navigates via tongue clicks. The echos tell him about his surroundings. I was struck by the similarities with self-experimentation:

1. Don't wait for experts. A blind person could wait for a sighted person ("At the time I went to school, blind kids either waited for people to take us around or we taught ourselves to strike out on our own"). Just as I could have waited for a sleep expert to figure out why I was waking up too early. But I didn't: I struck out on my own via self-experimentation.
2. Many little probes. Kish guided himself by clicking his tongue many times. Likewise, effective self-experimentation, in my experience, involves many little experiments.
3. Free. Kish can go where he wants when he wants. It costs nothing. Likewise, my self-experimentation needs no grant, and allows me to study whatever I want and reach any conclusion.
4. Learning by doing. An experiment, like sonar, involves doing something, getting feedback, and moving forward based on interpretation of the feedback.
5. Active better than passive. "Passive sonar that relies on incidental noises such as footsteps produces relatively vague images. Active sonar, in which a noise such as a tongue click is produced specifically to generate echoes, is much more precise," writes Kish. Likewise, I've learned more from active experimentation than from measuring something day after day, which relies on natural variation.
6. Ancient. "The readiness with which people learn sonar suggests to me it may be an inbuilt skill," writes Kish. Self-experimentation is a form of trial and error, which predates humans.
7. Verification in other ways. "Ultimately, students verify what they hear by touching," writes Kish. The solutions I come up with via self-experimentation I verify by using them. Do they work? Another kind of verification is with experiments involving others.

The broad similarity is that self-experimentation, at least mine, is a way of navigating a world with plenty of important cause-effect relationships I don't know about (e.g., what makes my sleep better or worse). Rather than continually bumping into them.

Mike Kenny (2009-05-30 08:40:31)

I'm reminded of John Boyd, the military theorist, who came up with an idea that we make decisions in "Observe-orient-decide-act" cycles. More or less, you view the world, come up with a mental model, decide what to do, and then act. You repeat the cycle over and over. If you can do these cycles quicker than your opponent, you get more info about the battlefield quicker, giving you an advantage. Self-experimenters seem to go through their OODA loop or decision cycle quicker than academic experimenters.

Ben Hyde (2009-05-30 12:06:47)

I first read about that decades ago in a truly wonderful book, <http://isbn.nu/9780801493676> Listening in the Dark Acoustic Orientation in Bats and Men, by Donald Griffin. It's surprisingly easy to do once you realize the signal is there, and yes making a bit of noise to can help. About half the blind people I've mentioned it to are aware of it. Griffin mentions one guy you could sense the parking meters along the street, but when they removed them leaving only the posts he couldn't 'see' them anymore. The resolution of the signal being determined by the spread of your ears.

### **Yogurt Power (2009-05-31 08:23)**

My interest in fermented food started in January, at the Fancy Food Show in San Francisco, where I had a theoretical idea: The pleasure we get from sour, umami, and complex flavors had the effect, when it evolved, of increasing bacteria intake. This suggests we need to consume plenty of bacteria to be healthy. Three things happened at that convention that supported these ideas: (a) Someone trying to make a high-end non-alcoholic drink said he found it impossible to get enough complexity without fermentation. (b) I remembered that after a trip to Japan, I had started eating lots of miso soup. Miso (fermented soy beans) is an unusually effective flavoring agent. (c) A [1]Stonyfield Farms employee told me that her health improved a lot when she started eating yogurt every day two years ago. (Stonyfield Farms makes yogurt.)

Recently I learned more about the health improvement. She started eating more yogurt about two years ago because she changed jobs – from an architecture firm in Boston to Stonyfield, in New Hampshire, where the employee kitchen has a refrigerator full of free yogurt. In Boston, she ate yogurt about once/week; at Stonyfield, she eats it once/day (for breakfast).

When she moved to New Hampshire, she also changed her diet in other ways. She now eats more foods that are "natural and organic" and less fast food. She doesn't eat anything with aspartame any more; she also avoids caffeine. She eats more fruits and vegetables. Maybe the biggest change is that she eats three good meals every day instead of one meal on the run. Other changes in her life include less stress, a different atmosphere, and more exposure to nature.

In Boston, she had lots of colds and sinus infections, maybe 3-4/year. When she got sick it took a long time – 2 weeks – to get better. She also felt sick to her stomach a lot. In Boston she got mononucleosis; it took six months to

completely recover. In New Hampshire, she's had only 1 cold in the past year and it only lasted 3-4 days. No other illnesses. Another change she's happy about is that she gained weight. In Boston she weighed about 90 pounds; now she weighs about 110. (She's 5' 4" and 30 years old.)

She's noticed that Stonyfield employees are healthier than other places she's worked (as [2]this study suggests). Fewer people are sick and when they're sick they aren't sick as long. Everyone eats the free yogurt, except the lactose-intolerant. Stonyfield yogurt contains less than half the lactose of milk; for some lactose-intolerant people that's low enough, for others it isn't low enough. (Stonyfield makes a soy yogurt without lactose.)

2. <http://www.blog.sethroberts.net/2009/05/14/probiotics-and-resistance-to-illness/>

---

Jeff (2009-05-31 08:38:53)

Fermented foods usually have lower pH, which tends to retard spoilage bacterial growth. It explains a lot of things, including why drinking weak beer was favored to drinking plain water before the advent of municipal water treatment. Wine, beer, cheese, yogurt, summer sausage, lots of foods are all fermented partially. And they may persist because when people of long ago ate them, they did not get sick. Maybe.

seth (2009-05-31 08:44:51)

"Tends to retard bacterial growth"? Maybe I'm missing something. Fermented foods have lots of bacteria. I think the preservation argument needs to be more subtle.

Charles (2009-05-31 09:48:53)

Based on this series of posts, I've been making kefir at home. After two weeks of drinking it daily, some long-standing stomach problems have gone away, and I just feel better all around. From some of what I read, kefir seems even more powerful than yogurt, but that may be due to personal differences.

seth (2009-05-31 10:08:51)

Thanks, Charles. I always like to hear these stories... Yeah, kefir may be more powerful than yogurt. The kefir I make is a lot sourer than the yogurt I make and it takes much longer to make. More sour may mean more bacteria (more lactose turned into lactic acid).

Evelyn (2009-05-31 14:58:20)

Are the lactose intolerant also intolerant of lactic acid?

seth (2009-05-31 15:03:18)

Evelyn, perhaps the problem is that not all the lactose is converted to lactic acid.

Adam (2009-05-31 19:25:46)

I've been having lots of difficulty with dairy as of late so I started taking Lactaid but it didn't help whatsoever. I'm not sure if I'm lactose intolerant but right now I'm avoiding all dairy - except for yogurt, which doesn't bother me whatsoever. I've read in other forums that lots of lactose intolerant folks find yogurt similar stomachable.

seth (2009-05-31 21:29:12)

Hmm. I will check with the person at Stonyfield.

wcw (2009-05-31 21:56:21)

In re: preservation, that rings true to me. If bacteria are human pathogens, they probably like human pH. If you ferment with acidifying bacteria, voila, you have an environment more acidic than human, and pathogens probably like it less. Similarly, if you ferment with yeast that produces ethanol, you have an environment with an organic toxin, and pathogens probably like it less. My relatives who farm in old Europe habitually drink watered hard cider ('Most', probably 5 % ABV before dilution) with lunch. It's both acidic and alcoholic. I don't worry about anything infecting it.

Todd Fletcher (2009-06-01 15:56:00)

I've had a similar experience with yogurt. I had a bad flu last winter and had lingering stomach problems from it. I started having Strauss whole milk yogurt for breakfast, and it completely went away. But I kept eating the yogurt and have lost 20 lbs since then, with very little effort. I also started keeping kefir in the fridge at work. My excema, which I had for 15 years has disappeared also. I used have daily heartburn, for which I took Pepcid. I no longer have to take it at all. I've had my 14 year old son drinking it for the past month and his acne has gone away. I'm sold on it! Also, I think an important part of the secret is that these sour flavors make a lot of other things taste too sweet, like soft drinks. I've completely stopped adding sugar to my coffee as well.

Oceanesque (2009-06-04 02:07:13)

I've been following your blog for a while now (I came here via Freakonomics), and after reading this and other posts on the possible value of kefir in preventing both pathogen-caused and auto-immune illness (ie eczema), I started keeping an eye out for it. A local supermarket sells a product called "Babushka Probiotic Kefir yoghurt" which claims to contain "more than 12 billion live probiotic bacteria per 62ml serve". Is this likely to be a worthwhile product from a fermented foods / health benefits perspective? What qualities should I look for when purchasing commercially-produced kefir products? (I have no connections, financial or otherwise, with any manufacturer of dairy products, I'm just feeling a little confused about which kefir/yoghurt products are worthwhile and which are a waste of time. The variety of Kefir yoghurt I mention above tastes okay, but not great - it's a question of steeling oneself a little and saying "Well, it's \*good for me\*" - so it is only worth drinking if it is likely to have a health payoff.)

seth (2009-06-04 06:27:14)

I know little about kefir although I make it. It's a good question and I don't know the answer. My approach has been to try a large range of fermented foods and eat a lot of them.

## 4.6 June

### Strip Clubs and Research Universities (2009-06-01 21:07)

In the 1990s, there was a high-end "men's club" (strip club) in New York named Scores. Upstairs at Scores was a special lounge where you paid \$500 (or so) to get in and \$180 (or so) for a bottle of champagne. A friend of mine, who told me about this, knew a woman who worked there. The men who went upstairs expected to get a blowjob. But this wasn't in the job description of the women who worked there. They didn't want to give blowjobs - and they didn't. She didn't mind stripping but working in the upstairs lounge was really uncomfortable because of the differing expectations.

The same thing happens at UC Berkeley (and no doubt other research universities). When I was a grad student, and went to Berkeley to give a job talk, I met with grad students there. One of them asked: Which do you like better, research or teaching? Research, I said. The grad students were amused. The proper answer to that question is "I like

both equally” – but, as all faculty and grad students knew, about 95 % of Berkeley professors like research more than teaching. You just weren’t supposed to say so.

Why? Just as it was in the interests of Scores management to conceal the fact that you were not going to get a blowjob upstairs, so it is in the interests of those who promote UC Berkeley to the outside world to conceal the fact that the vast majority of Berkeley professors care little about teaching. UC Berkeley undergraduates, who have paid far more than \$500, often realize this basic fact only when it is too late – after they have come. Just as at Scores, the difference in expectations makes both sides uncomfortable. It bothers the average undergraduate that the average professor doesn’t seem to care very much and doesn’t try harder. “Isn’t it part of their job to teach us?” the students say. The average professor dislikes that the average undergraduate doesn’t “care about learning” – a fancy way of saying that they want to be entertained. What goes unspoken among Berkeley professors – just as I imagine it did among Scores employees – is that what the students want is seen by professors as demeaning. It would be demeaning to try hard to give the students what they want; it would be like being their servant.

---

Aaron Blaisdell (2009-06-02 07:37:11)

Hmm...that’s a funny way to look at it. I never think of being a good teacher as demeaning myself to my students. I take pride in what I have to offer, and humbled by how often a student can ask a question that makes me realize my limitations. I view that as a challenge rather than an obstacle or weakness. Anyway, I get the impression that it is more common for other faculty at UCLA to feel like me about teaching rather than like the way you portray Berkeley professors. I prefer and enjoy research to teaching, but I realize that teaching keeps me grounded, humbled, and motivated and excited all at the same time. I guess part of it also comes from my viewing teaching as story telling (non-fiction, of course) and every story teller loves an audience. I wonder if the UCLA students have a better learning experience than do Berkeley students? I’m glad you didn’t blow the job at Berkeley with your honesty.

Darrin Thompson (2009-06-02 07:39:21)

I’ve had a rotten attitude about college. I avoided it, got a minimal degree via mostly correspondence and portfolio assessment, blah blah, mainly because I didn’t want to give money to someone for learning, when they wouldn’t take that job seriously. Being older and wiser now I’m sure I overreacted, but this sure brings back the old feelings. And I didn’t need to be entertained, but for several deca-kilo-bucks, I expect you to take me seriously. The universal attitude among professors is that I’m asking too much. Or maybe that I’m paying for something other than the teaching?

seth (2009-06-02 10:02:00)

Aaron, I think you’re different than most professors. I completely agree, undergraduate teaching can be seen as a challenge and invigorating. I learned a lot by teaching introductory psychology, for example.

## **More Benefits of Fermented Foods (2009-06-02 09:12)**

A [1]study published last year in Oncology Reports found that fermented noni (an Asian fruit) juice fights cancer in rats.

Noni (*Morinda citrifolia*) has been used in traditional Polynesian folk medicine for more than 2,000 years. Recently, researchers have discovered that Noni juice has the ability to destroy cancerous tumors. . . .

The researchers evaluated Noni™'s ability to both prevent and treat cancer. In the prevention study, female mice were injected with one of three substances: fNE, a phosphate-balanced solution (PBS, which is similar to saline solution), or lipopolysaccharides (LPS, a natural toxin found in bacteria and in fermented Noni juice) for three days. Then the researchers injected the mice with lung cancer and sarcoma cells. In the treatment study, the mice were first injected with the cancer cells, and then treated with three doses of fNE [fermented noni exudate], LPS [lipopolysaccharides], or PBS [phosphate balance solution].

After the mice were injected with fNE, they developed greater numbers of immune cells such as granulocytes (a type of white blood cell) and natural killer (NK) cells, indicating that fNE had stimulated their immune system. A month after receiving fNE for sarcoma treatment or prevention, more than 85 percent of the mice were not only alive, but also cancer-free. fNE also was effective against lung cancer tumor cells, although the tumor prevention rate was slightly lower (62 percent). Meanwhile, all of the mice that received PBS or LPS died.

Emphasis added. It is telling that they used fermented noni juice rather than plain noni juice; apparently plain noni juice is less effective. Fermented juice has many more bacteria than plain juice; it makes a lot of sense that the fermented bacteria stimulate the immune system.

Thanks to Peter Spero.

1. <http://www.cancermonthly.com/inp/view.asp?ID=292>

---

stephen (2009-06-02 11:18:39)

interesting seth. i recently came across this italian doctor who is largely regarded as a quack but strongly believes that cancer is essentially a fungus and should be treated accordingly: <http://www.cancerfungus.com/pubmed-100903.php> i'd be interested on your thoughts on this - quackery or a hypothesis worth testing?

Charles (2009-06-02 13:00:38)

Here's a link to a U of Hawaii web site talking about noni, and how it goes through the fermentation process, which is why I'm fairly sure that fermenting it is the standard preparation: [http://www.ctahr.hawaii.edu/noni/fruit\\_juices.asp](http://www.ctahr.hawaii.edu/noni/fruit_juices.asp) The first time I tried Noni was when I was on my honeymoon in Belize about six years ago. I had heard about Noni, but had never tried it. But I got our naturalist/guide to take me to a small village where there was an herbalist. He lived in this small ramshackle house on the edge of town, and there was a noni bush growing outside. In the house, there was a shelf with some recycled plastic bottles of brown liquid, which I was told was noni juice. I imagine it was fermented. I think all noni juice is basically fermented, but maybe I'm wrong about that. This stuff was, though. I bought a couple of bottles, and to my wife's dismay, started drinking the juice. She (and our guide) thought I was nuts to drink this unlabeled brown liquid out of these used plastic bottles (they were from an orange-juice bottling plant in the next town.) Within a couple of weeks, a shoulder problem that had been stopping me from swimming for a number of years was basically gone, and I was up to a mile or so every other day within a couple of months. An enlarged prostate seemed to go away, too, and I didn't have to get up at night to go to the bathroom anymore. So along with any cancer protection, my experience was that it was a pretty potent anti-inflammatory, but that may have been because that was my body's particular reaction. I have heard that from others, though.

Charles (2009-06-02 13:05:33)

Now I'm remembering that there is a controversy in the noni-juice biz about fermenting vs. non-fermenting. The non-fermenters claiming there is no scientific evidence that fermented juice is better. (You can google around for this, I don't want to link to commercial sites.) I'd be interested to hear why they chose the fermented version for this study...

Charles (2009-06-02 13:08:31)

And here's a link to a study about the probiotic potential of fermented noni juice. <http://www.informaworld.com/smpp/content-content=a910157735 db=all order=pubd> I'm sure it's just a coincidence that fermented noni juice would be more expensive to make, as it has to sit and age for a time. So if you wanted to sell larger quantities of juice (through an MLM for instance) you might suggest that the fresh juice is better...

Dan (2009-06-02 20:21:29)

Where would someone find fermented noni juice for purchase? And what would brand names be? I'm in Seattle btw.

Charles (2009-06-02 21:29:23)

Just Google "fermented noni juice," or go to a local whole foods or similar. There are a lot of brands of noni juice out there. Just read the label carefully to make sure it's fermented, as some aren't. Getting good at reading between the lines of labels is a useful skill in any case.

## **A Book About the Value of Fermented Foods (2009-06-02 09:58)**

[1]Handbook of fermented functional foods, second edition, 2008.

Presenting new findings and interpretations that point even more clearly to the important role fermented foods play in our diet and overall health, this second edition demonstrates the current knowledge of fermented food production and reflects the growing credibility of probiotics in health maintenance.

You can read a lot of it online.

---

Darrin Thompson (2009-06-02 11:44:54)

Nice to see that a collected canon of fermentation wisdom exists. But at \$160 I'll wait for something leaner. But it's very cool.

## **The Nutritional Wisdom of Young Chicks (2009-06-02 11:26)**

After I wrote that [1]young children may be picky eaters because they are offered unhealthy food, some readers disagreed. But here is another example:

I myself have been amazed to see hungry young chicks refuse to touch a purified diet until we added thiamin, which we discovered to have been accidentally omitted from a published formula.

From Kenneth Carpenter's excellent [2]Beriberi, White Rice, and Vitamin B (2000), p. 193. If young chicks can better judge the nutritional quality of food than nutrition professors, perhaps young children can, in some situations, better judge the nutritional quality of food than their parents. And rightly decide that food their parents think is healthy isn't so healthy.

[3]The wisdom of the one-year-old picky eater.

Andrew Gelman (2009-06-07 20:26:48)  
All I can say is . . . nobody with kids would say this!

seth (2009-06-07 20:42:22)  
Andrew, I'm not saying that kids always know best. That's absurd. What isn't absurd is that we have inborn mechanisms that help us choose a healthy diet. Many parents fail to understand this. It means that when a kid refuses a food there may be at heart a sound reason. And this quote supports that idea.

### **The Effects of Institutionalization on Children (2009-06-03 06:33)**

From the latest issue of the [1]American Journal of Psychiatry:

Young children living in institutions in Bucharest were enrolled when they were between 6 and 30 months of age. Following baseline assessment, 136 children were randomly assigned to care as usual (continued institutional care) or to removal and placement in foster care that was created as part of the study. Psychiatric disorders, symptoms, and comorbidity were examined by structured psychiatric interviews of caregivers of 52 children receiving care as usual and 59 children in foster care when the children were 54 months of age. Both groups were compared to 59 typically developing, never-institutionalized Romanian children recruited from pediatric clinics in Bucharest. Foster care was created and supported by social workers in Bucharest who received regular consultation from U.S. clinicians. Results: Children with any history of institutional rearing had more psychiatric disorders than children without such a history (53.2 % versus 22.0 %). Children removed from institutions and placed in foster families were less likely to have internalizing disorders than children who continued with care as usual (22.0 % versus 44.2 %). Boys were more symptomatic than girls regardless of their caregiving environment and, unlike girls, had no reduction in total psychiatric symptoms following foster placement.

Note the phrase "internalizing disorders" – it means that other types of disorders were not decreased by the expensive treatment. Moreover, the 22.0 % "control" value is probably higher than what you'd find if all kids of that age were surveyed; I assume the kids found at pediatric clinics are less healthy than average. Although the experiment is trying to show a (negative) effect of institutionalization, it doesn't even manage to do that very well, because of the cherry-picking aspect of the results. All in all, a horrible situation.

Micromeasures of development – something you can measure every week, for example – might help so that many little things could be tried with individual children rather than doing these difficult large-scale experiments.

The whole thing has the feel of the 1800s when to be institutionalized was to be at high risk for some sort of vitamin deficiency, such as pellagra or beriberi.

1. <http://ajp.psychiatryonline.org/cgi/content/abstract/appi.ajp.2009.08091438v1?papetoc>

---

Darrin Thompson (2009-06-03 08:10:05)

Help an idiot here. I tried to plug their numbers into a Bayes theorem table using their result. I that by their result 75 % of of all children have internalizing disorders. Also, in their control group, twice as many had internalizing disorders vs. those that didn't. Is that what you are getting at with the "high" control number? Of course maybe I just did it wrong.

Darrin Thompson (2009-06-03 11:36:21)

Ok. I think I see it. The 75 % number means not much. That shows that 75 % of the kids in the study had the disorders, but that's skewed because the control group was smaller than the experimental group. The fact that two thirds of the control group had the disorders was still noteworthy. So I tried seeing if the probability of having the disorders times the probability of being institutionalized would be very different from the 53 % they quoted in the study. I got about 48 % which is only different by 5 %. I don't know how to take the difference and interpret it as the two variables being dependent or not. Perhaps I am only revealing my ignorance. Anyway, fun puzzle to try to research and interpret.

seth (2009-06-03 12:02:30)

sorry, I have no idea how you got 75 %. There is no "probability of being institutionalized" given in the abstract. Perhaps you are interpreting one of the numbers incorrectly. The "control" number (22 %) is higher than what you'd get if you got a random sample of non-institutionalized kids – that's what I'm suggesting.

Darrin Thompson (2009-06-03 12:32:59)

There was a probability of having ever been institutionalized \_within \_ the study group, 111 kids out of 170. (65 %) And within the study group there was a 75 % chance of having disorders from the control and experimental groups combined. From the figures given you could play sudoku and fill in a table with the groups and disorder variables and probabilities the results were disappointing. Anyway, I'm totally not good at this and you are I'm sure quite busy. Thanks for replying.

seth (2009-06-04 00:22:13)

the number of kids in each of the three groups (52, 59, and 59) are not any kind of random sample. They are set by convenience. By what the experimenter wants. Just as when you go to the store the number of loaves of bread you buy is your choice.

Lynda (2010-01-09 06:17:15)

Statistics as you guys know can be skewed to say what you want them to say. I was a ward of the state... institutionalisation of any sort messes with your life. You don't need a study to tell you that. My experience says 'Institutions do not teach you how to live, they teach you what you must do to survive'. This is not living. Oh Seth, children are not loaves of bread as you so eloquently put it!

## Canker Sores Prevented by Omega-3? (2009-06-04 12:09)

Eric Vlemmix writes:

I've had these oral sores [canker sores, also called Aphthous ulcers] since childhood [he's 33], but since taking flax/fish oil I have had hardly any ulcers! The times I had an ulcer it was small, less painful than usual, and would disappear in a few days. The doctors never knew what the cause of these ulcers was, and [1]Wikipedia states: cause unknown.

I asked about his fish oil and flaxseed oil intake:

Something like 15 ml [= 1 tablespoon] of flaxseed oil daily. Most days I also take a Minami morEPA plus capsule which has 635 mg EPA, and 195 mg DHA.

I started SLD in June 2008, and I think I switched from olive oil to flax the same month. Since then I haven't had a real serious case of ulcers. Some small issues sometimes, but not the real big and extremely painful ones that I had before. Sometimes a small mini zit-like thing.

According to [2]Family Doctor, "Doctors don't know of anything that prevents canker sores from forming." The [3]Mayo Clinic website is equally unhelpful. To prevent canker sores, [4]EMedicineHealth advises, "Do not talk while chewing." According to [5]KidsHealth, "About 1 in 5 people regularly gets bothersome canker sores."

Any canker-sore sufferer want to start taking flaxseed oil and fish oil (in the amounts Eric uses) and tell me what happens?

---

Aaron Blaisdell (2009-06-04 12:40:13)

Well, I used to get canker sores about once or twice a year. They'd last a few weeks before disappearing. In the past year I haven't had any. I've also made a number of dietary changes (which Seth has posted here (<http://www.blog.sethroberts.net/2009/02-08/aaron-blaisdell-recommends/>) that include an improved balance between omega6 and omega3 PUFAs. While I don't take flax oil, I do take a daily dose (1/3 teaspoon) of fermented high-vitamin cod liver oil and 1/3 teaspoon of high-vitamin butter oil. I also used to have a small amount of bleeding after flossing around the gum of one of my capped teeth. This would occur about once a month during which the gum would bleed a little and be a bit tender. I haven't had that happen for at least 6 months now.

seth (2009-06-04 13:36:35)

I have never had canker sores. I did get bleeding after flossing, however. The less I flossed the worse it got. That never happens now even though I rarely floss.

Lauren Rosenthal (2009-06-04 18:37:59)

funny, our 6 year old has had canker sores on and off for a few years. We started giving him fish oil in the fall and he does seem to have fewer canker sores. Coincidence?

Gian (2009-06-05 00:05:47)

Could you do some self-experimentation by replacing flax oil by rapeseed oil/canola? Canola is also rich in omega-3 and is traditionally consumed in India.

Eric Vlemmix (2009-06-05 04:20:55)

Canola might also work, it has a omega3/6 ratio of 1:2 (which is quite ok) if I check this: <http://www.health-heart.org/FattyAcidTable.gif> . Flaxoil and fishoil have better omega3/6 ratios, but canola might work depending on the rest of your food intake (how much omega3's and 6's). If your omega-6 intake is higher than 4 % of your calories, you might need an extra boost of omega-3 to outcompete the omega-6. If your omega-6 intake is quite low, you probably do not need a whole lot of extra omega-3 to compete with it because the numbers already are quite low. See <http://wholehealthsource.blogspot.com/2009/05/eicosanoids-and-ischemic-heart-diseases.html> for extra details.

seth (2009-06-05 04:50:14)

Lauren, your observations suggest that a higher dose would be better. Gian, canola oil has much less ALA (short chain omega-3) than flaxseed oil. Canola oil is about 10 % ALA while flaxseed oil is about 50 % ALA. Canola oil is rich in omega-3 compared to other fats, which have less.

chuck (2009-06-05 05:36:28)

I was plagued with canker sores for years. Often suffering with pain from sores the diameter of a pencil for weeks on end. I am convinced that sodium laurel sulfate in toothpaste aggravates them for me; removing the layer of repair and exposing the sore to mouth bacteria. I have found complete relief by avoiding normal toothpaste and using Biotene only. Also by controlling

bacteria by staying hydrated. I still will get a small one now and then from a mouth bite but it heals normally. I also have greatly improved my diet along omega 3 lines so that is consistent with this post but for any sufferers reading this out there, please consider not sudsing up your mouths so much with normal toothpaste.

Ted (2009-06-05 10:08:11)

I found out quite by accident WALNUTS get rid of them quite quickly. The first sign of an ulcer I chew walnuts and leave the paste in my mouth for a little while (30 seconds or so). The first time was by accident, my ulcers disappeared so quickly I knew it had to be something I ate. And the only thing I had eaten differently the past day was walnuts.

seth (2009-06-05 15:23:52)

I'd say the walnut story, along with all the other evidence, proves that lack of enough omega-3 causes canker sores.

Seth's blog » Blog Archive » Yes, Canker Sores Prevented (and Cured) by Omega-3 (2009-06-06 10:32:13)  
[...] Canker Sores Prevented by Omega-3? [...]

WSB (2009-06-06 17:01:51)

DH's canker sores improved when he switched to Tom's of Maine toothpaste (no laurel sulfate). They went away when he went gluten free. He hasn't had one since 11/07. IMO, anyone with canker sores should consider testing for gluten intolerance.

jad (2010-01-20 11:04:38)

"I found out quite by accident WALNUTS get rid of them quite quickly." That is odd. From my reading' walnuts CAUSE canker sores for many people.

kevin (2011-04-18 08:20:45)

on the walnut story, some of the bitters in the skins might help as well. tannins are supposed to be soothing to canker sores and I recently had luck calming one down (didn't go away but wasn't so irritating) taking a wet tea bag and sticking it on the sore for a minute. one of the supposed reasons that walnuts aggravate canker sores is because they contain relatively high amounts of a particular amino acid. seems like they are more nutritionally correlated with sores than anything, so that wouldn't necessarily rule out their efficacy as a topical treatment. at any rate, these things are really annoying! i've had two in the last month ( I know, not so bad) definitely catalyzed by stress, but maybe with other underlying factors. I was already conscious of using toothpaste alternatives, but now I will avoid sodium lauryl sulphate like the plague! probly will just use baking soda and try to keep up on flossing. also, this whole thing makes me want to start taking fish oil again. is anyone concerned about sourcing and potential concentration of toxins and pollutants in the oil? are there reputable sources?

Dale (2011-05-22 19:42:37)

I am trying the walnut remedy right now, the thing I suspected was energy drinks, red bull seems to be worse than monster, and the coffee ones dont seem to cause them at all. I am pretty sure they cause them for me, it seems like when i drink them for a few days in a row i will have a sore. I do hope the walnuts work just to know the exact source would be the lack of omega - 3 and I can adjust my diet accordingly.

Gary (2011-08-14 14:08:39)

I came here looking for answers... My sores are Caused by Walnuts. :(

Stone Glasgow (2012-02-06 12:52:40)

Hydrogen peroxide used as a mouthwash is the only solution that worked for me. I used to have a lot if them that lasted for weeks. Deleting sodium l. sulphate didn't work. Neither did high dose omega 3 fish oil.

## What Does Profound Stagnation Look Like? (2009-06-05 12:12)

Economic stagnation = no development of new goods and services. Stagnation in the field of health has been so long-lasting and widespread that it is hard to see. I have never read a good description of it. Michael Moore thought the state of our insurance coverage was scandalous, and made *Sicko*; but much more harmful is the stagnation.

Here is what it looks like. Americans have many health problems. Obesity. Diabetes, closely connected to obesity. Mental illness, especially depression. Drug and alcohol addiction, a kind of self-medication. Allergies and autoimmune disorders, such as arthritis. Economic progress, lack of stagnation, would be coming up with and disseminating effective solutions to these problems.

When a helpful innovation arises, what happens? As Jane Jacobs pointed out in *The Economy of Cities* (1969), stagnation is in the interests of the powerful. As long as things remain the same, they remain powerful. Power also generates complacency; although the most powerful have the most resources, they are unlikely to find or develop the solutions. (Example: General Motors.) Within the health industry, Harvard Medical School professors are powerful. Here's what happened when [1]Dr. Erika Schwartz gave a lecture there:

When I gave my lecture on bioidentical hormones at Harvard on February 2, 2009, . . . I asked the chairman of the department of ob-gyn, Isaac Schiff, MD and the rest of the physicians in the audience, "How come Suzanne Somers and Oprah are the ones to teach the public about bioidentical hormones? What has the medical profession done with the information of the Women's Health Initiative study?" Nine years later and women are still suffering and the medical establishment has not stepped up to the plate to help women find safe solutions to menopausal symptoms. Why are bioidentical hormones still controversial? They had no answers.

That's what stagnation looks like. It's unsurprising that Oprah would publicize the innovation; her power is not in the health industry. She has nothing to lose. That *Newsweek* runs [2]a cover story complaining about Oprah's publicity for "risky advice" shows that top editors at *Newsweek* fail to see the stagnation in health. Innovations are always called "risky" by someone in power. Stagnation in health is probably the most important news story of our time. The health problems that have stacked up unsolved – obesity, mental illness, and so on – affect everyone every day.

Here's another example of what stagnation looks like. The [3]current *Business Week* cover story is about innovation, and the lack thereof. One of its examples involves health. What's revealing is how minor the innovation is.

To see both the reality of the innovation shortfall and its potentially happy ending, look at Organogenesis, a small company in Canton, Mass. Back in 1998, Organogenesis received approval from the Food & Drug Administration to sell the world's first living skin substitute. The product, Apligraf, was a thin, stretchy substance that could be grown in quantity and applied to speed the healing of diabetic leg ulcers and other wounds that had stayed open for years. . . But there were several big problems, recalls Geoff MacKay, the company's current CEO . . . By 2002 the early enthusiasm for Apligraf had vanished, along with the money. . . Shortly after, MacKay took over at Organogenesis with a clear mandate to straighten out the company's manufacturing, logistics, and sales, and turn this tarnished product into a moneymaker.

And that's what he did. . . Organogenesis is fulfilling the promise of 1998—a decade later.

A product that helps diabetic leg ulcers heal – without curing diabetes. In a cover story about innovation, a trivial innovation is the big example of successful innovation. This is another way stagnation is visible: Low standards for what is important innovation.

---

Nadav Manham (2009-06-06 08:38:06)

Seth, Many of the health problems you cite are themselves the result, or rather the undesirable side effects, of innovation. There has been no lack of innovation in reducing the price of pure carbohydrate delivered to the human bloodstream—the US has done a better job at it in the last few decades than Carnegie did with steel. Side effects of this innovation: obesity and diabetes. Similarly, there's been tremendous innovation in the "purification" of our food, resulting in the loss of beneficial bacteria. Likely result: increased allergies and other maladies. Billions of dollars are invested annually in "curing" these diseases through "innovation." The results may be disappointing so far, but that's not the same thing as stagnation. The most elegant cures to these diseases would not be innovation, but rather innovation's opposite: a return to the way we used to live before these diseases became epidemic (e.g. the other changes you've made to your diet other than SLD). True innovation should be in prevention. That's much harder to do, and MUCH harder to monetize, and probably accounts for our lack of progress more than stagnation per se. If you want to achieve innovation through prevention, maybe the place to focus on is the legal, tax, and regulatory side, which is how smoking was reduced in this country.

seth (2009-06-06 09:35:06)

Nadav, thanks for your comments. All those health problems are due to innovation. Go back 100,000 years, none of them existed, I'm sure. I fail to understand the difference between "lack of progress" and stagnation. I agree about prevention. I say just what you say: far too little emphasis on prevention. What you may not see is that prevention doesn't require going backwards. There's nothing ancient about drinking flaxseed oil as I do. Go back far enough people didn't even eat fermented food – they just ate food that wasn't fresh. While some prevention involves reducing or removing poisons (such as cigarette smoke), other prevention involves figuring out what are the necessary nutrients. No legal ruling or tax code change will be much help with that.

Nadav Manham (2009-06-06 10:35:04)

Thank you for your reply, Seth. I think what I missed is that there is a difference between stagnation on the medical level and stagnation on the level of society as a whole. If you asked a medical researcher if we are living in an era of stagnation or innovation he/she would say "No way, we're living in a golden age of innovation." E.g. the new CEO of Organogenesis, or the psychiatrist you saw interviewed on Larry King who said today is the best time to have a mental illness because of all the breakthroughs. If you asked an average citizen whether we're living in an age of stagnation or innovation, you'd get the opposite answer: "None of my eight great-grandparents were obese, so why am I and why can't I lose weight? None of my ancestors ever heard about diabetes so why do I have it and why do I have so much difficulty living with it? My grandparents all had tough lives, while I grew up comfortably in the suburbs—so why do I get chronically depressed and they don't?" Etc. I guess the difference is between inputs and outputs. Medical researchers measure innovation by measuring inputs—dollars invested in research, grants awarded, medicines approved, etc. Normal people care about outputs: how much sickness and suffering per capita persists? Now that I'm looking at it the right way, I see what you're saying about Jane Jacobs (I would cite also Mancur Olson, a very Jacobs-esque economist). In the area of disease, we have stagnation/lack of progress because the medical establishment benefits greatly from the "spend a lot to cure/manage rather than a little to prevent" status quo. BTW, last Thursday I attended a talk in which Tyler Cowen addressed whether the internet was good for society. An audience member complained that the internet made people less healthy because it replaced exercise. Neither Tyler nor I had a chance to make an obvious counterpoint, which is that the internet also gives individuals tremendous opportunities to IMPROVE their health. Case in point: Seth Roberts and Tyler's gums! The internet makes me optimistic that this medical stagnation can be addressed. If the internet could kill off most of America's largest newspapers, whose founding families were as close to an aris-

tocracy as we've had in this country, I believe it could also go up against the medical establishment. Sorry for the long comment.

Seth's blog » Blog Archive » Yes, Canker Sores Prevented (and Cured) by Omega-3 (2009-06-07 18:52:29)  
[...] What Does Profound Stagnation Look Like? [...]

Luitpoldt Drake (2009-06-22 14:43:21)

Although the public has been conditioned to believe that we are living in an era of perpetual 'medical breakthroughs,' in fact we are enduring a period of long-standing medical stagnation. Even the FDA has recently expressed alarm over the slow pace of new drug developments. Lupus, cystic fibrosis, multiple dystrophy, multiple sclerosis, type 1 diabetes, a host of autoimmune diseases, half of all cases of heart disease, and half of all cases of kidney failure are not only incurable but also not preventable by any lifestyle modifications. To take just the case of type 1 diabetes, insulin injection is a tragically ineffective treatment for this disease, but after more than 80 years of scientific development, this is still all that is available. But insulin was discovered several years before the first flight across the Atlantic, while we are now 40 years past the first landing of men on the Moon, and yet type 1 diabetic therapy has remained stagnant. Generally, if you compare the state of medicine 50 years ago with that of any other field of science or technology, you will find that medicine has progressed much more slowly than other areas. Obviously monetary interests have played a great role in this stagnation. The major pharmaceutical companies make huge profits by not curing anything, since while a cure can only be sold to patients once, an incompletely effective treatment can be sold again and again, generating profits forever from a captive patient population. Doctors also have a vested interest in not curing any diseases, since they make their money today primarily by 'managing' incurable illnesses. If innovation were not suppressed by the medical societies and their ally, the FDA, old doctors with established reputations would suddenly find themselves on an equal footing with everyone else just learning about some new treatment, and those now charging inflated fees for their superior experience with old treatments would lose their competitive advantage. The licensing restrictions for new drugs and treatments are also absurd, since they require any novel approach to disease to prove that it is 'safe and effective' before anyone is given the freedom to try it for himself. But since the current treatments for many serious diseases have already been proved to be unsafe and not very effective – such as insulin therapy for diabetics – why are patients being denied the freedom to control their own bodies, their own health, and their own chances of a better medical future by freely experimenting with new remedies whether some Washington bureaucrat has approved them or not? In a free country decisions about how you wish to preserve your health or save your life should be up to you, not the government, especially when it is owned by the pharmaceutical interests and the American Medical Association, whose massive campaign contributions have bought its obedience to them.

seth (2009-06-22 17:02:41)

Well put, Luitpoldt. I'm not sure I agree with your last paragraph, however. I believe all serious diseases from which Americans suffer, such as the ones you name, are due to the wrong lifestyle – e.g., the wrong diet. You don't need FDA approval to change your diet. I don't need FDA approval to try different doses of flaxseed oil or different amounts of fermented foods. Nor do their manufacturers need FDA approval to sell them. Nor do I need FDA approval to write about them.

### **Yes, Canker Sores Prevented (and Cured) by Omega-3 (2009-06-06 10:31)**

Here is [1]a comment left on [2]my earlier canker-sore post by a reader named Ted:

I found out quite by accident WALNUTS get rid of [canker sores] quite quickly. The first sign of an ulcer I chew walnuts and leave the paste in my mouth for a little while (30 seconds or so).

The first time was by accident, my ulcers disappeared so quickly I knew it had to be something I ate. And the only thing I had eaten differently the past day was walnuts.

Flaxseed oil and walnuts differ in lots of ways but both are high in omega-3. [3]My gums got much better around the time I started taking flaxseed oil. I neither noticed nor expected this; my dentist pointed it out. [4]Several others

have told me the same thing. Tyler Cowen's gums [5]got dramatically better. [6]One reader started and stopped and restarted flaxseed oil, making it blindingly clear that the gum improvement is caused by flaxseed oil. There is [7]plenty of reason to think the human diet was once much higher in omega-3. All this together convinces me that omega-3 can both prevent and cure canker sores. Not only that, I'm also convinced that canker sores are a sign of omega-3 deficiency. You shouldn't just get rid of them with walnuts; you should change your diet. Omega-3 has other benefits (better brain function, less inflammation, probably others).

Let's say I'm right about this – canker sores really are prevented and cured by omega-3. Then there are several things to notice.

1. Web facilitation. It was made possible by the internet. My initial interest in flaxseed oil came from reading the [8]Shangri-La Diet forums. I didn't have to read a single book about the [9]Aquatic Ape theory; I could learn enough online. Tyler Cowen's experience was in his blog. Eric Vlemmix contacted me by email. No special website was involved.

2. Value of self-experimentation. [10]My flaxseed oil self-experimentation played a big part, although it had nothing to do with mouth health. These experiments showed dramatic benefits – so large and fast that something in flaxseed oil, presumably omega-3, had to be a necessary nutrient. Because of these results, I blogged about omega-3 a lot, which is why Eric emailed me about his experience.

3. Unconventional evidence. All the evidence here, not just the self-experimentation, is what advocates of [11]evidence-based medicine and other [12]evidence snobs criticize. Much of it is anecdotal. Yet the evidence snobs have, in this case, nothing to show for their snobbery. They [13]missed this conclusion completely. Nor do you need a double-blind study to verify/test this conclusion. If you have canker sores, you simply drink flaxseed oil or eat walnuts and see if they go away. Maybe this [14]omnipresent evidence snobbery is . . . completely wrong? Maybe this has something to do with the [15]stagnation in health research?

4. Lack of credentials. No one involved with this conclusion is a nutrition professor or dentist or medical doctor, as far as I know. Apparently you don't need proper credentials to figure out important things about health. Of course, we've been here before: Jane Jacobs, [16]Elaine Morgan.

5. Failure of "trusted" health websites. Health websites you might think you could trust missed this completely. The [17]Mayo Clinic website lists 15 possible causes – none of them involving omega-3. (Some of them, we can now see, are correlates of canker sores, also caused by lack of omega-3.) If canker sores can be cured with walnuts, the [18]Mayo list of treatments reads like a list of scurvy cures from the Middle Ages. The [19]Harvard Medical School health website is even worse. "Keep in mind that up to half of all adults have experienced canker sores at least once," it says. This is supposed to reassure you. Surely something this common couldn't be a serious problem.

6. Failure of the healthcare establishment. Even worse, the entire healthcare establishment, with its vast resources, hasn't managed to figure this out. Canker sores are not considered a major health problem, no, but, if I'm right, that too is a mistake. They are certainly common. If they indicate an important nutritional deficiency (too little omega-3), they become very important and their high prevalence is a major health problem.

---

Eric Vlemmix (2009-06-06 11:58:59)

Great to see there are a number of other people with the same experience as I had! Our doctor never had a real answer, and I always ended up with covering the sores with some gel, trying some items normally used for a sore troath to have less pain, and things like that, but never a way to remove the cause of it. Now, for some others and me, it seems that by getting more omega-3 (resulting in a better ratio of omega-3:omega-6) it's possible not only to treat, but more importantly, do something about the cause. Indeed, self-experimentation can bring you some good insights. I wasn't looking for a cure for canker sores, but I started with a diet, SLD, I became more interested in fats, nutricion, and links with conorary heart disease, and suddenly I realized that canker sores are no longer a real issue for me anymore. Serendipity! Bring in the Internet to connect to some other people with the same interest/activities. And yes, I could communicate this experience/theory without being ridiculed because I do not have a medical education/profession. Seth, canker sores might indeed be a sign of omega-3 deficiency, just as impotence in some cases is a sign that you might have (higer risk of) coronary heart disease (<http://www.reuters.com/article/rbssHealthcareNews/idUSLL14374620081021>), but in case of these sores, some people are warned 10's of years before the real problems start (chonic omega-3 deficiency -> chonic inflammation -> plaque in the arteries -> failure of coronary circulation -> heart failure)

Gerry (2009-06-07 10:41:10)

The Oregonian newspaper ran an article today by Leslie Kaufman ( NY Times) on an experiment in Vermont to reduce cow-produced methane by changing the cow's diet. They are replacing soy and corn with more alfalfa and flaxseed to "mimic the spring grasses that the animals evolved long ago to eat". Stonyfield Farm is involved in the study. To quote further," The answer, the scientists determined, was that spring grasses are high in Omega-3 fatty acids which may help the cow's digestive tract operate smoothly." The cows were reported to produce less methane and are more robust. Also noted was that "Corn and soy, the feed that thanks to postwar government aid, became dominant in the dairy industry, has a completely different type of fatty acid structure." Flaxseed saves the world from climate change???

Dennis Mangan (2009-06-07 18:38:21)

My self-experimentation - well, it wasn't on myself - is getting published! <http://mangans.blogspot.com/2009/05/my-letter-in-medical-hypotheses.html> Also, it seems that all of Seth's points above apply to my experience.

seth (2009-06-07 18:51:19)

Congratulations, Dennis. The original post is here: <http://mangans.blogspot.com/2009/05/niacin-for-restless-legs.html>

Nathan Myers (2009-06-07 21:48:23)

It's a huge leap of faith to conclude from success with walnuts that it is the omega-3 oils in them that are responsible. Walnuts contain hundreds of compounds, many oily or oil-soluble, many not. While it's just possible that the omega-3 oil is responsible, that's not the way to bet. Thousands of people have been taking omega-3-rich oil every day, and nobody else has reported instant relief of canker sores. Anyway, walnut oil isn't especially rich in omega-3 oil, and omega-3 is only a description, not a chemical. Lots of different oily compounds, with various metabolic effects, are omega-3. The same may be said of tannins, another component noted in walnuts. "Tannin" describes a property, not a specific chemical. We can start by testing whether walnut flour alone, or walnut oil alone, provides such instant relief, and whether walnuts help anybody else besides Ted. Maybe Ted's just lucky (or unlucky, depending on how you count such things). I've had many fewer canker sores since I began avoiding oranges, and my sinuses have stopped bleeding since I began avoiding onions. I've tested both of these connections pretty thoroughly, not to say painfully.

seth (2009-06-08 05:24:30)

Nathan, it's not just the success with walnuts that leads me to my conclusion. It's all the other data I listed as well. E.g., Tyler Cowen's experience. I should have listed something else as well: evidence that omega-3 is used to make an anti-inflammatory signalling molecule. In any case, look on the bright side: if walnuts cure/prevent canker sores, that's great to know regardless of the crucial ingredient in walnuts. All the other evidence I cited says that this observation makes sense. Is unlikely to be limited to Ted.

Willy (2009-06-08 06:46:29)

An interesting article: Omega fatty acid balance can alter immunity and gene expression "This study demonstrates, for the first time in humans, that large changes in gene expression are likely an important mechanism by which these omega fatty acids exert their potent clinical effects." [http://www.eurekalert.org/pub\\_releases/2009-05/asfb-ofa052909.php](http://www.eurekalert.org/pub_releases/2009-05/asfb-ofa052909.php)

Paul (2009-06-08 07:42:19)

I had suffered bouts of painful canker sore outbreaks several times a year before switching to a non sodium lauryl sulfate (SLS) toothpaste. This was really the defining change since I did not appreciably change my diet at the same time. I have also reintroduced canker sour outbreaks since then with only a few uses of the old SLS toothpaste.

bennetta (2009-06-08 10:28:28)

I believe this may affect the theory I posted about before regarding the Eskimo diet, Atkins, and bad breath. The Atkins diet is infamous for causing bad breath and body odor. The Eskimo diet is very similar to Atkins, but with one exception- they eat a lot of rotten fish. Eskimos do not have bad breath. A lot of that rotten fish, however, is salmon, a fish rich in omega 3. So is it the omega 3, the probiotics, or both, that keeps them from having bad breath? I'd also be interested to see if canker sores and inflamed gums are common in the Eskimo population.

Gian (2009-06-08 21:53:43)

Seth, Did you reduce our intake of omega-6 oils as well?.

gallier2 (2009-06-09 08:45:26)

@bennetta the bad breath on Atkins is normally transient. It happens when the metabolism switches from mainly glucose to ketone "burning". As long as not all enzymes are up to their task, the surplus of ketones (mainly acetone) will be discarded in

the lungs, thus the strange odour and the metallic taste in the mouth. You can experience the same odour on long time fasting or on long term alcoholics. When your body is adapted to the fat metabolism (like the eskimos) you will no longer smell.

Ted (2009-06-09 12:57:21)

Nathan, I would add that oranges and citrus definitely aggravate any canker sore I had, sometimes turning them into raging sores. But I could drink/eat citrus during the time I didn't have sores. I've never noticed any reaction positive or negative from onions to the sores. I also noticed high salt items might bring on the sores. Although once again, I was able to eat pretzels and stuff without problems often. In my youth and 20s, I probably never ate fish or any omega-3 rich foods very much. It's only recently that I've started to try to eat with more intention.

Nathan Myers (2009-06-09 13:43:37)

Ted: I got canker sores from orange because I'm allergic to orange. Excess walnuts, for me, bring on cold sores. I would be pleased to find that it is something in the oil that alleviates canker sores, as I happen to know it's something in the walnut *protein* (as in other nuts, and in peanuts) that brings on cold sores: excess arginine. However, another correspondent noted that black tea soothed his canker sores, which hints that the tannins may be important. I would not be at all surprised to find that preventing canker sores involved entirely different chemicals than those involved in alleviating pain and speeding healing. I would also not be surprised to find that certain omega-3 oils are deadly toxic, or metabolically useless. My experience with flaxseed oil, in particular, though, is that since I began taking it more or less regularly I have reduced my waistline and added upper-body muscle mass.

Heidi (2009-06-23 18:03:42)

hi everyone, my daughter (18 yrs) has chronic acute cankers and has for years. This means that every month she has a mouth full - and sometimes on the outside of the mouth. They are large (size of the end of your baby finger) and occur in all places in the mouth, gums and throat. We have tried for years to find and try remedies from the tooth paste, washes, prescriptions etc. but it is useless. She has had minimal and inconsistent results at best from home remedies. The medical community is baffled by cankers and it is frustrating - they don't take it too seriously even when they see that my daughter often can't speak or eat and her lips are so swollen because of cankers she looks like she has been in a fight. Most people can hardly tolerate the pain of one or two - she never has less than 10 and doesn't even register pain for an average sized one. This is hardship for a teenager who is concerned about appearances as well. Anyway, I am going to try this flaxseed and walnut oil and let you know if there is any improvement. A polite note to the posters above referring to the 'eskimos'. They actually call themselves "Inuit" and eat raw fish and seal as well as caribou etc. I don't think they eat rotten fish or meat - or at least I have never heard of that and many of my family have travelled to the north and Arctic areas and never observed this either. Most of their food is kept frozen out of doors which is easy to do in the Arctic! thanks for the discussion. Heidi in Canada

seth (2009-06-23 23:30:48)

Heidi in Canada, I would like to know what happens in either case - whether there is improvement or not in your daughter's canker sores. Either result - improvement or no improvement - would be very interesting! As for the Inuit, they certainly do or at least did eat rotten fish. See <http://www.blog.sethroberts.net/2009/03/26/what-did-eskimos-eat/> <http://www.blog.sethroberts.net/2009/01/26/the-inuit-paradox/>

Eric (2009-07-22 04:56:53)

Heidi, I am also very interested in your findings. It's a pity that I can not really specify how many weeks/months I used flaxoil and fishoil before I noticed a change. Only after some months I suddenly realized that I did not have had any serious sores for quite some time, as I also had huge sores before that hindered my speech and swallowing foods. Just leave a message here and inform Seth please. Good Luck!

andrea (2009-08-08 05:47:11)

Heidi, Seth and friends! Omega 6: Omega3 ratio's imbalance is another facet of the condition. Too much omega six (for example a diet based on olive oil, canola oil, eggs, lamb, poultry and some beef) can really create a serious imbalance and generate

inflammation (joints and mucous lining) + depression + anxiety + canker sores (lots). One word for your (and my tests): fish oil omega 3 is more potent than flaxseed oil. Search wiki for Omega3 and minami nutrition for omega3 (moreEPA) I am testing that now!

Liza Glazner (2009-09-16 09:29:05)

I have had an ongoing problem with canker sores my entire life. I began taking flaxseed oil a few months ago with no knowledge that it may prevent canker sores. Just recently, however, I got out of the routine of taking the flaxseed oil. I have had a canker sore every day for the past three weeks. When one goes away, a new one pops up in a different place. I am going to start taking the flaxseed oil again and see if the pattern changes.

Gina (2009-10-11 06:31:38)

Hello to all, I'm also suffering from canker sore all my life that's why I found this site cause am so desperate to know how to prevent and cure this sickness and I tried so many medicines prescribed by Dr. and over the counter . I also try switching my toothpaste now I'm using argelitz( it is an organic toothpaste) and try to used heompathic medicines but apparently non of those work for me and am sick and tired of this sickness. I always have sores sometimes 7 at the same time and it does'nt stop, one would healed and then there is another one coming out. Its so painful , I cannot eat, talk, smile and my husband is complaining because he cannot even kiss me and it makes me crazy. So maybeam going to try that omega 3 and see if its work for me. Thanks

Tom (2009-10-16 05:47:20)

For lots of discussion on canker sores, check <http://www.mouthulcers.org>

Penny Boehle (2012-01-18 10:22:38)

I discovered the walnut connection too by accident. Trying to get my daughter who is plagued by canker sores to give it a try but she is resisting. most sites say to avoid walnuts. I noticed first a lessening of pain and then it was gone after a few days.

## **Homemade Kombucha: What I've Learned (part 1) (2009-06-07 18:40)**

From [1]Rejuvenation Company's kombucha I learned how good it can be. From a [2]Ferment Change party a few months ago I got kombucha starter. Now I have eight jars brewing kombucha. Here's what I've learned:

1. Hard to fail. It's hard to kill the kombucha "mother". After weeks in an airtight bottle (see Mistake 2), after I let air in it grew fine. You make kombucha at room temperature. You don't have to check it. You simply wait until it's sour enough.
2. Air needed. It's aerobic fermentation, so it needs unlimited oxygen. I learned this after I used a sealed container and nothing happened.
3. Takes weeks. It has taken weeks for my kombucha to become really sour. Maybe I can reduce this to a week under better conditions (high surface to volume ratio, start with large kombucha mother).
4. Use a wide container. The more surface to volume, the better. The kombucha culture grows on top of the tea/sugar mixture because it needs contact with air. The wider the container, the more contact it can have.
5. Cover tightly with something air-permeable. I cover each jar with a paper towel secured with a rubber band. Before I started using a rubber band to hold down the paper towel I found a fly in one of them.

I use cheap black tea (in teabags) and ordinary sugar. Maybe I should get a pH meter to learn more about the process.

1. <http://www.blog.sethroberts.net/2009/04/10/rejuvenation-company-interview/>
2. <http://www.indybay.org/newsitems/2009/03/13/18576981.php>

---

JLD (2009-06-08 00:01:52)

I may add another piece of advice. Beware of potted plants nearby, mold from the pot soil will poison the kombucha and grow on the scoby. I never succeeded to keep a clean scoby for more than 2 or 3 runs and finally gave up.

Brody (2009-06-08 10:37:35)

I use a Seed Starter mat (basically a lower-temperature big flat heating pad) that I got at Orchard Supply Hardware, and I set my wide-mouthed 1-gallon glass kombucha container on that. It does wonders to speed up the process! (Side note- it also works well to set my pot full of yogurt mix on, when I'm making homemade yogurt and leaving it to sit overnight...I use the removable crock from my crockpot, set it on the Seed mat, and then wrap it in a beach towel. Perfect temperature for yogurt-making!)

Rachael (2009-06-08 14:16:53)

I had been wondering when you would mention Kombucha. I have a wicked Kombucha habit, I literally don't feel well unless I have at least 16 oz. a day. But I have hesitated to ferment my own. Please keep us updated on your progress, and any tips. I had good luck making sauerkraut last fall, though it turns out 30 pounds was more than my family could eat in one winter. (I just discovered your blog a few weeks ago and have been reading your archives. Well done! I enjoy your writing a lot.)

seth (2009-06-09 05:19:14)

Thanks, Rachael. Good idea, Brody. I notice that heating pads are sold by drugstores for as little as \$17.

Brody (2009-06-09 11:16:33)

Regular heating pads are usually 1) way too warm, and 2) don't maintain a constant temperature for hours....and aren't designed to be left on so long. The seed mats are just about the right temperature not to bake your kombucha/yogurt to death, and maintain a very constant heat for days. Also, a reptile-cage heating mat works too, I bet those are more expensive than seed mats, but who knows, someone might have one lying around.

Caragh (2009-07-13 17:26:06)

As with any dietary supplement, it's critical to do your homework before considering using Kombucha tea. First, determine the level of evidence supporting the health claims. In this case, Kombucha tea's benefits are based on personal reports, and lab and animal studies. To date, there hasn't been a single human trial reported in a major medical journal. This doesn't mean that Kombucha tea can't possibly have health benefits; it just means that at this time there's no direct evidence that it provides the benefits it's reported to have. The next question is whether there have been any reports of harm or illness caused by the product. In the case of Kombucha tea, there are reports of adverse effects such as stomach upset and allergic reactions. More worrying are the reports of toxic reactions and metabolic acidosis. In addition, the Food and Drug Administration cautions that the risk of contamination is high because Kombucha tea is often brewed in homes under nonsterile conditions. Lead poisoning also may be a risk if ceramic pots are used for brewing "the acids in the tea may leach lead from the ceramic glaze. In short, there's not good evidence that Kombucha tea delivers on its health claims. At the same time, several cases of harm have been reported. Therefore, until definitive studies quantify the risks and benefits of Kombucha tea, it's prudent to avoid it.

seth (2009-07-13 18:41:26)

Caragh, "not good evidence"? "No direct evidence"? I drink kombucha because I believe in the umami hypothesis, evidence for which I have posted. You make a good point about lead leaching from ceramics. I use glass containers.

## Bay Area Fermentation (2009-06-08 12:56)

Yesterday's San Francisco Chronicle had [1]an article on fermented foods in the Bay Area: the fermentation festival, sauerkraut, kimchi, and so on. (No discussion of yogurt.) I especially liked this:

Leaving foods unrefrigerated for two weeks or more can be disturbing to those who weren't raised with a crock of pickles in the hallway. But U.S. Department of Agriculture research service microbiologist Fred Breidt says properly fermented vegetables are actually safer than raw vegetables, which might have been exposed to pathogens like E. coli on the farm.

"With fermented products there is no safety concern. I can flat-out say that. The reason is the lactic acid bacteria that carry out the fermentation are the world's best killers of other bacteria," says Breidt, who works at a lab at North Carolina State University, Raleigh, where scientists have been studying fermented and other pickled foods since the 1930s.

Breidt adds that fermented vegetables, for which there are no documented cases of food-borne illness, are safer for novices to make than canned vegetables. Pressurized canning creates an anaerobic environment that increases the risk of deadly botulism, particularly with low-acid foods.

Nothing about fermented – also called aged – meat. The last taboo. I believe we like umami flavor so that we will eat more bacteria-laden protein. (Glutamate, which produces the umami flavor, is a protein breakdown product.) All meat producers, as far as I know, age their product 2-3 weeks to improve the flavor. Understandably, they don't like to talk about it.

Thanks to Ashish Mukharji.

1. <http://www.sfgate.com/cgi-bin/article.cgi?f=/c/a/2009/06/07/FDS617UQKF.DTL&type=food>

---

david (2009-06-09 04:53:05)

I think in certain contexts people talk about aged meat. I worked at a steakhouse once and the managers would tell the customers the meat is aged. Before you started blogging about this though I'd never heard (or paused to reflect on the fact) that the purpose of aging meat is to cultivate beneficial bacteria. But there are lots of things regarding meat that people willfully forget...like the fact that it's full of dead parasites. I also worked at a Long John Silver's as a teen and learned to cut the fish. We were taught to remove the small pink parasites when we found them. They weren't a health issue, just aesthetic (they plump when you cook em, so people would notice them in the white fish meat). I was told other meats have parasites too but you can't see them because they're the same color as the meat.

Ben (2009-06-10 12:13:32)

This is known in hanging meat. Hanging meat is a big issue amongst foodies in the UK. When my family has game or turkey at Christmas it's typically hung outside in a shed for a few days prior to cooking. Perhaps its most vocal proponent of hanging meat in the UK is Hugh Fearnley-Whittingstall, there's a review of his "Meat" book, in which he discusses hanging at length, here: <http://www.guardian.co.uk/books/2004/jun/19/highereducation.houseandgarden> We even have a company called the Well Hung Meat Co.: <http://www.wellhungmeat.com/>

JohnN (2009-06-10 17:22:09)

Seth, Perhaps you should heed your own advice. I'm referring to the title of your subsequent post - "A Little Knowledge...". Aging meat is controlled breakdown of the proteins by lactic acid which tenderizes it. It's usually carried out at a few degrees above freezing and has very little to do with fermentation. Umami has something to do with access by the taste buds to glutamine in food (an amino acid and a neuro transmitter).

### **A Little Knowledge about Obesity is a Dangerous Thing (2009-06-10 09:36)**

[1]Rajiv Mehta of [2]Zume Life, a company that helps patients follow treatment regimes, told me that he's been doing the Shangri-La Diet with some success – he's lost 3 pounds in a month. Now and then he tells others about the diet. There are two types of reactions. Those who are outside the field of obesity prevention/research are interested. Those inside the field, obesity professionals (e.g., a Stanford professor), uniformly reject it: "Impossible," they say. Can't possibly be true.

1. <http://www.zumelife.com/leadership.php>

2. <http://www.zumelife.com/index.php>

---

bill (2009-06-10 12:21:17)

I have come to the conclusion that the primary purpose of education today is to make sure people do not stray too far from the conventional wisdom.

Kevin (2009-06-10 16:18:17)

Seth, Have you seen the studies in this link <http://diabetesupdate.blogspot.com/2009/06/good-science-dr-leibel-explains-it-all.html> which support the idea of set-points

Nadav Manham (2009-06-10 19:20:18)

Sometimes there seems to be an inverse relationship between a particular medical establishment's ability to make progress in treating its given problem and the vehemence with which it rejects alternative methods of treating that problem. If any field should be open to new treatment ideas it should be the mainstream obesity establishment, as it has been singularly and embarrassingly unsuccessful at reversing obesity.

Wilbur (2009-06-11 09:03:09)

Clearly the obesity professionals have not thought the matter through. Losing three pounds in a month is no big deal. I find that my weight can fluctuate a couple of pounds over the space of a day, so being down three pounds in one month is very possible, even doing nothing at all. The professionals should be saying, "Hmm, that's nice, but let me know how you're doing a year from now".

Rajiv Mehta (2009-06-12 19:24:16)

Wilbur – yes, the daily weight variation is often quite substantial. To smooth the fluctuations, I've been calculating a Trend value, using simple exponential smoothing algorithm:  $Trend\_n = 0.1 * Weight\_n + 0.9 * Trend\_n-1$ . - Rajiv

## How Safe are Vaccines? (2009-06-10 23:36)

Or, at least, how safe do the people who prescribe and give them think they are? Jock Doubleday has an interesting way of finding out: Offer money to drink the ingredients, adjusted for body weight. The offer, which began in 2001, [1]is currently \$200,000 to "an M.D. or pharmaceutical company CEO, or any of the relevant members of the ACIP [the CDC's Advisory Committee on Immunization Practices] now including liaison representatives, ex officio members, chairman, and executive secretary" who will do this.

More The person who accepts this offer needs to fulfill a contract posted [2]here. However, it isn't clear what the "Agreement-in-Full" mentioned in the contract consists of. So it isn't clear if the person can know what he or she is getting into before putting \$5,000 at risk. If the Agreement-in-Full cannot be examined now, this is a meaningless – too vague to be understood – offer. I have written to Jock Doubleday to find the Agreement-in-Full.

And more Mr. Doubleday says he has the Agreement-in-Full but he would not show it to me nor apparently to anyone else not on the list of those eligible for the offer. So the whole thing is a tribute to the magic of web pages.

1. [http://www.spontaneouscreation.org/SC/\\$75,000VaccineOffer.htm](http://www.spontaneouscreation.org/SC/$75,000VaccineOffer.htm)

2. <http://www.spontaneouscreation.org/SC/ContractPartA.htm>

---

JLD (2009-06-11 00:51:46)

This is silly. BOTH sides are wrong (and right as well). Smallpox and Polio vaccines are obviously effective AND most vaccines are dangerous too.

Conrad Hackett (2009-06-11 02:57:37)

Seth, I think you should do a critical evaluation of this link ASAP. I had never heard of this offer before seeing it here but I don't think this is legit. Consider the terms of the offer here: <http://www.spontaneouscreation.org/SC/ContractPartA.htm> For example, a potential participant has to pay for 3 psych evaluations with psychiatrists chosen by the challenge coordinator. The potential participant is barred from getting copies of any of the evaluations he/she pays for but any one of these evaluations can be used as the basis for disqualification. Other requirements are even crazier, like tests on the content of anti-vaccine books. This seems to be an offer designed so that no one will be able to qualify, allowing Doubleday to boast that no doctor will take a risk equivalent to what they routinely prescribe for children while Doubleday does not really put any money at risk. Note that he doesn't provide any evidence that he has \$200,000 available to pay a qualifying candidate or any indication of where the additional \$5,000 a month for this challenge comes from. This offer raises so many red flags that I won't even bother to enumerate them further. I appreciate your willingness to question conventional medical wisdom but do you really want to tie your reputation to Jack Doubleday's? Do you have any reason to think this is a legitimate offer? If so, why do you think no one has accepted the offer?

seth (2009-06-11 05:24:23)

Conrad, I don't see the problems you see with the contract. The mental health screenings seem reasonable; you don't want a crazy person accepting the offer. The need to take a test on anti-vaccination books doesn't strike me as making the whole thing not legit; I see it as a way of ensuring informed consent. Whether Doubleday has the money is a good question; certainly someone who wanted to take him up on it might demand proof. Why has no one accepted the offer? Some combination of (a) vaccines are dangerous and (b) it would be seen as demeaning to accept the offer. And perhaps (c) Doubleday is seen as tainted – if you have contact with him that taints you.

NE1 (2009-06-11 07:43:18)

I concur with Conrad. This is a publicity / grandstanding stunt. Note that he hasn't gone so far as to measure out the ingredients yet and is still trying to scaremonger at that point. I wouldn't trust him to know the real scales present in vaccines. He's made no attempt to involve neutral parties.

seth (2009-06-11 09:04:00)

NE1, of course it is a publicity stunt – that is, a way to get publicity. If vaccines are safe, then this publicity stunt could be used to emphasize that. Why vaccine safety would be bad to publicize I fail to see. I don't know what "real scales" means. when you make an offer like that, I don't think the failure to spell out every last detail means it should be ignored.

Conrad Hackett (2009-06-11 10:10:18)

Seth, I am disappointed that after thinking about this further, you are still linking your credibility with Jock Doubleday's. If you are wrong about the results of your self-experiments, the consequences for others in trying these experiments should be minimal. However, the stakes are higher regarding vaccines so it is that much more important to carefully evaluate the credibility of those who challenge the wisdom of vaccinations. Jock Doubleday and Jenny McCarthy have the disadvantage of not having any impressive credentials or a reputation for their critical thinking prowess. You have academic credentials and a demonstrated commitment to publicly challenging bogus research, so your endorsement will be great news to people like Jock and Jenny. Since neither my initial comments nor your own further reflection have enabled you to "see the problems [I] see with the contract," let me further enumerate just a few more red flags: 1. If just one of three psychiatrists chosen by the guy allegedly putting up the money for the challenge finds a participant "in any way psychologically unstable and/or of unsound mind," the participant is disqualified. I wonder how many Americans could visit the three psychiatrists this guy would choose without being found in some way unstable by at least one. Furthermore, the structure of this requirement (multiple psychiatrists, the participant can't read their reports) is such that there would be no way to challenge one's disqualification or, for that matter, learn about one's alleged mental issues. 2. Jock Doubleday ostensibly believes that accepting this challenge would pose great health risks to the participant. If any one of the named psychiatrists happens to agree with this assumption, they should by definition agree that anyone accepting the challenge is of unsound mind. 3. Signing part A of the agreement (necessary to begin the challenge) without completing the agreement in full (which includes part B, the terms of which are not disclosed until after signing part A and passing psychological and "vaccine knowledge" tests) obliges the participant to donate \$5,000 to Doubleday's organization. 4. Anyone who wants to take this exam has different assumptions about vaccine safety than Jock Doubleday yet they have to pass Doubleday's tests about vaccination theory and practice (don't you see a potential problem here?). Doubleday claims the right to publicize their answers to these tests. It seems likely that "passing" these tests requires saying that vaccines are unsafe. If one does so, Doubleday can then claim, "X actually admitted that vaccines are unsafe—here is what they wrote." 5. I give Doubleday credit for publishing part A of his terms and for a crafty publicity stunt. However, in my opinion, there are so many red flags here in part A (and I am still not bothering to enumerate all of them) that there is no reason to take this seriously. But if one did find all requirements reasonable (as you do, apparently Seth), wouldn't you at least agree that it is peculiar to be bound to make a \$5k donation if one fails to meet both the troublesome requirements in part A of the agreement as well as the unknown requirements of part B of the agreement. How could one even sign any document obliging a \$5k commitment of any kind without having read the full agreement? I hope that you will reconsider your endorsement of this stunt. The public health stakes are much higher here than they are for drinking a little oil, standing on one foot, and starting the day off with Good Morning America. I have am not an expert on vaccines but I don't believe Jock Doubleday is either and it was my hope that anyone who carefully read the terms of his offer would see that his alleged money is safe because none of the people he has challenged could be expected to actually qualify to drink the vaccine ingredients. Meanwhile, if the general public accepts the premises of this stunt and shuns childhood vaccinations, diseases will spread unnecessarily, kids will get sick, and many will die. I have enjoyed reading your blog and have read your posts with an open mind. Given your endorsement of this offer, I think I will be much more skeptical about your posts in the future.

seth (2009-06-11 12:51:06)

That's a good point about having to risk \$5000 before seeing the Agreement-in-full. However, I am less sure than you that that's the case – that the Agreement-in-Full does not exist. How do you know this? In any case, I will try to find out.

Conrad Hackett (2009-06-11 13:52:18)

Hi Seth, It is interesting that you suggest I think the agreement in full does not exist. All I said it that a potential participant cannot, according to the terms of this contract, learn about the terms of Part B before meeting the requirements of Part A. The only reason I know this is because I read the agreement carefully. Here is what it says, "Participant agrees to take a written open-book examination (the "Basic Exam") before becoming eligible to receive Part B of the Agreement." According to the terms of this challenge, Doubleday has many reasons not to send you the full agreement. First, you are not a medical doctor so you are ineligible for the challenge in the first place. Second, you haven't paid to have his shrinks examine you and submitted your complete mental health history to him. Third, and most critically, you haven't passed his test, which his agreement specifies you must get 100 % correct in order to qualify to receive and read Part B of the agreement. I am glad your skepticism is growing and you agree about one of the many red flags in this offer. I suggest you don't hold your breath on getting a satisfactory response from Jock Doubleday. Incidentally, it is my opinion that the agreement in full probably does not exist. After working so hard to craft Part A of an agreement that no one can complete, why should Jock waste time writing Part B that no one can qualify to receive? More importantly, the reason he won't send this is because it is an escape clause for him. If, somehow, someone manages to negotiate the challenges for participating in this challenge outlined in Part A, he can throw up new hurdles to participation when he writes Part B. This is a stunt. No doctors have accepted this challenge because it is impossible to qualify by design.

seth (2009-06-11 15:01:12)

If the Agreement-in-Full doesn't exist – or can't be looked at – I agree with you. But if it can be looked at, I want to see what it says.

Conrad Hackett (2009-06-12 07:30:58)

It looks like Jock has uncovered some other conspiracies besides doctors maliciously poisoning the population with vaccines. See here for his message about "a dark force working to undermine all ecosystems on Earth," which is responsible for the 9/11 attacks and the current financial mess: [http://scienceblogs.com/insolence/2009/02/i\\_get\\_e-mail\\_too.php](http://scienceblogs.com/insolence/2009/02/i_get_e-mail_too.php)

## **Self-Tracking: What I've Learned (2009-06-12 09:41)**

I want to measure, day by day, how well my brain is working. After I saw [1]big fast effects of flaxseed oil, I realized how well my brain works (a) depends on what I eat and (b) can change quickly. Maybe other things besides dietary omega-3 matter. Maybe large amounts of omega-6 make my brain work worse, for example. Another reason for this project is that I'm interested in how to generate ideas, a neglected part of scientific methodology. Maybe this sort of long-term monitoring can generate new ideas about what affects our brains.

So I needed a brain task that I'll do daily. When I set out to devise a good task, here's what I already knew:

1. Many numbers, not one. A task that provides many numbers per test (e.g., many latencies) is better than a task that provides only one number (e.g., percent correct). Gathering many numbers per test allows me to look at their distribution and choose an efficient method of combining (i.e., averaging) them into one number. (E.g., harmonic mean, geometric mean, trimmed mean.) Gathering many numbers also allows me to calculate a standard error, which helps identify unusual scores.
2. Graded, not binary. Graded measures (e.g., latencies) are better than binary ones (e.g., right/wrong).

Every experimental psychologist knows this. What none of them know is how to make the task fun. If I'm going to do something every day, it matters a great deal whether I enjoy it or not. It might be the difference between possible and impossible. People enjoy video games, which is a kind of existence proof. Video games have dozens of elements; which matter? Here's what I figured out by trial and error:

3. Hand-eye coordination. Making difficult movements that involve hand-eye coordination is fun. [2]My bilboquet taught me this. Presumably this tendency originated during the tool-making hobbyist stage of human evolution; it caused people to become better and better at making tools. Ordinary typing involves skilled movement but not hand-eye coordination. This idea has worked. I led me to try [3]one-finger typing (where I look at the keyboard while I type) instead of regular typing. And, indeed, I enjoy the one-finger typing task, whereas I didn't enjoy the ordinary typing tasks I've tried.

4. Detailed problem-by-problem feedback. Right/wrong is the crudest form of feedback; it doesn't do much. What I find is much more motivating is more graded feedback based on performance on the same problem.

5. Less than 5 minutes. The longer the task the more data, sure, but also the more reluctant I am to do it. Three minutes seems close to ideal: long enough for the task to be a pleasant break but not so long that it seems like a burden.

Experimental psychology is a hundred years old. Small daily tests is an unexplored ecology that might have practical benefits.

---

Dennis Mangan (2009-06-12 10:42:41)

Seth: Off topic (I seem to have lost your email address), but have you heard of something called ThreeLac? <http://www.threelac.com/> It's a probiotic, a mixture of three bacteria, none of which are found in the usual probiotics, and testimonials, e.g. on Amazon, are over-the-top. Many people claim that it completely restored their health, in particular by killing Candida and healing leaky gut.

seth (2009-06-12 10:53:31)

Dennis, no I hadn't. That's really interesting. I drink Rejuvelac. Which I get from the Rejuvenation Company and learned about from another reader comment. The website you cited doesn't seem to exist.

Dennis Mangan (2009-06-12 10:59:22)

Seth, try here: <http://www.candidafree.net/> If it's to be believed, it's the greatest thing since sliced bread.

JLD (2009-06-12 12:05:40)

I found this, Google isn't ThreeLac friend: <http://www.holistichelp.net/threelac.html> Not all bacteria are good for you, Enterococcus Faecalis probably not...

Darrin Thompson (2009-06-12 13:26:49)

I don't know about the candida product but my Autism kids get really hard to manage when they are off Nystatin for a few days. If I knew of a cheap easy to get fermented food I could convince them to like I'd feed them a ton of it. Rock Band 2 song drumming meets some of your criteria. It's wildly fun, can be \_really\_ hard, and if you finish a song it's graded numerically with longest streak or correct notes and percent of notes correct. Unfortunately it's 3-5 minutes for just two numbers and it takes a minute or two to get set up. I'm thinking of plotting fish oil vs. my scores, because I've noticed that some days I can

finish really difficult songs on the hard (not expert) level. Then another day I'm kinda klutzy, miss too many notes and fail out of a song a beat just a few days ago.

peter (2009-06-12 13:51:44)

i had candida and tried Nystatin; but found that citricidal (grapefruit seed extract) works better, and you can stop taking it after the candida clears. it's awful tasting so you may have to put in a capsule with some sort of filler. It also is suppose to have anti-biotic and anti-viral properties.

rich (2009-06-13 09:15:36)

I am curious, how do you account for the fact that practice will make you better at tasks, especially hand-eye coordination heavy ones, over time? Thanks for the great site. Rich

seth (2009-06-13 09:26:33)

Thanks, Rich. The effect of practice gets smaller and smaller. In other words, learning slows down. And the speed of learning, whatever it is, can be estimated and subtracted - that is, allowed for.

Steve Rothman (2009-06-13 18:16:20)

It would be great if there was some sort of "game" for a phone like iPhone or Blackberry that would satisfy your 5 criteria and would keep records that could be transferred to a computer for statistical purposes. This would be especially good with a portable gadget because, obviously, it's sometimes not convenient to be near a computer, and also these portable gadgets all have alarms etc. to remind you to take the game/test. I wish there was something like that for iPhone.

Nathan Myers (2009-06-16 00:47:45)

It's rather easier to get started programming a Google Android gadget than an iPhone.

## **Extreme Medical Tourism (2009-06-12 21:20)**

In [1]this post Jasper Lawrence describes a trip to Cameroon to infect himself with hookworms. Here's how it begins:

As my asthma got worse I became increasingly reliant on inhalers, pills and antihistamines as well as upon the oral steroid prednisone to stay out of hospital. I tried all the drugs and therapies available. As it was by the time I was in my late 30s I was a frequent visitor to the emergency room. As anyone who has experienced a severe asthma attack can tell you they are terrifying.

My use of prednisone increased, and as you may know the side affects of prednisone are quite horrible, particularly with long-term use. I started to suffer from some of these side affects, particularly obesity, and despite all this these drugs were only marginally effective in controlling my asthma.

Soon I was denied health insurance and so now I had the added burden of paying for all my medical care.

On a trip in the summer of 2004 to visit relatives in England I learned of a BBC documentary about the connection between a variety of intestinal parasites and various autoimmune diseases.

In Cameroon:

Cameroon has no tourism infrastructure, its people being so poor (your pocket change represents two or three months wages) and the insane corruption make for a very challenging environment for a western traveler, particularly a conspicuous white one. You are a walking pile of cash, a visitor from another, much wealthier, planet. One feels very vulnerable and exposed. It can be very wearing and the danger of being robbed is constant. . . . With the driver's help (I told everyone of my quest) I was able to visit a variety of villages and with practice learned to identify where the locals would defecate.

## **The American Health Paradox: What Causes It? (continued) (2009-06-13 05:39)**

Atul Gawande might be the best medical writer ever. He is the best medical writer at The New Yorker, at least, and the best one I've ever read. He consistently writes clearly, thoughtfully, and originally about the big issues in medicine. That is why [1]his recent article about health care costs (my comment [2]here) and [3]his graduation speech at the University of Chicago are so telling. And not in a good way, I'm afraid.

The graduation speech starts off with an excellent story:

The program, however, had itself become starved of money. It couldn't afford the usual approach. The Sternins had to find different solutions with the resources at hand.

So this is what they decided to do. They went to villages in trouble and got the villagers to help them identify who among them had the best-nourished children—“who among them had demonstrated what Jerry Sternin termed a “positive deviance” from the norm. The villagers then visited those mothers at home to see exactly what they were doing.

Just that was revolutionary. The villagers discovered that there were well-nourished children among them, despite the poverty, and that those children’s mothers were breaking with the locally accepted wisdom in all sorts of ways—feeding their children even when they had diarrhea; giving them several small feedings each day rather than one or two big ones; adding sweet-potato greens to the children’s rice despite its being considered a low-class food. The ideas spread and took hold. The program measured the results and posted them in the villages for all to see. In two years, malnutrition dropped sixty-five to eighty-five per cent in every village the Sternins had been to. Their program proved in fact more effective than outside experts were.

Bill Gates, Jeffrey Sachs, are you listening? Gawande goes on to say that to improve medicine, there needs to be the same sort of study of “positive deviants”. Here is his first example:

I recently heard from one such positive deviant. He is a physician here in Chicago. He’d invested in an imaging center with his colleagues. But they found they were losing money. They had a meeting about what to do just a few weeks ago. The answer, they realized, was to order more imaging for their patients—to push the indications where they could. When he realized what he was being drawn to do by the structure he was in, he pulled out. He lost money. He angered his partners. But it was the right thing to do.

No kidding. The contrast between mothers who figure out creative iconoclastic new ways to feed children on tiny amounts of money and a doctor who merely refuses to be a scumbag could hardly be greater. But Gawande uses the same term (“positive deviant”) for both! This is the depth to which a writer and thinker of Gawande’s stature has to descend, given the straitjacket of how he thinks about medicine. Gawande thinks that doctors will improve medicine. He’s wrong. Just as [4]farmers didn’t invent tractors – nor any of the big improvements in farming – neither will doctors be responsible for any big improvements in American health. The big improvements will come from outside. I’m sure they will involve both (a) advances in prevention and (b) patients taking charge of their care.

When these innovations happen, where will doctors be? Helping spread them or defending the status quo? That’s what Gawande should be writing about. One big advance in patients taking charge was home blood glucose testing. It came from an engineer named Richard Bernstein. Best thing for diabetics since the discovery of insulin. Doctors opposed it. When I invented the Shangri-La Diet, and lost 30 pounds, my doctor didn’t ask how I lost all that weight. Not one question. Like all doctors, he had many fat patients; the notion that I, a mere patient, could know something that would help his other patients didn’t cross his mind. When I was a grad student I did acne experiments on myself that revealed that antibiotics (hugely prescribed for acne) didn’t work. My dermatologist appeared irritated that I had figured this out. That’s a little glimpse of how doctors may react to outside innovation involving patients taking charge. Of course doctors, [5]like dentists, cannot do good prevention research.

If Gawande took the first story he told to heart, he might realize it is saying that the improvements to health care won’t come from doctors, just as the improvements to the health of those village children didn’t come from experts. [6]As I said earlier, doing my best to channel Jane Jacobs, a reasonable health care policy would empower those who benefit from change. That’s what the village nutrition program did. It empowered mothers who were innovating.

Dennis Mangan (2009-06-13 06:33:24)

Well said, Seth. Most doctors simply do not care and take any questions or suggestions made by the patient as an affront. It's happened to me and family members many times - it's happened to me on my blog in a discussion about statins: <http://mangans.blogspot.com/2009/03/dont-take-statins-if-you-need.html> I do think that perhaps you overestimate the degree to which patients will take charge of their health. Many people simply don't care, and others aren't smart enough, the two categories overlapping of course.

seth (2009-06-13 06:43:22)

Thanks, Dennis. I think you make a good point about patient inaction. My guess is that there is vast epidemic of subclinical depression and what to do about it is a different topic.

Nadav Manham (2009-06-13 11:48:51)

As an exercise, is there a way to test your three assertions historically? The three assertions are: 1) Doctors will not be the ones responsible for big improvements in American health, outsiders (non-doctors) will. 2) Big improvements in American health will involve advances in prevention. 3) Big improvements in American health will involve patients taking charge of their care. By "test historically," I mean: Can we look at the great health innovations of the past to see if they fit Seth's three assertions? Here is one list of the greatest medical innovations in history: <http://www.infoplease.com/ipa/A0932661.html> I don't know if it's the best list but it's probably pretty good. Just looking through it as a non-expert, I can see several examples of Seth's premises in action, but also several counterexamples: of advances coming from within the medical establishment, of advances via treatment rather than prevention, and of advances that happened without patients taking charge of their care. Seth, is there anything "special" about the specific diseases of American modernity (obesity and diabetes, asthma, allergies, depression, etc.) that leads you to believe that advances in them will come via your three assertions?

The American Health Paradox (2009-06-13 17:21:31)

My posts generally don't contain medical or legal advice, if you have a problem seek the opinion of an expert I don't believe in Beliefs. Nassim Nicholas Taleb [...]

Nocancer Chuck (2009-06-13 17:42:01)

Being a doctor is a job like sniffing armpits (deodorant testing). The purpose is to sniff armpits but they do not care how the armpits smell. They do the job just to get paid. As soon as you give them \$10 million, they will quit. So why should the doctor care about your ideas. He just wants to do his job and get paid. Your ideas do not make that any easier for him. Give him \$100 million and he will quit his job and do something that he wants to do like play golf. Then approach him with a tip on how to play golf better and he will listen to you. "Money makes the world go round." Many people do not believe in God, but they believe in money. Money did not exist for 3 million years and then they locked up the food and created the need for money.

seth (2009-06-13 23:07:41)

Nadav, that's an interesting question – the empirical support for my predictions. One is the vast improvement in health over the last 100-odd years. As many have concluded, it is unlikely to be due to advances in medicine. Another is the home testing example, an improvement in diabetes care much greater than anything doctors have come up with. Third is that those diseases you list are all much rarer in at least some poor countries – so they are "diseases of civilization" caused by lifestyle. Figuring out how lifestyle causes them – which doctors will never do – will pay enormous benefits. It's true that doctors have pioneered a few important things, such as vaccinations. But that was long ago. See the movie *First Do No Harm* for an example of how doctors actively impede progress.

Nadav Manham (2009-06-14 06:01:19)

Thanks for your reply Seth. I think you're generally right: if civilization were to hold a "contest" to eliminate the chronic diseases of civilization, with one contestant the medical/pharmaceutical establishment and the other the Seth Roberts' and Richard Bernsteins of the world, I would bet on the latter to produce better solutions at lower cost with fewer side effects. I think the internet will greatly help the latter also relative to the former. But does that imply that the medical establishment should not be allowed to be a contestant at all? I don't think so, for three reasons: First, the medical establishment is a collective, made up of individuals. The word "maverick" describes an individual member of the establishment who comes to hold a view outside the establishment (which often results in excommunication), and many medical advances have been the results of mavericks: William Harvey was a maverick, as was Ignaz Semmelweis. Second, the medical establishment should be allowed to compete because sometimes it comes up with the best solution. I had my thyroid gland removed, and need synthetic thyroid, an invention of the medical establishment, in order to live. You and I, and perhaps the majority of college-educated Americans, suffer from an incurable disorder of unknown cause, that tends to get worse over time, and that untreated is crippling to one's quality of life. It's called nearsightedness, and the medical establishment has figured out a way to treat it in such a way that no one really thinks about it as a disease at all. I'm happy about that. Maybe one day a pharmaceutical company will discover a treatment for obesity that renders it as inconsequential as nearsightedness is today. Third, the competition itself between the two contestants is healthy for society. Each side pushes (or should) the other, or at least embarrass the other, to improve solutions to problems.

Maggie (2009-06-15 20:23:52)

Gawande is awesome. Great post :)

Nathan Myers (2009-06-16 00:39:55)

Seth, the doctors you encounter are, in every essential detail, not any different from your auto mechanic or the plumber who comes to your house. They learned a trade, and they're executing what they learned. If they learn a few new tricks, they might be able to apply them, but they won't mention them to others. Doctors, in particular, risk losing lawsuits if they depart in any substantive detail from what their competitors would have done. Of course they're irritated to learn things they can't use. Improvements in automotive design and plumbing practice occur, when they do occur, outside your immediate circle, and they are overwhelmingly the work of engineers. Scientists – particularly social scientists – are taught to hate and fear engineers, but it is with engineers that practically all the improvements to details of modern life, where it does improve, originate. It is the same in medicine. In fact, it is often experienced engineers pursuing a second career in medicine who pioneer new procedures and practices. (E.g., read Gawande about changes to anesthesiology; or look up the leading hip replacement surgeon, working in Sacramento.) Medical scientists work to understand biological processes, but there's remarkably little prestige in applying such understanding to better patient care. That medicine does not recognize the role of the engineer is a crippling impediment to progress.

## **The Fall of GM (2009-06-14 06:32)**

There is nothing new about large industry leaders, such as General Motors, going bankrupt; in *The Innovator's Dilemma*, Clayton Christensen gives many examples and an explanation: complacency, also called smugness. We're

doing well, why shouldn't we continue to do things our way? They fail to innovate enough and less-complacent companies overtake them, often driving them out of business. Complacency is human nature, true, but it's the oldest mistake in the economic world. (I've studied a similar effect [1] in rats and pigeons.) In the 1950s, complacency was surely why the big American car companies [2] rejected the advice of quality expert Edward Deming. In less-complacent Japan, however, his ideas were embraced. This doomed the US car industry. Much later, Ford was the first American car company to take Deming seriously, which may be why Ford is now doing better than GM or Chrysler.

The further away you are I suspect [3] the more clearly you see complacency for what it is – a failure to grasp basic economics (innovate or die):

"Chinese financial assets [in America] are very safe," [Treasury Secretary Tim] Geithner said. His response drew laughter from the [Peking University] audience.

---

Darrin Thompson (2009-06-15 06:36:46)

I think if you look closely into the history you find that American auto makers found Deming, and embraced his methods, and subsequently quality of US cars went up. However, Deming's book *Out of the Crisis* is riddled with frustration that US management is missing the point of his methods. They're seeing innovations like just-in-time and kanban and consistently seeing only short term improvements. Deming reiterates that the real innovation is in management. That management must change its goals, change its relationship with workers, and change the methods used even by the very top officers and boards of directors. That's where he found things falling short the most.

seth (2009-06-15 09:42:43)

Thanks, Darrin. I didn't know about that book. A book "riddled with frustration" might be good reading.

## Relief for Ankylosing Spondylitis (2009-06-15 15:20)

[1]Ankylosing spondylitis is a kind of arthritis with puzzling symptoms all over the body. Its main symptom is back vertebrae fusing together; ankloysis is stiffening or fusion of a joint. To read Wikipedia you'd think it can only be treated with dangerous drugs that don't work very well.

I recently learned from someone with the condition that it got much better after he cut out all refined carbohydrates, especially sugar, an idea he got from [2]Dr. Bruce West. He describes his regimen as "avoid processed foods [= food with lots of additives], such as fast foods, and especially refined carbohydrates, such as high fructose corn syrup." After he started this, he felt better in three days. He can eat fruit, but not bread or soft drinks or desserts. He's never tried eating more fermented foods; he barely knew what they were.

Is the idea spreading? I asked. No, he said. Curious, in this day of forums and patient-centered websites.

More A reader noted that the same advice is given [3]here.

3. <http://www.kickas.org/londondiet.shtml>

---

SB (2009-06-15 16:22:36)

"Is the idea spreading? I asked." Yes, it is. See <http://www.kickas.org/> There is a ton of information on low starch, high protein diets under "Diet Center". Unfortunately, the ASkickers are still afraid of fat. And I don't see anything about omega 3 vs. omega 6 or about fermented foods.

## Hangnails Cured by Fermented Food? (2009-06-15 20:49)

Today I had a hangnail. I realized I hadn't had one in months. I used to get them all the time - say, once a week. The only big change in my life in the last few months is all the fermented food I now eat. I find it hard to believe there's a connection but I can't remember another time in my life when they went away.

---

Cliff Styles (2009-06-15 21:44:36)

Your interest in fermented food has sparked my interest for the past 3 months or so, so I thought you might be interested in changes that I noticed from adding daily kombucha and rejuvelac. I follow a pretty low carb, almost grain free routine, but I was on this diet long before I started adding the fermented stuff. I dropped wheat as an experiment about 3 years ago, and it was a revelation. More on that, if you request. The two most noticeable changes from the fermented food? I would regularly get some late afternoon belching, long after lunch, sometimes vicious enough to the point of serious discomfort. This has disappeared almost completely, and it's a great relief. It's been consistent, even after big mexican food lunches (includes beans, no tortillas, rice or chips). The second thing I noticed was a substantial reduction in the puffiness under my eyes, sufficient that

my significant other noticed, too. I prefer the very low residual sugar kombucha - the brand you like has just too much sugar for me.

seth (2009-06-15 22:31:39)

yes, I'm interested, Cliff. What happened when you stopped eating wheat? Now that I make my own kombucha I find that brand is a little too sweet, as you do.

MC (2009-06-16 04:21:43)

This post caught my eye too. I've hardly ever experienced hangnails (I am not a native english speaker and had to look up the internet to understand what they are), maybe only 3-4 times as far back as I can remember (I'm 23 yrs old). Since childhood, I've always eaten fermented food - as this type of food is part of the traditional diet in my home country (Romania). I eat approx 3 servings of yoghurt or fermented milk/cheese a day, as well as all kinds of pickled vegetables. I don't know whether there's a connection here, but in addition to not having any skin/nails problems, I have never had tooth cavities and never needed any fillings (which always surprises my dentist when I run my annual checkup). I've never tried stopping fermented food altogether to see if anything happens. If I ever try it, I'll let you know if I notice any changes...

Cliff Styles (2009-06-16 08:19:22)

With regard to ceasing to eat wheat, the following happened: I dropped about 15 pounds of fat quite quickly, within a few weeks. I had long had a very annoying (even disturbing) morning cough, a real hacking at times. That ceased completely. I was a smoker when I was young, but quit 35 years ago. My sleep apnea ceased completely, and my night time snoring declined by a substantial amount. Again, verified by my significant other. When I quit the wheat, I felt like I had the flu for about 4 days. I notice now that if I have a bit of wheat once in a while, the cough does not return, but my snoring apparently immediately gets worse. If I have wheat for 3 days together, then the cough comes back. Since this experiment, I have read Taubes' book, and other bloggers (like cardiologist William Davis at the Heart Scan Blog) who have provided more concrete evidence of other reasons to quit wheat. That has helped with motivation, since I found that giving up wheat was much harder than giving up cigarettes.

justin (2009-06-16 08:39:59)

I've upped my fermented food intake drastically over the past maybe four months but I have not seen any reduction in hangnails. I also have never had any cavities and my dentist (well, the last time I went to one, which was around 2004, I think) said I had "textbook teeth." I've mainly gotten my fermented food fix from yogurt (homemade for the past month or so) and kefir. Recently I've added some natto and I'm working on growing a SCOBY to do my own kombucha. I don't buy kombucha though as it's just too expensive/out of the way to get. I also follow a low-to-no carb diet (exceptions: fruits, non-starchy vegetables, alcohol, fermented foods, and occasionally ice cream) and practice intermittent fasting. Since the fermented food addition, I've noticed that I actually have a craving for yogurt. It's as though I have to have \*something\* fermented every day now - this is as opposed to supplementing fish oil, which I know I \*should\* do, but often forget and/or disregard. Of note, my snot has consistently had that greeny/yellow look ever since regularly incorporating fermented foods; however, I've not had any colds or other respiratory infections, and I successfully avoided a cold/flu that I felt onset symptoms for by mega-dosing Vitamin D3 (an unprecedented event for me). I've also speculated that I've seen minor improvements (or at least maintenance of the status quo) in body composition while adhering less to working out. Finally, when I have had the inevitable carb-binges, I've made it a practice to incorporate some fermented foods. This change seems to have reduced or eliminated the typical carb hangover (typically characterized by truly horrible gas). But I still get hang nails.

Kirk (2009-06-16 09:13:25)

I have seen two changes since increasing use of probiotics. First, it seems to me that my sclera are whiter. (No way to measure, of course, this is simply my impression.) Secondly, I used to enjoy a small glass of wine with supper. I no longer have much of a desire for a glass of wine . . . I might have one about once a week now. My probiotic sources are, in order of volume and significance, real kefir, water crystal kefir, cheese, miso, kimchi, pickles, tamari. I tried kombucha for 3 weeks but finally my body asked for kombucha to be dropped from the menu.

Rick Diamond (2009-06-16 10:34:03)

I work for an independent publisher of vegetarian and alternative health books. We publish a book that might be of interest to your readers. It is called Making Sauerkraut and pickled vegetables at home. The authors are Klaus Kaufmann, DSc, and Annelies Schoneck. Step-by-step recipes guide the modern reader through centuries-old methods. The book includes recipes illustrated by full-color photos. ISBN: 978155312037-7 64 pages 6 1/2 x 8 1/2 inch paper \$11.95 Our books are available through many bookstores and online book dealers and directly from our website: [www.bookpubco.com](http://www.bookpubco.com).

Glen Raphael (2009-06-16 10:36:12)

Wikipedia says: "hangnails are usually caused by dry skin or (in the case of fingernails) nail biting, and may be prevented with proper moisturization of the skin." So I suppose I'd check for changes in humidity, bathing/handwashing habits (any new soap?), clothing habits (I always get hangnails when I wear ski gloves), gardening habits...

Nathan Myers (2009-06-16 13:08:03)

I used to get hangnails all the time. They went away when I went (ovo-lacto-) vegetarian.

Todd (2009-06-16 18:27:13)

Here's a speculative connection. Dry skin is a classic sign of poor thyroid function. Some have speculated that poor thyroid function can be caused by adrenal fatigue, which in turn can be caused by an overactive immune system. So, fermented food reduces excessive immune response, which reduces the burden on the adrenals, which helps thyroid function, which helps with dry skin, which helps with hangnails.

Scot (2009-06-16 18:33:25)

Fermented food and HIV? <http://www.pri.org/health/global-health/yogurt-limit-hiv-aids1435.html>

Wilbur (2009-06-17 04:54:07)

Oh for Christ's sake. "My hangnails went away when I started taking probiotic homeopathic placebos".

## **Homemade Kombucha: What I've Learned (part 2) (2009-06-16 19:53)**

I've been making it in 2-quart jars. Doing little experiments, I've figured out that

1. 4 tea bags is better than 6. I've been using Tetley's low-cost black tea. Each teabag supposedly has 33 % more tea than usual. In Wild Fermentation, Sandor Katz suggests 4 teabags for 2 quarts.
2. 3/4 cup of sugar is better than 1/2 cup of sugar. The Wild Fermentation recipe says 1/2 cup of sugar for 2 quarts.

[1]Part 1.

1. <http://www.blog.sethroberts.net/2009/06/07/homemade-kombucha-what-ive-learned/>

---

Dan (2009-06-16 22:00:55)

I started my first batch on Sunday. We'll see how it goes. I used green tea using a starter culture from Kombucha America. They recommend starting with green tea for the first batch. I'm brewing in a gallon glass jar. I've got the jar in an ice chest with

a heat pad just barely over one side of it on the inside. With the top on, a digital thermometer that says it's 80 degrees inside, plus or minus a degree all day long. As for the commercial versions, GTS is lowest in sugar and sweetness which is what I want mine to be. The one from Rejuvenation Company is extremely sweet and twice the sugar as GTS. Another one that's good but also sweeter than GTS is High Country. They make one that tastes like root beer and it's very good.

Dave (2009-06-17 05:42:13)

Thank you for your posts Seth. Is "stronger" Kombucha better for you? That is to say is more sour or longer fermented better?

seth (2009-06-17 07:29:00)

Dan, thanks for the details. Dave, I'm sure that stronger kombucha is better. Tea with sugar has no wonderful properties.

Dennis Mangan (2009-06-17 09:20:30)

I've looked around a bit on the net and reread some of Seth's past entries, but one thing I'm not clear on is whether there are live cultures in the finished product, like yogurt, or do they all die due to waste products, as in wine or vinegar?

seth (2009-06-17 09:25:12)

Dennis, there are live cultures in kombucha unless it is pasteurized (as one manufacturer does). You could probably use commercial kombucha to start making homemade kombucha – something I didn't quite realize.

Dennis Mangan (2009-06-17 09:57:57)

Seth: Let me immodestly suggest a modification to your hypothesis that fermented food is healthy because it stimulates the immune system. The immune system outside the gut does not want to see lipopolysaccharides (LPS), which are breakdown products of bacterial cell walls, nor does it like to see the bacteria themselves. When it does, bad things happen, basically a chain reaction of autoimmune activation, inflammation, and free radical generation. Normally the gut is highly selective in what it allows into the body, but in cases of leaky gut, LPS as well as gluten and casein enter the circulation, causing fatigue, lupus, autism, and maybe lots more. Leaky gut in turn is caused by dysbiosis in the intestines, whether by candida or gram negative bacterial overgrowth. Therefore fermented foods work by restoring proper microbial balance in the intestines, sealing the leaky gut and killing candida and gram negative overgrowth. It might be almost the opposite of stimulating the immune system (outside the gut); it actually *\*prevents\** stimulation and activation. Secretory IgA is the type of immunoglobulin most important inside the gut, and dysbiosis, e.g. from candida, causes a radical decrease in its production by the immune cells lining the gut. The right fermented foods ought to restore IgA production. By the way, I also think that this could be such a problem in the modern world because of the emphasis of low fat, high carb diets, which probably foster dysbiosis.

Dennis Mangan (2009-06-17 10:00:04)

The psychiatrist and scientist Michael Maes believes that dysbiosis and leaky gut, along with subsequent immune stimulation, is a major mechanism behind depression and chronic fatigue. See here for starters with links: <http://mangans.blogspot.com/2009/06/unified-theory-of-disease.html>

seth (2009-06-17 12:17:28)

Those are good points, Dennis.

Dave (2009-06-19 10:56:47)

Does anyone add anything to flavor their homemade Kombucha like fruit juice? Anything work well, or anything to avoid?

Sunny (2009-06-20 14:48:11)

I like to add raspberries, huckleberries, or ginger to my finished kombucha. With the berries, it turns a lovely pink, and with the grated fresh ginger the taste is a bit 'snappier'. Those are the berries I've used, although others would be just as tasty, I'm sure.

Dave (2009-06-21 14:14:21)

do you add them whole, or juice them? How long do you leave them in there before you consume?

## Homemade Yogurt: What I've Learned (2009-06-17 13:00)

Years ago I made yogurt using a recipe from [1]Saul Sternberg. I still use the same ingredients – the basic point is to add about 1/2 cup powdered milk per quart of regular milk at the start – but I implement the temperature changes differently. Since I became interested in fermented foods, I've made yogurt a dozen times. Here's what I've learned.

1. Makes a great condiment. [2]I blogged about this. Store-bought yogurt, even the plain stuff, is too runny – not thick enough – nor sour enough to make this clear. The addition of powdered milk makes the yogurt thick enough to easily eat with anything, including meat. It improves the flavor of just about anything, especially if the yogurt is really sour. This might be the most important lesson since it means you can eat it at every meal and it makes cooking easier. I use spices much less now. The yogurt supplies complexity.

2. You can incubate it for days. I want it as strong as possible – not only because more sour (food writers euphemistically say tart) is better but also because the longer it ferments the more bacteria there will be. After a while it stops getting more sour and I stop. I routinely let it incubate one or two days, much longer than any recipe I've seen.

3. Preheating helps. Most recipes say you should heat the milk before you add the cultures. Some say this kills "bad" bacteria, which could compete with the bacteria you add. According to [3]Harold McGee, the preheating denatures the milk proteins, which helps them trap liquid (whey). [4]I did a little experiment in which I didn't preheat some of the batches. Without preheating, the yogurt was much less solid. Supporting McGee.

4. Strauss yogurt better than Pavel yogurt. (Two popular Bay Area brands.) When I make a new batch I start it with store-bought yogurt; that works better than using what I have left. Side-by-side tasting showed that Strauss yogurt is more sour than Pavel yogurt. I made yogurt using each as the starter; the Strauss-started yogurt was clearly more sour than the Pavel-started yogurt.

5. Slow cooker works great. It is very easy to do the preheating via a crockpot (also called a slow cooker). I put it on high and wait 3-4 hours. This heats the milk to about 185 degrees F. Then I cool it down, add the cultures, and put the whole crockpot in the oven (set very low) to keep it warm for a few days. No spillage. I use a food thermometer to track the temperature. I got the idea [5]from the Shangri-La Diet Forums.

6. Whole milk better than low-fat milk. Whole tasted better.

[6]Harold McGee's recommendations.

1. <http://www.psych.upenn.edu/~saul/>

---

Jeremy (2009-06-17 13:42:47)

Re your No. 4: you don't say why you think using a new starter works better than continuing the culture you already have. Of course, it's your blog and you don't have to, but my experience is the opposite. My old batch is a better starter than a new pot of yoghurt. It could be the brand, but I feel that the culture has adapted to the way I make, and like, my yoghurt.

curious (2009-06-17 14:25:54)

Any experience with the room temperature yogurts?

seth (2009-06-17 14:32:21)

Jeremy, I really don't have any good idea why. Maybe long incubation kills bacteria. They run out of food. Curious, I put yogurt in milk at room temperature and it didn't turn into yogurt. More like kefir.

curious (2009-06-17 14:45:33)

Seth, I should have been more clear. I was referring to matsoni, viili and similar cultures. I like the yogurt I make, but the idea of not having to keep the culture warm is appealing.

Rose (2009-06-17 16:49:48)

Seth, Do you know the specific carbohydrate diet recommends 24 hour incubated yogurt as the cornerstone of its stomach health program?

seth (2009-06-17 18:24:49)

Curious, I haven't tried those cultures. Rose, I didn't know that. That's really interesting.

Ashish (2009-06-18 01:58:23)

I've been meaning to make yogurt for a while - great to have these tips. Pavel yogurt I know I've seen around, though I usually buy Fage. Who carries "Strauss"? (I guess it doesn't matter - the principle is that store-bought yogurts work, so I don't need to track down aged relatives for their yogurt culture. Cool.)

bennetta (2009-06-18 09:42:35)

Seth, Unlike most commercially available yogurt, Strauss is unpasteurized- a process that kills the bacteria (<http://www.medicinenet.com/script/main/art.asp?articlekey=50610>) . I am not familiar with Pavel yogurt, but a big deal was made out of Strauss being unpasteurized when I worked in the natural food industry. This may be the primary reason why it seems to work better. I'm a huge fan of unpasteurized, well, anything, really. Unpasteurized apple juice (Apple-a-Day in Sonoma County makes some) tastes nothing like the sterile stuff you buy in boxes and is absolutely delicious. Pasteurization really does seem to make food taste a lot less interesting.

Brody (2009-06-18 10:47:33)

I've found that I can get really thick yogurt by straining it afterwards (same process used to make Greek yogurt), rather than adding powdered milk or anything else. When I make yogurt, I heat the milk to almost-boiling, cool it to 100-110 degrees, stir in the starter, put it into a pre-heated crock from my crockpot, wrap it in a beach towel, and let it sit on a Seed Starter mat for about 24 hours. Then to strain, I put a few layers of cheesecloth in a strainer and set it over a pot for about 4 hours. Turns out perfectly gorgeously thick, and simple. I'm pondering trying to add a few different brands of yogurt (including Yakult drink) as a starter, to get as many kinds of bacteria as possible. This seems like it would be a good idea (to my untrained brain!). Thoughts on this?

seth (2009-06-18 11:09:23)

bennetta. I agree. Raw milk cheese tastes a lot better than pasteurized-milk cheese. Brody, I tried making yogurt using Yakult drink as a starter. I think it failed. When I eventually added - in addition - regular starter, there was no taste difference in the

final product. Those are interesting production details, thanks.

Brody (2009-06-18 19:00:22)

RE: Yakult & other live culture sources...I wasn't thinking taste difference as much as I was thinking about getting a wide variety of kinds of live cultures. I would imagine that greater variety of critters = better for us? I'm just guessing, I have no idea and no microbiology training.

seth (2009-06-18 19:07:11)

Brody, I agree, more variety of bacteria is probably better. Because I couldn't taste a difference in the resulting yogurt, I was unable to be sure that adding the Yakult had made a difference. Maybe all the Yakult bacteria died.

Jim Breed (2009-06-19 12:40:25)

Seth, Just one data point but my first batch of yougurt, I used a pint of store bought for the cultures. Good product quality. Second batch I used a pint from the first. Not nearly as good as the first.

Kimo Johnson (2009-08-16 21:36:54)

Slow Cooker (Crockpot) Yogurt This is a simple and very effective way to make perfect yogurt using a crockpot....no need to use the oven or a thermometer: Use whole milk or better yet, a good quality of powdered milk. Add milk in whatever quantity desired to crockpot, adding an additional cup or so of milk powder to increase potency. Cover and cook on Low for 2 1/2 hrs. Keep covered (don't peek!), disconnect crockpot power (remove plug from power source) and leave for 3 hours. Mix whatever active yogurt starter (Yoplait Yoplus, plain or flavored works perfectly and contains Acidophilus) you want into the warm milk..... 2 or 3 tablespoons is enough. Re-cover the unplugged crockpot, wrap the pot in a towel and leave overnight or 8 hours .Be sure not to open the pot during this period. The yogurt will be thick and retain the original starter organisms.

seth (2009-08-17 06:47:26)

Thanks, Kimo. I will try it. I am moving to Beijing tomorrow where I don't have a oven in which to keep the yogurt warm. I think it should be easy to get a crockpot.

Kimo Johnson (2009-08-17 12:29:09)

Seth, The crockpot we used while living in Hong Kong and Singapore was a Chinese brand, and worked great.....so Happy Yogurt Making in exciting Beijing!

Steve in W MA (2010-09-05 12:43:09)

Some observations: Yogurt made without denaturing the proteins by heating to 190F or above (in other words, just heat to 130) may result in a better Greek-style yogurt after straining because it will retain less of the whey liquid. Waiting for a crockpot to heat half a gallon of milk up would drive me insane. I just use a metal pan on the stove. Then, if I want to get the process started sooner, to cool the yogurt to the desired temperature (incidentally, I start my fermentation at 129F or so, not 110F) I pour it into a cake pan. The milk cools several degrees F per minute faster in a cake pan than in the pan I heated it in. I repour the milk back into my original pan, add the starter (I use a stick blender to mix it in), then cover the pan and put it in a styrofoam cooler for overnight. RE: viability of starter: The starter I use is yogurt that I froze in ice cube trays, then put the frozen cubes in a ziploc bag. I have made successful yogurt from 2 year old frozen yogurt cubes in the past. I usually use what's left over from my last batch as a starter, but after about 3 generations I will start fresh with a new frozen cube starter. However, you could also just wrap the pan in a blanket and leave it on the counter and get good results. I have also made yogurt without starter "accidentally" by leaving milk that had been heated up for drinking out overnight. This milk had already been heated in the microwave and I was going to drink it but forgot. When I found it 2 days later it was yogurt. I suspect it got recolonized by bacteria once it dropped below 130 and acidophilic strains lowered the ph while it stayed in the 130F-105 F range. There are lots of ways to make yogurt!

Steve in W MA (2010-09-05 12:52:10)

My overall point is that you don't need to overstress about keeping the yogurt warm. Particularly if you start the fermentation at a higher temp like 120-129F, simply wrapping a pot with a blanket or towels will be enough insulation in most cases. Or putting it in a cardboard box with a towel and putting crumpled newspaper all around it.

### **Scott Adams Accidentally Does the Shangri-La Diet (2009-06-18 09:57)**

From [1]his blog:

Recently I lost my sense of smell thanks to, I assume, some allergy meds I've been snorting. . . . My wife, Shelly, kept asking versions of the question "Do you smell that? It's awful!" But I never smelled that. . . . I think I also gave up something in the food tasting department thanks to my lack of a functional sniffer, but I'm okay with that too. I've dropped about eight pounds in the last two months because lately I'm not attracted to the taste of food, just its utility.

Thanks to David Cramer

More In related news, [2]a popular cold remedy causes anosmia. Thanks to Marian Lizzi.

Steve (2009-06-18 12:56:48)

From the Times "A Slimmer You May Be a Whiff Away" <http://www.nytimes.com/2009/06/18/fashion/18skin.html>

Nathan Myers (2009-06-18 13:01:50)

Zinc gluconate only causes anosmia if you snort it. Confine it to the bits of your nose you can reach with your finger, and there's no problem.

david (2009-06-18 13:17:08)

I prefer the zinc lozenges anyway. I find them very effective at stopping colds, especially when combined with adequate sleep.

Gerry (2009-06-19 06:22:38)

Sinus Buster is a nasal spray containing capsaicin pepper. A while back there was an article in Woman's World magazine about a side effect of using Sinus Buster: appetite suppression. Now there is a weight loss version on the market, probably a diluted version. (Aside: Woman's World has also featured an article on SLD). I bought the regular SB and have used it on occasion when I have sinus troubles but usually at that point I don't have much of an appetite anyway so I can't verify the appetite suppression effect.

marymary (2009-06-27 16:00:04)

I just feel the need to point out that not eating less because the food you eat is unappealing to you is not the same as eating less because your appetite to eat is diminished. You can't necessarily call this an example of the Shangri-la diet as it's theorized

to work.

### Acne Gone Thanks to Self-Experimentation (2009-06-19 08:57)

A year ago I told students at my friend's [1]Mohamed Ibrahim's school that [2]a student of Allen Neuringer's had gone on a camping trip and found that her acne went away. At first she thought it was the sunshine; but then, by self-experimentation, she discovered that the crucial change was that she had stopped using soap to wash her face.

Now Mohamed writes:

I told my classes about your friend who went camping without her face products only to discover that the face products were contributing to her acne, and that from that point on she only washed her face with water. It turns out that two of my students wash their faces with water! And their skin looks great! I started "washing" my face with water about a month ago, and [now] my face is acne free and soft as a pair of brand new UGG boots. [He had had acne for years.] The only additional thing I do is wipe my face with a napkin throughout the day to remove any excess oil.

So one cause of acne is using soap to wash your face.

Acne really matters. And it's common. It now turns out that it has a pathetically easy solution, in at least some cases. Dermatologists don't know this. Apparently hardly anyone knows it. Somehow the entire healthcare establishment, to whom we entrust our health in many ways, missed this. Dennis Mangan's discovery that [3]niacin can cure restless-leg syndrome is another example of a pathetically easy solution missed by experts. Likewise, the Shangri-La Diet is very different than anything [4]an obesity expert has ever proposed.

What else has been missed?

More Imagine a med student in a dermatology class. The student raises his hand and asks a question. "I read in a blog that acne goes away if you stop using soap. What do you think about that?" What would the instructor say - after telling the student not to believe everything he reads on the Web?

---

Anthony (2009-06-19 11:39:58)

I used to have some sort of psoriasis on my face and chest. I had it for 2 years as it got worse (going from minor bother to major problem). I went to my dermatologist, who prescribed topical corticosteroids. They worked really well. After about 2 years of using these, I asked my dermatologist "Am I going to have to keep using these forever? Are there any solutions to the cause and not just the symptoms?" He said nothing was proven. I went to the internet, and started reading. It looked like a certain kind of significant dietary change had worked for some people. I tried it out (it was basically cutting out certain things - refined sugar, wheat, red meat, nightshade plants, and a few other things - and replacing them with other things). About 9 months

later, the psoriasis (or whatever it was) was significantly diminished (without using corticosteroids). It has now been about 5 years. The solution for me was long-term dietary changes (the changes took a while after implementation). While waiting in an airport, I found out that these dietary changes have recently been popularized in a new book. I don't know if dermatologists generally suggest trying significant, long-term dietary changes for skin inflammation or not, but mine didn't 5-7 years ago.

seth (2009-06-19 13:01:51)

Anthony, that's good to know. Thanks for your comment. What's the new book?

Mickey (2009-06-19 13:06:08)

While it would be nice to think that all we have to do to get rid of acne is stop using those expensive cleanser and just use water - this is just anecdotal evidence you present. It would require a large clinical trial to be conclusive.

seth (2009-06-19 14:13:25)

Mickey, a large clinical trial isn't needed for this information to be useful. Anyone can try this. It's perfectly safe. You appear to find large clinical trials more interesting/helpful than the evidence in my post ("anecdotal"). But let's compare. The info in my post, which comes from several people and includes experimentation, can help millions of people deal safely, cheaply and incredibly easily with something they care a lot about. (Moreover it cost nothing to gather, unlike large clinical trials.) Do you know of even one large clinical trial that's been that helpful?

Anthony (2009-06-19 14:46:06)

Hi Seth, The book that presents similar dietary recommendations is called "The Ultramind Solution" (it presents a lot of other recommendations, too - I just skimmed it). For me I did basically 3 things: 1. Eliminate refined sugar, white flour, red meat, nightshade plants (tomatoes, potatoes, bell peppers, eggplant, in particular). 2. Add more Omega-3s (fish and flaxseed oil - this is basically why I originally was interested in your blog). 3. Give a long time (in my case, about 9 months in I was noticing significant results). Now if I go back to something resembling my older dietary habits, my old skin condition tends to start to come back. I have now added in sourdough bread (freshly made locally, I can't resist), and it seems to be fine.

Kirsten (2009-06-19 14:50:34)

My doctor just figured out that the cause of my acne was probably an overgrowth of candida yeast, leading to leaky gut syndrome. After four weeks on the anti-yeast diet, my skin is completely clear for the first time in 8 years. I've also dropped 9 pounds. Turns out my digestive imbalance may have been the cause of countless other annoying but seemingly minor ailments—from mood swings to constipation to bad reactions to certain medications. Fermented foods are prohibited on the initial phase of an anti-yeast diet. But since they can help prevent a candida overgrowth in the first place, I plan to introduce them fervently as soon as I can.

seth (2009-06-19 15:07:42)

Kirsten, why are fermented foods prohibited on the initial phase of an anti-yeast diet?

NNM (2009-06-19 15:35:01)

Kirsten: That's great that you found a doctor who accurately linked your acne (and other problems) to candida yeast. Can you tell us how many other doctors you saw who missed this? What alternative diagnoses did they propose? How did you find the right doctor? Regarding Mickey's point about clinical trials being "required" before you can conclude something: I work in the investing industry, where return on investment, adjusted for risk taken, is the ultimate goal. Seth's discoveries, and the "pathetically easy" other solutions he highlights on his blog, all have tremendously high returns on investment, with very little risk. A clinical trial, on the other hand, requires a huge investment of time and money, often with very little return in the form of new knowledge learned, and sometimes at significant risk to the patients enrolled. Furthermore, drugs that are discovered as a result of these clinical trials often themselves have low risk-adjusted returns for the patients who take them, when their costs, side effects, and the likelihood that down the road the establishment will revise its thinking about their efficacy are taken into account. Just to take one example: compare the risk-adjusted return on investment for society of the Shangri-La Diet to that of Fen-Phen, both of which targeted the identical problem. There is no comparison, even if SLD turns out to work only for

a minority of people.

karky (2009-06-19 18:04:48)

<http://mwilliamson.com/yeastdiet.htm> Due some digestive issues I recently had, I considered that candida might be the cause, so I looked into an elimination diet. Plain yogurt is included in the 1st phase, but no vinegar until the final phase. I don't know the reasoning. First, though I just eliminated corn/wheat as it is a less restrictive diet. So far it has been working, so I am going to nevermind the yeast thing.

Mickey (2009-06-19 19:15:02)

I have nothing against the kinds of self-experiments that Seth blogs about. I agree they can sometimes be useful in identifying new, effective treatments or methods. In fact these sorts of self-experiments (N of 1 trials) are published on occasion in the medical journals. But these are mostly useful as starting places for further research. And they are not at all easy. You'll notice that the researchers conducting these clinical trials always take care in eliminating variables, which is very difficult to do when you have an N of 1. Take this acne case for example. A proper self-experiment would require that all variable factors are controlled for - diet, exercise, sleep, medications, weight, other changes in health, etc. - before the experiment can be conducted. And the experiment would require more than washing the face with water and seeing what happens. We'd also need a self-control, which would be washing the face with both water AND soap. But because we have an N of 1, the two experimental phases would have to be separated in time, e.g. I use soap and water for 6 months then just water for the next 6 months, meanwhile keeping all the other factors constant. And lets say the soap doesn't help but my acne goes away with the water. Can we then conclude that the water cured my acne (or the soap caused it)? No, because the two treatments were separated in time. Its possible that just by factors of aging, I lost the acne as I got older, and the water/soap had nothing to do with it. This is why I hesitate to conclude anything from a self-experiment. They are difficult to conduct and in general, unreliable. I believe they are good starting places for more rigorous investigation, but unfortunately, controlled, sometimes expensive clinical trials are how we advance our medical knowledge. And they do yield results. Seth, you ask about clinical trials that are helpful. Pick up a copy of JAMA from the last couple years. There's dozens of papers of randomized controlled trials that reverse the thinking about a medication or supplement, e.g. Vit B doesn't slow alzheimers or reduce the risk of cardiovascular events, as previously thought from observational studies. Ginkgo biloba, a supplement that for years had been thought to prolong the onset on dementia based on observational studies, was found to have no effect after a randomized control trial was conducted. And one of the more famous (and incalculably helpful) studies was that done on HRT. Menopausal women were encouraged to take HRT because observational studies showed that women who took HRT had half the risk of heart disease as women who didn't. So millions of women were taking HRT. But then they did an RCT and it turns out that HRT actually increases the risk of heart disease! Not to mention stroke, breast cancer, and colon cancer. This study saved lives. Scientific rigor isn't always easy, cheap, or fun, but unfortunately, it is necessary.

seth (2009-06-19 19:37:24)

karky, what do you mean by "nevermind the yeast thing"? You mean the yogurt thing? You mean you are going to ignore the instruction to not eat yogurt?

seth (2009-06-19 19:56:09)

Mickey, thanks for your reply. "A proper self-experiment would require that all variable factors are controlled for." That's impossible. I have learned a lot from self-experiments that weren't "proper" as you define it. Your examples of helpful RCTs are revealing. Which is more helpful: finding that something incredibly easy (not washing face with soap) works or that something moderately expensive (ginkgo biloba) doesn't work? Or that something cheap (Vitamin B) doesn't work? I choose the first. I agree that the RCT about HRT was indeed really valuable. But it is telling that this example is a case where the research merely undoes harm done by other research. In other contexts that's called a protection racket. I don't think "scientific rigor" is "necessary" for the info in my post to be helpful. If you have acne you can simply try it and see what happens. The evidence can be improved (as is always the case), but that doesn't mean it's worthless, which is what "necessary" seems to imply. If you had acne and washed your face with soap, would you - after reading my post - see what happens if you stopped washing your face with soap? Or would you wait for a large RCT?

NNM (2009-06-19 21:45:19)

Whether they realize it or not, aggressive advocates of randomized control trials as the only way to "conclude" that X causes Y belong to the medical branch of a larger philosophical tree whose trunk is the work of David Hume. I'm not an expert, but I believe Hume was the father of what we think of as modern scientific skepticism. What's ironic is that if you examine Hume the person as opposed to Hume the philosopher, you'll find a man much more concerned with improving his daily life and with "what works" than with the search for pure scientific rigor that he pursued in his professional life. Check out this famous letter he wrote as a young man to a noted doctor, in which he describes what is commonly referred to as his nervous breakdown. He was a self-experimenter (N of 1) par excellence: <http://serendip.brynmawr.edu/exchange/davidhume> My favorite excerpt: "I began to think of something more effectual than I had hitherto tried. I found, that as there are two things very bad for this distemper, study and idleness, so there are two things very good, business and diversion; and that my whole time was spent betwixt the bad, with little or no share of the good. For this reason I resolved to seek out a more active life . . ." Here is another excerpt, from his "Treatise of Human Nature," in which he describes his practical cure for the psychological anguish caused by the kind of pioneering skeptical philosophy he pursued: "I am confounded with all these questions, and begin to fancy myself in the most deplorable condition imaginable, invironed with the deepest darkness, and utterly deprived of the use of every member and faculty. Most fortunately it happens, that since reason is incapable of dispelling these clouds, nature herself suffices to that purpose, and cures me of this philosophical melancholy and delirium, either by relaxing this bent of mind, or by some avocation, and lively impression of my senses, which obliterate all these chimeras. I dine, I play a game of backgammon, I converse, and am merry with my friends; and when after three or four hours' amusement, I would return to these speculations, they appear so cold, and strained, and ridiculous, that I cannot find in my heart to enter into them any farther. Here then I find myself absolutely and necessarily determined to live, and talk, and act like other people in the common affairs of life." These are not frivolous excerpts or digressions. Hume knew he had a big problem: He had already experienced one episode of major depression, and was committed to a profession, to a mode of inquiry (something approaching philosophical nihilism), and to a lifetime of unpopularity as a result of his attacks on religion that made him prone to even more depression (today it is thought that those who have suffered one occurrence of major depression have an over 50 % chance of recurrence, and I suspect that rate is ever higher among professional philosophers, notwithstanding the advances in psychiatry between now and then). But he set out to solve this problem Hume with self-observation and self-experimentation, and never again had another breakdown. In fact he became known as one of the most cheerful, likable, and personally happy philosophers who ever lived. I consider this a remarkable accomplishment.

Stephen M (Ethesis) (2009-06-20 09:21:15)

I hadn't thought of it, but when I started washing my face regularly and the acne went away, I was generally washing with just water. I wanted to start washing regularly but was busy and so just washed with water and a washcloth. It did the job so ... You've made me think.

karky (2009-06-20 11:41:32)

Seth, I decided it probably wasn't candida, so I did not go on the yeast elimination diet. I only cut all corn/wheat products out. I still am drinking my kefir and my ACV every day. My issue stopped the first day I cut out the corn/wheat, so I concluded that was causing the problem. I talked more about it over on my thread. I also have no acne and only wash my face with water, I have washed my face with only water for at least 20 yrs. In high school I used soap and water and zit cream and had plenty of acne.

Anthony (2009-06-20 11:52:49)

"I hesitate to conclude anything from a self-experiment." This is nonsense. You're concluding things from self-experiments all the time - you just don't call them "self-experiments."

wcw (2009-06-20 14:08:01)

Google "acid mantle". Some people (like my wife) just can't wash their faces with soap and keep their skin in shape. Most can, though you still don't want to overdo it.

jim (2009-06-20 16:50:37)

I guess I'm a bit of a counter example to the 'wash with water' acne cure. In my teens and 20s I had terrible acne over my face, chest and back. My face and chest were washed daily with soap (in the shower), but never my back, which was only rinsed by water. The acne was pretty much the same everywhere. Nothing much helped it till I took a course of accutane in my mid-20s.

Robert Reis (2009-06-20 21:42:30)

A very expensive call girl of my acquaintance was carded in nightclubs at age 40. She never used soap.

Jeremy (2009-06-21 20:45:40)

In response to Mickey's comments about controlling for confounding variables, the less time-expensive solution is randomization, just like with larger clinical trials. For the acne case, the self-experimenter could flip a coin at the beginning of each week to decide whether to wash their face using or not using soap and record results at the end of each week. Any variable not connected with the presence or absence of soap has an equal chance of acting in any given week. If any unknown variable correlates with the use of soap, who cares? The experiment is less interested in proving or disproving "Washing without soap causes less acne" than demonstrating that "there's less acne when washing without soap." Further, such self study may demonstrate a solution that works for an individual, but may not work for a larger population as would be necessary for a definitive conclusion from a clinical trial. The trouble with the randomization I described is that it requires that the self-experiment be both disciplined and organized, but flexible enough to not fall into a routine "but alternating 6-month samples fails to control for seasons as a variable, so that's one for one.

seth (2009-06-21 22:52:44)

Jeremy, in practice much simpler designs work fine. For example, suppose you have recorded your acne daily for six months. You stop using soap and all of a sudden the measurements go much lower than usual and stay there. That's almost proof right there. If after a few weeks you resume using soap and then the acne comes back, that's all a sane person would need.

Kirsten (2009-06-22 09:47:15)

Hi all- Seth: They keep fermented foods out of the diet for the first phase because your gut is irritated and is leaking food into your bloodstream, which causes problems in other areas of the body. The theory is that fermented foods (or even just acidophilus) will irritate you further until you kill the yeast and heal your gut-at which point, they will become essential. (Spicy foods are prohibited too, for pretty much the same reason.) NNM: I have an \*extremely\* good doctor who I started seeing only about a year ago-and he spotted this during a chat about something else completely. The interesting thing is that I had discussed many of my yeast-related symptoms with other doctors over the years-including acne, terrible reactions to birth control pills (including anxiety and mood swings), allergic reactions to allergy medications (steroids), persistent stomachaches that weren't helped by stomach remedies. But the doctors had no answers, and I felt these were annoying rather than important ailments. Really, I thought of myself as a very healthy person. I was in for something else and my doctor was prescribing me an antibiotic, so we were discussing any other medications I was on (none), compared to what he'd prescribed me in the past. The trigger was when he asked how I was doing with the low-dose Prozac he'd prescribed to treat PMDD. I told him I'd used it for about two months, but that the issue had gotten much better when I removed white flour and white sugar from my diet. Then he started looking at my reactions to medications and some of my medical complaints, and realized they formed a pattern. Most doctors don't do this or listen anywhere near as closely. A friend of mine has gout, which his doctors tell him is triggered by red meat, organ meats, and wine. In his experience, though, it seems to be triggered by sugar, and not at all by those other things.

Jeremy (2009-06-22 13:38:27)

Seth, as with so much else in life, there's often a tradeoff between how sure an experimenter wants to be and how much effort and resources the experimenter is willing to commit to that certainty. The method I presented was merely an answer to Mickey's desire to rule out the influence of confounding factors with only one research subject, at the expense of simplicity for that subject's experience. I'd be impressed if anyone has a method that works for undisciplined self-experimenters who are neither prone to the organization to randomize and record their washing habits or routine to stick to either method for any

length of time.

Cord (2009-06-22 18:19:14)

Self-experimentation is the only way to deal with acne, IMO. All the standard advice (wash more, it'll go away when you're older, use acne cream, don't pick at it!) is totally useless. I discovered long ago that I did better by not using soap on my face. And later, I used the RPAH elimination diet to experiment until I pinned down the remaining causes of my acne: wheat and chocolate. My face has been wonderfully clear for a couple of years now, except the two or three times I have been lured into eating baked goods over the holidays. But talking with other people who've eliminated their own acne... not everyone's acne is caused by the same things. So since there's no uniform cause, it's a cinch there's no uniform cure either.

Seth's blog » Blog Archive » The Pashler-Roberts Law: Expense versus Honesty (2009-06-23 06:11:36)

Seth's blog » Blog Archive » Acne Self-Experimentation: Why It's Promising (2009-06-24 23:29:54)

[...] Acne Gone Thanks to Self-Experimentation [...]

Walter (2009-06-27 19:42:43)

Seth, Could the washing with soap be changing the ratio types of bacteria so that the acne bacteria runs amok? Sort of like the inverse of your fermented food idea. Walter

seth (2009-06-27 21:56:21)

Walter, that's an interesting possibility. The usual explanation is that washing your face with soap washes away oils that are then generated in too-large amounts to try to make the face oily again.

Janet R (2009-06-30 11:05:44)

Actually, standard advice is to never use soap, never use bar cleansers of any type because solids leave behind residue that is hard to wash off that irritates the skin, and to not use any type of cleanser more than 2 times per day because it dries. Instead, the recommendation is to use a gentle liquid cleanser such as Clean and Clear, Cetaphil, Suave's facial cleanser, or a few similar ones, as simple as possible, no additives and clear in color if possible, and never anything that tingles because that means the skin is being irritated. See Paula Begoun's book. I got rid of my acne based on clinical trial results. Initially I was using benzaclin, a prescription cream that is a mixture of antibiotics and 5 % benzoyl peroxide. It worked well but I read the package insert and noticed that the t was barely significant between the prescription and just plain 5 % benzoyl peroxide, so I started using just plain 5 % bp and that was equally effective, though slightly more effective because it was cheaper by an order of magnitude so I felt okay using lots of it. I buy it for \$2 a tube online, versus \$20 as my prescription copay. There was a self-experimentation aspect, in that I started using the benzaclin in large amounts because I noticed it was close to the end of its effectiveness date and I wanted to use it up, and it was more effective that way. Turns out that using a lot of b.p. is a common way to get rid of acne, as a guy who owns acne.org turns out to have also "discovered" the same thing.

Dennis Mangan (2009-07-04 11:04:04)

Seth, wasn't sure where to post this, but you'd find it interesting I think. It supports the dirt hypothesis. PMID: 19177167 "Crohn's disease and early exposure to domestic refrigeration. BACKGROUND: Environmental risk factors playing a causative role in Crohn's Disease (CD) remain largely unknown. Recently, it has been suggested that refrigerated food could be involved in disease development. We thus conducted a pilot case control study to explore the association of CD with the exposure to domestic refrigeration in childhood. CONCLUSION: This study supports the opinion that CD is associated with exposure to domestic refrigeration, among other household factors, during childhood." Also, this <http://www.pnas.org/content/105/43/16413.long> "Therapeutic correction of bacterial dysbiosis discovered by molecular techniques" states that "Molecular analysis of fecal and mucosal samples have increased culture-based estimates of 200â€³300 individual colonic bacterial species to as high as 1,800 genera and 15,000â€³36,000 species (7). "

seth (2009-07-04 15:15:54)

thanks, Dennis, a fascinating study about refrigeration.

Mark Jayson (2010-02-12 10:10:25)

Water is one of the powerful solvent in earth. didn't you ever notice that God created us in NATURE way.meaning to say like adam and eve way back long time ago,they don't use soaps,they just use water for cleansing.

Melissa (2010-06-17 13:05:55)

I use organic aloe gel to wash my face. It isn't drying & I rarely get acne. Aloe is moisturizing & the water just sort of dries things out worse if that is all you use.

Genius (2010-11-15 12:31:32)

For people who don't wash their faces with soap: do you continue to use benzoyl peroxide? Do you use shaving cream when you shave?

pinn (2011-11-25 16:58:48)

My classmate once told me that she was weird out by knowing that most girls usually have face cleansing soap in their bathrooms. Then I asked her, what did she use then? She only washes her face with salt( of course with water also..) & I can say that her face is flawless ( like baby's skin) . She only gets a zit when she has her period though but her skin is flawless most of the time o.o

michael (2011-11-29 05:07:55)

Fascinating discussion - glad I found it. To play devils advocate though, what about the health risks of poor hygiene, which were conclusively proved at hospitals during the 1800s? I'm all for using less soap on the face, but its still important on your hands.

Seth Roberts (2011-11-29 11:16:21)

I'm all for using less soap on the face, but its still important on your hands. I agree. I still use soap on my hands several times/day.

## **Fermented Food in Africa (2009-06-19 15:40)**

Michael Bowerman writes from Kenya:

First, I've made a point of eating yogurt daily and have had no stomach problems in a month of eating here. May be coincidence as I haven't eaten at riskier spots, but most others I know here have had some problem during their stay. I did drink one yogurt which tasted foul, and realised it was past expiration. I wonder if my perception that it was foul was culturally indoctrinated, or a useful rejection of spoiled food. What is the relationship between fermentation and true spoilage?

Second, reading Nelson Mandela's autobiography he talks about a traditional drink of his tribe, the Xhosa, called amasi - fermented milk. He writes about how much he loves the taste during an anecdote where fermenting the milk on his window ledge while staying at a safehouse in a white neighbourhood draws the attention of passing Africans who are wondering why "their" milk is in the window. I wonder if he would have liked my "spoiled(?)" yogurt? I haven't looked for commercial versions yet, but will.

Third, a Sudanese friend told me that the Sudanese have a drink made from cow's blood, urine, and fermented milk. The only part I was incredulous about was the urine but it seems cow and camel urine have been drank by other cultures – there is a urine-based soft-drink being released in India called Gau Jai. I found [1]this site which documents the extensive fermentation in Sudanese culture – meat, milk,

urine – including "...mish, which is made by prolonged fermentation to the extent that maggots thrive in it. The product is consumed whole, with the maggots included. These two products are closely related to Egyptian mish (1)."

1. <http://nzd1.sad1.uleth.ca/cgi-bin/library.cgi?e=d-00000-00---off-0hd1--00-0----0-10-0---0---0direct-10--4-----0-11--11-en-50---20-about---00-0-1-00-0-0-11-1-0utfZz-8-00&cl=CL1.1&d=HASH8403ef70002be1ecf3acbb.4.3&x=1>

---

Karina (2009-06-26 18:07:22)

I lived and studied in Russia twice for a total of over a year, and never had a gut or stomach problem. A number of fellow foreigners had such issues (especially if they drank the municipal tap water or ate street food). Though I might just have a strong system (I would later eat street food in India with impunity), I still credit my health during those times to the fact that I had plain kefir every day, at least two to four servings of it (a marvelous food, and can be found pretty much at every convenience store or grocery or market in Russia). I didn't eat it for the protective use, but I loved the taste of it – nothing like it in the USA. And I consumed a fair share of tap water, to boot.

### Ray Bradbury is Unclear on the Concept (2009-06-20 06:31)

I completely agree with [1]Ray Bradbury about libraries:

“Libraries raised me,” Mr. Bradbury said. “I don’t believe in colleges and universities. I believe in libraries because most students don’t have any money. When I graduated from high school, it was during the Depression and we had no money. I couldn’t go to college, so I went to the library three days a week for 10 years.”

Here’s what he says about a similar source of free knowledge:

“The Internet is a big distraction,” Mr. Bradbury barked . . . “Yahoo called me eight weeks ago,” he said, voice rising. “They wanted to put a book of mine on Yahoo! You know what I told them? ‘To hell with you. To hell with you and to hell with the Internet.’”

“It’s distracting,” he continued. “It’s meaningless; it’s not real. It’s in the air somewhere.”

When I was in college (at Caltech), I didn’t find classes or books very helpful. I liked reading old New Yorker articles. Which then I got from the library but now I’d get online.

1. <http://www.nytimes.com/2009/06/20/us/20ventura.html?em>

Aaron Blaisdell (2009-06-20 07:21:11)

Well, college is not a one-size-fits-all. There is too much reliance on college these days. There are a lot of students going to college who have no business doing so, probably in part because college is a business. But, in defense of colleges/universities—I've thrived in and on them. They fit me like a glove and allowed me to flourish and be creative. And they continue to do so now that I'm a professor.

seth (2009-06-20 09:07:30)

Aaron, I agree. About the students "who have no business doing so", I'd put it differently. I'd say there are many students who are forced to go to college.

Stephanie O (2009-06-20 09:17:32)

I didn't know you went to Caltech (new reader here). Did you see this article in Engineering & Science? <http://eands.caltech.edu/articles/LXXII1/mazmanian.pdf>. It's all about beneficial bacteria, mostly with respect to irritable bowel syndrome (where they've been doing the science with mice), but making suggestive connections to asthma, eczema, and even diabetes. I'm making my second batch of yogurt today. :) It's fun!

Andrew Gelman (2009-06-20 12:09:15)

One advantage of the library is that going there gets you out of the house.

Esta en el aire, en alguna parte (2009-06-20 13:04:38)

[...] Visto en esta página. [...]

Nansen (2009-06-22 17:17:06)

It's hard to believe that you prefer online to print for reading articles and books, unless your monitor has very high resolution.

Michael (2009-06-25 06:47:51)

"To hell with you and to hell with the Internet." Har! Ray Bradbury is cranky old man of the day. Fantastic!

Cliff Styles (2009-07-01 14:34:41)

Bathetic. The internet is 'A Medicine for Melancholy'.

Rodney (2009-08-26 23:21:33)

I love Ray Bradbury. Every April he gives a speech at UCLA during the Festival of Books and I love to hear him speak. He's so inspiring. However, I think he's wrong about the Internet and he's certainly entitled to his own opinion. I think the Internet is now for good or ill (and more often good than ill) the new library of the world. It takes an entirely different set of skills to manage it though. And the Internet, along with email, can certainly be a distraction.

## **Wise Government: San Francisco Subsidizes Solar Power (2009-06-20 19:30)**

People in power, by and large, are terrible problem-solvers. They like the status quo – it brought them where they are. They have a hard time seeing the benefits of change. The bigger the change, the less they like it. Thus self-experimentation, a new way of solving health problems, [1]offends med school professors.

But sometimes people in power make a wise choice – possibly by accident. An example is how the City of San Francisco is encouraging solar power. They are giving huge subsidies to homeowners and renters who install electric power. The program is about a year old. If your income is low, the subsidy is so large that your power becomes almost free. This is a use of government money that encourages change and new solutions. It will help the local solar power industry grow. It might create a solar power hub near San Francisco the way defense department subsidies helped create

Silicon Valley.

Why is this happening? Because the responsible department in San Francisco government gets \$100 million/year by selling electricity from hydropower. (Which they don't like to talk about, for obvious reasons.) The money can't be transferred to other departments; it has to be spent in energy-related ways. On its face, the restriction seems cruel – why not use the money to help social services? But more money for social services is unlikely to improve the local economy. Whereas this use of the money helps poor people and the local economy. It does so in the basic way Jane Jacobs recommends: It empowers those who benefit from change – in this case, the solar power industry.

---

thehova (2009-06-21 08:54:13)

And this is why the most resourceful state in the country is going bankrupt. Have fun with solar while the federal government saves your financially irresponsible state.

Glen Raphael (2009-06-21 09:12:17)

The obvious alternative option would be to just lower the rates they charge, enabling homeowners everywhere to self-experiment with other ways to make their life better via the money they save on poer. Is it so obviously a great idea that we should overcharge users of hydroelectric - another renewable energy source - to subsidize users of solar power in forms that are currently too inefficient to be worth installing on their own? Attempts to create a "hub" are almost always money-wasting boondoggles. A "hub" is a fine thing to have when the thing that hub is producing is worthwhile on its own. But the point is the production. When the goal is simply to have a "hub" and the thing that "hub" is producing requires massive subsidies to be competitive, you're just turning a short-term commitment to fund bad ideas into a persistent, long-term commitment.

seth (2009-06-21 09:32:38)

Thanks for your comment, Glen. You're exactly right – it isn't so obviously a great idea. That's why I wrote about it. That's why Jane Jacobs wrote her books: what she was saying wasn't obvious. And that's why I'm essentially repeating her. Given the basic fact that economies must innovate to stay healthy, it is stunning how little space intro economics textbooks devote to innovation – especially how to nurture it. To simply give homeowners money, as you propose, does nothing to increase innovation. So if you need innovation – as all economies do – that might not be the best use of extra funds. Does solar power now require massive subsidies to be competitive? Yes, in the beginning all new ideas require subsidies to grow. If you've read a lot of this blog, you may realize that this is my explanation for art, ceremonies, gift traditions, and a few other things: our enjoyment and willingness to pay for this stuff had, long ago, the effect of subsidizing innovation. Xmas cards require fine printing, for example – so Xmas subsidizes fine printers. See [1]my posts about human evolution for more examples. Will solar power always require massive subsidies to be competitive? Unlikely. As more experience develops, efficiency will go up and costs will come down. Not to mention the price of alternatives going up.

1. <http://www.blog.sethroberts.net/category/human-evolution/my-theory-of-human-evolution-directory/>

thehova (2009-06-21 11:35:35)

I came across a bit nasty this morning. I apologize. But I do think it's a gamble to massively subsidize specific forms of energy like Germany does now and many want the US to do. It could crowd out better forms of energy.

seth (2009-06-21 12:04:16)

In China they give rebates for electric cars – so consumers put energy into finding which is the best. It is better than the government choosing winners, I agree. In the case of San Francisco, it isn't obvious what small-scale alternatives exist to solar power. So It's unclear what forms of power are being "crowded out."

thehova (2009-06-21 20:07:00)

"I agree. In the case of San Francisco, it isn't obvious what small-scale alternatives exist to solar power. So it's unclear what forms of power are being "crowded out." " point taken. I was a bit confused about that for some reason. Smart structured subsidies which avoid the corruption of "picking winners" does seem like reasonable policy.

Glen Raphael (2009-06-22 10:34:00)

"As more experience develops, efficiency will go up and costs will come down." I agree that's the general case for new technologies, but I'm not convinced the sort of subsidies you're talking about help with that. If that happens here it might be \*despite\* the subsidy rather than due to it. My contrary intuition is that if you provide a subsidy, that reduces some of the competitive pressure that would otherwise tend to drive costs down. Without the subsidy, only the most super-efficient providers can stay in business; the less efficient companies and technologies go bust. With the subsidy in place, inefficient companies and technologies and workers can afford to stick around longer; the average level of cost and efficiency over the local industry will be much \*higher\* than without it. Relative-money prices send messages throughout the economy about what is and isn't worth doing based on the current level of available technology; taxes and subsidies tend to reduce the information content of those messages.

Glen Raphael (2009-06-22 11:11:49)

When the US protected its steel industry from foreign competition via import tariffs and quotas, that protection undoubtedly increased the amount of steel the big mills produced. The mills were bigger, had more income, employed more workers than they would have without the protection. One might theorize that this concentration of effort could lead to economies of scale and improvements in efficiency, leading those big US steel mills to dominate the world market. Is that what actually happened? US auto industry quotas and subsidies: same question. Or computers: how did Japan's "Fifth Generation" project turn out? Or, heck: Japan's protection of the domestic rice industry, or US protection of the domestic sugar industry. Did US beet sugar get more competitive with foreign cane sugar after we instituted that policy? When the government props up a local industry in order to "make it more competitive" my impression is that this usually ends up making that local industry \*less\* innovative and competitive, not more. I'm undoubtedly suffering from availability bias, so: can you suggest some counterexamples? (The Lockheed example only gets half credit because the point there was \*buying a specific product or service, at any cost\*; supporting local industry was a side-effect. Here you're talking about a policy where supporting local industry is the main effect.)

Anthony (2009-06-22 12:20:08)

@Glen, I think it really depends on the form of the subsidy, the direction of the industry, and so on.

Tom in TX (2009-06-22 19:37:42)

It is way too early to call this move "wise". Ten years from now, if the solar-generated electricity is costing the taxpayers \$1000/kWH, it may not look like such a good idea. But it will be hard to do away with it, because every dollar of subsidy is a dollar of income to the guy who gets it.

Nathan Myers (2009-06-23 11:31:10)

People who retrofit water-heating apparatus to the backs of their solar-electric panels are finding that it extends the life of those panels from less than 10 to more than 20 years, apparently from the effect of keeping the panels cooler. Besides the intrinsic interest of the idea, and the value of the hot water, it's interesting that we don't hear much otherwise about how long the panels are expected to last. It's not in the interest of the manufacturers of panels to promote means to make them last longer, or (moreso) to call attention to limited life. It might give a competitive advantage to a manufacturer that only makes integrated water-cooled panels, but I don't know of any. California's fiscal problems are a consequence of its peculiar Constitution, the ballot initiative system it prescribes, central ownership of media, and its miserably bad primary and secondary education apparatus.

Rodney (2009-08-26 23:15:57)

Seth, Here's my question. How does a government decide which forms of alternative energy it should subsidize? Are there

other types of power they could subsidize as well? I wonder if they could instead of choosing solar make a list of types of power they would subsidize. However, more options may dilute the effectiveness of the subsidy. It might be better to subsidize one industry to get it to grow and then try subsidizing another form of alternative energy once solar get going. What do you think?

## Scorpion Stings, Bee Stings, and the Umami Hypothesis (2009-06-21 22:17)

Someone who lives in the southwestern US posted this on a helmenthic therapy forum:

One [scorpion keeper] reported how a pain in his leg from a motorcycle accident that had been with him for years spontaneously resolved after getting stung by some fairly nasty [scorpion] . . . . It's fairly well-known that beekeepers don't face the same risk from arthritis as the general public.

I haven't managed to find support for this "fairly well-known" idea. But it's quite plausible because [1]bee stings are used to treat arthritis and multiple sclerosis. In [2]this video, an Indonesian therapist says that 85 out of 100 sufferers are "cured" by the treatment.

"A therapy most of us would find taboo," says the narrator of [3]this video. I wonder. Here's what [4]Wikipedia says:

There is no known cure for [multiple sclerosis]. . . [5] MS medications can have adverse effects or be poorly tolerated, and many patients pursue alternative treatments, despite the lack of supporting scientific study.

Multiple sclerosis and some forms of arthritis are autoimmune disorders. My "[6]umami hypothesis" says that autoimmune disorders and other immune disorders, such as allergies, are deficiency diseases. They are caused by not enough immune-system stimulation – stimulation that long ago we got from bacteria-laden food. This suggests a new interpretation of what's going on with bee-sting therapy. Their healing properties have been attributed, at least in these videos, to special properties of the venom. The umami hypothesis suggests that the foreign proteins in venom calm the immune system and that quite different foreign substances would do just as well. I don't know of anyone treating arthritis or MS with fermented food – but before the Shangri-La Diet, I didn't know of anyone drinking sugar water to lose weight. The fact that such hugely different agents as [7]hookworms, bee stings, and fermented foods have similar effects is considerable support for the hypothesis. Without the hypothesis, no one would have grouped them together.

Now I wonder about acupuncture: Could it work, at least some of the time, because it injects foreign substances? Surely acupuncture needles put plenty of bacteria into the body. This line of thought explains why [8]stabbing a knee with a scalpel apparently helps arthritis (and involves a lot less hand-waving than calling that result a placebo effect). Keep in mind that this is the hallmark of deficiency diseases: They get a lot better, almost miraculously and without side effects, if you supply even a little of what's missing. The cure rate can be very high.

PS (2009-06-21 22:55:37)

I know in Yunnan province scorpion bites are part of Chinese medicine - but I can't recall what for [and a quick Google doesn't help]. I'd ask around some of your local friends, if you're still in China.

Aaron Blaisdell (2009-06-22 06:58:20)

Technically that would be scorpion stings. As far as I know scorpions don't bite (with mouth parts) except when they are eating small insect (which of course they have to bite in order to eat). But the sting (at the end of their tail) can be nasty. During my teenage years, I was stung by a scorpion at a boy scout camping trip. It hurt but I had no other reactions. I've been stung by bees innumerable times throughout my childhood and a wasp once or twice.

Glen Raphael (2009-06-22 09:09:48)

Wow! That is a really interesting idea. If acupuncture is just a special case of hormesis, that implies accupuncturists who do an especially good job maintaining a sterile environment could easily have \*worse\* results than those who are less careful. It gives us a non-woo hypothesis to explain why one particular accupuncturist might have great results in his office which can't be reproduced by other accupuncturists or via the same interventions performed in a carefully controlled laboratory experiment somewhere else.

Fly Sky (2009-06-22 19:13:37)

I'm from China, scorpion is one of the Chinese Medicines which can be used to treat the arthritis and pains such as side-headache, you can get some infomation from this url: <http://bbs.gltcm.cn/thread-44779-1-1.html> (in Chinese:)

beagle (2009-06-23 00:59:38)

The only "conventional" treatment for MS that I'm aware of is LDN (Low Dose Naltroxene). It's conventional in the sense that it's artificially manufactured. But despite showing great promise, it's not in the focus of any conventional research.

Seth's blog » Blog Archive » The Wonders of Tumeric (2009-07-15 20:53:28)

[...] Is this another example of foreign substances reducing arthritis? (Not to mention other immune disorders.) Or something different? I don't know but it's really interesting. [...]

Seth's blog » Blog Archive » "Kombucha Reconsidered" (2009-08-28 03:49:13)

[...] This is also a reason that theory is important. John Tukey, the statistician, spoke of "gathering strength" when analyzing data. It is rare that a single body of data tells you how to analyze it, he said. (For example, what transformation to use.) You should use similar data sets to help decide. Scientific theory has the same effect. Before I started drinking kombucha, I didn't have obvious digestive problems (unlike a friend) and my immune system seemed to work well. So it wasn't easy to measure its effect. Yet I drink it and am untroubled by the evidence that worries RVM because I have a theory: the umami hypothesis (that we need a steady intake of bacteria to be healthy). This allows me to assess the effect of kombucha — whether it is likely to be good or bad — with the help of evidence from other bacteria-rich food (yogurt, natto, etc.) and much different data (the effect of bee stings on arthritis, hormesis, epidemiology, the effects of turmeric, etc.). Because the umami hypothesis appears to be true, apparently bacteria intake is beneficial — and kombucha has lots of bacteria. [...]

Bee Keeper (2010-06-22 18:35:16)

Wow! This finding was interesting! If bee sting can treat arthritis then it has its advantage. Thanks for posting this very relevant

blog.

Val Quinnell (2010-10-11 06:12:10)

I live in Almeria, Spain and have suffered from arthritis in both my wrists for several years. In June 2010 I was stung by a scorpion on my right index finger. It was extremely painful for two days but lo and behold, a week later there was no arthritis in my right wrist. It is now October 2010 and still clear. Is there any homeopathic treatment using scorpion venom? It would be nice to treat the other hand but I am not keen for direct contact with a scorpion again!

Nick (2012-03-04 18:42:18)

My grandfather is active, healthy and in his 100th year of life. As a fisherman, he typically gets stung with "poisonous" fish while cleaning his nets. The poison now has no effect on him but known to cause sickness and death in others.

### **Smart Spam (2009-06-21 23:09)**

I just got a spam email from a company in China offering to sell me crystalline fructose. I have bought far more than my share of crystalline fructose (that's how I originally did the Shangri-La Diet) and I live in China part of the year. How in the world did they know?

---

rod (2009-06-22 03:51:49)

Seth: i don't see any contact info anywhere on your site so I apologize for posting this here, but I found your experiment pertaining to "standing on one leg" and it's correlation with sleep to be absolutely fascinating. I would greatly appreciate it if you would write more posts or conduct more experiments pertaining to sleep/energy as I really found your approach of seeking optimal levels to be very refreshing and unique.

Tom Moertel (2009-06-29 15:02:42)

"How in the world did they know?" They didn't. Your spam filters, however, did know, and because they are strongly biased against marking legitimate email as spam (i.e., reporting a false positive), they started letting related spam flow into your inbox. In more detail, when you bought far more of your share of crystalline fructose and when you were in China, you trained your spam filterers that those topics are more likely to be legitimate by marking legitimate email containing those topics as "not spam." Thus when spammers sent you spam about every conceivable topic "and they do" the subsets of that spam mentioning crystalline fructose and China were less likely to meet your filter's it's-spam threshold, and some of those spams slipped into your inbox. So the spammers don't know anything about you, other than your email address. But they do send spam about everything, and your spam filter selects the subset of everything that is similar to your past legitimate email, thus creating the illusion that the spammers are targeting your interests.

### **One Woman's Shangri-La Diet (2009-06-22 14:59)**

From [1]the SLD forums:

It has been two years since I started [SLD], and I just couldn't think about changing this simple, natural

way of life that has given me such peace and freedom. I often think of a comedy skit I saw on t.v. some time ago where this guy was given a new electric sander as a gift, but kept using it without plugging it in.

To try to lose weight without SLD is like not plugging in an electric sander. Other weight-loss methods work; they're just much harder, like a sander versus an electric sander.

In her sig file she describes her method and results:

48 years old, 5 feet 4 inches

March 7 160

May 8 119

May 9 116

1-2T OIL/day AND/OR N.CLIP 300-500 calories food.

CFF daily.

To sustain weight loss: Eat fewer calories; enjoy the food you eat; low G.I.; only highest quality.

Don't assault your precious body with empty calories.

N.CLIP = noseclip. CFF = calorie-free flavor. See the SLD forums for more about them.

To lose 25 % of your weight and go a year without regain is a huge accomplishment.

1. <http://boards.sethroberts.net/index.php?topic=6713.msg79998#msg79998>

Nathan Myers (2009-06-22 17:38:40)

Off-topic... my seven-year-old son, who said he had had a canker sore for months, reported after a week taking sardine oil capsules, sporadically, that he can't find it any more. He says it stopped hurting the second day. He had been violently skeptical, always hated swallowing pills or capsules, and utterly refused oil. Now he takes the capsules eagerly.

seth (2009-06-22 17:48:21)

very interesting, Nathan. Why did he start taking sardine oil capsules?

Nathan Myers (2009-06-22 18:19:06)

My daughter is taking them; she has Asperger's, and reports that she feels less anxious after taking a few. In particular, she notes she doesn't feel a need to gallop around the room on all fours. We have interpreted that behavior as a compensation for the reduced joint and muscle stress sensation common in Asperger's kids. Flax oil capsules, by the way, had no noticeable effect. (Score one for 20-base acids, vs. 18-base flax oil? Autism spectrum kids often have various metabolic deficits.) I had asked my son, just incidentally, if he had any canker sores, and was surprised when he said, very offhandedly, that he'd had one for months. He might have mentioned it, or a previous incident, and been told there was nothing to be done, and was just living with it. He refused to consider chewing up walnuts; as a two-year-old he had painful reactions to them, and still won't touch them. He consented to let me apply a drop of fish oil directly to the canker sore, but complained for hours afterward of nausea from the odor. I was surprised when he asked for a capsule to swallow the next day. (These are big 1.2g gel caps.)

Darrin Thompson (2009-06-22 19:46:28)

My kids' doctor who specializes in care of autism kids recommends that they get fish oil and not flax. Her reason, iirc, is that they lack the ability to convert ALA to DHA and EPA. Or it's at least impaired. I can't completely isolate it to the fish oil since we're always making little adjustments week to week, but they've been on a big dose of fish oil for about, what, a month, and I've seen greatly improved language development the last few weeks so I'm at least partly blaming it on the O-3's.

seth (2009-06-22 20:03:18)

thanks for explaining that, Nathan.

Nathan Myers (2009-06-23 11:15:55)

... and thank you, Darrin, for the background. The only other chemical intervention we have found that helps her Asperger's symptoms is melatonin, which helps settle her jumpiness at bedtime. Others I know report success with megadose B complexes. I suspect that reports of success with chelation really record success with mineral supplementation, and the chelation part is incidental. Mineral supplementation seems rather less intrusive (not to say dangerous) than chelation.

Heidi 555 (2009-06-23 16:49:00)

Darkhorse/minuet is a woman. Perhaps she made a typo in her signature... Here are some of her other great posts: <http://boards.sethroberts.net/index.php?topic=6122.0> <http://boards.sethroberts.net/index.php?topic=6314.0>

seth (2009-06-25 08:33:14)

Thanks, Heidi. She made a mistake in her signature, yes. But that explains the extremely low weight (for a man).

### **The Pashler-Roberts Law: Expense versus Honesty (2009-06-23 06:11)**

In [1]this post Andrew Gelman comments on [2]my recent post about acne self-experimentation. He makes an excellent point about drug-company studies:

How would you want to evaluate the risks and effectiveness of a new drug that was developed by a pharmaceutical company at the cost of millions of dollars? I'd be suspicious of an observational study: even if conducted by professionals, there just seem to be too many ways for things to be biased.

Right. And it's not just observational studies. The data from any big study can be analyzed many ways. The more at stake, the greater the chance of what Andrew calls bias and I call making choices that favor the result you prefer. Independently of Andrew, [3]Hal Pashler and I came up with what I call the Pashler-Roberts Law: The more expensive the research, the less likely the researchers will be honest about it.

You may remember that [4]Robert Gallo, the AIDS researcher, did very expensive research. The deception (possibly self-deception) that accompanied very expensive fusion research is described in Charles Seife's [5]Sun in a Bottle: The Strange History of Fusion and the Science of Wishful Thinking (2008).

As Andrew says, this is a big virtue of self-experimentation. Because it's free, it's easy to be honest, especially about failure. The cheaper the better is a broad truth about science that's hard to learn from books or classes or even talking to scientists.

---

david (2009-06-23 07:35:08)

It seems that the expense of the study is an indication of how much the person funding the study stands to make due to the desired outcome of the study. With self-experimentation, you are "funding" the study with your time (which you could use for other activities) and typically don't stand to make any money or realize any benefit other than making your own life a little better.

seth (2009-06-23 08:37:42)

David, that's an interesting point. Whereas drug companies lose money if the experiment has a certain outcome (the drug doesn't work), someone who self-experiments benefits with either outcome (the treatment works or it doesn't work). Because either way the self-experimenter is closer to improving his or her life. You could say the payoff matrix is more balanced.

Cheaper is more honest « Entertaining Research (2009-06-23 09:16:34)

[...] Cheaper is more honest By Guru Seth argues — when it comes to research: what I call the Pashler-Roberts Law: The more expensive the research, the less likely the researchers will be honest about it. [...]

John S. (2009-06-24 18:02:43)

The CEOs of drug companies should self-experiment with their own drugs and post the results on blogs. No randomized trials, no double-blind, nothing.

## **Gmail as Ponzi Scheme (2009-06-23 11:49)**

Now that everyone knows what a Ponzi scheme is, isn't gmail quite close to one? More and more users, more and more storage needed to store their email. The price of storage is unlikely to fall forever. Eventually cost per user will overtake profit per user – and then the whole thing begins to collapse. Not in my lifetime, please.

---

Jim Wyck (2009-06-23 12:14:38)

Hey Seth ... and all. Have you seen the ads that are on the right hand side of your gmail account? Do you have any idea of the revenue generated? Ponzi would have lasted a long, long time if he had the kind of pay per click ad revenue that Gmail delivers. J

Daniel Lemire (2009-06-23 12:40:22)

Given that Gmail is free (but ad supported), I do not see it as a Ponzy scheme. Sure, it might be painful to have to switch to another provider, but nothing lasts forever. In any case, I see no reason why Google Mail could not survive for a very long time by asking us to pay.

seth (2009-06-23 13:11:36)

Daniel, Ponzi scheme = you store your money there. Gmail = you store your email there. Ponzi scheme = better than other money-storage (investment) choices. Gmail = better than other email choices.

Peter Smith (2009-06-23 13:14:29)

Maybe the network effect will help – bigger audiences yield higher CPM/ad rates. It'd be interesting to see what the numbers look like – maybe it's making money already?

thehova (2009-06-23 13:30:37)

youtube is also a puzzling business for google.

Nathan Myers (2009-06-23 13:45:25)

Storage prices do follow an exponentially decreasing curve. The value of an ad impression may decline too, but is unlikely to keep up. (Jim: no, I don't see the ads unless I specifically look for them, but it is manifestly evident that many do.) The danger is that the size of messages may grow exponentially to match, but that doesn't seem to be happening. Maybe that's because most big attachments people send are duplicates of ones others send, that Google can (if they choose) store once for all. Or maybe it's that producing big attachments is time-consuming.

Nathan Myers (2009-06-23 16:11:44)

It occurs to me that youtube may be a method Google employs to minimize the storage demands on gmail...

Robert Simmons (2009-06-23 19:23:23)

Well, I will grant you, those are certainly novel definitions of a Ponzi scheme.

Benjamin Lukoff (2009-06-23 22:18:01)

Shh – don't tell Google – but I'd be more than happy to pay for Gmail if I had to.

Tom (2009-06-26 06:19:08)

Gmail already has a paid version for heavy users. But I don't see "free" Gmail as a major money-loser; it is extremely valuable to Google because it lets them target ads at you based on your private correspondence. No marketer in human history has ever known that much about its audience. Mark Cuban had an interesting post on how (he's convinced) Google will have to pull the plug on YouTube in its present form: <http://blogmaverick.com/2009/06/02/the-google-youtube-conundrum/>

Nile (2009-06-26 06:23:33)

One terabyte hard drives are selling for under \$80.00 on the net. It is likely that one of these drives would be enough for several lifetimes of email. Storage doesn't have to get any cheaper - it is cheap enough as it is.

Tom Moertel (2009-06-29 13:51:34)

One factor that is relevant to Google but not your typical ISP is that Google has enough market share to see a large slice of email traffic, and therefore each email sent or received is more likely to be sharable, at least in content if not headers. Thus Google has the opportunity to use interesting sharing algorithms to reduce storage requirements.

Patri Friedman (2009-07-01 23:20:09)

*The price of storage is unlikely to fall forever.* It is impossible to fall forever - the heat death of the universe is lurking in our future. But until then, barring major wars or catastrophes, I see no reason for the storage cost to ever stop falling. That's how technological advancement works. I certainly don't see any reason for it to stop falling anytime in the next few decades. I am probably forbidden by confidentiality agreements from telling you what gmail costs per user per year, but it is shockingly low.

## Acne Self-Experimentation: Why It's Promising (2009-06-24 23:29)

[1]This article reports that there was no acne whatsoever among the Kitava Islanders in Papua New Guinea and the Ache hunter-gatherers in Paraguay. Here is the abstract:

**BACKGROUND:** In westernized societies, acne vulgaris is a nearly universal skin disease afflicting 79 % to 95 % of the adolescent population. In men and women older than 25 years, 40 % to 54 % have some degree of facial acne, and clinical facial acne persists into middle age in 12 % of women and 3 % of men. Epidemiological evidence suggests that acne incidence rates are considerably lower in nonwesternized societies. Herein we report the prevalence of acne in 2 nonwesternized populations: the Kitavan Islanders of Papua New Guinea and the AchÃ© hunter-gatherers of Paraguay. Additionally, we analyze how elements in nonwesternized environments may influence the development of acne. **OBSERVATIONS:** Of 1200 Kitavan subjects examined (including 300 aged 15-25 years), no case of acne (grade 1 with multiple comedones or grades 2-4) was observed. Of 115 AchÃ© subjects examined (including 15 aged 15-25 years) over 843 days, no case of active acne (grades 1-4) was observed. **CONCLUSIONS:** The astonishing difference in acne incidence rates between nonwesternized and fully modernized societies cannot be solely attributed to genetic differences among populations but likely results from differing environmental factors. Identification of these factors may be useful in the treatment of acne in Western populations.

This implies that acne isn't inevitable. It's almost surely caused by something environmental – perhaps diet, perhaps something else (such as [2]washing your face with soap). That's why self-experimentation about acne is promising: By changing your environment in various ways, you may be able to figure out what's causing your acne.

1. <http://www.ncbi.nlm.nih.gov/pubmed/12472346>

2. <http://www.blog.sethroberts.net/2009/06/19/acne-cured-thanks-to-self-experimentation/>

---

Brent Pottenger (2009-06-25 07:04:09)

My experiment: No bard carbs + less use of soap = Much improved skin complexion on face (tremendous reduction of old scars from acne).

NE1 (2009-06-25 09:49:19)

These are two isolated, indigenous populations. How exactly does that imply it's not genetic?? Do you know of a European that has married into the Ache recently? The paper only timidly brushes aside these factors. It's also difficult to imagine that 25 million desperate teenagers are unable to self-experiment their way to clear skin without acknowledging that it may take something more cunning.

seth (2009-06-25 10:33:52)

NE1, when people from these populations moved out and lived like the rest of us, they developed acne. You're right I should have made that point. I also agree that it is a very good question why the average teenager hasn't managed to do the necessary self-experimentation.

Dennis Mangan (2009-06-25 11:45:19)

Most illnesses including acne are probably always the result of some combination of genetics and environment. A succinct formulation of this is: our genes didn't evolve to kill us or to make us sick. In the case of acne, it seems unlikely that our genes

would want us to have ugly blemishes on our faces, especially during the years of peak reproductive life. Wouldn't they be strongly selected against?

Keith (2009-06-25 11:48:59)

I found though some self experimentation that French Fries cause my acne. Eat even a few fries and within 3 days I get pimples. No fries, no pimples. It's something about the French Fries specifically. I can eat baked potatoes without any problems. I'm guessing there is something in the fried potato that is particularly yummy to the acne bacteria. I've also seen a combination of lots of salt + caffeine sometimes cause me to break out, but its much less likely. I'm thinking this happens due to high blood pressure causing stress, but I'm not sure. Theoretically burgers have more salt than the fries, but I've never gotten acne from eating just burgers.

Aaron Blaisdell (2009-06-26 07:26:25)

Keith, Given the information about how bad rancid fats are, and how most industrial oils (high in omega 6 polyunsaturated lipids) used to make fried foods at restaurants are rancid, I'd guess that it's the rancid fat and not the potato starch that caused your acne when you ate french fries. Try a self experiment at home: cut up some potatoes into fries and cook one batch in a pan containing coconut oil (or lard or beef tallow or ghee) and another batch in a different pan using cotton-seed oil or corn oil. Eat one one day and eat the other a week later. Use an ABBA design to really nail down the effect (if there is one). That is, eat the corn oil fries on week 1 and week 4 and the coconut oil fries on week 2 and 3. If you get acne for a few days in weeks 1 and 4 but not 2 and 3 you then have clear evidence for my hypothesis. If you get acne all four weeks or sporadically (e.g., weeks 1 and 2 only) then the evidence would fail to support the hypothesis. Or you may get outbreaks on weeks 2 and 3 only which would disconfirm my hypothesis and suggest that it's fries cooked in coconut oil (or ghee or whatever you use) that causes it—but would contradict the evidence collected from restaurant fries (which are NOT cooked in coconut oil).

dgm (2009-06-27 08:55:49)

Maybe one reason teens don't self-experiment with acne is because where the parents can afford it, they'll take their child to the doctor for Accutane or some other prescription in the hope of solving the problem quickly. If the mindset is that acne is genetic and/or inevitable, people aren't likely to look to self-experimentation. I never had bad teen acne, but now in my 40s I've developed "hormonal acne" (apparently one indication of this is that it is isolated around my jawline). I started taking zinc, which helped some but not completely. One day we were out of milk (which I drink a couple of times a day in my cappuccino) so I skipped it. I skipped milk several days, in fact, and noticed that my skin was clearer. Then I drank milk and within two days the cyst-y, painful acne was back. I'm not completely dairy-free—I love cheese and yogurt too much—but I've eliminated the milk and really scaled back on daily cheese consumption and my skin is clearing up, although not entirely. Maybe one of these days I'll go hog wild and try to eliminate caffeine.

Seth's blog » Blog Archive » What Else Causes Acne? (2009-07-20 19:46:44)

[...] Previous posts have implicated Western Civilization and face-washing with soap in the etiology of acne. What else might be involved? A reader writes: My girlfriend suffered from acne for years. She went to a dermatologist, tried every fancy soap and skin cleansing system, but nothing worked. She was also a Diet Coke fanatic. Every morning while she was getting ready for work, like a coffee drinker, she'd have one. It was her daily jolt of caffeine. [...]

Seth's blog » Blog Archive » Acne Treatment Statistics (2009-08-11 11:19:05)

[...] Cure Together has acne treatment statistics: Comparisons of the effectiveness of about a dozen treatments. Only two treatments rate high for effectiveness and both have only a few raters. Neither of the high-rated treatments (Roaccutane and Dr. Hauschka Skin Care) was part of Stone-Age life. Because of the absence of acne in at least a few groups of people living more Stone-Age-like (stoneagesque?) lives, it is likely that something about modern life causes acne. When whatever that is is figured out, it should be possible to eliminate acne cheaply and safely. [...]

Anthony (2010-02-06 21:45:48)

NE1 said: "It's also difficult to imagine that 25 million desperate teenagers are unable to self-experiment their way to clear

skin without acknowledging that it may take something more cunning.” If by “25 million” you mean “all teenagers in the US,” how do we know this is true?

Annabel (2010-07-01 15:04:41)

Aloha, I had a huge acne problem in graduate school...I had volcanic pimples and those pimples had pimples too. It was painful, it was embarrassing, I was miserable. I did so much research. I tried all kinds of skin care products with no success at all. I didn't want to do accutane because I am a beer drinker and I hear that accutane is hard on the liver. I discovered spironolactone and persuaded my doctor to let me try it. At 100 mg a day, my acne literally disappeared; one day I was generating new pimples and the next day, no new ones, and so on, until all that had been there was healed and no new pimples. Hallelujah! So I was on spironolactone for a couple of years and then moved to Hawaii, where it is difficult to persuade a doctor to prescribe medicine off-label (spironolactone is actually a weak diuretic that treats high blood pressure by helping flush out water, but has the extra benefit of binding extra androgens). I started to panic, and then just sat down and thought about what that means, binding excess androgens. I remembered reading that excess androgens are what cause pattern baldness and prostate enlargement in men, so I looked for an herbal remedy for those symptoms and presto! Saw palmetto is one, and spearmint is another. A few days off spironolactone, and I was just beginning to get some pimples along my jaw line, and began taking 600 mg of Saw palmetto every day in the morning, and drinking spearmint tea sometime during the day. No more pimples. This went on for about a month and then I realized I had been forgetting to take the saw palmetto. Okay, so just spearmint tea. Still no pimples. Then I realized I had forgotten to drink spearmint tea for a few days and decided, since I didn't have any pimples, to wait and see. Well, something changed, and not sure if it was the saw palmetto, the spearmint tea, or the combination, but I still don't get pimples (except a couple of very tiny ones at PMS time) anymore and that was about six months ago. My skin is clearer than it has ever been. And I keep both saw palmetto and spearmint tea handy just in case!!!

Mira (2010-07-24 17:42:10)

I have had acne all my life not bad but consistent and I am now 38. I have never used soap on my face. As a teenager I realized that this made things worse. I also don't use any creams at all (except for suncream lotion and that makes things much worse so I tend to stay in the shade instead. I moved from a dry air environment (Christchurch New Zealand) to a very humid environment (Auckland New Zealand) 3 years ago and my acne has been much worse since. I have not yet found a solution for this.

### **A Perfect Storm of Airport Improvements (2009-06-25 12:47)**

I'm flying to Los Angeles today. Three new things – all of them new to me this flight – are making this trip distinctly more pleasant than earlier trips:

1. Southwest has special check-in if you've checked in online but have a bag to check.Â The line went very fast.
2. Crocs shoes. So easy to slip off and on at security.
3. Free Wi-Fi while waiting for flight.

I suppose after a while I'll get used to this but right now it reminds me of how I felt the first few times I read the NY Times online.

Barry Brolley (2009-06-26 12:51:47)

Seth, instead of Crocs try VFFs , I just walked through security at the Denver airport telling security they were socks. <http://www.vibramfivefingers.com/> Got the idea about wearing them last year after reading : <http://nymag.com/health/features/46213/> ..hmm maybe some self experimentation on balance, running times, posture wearing my VFFs is in order?

Drew (2009-07-05 19:11:04)

Be careful on those airport escalators!: <http://abcnews.go.com/GMA/Consumer/story?id=2530368 &page=1>

## **The Story of Hyundai: A Lesson in Public Speaking (2009-06-26 07:24)**

Hyundai, rhymes with Sunday.

I loved [1]this talk at MIT by John Krafcik, head of Hyundai's American branch. It lasted an hour; I wished it was longer. It reminded me of [2]Carl Willat's [3]Trader Joe's commercial: Full of emotion, in this case Krafcik's pride in his company and what they've done. Toyota is the world's number #1 car company; when a Toyota executive interviewed for a job at Hyundai, he told them that at Toyota, they are most afraid of Hyundai. So afraid that they bought five straight years of a certain Hyundai model, took them all apart, and studied how each system changed from year to year. (I used to compare New Yorker articles with their book versions, word by word, to see what the editors changed. John Updike compared two versions of Vladimir Nabokov's memoir, *Invitation of a Beheading* and *Speak, Memory*, word by word. More recently I noticed that Zadie Smith's *On Beauty* had significant differences between the audio and printed versions.)

Krafcik repeated an old Jay Leno joke: "How do you double the value of a Hyundai? Half-fill the gas tank." So he had a great story to tell, the return from ignominy, but curiously he barely told it. Probably this was because he was working at Ford at the time. I have no great interest in cars, I'm not particularly interested in why one company does better than another, yet I was entranced. I came away thinking that most of what I'd heard about public speaking was wrong – most of the stuff in [4]Made to Stick, for example. Sure, the advice to tell a story – and [5]most speakers don't even understand that – is right. Krafcik did tell a story. But that's the easy part. I think everyone understands what a story is. The harder part is convey emotion.Â Carl Willat has said to me that in movies, that's all that matters. Absolutely, and I think what's he saying applies to talks as well. Of course an academic talk must have content. But the practical lesson for me is that when planning a talk I should pick something I care a lot about and in the talk do my best to convey how I feel. That's all. Don't worry about telling a joke, don't worry about slick visuals, don't try to impress them.

I plan to show Krafcik's talk to graduate students (in psychology) because it makes a point I doubt they've heard: It's fine if it's other people's work that you feel strongly about. Krafcik isn't the head of Hyundai. He had nothing to do with their long comeback. But he's proud of his company – and he conveyed that in spades, and that was enough. Suppose you do research on X. You're giving a talk about it – perhaps a job talk. Maybe your research is mediocre. But you think research on X is incredibly important. Fine – just make that clear. Everyone in the audience will like you for being able to appreciate the work of others, that's so rare. When you point them to other work that is great, you're helping them. Suppose you're teaching a class. Find the parts of the subject that you feel strongly about. Do your best to convey how strongly you feel. Better positive than negative but negative works. (Ask Nassim Taleb.) Avoid the parts you don't feel strongly about.

In a sense all speaking (and all writing) is public speaking (unless we're talking to ourselves, which is rare). The audience might be one person or a hundred people, it doesn't matter, the principle is the same: We use the emotion in what we hear to judge how much attention we should pay to it. Zero emotion = zero attention. I once visited Alaska. While I was there I took a day trip to a glacier. Near the glacier was a building with a little slide show about the glacier,

with a taped narration. It was all very dry – the glacier grows in winter, shrinks in summer, there are these animals nearby – but you could tell the speaker cared a lot about the glacier. I was terribly struck by that. How rare it is to hear someone talk about something they really care about, I thought. I've told that story dozens of times. But I didn't manage to translate it into advice about how to give a talk.

HowTo: give public speeches « Entertaining Research (2009-06-26 21:32:28)

[...] HowTo: give public speeches By Guru Seth has some thoughts: Suppose you do research on X. You're giving a talk about it – perhaps a job talk. Maybe your research is mediocre. But you think research on X is incredibly important. Fine – just make that clear. Everyone in the audience will like you for being able to appreciate the work of others, that's so rare. When you point them to other work that is great, you're helping them. Suppose you're teaching a class. Find the parts of the subject that you feel strongly about. Do your best to convey how strongly you feel. Better positive than negative but negative works. (Ask Nassim Taleb.) Avoid the parts you don't feel strongly about. [...]

Aaron Blaisdell (2009-06-27 18:05:18)

I get the same feeling when watching Huell Howser present one of his "California Gold" TV documentary shows (<http://www.calgold.com/>)—each about a little bitty piece of the great state of California. And he's not from California; he's from Tennessee.

### **Less Popular than Jesus (2009-06-27 06:57)**

John Lennon once said, referring to the Beatles, "[1]We're more popular than Jesus." At dinner last night someone said that Michael Jackson was more popular than the Beatles. That surprised me. Was Michael Jackson more popular than Jesus? Google hits, as of this morning:

- Beatles: 54,400,000
- Jesus Christ: 47,600,000
- Michael Jackson: 41,600,000

For comparison:

- Barack Obama: 95,800,000
- Harry Potter: 93,200,000

- Brad Pitt: 28,200,000

Does that make J. K. Rowling (6,600,000 Google hits) the most powerful person in the world? Unlike President Obama, she can say whatever she wants. And she speaks to the most impressionable people in the world.

1. <http://music.aol.com/feature/famous-quote-john-lennon>

---

Aaron blaisdell (2009-06-27 07:47:59)

Very rhetorical post. Of course you need to sample the google hits over a longer time frame to get a sample less biased by the hot topic of the moment.

Riker Polly (2009-07-10 21:13:47)

Also, if one isolates Jesus and Christ the numbers skyrocket. 220,000,000 for Jesus alone and 131,000,000 for Christ alone. A larger natural language processing study would be required to understand the context of using just Jesus, or just Christ to determine the frequency of relevance and how that compares with the Beatles.

## **Flaxseed Oil and Better Shaving (2009-06-27 22:31)**

Roberto Medri, a 27-year-old who works in Italy for [1]Bain & Company, a consulting firm, writes:

I have had bad shaving problems since I started working three years ago. I tried pretty much everything: multiple blades, old-time safety razors, expensive British shaving soaps, silvertip brushes, pre-shaving oil and creams, abstruse shaving methods and blade techniques: all to almost no avail. Instead, my face would bleed more and more every day, making it frustrating and time-expensive to shave, only to get results which ranged from laughable to frightening.

I noticed two patterns:

- Once in a couple of months, I used to have a perfect shave: fast, enjoyable, baby-butt smooth with no irritation. I was not, however, capable of isolating the deciding variable, as those epiphanies seemed to be completely random.
- When I took up a new remedy (another pre-shave cream, steamed towels, etc.) things got better for 2-3 shaves, then back to normal horror.

A fortnight ago, I began having perfect shaves. Consistently. I am simplifying my routine because all toners and moisturizers now seem useless. My towels are not stained, I am on time, I actually look forward to shaving every morning (with but only a slight fear of it all ending).

The only explanation I can think of is that, following your advice, I started taking four softgels/day of flax oil about a month ago.

It's very difficult to get flaxseed oil in Europe (bottled oil simply is not available). I have recommended flax to my colleagues also plagued by red necks to no avail: they are elite in two ways, white collar elite (working for Bain) and dietary elite (as Italians, which supposedly have the best and healthiest food ever), so it fits with your reasoning that they are [2]very change-averse. In fact, a manager told me that my taking softgels during the day is "inappropriate" and "disturbing" colleagues.

### **Why One Student Loves Tsinghua University (2009-06-28 21:08)**

After reading my post about [1]Reed College's horrible treatment of Chris Langan, a friend of mine who is a student at Tsinghua University wrote this:

I feel so lucky that we have lots of brilliant scholars who are at the same time good teachers. Many of them do care about undergraduates and give good advice. I don't know which education system for undergrads [Tsinghua's or Reed's] is best, for colleges that do poorly in educating undergrads [like Reed] may produce students who are more independent. But being educated here, I have to say I love

Tsinghua and its teachers a lot.

Why does she love Tsinghua? I asked.

I think it is very tolerant.Â I made many mistakes while I was growing up, but just like my parents, my school didn't forced me to do anything to correct my mistakes. It gave me freedom to choose, to live my own life. I'm glad it didn't interrupt my life and gave me the chance to see my mistakes and to correctÂ them by myself. And when I did want to correct them, it allowed me to. I realize that there won't be many chances to make mistakes and to correctÂ them by myself after I leave school so I value the time in the school. So I guess the best thing about Tsinghua is its freedom and tolerance.

My friend started as a math major. Then she became an English major. Now she is taking economics classes because she wants to study economics in graduate school. That's what she means by "mistakes": choosing the wrong major.

[2]Tsinghua versus Reed.

### **Probably Not Placebo (2009-06-30 06:34)**

[1]This, from the SLD forums, made me laugh:

Ya know its probably NOT placebo. . . . First time I ever did it I could not finish my bowl of oatmeal. Before SLD I had never, not ever, been able to not finish anything.

1. <http://boards.sethroberts.net/index.php?topic=7133.msg87040#msg87040>

### **Shangri-La Diet for Pets (2009-06-30 15:21)**

In March, Century posted [1]this on the SLD forums:

I'd like to put my dog on SLD by giving him his calories through sugar cubes. Would that work?

The dog will whine constantly when he's hungry. He's pretty old, and at this point, we don't have the heart to put him on a strict diet. The hope is that with SLD, we won't have to choose between a happy dog and a healthy dog. If it works, he won't whine after he's been fed his normal serving.

Today he posted this:

It's worked incredibly well. It's gotten to the point where he won't whine at all. If I don't remember to feed him, he won't eat anything. I haven't been able to weigh him, so I don't really know how much weight he has lost, but a number of people have commented on how much thinner he looks. I've started to cut back on the sugar.

Any doubt I've had that SLD is for real has been erased. It's unreal how well it's worked for the dog.

Thanks to Heidi.

## The Trip of 100 Pounds Lost: How Did it Begin? (2009-06-30 22:33)

Someone named August [1] posted today on the SLD forums that he'd lost 100 pounds:

The scale dipped to 185 a bit unexpectedly this weekend. [He is 6' 3".] Well, that was my target.Â Now what?

100lbs down.

Anticlimatic really.Â The last three pounds just disappeared overnight.

And I can still stand to lose more, despite having people telling me I shouldn't lose anymore since last year.

Since he has [2] posted many times, and has been so successful, I think there is a lot to be learned here. Here is some of what he learned along the way.

[3] Are your habits getting in the way?

I had a similar slow start with SLD too.Â It wasn't until I realized my habits kept me eating far more than I needed to that I started losing significant amounts of weight.

[4] Bananas: good or bad?

I used to eat bananas everyday for potassium, but within an hour, I'd be really hungry.Â One day I brought brisket I cooked overnight and I didn't want to put it in the fridge, so I had it when I usually had my banana.Â I didn't think about food again until it was almost time to go home and I realized I hadn't eaten anything else!

[5] What about sweeteners?

I drink a lot of coffee, and when I decided to drop the sweeteners and take it black, the temptation to eat wheat products practically disappeared.

[6] What about patience?

I began in a very low key way.Â I simply started trying sugar water, then different oils, and for a while it didn't seem like it would work.Â Then one day Seth linked to the guy who ate protein nose clipped.Â I decided to get a nose clip and try that for a while.Â It worked in a borderline way, in other words it was effective enough to keep me doing it, but I wasn't losing very much weight at the time.Â Eventually, I ended up taking two tablespoons of walnut oil in the morning everyday.

The AS was enough for me to realize I was always eating more than I needed.Â I'd dig into something and then realize I didn't need to finish it.Â My life was built around food.Â I love to cook and I live by myself, so that means way too many calories in one place.Â As I started to recognize this, I began to wonder

how to change this.

Then on Good Friday I did a fast. I decided that if I started to feel bad, I'd just take some oil. It worked very well. I realized I could get by with very little food.

Thanks to Heidi.

Charles (2009-06-30 23:15:16)

A couple of posts have highlighted this "I realized I didn't need to eat so much," phenomenon. Having something bubble up and happen at that higher-level of decision-making is really interesting. What is it that's bubbling up? Where is that actually happening? By "where," I mean in what neurochemical pathway?

John (2009-07-01 08:26:51)

That thing about the banana is good. Replacing a high carb food with a high fat food is always a good thing. I like the thing about sweeteners too. I wish I enjoyed coffee black but I like it sweet and creamy.

## 4.7 July

### Michael Bailey on Michael Jackson's Sexuality (2009-07-01 06:24)

[1]The Man Who Would Be Queen by Michael Bailey, a professor of psychology at Northwestern, isn't just the best book about psychology I have ever read, it is one of the best books about anything I have ever read, right up there with [2]Totto-Chan by Tetsuko Kuroyanagi and The Economy of Cities by Jane Jacobs.

Now Bailey has written [3]a brilliant analysis of Michael Jackson's sexuality. Bailey writes:

Jackson's weirdness was so multifaceted that it presents both a challenge and an opportunity. . . . I propose an explanation of Michael Jackson that, if true, can explain several seemingly unrelated things: the molestation accusations and interest in children, the obsession with Peter Pan, and the facial surgeries.

Plus the high-pitched voice. This is a basic point about causal inference not widely appreciated: If several rare things might have the same explanation, they probably do. Bailey's conclusion is that Jackson had a very rare sexual identity disorder: He was sexually aroused by thinking of himself as a barely pubescent boy, just as a tiny number of men are sexually aroused by thinking of themselves as amputees (and these men try to become amputees) and a larger number of men are sexually aroused by thinking of themselves as a woman (and these men often have sex-change

operations).

His facial surgeries made Jackson look unlike anyone else:

Normal people would hate to look like Michael Jackson did near the end of his life, and so normal people tend to assume that the surgeries were a series of big, compounded mistakes that Jackson must have regretted. Bad plastic surgery surely happens. But when it does, it is generally recognizable as a poor rendition of an aesthetically pleasing goal. Not so Michael Jackson's face, which resembled nothing in the actual human, living world. Moreover, it has seemed to me that there was something coherent about the redesign of his face . . . If so, the 13 surgeries may be explained by something other than 13 different errors of judgment. . .

The face and the voice were both unnatural, and he went to a lot of trouble to have them. What was he trying to say and show with them? He told us, quite directly, the most likely answer.

"I am Peter Pan," he said, more than once. He lived in Neverland. His second wife, Debbie Rowe, said that in order to get in the mood to have sex with her, Jackson dressed up as Peter Pan and danced around the bedroom. She said: "It made him feel romantic."

Peter Pan, in the Disney version that Jackson knew, was a barely pubescent boy.

I wonder if diversity of sexual orientation persists because it produces diversity of occupation. People who enjoy unusual jobs have an advantage (less competition). Homosexual men probably have fewer children than heterosexual men – but what if homosexual men had an occupational advantage? Then they could make more money (or whatever) and their children would be better off. This would explain the persistence of homosexuality. Jackson, of course, was a huge occupational success. Bailey says a little about this:

Does my theory say anything about the origins of Michael Jackson's tremendous talent? There are some correlations between sexuality and [occupational] abilities. For example, gay men are vastly overrepresented among professional dancers and fashion designers. This may reflect their increased interest in and dedication to dance and fashion, rather than natural talent per se. Autogynephiles [men sexually aroused by thinking of themselves as a woman] tend to be gifted in technical, mathematical, and scientific pursuits, with computer scientist being the prototypic autogynephilic occupation. But we don't really know anything about the occupational interests of hebephiles [men attracted to barely pubescent boys], much less autohebephiles.

---

Wilbur (2009-07-02 06:05:53)

I disagree with your glowing appraisal. While well-written, the piece reminds me of the official sounding mumbo-jumbo produced by FBI profilers and the like: ad hoc, "just-so stories" that may convince juries, but are unfalsifiable and have no predictive power (which could serve as a good working definition of the entire "science" of psychology).

seth (2009-07-02 07:57:05)

Wilbur, Bailey's analysis makes 2 types of predictions: 1. Symptom cluster. Bailey is saying these four traits have a single cause. Those four traits should appear together in other cases. 2. Other traits. This analysis predicts that Jackson is sexually aroused by thinking of himself as a pubescent boy. In addition, identification of another erotic identity disorder similar to autogynephilia makes it clearer what the general concept is (just as the concept of autoimmune disease is clarified by having more examples).

Risa (2009-07-19 23:27:36)

Michael Jackson was not interested in young boys, nor was he interested in sex. His plastic surgeries were due to Body Dysmorphic Disorder. He identified himself with pubescent boys, as he was arrested at that stage emotionally. If he was interested in pubescent boys, he would have had sexual relations with many children. There was no way to get away with it, if he indeed molested children. Our society places too much emphasis on sexuality. Sexual deviation is considered to be more normal than asexuality.

seth (2009-07-20 09:38:24)

Risa, to say Michael Jackson's plastic surgeries were due to Body Dysmorphic Disorder doesn't explain the high-pitched voice nor the interest in children that Bailey considers. More generally, attaching a name to a phenomenon (= diagnosis) isn't much of an explanation. For example, if I told a teenager, "the explanation for the spots on your face is that you have acne," I think you'd see what I mean about the difference between diagnosis and explanation. I have no idea why you say Michael Jackson wasn't interested in young boys.

Saida (2009-08-27 17:18:11)

Except that his high pitched voice was a masquerade he put on for the media. Check out Michael Jackson's Private Home Movies on Youtube, Michael Jackson speaks out against racism, and the live concerts where he talks to his fans. It'll give you an idea what his normal talking voice sounded like. It'll likely also change your perception of the man in general. He likes to think of himself as a pubescent? This part had me laugh out loud. So this is the reason for his sensual/sexual and very adult mannerism on stage?

Lisa (2009-10-10 13:22:16)

Saida is completely right. Michael Jackson wasn't an idiot. In fact, he was extremely intelligent and a good business man. The high pitched voice made him seem soft and gentle. Because of this soft voice, people thought of him as 'a nice guy'. If any of you are planning on watching 'This Is It', listen out for his voice. It's deep and manly. As for thinking of himself as a pubescent, that's a load of bs. He danced in a very suggestive manner (if you don't think so, go watch his 'In The Closet' video) and had sex with Lisa Marie Presley while they were married (she confirmed that). These are not things that young boys do. Regarding his face, I think that Michael is handsome. As for Debbie Rowe and the Peter pan thing, where is this interview? I won't believe it until I see it for myself. Even if she did say it, Debbie keeps changing her story. The last that I heard, her and Michael never even slept in the same room let alone with each other...

Lisa (2009-10-10 13:25:32)

oops sorry I meant \*pubescent not puberescent

Kayla Smith (2009-11-01 10:12:13)

i am already a great fan of Michael Jackson ever since i was just a little kid. i would really miss the King of Pop -

Quixote (2009-12-06 17:35:22)

Everyone else who agrees with me that any of that high-minded BS is actual BS, then I salute you. Good God! Debbie said that? I have not seen that statement anywhere but here. And, yes, she tends to change her tales as much as LaToya Jackson. LMP has said time and time again that her marriage to him was consummated. Why in the world would she lie? I think they had sex before they got married. Why wouldn't they have, anyway? They were married afterall. I can't say that I know positively whether or not he was not bi-sexual or asexual to some degree, but I don't believe he was gay.

Chezzny22 (2009-12-14 09:07:16)

Michael Jackson would always be the best popstar ever. i love all his songs and his live concerts. \*

kitty (2010-11-27 18:58:04)

This completely ignores the fact that Michael Jackson factually suffered from two very disfiguring skin diseases, vitiligo and lupus. This is what his doctors have said about the reason behind his nasal surgeries: Dr Richard Strick, who was appointed and paid for by the DA (Tom Sneddon) performed the court ordered examination of him in December 1993 and had viewed his medical records and therefore had no bias towards Jackson: *“Michael had a disease vitiligo in which the pigment is lost and attempts had been made to bring that pigment back which had been unsuccessful so he tried to bleach it out so it would be one colour. Lupus is also an autoimmune disease and he also had skin involvement, which had destroyed part of the skin of his nose and his nasal surgeries and all were really reconstructive, to try and look normal. So all these nose reconstructions you’re saying was as a result of him treating his lupus? The first one was to try and reconstruct from some scar tissue and obstruction that had happened with the skin there. It didn’t work out very well and all subsequent attempts were to make it right. I think he was trying to look like a normal guy as best as that he could.”* As for his sexuality, the court uncovered most of his desires: <http://laci negasmiled.wordpress.com/category/2005-court-case/porn/> And many of his friends, girlfriends and employees have also spoken up about it: <http://laci negasmiled.wordpress.com/category/love-sex-and-playboy/> And finally, his voice was not naturally that high. He only spoke that way publically back in the Thriller era, after that his voice was the same pitch as any of his brothers and could get very low: Audio of his real voice in 2006 <http://www.youtube.com/watch?v=TsSp78gq8UQ> He kept it soft to conserve his voice.

kathyp. (2011-09-04 11:51:12)

i visited michael childhood home in gary indiana 2 weeks ago and i could feel his spirit he grabbed and pulled me closer to him. all i can say is the man aint gay. misunderstood but not a homo.

## **Fermented Art, Beijing Style (2009-07-02 07:49)**

From [1]Time Out Beijing:

Veteran Beijing artist Gu Dexin . . . first turned European noses at a satellite show of the Venice Biennale in 1995, when he dumped three hundred kilos of raw beef into three glass coffins set in a local casino.

In the heat of summer, poisonous gases from the rotting meat quickly forced officials to clean up the show. This shy enfant terrible of the art world went on to astound European audiences in a succession of shows, placing raw meat or fruit in public places and letting them rot.

Up until this year, when he installed raw pork at the Legation Quarter, the formula has served him brilliantly. Part of the force of this current show is the absence of decay “resulting in a sterile and odourless silence.

1. <http://www.timeout.com/cn/en/beijing/aroundtown/feature/8108/gu-dexin-at-gallerina-continue-until-sep-6.html>

Tom in TX (2009-07-02 08:24:17)  
Not fermented. Just rotten.

david (2009-07-02 08:41:51)  
Ok, that gives me an idea for an "installation": how about a cannister of compressed methane gathered from bovine sources that slowly releases its contents for all to smell. I'll call it "Fart Art"

Aaron Blaisdell (2009-07-02 11:27:52)  
@David, or you could call it Fumigating (or Fermenting) Art or FArt for short. I think F'Art is catchy.

## How Much Should We Trust Clinical Trials? (2009-07-02 20:32)

Suppose you ask several experts how to choose a good car. Their answers reveal they don't know how to drive. What should you conclude? Suppose these experts build cars. Should we trust the cars they've built?

[1]Gina Kolata writes that "experts agree that there are three basic principles that underlie the search for medical truth and the use of clinical trials to obtain it." Kolata's "three basic principles" reveal that her experts don't understand experimentation.

Principle 1. "It is important to compare like with like. The groups you are comparing must be the same except for one factor – the one you are studying. For example, you should compare beta carotene users with people who are exactly like the beta carotene users except that they don't take the supplement." An expert told her this. This – careful equation of two groups – is not how experiments are done. What is done is random assignment, which roughly (but not perfectly) equates the groups on pre-experimental characteristics. A more subtle point is that the X versus No X design is worse than a design that compares different dosages of X. The latter design makes it less likely that control subjects will get upset because they didn't get X and makes the two groups more equal.

Principle 2. "The bigger the group studied, the more reliable the conclusions." Again, this is not what happens. No one with statistical understanding judges the reliability of an effect by the size of the experiment; they judge it by the p value (which takes account of sample size). The more subtle point is that the smaller the sample size, the stronger the effect must be to get reliable results. Researchers try to conserve resources so they try to keep experiments as small as possible. Small experiments with reliable results are more impressive than large experiments with equally reliable results – because the effect must be stronger. This is basically the opposite of what Kolata says.

Principle 3. In the words of Kolata's expert, it's "Bayes theorem". He means consider other evidence – evidence from other studies. This is not only banal, it is meaningless. It is unclear – at least from what Kolata writes – how to weigh the various sources of evidences (what if the other evidence and the clinical trials disagree?).

Kolata also quotes David Freedman, [2]a Berkeley professor of statistics who knew the cost of everything and the value of nothing. Perhaps it starts in medical school. As I blogged, [3]working scientists, who have a clue, don't want to teach medical students how to do research.

If this is the level of understanding of the people who do clinical trials, how much should we trust them? Presumably Kolata's experts were better than average – a scary thought.

1. [http://www.michaeljfox.org/newsEvents\\_parkinsonsInTheNews\\_article.cfm?ID=400](http://www.michaeljfox.org/newsEvents_parkinsonsInTheNews_article.cfm?ID=400)

2. <http://www.blog.sethroberts.net/2008/12/02/unfortunate-obituaries-the-case-of-david-freedman/>

---

Charles (2009-07-02 23:21:30)

Well I don't know about clinical trials, but I know we shouldn't ever trust Kolata. She had an illuminating back-and-forth with Gary Taubes at one point (you documented it) which demonstrated her inability to read and understand simple English sentences, much less basic science.

Andrew Gelman (2009-07-03 11:30:23)

It sounds like this reporter talked with the wrong experts. Not to overgeneralize, but I've noticed that a lot of biologists have a pretty naive understanding of statistics. It would maybe better for her to talk with some econometricians, psychometricians, or quantitative political scientists and sociologists. That said, I think you're confused on Principle 2 above. With a small sample size, you can still find statistically significant differences by chance--and they'll look huge! Take a look at my paper with Weakliem that just appeared in American Scientist.

seth (2009-07-03 12:04:14)

Andrew, she wanted to understand clinical trials, so she talked to some experts who do them. What she found revealed incompetence, which is interesting. Talking to quantitative political scientists or psychometricians wouldn't be a good way to learn about clinical trials. Principle 2: An experimental psychologist who read an experiment (in psychology) with a large sample size (e.g.,  $n = 20$ ) would be suspicious: Why such a large sample size? It must mean the effect is weak or maybe they did the experiment with  $n = 10$  (a typical size) and didn't find anything. Anyway, it would mean something was off. In this sense, the larger the sample size, the less trustworthy.

Andrew Gelman (2009-07-03 14:58:02)

Seth: In the best of all worlds, Kolata would've spoken with a medical-statistics expert such as Stephen Senn, John Carlin, or Chris Schmid. But, given whom she did talk with, I'm thinking it would've helped for her to broaden her understanding by talking with some social science statisticians. Regarding principle 2: it depends on what you're studying. If it's a rare condition, you might need a large sample size to get lots of cases. Or if there's a high level of natural variability, you'll need a high sample size to see signal amid noise. The example I was referring to was the sex ratio of babies, which is close to purely random. As we discuss in our paper, you need a very large sample size to discover patterns here. You might argue that a 1 % change in the probability of a girl birth is so tiny that nobody should care about it--and maybe you're right--but that's the context of some things that people study. Medical outcomes can be highly unpredictable, and small effects can be of interest to people. Anyway, my main point is not to defend large studies but to disagree with the implications of your two statements, claiming (1) people with statistical understanding judge "the reliability of an effect" by the p-value, and (2) "small experiments with reliable results are more impressive than large experiments with equally reliable results." Not so. As discussed in our American Scientist article, statistical significance doesn't necessarily tell you much at all, if the estimate is so large as to be scientifically implausible. That's something you can learn from statistical power analysis, or from Bayesian inference. Finally . . . lots of psychology studies have  $n > 20$ . Just for example, my sister's most cited article is based on a study with 104 kids. If you can find it with  $n=10$ , great. But I don't think that experimental psychologists have been barraging Susan with questions about why her sample size is so much more than 10.

seth (2009-07-03 15:58:42)

Andrew, by "effect" I meant experimental effect. The whole discussion is about experiments. The sex ratio stuff in your Amer Scientist article isn't experimental (= does not come from experiments). I'm happy to learn about an example that contradicts what I said but it would need to be an experiment. Your sister's research isn't experimental psychology, it's developmental psychology. I agree, the term experimental psychology (= perceptual and cognitive psychology and animal learning) isn't terribly clear to outsiders. Developmental psychology experiments tend to have larger  $n$ 's than experimental psychology experiments.

Andrew Gelman (2009-07-03 18:15:09)

Yes, it sounds like you use the terms "effect" and "experiment" in different ways than statisticians do. Which is fine; I realize that our usages aren't always so intuitive.

Vince (2009-07-03 20:08:25)

You're being unusually uncharitable in your reading here, Seth. I don't see anything inaccurate in her article. It's a bit imprecise or unclear in places (for instance, she shouldn't have said "exactly"), and it all seems pretty basic, but I don't see this deep ignorance of research design that you're reading into her article. Her first principle is that you need to eliminate confounding variables so that you can be confident that differences are due to the factor that you're trying to study. She describes random assignment as the standard way to do this (I'm not sure why you think she doesn't understand random assignment when she discusses it right there, explaining why randomization is better than observational studies that try to statistically control for differences). The second principle is saying (correctly) that larger studies give you a more precise estimate of the effect size. Studies with a smaller sample size have wider confidence intervals. A point estimate of a 20 % reduction in risk may be misleading if the confidence interval is a 5 %-35 % reduction. The third principle is that other evidence can continue to be relevant after you've done a full study with random assignment. She seems to reach the correct conclusions about the two examples that she describes, one (prayer) where she thinks you should doubt the results of the study because of other evidence and one (beta carotene) where she thinks that you should trust the results of the study despite the other evidence, although you're right that she doesn't give much of an explanation of how to reach these conclusions.

seth (2009-07-03 20:36:45)

True, she does mention randomization. Maybe her mistake was to ask an epidemiologist about clinical trials. Not realizing that epidemiologists do surveys, not experiments. Equation of the groups being compared is a much bigger deal for epidemiologists than experimenters. I don't think it's obvious that the beta-carotene clinical trials are more trustworthy than the other beta-carotene studies. I'd have to know a lot more about the details before I'd reach that conclusion. For example, large clinical trials allow vast possibilities for data entry errors, which will reduce differences between groups. I know an example where a transcription error wasn't noticed for 40 years. Did the MRFIT clinical trial reach the right conclusion (of no effect)? It's still hard to know. What neither Kolata nor her experts understand is that until something more accurate than "randomized clinical trials" comes along, we have no way of generally assessing their accuracy – just as the problem with eyewitness testimony only became apparent when DNA testing came along.

Tom (2009-07-04 19:56:42)

Another NY Times expert: The fat gent heading up Yale's Obesity Center: <http://www.nytimes.com/2009/07/04/health/04patient.html> *What matters most is your level of motivation and your willingness to change,* says Kelly D. Brownell, a psychologist and director of the Rudd Center for Food Policy and Obesity at Yale. Really, Dr. Brownell? How would you know?

Seth's blog » Blog Archive » Yogurt Associated With Less Allergies (2009-07-11 09:15:02)

[...] Note the small sample size. Contrary to some experts, it's a good sign. It means the differences were strong enough to be significant in a relatively small sample. [...]

Fri, Jul 17th – CrossFit Ireland - Great People. Great Fitness. (2009-07-16 16:02:24)

[...] Perfectionism - Brian Degenero How Much Should We Trust Clinical Trials - Seth Roberts [...]

Don (2010-02-16 12:47:34)

thanks for your posting. I loved the comments and that back and forth. It reminds me, in some slight way, about how clinical trials come about, and how they are used to find both negative and positive results. We all need to go back and forth and finalize and make our opinions clearer as we move forward. Thank you for an enlightening post!

## Teaching Kids to Cook (2009-07-03 15:40)

Outside Berkeley Whole Foods I encountered [1]this cooking camp in session – they teach kids 8-12 years old to cook in two-week sessions, 4 hours/day. I love the idea. I think childhood obesity is due to eating ditto foods (foods, usually factory-made, that taste exactly the same each time) – teaching someone how to cook is a good way to reduce that.

I asked if they included any fermented foods in the curriculum. "Tomorrow we're making tofu," said one of the counselors – a Nutrition major at UC Berkeley. "Tofu is not a fermented food," I said. She wasn't sure what a fermented food was.

1. <http://www.sproutscookingclub.org/>

---

Carol (2009-07-03 20:17:54)

Did you at least give her a recipe for making yogurt? Some 30-ish years ago, I used to make my own tofu, and one of the steps is soaking the soybeans overnight. In warm weather, they frequently 'fermented' to the point of being quite bubbly before the steps of grinding, milking and boiling. I'm sure anything alive was killed in the process of boiling, of course. No tofu I have had since tastes as nice as fresh tofu still slightly warm from the coagulation and straining stages. Once it's refrigerated, it becomes something entirely different.

## SLD on Twitter? (2009-07-04 19:29)

According to [1]this there is a Shangri-La Diet page on Twitter. I found only [2]these tweets.

1. <http://boards.sethroberts.net/index.php?topic=7143.msg87172#msg87172>

2. <http://search.twitter.com/search?q=shangri+la+diet>

---

Aaron Blaisdell (2009-07-05 08:50:26)

Interesting how this "snake oil" comment that one of the tweets made seems to crop up repeatedly regarding the SLD. Funny thing is, the SLD is virtually free (i.e., the price of a bottle of ELOO or a bag of table sugar and tap water) and you don't stand to make any money on it (except from your book, of course). So it completely does not fit the pattern of a snake-oil salesman. The point of a snake-oil salesman is to make money by selling a placebo as if it were medicinal. But you aren't selling anything–so even if taking oil (or sugar water) by your method turns out not to work (and the evidence is against this) you're not getting rich off of it.

Pinkmug (2009-07-07 06:35:21)

Oh! Only two tweets! The day I first saw that page there were 10 or more! Weird... unless tweets can be taken back. :O

## Tucker Max on Law School (2009-07-04 19:37)

When [1]Tucker Max was in law school (at Duke, a [2]top-rated law school), he made a bet with his friends. He claimed he could sign up for a class, attend none of the classes, do none of the reading, never study, and – armed only with class notes from a friend (who attended the class) that he brings to the final without previously studying – get a 2.5 or better on the final, thus passing the course. (Highest possible grade is 4.0.) And he would let them choose the class.

A friend chose Federal Tax. A really tough class, it was said. The final lasted two hours. It consisted of several hypothetical situations to which you write an essay-like answer.Â Tucker finished 20 minutes early. He got a 2.7, which wasn't the lowest score in the class (of about 60 students).

[3]More trouble with the basics at Duke. [4]For whom do law schools exist?

1. <http://www.tuckermx.com/>

2. [http://en.wikipedia.org/wiki/Duke\\_University\\_School\\_of\\_Law](http://en.wikipedia.org/wiki/Duke_University_School_of_Law)

4. <http://www.blog.sethroberts.net/2008/05/13/for-whom-do-law-schools-exist/>

---

Heidi 555 (2009-07-05 04:56:15)

lol Seth, this anecdote brings back memories. When I was a freshman at Tufts, I was taking some kind of Intro to Psychology course that was required before taking any other classes in that department. It was a huge lecture class and the professor (to me at that age) was terrible. The first exam was multiple choice and so easy that I realized that I could quit the class (which felt like a complete waste of my time) and still do well. I sold my book, stopped attending the lectures, did not look at anyone's notes, and bragged to my friends. My recollection is that I got B or a B+. It's both funny and sad.

peter (2009-07-05 08:21:08)

the purpose of going to law school (or any school for that matter) is not to get a grade; it's to develop one's mind. doing the reading and attending class is directed towards that purpose; the grades are a misdirection (think food pellets given to rats for pressing the right button) and incidental to the main purpose.

Bryan (2009-07-05 09:48:47)

Peter, grades are not at all incidental to law school. Unlike undergrad, you are being ranked according to your GPA. Job opportunities are dependent on this ranking. (It's true that grades are most important to securing your first job – after that, you will be evaluated on your job performance and experience.) I agree with you in a general sense that the purpose of school is "to develop one's mind", but law school (like med and business school), is designed to teach you specific skills – how to perform a legal analysis, conduct legal research, write legal documents, etc. Grades are supposed to signal to future employers of how well you do those tasks relative to the other people in your class.

seth (2009-07-05 13:34:10)

Peter, if anyone goes to law school to "develop one's mind" I haven't met them. The overwhelming reason is to become a lawyer. On the other side, law professors deeply dislike the notion that they are teaching job skills – so declassé! So most of them – at least at prestigious law schools like Duke and Berkeley – do as little of it as they can get away with, entirely consistent with a Veblenian view of academia (everyone tries to be as useless as possible).

Michael L. Van Cise (2009-07-05 18:28:59)

I can believe the student's story. I recently graduated from law school (2006) and I took federal tax. I would expect that with good notes and some time spent studying, a highly intelligent person could pass a law school course. Someone who was able to get into Duke law and has enough confidence to propose the bet must be pretty smart. Federal tax is tough, but it's also fairly difficult to fail a law school course if you get a general gist of the concepts and have good writing skills. I second one of the commenters in that grades aren't the sole reason for the education and would agree that something is gained from the time spend in class over the course of the semester.

Andrew Gelman (2009-07-07 06:43:00)

Sitting in the classroom is useful for some students and not for others. Just because someone managed to get a grade that "wasn't the lowest score in the class" without studying, doesn't mean that the lectures are useless to everyone. Personally, I also think it's ridiculous to think that in academia, everyone tries to be as useless as possible. Maybe this was true 100 years ago for the people Veblen studied, but it certainly doesn't fit with my experiences. I also think Seth is putting universities in a damned-if-they-do, damned-if-they-don't situation: if they teach job skills, you can criticize them for not truly caring about learning; if they don't teach job skills, you can criticize them for being snobs. I know some law professors. I've never sat in their classes, but I'd guess they teach general concepts and also job skills; the two can't be completely separated.

seth (2009-07-07 07:35:45)

Veblen was trying to make a point - that academics, like many other groups of people, show off by showing how useless they can be. To make that point he gave examples. It's like the difference between a drawing and a photograph; the drawing leaves out a lot for the sake of emphasis. A current example of what Veblen was talking about is here: <http://www.blog.sethroberts.net/2007/09/11/modern-veblen-flight-from-data/> I wouldn't criticize universities if they taught job skills. I've said about a thousand times that they should do more to help undergrads figure out what jobs they'd be good at and what jobs they'd enjoy. That's close to teaching job skills. I know one law professor. She says that law professors should stop being second-rate philosophers and start teaching job skills. That's what she tries to do but she's the rare exception, according to her.

Corina (2009-08-28 11:17:15)

My name is Corina and I am a nerd. I Hope they Serve Beer in Hell is not a frat novel, it's a gothic novel, how do I know? I know because I am a nerd. I contacted Tucker Max about this, because the movie is a comedy based on a gothic novel, college students sucking dick in public restrooms is not laughing matter. what about the innocence of children? The Revolution of the Nerds start today. NERDS are the new Goths, our books are our weapons, and our mission in life is to defend the innocence of children.

Andrew Hales (2011-12-05 05:52:06)

I love your blog. Nice job. :) "Fail Harder" - Mark Zuckerberg

## **Progress Announced in Scurvy Research (2009-07-05 10:24)**

From [1]here:

"Cure just around the corner"

WASHINGTON (Reuters) - Scientists from the National Scurvy Institute (NSI) recently convened a 5-day conference to assess progress in the War on Scurvy. . . .

A cure is just around the corner, announced a spokesman at the conference. Over the past 30 years NSI, NIH (National Institute of Health) and ASS (American Scurvy Society) have spent over \$30 billion on scurvy research. Pharmaceutical companies have over 80 new drugs in development to combat scurvy according to the FDA.

The 5-year survival rate after diagnosis of scurvy is over 50 % up from 30 % just 20 years ago although 500,000 Americans continue to die of the disease each year. . . .

Risk factors for scurvy include cigarette smoking, diets high in saturated fat, and long ocean voyages. Sailors are particularly at risk for the disease. A researcher at the University of Washington has speculated that there may be a substance in sea water that triggers the disease. . . .

Researchers at the University of Maryland, working on the Human Genome Project, have identified a "Scurvy gene." From this it may be possible to develop a test to identify individuals at risk for the disease.

Scurvy doctors have long emphasized the importance of frequent screenings for scurvy in at-risk individuals. The disease can be effectively treated if detected early enough. Men and women over 40 should get regular checkups.

Conventional treatments for scurvy include frequent gum cleanings to combat the bleeding associated with the disease, surgical amputation of atrophied limbs that have been ravaged by the disease, and stimulants to combat the lassitude characteristic of the disease.

A pilot research program has been proposed to NSI that would study a possible connection between Vitamin C and scurvy. A study conducted on 20,000 Americans at the University of Florida showed a substantially higher rate of scurvy in people who don't eat fruits and vegetables. Dr. Henry Jacobson, assistant director of NSI, was quick to point out that no such connection has ever been scientifically proven. Vitamin C as a treatment for scurvy remains on NSI's "unproven remedies" list. Clinical trials conducted in the 70's showed no effect of Vitamin C on scurvy, added an NSI spokesman.

In related news, officials at the American Pellagra Society (APS) have designated the month of May as "Pellagra Awareness Month"...

1. <http://www.internetwks.com/pauling/haha.html>

---

NM\$ (2009-07-05 11:18:23)

Depressing, and yet optimistic. Scurvy was once considered as big a problem as cancer for those who got it or had to pay for it, yet its solution proved pathetically simple, even before the precise mechanism of how it was caused was understood. But also depressing: It took decades for this solution, easy as it was, to be widely adopted. Per Wikipedia, John Woodall first identified a dietary deficiency as the cause of scurvy, and prescribed fresh food or citrus fruit as a cure for it, in 1614. It wasn't until 1747 that James Lind "formally" proved scurvy could be both treated and prevented with citrus fruit (I don't know what what "formally" means here). But it wasn't until the Napoleonic Wars, which began in 1803, that scurvy was finally eradicated from the Royal Navy. <http://en.wikipedia.org/wiki/Scurvy>

Ashish (2009-07-05 16:03:14)

"Scurvy kills millions"! This isn't real, uhh, is it?

seth (2009-07-05 16:20:40)

no, not real

Nathan Myers (2009-07-06 12:35:54)

Astonishingly enough, the means to prevent scurvy was actually forgotten only decades later. Robert Scott, the south polar explorer, and most of his crew died of scurvy in 1912. They brought along no food containing vitamin C, or indeed anything

fresh. The Royal Navy had lately standardized on rations including canned lime juice that had all the vitamin C cooked out. Scott's rival, Roald Amundsen, fed his crew fresh seal meat, and lost none of them.

Quercki (2009-07-14 12:40:37)

The Portuguese found that chile peppers prevented scurvy and took them to their colonies in India and Asia, probably in the 1500s.

### **Refrigerator Parents (2009-07-08 21:23)**

Two epidemiological case-control surveys have linked the age at which, growing up, your home got a refrigerator with your chances of getting Crohn's Disease later in life. The controls (without Crohn's) got refrigerators later than the cases (with Crohn's). This is not one of those data-mining correlations. It was (a) predicted and (b) found in two independent studies.

Crohn's Disease is much more common in rich countries than poor ones so it was reasonable to examine aspects of lifestyle that distinguish rich and poor countries. In rich countries, the likelihood of having Crohn's seems to be increasing over time, which is more reason to look for environmental explanations. [1]One of the studies was done in Tehran, where a significant fraction of the population didn't have a refrigerator when they were born. The control group was patients with irritable bowel syndrome, a curious choice. (The differences might have been larger had they chosen a non-inflammatory digestive problem.) [2]The other study was done in England and used a control group of patients with a non-inflammatory disease.

Refrigerators, of course, retard the growth of bacteria, which I believe everyone needs to eat plenty of (the umami hypothesis). Long ago, "[3]refrigerator mothers" – mothers who treated their children with insufficient warmth – were blamed for autism and schizophrenia in their children. Now that it is clear that [4]autism is connected with digestive problems there may be ironic truth in the old claim.

Thanks to Dennis Mangan.

5. <http://www.stumbleupon.com/s/#2jZnDG/isnoop.net/toys/magwords.php/>

---

Nathan Myers (2009-07-08 21:50:26)

My daughter has Asperger's, but no discernible digestive problems. I wonder if the connection is only that the apparent severity of autism symptoms is exacerbated by gut pain. Fix the gut pain and the symptoms largely subside, just because autism sufferers are (as for other distractions) not good at ignoring pain. The number of people reporting successful treatment of autism with chelation despite the difficult theoretical problems with the idea (chelation mostly removes metals from the liver) leads me to suspect that it's the big mineral supplements chelation patients get, after a session, that actually help. It

seems easy to test.

justin (2009-07-09 09:15:32)

I wonder if the connection here to Crohn's is related to bacteria reducing the impact of anti-nutrients (phytic acid) – such as those found in grains/legumes. <http://wholehealthsource.blogspot.com/2009/01/how-to-eat-grains.html> Or maybe it's just that so much of our ability to digest stuff is dependent on bacteria, so abundance (and perhaps diversity?) of bacteria make the gut much more efficient.

Nathan Myers (2009-07-09 14:13:53)

Everybody insists bacteria don't survive a trip through the stomach, yet our colon is full of them. How did they get there, and how did they survive the trip through the stomach? Is it only bacterial spores that get through? Should we be eating slow-dried fermented food, because those bacteria have had a chance to put themselves in spore capsules while it dried?

seth (2009-07-09 17:29:32)

I agree, Nathan, the idea that 'bacteria don't survive a trip through the stomach' makes no sense except as a vague approximation. (Like caloric values of foods.) And if 99.99 % of a certain bacteria are killed in the stomach, so what if we eat a billion of them? However, the notion that we should be constantly eating bacteria-laden food (I believe daily) implies a great daily die-off. And therefore a need for replenishment.

### **Homemade Kombucha: The Hard Part Made Easy (2009-07-09 14:58)**

The only hard part of making kombucha is getting starter culture. [1]Here's an easy way to do that:

Get a bottle of K.T.'s [or any non-pasteurized brand] . . . remove the cap, cover with cotton [or paper towel] and rubber band, set in warm spot [room temperature is fine] for about 3 weeks [or less] and a nice baby culture will grow on the top! Simply pour the entire contents in your . . . tea and sugar mixture.

I noticed the same thing with [2]Rejuvenation Company kombucha stored at room temperature for a few weeks. To speed up culture growth transfer the kombucha to a container with a wide mouth, so that it gets more oxygen. Adding sugar, a few teaspoons/cup of kombucha, might help.

1. [http://www.earthclinic.com/Remedies/kombucha\\_tea.html](http://www.earthclinic.com/Remedies/kombucha_tea.html)

2. <http://www.rejuvenationcompany.com/>

---

Aaron Blaisdell (2009-07-10 06:59:24)

Seth, thanks for providing me with a piece of your Kombucha starter. I placed it in a wide-mouth glass jar with some black tea and sugar about a week ago and a nice mother has formed on top. I tasted it last night and it is still too sweet so I'll let it sit some more and keep tasting it every few days until it's sour enough for my liking. It already smells great!

justin (2009-07-10 08:49:05)

This is basically the method I used to get started. I just went the "speedy" route and brewed some fresh sweet tea, let it cool to room temp, put it in a widemouth gallon sized jar (same size I'd ultimately use for a full batch), cover, and wait. I've now on

batches two and three of kombucha – this is probably five weeks later?

Dan (2009-07-10 13:45:53)

I've done two batches now and starting on my third. The first I took down too soon and it was too sweet because of it. I simply judged it wrong during testing. I should have let it ferment longer. It took 9 days. It had 1 1/4 cup sugar and 10 green tea bags and 1/4 cup white vinegar. The second batch I used 1 cup sugar and 8 tea bags (lipton) and 1/4 cup white vinegar. This one took 9 days too but this time I was better at judging the sweetness when I finished it. Interestingly this second batch had a fizz to it, even in the big gallon jug as I was pouring it into 16 oz ball jars for the fridge. But after it's been in the fridge even with lids, the fizz went away. This next batch I'm starting today I'll use 1 cup sugar and 10 lipton tea bags. At the end I plan on leaving a few of the 16 oz ball jars of finished tea at room temp for a few days before refrigerating. I've read this will give it fizz. All batches I use a gallon wide mouth jar, put in a Coleman ice chest with part of a heating pad inside. I have a digital thermometer inside and I keep it around 80 degrees, plus or minus a few degrees. My first batch I used a starter culture from Kombucha America. The second and now my third batch I use the mushroom from the old batch. I rinse it off using spring water first. My goal is to get it to taste like GT's original version. So far mine have not had as much flavor or tasted as strong as I'd like. Too much info? Dan

Dan (2009-07-10 13:57:29)

I just noticed on the side of the GT's bottle it says "cultured for 30 days". Now this is interesting because everything I've read online and the instructions from Kombucha America all say the same thing, from 7 to 10 days to culture. If 30 days is what it takes to get something like GT's, I'm wondering how much of each ingredient they use at the start. Could they be using quite a bit more sugar, so when it gets to 30 days, although the sugar is gone you have a much tastier beverage? Dan

seth (2009-07-10 14:19:10)

Dan, I've varied the number of tea bags (per two quarts water). 3 is too weak, 5 is too strong. So I use 4. The flavor I get is just as good as GT's, if I wait a few weeks or more.

Dan (2009-07-10 14:28:38)

Ah, so I've just been a little impatient sounds like. I'll let this batch go longer this time. How much sugar do you use for two quarts? And do you use vinegar or some tea from a finished batch or none of these? Thanks

### **Modern Veblen: Kathy Griffin Tells the Truth (2009-07-09 20:12)**

From Season 3, Episode 6 of My Life on the D-List:

TV SHOW PRODUCER [preparing Kathy for the questions she'll be asked] What do you love about hand-bags?

KATHY GRIFFIN That they are a statement that I'm rich.

This reminds me of Albert Einstein saying his two favorite thinkers were Thorstein Veblen and Sigmund Freud. We really are smarter now, just as James Flynn says. Einstein, surely the best physicist of his generation, was unable to see that Freud was bogus, and, although he was right about Veblen, talented comedians now say exactly what Veblen said.

More Kathy Griffin in this week's EW: "I have not read a book since last week's Us Weekly." That makes two of us, Kathy.

---

Aaron Blaisdell (2009-07-10 07:07:43)

Actually modern neuroscience is vindicating much of Freud's hunches about the human psyche. Psychotherapy itself can be likened to incentive learning, of which my colleague Bernard Balleine studies the neuroscience of in rats. Sure, Freud made some glaring errors that drew ire from the more "scientific" community, but unfortunately he has been derided and misrepresented by most scholars and laypeople alike but without knowledge of what he actually wrote and said.

seth (2009-07-10 10:03:52)

What hunch of Freud's is neuroscience vindicating? I've read lots of Freud. I kept hoping the next book would make it clear - but it didn't.

Andrew Gelman (2009-07-10 11:59:48)

Seth: You seem to be backing away from your claim that "Freud was bogus" to a weaker claim that you don't know. Also, I don't see the connection between Flynn and Einstein. Are you saying that, if Einstein only had 15 more IQ points, he would've agreed with you that Freud was bogus???

Anthony (2009-07-10 13:23:41)

@Aaron, "Actually modern neuroscience is vindicating much of Freud's hunches about the human psyche." I second Seth's question - which ones? How many hunches vindicated: >10 %, >20 %, >50 %? Finally, what does "vindicating [...]" hunches" mean here (how strong of a claim is it - how much distance between his 'hunch' and an actual contemporary theory that is well established)?

seth (2009-07-10 13:54:32)

Andrew, I have no idea what Aaron is talking about. As for Flynn and Einstein, I'm not saying I'm smarter than Einstein. I'm saying that, in agreement with Flynn, that I live among smarter people. To say Freud is bogus is nothing new these days. The curiosity is the opposite - smart well-educated people, such as a Berkeley professor of English, who write long articles against Freud. Don't they realize it's obvious? If the average IQ in Einstein's time had been 15 points higher, I suspect the scoffing of his friends would have set Einstein straight.

Aaron Blaisdell (2009-07-10 15:53:31)

I already gave one example. According to Howard Shevrin, professor emeritus at the University of Michigan Psychology Department, the whole enterprise of psychotherapy is largely predicated on leading the patient or client to discovering the source of their problem (anxiety, fear, or other types of emotional conflict) through a dialog with the therapist. According to Howie, the therapist often sees the likely underlying problem early on in the psychotherapeutic process, but just telling the patient would not help them much. It isn't the cognitive knowledge of the nature of their problem that will help them, but reliving the problem or facing it directly from memory that allows the patient to resolve the emotional or psychological problem. This is very similar to incentive learning (in people and rats). Tony Dickinson, an experimental psychologist at Cambridge University, related a tale of drinking too much wine and eating watermelon as a child on a trip to Spain. The next day, he went back to the market for more watermelon which he was craving, but as soon as he bought one, opened it up and smelled and tasted it, he discovered that he was repulsed by it. He had acquired a conditioned taste aversion to the watermelon, but didn't realize it until he learned about the new incentive value of the watermelon. This is called incentive learning, and there is a parallel phenomenon in rats which Tony has shown. A rat first learns to press a lever to get a type of food in a skinner box. Then the rat is allowed to eat that food in its home cage followed by getting sick (with injections of lithium chloride). Finally, when the rat is returned to the skinner box, it presses the lever avidly, but when the food is actually delivered it will refuse to eat it. That is, the rat engages in a goal-directed response (lever pressing) until it is faced with the food reward and it discovers that it now doesn't like it. Bernard Balleine, a behavioral neuroscientist in the psychology department at UCLA (and former Ph.D. student of Tony Dickinson) has dissected the neural circuitry contributing to both goal-directed learning and incentive learning.

I believe Freudian psychoanalysis involves a similar kind of incentive learning that the patient must be confronted with (as the rat is confronted with the revalued food) in order to realize and thus resolve (or deal with) their problem. A second point on which Freud seemed to be correct was on his notion of primary versus secondary process—a central tenet of Freudian theory. These processes map very nicely onto attributional versus relational processes in cognitive psychology (see for example papers by Douglas Medin).

seth (2009-07-10 20:37:18)

Thanks, Aaron. I find it hard to imagine anyone reading Freud and predicting, even a little, the two phenomenon you mention. Here's a description of his primary/secondary distinction:

Freud's terms "primary process" and "secondary process" designate two opposed yet nevertheless complementary modes of functioning within the psychic apparatus. The primary processes, directly animated by the drives, serve the pleasure principle and work to actualize a free flow of psychic energy. Secondary processes, which presuppose the binding of this energy, intervene as a system of control and regulation in the service of the reality principle.

from <http://www.answers.com/topic/primary-process-secondary-process>. It sounds like an idea about motivation, not about how we think (cognitive psychology).

Aaron Blaisdell (2009-07-11 07:58:06)

Hi Seth, Thanks for the definitions. I actually have not read a lot of Freud. I used to shun him thinking he was at best a quack. But a conversation with Howie Shevrin, one of the leading modern proponents of psychoanalytic theory in psychological research, I have revised my opinion of Freud. It was Howie who described to me primary and secondary process in cognitive terms. One of his collaborators, Linda Brakel, has written a book on the use of psychoanalytic theory in cognitive research. The book is titled "Philosophy, Psychoanalysis and the A-rational Mind (International Perspectives in Philosophy and Psychiatry)".

### **The Wisdom of Young Picky Eaters (2009-07-10 09:50)**

I'm sure that what we want to eat is a good guide to what we should eat, so long as you ask what our preferences would have led us to eat 100,000 years ago – before we killed off the woolly mammoths. (Curiously, I've never seen this obvious idea in any nutrition text.) A vast amount of trial and error is embodied in those preferences. Because we learn to like foods, our best guide to unlearned preferences may be what children want to eat.

The great essayist [1]George Trow doesn't quite get it, I'm afraid:

In the New History, the preferences of a child carried as much weight as the preferences of an adult, so the refining of preferences was subtracted from what it was necessary for a man to learn to do.

[2]The Wisdom of the One-Year-Old Picky Eater. [3]The Wisdom of the Five-Year-Old Picky Eater.

1. [http://www.newyorker.com/archive/1980/11/17/1980\\_11\\_17\\_063\\_TNY\\_CARDS\\_000329878](http://www.newyorker.com/archive/1980/11/17/1980_11_17_063_TNY_CARDS_000329878)

2. <http://www.blog.sethroberts.net/2009/05/10/the-wisdom-of-the-one-year-old-picky-eater/>

3. <http://www.blog.sethroberts.net/2009/04/09/the-wisdom-of-the-five-year-old-picky-eater/>

Andrew Gelman (2009-07-10 11:57:23)

Seth, I recommend you spend a day following the local ice cream man. Based on this, I'm pretty sure you'll find that we should all be eating SoftServ all day and all night.

Aaron Blaisdell (2009-07-10 12:43:44)

And the only way to get my 3 year old to eat her yogurt is to put crackers or malted milk balls or the like into it. She turned her nose up at the free-range hard boiled chicken egg served in my home made chicken stock (also from a free range chicken).

## **Yogurt Associated With Less Allergies (2009-07-11 09:14)**

From the abstract of [1]a 2006 study done in Japan:

An epidemiological study was carried out on [134] first-year junior high school students in Wakayama Prefecture. Analyses were performed to investigate the relationships among eating habits of fermented milk or fermented soybean foods and the presence of atopic diseases. Serum levels of total IgE values, specific IgE to house dust mite and Japanese cedar pollen in these subjects were evaluated to clarify atopic status. . . . RESULTS: Serum total IgE levels were found to be significantly lower in those subjects habitually eating yogurt and/or fermented milk drinking, in comparison with those who do not habitually eat such fermented milk foods. Subjects with habitual intake of these fermented milk foods were significantly lower in having various allergy diseases compared with those without such an eating habit. However, no difference was found on the total IgE titers and having allergy diseases between subjects with or without habitual intake of Natto, a fermented soybean food.

Note the small sample size. [2]Contrary to some experts, it's a good sign. It means the differences were strong enough to be significant in a relatively small sample. [3]A review article about allergies and fermented foods.

Last January (2008) I got home from Japan and started eating miso soup so often I forgot what I used to eat. This January (2009) I went to the Fancy Food Show and became so interested in fermented foods I'm having trouble remembering what I used to blog about.

Thanks to Peter Spero.

peter (2009-07-11 11:08:18)

my thought (and intuition) is that different types of fermented foods generate different types of antibodies and that a variety of fermented foods is more likely to create a broad spectrum of immunity. i suppose that would also be true of probiotics.

seth (2009-07-11 17:40:32)

Peter, I agree, the difference between natto and yogurt is a puzzle. It might be a dose difference. In yogurt the bacteria are

everywhere. In natto, they grow on the surface. Perhaps different fermented foods generate different antibodies but there is almost an infinite number of possible antibodies. So whether you eat 2 or 10 isn't going to make a difference in terms of antigen-space coverage.

Seth's blog » Blog Archive » Easy versus Hard: Hunting, Agriculture, Etc. (2009-07-12 12:15:29)

[...] Medical Drugs: Hard. Hard to invent, hard to make, hard to sell, hard to get, hard to afford, not to mention dangerous. It is much easier to cure/prevent problems by eating fermented foods, such as yogurt. [...]

Kevin Miller (2009-07-12 18:40:38)

The benefits of small samples assumes that all studies are going to be reported (or are equally likely to be reported). But the "file drawer" problem is particularly acute for small studies, given the relatively small resources involved. If you do (or the community does) 20 small studies and only report the one that's significant, then the assumption that the large effect size means a robust difference is not going to hold. Other than that, I agree that a plethora of small studies is better than one big one, but I do see the file drawer problem as a big issue that you're not taking into account here.

seth (2009-07-12 20:56:19)

Kevin, a "big" issue? If there is any evidence that the file drawer problem has ever mattered, I'd love to know about it. Then I might agree with you. Without evidence, this idea resembles the complaint about graphing data that was made when exploratory data analysis, which emphasizes graphing, first became popular: The more graphs you make the more likely you will be misled by random patterns. Professors of statistics actually said this!

Kevin Miller (2009-07-20 07:38:31)

Good point. I found this article: [http://www.scientificexploration.org/journal/jse\\_14\\_1\\_scargle.pdf](http://www.scientificexploration.org/journal/jse_14_1_scargle.pdf) that presents a model (but with no actual evidence) suggesting that it doesn't take much of a file-drawer effect to bias the literature. I remembered this article - <http://www3.interscience.wiley.com/journal/119263052/abstract?CRETRY=1&SRETRY=0> - which argues that some of the "effects" of early day care on attachment suffer from this problem. That is exactly the kind of situation where you might expect this to be a problem - relatively small effects within the range of variation across countries and a lot of within-country variation, some probably due to temperament, some of the rest due to parenting, and room for other factors. I'd also heard the Thompson and McConnell planaria/learning/cannibalism results attributed to a version of this (that they kept running more worms until it worked, then stopped), although I couldn't find a citation to that claim and it may be folklore. What I would love to see as a paradigm is one where advocates of different views get together to design and run experiments that they would accept as being dispositive. In this case you'd have two biases (confirmation and what I'll call "I saw it myself") working against each other. But clearly small scale experiments are more informative than large scale ones.

seth (2009-07-20 09:32:45)

Thanks for the examples, Kevin. I suspect a variant of the file-drawer problem exists in epidemiology where the same data is analyzed many different ways until a significant difference is found. Here the evidence is that surveys find significant effects that when experimentally studied fail to produce the expected results. In all my experimentation, with rats, myself, and other humans, I usually do the experiment more than once to make sure the effect is repeatable. Nothing ever rests solely on one significant difference. Moreover, the effects are always much more significant than  $p < 0.05$ . This is another benefit of small experiments: Easier to check the results by doing another experiment.

### John Tukey and GPS (2009-07-11 20:31)

In [1]this amusing article Emily Yoffe tells about her troubles with GPS. She fails, unfortunately, to look on the bright side - to say how flawed GPS is better than no GPS. After a talk by [2]John Tukey, the statistician, at Berkeley, I told him that I had found the tools he wrote about in Exploratory Data Analysis to be really helpful. (For example, smoothing my data led me to discover that [3]eating breakfast made me wake up too early.) Tukey replied that if the tools are

helpful half the time, that's good. It isn't easy to make an interesting response to a compliment!

[4]Something is better than nothing.

david (2009-07-12 07:07:57)

"One night at 4 a.m., a driver found he had literally reached the end of the road in their back yard. This so unhinged him that he set his car on fire – the explosion woke up my in-laws – and ran off looking for the highway. When the police picked him up a few hours later, he said that when he realized the GPS had sent him to this dead end, he lost it." If it hadn't been the GPS, it would have been something else...

Inge (2011-04-01 11:35:18)

Great post related to my field of gps, thanks for the interesting read!

### **Shangri-La Diet Quote of the Day (2009-07-12 09:25)**

From [1]Daffodil-11:

The other great benefit I've seen, the thing that makes it worth chugging my mix of oil and water twice a day in and of itself, is the change I've felt in my attitude toward myself. I no longer feel disordered and tortured and ashamed. I no longer feel that I'm daily failing at something that so many people seem to find so easy and effortless. Now this thing I've fought with my whole life has become so much easier, so very nearly effortless for me as well. It turns out it wasn't a fundamental failure of my essential being after all. Who'd have guessed?

### **Easy versus Hard: Hunting, Agriculture, Etc. (2009-07-12 12:15)**

Coming across this sentence

The more intensive the agricultural system, the more work required for a unit of food.

in Charles Maisel's *The Emergence of Civilization* (1990, p. 35) made me think for a while and make a list:

1. Hunting: Easy.
2. Agriculture: Hard. In agriculture you have to start from scratch in a way you don't when hunting.
3. Self-Experimentation: Easy.
4. Ordinary Science: Hard. It is much harder to discover something useful via ordinary science than via self-experimentation.
5. Fermentation: Easy. It is easy to make yogurt or kombucha, for example.
6. Medical Drugs: Hard. Hard to invent, hard to make, hard to sell, hard to get, hard to afford, not to mention dangerous. It is much easier [1]to cure/prevent problems by eating fermented foods, such as yogurt.

What's interesting is the starkness of the differences. Hunting and agriculture are two answers to the same question. I suppose we backed into agriculture because we over-hunted. In the other two pairs, I think the basic Veblenian dynamic was/is at work: The more useless, the more high status. Scientists must be [2]elaborately theoretical and high-techy and wasteful to be high-status. Likewise with home remedies (such as fermented food) versus medical drugs: To be high-status, doctors had to promote elaborate, obscure, hard-to-get remedies.

1. <http://www.blog.sethroberts.net/2009/07/11/yogurt-associated-with-less-allergies/>

2. <http://www.blog.sethroberts.net/2007/09/11/modern-veblen-flight-from-data/>

---

Jason Coyne (2009-07-12 13:08:40)

If all of the "easy" things are really that easy, nobody would bother with the "hard". They never would have been invented. The problem with all of the easy things is the same thing. They are inconsistent. Hunting works great, until you starve to death. Agriculture, once working gives much more predictable results. Self experimentation works great, until you poison yourself. Self experimentation also has quite a few issues with repeatability, and objectiveness of results. Science gets rid of "I think this worked for me." More importantly it gets rid of "I guess arsenic is a poison. Too bad I'm dead or I would tell someone else not to try it." Fermentation is easy. But one batch can be highly different from the next, and there are only so many problems yogurt will solve. Medicine lets you solve other problems, and have consistent results. In your effort to say that science occasionally misses obvious answers (which it does), you have somehow morphed into science is worthless.

seth (2009-07-12 13:26:33)

Let me correct a few misunderstandings: 1. I'm not complaining about "medicine" in general. It's the way doctors and medical researchers dismiss home remedies, such as yogurt, that's the problem. The way dermatologists dismissed the idea that acne was due to diet. 2. Nor am I saying "science is worthless". I am saying that most scientists find it enormously difficult to do useful work. (Among other problems, many of them find it degrading.) In spite of that, useful work gets done. I used a lot of it in developing the Shangri-La Diet, for example. I've used a lot of it to support the umami hypothesis. 3. Nor am I saying "science misses obvious answers". I'm saying conventional science, such as conventional weight control research, misses easy solutions. These easy solutions aren't obvious. What's an example of the problems of "repeatability" and "objectiveness of results" that self-experimentation has? All experiments are n=1 in various ways: one classroom, one school district, one lab.

Jason Coyne (2009-07-12 15:49:13)

I think there is quite a bit of possibility for a placebo issue with something like the shangrila diet. People are thinking their appetite will be reduced, and therefore it is. Repeatability : Are people using the same quality of oils/sugars/whatever? Same doses? Same timing? What were their diets before, what was their weight before, what is their history with dieting, etc. That's a lot of variables in play, that could completely skew results. Objectiveness : You have no control group with  $n=1$ . Changes could be placebo, could be environmental, could be many things. This does not mean self experimentation is worthless. I think self experimentation is a great way to develop a hypothesis. My issue is that you seem to have jumped to "This works, it's a fact.", and to get that level of confidence I think you need to go back to a more scientific process.

karky (2009-07-12 17:13:03)

I was not expecting the Shangri-La Diet to work. Nothing else ever worked, so my expectations were not high at all. Yet I have lost nearly 100 lbs on it and kept it off for 2 years now.

david (2009-07-12 18:17:16)

The problem with studies seems to be the expense and also motivation. Who's going to fund a study to test the SLD if they have no chance of making any money due to the results of the research? I suppose if enough people lose weight using the SLD, then someone selling a competing diet would have incentive to do a study in hopes of finding some problem with it.

beagle (2009-07-12 22:34:08)

Jason, I think you're comparing real world self experimentation with idealised scientific experimentation. Real world "scientific" experiments made by the medical community are often (perhaps more often than not) unscientific: Most results are found for a small focused group (one ethnicity; limited age group; limited geographical spread; no control for diet factors, etc.) and then assumed to be true for the population at large; Often, that's not the case. Drugs are often taken off the market for being harmful. Sometimes, it turns out that a drug has seriously unwanted side effects (e.g. Vioxx, antidepressants for young kids). Experiment size is \_never\_ taken into account in medical research – e.g., if you try 1000 different substances, 50 of them will have a p

seth (2009-07-13 04:14:47)

Jason, there are several reasons that weight loss via the Shangri-La Diet is unlikely to be due to a placebo effect. 1. I don't know of any weight loss studies that have shown a placebo effect. 2. The underlying science is heavily based on rat research. No placebo effect with rats. 3. Almost everyone who tries SLD has tried other ways – often many other ways – of losing weight without success. If the placebo effect was powerful in weight loss, then this wouldn't happen. Before I stumbled on SLD, I too had tried several ways of losing weight that failed. And even the ones that worked didn't work nearly as well. 4. Pets have lost weight via SLD. The "control group" with self-experimentation is previous and/or later observation – observations before or after the treatment of interest. As someone else commented after another comment, you're doing self-experimentation and you rely on it all the time; you just don't call it that.

Nadav Manham (2009-07-13 05:57:10)

Seth: It remains a mystery, but I believe some have hypothesized Veblenian dynamics in the development of agriculture as well. In hunter-gatherer societies it was difficult to display status via wastefulness and idleness—everyone had to work and most of what they worked for was consumed immediately. Agriculture promoted private property (this piece of land is mine, not yours; this stored harvest is mine, not yours) the division of labor, and the emergence of classes separated by the amount of manual labor performed—field workers as separate from supervisors and later kings, as separate from priesthoods to pray for rain, etc. All of this enabled Veblenian dynamics to take hold.

Jason Coyne (2009-07-13 14:45:50)

My point was not that SLD is a placebo effect. I think it actually works. My point is that things LIKE SLD are often subject to a placebo effect, due to the issues described above. These issues make it very difficult to separate the legitimate discoveries via self experimentation from the junk science. That distinction problem is why more formal science has taken over the "market"

in invention and discovery. Yes, it misses some things (even many things). But by doing systematic searches etc, it can find things that self experimentation is unlikely to stumble upon.

seth (2009-07-13 15:46:42)

Jason, without actual examples (not hypothetical ones) of what you're talking about, it is hard to even know what you mean, much less figure out if there is anything to it. What's an example of a "thing LIKE SLD" that is "subject to a placebo effect"?

### **Antibiotics and Debt: Sources of Weakness (2009-07-13 15:40)**

Alexander Fleming, the Scottish bacteriologist who discovered penicillin, the first antibiotic, served in the military during World War I. According to *Happy Accidents* (2007) by Morton Meyers, soldiers in that war often died from infections in relatively minor wounds. Rather than conclude that something was wrong with their immune systems, and wonder why, Fleming – unsurprisingly for a bacteriologist – began to think we needed more substances that killed bacteria. A hundred years later, the blind spot still exists. A few years ago I noticed that a wide-ranging course on epidemiology was being taught in the UC Berkeley School of Public Health. I knew the professor. I asked him, "Will the course cover what makes the immune system weak or strong?" "No," he said. You will look in vain for that topic in any epidemiology text. To call it a blind spot is being nice. Half the subject – the more important half – is being ignored. And Schools of Public Health favor prevention. Medical schools are worse.

In [1]an editorial in today's Financial Times, Nassim Nicholas Taleb and Mark Spitznagel point out that debt is inherently destabilizing because it creates less room for error. Financial professionals and economists, including those at the very top, don't realize this:

Alan Greenspan, former Federal Reserve chairman, tried playing with the business cycle to iron out bubbles, but it eventually got completely out of control. Bubbles and fads are part of cultural life. We need to do the opposite to what Mr Greenspan did: make the economy's structure more robust to bubbles.

Taleb and Spitznagel note that the dotcom bubble, when it burst, had only minor consequences. That's because it was an equity bubble rather than a debt bubble. The stimulus package is just more debt: public rather than private. It doesn't reduce the source of the problem: A too-fragile system. A great point – fascinating how rarely I hear it.

Just as Greenspan failed to understand the problem and chose the wrong lever to pull, so did Fleming and a million doctors and medical/drug researchers. They have tried to deal with a too-fragile system by killing bacteria. Bacteria, like financial bubbles and fads, are part of life. We need to make our bodies more robust to them. Fermented foods do that. By killing off bacteria inside our bodies, antibiotics do the opposite: Make us even more fragile.

1. [http://www.ft.com/cms/s/0/4e02aeba-6fd8-11de-b835-00144feabdc0.html?nclick\\_check=1](http://www.ft.com/cms/s/0/4e02aeba-6fd8-11de-b835-00144feabdc0.html?nclick_check=1)

---

justin (2009-07-13 19:29:03)

I couldn't agree more. And the blind spot with regard to our financial system is all-encompassing. Even many of the more "clear-eyed" pundits fail to see the problem, prescribing more and more policies in a misguided attempt to change reality (and force human beings to be virtuous). Incidentally, the most obvious solution is not more control, it's more decentralized money because only a massively decentralized system can escape the systemic risk of central control. And more decentralized money

requires money to have more behind it than a promise by some debtor to pay you back (as with fiat currency or other forms of credit).

Eric Arias (2009-07-13 21:39:06)

If I'm understanding you correctly the typical logic for both the 'fixing' the economy and health is like: A perceived harmful thing (bacteria, less money changing hands) causes a problem in some entity (the economy and personal health). So the problem with both Greenspan and the medical establishment's approach is they ignore the aspect of some problems. In both cases the problem is better read as: the entity cannot defend itself the harmful things, how to help the entity defend itself (yogurt and less debt/more businesses and innovation)? If that's roughly how you meant it it seems fun. It's saying things happen all the time which can have harmful effects but those effects can or will be mitigated by keeping whatever entity (the economy, your health, culture) robust. This makes me think of my wife bragging about how Volvo engines are built to last 5,000 - 6,000 miles per oil change instead of the usual 3,000 on most cars because they can handle a little sludge. This seems to reflect the Shangri-la diet as well. Instead of trying to remove the so-called bad calories as most diets do, SLD makes one's system more robust to the need for calories. I wonder how this problem solving orientation can be applies to other areas such as personal productivity, greenhouse gases and the like.

Nathan Myers (2009-07-13 23:25:53)

Sorry, Eric, all cars can do 9000 miles between oil changes these days. It's because the oil is better now, and the gasoline isn't full of the corrosive chemicals that used to be needed to keep all that tetraethyl lead in solution. That's also why engines last longer – besides being more precisely machined, for less wear. The only thing that will affect greenhouse gases appreciably will be a source of power substantially cheaper than coal. (Extra points if it can produce high-pressure gases or vapor to drive existing coal plants.) Once a source cheaper than coal exists, coal will instantly become too expensive to dig up.

seth (2009-07-14 08:59:59)

It's a good question why the same sort of mistake – failure to make the system more robust – was made in two different areas. Maybe because demonization (bubbles are bad! bacteria are bad!) is easy while its opposite is hard? Or maybe because it is harder to understand what makes a system weak or strong than to notice the immediate source of the problem. That was certainly Barry Marshall's problem: It was easier to notice that a certain bacterium was associated with ulcers and kill it than to notice that low immunity was associated with ulcers and boost it.

justin (2009-07-14 13:52:56)

To some extent, I have to wonder if the mistake here is hubris: the belief that we \*can\* control complex systems with simple solutions. And in the case of the financial system, there are powerful interests that benefit from a credit/debt-based monetary system: banks and bureaucrats. Just look at Goldman Sachs' earnings today. How does a bank that quite nearly imploded nine months ago manage to blow out earnings in the worst recession in decades? Perhaps it is because they profit off of volatility in the system. They make money when the bubble is blown and place bets to profit when the bubble ultimately bursts. And in the meantime, they have a direct line to the U.S. government to bail them out or change the rules (And by direct line, I mean they have ex-employees running the show. ::cough:: Hank Paulson).

## **Genes Or Environment . . . Or Environment? (2009-07-14 06:29)**

Forty or fifty years ago, psychologists and other scientists talked about "genes" determining this or that. ([1]James Watson still talks this way.) A certain percentage of the variation of this or that (e.g., intelligence) was attributed to "genes". Hardly anyone outside genetics or behavior genetics knew what this meant, but many people thought they did. In reaction to the huge misunderstanding (e.g., those who said intelligence was "80 % genetic" but did not know what this meant), psychologists began to talk about gene-environment interaction. "Is the area of a rectangle determined by its height or its width?" they like to say.

But notice how fact-free this view is. A tiny number of studies have observed gene-environment interactions but they are very difficult. I think this has made it hard to realize something basic and important. Years ago, I heard a talk about squirrel circadian rhythms by Patricia DeCoursey, the scientist who introduced the concept of [2]phase-response curves. At her talk, she showed results from about 15 squirrels. She tested each one – with an emphasis on individual results that resembles self-experimentation – to determine how much light it needed to become entrained to a 24-hour light/dark cycle. One squirrel needed much stronger light than the others.

Here was an interesting finding that another scientist might have missed. What did it mean? Because the squirrels lived under very similar conditions (e.g., identical diets), it was almost surely a genetic difference. Let's assume it was. In nature, sunlight is plenty strong. The lab light was weaker. In nature, the genetic difference wouldn't make an observable difference. Only under artificial conditions did it become visible. It only became visible when the artificial conditions didn't supply enough of something important (sunlight). In other words, the newly-visible genetic difference implied there was something lacking in the artificial conditions. The genetic difference implied the environment mattered. The opposite of the usual interpretation.

I don't know any reason to think this is an unusual case. Aaron Blaisdell told me a story that shows its relevance to human health. Aaron is unusually sensitive to sunlight. Until recently, he could only spend 5 or 10 minutes in the sun before it became unpleasant. The condition is genetic. His mother has it; her father had it. It's called [3]Erythropoietic Protoporphyria. It is autosomal-dominant. Scientists even know where the gene is. That's where the understanding of most scientists stops. A genetic condition. Recently, however, [4]Aaron drastically changed his diet with great results, as noted earlier. At the same time as the dietary changes, his sun sensitivity got much better. He can now stay in the sun for an hour or more without discomfort. This is a gene-environment interaction, of course, but of a particular sort: The genetic effect showed there was something wrong with the environment, just as it did in DeCoursey's experiment.

Sure, there's always genetic variation – it's just usually hard to see. The wrong environment makes it much easier to see. It reveals a range of genotypes, all of which would be harmless in the right environment. So when you come across a "genetic disorder" such as Erythropoietic Protoporphyria, it is likely to imply an environmental problem. No one had ever told Aaron or his mother or her father that their condition suggested that environmental changes would help them.

4. <http://www.blog.sethroberts.net/2009/02/08/aaron-blaisdell-recommends/>

---

Aaron Blaisdell (2009-07-14 08:38:25)

Seth, that's a nice tie-in with the squirrel study. I think the same theme is discussed in the 10,000 year explosion. The authors suggest that different modern peoples around the world have different mixtures of genes, with some people lacking alleles adapted toward a particular aspect of the environment, such as the Native Americans lacking alleles for small-pox immunity, or Europeans lacking alleles protecting against malaria. The genetic differences are meaningless in the environment to which the people are adapted, but show up when they are placed in the wrong environment (in the NA case the wrong environment was having small pox and other diseases introduced to their location). I think much of the data from Weston Price's book shows the same thing by showing how poorly many people around the world did on a Western diet of sugar and refined flour. The sugar and flour was the wrong nutritional environment. I really have thrived after moving toward a WAPF / Paleo / Primal type diet. And many people on the paleo and primal forums (e.g., Stephan's Whole Health Source blog and Mark's Daily Apple)

have reported much lowered sensitivity to the sun after going primal or WAPF. There was discussion on Stephan's blog of the importance of the correct ratio of omega 6 to omega 3 fatty acids on inflammation which can directly affect sun sensitivity. Getting off of industrial vegetable oils and replacing them with natural fats (e.g., saturated and omega 3 PUFAs and MUFAs) leads to improved gum health, healthier arteries, improved quality of sleep, and lowered sensitivity to sunlight among other things. It all revolves around systemic inflammation.

bennetta (2009-07-14 11:13:16)

"In other words, the newly-visible genetic difference implied there was something lacking in the artificial conditions. The genetic difference implied the environment mattered. The opposite of the usual interpretation." I have argued this exact thing many times, as have two medical doctors who are friends of mine, to explain attention deficit disorder. Even fifty years ago, ADD would not have been a problem for most folks as our lives were more mobile. We did a lot more with our bodies back then. Unfortunately, as we became less active, certain individuals became unable to cope. It's not that the round peg (ourselves) became square all of a sudden, but that the square hole (the environment) became round, creating a problem. One of the most popular methods of coping with ADD, as you might expect, is to change your immediate environment to become more ADD-friendly. Indeed, those who are diagnosed later in life (such as myself) probably already did so subconsciously, but were unable to adapt for some reason later on, causing it to become an issue. Myself, I played seven musical instruments by the time I graduated college, because it was the only thing I found I was good at and enjoyed. This doesn't translate well to real-life scenarios, however, where we are expected to have 40 hour a week desk jobs, pay bills, etc. To anyone with ADD such as myself, this environment relationship is obvious, as it is something we have lived with our entire lives. Clearly we are not stupid, yet for some reason we are still at a disadvantage in modern society. In primitive society, something like ADD may have even been a biological advantage. "The genetic effect showed there was something wrong with the environment, just as it did in DeCoursey's experiment." Exactly.

Robert Simmons (2009-07-15 09:11:07)

"No one had ever told Aaron or his mother or her father that their condition suggested that environmental changes would help them." I'm quite certain that this is wrong. Surely many people offered suggestions to them. "Wear sunscreen. Put on a hat. Do sunglasses help?" Etc. That they didn't phrase it the way you might have is irrelevant, as is that all of the proposed solutions either failed or were only marginally useful.

seth (2009-07-15 11:20:48)

Robert, by "help" I meant "reduce their sun sensitivity". I agree, I should have been more explicit.

Varangy (2009-07-16 14:52:02)

This post's title is a strawman: "Genes Or Environment . . . Or Environment?" No need to be mutually exclusive, allow me to summarize this post in two words: Gene expression.

Why is it hard to stick to a diet? (2009-07-31 07:09:56)

[...] Making decisions is hard because we aren't rational creatures even when we think we are. When it comes to the "listen to you body" advice, you can also change what your body says. Seth Roberts for example recommend to eliminate smell while eating by wearing a nose clip. A nice post from Seth about the nature of what genes determine: Seth's blog » Blog Archive » Genes Or Environment . . . Or Environment? \_ \_ \_ \_ \_ I am always open for feedback on my posts. That might focused on the argument at hand or on my writing style. If your feedback would go offtopic feel free to send me a Personal Message. My posts generally don't contain medical or legal advice, if you have a problem seek the opinion of an expert I don't believe in Beliefs. Nassim Nicholas Taleb [...]

Heather McD (Heather Eats Almond Butter) (2009-07-14 14:24:45)  
Seth, Good to hear you enjoyed your oatgurt!

John H (2009-07-14 21:53:24)

The cited review of The Paleo Diet asserts that "virtually all canola oil is deodorized, a process that gets rid of the omega-3s." Does Seth Roberts or anyone else have a comment on this? I know Seth recommends flax oil, but some of us find the strong flavor and aftertaste hard to take, even with nose-clipping. My understanding from the SLD book was that canola oil was also a good source of omega-3.

Anthony (2009-07-15 11:31:31)

Hi John, I don't know if you're talking about taking flax oil for the SLD or in general. If in general, you can combine it with other foods, such as yogurt or juice - I hardly taste it when I do this.

### **The Twilight of Expertise (mothers) (2009-07-14 16:57)**

A friend of mine, who lives in Shanghai, has a 3-year-old son. She gets all her parenting advice from the Internet. This would be uninteresting except that her mother lives with her. (So does her husband's mother.) On a daily basis, in other words, whatever her mom thinks about how kids should be raised is being ignored. My guess is that her mom actually likes the situation because it removes a source of conflict. But I didn't dare ask.

## Margaret Meklin Wins Russian Prize (2009-07-15 12:12)

A friend of mine named Margaret Meklin recently won the [1]Russian Prize – awarded for the best work in Russian by a writer living abroad – in the short-story category. From [2]her amusing essay about going to the prize ceremony in Moscow:

I chose to participate in this contest out of desperation: Working at a U.S. company in the customer service department, I was somewhat tired of clients who didn't hide their annoyance at my Slavic accent.. . . I was hoping that upon winning this prize, I would acquire an inner strength protecting me from [their] impatience.

. . .

After the ceremony, I stumbled upon the main juror, the one who had ironically called me a "genius," and the phrase he greeted me with was, "Are you surprised that you got it? You haven't read the other nominees . . . they were even worse than you!"

## The Wonders of Turmeric (2009-07-15 20:53)

From [1]Time:

When he first started coming to me, I gave him the usual anti-inflammatory medications we use for arthritis pain. He had no side effects, but he wasn't helped much either, so he stopped the pills and lived with the pain. Then he found turmeric. Soon enough, there was no pain at all. [Note that this couldn't be a placebo effect.] And his lower back and hands, which ached before, were also now pain-free.

Is this another example of [2]foreign substances reducing arthritis? (Not to mention other immune disorders.) Or something different? I don't know but it's really interesting.

Thanks to Chuck Remes.

1. <http://www.time.com/time/health/article/0,8599,1910028,00.html>

2. <http://www.blog.sethroberts.net/2009/06/21/scorpion-stings-bee-stings-and-the-umami-hypothesis/>

David (2009-07-15 23:14:27)

The current issue of Wired arrived today. It contains a story about cartoonist Scott Adams dealing with a neurological problem that prevented him from speaking. The article describes his quest to regain his speech, which involved quite a bit of self-experimentation although ultimately an experiment with surgery was required. I wonder if he ever tried giving up the Diet Coke habit he mentions on his blog. I would have tried that experiment first, given how many people self-report neurological problems linked to diet drinks. I realize this isn't turmeric related but I thought it was interesting.

mekhala (2009-07-16 06:26:44)

A Univ of Michigan chemist recently found that curcumin (turmeric ingredient) inserts itself into a cell membrane, making it stiffer and hence, more immune to infectious agents. <http://www.sciencedaily.com/releases/2009/03/090306172615.htm>

Jeff (2009-07-16 07:03:05)

Seth, Why do you say it couldn't be a placebo effect? Jeff

seth (2009-07-16 10:17:01)

Jeff, it couldn't be a placebo effect because actual medicine – which should produce a great placebo effect – didn't work.

Tom in TX (2009-07-16 11:00:14)

Turmeric and other natural remedies could be very important for people living in countries where health care is a "right". "A 9-month wait for arthritis treatment: Delay can mean a lifetime of agony for victims" <http://www.dailymail.co.uk/health/article-1199714/A-9-month-wait-arthritis-treatment-Delay-mean-lifetime-agony-victims.html>

Nathan Myers (2009-07-16 12:42:22)

"Turmeric", surely.

seth (2009-07-16 17:49:31)

thanks Nathan

seth (2009-07-16 17:51:41)

From Wikipedia on curcumin [turmeric's active ingredient]: "Numerous studies have demonstrated that curcumin, amongst only a few other things such as high impact exercise, learning, bright light, and antidepressant usage, has a positive effect on neurogenesis in the hippocampus and concentrations of brain-derived neurotrophic factor (BDNF), reductions in both of which are associated with stress, depression, and anxiety." See also: "Role of Brain-Derived Neurotrophic Factor in the Circadian Regulation of the Suprachiasmatic Pacemaker by Light", The Journal of Neuroscience, April 15, 2000, 20(8):2978-2987. posted for a friend

Jeff (2009-07-17 05:01:08)

Seth, I don't follow your logic completely. Because the placebo effect is motivated by the patient's beliefs, it matters what the patient thinks. If the man did not expect anti-inflammatory drugs to work, he would probably not have a placebo effect from them. If he did expect turmeric to cure his pain, it would be more likely to have a placebo effect. Yes? I'm not disagreeing with possible benefit from turmeric, but your dismissal that it could not be a placebo effect, in this case. Thanks, Jeff

seth (2009-07-17 06:23:49)

Jeff, "couldn't be" was shorthand for "couldn't plausibly be" or "is unlikely to be". Yes, there is some chance, perhaps very small, that anything could be a placebo effect. If the patient didn't think the doctor's medicine would work, why did he try it? If he thought turmeric was more likely to work, why didn't he try it first? My general reasoning is that if you've tried A, B, and C, and none of them worked, and then D works, it's unlikely to be a placebo effect.

## One Crazy Diet (2009-07-16 07:02)

The Shangri-La Diet has made a list of [1]Top 10 Craziest Diets Ever. Part of the description:

The principle behind this diet is that the body has a set point (the weight that it wants to sustain) and appetite is moderated by the body to ensure that you stay at your set point.

That's exactly right. The idea that this is "crazy" amuses me.

1. <http://listverse.com/2009/07/15/top-10-craziest-diets-ever/>

---

Darrin Thompson (2009-07-16 07:34:42)  
But how about those tapeworms at number 1, eh?

david (2009-07-16 07:35:05)  
The cartoon is mostly accurate except for the "every day for the rest of your life" part. I believe you do talk about a "maintenance" dose but in my experience the need for this is minimal. I'm speaking as someone who started the SLD when it was first mentioned on the Freakonomics blog. I suppose it depends on whether you're a 'supertaster' or not.

Glen Raphael (2009-07-16 09:33:55)  
The cartoon seems accurate for me - I lost 10lbs or so on SLD, stopped doing it, and gained the weight right back as fast as I'd lost it. Twice. If I can make myself keep doing the oil every day for the rest of my life I think I can achieve and maintain a lower bodyweight via SLD; if not, not.

seth (2009-07-16 10:18:37)  
Glen, try flaxseed oil (nose-clipped). You're probably not getting enough omega-3 anyway. So you'll want to drink the flaxseed oil for the rest of your life.

Tom in TX (2009-07-16 10:57:03)  
I would pick another bone with the cartoon: "a method that caused the pounds to melt away". SLD gives you appetite suppression. It is not some magic way to "melt" off pounds.

Jonas (2009-07-16 17:26:46)  
Hey Seth Question for you off topic - tried a tablespoon of extra light oil today. Gave me a bellyache, pretty unpleasant. Is this normal? Do you get used to it?

david (2009-07-16 19:04:46)

Btw, the #1 crazy diet is the processed-food centric western diet :-). Guaranteed to cause diabetes, heart disease, obesity, etc.

seth (2009-07-16 22:27:56)

Jonas, It's not uncommon. It goes away after a while – after you get used to digesting the oil. You can start with smaller amounts.

Glen Raphael (2009-07-17 11:56:06)

Jonas, what worked for me as a tolerable delivery mechanism was the oil-in-water thing. Oil straight up is too nauseating but a couple tablespoons of oil poured into 1/3rd cup or so of water is much more doable to chug right down.

### **Poorly Made in China (2009-07-17 09:55)**

The subtitle of [1]Paul Midler's book is "An Insider's Account of the Tactics Behind China's Production Game." Midler is an American who helps American and European companies get stuff made in China. The book is about how, in a dozen ways, Chinese manufacturers manage to make manufacturing deals more profitable to them at the expense of their customer – and, often, the ultimate consumer. Most of the book is about what happens to an unnamed American company that imports "telephone numbers" of beauty products. One problem is "quality fade." The product slowly gets worse until the importer objects. For example, at one point the fragrance put in liquid soap was changed. Instead of different fragrances for products with different labels, almond was used in every case. So a product labeled Aloe Vera smelled of almond. ([2]I discovered I couldn't trust flaxseed oil made in China.)

A friend of mine became a vegetarian after working at Burger King. Midler had a similar conversion:

I found myself losing faith in all sorts of products manufactured in China. I was soon careful to purchase health and beauty products that were not made by local [i.e., Chinese] companies, but by large, multinational corporations – but then I realized the body wash I had been using, while it was made by a reputable global company, was actually manufactured in a plant located in South China. . . . I knew these production managers well. . . . They believed that what a customer didn't know couldn't hurt him.

I found myself using less body wash, eventually relying on only hot water for my showers. When no one seemed to notice the difference, I stopped using the wash altogether. And then I stopped using soap, as well. . . . Why take any chances?

The attitude of cheat your customer as much as possible isn't a great long-term strategy, as Chinese manufacturers are learning – the situation used to be even worse. A friend of mine analyzes the situation like this: For a long time Chinese were taught Confucianism. When the Communists took over, that changed to The state is God. Now that system of morality is gone, but nothing's replaced it. In *Systems of Survival*, Jane Jacobs wrote about two systems of morality, a "guardian syndrome" and a "commercial syndrome." The commercial syndrome, appropriate for trading, placed great weight on honesty. (The guardian syndrome, in contrast, placed great weight on loyalty.) Behind Jacobs's classification was the implication that these syndromes had evolved because they worked better than other possibilities.

*Poorly Made in China* was easy to read. It has those two essential elements: it's a series of stories, long and short; and the author feels strongly about his topic.

1. [http://www.economist.com/books/displaystory.cfm?story\\_id=13642306](http://www.economist.com/books/displaystory.cfm?story_id=13642306)
2. <http://www.blog.sethroberts.net/2009/03/07/hey-what-happened-to-my-brain-part-1/>

---

NotInChinanow (2009-07-17 19:10:53)

The connection between Jane Jacobs and China makes me remember how chinese cities seem to be built to a superhuman scale. Beijing was especially bad in this regard. Blocks on JianGuoMen or ChaoYangMEN seemed to be definitely too long, although of course some neighborhoods were much more manageable. I think Jane Jacobs would have disagreed with the current Chinese development patterns. Any opinions?

## **The Epistemology of Academia (2009-07-18 16:06)**

A professor [1]complains about ivorytowerism:

In the epistemology of academia, no knowledge truly is knowledge if it is not vetted and approved through the channels it has established over time. Those channels are esoteric, made up of the "few, though worthy" who are the elect in the kingdom of knowledge. The epistemology of academia proceeds on the basis that the public has nothing to do with real knowledge. It doesn't make any sense intellectually, of course, but it makes perfect sense if the primary goal is not really the development of knowledge but the preservation of a well-designed, internally self-confirming authority economy.

Some professors go further than this: The public shouldn't know about academic research. Several years ago, a colleague of mine in the Berkeley psychology department was approached by a journalist. He was writing an article for The Atlantic about her area of research. She wouldn't talk to him. She felt his article would somehow be wrong or unseemly.

Open access is changing this, of course. I'm a big beneficiary. Because [2]my long self-experimentation paper was open access, it could be read by people outside of psychology. As a friend put it, "It cost Steve Levitt nothing to say he liked your paper." Whereas inside psychology departments, you'd pay a price.

1. <http://www.academicevolution.com/2009/04/scholar-or-public-intellectual.html>
2. <http://repositories.cdlib.org/postprints/117/>

---

Monkey (2009-07-20 18:35:41)

Could be re-written as follows: "In the epistemology of the high priesthood, no knowledge truly is knowledge if it is not vetted and approved through the channels it has established over time. Those channels are esoteric, made up of the "few, though worthy" who are the elect in the priesthood of knowledge. The epistemology of high priesthood proceeds on the basis that the public has nothing to do with real knowledge. It doesn't make any sense intellectually, of course, but it makes perfect sense if the primary goal is not really the development of knowledge but the preservation of a well-designed, internally self-confirming authority priesthood."

Matt (2009-07-20 20:28:55)

Without regard to the general point, I'm not sure distrusting journalists is the same as believing that the public shouldn't know anything about academic research – and neither one is the same as worrying that you might face intramural punishment if you misspeak or are misquoted. (Of course, you know the professor in question better than I do.)

Harold Knight (2009-11-03 09:21:36)

As a lucky academician, I take great delight in these kinds of discussions. I'm in a don't-have-to-publish-or-perish position, and my life is a (ridiculously) open book which IS my research. See my blog for the exhibitionist academic at work.

## **Living Without (2009-07-18 16:18)**

One indication of the severity of the epidemic of allergy and similar disorders is the existence of a magazine called [1]Living Without. Judging by volume numbers, it is 11 years old. Supporting the idea that autism may be caused by digestive problems, two of the six events on [2]their event list involve autism.

1. <http://www.livingwithout.com/>

2. <http://www.livingwithout.com/events.html>

---

Dennis Mangan (2009-07-19 07:01:47)

Seth, in recent reading on evolutionary medicine i discovered that there's an inverse relation between allergies and cancer. Allergy is protective; it functions to keep environmental insults at bay. Maybe allergy has increased because we have more of these insults now. <http://www.ncbi.nlm.nih.gov/pubmed/4014202?dopt=AbstractPlus>

Nathan Myers (2009-07-20 15:32:22)

That autism symptoms would be aggravated by digestive problems – as by any persistent distraction – is trivially obvious. Reports of major improvements in autistic patients after digestive distress is relieved should, therefore, encourage us to treat autistic patients' digestive problems promptly. It would be silly to conclude that these digestive problems actually caused the autism, not least because very many autism patients don't have digestive problems. Similarly, major improvements resulting from chelation might lead one to conclude that all autism patients should get chelation. This neglects that one of the key features of chelation treatment is mineral supplementation. Before trying dangerous chelation, try safe mineral supplementation.

seth (2009-07-20 17:24:18)

Dennis, thanks for the link, that's a fascinating correlation. I didn't know about it. Nathan, that the link between autism and digestive problems is because "autism symptoms would be aggravated by digestive problem" strikes me as too flexible to be helpful. You could use it to explain just about any linkage of another disorder and autism. No one is "concluding" that this one bit of info is persuasive; it is just added to other bits of info. As for "very many autism patients don't have digestive problems," I didn't have obvious digestive problems before I started eating lots of fermented foods. Yet I benefited from them. You seem to be dismissing the autism/digestive problem correlation rather than trying to learn from it.

Nathan Myers (2009-07-21 15:57:19)

It is a signature symptom of autism-spectrum to have difficulty processing and blocking distractions. Some have more trouble with one stimulus (touch, sound, etc.) than another. Many of the more recognizable symptoms ("stimming", particularly)

are actually attempts to compensate for that difficulty. Some fraction have digestive difficulties – probably a higher fraction than the general population, because they are less able to articulate their distress, or to get it acted upon. (Likewise, for urethral or ear infection.) Still, it's just a fraction, and the path from subtle cause to life-disrupting effect is painfully clear to anyone with experience with even one autism-spectrum patient. Blaming our children's autism on digestive distress is almost as cruel a joke as blaming it on vaccination or on our own lack of empathy. We are always trying to find any hint of something that might help. We've heard of all the fads, and tried them all, and hundreds of other things besides. Sometimes something seems to help one child in five, and that's about as successful as anything ever gets. You didn't have any obvious digestive problems, but you benefited from eating fermented foods. Probably our kids, and we, would benefit the same ways. (I did have, and did benefit.) A wide sea lies between "benefits from treatment of" and "condition is caused by".

Janet (2009-07-23 09:26:08)

There's evidence suggesting that gluten-free casein-free diet is helpful for autism. That's why lots of parents put autistic kids on GFCF diets, and these parents are a major readership for GF publications.

Brody (2009-07-23 11:42:59)

Seth, not quite sure where to put this in your blog comments, but here's an interesting piece of a Q &A with a guy who's been living without money since 2000...he lives in a cave and eats foraged stuff and roadkill and dumpster-dives. He mentions that he's way healthier now than when he had money..... perhaps some anecdotal evidence that it's better for us to have more exposure to 'germs' and whatnot. <http://sites.google.com/site/livingwithoutmoney/Home/6-do-you-get-sick-from-dumpsters—roadkill>

## Where Do Foodies Come From? (2009-07-19 03:23)

Yes, to the man with a hammer everything looks like a nail. But until someone comes up with a better explanation of why we like umami, sour, and complex flavors, I will continue to believe my explanation: We need to consume plenty of bacteria every day. If you fail to give such large and important systems as the digestive and immune system something they need a lot of, obviously many things will go wrong.

In the current New York Times Magazine, [1]Frank Bruni writes about a childhood in which he ate too much. He was chubby, but not because of ditto food (which I think is the main cause of the obesity epidemic). There was much less ditto food when he was young. Bruni seems to have gotten abnormal pleasure from non-ditto food. One sign of this is how clearly he remembers certain favorite foods:

I remember almost everything about my childhood in terms of food – in terms of favorite foods, to be more accurate, or even favorite parts of favorite foods. . . .

Age 7: I discovered quiche. Quiche Lorraine.

Age 8: lamb chops.

No mention of fermented food among the foods of his childhood. His family apparently ate a lot of frozen meat. If [2]refrigerated food is dangerous, frozen food is probably worse. I suspect recently defrosted meat has less bacteria than meat that's been in a refrigerator for several days.

I wonder if Bruni was (and is) like [3]the squirrel who needed stronger-than-average light to entrain properly. All squirrels need light; a few need stronger light. Under healthy conditions (sunlight) the genetic diversity has no consequences. I think the pleasure we get from complex flavors and the like can vary because of these experiences:

1. On a visit to New York, [4]as I blogged, I noticed I was far less interested in fancy restaurants than in the past. The only change in my diet is that I now eat far more fermented food.
2. It isn't just New York. In Berkeley I notice the same thing has happened. My interest in complex food has gone way down. Fancy restaurants, apart from the social aspect, are less interesting. My back issues of Saveur are less interesting. I read food sections of newspapers less.
3. Brain injury can cause something called the gourmand syndrome, where the person becomes obsessed with food with complex flavors. In one case [5]the person became a restaurant critic (like Bruni).

Perhaps [6]Bruni's forthcoming book will shed more light on this. Everyone knows about the obesity epidemic and the allergy epidemic; less mentioned is the vast rise in interest in fancy food over the last 30 years. [7]The word foodie was coined in 1981, close to when the sharp rise in American obesity began. Many newspapers, including the New York Times and the San Francisco Chronicle, had until recently much bigger food sections than they had 30 years ago.

7. <http://en.wikipedia.org/wiki/Foodie>

---

Dennis Mangan (2009-07-19 06:58:06)

I would probably ascribe the rise of the foodie to people having more leisure time and more money to spend. Since the average person isn't exactly an intellectual or even interested in much of anything beyond what the media tells him to be, and since media has greatly expanded - cable TV especially - food seems like a natural topic for expanded interest. Same thing has happened with wine and many other things, in which consumption is partly to express how sophisticated you are.

thehova (2009-07-19 09:33:46)

I too crave gourmet foods. I often stay up late watching the Food channel. I never eat fermented foods. Maybe there's a connection.

Steve G. (2009-07-19 10:58:39)

I have to agree with Mr. Mangan about the most likely hypothesis for the "foodie" phenomena. Me? I like a lot of different foods, both fermented and more richly flavored. (Must one pick?) Your fermented food hypothesis as a restrain on appetite (shall we say a "Shangri-la effect") seems possible, and worth learning more. I for one have taken to eating more fermented foods as an immune and digestive aid is a . Why not? (Any skeptics out there?)

Barbara P (2009-07-21 14:25:11)

For most of the 1970's I was part of a macrobiotic community of more than 200 people who lived and studied together in households in Boston. Everyone ate miso soup at least once a day. I'm sure you know that miso is fermented soy bean paste. Our diet consisted of about 75 % whole grains (usually brown rice), supplemented by beans, vegetables, seeds, nuts, seaweeds, and very small amounts of fish and fruit. Sometimes people would go binge on ice cream, junk food, or favorite foods from previous years, but for the most part, folks found the simple diet satisfying. On occasion other fermented foods were part of a

meal – natto, real soy sauce, rice bran pickles, homemade sauerkraut, amasake, or beer. Perhaps this adds anecdotal evidence to your theory about what fermented foods do to the appetite, curbing cravings for complexity. By the way, not one of these hundreds of people was fat, and no one had acne. My own three children, raised without dairy foods, meat, or eggs, have grown to be healthy adults. I can only guess that brown rice, despite its presence at almost every meal at our house for 20 years, did not function as a ditto food, because it always tasted a little different. A different crop. Long, short, or medium grain. Mixed with barley or buckwheat or millet. Garnished with seeds or nuts. And, as we used to say, "the cook's vibrations that day."

Karina (2009-07-23 15:04:27)

This is very interesting. As I understand it, some of the more bacteria-rich non-fermented foods are raw organic fruits and vegetables. (It stands to reason: they haven't had pre- or post-harvest spraying with antibacterial/antifungal treatments, and haven't been semi-sterilized through cooking yet, even if they've been washed). They're particularly rich in fecal bacteria, which we used to be exposed to far more frequently as a society. This leads me to wonder if some of the health benefits claimed by raw-food diet followers come from this high exposure to bacteria. Many also consume fermented foods such as unpasteurized sauerkraut. Quite a few raw-food dieters also claim that over time, their tastes become much simpler. In my experiments personally I have found that when I eat a high proportion of raw vegetables and fruits, I eat less and have far simpler tastes. Some of that is also the non-ditto-food nature of raw produce, which can be highly variable in taste and texture. Nobody explains it as "I'm healthier because I'm eating tiny quantities of poo" but then again, that would make a very poor selling point.

## What Else Causes Acne? (2009-07-20 19:46)

Previous posts have implicated [1]Western Civilization and [2]face-washing with soap in the etiology of acne. What else might be involved? A reader writes:

My girlfriend suffered from acne for years. She went to a dermatologist, tried every fancy soap and skin cleansing system, but nothing worked. She was also a Diet Coke fanatic. Every morning while she was getting ready for work, like a coffee drinker, she'd have one. It was her daily jolt of caffeine.

When I read about your diet modification, part of which included giving up soda, and your subsequent acne disappearance [I found that Diet Pepsi caused acne], I of course told her about it. "No, it has nothing to do with my diet, it's hormones and bacteria." She was not about to give up her beloved Diet Coke! How else could she function in the morning? In the meantime, she would periodically get upset at what she called the "open sores" on her face.

About 9 months ago, she decided to go on a detox diet – not with the aim of treating her acne, but just to lose a couple pounds. It required her to eliminate as many artificial chemicals and preservatives from her diet as possible. Out went the Diet Coke. Within days, her skin cleared up. She hasn't had a major breakout since.

Yet more evidence that acne is due to lifestyle factors and can be completely cured by lifestyle changes, often dietary. There should be a list somewhere, ordered from most to least likely, of lifestyle causes of acne. If you have acne you just go down the list eliminating each one in turn until you find the culprit.

2. <http://www.blog.sethroberts.net/2009/06/19/acne-cured-thanks-to-self-experimentation/>

---

Brody (2009-07-20 19:57:39)

I tried just washing with water for about a month, and my face broke out even worse. Bummer. If you read the boards on acne.org, people are trying EVERYTHING...and I think it all comes down to whatever-works-for-you-particularly. There's definitely no one size fits all cure for it. Between acne and migraines, I get the feeling sometime that my body pretty much doesn't want me eating anything but brown rice and a few vegetables and water. And that's darned no way to live.

seth (2009-07-20 20:39:54)

Brody, thanks for telling us your experience. When I was a teenager I asked my dermatologist when my acne would go away. "Everyone's different," she said. Not helpful. Even if "there's no one size fits all cure" for acne, it would help to learn what the most common causes are.

Christian (2009-07-21 06:45:42)

Milk. I had the same experience as your reader's girlfriend, but with milk instead of Diet Coke. Inspired by your site I have been experimenting. And I am just coming off a round of drinking milk again, which caused a bad break out. After my face clears again, I'm going to try organic milk, as I believe it might be antibiotics or growth hormones.

Glen Raphael (2009-07-21 08:16:09)

To show causality in a situation like that you really need to see a change in both directions, not just one. That is: verify that if she resumes drinking diet coke the acne \*comes back\*. Otherwise you could be fooling yourself. Analogous example: Somebody is depressed. Tries drug A; still depressed. Tries a higher or longer dose of drug A; still depressed. Switches to drug B; still depressed. Adjusts the dose higher or lower, then switches to drug C...Eventually the depression goes away right after switching to drug D. Doctors conclude that this person's depression is cured by drug D, but for all we know it's just the passage of time since whatever caused the depression. Acne problems eventually diminish in most adults. People who are paying close attention are likely to remember some change prior to the improvement, but that doesn't mean the change caused it.

seth (2009-07-21 09:41:42)

Glen, when I take other things into account – the lack of change for several years, the sudden change when the diet changed, outside evidence that Diet Pepsi causes acne, outside evidence that diet causes acne – I find this particular case convincing evidence of causality. Without that other evidence I would agree with you.

Annie (2009-07-21 09:45:36)

Not only is there the question of "What causes acne?" but also the question of "how much of it is necessary?" I recently went off the pill, which I originally went on to solve my skin problems. It works. But it's a bit creepy too. Two months ago, I decided to go off the pill once and for all, to solve the skin issues. I've been seeing a naturopath during this process, who seems to be a bit more dedicated to finding root causes. In a word, the approach has to be "radical." For 1 month, I eliminated every possible trigger: 1. Soy 2. Gluten 3. Refined grains 4. Sugars (agave and stevia were permitted) 5. Corn (a sensitivity or allergy to corn often shows up on the face specifically) 6. Caffeine (yes, even in green tea) 7. Nightshade vegetables 8. Soap 9. Bananas (I suspected an allergy) 10. Portion control. I find eating too much causes an inflammatory reaction I began the trial as a vegan so meat and dairy were already ruled out. I stuck to the "radical" elimination diet for a month, and included vigorous workouts (promotes good sleep and sweating). Surprise, surprise, my skin cleared up. Slowly, I began to add things back. Soap was fine. Gluten was fine. Bananas were fine. Until finally I realized: The SMALLEST amount of sugar and refined flour did the trick. Overblown portions didn't help. I never suspected these items because I don't eat a lot of sugar to begin with. I'm 5'8 and 125 lbs so how much could I possibly be overeating? I didn't realize that micro amounts would have an effect. In my case, the point was that the accumulation of too much refined food and the accumulation of big portions, caused my skin to first get red (next morning). Then, small bumps (2 days after). If I didn't correct it, I was in for a week of larger blemishes and scarring. The word is "radical." I had to be radical to find out what was causing my acne and I have to be radical to avoid it. It's an easy way to feel

sorry for yourself but, calling the glass half-full, it's a great reminder and incentive to stay away from foods we should never have invented in the first place.

Andrew (2009-07-21 14:20:02)

If you believe the low-carbers like Taubes, etc. (little to no refined carbohydrates like sugar and white flour and moderate to low amounts of complex carbohydrates like fruit) sugar consumption in the modern/Western diet is linked to the other diseases not found in traditional, non-westernized cultures like obesity and heart disease. It wouldn't surprise me if highly refined carbohydrates were to blame for acne as well.

Anthony (2009-07-21 16:33:15)

@Annie, Thanks for the summary of your experiment. By 'sugars', do you mean just refined sugars (white sugar, brown sugar, fructose-glucose)?

Karina (2009-07-23 14:30:45)

I don't doubt that a person could have skin-evident sensitivity to something in the soda – all those company-proprietary flavors and colors can cause reactions in some people. My heart goes out to people who have to go through this process of elimination. For a contrasting data point: I consume several cans of diet soda a day (along with a low-glycemic, low-processed vegetarian diet) and I can count on one hand (!) the number of pimples I've had in my life. It's probably not a personal-care practice thing: Back in high school I never used cosmetics and only washed my face with water, plus avoided sun/tanning (being a shut-in nerd kept me from those teen-girl rituals, happily). But I've begun to wear cosmetics and wash my face with soap now, no problem. It's probably not a diet thing: Back in high school I was also acne-free, but my diet was more similar to my peers – pizza, cake, etc. It's probably not a genetic thing: The rest of my family is not at all low-acne. I'm very odd for the genetic pool. Which leaves me with.... I had cancer and high-dose chemotherapy right before puberty. This may have done a funny hormone hack on me in this narrow aspect, giving me oh-so-amazingly-clear skin. Chemotherapy can give you very odd little outcomes (for me, my ability to ingest near-unlimited quantities of capsaicin was another one). But needless to say, it's not an acne-prevention program I'd recommend.

Dave (2011-01-18 08:55:15)

My daughter went through the whole acne regimen. Every lotion and potion, birth control pills etc. until we finally found a dermatologist who would prescribe accutane. 7 months later the acne was gone and has stayed gone for 2 years now. My daughter blossomed into a beautiful young woman and has so much more self-confidence than a few years ago. The drug worked miracles on her. I know there are possible side effects so no negative comments about that, just anted to let people know that it does work.

### **Acne.com versus Acne.org (2009-07-21 10:11)**

Acne.com, a website paid for by the drug company behind Proactiv, a common acne medicine, [1]has the following:

Acne Myths & Claims: Certain foods cause acne. No, those french fries you had yesterday didn't give you new zits today. In fact, scientists have been unable to find ANY substantial connection between diet and acne. So all the foods you've been afraid of – pizza, french fries, chocolate – are fine. Of course, that doesn't mean you should binge on your favorites whenever you want – a healthy diet will help your body have the strength to help you in your fight against acne. So use your common sense, but don't be afraid to indulge now and then.

"All the foods you've been afraid of are fine"? This is much too certain-sounding. The studies that failed to find a diet/acne connection were poor. [3]Other research suggests that acne may well have a dietary cause. The false

certainty is self-serving. Because foods don't cause acne don't bother trying to figure out which ones; just take our medicine! It resembles [4]my surgeon claiming there was evidence that the surgery she recommended and would profit from was a good idea when there wasn't any such evidence.

In contrast, acne.org [5]has this:

Myth: Diet and acne are related. Reality: The bottom line is we need more research. We do know that people in some indigenous societies do not experience [any] acne whatsoever across the entire population. This is in stark contrast to the widespread presence of acne throughout all modern society. It leaves us to ponder the question of whether the indigenous people's diet contributes to their acne-free skin. Discovering a dietary way of preventing acne may be a future reality, however, we may live so differently from our hunter/gatherer ancestors that it has become close to impossible to replicate our ancestral diet. But let's see if we can work together to come to some consensus from our own experiences. If you feel that you have cleared your acne using a particular diet, or if you are planning on attempting a diet of some kind, please post your method on the Nutrition & Holistic health message board.

That's reasonable and helpful. The website that couldn't hire expensive experts had better information.

Nadav (2009-07-21 19:09:21)

The acne.org paragraph is one of the most epistemologically sound I've ever read about a practical health problem like acne. Not only does he have better information than the paid experts, but his underlying view of human knowledge, its limits, and how to improve it stands out as well.

Nadav (2009-07-21 19:23:05)

Seth, Based on your experience with dermatologists, could you compare the regimen recommended on acne.org with what a "typical" dermatologist would prescribe? Thanks.

Ainsprid (2009-07-22 03:08:34)

That's very interesting Seth!

Eugene (2009-07-23 09:08:18)

When it comes to dissing dermatologists and medical journals, Michael Holick deserves some sort of prize. I saw this [1]highly entertaining lecture on UCTV. Among other things, good examples of: 1) telling stories; 2) use of clinical, "rogue" and self-experimentation (small and large samples).

1. <http://www.uctv.tv/search-details.aspx?showID=15773>

Adam (2009-07-25 11:27:55)

Out of all food, caffeine has the greatest impact on my acne. Abstaining from anything with caffeine in it (including chocolate), took care of 25 % of my acne problem. Benzaclin, a prescription topical agent, took care of another 4th of the problem. No other medications worked. Actually, the most striking difference I've seen from any therapy has been simple supplementation with Pantothenic acid, a b vitamin that is cheap and OTC. Nothing cleared my "backne" until I started using that. I don't hear a lot on this blog about supplementation, but that one worked for me. Oddly, from my self-experimentation, fish oil/flax seems to have a mild aggravating effect on my acne. I've had to do extensive experimentation to find the right soap product. I disagree that washing with soap is a problem - its simply a matter of finding the right soap. I recommend the facial cleanser from Neutrogena. Find it at target, in a blue squeeze bottle. Cleans but doesn't dry the face out (contrary to what would seem logical, skin that is too dry can also lead to breakouts, in my experience).

mitesser (2010-05-07 22:47:32)

In a lot of cases it can be very difficult to heal acne and comparable skin diseases. I am a long time sufferer myself and I am still hoping to find a treatment that works for me. I will try out what is mentioned here, maybe it brings relief. Stupid companies and their 'neutral' websites probably partly ruined my skin, screw them!

### **JAMA Editors Continue to Display Staggeringly Poor Judgment (2009-07-22 23:03)**

In [1]an earlier post I called a certain JAMA editorial "the most self-righteous editorial I have ever read." Perhaps the authors reluctantly agreed; the editorial, which used to be [2]here, is gone. Since I quoted from it, you can still see what I was talking about. The BMJ has[3] an article about the disappearance, which includes this:

The BMJ sent emails to JAMA's editor, Catherine DeAngelis, and the journal's media relations office asking about the disappearance of the March editorial. The BMJ also asked whether Dr DeAngelis could explain why the new July editorial had toned down the policy outlined in the March editorial.

The response from a JAMA spokeswoman was "no comment."

Correct: It is indefensible. What I said earlier still holds: The whole incident – self-righteous editorial, [4]trash-talking by DeAngelis to a WSJ blogger, deletion of the editorial, failure to explain the deletion – "sheds a hugely unflattering light on the very powerful doctors who run JAMA" and thus an hugely unflattering light on a culture in which such people, like Nemeroff, gain great power."

Jim Purdy (2009-07-26 07:43:27)

That whole episode was bizarre.

## Acid Reflux Cured by Kombucha? (2009-07-24 21:48)

A friend of mine had acid reflux. When he ate certain foods – tea, chocolate, foods high in sugar or fat – and when he ate too much, he got a pain in his stomach. "Maybe I've got an ulcer," he thought. He first noticed it after eating brussels sprouts, about a year or so ago. At the time it was only uncomfortable. He was taking Alleve for back pain around that time – that might have messed up his stomach. He was also worrying a lot at the time.

It got worse. Periodically he would have pain in his stomach in the middle of the night and during the day. In particular, after eating Oreo cookies. Mint tea, which he thought would help, made it worse. Friends suggested he try Prilosec OTC. A 14-day course seemed to clear it up. A month after the Prilosec ended, however, he went to a big party. He ate a lot of food, a lot of different things. He woke up in the middle of the night with the worst pain yet. So then he went to a doctor. The doctor said it was probably acid reflux; try Asiphex ( \$60 for two weeks), he said. It was less effective than the Prilosec. Then I suggested that some sort of fermented product might help. So he bought Activa yogurt. It wasn't clear if it had any effect; maybe a small one.

Recently he was in Rainbow Grocery, in San Francisco. They sell kombucha. He bought some because I had spoken particularly highly of it. After four days of drinking it, he felt much better even though he'd only finished 3/4s of the bottle. His stomach doesn't hurt any more. That improves his mood. His back feels a lot better – but that comes and goes. That might be a placebo effect, he says – "even though I don't believe in kombucha, I think it's bunk, but I have to admit that it works," he says.

He'd heard of kombucha from his colleagues about three years ago. They raved about it but it seemed faddish to him. He'd tried it, but just to taste it. He doesn't eat any fermented foods besides vinegar; he doesn't drink wine or beer. Hadn't been eating yogurt. He had gone on a vegan diet for a few months before the Prilosec. He'd thought the vegan diet would protect him from stomach problems, but he was wrong.

He has continued to drink small amounts of kombucha and the improvement has persisted, although recently something mint at a party caused a problem.

---

dgm (2009-07-25 06:39:44)

Isn't unfiltered apple cider vinegar also supposed to prevent acid reflux?

Tom in TX (2009-07-25 07:19:13)

Water worked very well for me. When I stay hydrated, no acid reflux.

karky (2009-07-25 09:49:12)

Before I started drinking apple cider vinegar every day I got heartburn from drinking plain water. Water with a slice of lemon didn't cause heartburn at all, but plain old water did. And it didn't have to be a lot of water either, just a small glass of water would do it. But since I have been drinking the vinegar every day, I haven't had any heartburn at all.

Adam (2009-07-25 12:00:18)

Famotidine takes care of the acid reflux problems for me :)

Tom in TX (2009-07-25 14:28:20)

@Adam: That is good, but for me I would like to get to the cause of the problem and fix that, rather than just relieve the

symptoms. I am pretty sure acid reflux is not caused by a Famotidine deficiency. 8-) I do not know much about Famotidine specifically, but in general medications cost money, do not really cure the disease, and generate their own side-effects.

Adam (2009-07-25 14:35:44)

Sure, I get that. For me the causes are pretty apparent: spicy food. But I'm not about to give that up. Famotidine is OTC and cheap, has an excellent safety profile, and lasts 24 hours, so I use that when it flares up.

peter (2009-07-25 20:23:40)

the causes of acid reflux are probably varied. One cause is the the sphincter between the esophagus and the stomach becomes defective and the stomach acid (which is otherwise kept in the stomach by a well functioning sphincter) splashes up into the esophagus, thereby causing the sensation that is commonly referred to as acid reflux. the various drugs, i.e., prolosec, pepcid etc.. eliminate the acid thereby eliminating the sensation and discomfort. The problem is that this is a physical condition that requires constant treatment. long term use of prolosec (or other PPI therapies) is associated with both increased hip fractures (as i recall 400 % increase) and a 40 %? increase in pneumonia (as i recall for hospitalized patients). since i have this condition, i'll try kombucha, but the only way it can work for me is if it somehow eliminates/reduces stomach acid. hard to believe that something acidic will eliminate/reduce stomach acid, but i'm open minded. Up to now i've found that eating arugula helps to reduce stomach acid (i read about an extract of arugula being used as an alternative to drugs such as prolosec; but to my knowledge, an arugula extract is unavailable at this time). and i also take pepcid before i sleep and use a special sleeping wedge to keep my up body at a 20 degree? angle to lessen the acid reflux. BTW, the condition is not simply a benign discomfort. It can lead to esophageal cancer, which is the fastest growing cancer in the western world,

tom (2009-07-26 09:09:53)

Interesting post on acid reflux by Michael Eades: <http://www.proteinpower.com/drmike/uncategorized/heartburn-cured/> After a couple of weeks off carbs, acid reflux resolves. What seems to be happening is that a high-carb intake stokes an immense population of intestinal flora which generates enough back pressure to drive acid all the way up to the throat. Take a respite from the carbs, the flora dies down and the throat gets a break. I think there is also something in the kombucha which is correcting our internal flora – either suppressing some of the stuff that shouldn't be there, or supporting stuff that should be there (but isn't, with a typical diet.)

Nathan Myers (2009-07-27 19:10:25)

I'd like to discover something that would allow me to eat onions (and, more particularly, onion powder, which is in *everything*, sometimes labeled just as "spices") without causing my sinuses to bleed and the skin in my nose to blister and peel.

beagle (2009-07-29 23:59:40)

(Off topic for this post, on topic for Kombucha): A Kombucha recipe, and links to problems with Kombucha: <http://feeds.boingboing.net/~r/boingboing/iBag/3/COTZleDpAAw/how-to-make-kombucha.html>

peter (2009-07-30 21:53:50)

kombucha is a fungus; there is an association between fungus and depression; i wonder if kombucha can cause depression among those prone to the fungus depression syndrome?

Seth's blog » Blog Archive » Acid Reflux Cured by Kombucha? Yes (2009-08-10 11:01:10)

[...] My friend with acid reflux — who used to have acid reflux — contacted me today: My stomach is so much better [since I started drinking kombucha]. I rarely have problems. Every once in a while I might be a little uncomfortable. Then I drink a little kombucha, it gets better within an hour. I got up in the middle of the night the other night and I felt the usual kind of pain, took some sips of the kombucha, felt better, and fell back asleep. Hardly ever have pain now. The kombucha is much more effective than the Asipha medicine I took. That was \$60 for a 10-day course. It might even be more effective than Prilosec. (Which cleared up the problem but then it came back.)Â I've been drinking kombucha for about three weeks. I really like the grape, guava, and strawberry flavors of the Synergy brand. The grape flavor is like sangria that's just started to go bad. A

couple of people I've tried to turn on to it but they just can't stand the taste. My levels of stress haven't decreased. I'm drinking less than half a bottle a day. Now the problem is that I forget I'm supposed to have stomach trouble so I forget to drink it. [...]

Caitlin (2010-05-19 19:02:53)

I've had fantastic luck "curing" my GERD [Gastroesophageal Reflux Disease, also called acid reflux] with kombucha. I developed very serious acid reflux very quickly and was prescribed a very high dose of omeprazole to suppress my symptoms. I saw a lot on the internet suggesting that highly acidic foods can actually help control GERD. Apple cider vinegar was too harsh for me, but I love kombucha and by drinking at least 1/2 bottle at least every other day, I have decreased my omeprazole dose from 80 mg/day to 40 mg/day or less. I'm confident that I will be able to eventually wean myself off of the omeprazole completely, but probably won't be giving up the kombucha anytime soon. Try the Gingerade flavor by GT's - it's excellent!

Radar (2010-06-20 11:14:51)

RE: Peter Kombucha is similar to vinegar, in that it is a base, not an acid. Kombucha also contains proteins and bacterias naturally found in the stomach and digestive track, so it can rebalance an otherwise off-kilter stomach. In other words, it can off-set the increased amounts of stomach acid that play a large role in Acid-Reflux. Also, Kombucha isn't a placebo, and there's no myth around it. It eases digestion and helps the body purge more fat, while getting more nutrients out of the food that's being digested. That's why the 'wonder tonic' claims are so far reaching-Kombucha's work in the digestive track goes a long way towards buttressing the immune system and upping energy levels, primarily because the drinker is getting more bang out of every calorie digested.

Dave Schultz (2010-07-12 12:02:21)

My heartburn occurs daily unless a) I stick to a strict diet with no carbs, dairy, or greasy/fatty food, like the Paleo Diet or b) I drink Kombucha daily. It's not always possible to do a), so Kombucha has literally been a life saver for me. The medical knowledge that is being sold by doctors regarding heartburn is basically false. I have seen 3 about my heartburn, researched heartburn, GERD, and acid reflux literature throughout the medical literature and on the internet, taken Prilosec, Reglan, and got an endoscopy performed as well. The search for an answer did not stop there. 5 years later, after long periods of experimentation, I have come to realize you have to listen to your own body when it comes to these kinds of health issues. Listen to its reactions to every kind of food. The FDA and the medical industry in the U.S. are completely distorted in a way that is too complicated to explain, most likely due to government noses where they shouldn't be. I'm sure they can help your broken leg, but not your heartburn. Now that the FDA has banned Kombucha until further notice, I am starting to brew my own. Good luck to the rest of the misguided herd out there.

Leila (2011-05-29 06:38:17)

Hi! I started using Kombucha 2 days ago after trying a lot of different techniques to relief my stomach problems. I can eat only certain foods, and have problme when eating yogurt, kefir or cheese, even bread. I have noticed that after drinking Kombucha I have some sour feeling in my stomach, like something is fermenting. Is it normal? It feels like I am full of acid .. Please tell me about first reactions that Kombucha does.

## Tsinghua Dumplings (2009-07-25 23:07)

Jennifer Lee, author of [1]The Fortune Cookie Chronicles, has [2]a nice post about dumplings, including this:

I once made 888 dumplings for a party, my personal record. . . . You might have crudites, warm cheese, stale hummus, left over at the end of the party. You will never have leftover dumplings – unless you burned them.

This reminds me how much I liked the dumplings at the Tsinghua student cafeterias. I think they were served at every meal but I associate them with breakfast, maybe because there was less choice at breakfast. Fresh and homemade and chewy and well-spiced and incredibly cheap (like all the cafeteria food). Maybe 6 for 25 cents. There was an optional vinegar-like sauce (speaking of fermented foods). There were two types (pork & ??) but I didn't understand the Chinese names.

I tried to avoid them. They were too easy and familiar. But it takes a certain amount of stamina to eat strange food so if I was tired, I'd have dumplings.

## More About Turmeric (2009-07-26 10:23)

From [1]the Shangri-La Diet forums:

I've begun taking turmeric and it's been a miracle. I used to be really into rock climbing and this really messed up the big toe in my right foot. (Wearing shoes 2.5 sizes too small and bearing all my body weight on my toe joints will do that, apparently.) The podiatrist said it was arthritic in nature and that the only thing that would stop it was to stop climbing. So I did. One year later, the pain had lessened, but it still hurt, and I couldn't start running again.

Last week, on a humbug, I tried turmeric. I made some vile anti-inflammatory spice concoction and managed to get a few tablespoons of it down. It probably would have ended there because it was so freaking disgusting, but I noticed later that day that my toe pain had diminished to a dim sensation that was barely uncomfortable. Desperate to come up with a non-disgusting means of taking my new "medicine," I settled on mixing turmeric, cayenne, and yellow mustard into a paste. It tastes like grainy, spicy mustard and I take about a tablespoon in the morning and a tablespoon at night. I'm also trying to take some fenugreek, cinnamon, and cardamom. I mix the fenugreek with my green tea, allow it to steep and expand between brewings, and then eat the seeds once they get soft. The cinnamon and cardamom are pleasant enough, so I just chew on them. (I use mexican cinnamon, probably 1/3 to 1/2 stick per day.

Vile Spice Mixture = VSM. James Lind tried a VSM in his famous scurvy experiment; it had no effect.

[2]The Wonders of Turmeric.

Thanks to Heidi.

Nathan Myers (2009-07-27 16:40:01)

I don't understand why she doesn't put it in gel caps.

seth (2009-07-27 17:02:25)

Thanks for the suggestion, Nathan.

tom (2009-07-27 22:46:56)

It's very weird that people are eating the spice instead of the active ingredient: <http://www.vitacost.com/productResults.aspx?ss=1 &Ntk=products &x=13 &y=13 &Ntt=cucurmin>

Nathan Myers (2009-07-28 11:28:31)

The spice is very cheap, the "active ingredient" is expensive. What's weird? Furthermore, how do we know there's only one active ingredient?

### Academic Horror Story (Stanford University) (2009-07-26 15:47)

From the [1]Washington Post:

At the open house, a STEP [Stanford Teacher Education Program] instructor asked [Michelle Kerr] if she planned to accept the offer of admission [to Stanford's School of Education]. Anyone else would have said yes. But Kerr, who calls herself "fatally truthful," said the tuition would be difficult to afford and admitted she was philosophically out of sync with the program. . . .

[[2]Professor of Education Rachel Lotan, the director of STEP,] called Kerr in for a 45-minute session on her doubts about the STEP policy orientation. Wouldn't she be more comfortable elsewhere? Even when university ombudsman David Arnot Rasch assured Kerr the offer of admission was binding, Lotan couldn't let it go. According to Kerr, Lotan looked for legal grounds to keep Kerr out, something Kerr said she discovered when another official mistakenly sent her an email that was meant just for Lotan.

"I really can't believe this response," the official said of Kerr's decision to accept admission and decline another meeting with Lotan. "Are you forwarding her response to the lawyer?"

Kerr called Lotan "a ruthless political animal who believes she was protecting her program from enemy infiltration." During a second meeting with Kerr, [3]Lotan said that she asked a lawyer about the possibility of rescinding Kerr's admission. The lawyer had told her that was untenable. "Unfortunately," said Lotan.

After Kerr became a student at Stanford, [4]Lotan tried to get her in trouble at her internship school. In [5]an official letter to Kerr, Lotan complained "you raised your voice."

[6]More about this.

---

anonymous (2009-07-27 07:03:09)

I was all ready to accept Kerr as being the victim, but, then you have this, as quoted from her e-mail on FIRE: "For those of you who wish to continue requesting that you not sit with me in practicum, make sure you mention the reason so that Rachel can build her case for the next time we do our little dance. "Rachel, I do not want to sit next to Michele in practicum. It has nothing to do with her views; she's just an domineering, overbearing bitch." DOB. We could print up cards or something. Don't Sit Me Next to the DOB! . . . I am being told that I'll be expelled if I can't figure out how to stop my classmates from complaining about me. That's a valid standard for a fifth grader clique, but it's not one I'll accept in a graduate academic setting. I'll continue being me, and those of you who feel uncomfortable can maybe learn how to speak up. Or not. Your call." AKA the old Cartman "I don't care! I don't care! I do what I want!" More or less, I am betting the actual problem is not that Kerr has problems with the program, but rather, that she is incredibly unpleasant and no one likes her. Surely you've met people like this in academia. I've had classes with them. Martyrs. Their problems look incredibly good on paper because the only actual ways people can get rid of them are technicalities. People want to get rid of them because they are INTOLERABLE, but since that is matter of opinion, even if it is a extrasupermajority, there are no procedures in place to make them leave. Don't get me wrong, they could very well have valid points and good ideas (Richard Stallman, anyone?), but valid points and good ideas that you wish were being injected into the discussion far, far away from you. Disclaimer: I (really and truly) don't know any of the people involved here. I'm just going based on what she said about herself. Anyone who knowingly calls themselves a domineering overbearing bitch

is by definition, not someone you want to work with. The fact that she doesn't have the good sense to not even say that about herself speaks volumes.

seth (2009-07-27 09:35:29)

anonymous, the "actual problem" is that Lotan wanted Kerr out of the program because Kerr disagreed with Lotan. That's thought police. That's awful anywhere; at a place like Stanford, that's supposed to make intellectual progress, it's even worse. Not only did Lotan try to enforce conformity, she really was ruthless in her attempts to do so. Lotan started treating Kerr very badly long before there was time to decide that Kerr was "intolerable". As for her classmates complaining about her, I agree with Kerr: They shouldn't go running to higher authority. They're graduate students, for heaven's sake. They should be able to solve their own interpersonal problems. If they have a problem with Kerr, they should complain to Kerr.

anonymous (2009-07-27 09:58:50)

You might be right. I concede that I do not know all the facts, nor do I condone what happened. I just do not believe Kerr to be entirely faultless.

Ashish (2009-07-27 18:35:36)

Without knowing the people involved - though I've probably sat next to them at Borrone - I think the first comment brilliantly describes a situation with which we are all familiar. People are people first, whether it's fifth grade, grad school, or work, and one obnoxious, disruptive, person can and does ruin it for the entire group. Most of us don't want to be fighting all day long. (I will say that Stallman was nice enough when I knew him - rather quiet, in person.)

seth (2009-07-27 18:53:33)

"Most of us don't want to be fighting all day long." Again, the mistreatment of Kerr began long before any "fighting" or disruption. She was mistreated after she simply expressed an unorthodox opinion. The fact that a STEP instructor went to Lotan and told her about an unusual student she'd met during open house (Kerr) also reflects badly on the program - and especially badly on Lotan.

Ashish (2009-07-27 19:14:24)

I'm guessing that the original issue - and the real issue throughout - may have been not so much with the content of some opinion that Kerr expressed, as with the manner in which it was expressed.

seth (2009-07-27 20:18:26)

If Lotan objected to Kerr's behavior (how she expressed herself) rather than Kerr's opinions, Lotan should have made that clear right away. I see no indication that happened.

## **Do They Eat Dogs? (Continued) (2009-07-27 11:46)**

In answer to the question "Don't they eat dogs?" a blogger living in Taiwan [1]stated flatly: "No. They don't eat dogs." Now, from a Beijing University student named Xiong Lilin, here is a definitive answer about Mainland China:

Yes, we do. But not every Chinese person eats dog and never for everyday meals. In some provinces, there are restaurants that serve dog meat in the winter. A few people will have one or two meals every year during the coldest days. Eating dog meat can make people warm and prevent colds. Although these kind of restaurants exist, they are disappearing. In fact, mutton has the same function as dog meat. In my home town, Chengdu, many people eat mutton on [2]DONGZHI, the day winter begins according to the Chinese traditional calendar.

More In [3]this New Yorker article, published today, Michael Savage, the radio host, contemplates eating dog. Xiong Lilin later wrote: "Yesterday, my roommate asked me what kind of dog we eat. She seems to think that we eat pet dogs. In fact, we do not eat pet dogs, the dogs we eat are raised specially for eating and belong to different kinds from the pet ones."

---

Timothy Beneke (2009-07-27 20:23:08)

In 2002, in Xian, in central China, I was served dog at a restaurant as part of a meal I was eating with a leading artist there and the Xian chief of police and some others in our group; there was also chicken and beef and other food, but dog meat was part of meal that was ordered by the artist. No one seemed to think twice about it. I ate a tiny bit, rather beefy and stingy as I recall... The restaurant was part of an entertainment park with miniature golf and fishing and other activities...

thehova (2009-07-28 01:05:31)

I just read the profile on Michael Savage. What a strange figure.

Abe (2009-07-29 19:58:53)

Dog is still widely eaten in southern China ... especially Guanxi Autonomous Region and its Capitol Nanning Case in point 1: <http://www.fotothing.com/junne/photo/42b2cccae403d5e8be2a5a2160c72133/> Case in point 2: check minute 2:28 - <http://www.youtube.com/watch?v=ilmwVJWI83Q>

## **What I'm Looking Forward to Reading (2009-07-28 09:43)**

In September, David Owen, a staff writer at The New Yorker, will publish [1]Green Metropolis: Why Living Smaller, Living Closer, and Driving Less are the Keys to Sustainability. Or at least that's what the print says; the picture has a different subtitle. The book expands on [2]this New Yorker article. Owen criticizes Michael Pollan and Amory Lovins, among others. Maybe this is an example of the [3]insider/outsider advantage I've blogged about. Owen is not the New Yorker's environmental reporter; that would be Elizabeth Kolbert. So he can say anything, criticize anybody, without worrying about his ability to write more on the same subject. He can always go back to golf. Kolbert is not so free. In any case, Owen's book sounds better – less predictable – than [4]Kolbert's book on a similar subject. [5]A TV show on the subject. [6]Owen on bridge.

---

thehova (2009-07-28 10:18:46)

From the publisher's weekly review, I find this sentence to be interesting: "The environmental movement's disdain for cities and fetishization of open space, backyard compost heaps, locavorism and high-tech gadgetry like solar panels and triple-paned windows is, he warns, a formula for wasteful sprawl and green-washed consumerism." I guess there's a lot of sex appeal behind solar panels. And big business is more than willing to get into this highly subsidized government industry. But the bottom line is that from a scientific perspective, solar panels don't show much promise.

Nathan Myers (2009-07-28 14:43:07)

Solar panels on houses don't, but not so much because of the panels, but because it's a small number of panels attached to a big inverter and rack of batteries. Serving as roofs over big parking lots and commercial warehouses, they would make more sense, protecting the roofs and cars underneath as well as producing power, and be big enough to take advantage of economies of scale. Solar thermal power (using long, flat, rotating mirrors reflecting onto a long heat-absorbing pipe) is now competitive, and you could park, shop, or work under it too.

Preston L. Bannister (2009-07-29 16:45:39)

Simple question: If places like New York are efficient, why does it cost so much to live there? (And please, try not to go shallow on the answer.)

seth (2009-07-29 18:08:40)

I think energy efficiency is a small part of what determines cost. I think what it costs to live in New York is a function of desirability, what salaries are paid to the people who live there, how much everything costs (now & in the past – such as building costs), and how much it costs to live nearby. Given the huge rural-to-urban migration all over the world, you have a subtle point: In some system of accounting, it must be costing less and less to live in cities. Perhaps because all sorts of problems associated with city life are slowly being solved. E.g., better sanitation, better transportation.

## **The Mother of an Autistic Child Writes... (2009-07-29 01:08)**

Lisa Belkin, who blogs about parenting for the NY Times, [1]prints an excellent letter from the mother of an autistic child about what it is like:

“Crying.” The study talks of the crying. [The mom wrote to Belkin to complain that a study Belkin described sugar-coated things.] The word pales in the face of our son’s dissolutions into tears. These days, if he hears a simple “no” or learns of some change in plans, he might launch into a 10-minute jag, where he argues fiercely with us in between the sobs. Then he can quickly escalate to ear-piercing screams lasting another 15 minutes or more. It’s a wonder none of our neighbors have misconstrued what they might have heard and called 911. The shrieking does subside, back into sobs, and that part is somehow harder to watch, reminding me how terrifying it must be to feel to be that out of control, especially when you’re a small, anxious child.

No good deed goes uncriticized. An autistic adult named Sarah [2]writes to Belkin to complain:

Please, consider that autistic people read blogs and have feelings as well. Your blog entry claims to show “the unvarnished reality of autism,” but the feelings and perceptions of actual autistic people are sadly missing from your account.

What an idea: that no blogger should write something that might hurt the feelings of someone with autism. As for the "sadly missing," the passage I quoted from the mom describes the "feelings and perceptions" of an autistic person at length. Sarah blogs [3]here.

3. <http://autisticcats.blogspot.com/>

---

JR Minkel (2009-07-31 23:06:41)

Seth, maybe acknowledging what it's like from the autistic subject's point of view is part of finding a way to improve everybody's well-being. I wonder whether autistic kids could be raised in some alternative environment that would be less injurious to them and to their caregivers. I wonder how much NIH money goes toward figuring that out. Seriously!

### **Autism and Digestive Problems (2009-07-29 23:15)**

[1]The latest issue of Pediatrics has a study that asks whether autism is associated with digestive problems. The authors compared the medical records of about 100 autistics with about 200 matched controls. The controls came from an area in Minnesota, near the Mayo Clinic, in which almost everyone has a health record on file that the researchers could look at. So the controls are a good sample of the non-autistic population.

The [2]New York Times described the results like this:

The scientists found no differences [should be difference, singular] in the overall frequency of gastrointestinal problems reported by the two groups.

This isn't quite right. The study found that the proportions of persons in each group to have had at least one digestive problem by age 20 weren't reliably different. For the autistic kids, the proportion was 77 %; for the controls, 72 %.

The study design seems fine but the data analysis has a lot of room for improvement. You have an idea you want to test, good; try to test it with one test. The authors boiled down all their data into "at least one problem by age 20" – that's just what epidemiologists are told to do – but this was a poor choice. First, there is a ceiling problem. If both groups had percentages in the 90's, this would be obvious. Better to avoid the ceiling problem. Second, to combine different symptoms with the "at least one" rule is likely to be less sensitive to differences than a combination rule that takes amount into account. The analysis in the article treats someone with 1 problem as equal to someone with 50 problems. No justification is given. Third, it isn't obvious that it makes sense to combine symptoms this way. What if Symptom 1 and Symptom 2 are uncorrelated? In other words, what if whether you have Symptom 1 doesn't affect your chances of having Symptom 2? Then to combine them (as the authors do) makes no sense. Factor analysis is how you condense several correlated measures into a few uncorrelated measures.

The study separated digestive problems into five categories (constipation, diarrhea, and three others). In each of the five categories, persons in the autistic group were more likely to report the problem than persons in the control group; in four of the five categories, the difference was significant (with one-tailed p values; the authors misleadingly use two-tailed p values – without making that clear). In one of the five categories the difference isn't anywhere close

to significant – which supports the idea that there are at least two dimensions here: one on which the two groups differ, and one on which they don't.

In the discussion, the authors, not realizing that four out of five of their problem categories differed significantly in the predicted direction, try to explain away the two differences that were significant with two-tailed p values: in constipation and picky eating. They note that autistic children get more medication than normal children. "Many children with autism are treated with risperidone, and this may result in increased appetite and weight gain," they write. Why a drug that causes weight gain would cause picky eating isn't explained and, without explanation, doesn't make sense. Weight gain – they mean too much weight gain – involves eating too much; picky eating involves eating too little. Nor do the authors explain why their results differed from many previous studies. My take on the paper is that their results confirm previous studies, so that would have been interesting to read.

1. <http://pediatrics.aappublications.org/cgi/content/abstract/124/2/680>

2. <http://www.nytimes.com/2009/07/28/health/28autism.html?scp=2&sq=autism&st=cse>

---

JR Minkel (2009-07-30 15:32:49)

Speaking of autism and methodology, I was scanning a book on the epidemiology of schizophrenia for a story I'm working on, and in the very first chapter, right after explaining the difficulty in quantifying some general "heritability" from a particular sample, the author points out that studies of vaccine side effects can't separate cases from controls, so there's a methodological snag there. I have no reason to think autism is related to vaccines – I need to look at the studies – but if experts gloss over those sorts of technicalities in framing e.g. vaccine policy to the public, is it any wonder a savvy parent could become suspicious?

Nathan Myers (2009-07-30 17:05:37)

It's always been easy to construct a study to produce a negative result, if you can be confident the method won't be criticized. Because of its construction, this one doesn't, and can't, tell us much of anything about autism and GI problems. Instead, we need to ask, here, what it demonstrates that they have constructed this particular study this way.

seth (2009-07-30 21:32:30)

Nathan, I don't think this study was biased at all. The areas of possible improvement I point out are found in most epidemiological papers. The data analysis was done as it was because that's the way epidemiologists are taught to do that sort of thing. Not "to produce a negative result."

Scot (2009-07-30 22:57:29)

Two comments: first, you state that the overall outcome was not "reliably different". I assume what you mean is "not statistically significantly different". Statistical significance shouldn't be conflated with reliability of a finding (Nickerson R.S. (2000) Null hypothesis significance testing: A review of an old and continuing controversy. Psychological Methods, 5(2), 241-301, see specifically p. 256-257.). Second, I don't quite understand what you mean by the authors misleading by using 2 tailed p-values. Do you mean they used one tailed p values to make decisions but report 2 tailed p-values (i.e., they were confused) or that the tests should have been done with 1 tailed p-values only. If the former, I get it. If the latter, why would it be necessary to only use 1 tailed p-values in this setting...aren't differences in either direction of interest?

seth (2009-07-31 06:15:25)

Yes, by "reliably different" I meant "statistically significantly different." The authors started with a directional prediction they wished to test. When you have a directional prediction convention is to use a one-tailed test because one direction of change is the focus of interest and is much more plausible than the other direction of change. In spite of this they used two-tailed tests.

legal beagle (2009-09-11 10:20:07)

Not strictly related, but recently found this blog which has lots of info and a hypothesis tying missing bacteria required for nitrogen oxide production with autism and other problems: <http://daedalus2u.blogspot.com/2007/04/background-and-summary-no-and-asds.htm> | <http://daedalus2u.blogspot.com/2007/03/abstract-of-low-no-hypothesis-of-asds.html> <http://daedalus2u.blogspot.com/2007/03/introduction-to-low-no-cause-of-asds.html>

## **Does Bad Medicine Drive Out Good? The Case of Eczema (2009-07-31 18:46)**

In [1]an article on weight regulation I read this:

One subject . . . developed symptoms possible related to EFA [essential fatty acid] deficiency (ie, mild eczema relieved by the addition of fat to the diet).

In other words, the subject – in a metabolic ward at Rockefeller University where everything he ate was supplied by the researchers – developed eczema when fed a zero-fat diet. When fat was added, the eczema disappeared. The researchers understood that not enough fat in your food can cause eczema. This research was done around 1960. The conclusion is supported by dozens of reports from people doing the Shangri-La Diet who said that when they started drinking oil their skin improved. Dry areas disappeared. I found the same thing myself. (And judging by the large fraction of people who have dry skin, a lot of people aren't eating enough fat.)

The notion that eczema can be cured by eating more fat – perhaps high in omega-3 – could hardly be simpler. Around 1960, at least some doctors understood this (in a situation, I admit, where it was easy to understand). Yet here is how eczema is treated today, according to Bottom Line/Women's Health (April 2009, p. 9):

Eczema (dry, itchy, swollen skin) usually is treated with topical anti-inflammatory cream twice daily during flare-ups. Patients who applied tacrolimus (Protopic) twice weekly to lesion-prone areas even when no lesions were visible went 142 days between flare-ups, on average . . . versus 15 days for placebo users. Tacrolimus can cause nausea and muscle pain and may increase skin cancer risk – ask your doctor about the pros and cons of preventative eczema treatment.

The information comes from a study done by Sakari Reitamo, a professor of dermatology at University of Helsinki, and others published recently in Allergy.

The surface things – the things that impress many readers – appear good: large sample, big difference between groups, peer-reviewed journal, good university. Yet once you know that eczema can be cured by eating more fat, the whole thing sounds Orwellian.

1. <http://www.ajcn.org/cgi/reprint/55/2/350>

thehova (2009-07-31 20:54:11)

off topic, but I'm curious if you have any reactions to a couple of long Megan Mcardle posts on weight loss (the last one specifically mentions you): [http://meganmcardle.theatlantic.com/archives/2009/07/americas\\_moral\\_panic\\_over\\_obes.php](http://meganmcardle.theatlantic.com/archives/2009/07/americas_moral_panic_over_obes.php) and [http://meganmcardle.theatlantic.com/archives/2009/07/thining\\_thin.php](http://meganmcardle.theatlantic.com/archives/2009/07/thining_thin.php) of course, lots of people seem to disagree with her in the blogosphere.

Dennis Mangan (2009-08-01 05:24:07)

In his book, Taubes shows that carbohydrate restriction for weight loss was the conventional wisdom for around 100 years, but with the advent of the lipid hypothesis of heart disease, the knowledge was shoved down the memory hole. When low carb diets were revived, it was almost as if no one had ever heard of such a thing. But if you had gone to a major medical center or clinic for weight loss up until the early 70s, you would have gotten a low carb diet.

seth (2009-08-01 06:22:14)

thehova, thanks for letting me know about the McArdle posts. Besides being pleased she mentioned me, I thought the interview with Campos was very good. He makes several good points that aren't usually made. I disagree with him, however, that being thin isn't important. I wished McArdle had asked him: What about people who want to be thin to look more attractive? When Campos goes on about how it doesn't really help your health to be thinner, he's ignoring what I thought was pretty obvious: that it does help your attractiveness. Perhaps any reader of this blog doesn't need to be told that she appears to misunderstand my theory. I say that the obesity epidemic has arisen because we are eating foods that taste exactly the same each time (and have lots of quickly digested calories). Lots of factory-made food. Factories make food that's less variable than homemade food. Such food produces stronger flavor-calorie associations, which raise our set points more. This isn't the same as saying our food has lots of fat, sugar, and salt. Dennis, yes, that's a good example.

Ben Hyde (2009-08-01 12:41:24)

Bad money drives out good because money has two (among others) functions: store of value and means of exchange. The bad money is good enough for the exchange, while the good money is retained for its storage value. Presumably in this context we have rituals/knowledge that get used for treatments. But they have value in differing ways: short-term v.s. long-term efficacy. There are some narratives of the founding of professional medicine that argue that for centuries there was an unlimited demand for medical knowledge so lots of folks would volunteer to provide treatments. Such practitioners have a preference for treatments that have high short term efficacy - blood letting, caffeine, purgatives, etc. etc. Only once a monopoly was granted longer term efficacy could get a bit of seat at the table. No doubt all knowledge economies have analogous problems. How the split between short-term and long-term efficacy is balanced ain't amenable to naive rule making.

thehova (2009-08-01 12:57:43)

Thanks for responding. Yes, people truly want to lose weight. It seems like McArdle/Campos argue that this desire to lose weight stems from a major, erroneous misconception that fat equals unhealthy. But I don't think that's right. In college, being overweight, I struggled to get to classes around campus. I was starting to feel pain in my hips and knees. I had terrible acne from the types of food I was eating. I was often directly miserable from being overweight. Of course, strict calorie reduction, which health care experts seem to often advocate, often makes people more miserable. That's what's great about the SLD. You lose weight in a smart way.

seth (2009-08-01 13:22:48)

Thanks, thehova. Not only does Campos ignore the psychological benefits of weight loss, he may not realize that weight loss certainly causes blood pressure reduction and less damage to knees and legs, as you say.

## 4.8 August

### Andrew Gelman on Writing (2009-08-01 06:54)

[1]Andrew gives excellent advice about how to write a scientific paper. This is his best point:

Consider Table 2. Do you want the reader to know that in line 3, Min Obs is 894? I doubt it. If so, you should make a case for this. If not, don't put it down. When an article is filled with numbers and words that you neither expect or want people to read, this distracts them from the content.

In other words, most tables should be figures or omitted. I would add a broader point: **Don't try to impress anyone.** It gets in the way of helping them – helping them understand what you're saying. (The classic example is B. F. Skinner, apparently insecure Harvard professor, calling one of his books *The Behavior of Organisms* instead of *The Behavior of Animals*. The book said nothing about plants.) Many tables seem more meant to impress than communicate but it isn't just tables. That section at the end where epidemiologists talk about the "limitations" of their study: The content is so predictable, so fact-free and unhelpful that I think they are just trying to impress readers with how careful they are. So I would add to Andrew's advice: **Don't tell people what they already know.**

I also like his list of content-less words, such as *very* and *nice*. Allen Neuringer told me you should never use *very* and I was impressed.

[2]Alex Tabarrok's comments.

LemmusLemmus (2009-08-01 11:02:44)

*That section at the end where epidemiologists talk about the "limitations" of their study: The content is so predictable, so fact-free and unhelpful. . . . .* that one might suspect many authors only include those points so that they don't provide an open flank to reviewers?

Andrew Gelman (2009-08-01 13:49:20)

Hi, Seth. I'm glad you liked my advice. The Skinner story is amusing. It reminds me of when I was deciding on the title of my first book. Consider these three alternatives: 1. Bayesian Statistics 2. Bayesian Inference 3. Bayesian Data Analysis Option 1 was too general: our book covered data analysis but not other aspects of statistics such as data collection and decision analysis. Option 2 was too specific: "inference" does not include model building and model checking. Option 3 was just right. I do have one quibble with what you wrote above, though. I agree that most tables should be figures or omitted. But I disagree with your inference that people who include too many numbers in a table are trying to impress someone. I think people do it that way because that's how they think it's supposed to be done. They're just following the template.

seth (2009-08-01 14:15:40)

yeah, I agree, some tables are there just because it's conventional. Perhaps fear is the motivation: fear of not being conventional. Then the broad lesson is: Don't do something just because other people do it that way. Jane Jacobs told a story about people who cut the end off of their meatloaf before putting it in the oven. Why? she asked. They didn't know. It was just how it was done. Turned out it used to be done because the oven was too small for the whole thing. Now they had a bigger oven but kept on cutting off the end. Graphs were once hard to make, so people made tables instead. Now graphs are easy but not everyone has adjusted.

James (2009-08-02 07:09:37)

I can see one good reason to have tables in there - reproduceability. Give people your raw data so they can repeat the analysis themselves.

seth (2009-08-02 09:26:37)

James, that's very rare - anything approaching raw data. I agree with you but that stuff should be in an appendix.

HowTo: write research articles « Entertaining Research (2009-08-18 03:16:38)

[...] I got the link to Gelman's post via Seth, who has his own suggestions and also a pointer to Alex Tabarrok's comments on the same at MR. [...]

### **The Blue Sweater (2009-08-01 16:37)**

When Jacqueline Novogratz was a young girl, she had a favorite blue sweater. She continued to wear it after it became too small. One day a boy made fun of her for wearing it ("We can ski Mount Novogratz"). The next day she gave it away. A decade later, in Africa, she saw it being worn by a skinny young boy. Thus the title of her new book about trying to make the world, especially Africa, a better place: [1]The Blue Sweater.

In contrast to so many books, usually by men, about helping others, which tend to be about how right the author is/was, this book stresses how wrong she was. An example is a job interview.

"Tell me why you want to be a banker," he suggested. . . .

"I don't want to be a banker," I said. "I want to change the world. I'm hoping to take the next year off but my parents asked me to go through the interview process. I'm so sorry."

"Well," he said with a grin, shaking his head. "That's too bad. Because if you got this job, you would be traveling to 40 countries in the next 3 years and learning a lot not only about banking, but the entire world."

I gulped. "Is that really true?" I asked, my face completely red. "You know, part of my dream is to travel and learn about the world."

"It is really true," he sighed.

"Then do you think we might start this interview all over again?" I asked.

She got the job. It's easy to see why. And stories like that made me want to read the book

1. <http://www.thebluesweater.com/>

---

michael vassar (2009-08-02 10:53:11)

Too "heartwarming", too improbable (in a fairly easy way to measure and also in terms of the survival of the sweater) and too inconsistent with what I know of New York bankers. I simply don't believe her. Calling touching fictional stories non-fiction probably boosts sales.

seth (2009-08-02 13:26:44)

The sweater story doesn't strike me as heart-warming, just strange. As for "too improbable," I think Nassim Taleb's basic point is correct: We are very poor at estimating the likelihood of rare events.

### **Gamesinwelt.com Scam (2009-08-02 12:55)**

I finally decided to get a Wii Dance Dance Revolution. This required getting a Wii, and gamesinwelt.com had the lowest prices. Curiously they shipped from China, where Wii's are not for sale. I searched for "gamesinwelt.com complaints" and "gamesinwelt.com sucks" and found nothing. Okay, I thought. As it turned out my credit-card payment did not go through so I haven't lost any money but here is what should have made me suspicious:

1. The site didn't work very well. One of the error messages I kept getting made no sense.
2. It didn't take direct credit card payments. The credit-card payments were made through Paypal.
3. Delivery was not only free, it was really fast – 2-5 days.
4. The site listed FedEx as a delivery choice in one place but not on the home page.
5. Although there were about 9,000 Google hits for gamesinwelt.com, when I went to the pages the ads weren't there. They were brief ads. And only ads.

When I searched "gamesinwelt.com scam" – after the purchase – I did find [1]useful information that confirmed my fears. One persuasive point was that the site was registered only a week ago. This is why there was so little negative information available. Foolish me.

More "My credit-card payment did not go through" – that's what I was told when I called Paypay. But then I got an email saying it had gone through. Ugh! So I called Paypal again and complained. And was told I needed to call back in a week when I hadn't gotten the stuff. Then I waited a week and called Paypal for the third time. And then I was told a dispute had already been filed and – when it was resolved in my favor – I would get an email saying the money had been refunded. So I had to call Paypal three times (so far) to deal with this and one of those times was given wrong information.

[2]The story continues.

2. <http://www.blog.sethroberts.net/2009/08/22/paypal-the-empty-promise-way-to-pay/>

---

Natalie (2009-08-03 00:40:11)

So, did you get the wii? I found the site as well and was doing my research on it as well. Your blog came up but I didn't understand what you thought about it. Was it a scam? You didn't get what you ordered? Thanks

Ainsprid (2009-08-03 01:39:07)

I'm glad you didn't lose any money Seth o.o And I hope you'll find it on another site ^^

seth (2009-08-03 04:14:49)

Natalie, my payment to the site did not go through. Yes, I am saying the site is fake and that if my payment had gone through I would not have gotten anything.

bennetta (2009-08-03 14:31:13)

I work for a manufacturer (in the outdoor industry) and there's no way we would sell to an online business like this. To me, probably the biggest red flag here is the lack of a physical address and phone number. If they can ship so quickly, surely they must have a warehouse in the continental US. Do they even have a customer service department? How about a business address? Is this just some guy operating out of his apartment? How can they manage all communication through just one single email address? Either they must not communicate that much and they must not sell very much (which would make them unable to get such great deals), or they are sorely lacking in the service department. This is a concern not only for consumers, but also manufacturers who would need to contact them. General rule of thumb regarding internet sales: If it sounds too good to be true, it probably is.

seth (2009-08-03 16:18:04)

You might be right. But here's what I think: An address in China would be easy to fake. Amazon doesn't have an obvious address, phone number, or even, perhaps, a customer service department that you can reach by phone. The shipping is only a little fast – I often get stuff in a day or two if it's flown at some point. "If it sounds too good to be true, it probably is." The prices didn't sound too good to be true. They were no lower than many actual Chinese prices (at tiny stores). I've bought shoes in Beijing for 80 % less than I'd pay in America. Even before the internet, I often bought electronics for far less than retail.

Nathan Myers (2009-08-03 18:24:23)

Aren't there any Free Software alternatives to DDR?

Sid (2009-08-03 20:42:44)

i bought a wii from there but luckily papypal refunded me the money!! I thought i should take a risk as i know paypal could give me my money back if i opened a dispute.... In conclusion DONT BUY FROM THIS SITE!

Amin (2009-08-04 18:56:26)

I beleive this is scam! I placed a Nintendo Wii bundle with some additional games on July 30th and received an immediate order confirmation from gamesinwelt support center and a payment receipt from paypal. But then after 2 days when I did NOT receive any shipment confirmation from the seller, I sent an email to gamesinwelt support center but still no response. Then I called paypal and asked them to help. Paypal sent an email to the seller, Mr.Peng Lin, on my behalf on Monday, August 3rd and as of today, 8/4/09, I did not receive any response. Now, after I read your experiences, I am going to request Paypal to refund my money.

Lisa S, QLD (2009-08-04 19:13:40)

Hey Seth, Otto,I just brought \$350 worth of wii stuff online through this company.... Also i am in Australia, I really hope what you say isnt true( no offence). I am a single mother on a pension... I thought this was really cheap, the site didnt look fake to

me....shit what have i done?

Russ N. (2009-08-05 14:50:50)

Hello, I'm from maryland and I just purchased a wii from this company, I am very weary after reading this, to put my mind at ease I look to further investigation of this site. Thanks for the warning, but I will get my wii!!! come hell or high water.

r (2009-08-05 18:10:21)

well did any of you guys get your wii?????????????

Jason (2009-08-05 18:58:44)

Ok ... Not happy I just have been had by the same company. I also received a paypal receipt but inputted my CC directly and now 3 days later the transaction has gone through with no contact with game in welt no email for shipping. UGH!!

Fern (2009-08-05 20:27:23)

DEFINITELY A SCAM! Thanks to all the bloggers on this site for alerting us. I just wish I would have read this site before I purchased. Just contacted PayPal & they will require you to file a dispute (after several days of waiting for no item). They'll investigate and if they rule in your favor, you'll get a refund.

Lisa S, QLD (2009-08-06 01:29:11)

i have only just ordered mine, i have asked the seller a question but they haven't replied back. I dont even think the email went throght to them.

Donna (2009-08-06 12:32:20)

i found gamesinwelt.com using Google search engine on 7/31. i was suspicious and researched this company for scams/rip offs. after coming up empty, i reluctantly placed an order using a major credit card. it's been a week and my order is still in "new" status. i've emailed "service" several times and haven't received one response. the detail on my credit card shows the merchant as: Mark Paypal, Hamilton Ave, San Jose, CA and that the purchase was "professional business services". today, i contacted my CC company and reported this site to the IC3. i've found this vendor on many major search engines and websites including Monster's Marketplace....

Emmanuel Iheonu (2009-08-06 23:48:30)

i to had also purchased a psp 3000 bundle for \$112 on this same scam site on the 28th of july n i got a confirmation abt my order from the site but its been ova a week now and i haven't received any confirmation of payment and tracking info. I was sooooooooooooo pissed and deecided 2 cal paypal and they opened a case for me. They are currently investigating it so hopefully i would be able to get my money back!!!! The SITE IS A FUCKIN SCAM!!!!

Matthew (2009-08-07 12:51:48)

I too was alarmed after looking over several sites and my wife saying that the deal sounded too good to be true. I googled the site beforehand and didnt see this blog today I googled Gamesinwelt.com scam, and it confirmed my worst fear that I had been ripped off I even see that the paypal payment I made was to a different party than posted above I opened a dispute as well. I am using this website as cause to believe the site is fraudulent.

vicki (2009-08-09 00:37:47)

I wish I had read the reviews before purchasing my order last week. i have now put a dispute in with paypal and hopefully will get my money back. The offer did seem to good to be true.

Matthew (2009-08-09 15:21:29)

Follow Up: I have actually found paypals dispute resolution process to be somewhat tedious. I placed the dispute then I called my credit card company and they said if it had posted (it had) I could open a case with them.... It was my bank/debit card so this process was through my bank. I followed the instructions that they gave me and I should have my money back Via chargeback

which paypal then yanks the funds from the account they funded. I was lucky I found this website while I was still having my payment in verification stages from paypal so when I recieved the word they funded the other account I filed a dispute immediately. I am not sure what other financial instutions process is but I feel like I am glad I used paypal and my bank card I feel more reassured that I will get my money back, the people at my bank say this is fairly common that this stuff happens.

Bushe (2009-08-09 21:38:39)

Would you be interested in writing for The Neave Online Publication? I love your writing style and I feel like you would fit in perfectly with the other writers.

Jim (2009-08-10 07:59:17)

I ordered a Wii bundle on July 25. As indicated by all others I received a confirmation immediately and within 2 days payment was made thru paypal. No response to any emails at this point. I too am contacting paypal for resolution. Thanks to all for your comments - this sure looks like a scam to me.

vicki (2009-08-10 15:58:32)

has anyone else noticed that the web site to gamesinwelt no longer works?

vicki (2009-08-10 18:02:42)

Its back up again. How weird.

Lisa S, QLD (2009-08-11 00:06:19)

I wonder how much money he has actually scamed out of people.....

Bethesda (2009-08-11 16:27:48)

I too bought something from gamesinwelt.com on july 30, 2009 and I have yet to recieve anything. I've sent them three messages and haven't heard anything what so ever. I am more than convinced that this is a scam. Good thing I used paypal

Paul (2009-08-11 20:50:05)

All I can say is CRAP!!!

Amber (2009-08-12 11:49:06)

I too, have been duped by this site. I should have listened to my gut...dang it! So I am in the process of also disputing with PayPal. I hope this all goes smoothly. My question is, after reading everyone's post, how and why does PayPal continue to do business with this site when there are obviously so many disputes with the site!!! Makes no sense, when I actually get another live person, I think I will ask them this....here goes nothing.

Donna (2009-08-14 08:33:05)

it appears the gamesinwelt site is down or gone but i suspect they have a new site up under a new alias. as i said, i reported them to the IC3 = Internet Crime Complaint Center. you can find them at [www.ic3.gov](http://www.ic3.gov) if some of the earlier posters had reported them perhaps less folks would have been ripped off... BUYER's BEWARE! especially on the Internet.

Cynthia (2009-08-15 00:07:17)

I to have been screwed by this website! I have just filed a claim with paypal! Hopefully, hopefully I will get my money back! Agggggghhhhhh so mad at myself to good to be true website (should have known better)

Suzanne Simon (2009-08-17 04:28:39)

Just to let everyone know I was just done for \$750 and paypal are not going to get it back. They say there is no money in the account and how many of us have been done by this scam. Surly this is a police matter. I am going to my bank tomorrow seeing paypal goes with my debit/credit Visa card and see if i can get it back this way/.

Chris (2009-08-17 06:19:47)

I must have taken a stupid pill and it worked when I purchased my wii on line with this company. The old saying If it is too good to be true then it is not true. These people really prey upon us and what irks me is that they get away with it. How can we really know who to trust on line. Must we do our own background work before we buy anything on line? I guess so, Maybe congress can take a look at all the scamming done on line.

Dan (2009-08-17 08:37:55)

OK-had to put my two-cents worth in. This site ([www.gamesinwelt.com](http://www.gamesinwelt.com)) no longer exists. I was also duped for \$220.00. I ordered a Wii system over a month ago, and of course, never got it. Sent 8 e-mails and no response. I thought I would be covered since I used PayPal, but NO! I did file a dispute with PayPal and they ruled in my favor, but the account I paid into no longer existed, or didn't have the funds to recover. So PayPal's guarantee really doesn't work unless the seller leaves the account open with money in it. I am also going to file a claim with my bank-since I used my Visa through PayPal.

Marylee (2009-08-17 13:49:05)

Count me in...I got scammed as well. Ordered a Wii on 7/31 and have been trying to get a response from them ever since. I have never been scammed and a buy many products over the internet. This was an eye opener for me and I learned a big lesson! I wonder how much they got from unsuspecting people like us. Unlike you Seth...the charge did go through on my credit card. The charge did not show up until 8/6 so then I thought...we maybe it WAS coming and just shipped late. Stupid me!

Steph (2009-08-17 23:33:22)

I too have been scammed! I have been hoping and trusting in the good of people - but i bought my wii package on the 30th July and have not heard anything but a confirmation email. I am freaked! I am contacting paypal now...oh please god let me get my money back!

CAT (2009-08-18 10:05:42)

can someone please tell me why we should use paypal at all if it offers zero protection??? this site got me as well and i'm still in the process of an extremely tedious claim with paypal, which i believe (based on the above comments) that i will never get my money back. this kind of thing really makes my blood boil. WHAT IS THE POINT PAYPAL?????????

Janet (2009-08-18 14:06:18)

Same story as everyone else. Paypal told me to wait 10 days before I called my credit card company so they could investigate. What's to investigate? It's an obvious scam. Can't wait for paypal to return my money. I called my credit card company directly and they issued me a credit immediately. Let Paypal deal with the loss instead of me!!!!!! Everyone should do the same and maybe Paypal will be more selective as to who they deal with.

Janet (2009-08-18 14:07:28)

same story

Matthew (2009-08-18 20:30:30)

Well I was informed today that the paypal dispute process ruled in my favor... however since they alert the crook that I am filing a dispute and then give them a whole 10 days to respond to the complaint. Needless to say since it was said above that the paypal account that the money went to is bone dry and therefore they cannot refund any of my money, I actually was already repaid by my banks fraud department and it would have been nice for paypal to recoup that so I could give my bank back the money they so quickly replenished to my account. However paypal did give me these reassurances... and I quote "We will make our best effort to recover the funds in question if they become available in the seller's account in the future. Please be assured that we will also take appropriate action against the seller's account, which may include limitation of the seller's account privileges." I will be holding my breath... and NOT USING PAYPAL ever again.

vicki (2009-08-20 00:49:04)

DO NOT bother going through PAYPAL to recover the money from this seller. There is noooooo money in their account. I am going through my bank to get my money back.

Suzanne Simon (2009-08-20 16:53:24)

I would like to know if any one else has had trouble getting the money from their banks after paying with Visa to paypal. I have filed a dispute with my bank (Bank of Queensland) so i hope i get my money back. I thought if you did not get the goods delivered to you that visa repays all the money . Am i correct in thinking this way. Never had to deal with any thing like this before.

Dan (2009-08-21 16:40:07)

Add one more to the sorry list of ripped off folks, Gamesinwelt got \$193.00 from us and Paypal says, "After careful review, we have concluded our investigation of the Buyer Complaint described below. We have decided in your favor, however, we were unable to recover any funds from the seller's account. As stated in the PayPal User Agreement, recovery of funds associated with a Buyer Complaint cannot be guaranteed. So why do any of us use Paypal ? I am so P Off!! Paypal is a rip off too if they don't stand by their guarantee.

Amy (2009-08-21 20:31:46)

Same story! \$300 for a wii and a nintendo ds! the day after my husband ordered I tried to go back to the website and order some games. I got a message saying the company "could not accept paypal at this time" I then emailed paypals customer service and asked them if this meant that they were not a reputable company that I should not do business with. Paypal said, and I quote "it does not mean that they are not reputable, they could be experiencing problems with their internet connection to paypal." I was almost stupid enough to western union them (only \$9) for a ds game as this was going to be a bday present for my daughter. Paypal also decided in my favor (gee thanks) but there is no money to refund me. WHY USE PAYPAL? I thought that was the whole point!!!!!!!!!!!!!!

Branklin Carter (2009-08-22 11:55:39)

I was scammed by the same company and Pay Pal said that I won but there isn't any fund. First I'm going to contact the credit card company and then ic3.gov who check into internet fraud. This is my second time and even thou it wasn't over 200.00 it was my money. Please be careful of a company name ebrandsky.com also.

Seth's blog » Blog Archive » PayPal, the [Empty Promise] Way to Pay (2009-08-22 13:08:49)

[...] A few minutes after I sent gamesinwelt.com credit-card payment for a Wii via PayPal, I phoned PayPal asking them to cancel the transaction. Your payment did not go through, I was told. "Did not". So there was no need to cancel it. I was safe. To warn others, I wrote my earlier post about this. [...]

Fern (2009-08-22 16:52:33)

After a couple of weeks of waiting through PayPal's dispute process...I finally got an entire refund from PayPal.

Suzanne Simon (2009-08-23 06:28:16)

I wonder if this means we are all going to get our money back from Paypal. Two days ago they had no money in the account and now Fern says they have finally paid them. I wonder what is going on .

Marylee (2009-08-23 09:56:26)

Looks like they might be back under www.gamesingate.com!!!! How can we stop this site??? I am not technologically savvy enough to know

Marylee (2009-08-23 10:44:50)

Seth...how do you write a blog so that it will come up in an internet search??? I tried to do a blog about this gamesingate site but when I do a search it does not come up. I got to your site by merely typing in gamesinwelt. HOW did you do that???? I want anyone who types in gamesingate to get information about how they are a SCAM too

Suzanne Simon (2009-08-23 18:35:21)

Guess what I just logged into gamesingate.com using my account and password that i had on gamesinwelt and you will never guess. Up comes all the things that i ordered from Gamesinwelt on the account. DO NOT DEAL WITH GAMESINGATE.COM they are the same people as gamesinwelt.cvom. and paypal are dealing with them again. I wonder how many other unsuspecting people will be caught out. I dont know how come the police of FBI or someone cannot get these people.; I just want my \$750 BACK. There goes my childrens Xmas.

Chris (2009-08-23 22:59:08)

I was scammed by these people also.. but never again.. One off the problems is that they have learned how to manipulate the system. \*They pay their bill to GOOGLE which puts them at the top of the paid advertisers list. \*They use PAYPAL which we all trust and feel its secure. \*and their address is out of our reach in China Gamesinsport.com = Gameiswelt.com = Gamesingate.com (their newest one). If you go to <http://www.whois.net> you can see that they are all the same people. If you go to a command prompt and ping [www.gamesingate.com](http://www.gamesingate.com) you will see that their ip address is 67.213.221.198 which i hosted in the US. I don't know if the current web hoster is involved, but I have asked them to take down the site. <http://www.cqcounter.com/whois/?query=67.213.221.198> I may never get my money back, but I am dedicating my time to helping others avoid this SCAM and take down these SCAMMERS. Please help me in e-mailing GOOGLE, PAYPAL, the current website host ([arin-contact@hostingservicesinc.net](mailto:arin-contact@hostingservicesinc.net)) and whomever else you can think of.

Tam (2009-08-24 00:43:47)

Wow, I am feeling pretty lucky right now. Just did a search for "purchase Wii consoles online" and up came Gamesingate.COM I was surprised that they were so far below retail that I decided to do a bit of a search into it before purchasing and I am very relieved that I found this site. Please be aware it des look as though GAMESINGATE.COM is the same operator/s as gamesinwelt and is all one big SCAM

vicki (2009-08-24 01:28:52)

definitely another scammed website. the same thing happened to me when I logged into it. How can others be warned?

Seth's blog » Blog Archive » Gamesingate.com Scam (2009-08-24 01:55:57)

[...] The old scamming website was gamesinwelt.com; the new one is gamesingate.com. More details. [...]

seth (2009-08-24 02:00:11)

Marylee, your blog probably came up in the search – just not very high. This blog comes up higher because it is linked to more.

Marylee (2009-08-24 08:24:30)

Thanks Seth...I just wish we could get the word out FAST

seth (2009-08-24 08:34:50)

Marylee, we have. If you search gamesingate.com, information that it is a scam comes very high in the search results.

Emma (2009-08-24 21:44:45)

I bought a Wii for 203.00 on 8/22. I searched for gamesingate to see if it seemed like a scam, and nothing came up. Now I'm trying to figure out how to get my money back since it's only been 2 days, but Paypal doesn't have a very user friendly resolution process. Especially when I'm sure it's a scam. Any advice?

Hanisha (2009-08-24 23:11:07)

Hi Seth, I made a mistake and did not read the reviews about the site and my payment actually went through. I had ordered it a month back and have not yet received it. Is there any way I can get my money back?

Steve (2009-08-25 04:06:11)

Hi also bought from these scumbags and have lost about \$400 AUS, could have been worse!! I thought I was doing the right thing by paying via paypal HOWEVER!!!! not so!! I received the response below and have blown my doe. "After careful review, we have concluded our investigation of the Buyer Complaint described below. We have decided in your favour, however, we were unable to recover any funds from the seller's account. As stated in the PayPal User Agreement, recovery of funds associated with a Buyer Complaint cannot be guaranteed. We hope you understand our policy and that it reassures you that you are safe using PayPal. " How reassured do you think I feel????

Steph (2009-08-25 23:32:14)

I am not used to buying things from the internet, but did my research before i purchased anything...and paypal was supposed to be safe! They wont give me a refund, as many of you now know - gamesinwelt fund is empty! Can someone please give me advice on how to apply for the bank to refund me the money. Im with the commonwealth bank. Please help - im clueless!

vicki (2009-08-26 03:14:20)

Contact your bank and tell them you used paypal through your bank account/credit card and they will look into for you. I am with the NAB and they said it could take up to 90 days for a resolution. Worth doing.

Steph (2009-08-26 17:54:52)

Thankyou Vicki :)

Rob (2009-08-26 19:50:47)

I will go to my bank and see what they could do thanx vicki

vicki (2009-08-27 02:56:53)

on second thoughts, don't go through your bank. They contacted me and because i authorised the transaction they are unable to recover any funds for me. So Paypal and the banks cannot help and GOD help all those other suckers who decide to buy from these scam arseholes.

old folks (2009-08-27 03:48:04)

Hi Everyone, I ordered the US \$229.0 package on 26-July-09 (through PayPal), after 1 week I started writing emails to the seller and their office, no reply at all. When chatting to my friends of this bargain, they were so surprised about the deal and tried to make enquiry of it. Of course there is no answer. They find this blog and show me, o my gosh, so many people fall into this scam. As I used PayPal, so I lodged a complaint of the seller; PayPal started the investigation about 2 weeks ago. I today received the email from PayPal that they were in favour of me, but I can't get back any money. Then they had the case closed. Now I have to go to K-mart or Big W to buy the Wii. To HELL with PayPal and those arseholes.

vicki (2009-08-28 00:49:50)

Had another call from my bank today and they confirmed that I would not be getting my money back as I authorised the payment. I will be putting this down to experience and in future will be doing my homework first. If the deal looks too good to be true - then don't buy!

Kay (2009-08-28 06:10:26)

wow im glad i found this blog! i was researching wiis on sale and this site came up <http://gamesingate.com/Productlist.html?pfname=wii> Im soooo glad i didnt buy anything from them! And im so sorry to all of you that did. I agree that people like this need to be apprehended. If only there was a way to get this guy back. Thanks anyways for the review.

Kay (2009-08-28 07:03:46)

now that i know this website is a scam im wondering if another website is a scam also. if anyone here can give any feedback on it that would be great. the website is <http://www.zwee.com/> they offer really cheap prices on wii's and other gadgets. only when i google them i can't find any negative reviews. this is what i've found on it: <http://www.google.com/search?hl=en&source=hp&q=zwee.com+reviews&aq=f&oq=&aqi=> im curious to hear what you think before i try buying anything.

sally cameron (2009-08-29 01:24:01)

Don't rely on paypal with this one. I put in a dispute and I won but they did not retrieve any money even though they found in my favour. So much for protecting us! I am out of pocket 240 dollars. Very pissed off. Have now filed a complaint with my bank. I am more annoyed that paypal does not protect people from these fraudulent companies.

Daniel (2009-08-29 10:26:17)

On August 5th I used PayPal to pay for a Wii and other accessories from gamesinwelt for a total of \$337.00. After sending several emails to their "customer service" (obviously with no response) I started a google search and found this site. Immediately went to the resolution center on my PayPal account and filed a claim (Aug 14th) at which time received an email explaining that I needed to wait 10 days for the seller to answer... I knew what was going to happen but decided to wait... well... I called customer service to report the new scam under gamesingate.com but didn't push for a resolution on my case at that time. On August 24 I received another email indicating that PayPal ruled on my favor but since there were no funds available on the seller's account they could not refund my money. Full of rage wrote back to PayPal and pretty much told them they SUCK!!!! I also reminded them about gamesingate and how they were the same people who stole my money in the first place. To my surprise I received a new email yesterday from PayPal indicating that they had issued a refund for \$337... THE FULL AMOUNT!!! Not sure if it was a result of my "follow-up" email or some kind of miscommunication but I got my money back. I suggest you all push for a refund; chances are you'll have to make a few calls and send a couple of emails to PayPal's customer service but you can get your money (eventually)

Suzanne Simon (2009-08-29 16:56:08)

I think Paypal are taking the money from Gamesingate site because they did the same to me I got my \$750 back from paypal. I insisted on talking to a supervisor and told them i wanted my money back from the games in gate site seeing the other one scammed and guess what I got it. Paypal know that this is the same person I think with all the complaint they are taking the money from them. Mind you this won't last long as soon as the guy catches on to what is happening he will close his paypal account. So I suggest get in quick and see if you can get any money back.

old folks (2009-08-30 23:31:11)

Hi Everyone, Since Daniel & Suzanne had got back their money from PayPal last week. I tried my luck to chase for my lost from PayPal. To my disappointment I rec'd a letter telling me how secured PayPal would be and we should keep on using it in order to protect our fund, but of the money I lost, IT IS LOST FOREVER !!!! I NOW enclosed my reply for everyone to consider action. I had lodged a complaint to the Department of Fair Trading. I think we should report this to the Police too. What do people think? "Dear Jennifer All I want is a refund as PayPal do owe me a duty of care. It is obvious that in spite of all you are saying, no refund would be made so I would now lodge a formal complaint with the Department of Fair Trading as well as advise people who log onto the blog to do the same. You will be hearing from the Department of Trading shortly. It is disgraceful that in order to get a commission, PayPal has put all its clients at risk by dealing with people who set up scams. PayPal keep on telling people how safe it is but when something like this happened, your company do not provide a refund. As you already set a precedent by refunding some people, my legal adviser has advised that I have a very strong case once my complaint is lodged with the Department of Fair Trading. Old Folks "

laura (2009-08-31 09:16:24)

DO NOT BUY FROM THIS SITE. It is a huge scam and they took me for \$165.00. The only reason I decided to take a chance was because Paypal was offered as a payment method and I THOUGHT my money would be protected. WRONG!!!! Basically, they told me that since the purchase wasn't made from an auction site such as Ebay, they will only assist me in making a claim.

Whoopity doo! They basically did nothing. Said they couldn't get the money from the company ( big shocker) and basically I am out of luck. I could have done that on my own and still gotten the same outcome. Not only am I disappointed by the site taking my money, my opinion of Paypal has totally changed

vicki (2009-08-31 18:28:06)

i have been in contact with Department of Trading here in Perth who is called Department of Commerce Consumer Protection. They are unable to help as the company is outside of Australia so OLD FOLKS it is not worth you writing to them as they are unable to do anything. They advised me that I would need to contact the equivalent of this organisation in China as that is where GAMESINWELT are running out of. Sorry to be the bearer of bad news.

Old Folks (2009-08-31 20:02:03)

I did lodge a complaint against PayPal, an eBay company with the Department of Fair Trading and created a case. My argument is PayPal was aware of what's going on (with all the complaints they have been getting and some refunds they gave) and yet they made no attempt to protect our interest. If you read the conditions we accepted (which a lot of people didn't and unfortunately I was one of them), it offers no protection at all as nothing is guaranteed and is under the sole discretion of PayPal or eBay. We may have suffered a loss this time but we did learn a good lesson. We should warn our friends to be very careful of internet trading and agents like PayPal and eBay. As Laura says "my opinion of PayPal has totally changed" so PayPal has managed to ruin its reputation and in the long run, its business will suffer. Let's spread it to the word!!

Daniel (2009-08-31 20:54:40)

I would mention gamesingate.com and remind them that this is where they need to get the money from... that's how I got my money back

vicki (2009-08-31 21:25:55)

paypal is reviewing my case after many emails to them. I mentioned gamesingate.com so i will wait to see what they come back with. I even sent them the link to this blog.

vicki (2009-09-01 01:26:54)

Forget it. Paypal have said unless it was purchased from EBAY you won;t get your money back. Also unless the seller has money in there account which was purchased outside of EBAY you won;t get your money back. I told PAYPAL that they suck and would not be dealing with them again

Nik (2009-09-01 03:04:39)

Vicki you are absolutley right "Paypal" sucks and i won't be dealing with them. They are as responsible for this scam as f\*\*\*\*ing "gamesinwelt.com" coz they could have stoped people to buy from this site. lets get this message across not to trust f\*\*\*\*ing "PayPal"

Daniel (2009-09-01 19:13:32)

It's interesting to see how PayPal "closed their eyes" and allowed more and more people to be victimized by gamesinwelt/gamesingate scam. PayPal allowed this to happen for a few weeks and used other people's money to issue refunds for the first claims... from my perspective that makes them as guilty as the chinese scammers. I wonder when was this scam first brought to PayPal's attention? ... sounds like claims started to pile up around August 2nd or 3rd and I placed my order on august 5th!!!! ... HOW CAN PAYPAL SAY THAT THEY "PROTECT" MY PURCHASES WHEN MY ORDER WAS PLACED DAYS AFTER RECEIVING A SIGNIFICANT NUMBER OF CLAIMS FROM THIS SITE? Anyone placed an order after August 5th? maybe we can start building a case from here...

vicki (2009-09-02 05:15:54)

daniel What PAYPAL are saying is that because the transaction was not made through an EBAY purchase, you are no longer covered by their protection. It sucks. I made my purchase on 05 Aug. This is my response from PAYPAL after appealing

their decision. After careful review, we have concluded our investigation of the Buyer Complaint described below. We have decided in your favour, however, we were unable to recover any funds from the seller's account. As stated in the PayPal User Agreement, recovery of funds associated with a Buyer Complaint cannot be guaranteed. Please know that we will make our best effort to recover the funds in question if they become available in the seller's account in the future, and will take appropriate action against the seller. Such action may include issuing a warning, a temporary restriction, or terminating the account. Keep in mind that PayPal uses a number of factors, including member complaints, to determine when to take action. Due to privacy laws, we cannot discuss the details of any action taken. We hope you understand our policy and that it reassures you that you are safe using PayPal.

Branklin (2009-09-06 20:53:36)

I was taken by them and a Company name Ebrandsky who are really making a bundle off of people like us.I called my credit card company and told them that pay pal said I won my case but they couldn't get the money back and the credit card company did a charge back for me and I got the money that way,as for Ebrandsky they got the money and I don't think I will get it back.I filed a report with the Internet Crime (ic3.gov) and with TradeKey where I found them and now I'm looking for the Chamber of Commerce in China to see if they will do anything.Sorry it keep happening but we have to do more research.

Edith (2009-09-10 00:42:22)

Daniel is correct in saying that PayPal is as guilty as the Chinese scammers. My husband also fell victim but he eventually got his money back from PalPay after a long long battle. I did some research and people who still did not get their money back could contact the Financial Ombudsman Service on 1300 780 808 for information about their complaint resolution service. If still unsuccessful in resolving the complaint, you may lodge an application with the Consumer Trader and Tenancy Tribunal. The tribunal may have jurisdiction to hear a claim if the Paypal part of the contract took place in Australia. You can find information, forms and fee schedules for the tribunal at [www.cttt.nsw.gov.au](http://www.cttt.nsw.gov.au) and a claim can be lodged on-line. I have also filed a report on the scams in the ACCC website naming the Chinese parties as well as asking ACCC to contact the Chinese Consulate. In turn, the Chinese Police could conduct a money trace through the scammers' respective accounts with PayPal to catch these criminals. The other alternative is to talk to your bank and exercise your credit card chargeback rights (but do it quick as I think banks have time limits on disputes).

LC (2009-09-11 06:50:59)

Thank you so much for your site. I did not purchase from the "new" scam site [www.myshoppingsun.com](http://www.myshoppingsun.com), because I thought the prices were too low and I always do research before I buy anything off the web. It's unfortunate that Paypal deals with these people.

DK (2009-09-21 08:44:41)

I got scammed as well by this Chinese website, Paypal made the payment. And the product never came. Paypal decided case in my favor, but of course they cannot recover funds from this guy. But my credit card company was nice enough to pay me back the money. Looks like the site has been shut down now. But you never know they will come up with another name. Well I should have done more research before buying from them.

Seth's blog » Blog Archive » Myshoppingsun.com Scam (continued) (2009-09-30 01:26:43)

[...] A curious comment was left on a previous post of mine about an internet shopping scam: Hi Guys I really thank you for this blog [...]

Avinash (2009-10-15 12:56:10)

I wish I had read the reviews before purchasing my order last week. i have now put a dispute in with paypal ,But Paypal is telling it is not there problem and they cannot help to to return my money and hopefully will get my money back. The offer did seem to good to be true. Buyer one personal advise please see the review of the company before taking any thing and if any thing is cheap thing twice before booking it.

Seth's blog » Blog Archive » The Parable of the Wii (2009-11-14 13:59:20)

[...] For exercise (Dance Dance Revolution) and self-tracking, I decided to buy a Wii. My first attempt, I was scammed. It arrived in August. With difficulty, I took it and accessories unopened to China. That was hard. It was even harder — for no obvious reason — to install it in China. The box sat unopened next to my TV, easily visible, for two months. [...]

### Did Genghis Khan Read Weston Price? (2009-08-03 04:20)

In Genghis Khan and the Making of the Modern World (2004) by Jack Weatherford, I read this (p. 87):

Compared to the Jurchid [Chinese] soldiers, the Mongols were much healthier and stronger. The Mongols consumed a steady diet of meat, milk, yogurt, and other dairy products, and they fought men who lived on gruel made from various grains. The grain diet of the peasant warriors stunted their bones, rotted their teeth, and left them weak and prone to disease. In contrast, the poorest Mongol soldier ate mostly protein, thereby giving him strong teeth and bones.

To tenderize meat a Mongol would put it under his saddle while riding. I was pleased to read this because I eat a lot of meat and yogurt (but not milk). The source of this information is unclear but it's a surprisingly modern comparison. [1]Good Calories Bad Calories (2007) by Gary Taubes says much the same thing (minus the yogurt – the part that most interests me). Weston Price wrote many similar passages comparing people eating traditional food (= Mongols) with people eating modern food circa 1930 (= Chinese). Long ago, grain was modern food.

Thanks to Tucker Max.

---

Charles (2009-08-03 12:56:37)

As Taubes wrote, we all new until recently that it was starch that caused us to get fat. When I was 14, in 1965, I did my own self-experimentation, and went on a meat-and-milk diet, cutting out all bread and starches and sugars. I was a fat kid, and over the summer lost 30 lbs., and went from 205 to 175. I have no idea where I came up with that approach. But it worked, and ever since I've been able to manage my weight through managing carbohydrates. (Since that was pretty much a mongol diet, maybe I was a mongol in a previous life.) I really have little hope that as a population, we're going to be able to do anything to stop the obesity, diabetes, heart disease, and high blood pressure epidemic. There is too much money to be made in carbohydrate-rich mutant foods, and they have discovered how to tap into the worst of our hormonal and neurological responses to sweet/starchy/salty tastes. I mean even this whole umami hypotheses, which should lead us to healthy things, if one of your recent links is accurate, is turned against us by something as banal as ketchup. That has not gone unnoticed by food scientists, I'm sure. So it's only going to get worse for the bulk of the population.

**Edward Jay Epstein (2009-08-03 20:08)**

Edward Jay Epstein, who was a media critic for The New Yorker in the 1970s, is a great journalist. For example, [1]Diamonds aren't forever? and [2]Did Madoff act alone? [3]Here's something he said about the Warren Commission (to look into the assassination of JFK):

Part of the job of the Warren Commission was restoring confidence in the American government. And for this he had to pick seven very respectable men, men who would lend their name and probity to the report. The problem was, any seven men he picked of this sort, they would have very little time for the investigation.

Much later, still fresh. [4]His personal website is the best personal website I've encountered. The financial crisis has given him [5]a lot to write about. He has a new book on the movie industry ([6]The Hollywood Economist) coming out next year.

Ryan Holiday (2009-08-04 00:09:22)

His book The Big Picture is really good. I haven't read his Kennedy one but Bugliosi rips it pretty hard in his enormous (and some would say definitive) book on the assassination.

seth (2009-08-04 08:34:30)

Thanks, Ryan. By "rips it pretty hard" you mean (a) uses a lot of the material in it or (b) criticizes it a lot?

Ryan (2009-08-05 10:50:46)

Criticizes it a lot

seth (2009-08-05 12:02:31)

That's good to know, Ryan.

Edward Jay Epstein (2011-07-30 06:50:01)

My new ebook investigations are coming out on Kindle and Nook , including Killing Castro,Tabloids, Cartels and Rockefellers. Anyone interested in reviewing these for Amazon, let me know and I'll send advance copy. See <http://www.edwardjayepstein.com/cyberbooktable.htm>

## **A Complaint About College (2009-08-03 23:44)**

[1]Kent Pitman argues that college is overpriced. Perhaps the way out – freedom from needing to go to college to get a decent job – will look like this:

1. American colleges adopt gap years. (I proposed this to the Chancellor of UC Berkeley. My suggestion was brushed aside – impractical, I was told.)
2. A larger and larger fraction of students realize that they can profitably continue to do what they do during the gap year. So they don't go to college.
3. Given a substantial number in both categories, businesses notice that students who haven't gone to college (who have, equating for age, more useful skills) do better than those that have. I've heard complaints about Ivy League graduates not knowing basic stuff.
4. With less demand for college, there is less demand for college teachers. This causes research universities to shrink because, with less use for a Ph.D, they won't be able to attract as many graduate students. [2]Harvard is out in front here.

Just as the Pentagon is a tax on women (because the military is almost all men), so are colleges a tax on everyone who isn't a professor. (It's an arms race because if your competitor for a job has gone to college, so must you.) As the American economy implodes – in In The Jaws of the Dragon, Eamonn Fingleton says the rate of American decline has no historical precedent – non-professors and non-professors-to-be will become less willing to pay this tax.

2. <http://www.vanityfair.com/politics/features/2009/08/harvard200908>

---

Andrew Gelman (2009-08-05 04:32:08)

Regarding your last point, don't forget that Coca-Cola is a tax on everyone who isn't Michael Jordan (who whoever their current spokesmodel is), and of course don't forget that your local Dept. of Parks and Recreation is a tax on everyone who isn't a lifeguard.

seth (2009-08-05 07:25:18)

Andrew, I'm not forced to drink Coke. And the cost of lifeguards is tiny compared to the cost of the military or 4 years of life (what students are forced to spend on college).

Andrew Gelman (2009-08-05 20:29:10)

Seth: And the health care system is a tax on everybody who's not a doctor or a nurse, and the public water supply is a tax on everybody who isn't a plumber, and public buildings are a tax on everybody who isn't a bricklayer, zoos are a tax on everybody who isn't a zookeeper, etc. The "is a tax on" framing is a distraction, I think. The real point is that you and I disagree about the value of college. I think college is a good thing, you don't. If you think something is a good thing, you don't mind that people get paid to do it. If you don't think it's a good thing, it's natural to get annoyed about it.

Aaron Blaisdell (2009-08-06 07:05:28)

I agree with some points each of you make. I think college is very valuable, but at the same time I think there is such a higher expectation that everyone go to college (as if it's a right, not a privilege) that many more people attend college nowadays who shouldn't than back in the 30s, 60s, perhaps even in the 80s. But again, "college" is not just one thing.

seth (2009-08-06 07:18:33)

Andrew, a distraction? Then why mention it? I thought you made an interesting point about the "tax on" usage. To say I "don't think college is a good thing" is too simple. I think current versions of post-high-school education (= college) work well for a small subset of students. Let's say 20 %. For the remaining 80 %, I think that 40 % of them would benefit more from a different sort of college (less emphasis on what professors want to teach, more emphasis on what students want to learn) and 40 % would benefit from having the requirement of having to go to college removed. Aaron, your comment appeared as I was typing the above. I see we agree.

Andrew Gelman (2009-08-06 20:28:43)

Seth: You might be right about the top 20 %. I have no idea, but in our combined experiences teaching at Berkeley, Harvard, Chicago, and Columbia, I expect we've pretty much only seen the top 20 % in any case.

## **Bees and Kombucha (2009-08-04 19:49)**

After noticing how much it improved his own health, [1]B Wrangler tried it on his bees:

In the early spring, I grade my hives strong, average, below average, weak. This year, I sprayed the below average hives with slightly diluted, about 30 %, solution of overly ripe kombucha. It was probably about 3 weeks old.

The spraying was done incidentally, without any planning, etc., just to watch the initial reaction of the bees. After spraying, the below average hives were left alone, without any additional manipulation or observations.

The kombucha worked better than smoke for controlling the bees in a normal situation.

To evaluate the yard's progress, I'd pop the covers off a couple of strong hives and a couple of weak hives every few weeks. Ten weeks later, I popped the covers off the below average hives and found they had a full super of honey, while all of the others, even those with larger bee populations had none. In fact, they hadn't even entered the supers.

I was quite surprised to say the least! And I'd had forgotten about the incidental kombucha spraying until looking at my notes a week later.

This reminds me of the turning point in the discovery of Vitamin B1. Experiment 2 done by Christiaan Eijkman gave results opposite to Experiment 1. Eijkman was unaware, until he looked into it, that his chickens, the experimental subjects, had been fed different rice in the two experiments.

Thanks to Heidi.

1. <http://www.bwrangler.com/npro.htm>

---

NE1 (2009-08-04 23:23:32)

So... contaminated beehives don't produce honey.

bennetta (2009-08-05 09:45:05)

Interesting. And then you could use the honey as food for your kombucha! Actually, that brings up an interesting question: what else benefits from bacteria cultures? I'm in the process of whipping up a pair of two gallon jugs of kombucha and was trying to figure out what to do with it if it ends up tasting bad. I was thinking about maybe using it as fertilizer and seeing what my garden thinks of it.

seth (2009-08-06 07:30:23)

bennetta you are right: kombucha made with honey would be very very bad to spray on hives! I think your garden is already teeming with bacteria, so I wouldn't expect kombucha to help. Yeah, why should bees living in artificial hives be bacteria-deficient, which is what this observation suggests? The bees are eating natural food – aren't they? Or perhaps they are eating food that is unnaturally low in bacteria.

bennetta (2009-08-06 09:56:56)

Seth, That was my gut instinct: my organic garden would probably remain the same. Any sort of perceived change would probably be from additional nutrients in the kombucha (acids, vitamins, sugars, and whatnot) and not the bacteria itself. And bees feeding off of my garden? Why would they need the extra bacteria? They probably wouldn't. Certainly not in my garden. Granted, an organic home garden in Northern California isn't exactly a purely "natural" environment, but it's not a hospital or freezer. I guess the question remains. What to do with kombucha if it comes out tasting bad, without throwing it away?

seth (2009-08-06 11:30:07)

In my experience kombucha can be bad in three ways: 1. Too sour. Too close to vinegar. 2. Too weak flavor. Which means I didn't use enough tea. 3. Too strong flavor. Which means I used too much tea. I could use it to store kombucha mothers or use it to jumpstart another batch. If I had too sour kombucha today I would do an experiment: start 4 new jars of kombucha (tea + sugar + kombucha mother). In two jars I'd put some of the sour kombucha, in the other two jars I'd put nothing. Then see if there was a difference after two weeks. Perhaps the bad kombucha can speed up later batches of good kombucha.

karky (2009-08-06 17:50:06)

I was reading today that since honey has antibacterial properties that it shouldn't be used to make kombucha. Do you have an opinion?

seth (2009-08-06 19:21:37)

Karky, I've read the same thing. I haven't tried it. Even though I have too much honey. I think that's Advanced Kombucha.

karky (2009-08-07 10:17:13)

If you have too much honey, you should try to make mead. I have some of that aging in my bedroom closet right now.

seth (2009-08-07 10:20:30)

great idea, karky, thanks!

### **Lucky Journalist of the Year (2009-08-04 22:01)**

John Seabrook of The New Yorker. In [1]an article about the economics of rock concert tickets, with an emphasis on scalping, he appears to follow a New Jersey Bruce Springsteen fan who can't get tickets to a show. All gone in 10 minutes, mostly to resellers. Later, due to government intervention, she is able to buy two, and on the day of the show wins a lottery for seats next to the stage – her dream. A surprise happy ending to the story. Like all of Seabrook's work it was a pleasure to read but I wonder how Seabrook feels about it. Near the end it briefly mentions a new technology (paperless tickets) that makes scalping impossible. As if the problem was solved while Seabrook was writing about it.

1. [http://www.newyorker.com/reporting/2009/08/10/090810fa\\_fact\\_seabrook](http://www.newyorker.com/reporting/2009/08/10/090810fa_fact_seabrook)

### **Bacteria-Free Mice (2009-08-05 15:56)**

Bacteria-free mice have malfunctioning digestive systems and immune systems. Sarkis Mazmanian, an assistant professor at Caltech, has found that [1]as little as one bacterial-surface molecule can make their immune systems work much better. Exposure to this molecule also protects the mice against a bacterium that would otherwise cause a mouse model of irritable bowel syndrome.

So far, so good: More evidence that we need bacteria for our digestive and immune systems to work properly. But then things get murky:

The Human Microbiome Project, an undertaking funded by the National Institutes of Health (NIH) to sequence the microbiota from hundreds of humans, has challenged itself with determining the relative quantities of all bacteria present in the human gut. With a known baseline of the bacteria present in healthy individuals, it will be much easier to understand which bacteria might be missing in diseased patients.

How we will find "healthy individuals"? I believe that almost everyone in America eats too little bacteria and has suboptimal health. Mazarian continues:

With a known baseline of the bacteria present in healthy individuals, it will be much easier to understand which bacteria might be missing in diseased patients. Hopefully, the Human Microbiome Project will lead to the discovery of other beneficial bacteria [in addition to the bacteria that Mazarian is studying].

"Much easier"? The bacteria that people need to be healthy must have been abundant in our environment long ago. We got vast amounts of bacteria from what we ate – bacteria that grew on food. To test the idea that these bacteria are beneficial you merely need to feed people bacteria-rich food (such as fermented food) and see if their health improves. This has been done hundreds of times, with highly positive results.

bds (2009-08-05 20:43:20)

When tourists from 1st world countries visit 3rd world countries, they typically get the 'Delhi Belly' from street food, which is basically diarrhea. The natives living there consume the same food without any problem. I think the problem is that the food we eat is too 'clean', while the natives are exposed to a wider range of bacteria.

### **Sentence of the Day (2009-08-06 07:47)**

[1] Cafes are discouraging laptop use, says the WSJ:

At two of three Café Grumpy locations – one in Brooklyn and the other in Manhattan's Chelsea neighborhood – laptops are never welcome.

But is this a change in policy?

August (2009-08-06 08:58:13)

I think the whole article is inaccurate. Barnes and Noble just made their wifi free- last weekend in my town. A bit over a year ago, one coffee shop tried to go from free wifi to a pay system, but I hear they went back to free wifi rather quickly; I haven't been back because their coffee is lousy. Another coffee shop went out of business, but that was more to do with the owners moving to Oregon than the economy. Meanwhile yet another coffee shop has opened nearer to me, and they seem quite

welcoming. Of course, I actually buy coffee there too, and I come in during their down time (this place is oriented around live music events). So, I think there is either no clear trend emerging, or the trend emerging is actually the opposite to what the article suggests. Free wifi is a fixed cost, requiring only a small increase in sales in order to justify providing the service.

### **Genius of Common Sense (2009-08-06 23:08)**

From [1]Genius of Common Sense, a new young-adult biography of Jane Jacobs by Glenna Lang and Marjory Wunsch, I learned that Jacobs was an independent-minded young girl:

When Jane's third-grade teacher asked the class to raise their hands if they promised to brush their teeth every day for the rest of their lives, Jane refused to raise her hand and urged the other children not to raise theirs. . . Jane was expelled from school for the day.

Where have I read that before? In Chimamanda Adichie's [2]The Headstrong Historian:

Her teacher Sister Maureen told her that she could not refer to the call-and-response her grandmother had taught her as poetry, because primitive tribes did not have poetry. It was Grace who would laugh and laugh until Sister Maureen took her to detention.

Genius of Common Sense is plainly a labor of love, with a great selection of photographs and a belief in Jacobs's importance that you might say "shines through the book like a watermark" (Nabokov).Â The subtitle is "Jane Jacobs and the story of The Death and Life of Great American Cities" but that isn't right: It's mostly about how Jacobs and her neighbors fended off Robert Moses to preserve Greenwich Village. Which is a lot more visual. As I read it I kept wondering what I would have thought of it had I picked it up as, say, a third grader. I read a lot of biographies for children back then. I might have been attracted by the weird title and helped along by the high ratio (1 to 1) of picture space to word space. I would have liked the underdog aspect. Would I have appreciated the humor of

Several years later the Lower Manhattan Expressway was to raise its ugly head again. "The rule of thumb is that you have to kill expressways three times before they die," Jane quipped.

? Probably not. But maybe I would have noticed how much the authors cared about their subject.

### **Probiotics Prevent Colds (2009-08-07 22:07)**

Here's [1]a summary of a study that just appeared in Pediatrics:

More than 300 children between three and five years of age were randomly assigned to receive three different milk formulations: plain milk, milk plus the bacterium *Lactobacillus acidophilus*, or milk with *Lactobacillus* plus the bacterium *Bifidobacterium animalis*.

The group that just received *Lactobacillus* were half as likely to develop a cold and a fever. They also had fewer coughs and runny noses. Those that got both strains of probiotics had 72 percent fewer fevers. They were also less likely to come down with a cough or runny nose. If they did get sick, they got better significantly sooner. They also missed fewer days of daycare.

Here's [2]the abstract of that study:

**OBJECTIVE:** Probiotic consumption effects on cold and influenza-like symptom incidence and duration were evaluated in healthy children during the winter season.

**METHODS:** In this double-blind, placebo-controlled study, 326 eligible children (3–5 years of age) were assigned randomly to receive placebo (N = 104), *Lactobacillus acidophilus* NCFM (N = 110), or *L. acidophilus* NCFM in combination with *Bifidobacterium animalis* subsp *lactis* Bi-07 (N = 112). Children were treated twice daily for 6 months.

**RESULTS:** Relative to the placebo group, single and combination probiotics reduced fever incidence by 53.0 % (P = .0085) and 72.7 % (P = .0009), coughing incidence by 41.4 % (P = .027) and 62.1 % (P = .005), and rhinorrhea incidence by 28.2 % (P = .68) and 58.8 % (P = .03), respectively. Fever, coughing, and rhinorrhea duration was decreased significantly, relative to placebo, by 32 % (single strain; P = .0023) and 48 % (strain combination; P < .001). Antibiotic use incidence was reduced, relative to placebo, by 68.4 % (single strain; P = .0002) and 84.2 % (strain combination; P < .0001). Subjects receiving probiotic products had significant reductions in days absent from group child care, by 31.8 % (single strain; P = .002) and 27.7 % (strain combination; P < .001), compared with subjects receiving placebo treatment.

The probiotics were given as pills. Such large safe improvements are signs of a nutritional deficiency being remedied. It would be very hard to produce a drug that worked as well.

Thanks to Tom George.

John H (2009-08-07 22:59:27)

Seth, I know you're not practicing medicine here, but I'd be very interested to hear your thoughts on the three (!) flu shots the government wants us all to get this fall. Do you plan to get them yourself, and why or why not? Do you know of any downsides to flu shots? (In prior years, I've always got the recommended flu shot. But after all I've been reading here about kombucha and other probiotics, I'm wondering if that's necessary or desirable.)

seth (2009-08-08 05:02:50)

John, I do not get flu shots and for about ten years I've almost never had any obvious cold or flu symptoms either. I'm sure the reason is that I sleep really well so my body fights off the viruses. Before I started sleeping much better, I did get colds. This summer I believe I had either a cold or a flu – probably swine flu – but I barely noticed it. On one day I felt tired and for the

next two weeks my legs were weaker than usual. So I believe that with (a) good sleep and (b) enough fermented food, your immune system will work well enough that when you get sick (infected), your body will fight off the infection so fast you won't suffer.

Seth's blog » Blog Archive » Effects of Probiotics on Kids (2009-09-29 02:13:40)

[...] As I previously blogged, a recent study in Shanghai found that schoolchildren given milk with added bacteria had fewer colds than children given milk without added bacteria. The study was funded by Danisco, a Wisconsin company that makes bacteria-containing ("probiotic") capsules. Obviously they want to sell more of their product. But ordinary yogurt probably produces the same result. Aaron Blaisdell told me this: Since introducing yogurt into my daughter Maggie's diet on a daily basis about 5 months ago, she's gotten far fewer colds, and those she did get were milder. [...]

Dawn (2011-04-02 22:54:57)

I can definitely believe that the supplement helped reduce the number and severity of the colds. If people only realized how much our diet has changed over the last few decades. We use to eat a variety of fermented foods. Every culture seemed to have a basic ferment - whether it was sauerkraut or yogurt or cheese or whatever. Food use to do what we now need to take probiotic supplements for - but if we returned to plenty of raw fruit and vegetables and some sort of fermented food on a regular basis, we wouldn't need to.

### **Jane Jacobs and the Trouble with Medicine (2009-08-08 04:48)**

In Slate, [1]Barry Schwartz and Kenneth Sharpe argue convincingly that viewing bad performance as an "incentive problem" (meaning bad financial incentives) can be a mistake. If you pay doctors per procedure, they will do more procedures (too many); if you pay them per person, they will do fewer procedures (not enough). The heart of their argument is this:

When day care centers fine parents who are late to pick up their kids, [2]lateness increases. Why? Because the fine turns a moral obligation (come on time!) into a service for a fee (we'll take care of the kids if you pay us more!). Another example: When Swiss citizens were offered an incentive for agreeing to have a toxic waste dump in their community, their willingness to accept it [3]fell by half. Why? The offer of an incentive induces them to ask What's in my interest? instead of What are my responsibilities as a citizen? And when people offer a stranger a token payment for help unloading a couch from a moving van, strangers are [4]less likely to agree than if offered nothing. Why? Because the offer of money has turned the assistance from a favor into a job.

So far so good. At this point the authors get lost. Here's their advice about fixing medicine:

It is tempting, in light of our argument, to ask how can we incentivize good medical practice, so that we get more of it. Our answer is simple but perhaps unsatisfying: Good medical practice should be, and can be, its own reward. Almost all doctors want to practice good medicine—at least before they get socialized by the grind of medical school, residency, student debt, malpractice premiums, and the like.

The sign of their lostness is that they have zero data to back up this idea.

In [5]Systems of Survival, Jane Jacobs argued that we can see around us two systems of morality: a guardian system, which stresses loyalty and hierarchy, and a commercial syndrome, which stresses honesty and equality. Each is internally consistent; but they are quite different, and those familiar with one system have a hard time understanding

the other. She had plenty of data supporting her points. She went on to say that when the two systems are mixed – when policemen are given ticket quotas (= when policemen are treated like salesmen), for example – things go bad.

Why two systems? Because they correspond to two broad ways of making a living: taking and trading. The systems aren't arbitrary; they have survived because they worked.

Are doctors takers or traders? The flaw in trying to improve doctor performance by changing incentives is the balance of power: Doctors have almost all of it. Patients trust doctors. ([6]When I asked my surgeon the basis for her judgment that I needed surgery – treating her as an equal, in other words – she must have been stunned. She certainly didn't respond appropriately.) That's why it's so easy for doctors to do too much or too little. It's the same problem with quota systems for policemen: The policemen have too much power. The current balance of power makes doctors takers rather than traders.

So the choice is: either [7]reduce the power of doctors relative to patients or give them moral training as guardians. The first isn't going to happen in medical schools. Jacobs would recommend, I think, that doctors should be taught that they are guardians. (She might use the example of her father, who was a doctor.) And that those interested in improving medicine should study well-functioning guardian systems to see how they work or worked – how the accompanying moral system was instilled.

---

Tom in TX (2009-08-08 08:39:26)

Seth, you get a gold star for speaking up to your surgeon. Nearly all of such discussions about how-to-reform-health-care ignore the patient. It is just assumed that they are ignorant and stupid concerning their health and medical treatment. If that is a given, then it is just a question of whether the patient will be shafted by fee-for-service or shafted by fee-for-patient.

michael vassar (2009-08-08 09:15:21)

I largely agree with your analysis (and have used Jacob's framework in thinking about this issue for years) AND with Schwartz and Sharpe. Though their recommendation is vague, it points weakly in the guardian direction. They don't say how to do it, but the obvious solution is something along the lines of making doctors a type of professor, as their name implies, with tenure, legal protection from malpractice (risk of loss of tenure, not financial loss), and a professorial level salary and career path. They should be banned for providing medical services for pay, or rather, should lose tenure for some fairly long period and the right to call themselves a doctor of medicine plus malpractice insurance for doing so. Pharmacists as well as MDs should be empowered to prescribe drugs, not on the basis of their own diagnosis, but on the basis of a diagnosis from an expert system plus a general confirmation that the patient is of sound mind etc and understands risks and interactions associated with the drug.

seth (2009-08-08 09:47:37)

Tom, yeah, that's a very good point about ignoring the patient in discussions about how to improve health care. Which basically means the discussion about health care is mainly among those who like the status quo. Nothing would be more subversive of

the status quo than giving more power to patients.

Nadav (2009-08-09 06:52:54)

I'm pretty optimistic that status quo is changing and will change even more. Over time the balance of power of between doctor and patient will shift, or has started to shift, towards the patient. CureTogether is just one example. This is another: <http://www.blog.sethroberts.net>. If Seth's theories are even modestly correct (eg Omega-3 improves gums), the balance of power between, say, periodontists and patients will shift greatly. Another is my friend, a lawyer with no medical training, who after being diagnosed with a rare stomach condition undertook to learn all he could about it. Within about a month he knew as much or more about it than the doctors who were supposed to treat him for it. The common denominator is the explosion in the quantity and accessibility of information made possible by the internet. Doctors tend to hate the internet because they say it's full of crackpot theories. Which is true, but the solution is not less internet, but better filters of the information on it. Veblen might say doctors hate the internet because of the challenge it presents to their status.

### **Not All Probiotics are Wonderful (2009-08-08 15:32)**

From a mailing list I'm on:

Right before I left the U.S. I purchased Complete Probiotics from Dr. Mercola (online health guru). . . . I did not have the time needed to give these probiotics a good try before I left the States so I went ahead and purchased quite a bit. After arriving here in Beijing I began taking them just to find out they were not working well for me. I still think it is a good product, just not right for me.

I have 7 bottles total. 5 bottles expiration date: May 2011. 2 bottles expiration date: Dec. 2010

This batch I have has [in each capsule] 2 billion CFU [colony-forming units] and 500 mg of FOS [Fructooligosaccharides]. There are 90 V-caps per bottle. They are all completely sealed with shrink bands

Dr. Mercola's sale price is \$30 U.S.D. for a single bottle and about \$25 U.S.D./each for a 3-pack. [the 3-pack costs \$75]

She doesn't say why they're not right for her. I make kombucha for pennies per day. Homemade yogurt costs a few dimes per day. Also, they're delicious, the kombucha is thirst-quenching, and the yogurt, as a condiment, improves many other dishes (salmon, soup, hamburger). So they're easy to eat, whereas the vitamin pills I take I have to force myself to swallow. Because I am close to the making of the kombucha and yogurt - I sample them during brewing - I am sure that they have plenty of bacteria. With pills made in a factory, hard to be sure. And hard to know what those expiration dates mean.

---

Chris (2009-08-09 07:35:18)

A recent post to Boing Boing (<http://boingboing.net/2009/07/29/how-to-make-kombucha.html>) covered making Kombucha at home but also linked to three cautionary sites including people who died quickly of acidosis after drinking homemade kombucha and an interesting review that covered how little people know the organisms that make up the drink. This scared me off from making it at home especially off a 'mother' from a stranger. Since it seems like kombucha can be a

host for both beneficial and toxic bacteria (<http://www.fungi.com/info/articles/blob.html>), I wonder how this impacts the beneficial effects. If the umami hypothesis says that foreign bacteria is needed, I wonder if long term ingestion of the same fermented/bacteria rich foods would have the same impact. Eventually, your body would have an environment that's full of the kombucha/yogurt/etc. bacteria and the immune system wouldn't react anymore. Without varying the sources, there seems to be a risk of accumulating both good and bad bacteria and nullifying the immune benefits.

seth (2009-08-09 08:14:36)

Chris, if they died of acidosis I take that to mean they drank too much. "Eventually your body would have an environment that's full of the kombucha/yogurt/etc. bacteria" – I don't think that happens. The bacteria that can grow in milk or sweetened tea can't grow in the very different environment inside our body (lactose-poor, sucrose-poor). They're constantly dying and being sloughed off. That's why we need to keep eating them.

Adam (2009-08-09 10:25:49)

I love yogurt, and I made sure to buy the culture-rich kind (Dannon FOTB, YoPlait+, etc). For a while I took it every morning. But unfortunately, after some experimentation I found that it was the cause of some rather embarrassing flatulence and other digestive problems. These problems soon abated after I stopped eating yogurt. Perhaps I have an unusually healthy level of flora in my system already, because I can't take any type of probiotic without having this reaction. Perhaps this is what the person on your mailing list meant when she said it wasn't working well for her.

## **The Umami Hypothesis and the Meaning of Co-Morbidity (2009-08-09 04:51)**

In [1]an article in Slate about restrictive diets, Daniel Engber noted that

Celiac patients have almost twice the normal risk of cancer, and one-third of them suffer from another autoimmune disease, like Type 1 diabetes, lupus, or multiple sclerosis.

Does celiac disease cause cancer, Type 1 diabetes, lupus, and multiple sclerosis? Not very plausible. Does cancer cause celiac disease? Does lupus cause celiac disease? Not very plausible. Much more plausible is that all five have a common cause. I believe that common cause is a malfunctioning immune system due to not enough bacteria in the diet (the umami hypothesis).

More (May 2012). I now think that all these diseases are due to wheat molecules leaking into the blood and setting off an immune reaction that attacks parts of the body (because the wheat molecule resembles those molecules). The leaky gut that allows wheat molecules to enter the blood is caused by lack of bacteria in the diet.

Low carb a self fulfilling prophecy? | CST Free Weight Exercises By Scott Sonnon (2009-08-09 11:00:18)  
[...] Hat Tip to Seth [...]

Aaron Blaisdell (2009-08-10 08:19:35)

I agree that the most likely explanation is that they all share an underlying common cause. This is why I give my family yogurt and kefir every day, and why my wife and I eat kimchee every day. And why I started making kombucha.

Sheila Buff (2009-08-10 15:32:16)

Hi Seth– A major article in Scientific American for August discusses celiac disease in depth. It's pretty clear it's caused by an inborn heightened immune sensitivity to gluten. Eliminating gluten from the diet cures the condition. The interesting part of the article came in a sidebar that talked about delayed onset CD in adults and how it might be related to a change in the microflora of the gut that activates the genes. Excellent article, well worth reading.

seth (2009-08-10 22:28:37)

Thanks, Sheila. A big problem with the "inborn heightened immune sensitivity to gluten" explanation is that it doesn't explain the co-morbidity I describe. [1]The article puts it like this:

A growing body of evidence suggests that virtually the same trio of factors underpins most, and perhaps all, autoimmune diseases: an environmental substance that is presented to the body, a genetically based tendency of the immune system to overreact to the substance, and an unusually permeable gut.

In multiple sclerosis, what's "the substance"? In arthritis, what's "the substance"? Why should "an unusually permeable gut" cause arthritis? Or MS? It doesn't make sense. The author is confusing correlation with causation. Nor is there any explanation of elevated cancer rates, which go unmentioned in the article.

1. <http://www.scientificamerican.com/article.cfm?id=celiac-disease-insights&print=true>

Chris (2009-08-20 15:38:35)

Here is a study I just spotted: <http://www.ajcn.org/cgi/content/abstract/90/3/712S?etoc> Umami and the foods of classical antiquity<sup>1,2,3</sup> Robert I Curtis<sup>1</sup> From the Department of Classics, University of Georgia, Athens, GA. <sup>2</sup> Presented at the "100th Anniversary Symposium of Umami Discovery: The Roles of Glutamate in Taste, Gastrointestinal Function, Metabolism, and Physiology," held in Tokyo, Japan, September 10–13, 2008. <sup>3</sup> Address correspondence to RI Curtis, Department of Classics, Park Hall, University of Georgia, Athens, GA 30602-6203. E-mail: ricurtis@uga.edu. Umami is the taste of foods that are rich in glutamic acid and 2 ribonucleotides, 5'-inosinate and 5'-guanylate. This distinctive taste of modern Eastern cuisine, which is finding a receptive audience in the Western hemisphere, characterized many dishes that ancient Romans consumed >2000 y ago. Romans enjoyed numerous foods that are identified today as containing significant amounts of natural umami substances and frequently used fish sauce as a condiment in their recipes. Fish sauce imparted to Roman dishes a moderately salty, slightly fishy taste that combines synergistically with other foods to create the umami flavor. Fish sauce derives from the hydrolysis of fish in the presence of salt primarily through endogenous enzymic proteolysis. Its simple production process, low cost, and ability to enhance the taste of many foods has made it the basic condiment for traditional dishes consumed in many Southeast Asian countries. Fish sauce also has important nutritional value, primarily in the form of amino acids. Because ancient Romans made fish sauce in the same way and with the same resources as modern fish sauce producers of Southeast Asia, the amino acid profiles of the 2 products are probably nearly identical. Archaeological sources indicate that fish-processing centers operated throughout the Mediterranean area, and processed fish was an important element in long-distance trade. A close study of the remains of the Roman city of Pompeii indicates that fish sauce was a thriving business that rendered the popular condiment accessible to people of all social classes.

seth (2009-08-21 13:29:06)

thanks, Chris, I didn't know about that. Fascinating abstract.

Chris (2009-08-21 14:28:46)

That journal edition has loads of stuff on umami - worth a read for sure

## **Acid Reflux Cured by Kombucha? Yes (2009-08-10 11:01)**

[1]My friend with acid reflux – who used to have acid reflux – contacted me today:

My stomach is so much better [since I started drinking kombucha]. I rarely have problems. Every once in a while I might be a little uncomfortable. Then I drink a little kombucha, it gets better within an hour. I got up in the middle of the night the other night and I felt the usual kind of pain, took some sips of the kombucha, felt better, and fell back asleep. Hardly ever have pain now. The kombucha is much more effective than the Asiphax medicine I took. That was \$60 for a 10-day course. It might even be more effective than Prilosec. (Which cleared up the problem but then it came back.) I've been drinking kombucha for about three weeks. I really like the grape, guava, and strawberry flavors of [2]the Synergy brand. The grape flavor is like sangria that's just started to go bad. A couple of people I've tried to turn on to it but they just can't stand the taste. My levels of stress haven't decreased. I'm drinking less than half a bottle a day. Now the problem is that I forget I'm supposed to have stomach trouble so I forget to drink it.

If you know of anything (data, anecdotes, whatever), positive or negative, that sheds light on whether kombucha cures acid reflux, please let me know.

2. <http://www.synergydrinks.com/>

---

karky (2009-08-10 12:35:58)

How close is kombucha to ACV [apple cider vinegar]?

I stopped having heartburn symptoms when I started drinking ACV.

seth (2009-08-10 12:47:30)

Thanks, Karky. Yes, they're very close.

Nathan Myers (2009-08-10 18:03:07)

"Cured"? Sounds more like "treated". "Treated more cheaply", in particular. That's no bad thing, but not a cure.

bennetta (2009-08-10 18:33:57)

Don't overdo it, though! Here's a bit of information you might find interesting, Seth, regarding stomach problems and probiotics. My room mate has a very good friend who is Vietnamese and a surgeon, practicing in the US. According to him, Vietnamese eat a lot of fermented food, but not much fatty food. In the US, however, we do the opposite- eat a lot of fatty food, but barely any fermented food. In Vietnam, colon cancer is relatively rare, while stomach cancer is a real problem. Again, in the US, the opposite is true: we have low rates of stomach cancer, with colon cancer being much more common. Digestion of fats takes place primarily in the colon, while digestion of fermented foods is almost exclusively a stomach affair. You can probably see where I'm going with this. According to him, just look to whatever the bulk of digestion is taking place to see where the cancer will be. This seems to be the case in other cultures, as well. Czechs (a group I am personally familiar with) also eat a lot of fatty foods and colon cancer is a huge problem for them. Still, here in America, we could probably afford to eat a LOT more fermented food than we currently do. Overdoing it might be next to impossible. What do you think?

seth (2009-08-10 22:39:54)

Nathan, I'm afraid I don't understand the distinction you are making. What's the difference between "curing" something and "[successfully] treating" it? In this example, the problem didn't entirely disappear but it certainly is cause and effect (more kombucha, less acid reflux). If by "cure" you mean get rid of so that you don't need the treatment any more, then Vitamin C doesn't cure scurvy, because you have to keep taking Vitamin C. Bennetta, the Japanese eat a good amount of fermented food and have much higher rates of stomach cancer and much lower rates of heart disease than Americans. I don't know what their colon

cancer rate is. But perhaps their stomach cancer rate is high because their food is really salty, not because it's fermented. Might be the explanation for the Vietnamese, too – all that salty fermented fish sauce. Like the Japanese and their salty fermented soy sauce. Because of our liking for umami, sour, and complex flavors, I believe we need fermented foods to make up for the lack of bacteria in the rest of our food. It isn't a tradeoff (between colon cancer and stomach cancer); it's a deficiency being met.

Jaroslav (2009-08-10 23:47:16)

Hi bennetta, I am also personally familiar with Czechs, that's because I am one of them :) Little statistics about colorectal cancer in Czech Republic for you. I just looked it up using official statistics published by Institute of Health Information and Statistics of the Czech Republic: 2006 new cases: 152 died: 82 2005: new cases: 156 died: 83 2004: new cases: 158 died: 90 Total population: about 10 millions. Huge problem? No. And it even looks like a downtrend. Please do not let confuse yourself with press releases doing relative comparisons with other European countries. Absolute incidence is very small. In fact, number of death on colorectal cancer is lower then number of death on AIDS, and incidence of AIDS in Czech Rep. is very low. Source: <http://www.uzis.cz/cz/dps/english/index.html> Diagnoses: C18-C21 for both man and woman Now about your ideas about digestion. Human colon is not a digestive organ, even though some digestion happens there thanks to fermentative microorganisms, but the fatty acids produced by them are used mainly for colon nourishment (about 100 calories per day). Fats are absorbed in small intestine, as are absorbable parts of fermented foods. I will end with the relevant link: <http://www.fibermenace.com/>

bennetta (2009-08-11 08:58:00)

Interesting, Jaroslav. (and Dobry den!) I taught English in Prague, myself, and my friend Petr said it was a problem for them, citing two family members who had died of colon cancer. He was also extremely critical of the average Czech diet and blamed it for his family's cancer.

Jaroslav (2009-08-11 10:44:56)

I can imagine that the cancer is a real problem for people who are directly affected by it, but beside that, statistical data speak for themselves. Generally I see only two major problems with our diet: tons and tons of products made from refined white flour, and tons and tons of sweets. Replace that with something better, and Czech diet will become pretty sound (I should say that I don't see animal fats and red meat as a problem, as their supposed harmfulness is not being proved by science, and never was). That's of course pure fantasy :) Lots of people are still cooking at home (perhaps even most of them), so better choice of ingredients and methods of preparation would make a big difference.

akatonyk (2009-08-11 10:57:29)

I don't know about kombucha, but I've drank buttermilk when I've had heartburn, and it works really well. I believe that modern buttermilk is a cultured product.

Nathan Myers (2009-08-11 14:01:40)

Yes, Seth, curing means the condition goes away. Scurvy is caused by forcing people to eat bad food, and cured by letting patients eat what they choose. Vitamin C treats the acute condition. Kombucha treats acute acid reflux. Dietary changes may cure it. Kombucha might serve as a substitute for those dietary changes, just as taking vitamin (etc.) supplements may substitute eating for good food. There's no evidence to blame stomach cancer on salt instead of fermented food, is there? Maybe it's salt, maybe it's bacteria, maybe it's something else entirely. To decide up front that the fermented food can't have a role is just wishful thinking. Quantities matter. Vitamin A prevents all kinds of problems, but too much kills. It wouldn't be at all surprising if it were demonstrated we need to eat at least X mg of bacteria, and can tolerate up to nX, but more causes problems. Amounts of different strains matter too. The beneficial dosage of salmonella is probably fairly low. Science doesn't tell us until we do the work. Assuming interferes with doing the work.

seth (2009-08-11 20:44:49)

Thanks for explaining that, Nathan. My friend isn't drinking much kombucha. I'm pretty sure if he drank more the condition would go away completely. He doesn't eat any fermented food apart from the kombucha. Yeah, I suspect if he changed his

diet and ate other fermented foods, such as yogurt, he would no longer need to drink kombucha. I don't "decide up front" that fermented food has no effect on stomach cancer. I wrote "perhaps their stomach cancer rate is high because their food is really salty, not because it's fermented." Note the "perhaps." I think we agree that a range of possibilities should be considered.

Nathan Myers (2009-08-12 01:09:19)

Sure enough, you did say "perhaps", and I didn't read carefully enough. I asked at Berkeley Natural Grocery about kombucha starter, and they said they didn't have it and didn't know anybody who did. Then I thought of starting a colony from the bottled stuff, and sure enough people do that. One of the FAQs suggested "continuous fermentation" in a "sun tea" jar, where you draw some off from the spigot and then add more tea. That seemed to me most practical.

seth (2009-08-12 10:38:18)

I didn't know about continuous fermentation, thanks for mentioning it.

EAT: Drink More Tea « STRETCH EXERCISE EAT (2009-08-19 05:05:30)

[...] \*With tea, there is even a fermented foods option. A Symbiotic Colony of Bacteria and Yeast (SCOBY) is added to tea to ferment it and make Kombucha. Kombucha is slightly acidic. Drinkers of Kombucha relate many advantages such as improved immunity, alleviation of acid reflux, increased energy, sharper eyesight, and better skin condition. [...]

Seth's blog » Blog Archive » "Kombucha Reconsidered" (2009-08-28 03:42:52)

[...] This is also a reason that theory is important. John Tukey, the statistician, spoke of "gathering strength" when analyzing data. It is rare that a single body of data tells you how to analyze it, he said. (For example, what transformation to use.) You should use similar data sets to help decide. Scientific theory has the same effect. Before I started drinking kombucha, I didn't have obvious digestive problems (unlike a friend) and my immune system seemed to work well. So it wasn't easy to measure its effect. Yet I drink it and am untroubled by the evidence that worries RVM because I have a theory: the umami hypothesis (that we need a steady intake of bacteria to be healthy). This allows me to assess the effect of kombucha — whether it is likely to be good or bad — with the help of evidence from other bacteria-rich food (yogurt, natto, etc.) and much different data (the effect of bee stings on arthritis, epidemiology, the effects of turmeric, etc.). Because the umami hypothesis appears to be true, apparently bacteria intake is beneficial — and kombucha has lots of bacteria. [...]

Seth's blog » Blog Archive » Acid Reflux is Immune Problem, Says Rat Study (2009-11-21 06:55:49)

[...] Months ago I posted about a friend of mine whose acid reflux was cured by drinking kombucha. The implication of that case and the rat study is that acid reflux is caused by an over-active immune system. Perhaps stomach acid often gets into the esophagus. Only if your immune system is under-stimulated does this cause trouble. [...]

## **A Little-Known Bad Thing about Kombucha (2009-08-10 18:50)**

It causes dye to run. I took some homemade kombucha with me while traveling and it leaked onto two shirts. The dye ran. Unfixable. Now if I think I might have gotten kombucha on a shirt, I wash it immediately.

## Shaved Head, Good Coffee, and the Shangri-La Diet (2009-08-11 07:42)

How are they similar? [1]Kenneth Anderson at The Volokh Conspiracy writes:

I have shaved my head completely, as I have discovered from long experience that even if it doesn't help me discover my spiritual side, it weirdly helps me concentrate. I highly recommend it. I have much coffee, good stuff from Antigua Guatemala. Yerba mate from Paraguay. I have my extralight olive oil re the Seth Roberts diet - to which, although I realize I'm just bragging here - I sincerely credit the loss of 25 pounds [emphasis added] and a wholly unmedicated cholesterol score last week of 128 total and 66 good (!).

All three help you concentrate. (SLD helps you not be distracted by hunger.)

1. <http://volokh.com/posts/1249828721.shtml>

---

Dennis Mangan (2009-08-11 09:47:18)

Unfortunately, Mr. Anderson isn't quite up to speed on what constitutes a healthy cholesterol level. His is in the range of increased mortality. Low cholesterol kills: <http://mangans.blogspot.com/2008/10/low-cholesterol-kills.html>

Andrew Gelman (2009-08-11 14:36:31)

But . . . being "distracted by hunger" is one of the great joys in life!

seth (2009-08-11 16:53:08)

Everything in moderation.

## Acne Treatment Statistics (2009-08-11 11:18)

[1]Cure Together has acne treatment statistics: Comparisons of the effectiveness of about a dozen treatments. Only two treatments rate high for effectiveness and both have only a few raters. Neither of the high-rated treatments (Roaccutane and Dr. Hauschka Skin Care) was part of Stone-Age life. Because of [2]the absence of acne in at least a few groups of people living more Stone-Age-like (stoneagesque?) lives, it is likely that something about modern life causes acne. When whatever that is is figured out, it should be possible to eliminate acne cheaply and safely.

Regardless of the future, this table is a big step forward in dealing with the problem. It is the first unbiased look at the effectiveness of different treatments I have seen and it tests a lot of everyday treatments (e.g., face-washing). Academic papers on the subject usually study prescription drugs and the authors usually favor one of the treatments being studied.

1. [http://www.curetogether.com/Acne/\\_treatment/stats](http://www.curetogether.com/Acne/_treatment/stats)

2. <http://www.blog.sethroberts.net/2009/06/24/acne-self-experimentation-why-its-promising/>

Glen Raphael (2009-08-11 18:00:28)

Cure Together is a great idea! They also has a section on obesity but not much data there. I added two treatments to their list: (1) Shangri-La diet, (2) caffeine+ephedrine.

Alex Carmichael (2009-08-11 20:32:59)

Thanks so much for posting this, Seth! I find your theory of acne being a modern occurrence fascinating. As you noted, our goal at CureTogether is to bring patients together to share their expertise, not influenced by any medical or business interests. People know so much about their own conditions and what works and with enough data, statistics will be able to predict which treatment will work for any new patient with a particular set of symptoms. Think crowdsourced, personalized medicine. It goes along very well with your abundant expertise on self-experimentation!

Anne Softling (Face Skin Care Products) (2010-01-11 09:50:00)

I love this post. Patients can work together to share their expertise to solve acne problems which is a problem to most people. As an individual you yourself knows your own acne problem and the experience you have and by sharing it people will learn more about how to cure acne. This only proves that "Two heads are better than one".

Micky Lebrej (2010-03-09 12:44:37)

Good post, another thing to share with you is that answers at yahoo sometimes also can help regarding Acne. Talked about curing together lol. I must say I had very meager results with natural treatments.

Helen Riley (2010-06-16 00:31:39)

I'm a huge advocate of blue/red light acne therapy and want to get fellow sufferers to give it a go. I had acne for a miserable 15 years and it ruined my teenage and young adult years. Roacc was useful only for a few months but the acne returned. Light therapy, though, has worked a treat. Has anyone else tried it? I think the key is to make sure you discipline yourself to doing the therapy for 15 mins every day for the first two months and then reduce the frequency when your acne clears up.

Dave (2010-11-28 06:58:25)

Long ago our family doctor explained that all topical treatments for acne were all rubbish, and that acne can be stopped in three or four days by taking about 20 milligrams of amino acid zinc, daily. My eighteen year old son had acne so bad that it was lumpy and bleeding. Just as the doctor predicted, in about four days his face was almost as smooth as mine...no more acne, but you must continue taking it. Now, a very absorbable form of zinc called zinc picolinate, can be found in many stores. AND there is no need to avoid chocolate, fried foods, etc. The zinc keeps body oil fluid as it approaches the skin. Without enough zinc, it begins to harden as it approaches the skin, and the oxygen in the air. Also, no blackheads, waxy lumps behind the ears, etc.

Ula Monasterio (2011-08-13 02:30:47)

What is the most effective home acne treatment?

## **Probiotic Pills: Minus and Plus (2009-08-12 10:50)**

A reader writes:

I recently had a bottle of pills that became virtually inactive (i can tell from my bowel movements) after a few weeks, probably because they weren't refrigerated . . . I probably wouldn't have been able to get a lot of bacteria into my diet without pills, especially since I travel frequently for work. Â In addition, since I take thyroid pills every day, adding another pill is easy. Â I think pills are also clearly crucial to research efforts.

Good points. On recent trips (in America) I've found kombucha, yogurt, and kefir in the new locations, but it's been time-consuming. Pills would have been easier.

---

SG (2009-08-12 11:56:54)

My current favorite probiotics are Kyo-Dophilus by Wakunaga. They claim no need for refrigeration.

losing-it (2009-09-04 09:32:29)

Not sure if you've tried making your own kefir, yet? You can get cultures for it online...I've made my own from cultures...very easy to make, and I've also used commercial brands available at supermarkets and health-food stores. I also like using a probiotic containing HSOs (homeostatic soil organisms lacking in our diet) from Garden of Life products, called Primal Defense. I use a variety of fermented pre/probiotic foods including kefir, kombucha, yogurt... and add to that, Primal Defense (mainly because of the HSO ingredient). Not advertising...I don't know if any other company's probiotic formulae include HSOs in their complexes.

Nathan Myers (2009-08-13 22:20:47)

I've been thinking about the timing of response to flaxseed oil. The CNS improvement happens way too fast to be a nutritional effect, particularly considering that you take the stuff regularly and so can't be deficient. What it looks like to me is a drug response. (I note that my pinball scores double shortly after taking it.) Is there a plausible mechanism for flax oil - not necessarily the n3 component! - to have a fast CNS stimulant effect? I also wonder how much of the effect is a result of absorption in the mouth. I'm going to experiment with flushing it around in my mouth for a while before swallowing, and maybe without swallowing.

## Why Do Children Pick Their Nose? (2009-08-13 09:30)

In a clever series called [1]10 Mysteries of You: Ten things we don't understand about humans in New Scientist, Australian science writer Emma Young includes some obvious ones (blushing, altruism, dreams, art) but ends her list with a surprise: [2]nose-picking. This had not occurred to me:

It is possible that ingesting nasal detritus might help build a healthy immune response - after all, researchers investigating the hygiene hypothesis have built a large body of evidence indicating that lack of exposure to infectious agents can increase one's susceptibility to allergic diseases.

This seems to be Young's idea rather than that of the scientist she spoke to. She has her hygiene hypothesis stuff wrong. The original hygiene hypothesis was indeed that lack of exposure to infectious agents can increase allergies - but the data later collected did not support this. More infections in childhood did not correlate with less allergy. What did seem to help was exposure to dirt. Apparently the dirt was helpful whether or not it was infectious (= contained something that could make you sick). The nose-picking data (kids pick their nose a lot and sometimes eat the stuff) does make sense given my umami hypothesis, which says that exposure to bacteria is good for us. You couldn't get sick from eating what comes out of your nose but as it leaves your nose foreign bacteria grow on it; so eating your snot is a way to introduce foreign bacteria into your digestive system. Which the umami hypothesis says is needed for health.

Do kids who eat more fermented food eat less snot? As I [3]posted earlier, since I started eating lots of fermented food, my desire for fancy restaurant food has gone way down.

Thanks to JR Minkel.

Douglas Clegg (2009-08-13 14:31:15)

When I was a kid, I actually ate ants sometimes. Not often and I was under the age of 5, based on my last memory of doing it. I'd step on the ant (didn't want to eat one alive) and then eat it. I've read since that sometimes children do this who need iron, but given my diet (my mother was a health food nut with us early and had all kinds of nutritional boosters) I somehow doubt I needed much iron. Does make me wonder. It was always the black ants, not the little red ones. I have no idea - to this day - why I did it. But I'd love to think it was a toddler instinct that was good rather than some weird issue. I didn't massacre any ants, by the way - just a few over a year or so, as far as I can recall.

Douglas Clegg (2009-08-13 14:33:02)

p.s. Guess i should've added, I obviously drew a correlation between your post here and the "dirt" aspect to ants.

## HeartScan (2009-08-13 23:07)

A few months ago, because of this blog, I got a free heart scan from [1]HeartScan in Walnut Creek. It's a multi-level X-ray of your heart and is scored to indicate your heart disease risk. In spite of the fermented food I've been eating recently, and the flaxseed oil I've been drinking for about two years, my score was right in the middle. What's impressive about these scans is three-fold:

1. The derived scores are strongly correlated with risk of heart disease death. This isn't surprising because they are actually looking at your circulatory system. Here is [2]an example of the predictive power. About 1000 subjects were followed for about four years. About 40 of them had something go seriously wrong with their circulatory systems (e.g., heart attack):

The mean coronary artery calcium score was  $764 \pm 935$  [mean  $\pm$  standard deviation] among subjects with events as compared with  $135 \pm 432$  among those without events ( $p < 0.0001$ ). [Minimum score is 0.]

The standard deviations are more than the means because the distribution is very asymmetric. (Like most researchers, they should have [3]transformed their data.)

2. You can improve the score. Via [4]lifestyle changes.

3. The scans provided by HeartScan are low enough in radiation that they can be repeated every year, which is crucial if you want to measure improvement. In contrast, a higher-tech type of scan (64 slice) is so high in radiation that it can't be safely repeated. The higher-tech type of scan, offered by other heart-scan centers, is more profitable for the manufacturer of the equipment (General Electric), which may be why it has become increasingly common.

Heart scans, like the sort of self-experimentation I've done, is a way to wrest control of your health away from the medical establishment. No matter what your doctor says, no matter what anyone says, you can do whatever you want to try to improve your score. And if what you do works, it works; if it doesn't work, it doesn't work – regardless of what anyone says. My self-experimentation started with something similar to a heart scan: I counted the number of pimples I had. The lowest possible tech, sure, but when I did that, and varied the prescribed medicine, I could actually see what worked and what didn't.

---

JLD (2009-08-14 04:03:50)

they should have transformed their data Huh? This paper of yours isn't open access? So you really think that it is worth \$ 31.50 (of which you receive zilch))? I am going to revise the credibility of this blog...

seth (2009-08-14 04:49:26)

JLD, I've changed the link. Try again.

Peter (2009-08-17 10:28:21)

My coronary calcium score was zero. I'm not sure what exactly that means.

david (2009-08-19 09:38:04)

peter, what is your diet and lifestyle history? Sound like you are doing some things right...

david (2009-08-19 09:45:13)

and seth, how have your blood lipids been over the years if you don't mind the question?

seth (2009-08-19 16:56:41)

David, my HDL is low. The other stuff is okay.

david (2009-08-20 00:12:56)

thnx

anon (2009-09-25 20:59:59)

Because of the way it's calculated (look up the Agatston Scoring method) CAC has a big spike of values at exactly zero - maybe 50 % of the population. Transform away, but you're not going to get symmetry (and, for many statistical purposes, you don't need it) The scoring method certainly could be improved (and has been, by some statisticians) but Agatston remains the default. Moreover, there's reason to think that different biology may dictate people have some vs zero CAC, and lots vs not much.

seth (2009-09-26 04:14:56)

So what if you don't get symmetry - you'll get closer to symmetry. You'll improve the situation.

anon (2009-09-29 08:34:13)

Improve what, exactly? If you mean improving predictive ability in standard regression models, nothing says that the predictor has to be symmetric, or that prediction will be better/worse if you transform the predictor to be symmetric.

## **This Blog Reduces Sinus Congestion (2009-08-15 05:55)**

A reader writes:

I'm now 30 years old. For the past ten years or so, I've had constant post-nasal drip and stuffed sinuses, frequently coughing out phlegm. In addition, I've had fairly intense fatigue, moderate but consistent depression, and occasional but intense tendinitis (from typing). I tried nasal pharma sprays and many alternative therapies, feeling most intellectually compelled by neti pot style nasal washes with solutions that mimic salt balances of the body. However, none of my efforts did much good. So I reluctantly agreed to have sinus surgery, even though it seemed to be a blunt force approach to a sensitive tissue. I have since become convinced that treating the sinuses as anything other than an expression of overall health is preposterous. The surgery, with full anesthesia, improved things very slightly while being somewhat traumatic and certainly not worth the ordeal.

About 5 years ago, when I was 25, I discovered that I have a very under-active thyroid. Taking thyroid replacement was the biggest health change I've had in the past ten years, giving me much more energy, improving my overall health, and significantly reducing (but not eliminating) my sinus condition.

I didn't start reading your blog regularly until a few months ago. Your writing on bacteria and flax oils led me to start taking probiotic pills every day (Trader Joes brand and then kyodophilus), eat more yogurt

and kimchee, and take flax seed oil pills and try to incorporate flax oil into foods. Within a month of starting this, my sinus congestion was reduced by about 90 %. I don't need to constantly have tissues on hand and I can breathe easier every day. Thank you! I'm hoping to finally start making my own kombucha this week.

I suspect it was the bacteria rather than the flaxseed oil that helped his nose. Like him, I used to need to carry a handkerchief at all times and I went through a whole box of Kleenex in a few months. This didn't stop when I started drinking lots of flaxseed oil. After I started drinking lots of fermented foods, however, my nose became a lot clearer and my Kleenex consumption went way down.

---

david t (2009-08-15 07:18:14)

i have heard that bromines and bromides have a not so good effect on thyroid. check to see if you are ingesting any foods with those additives. eliminating these may improve that problem

Andrew Gelman (2009-08-15 12:56:46)

I don't understand: if you used to carry a handkerchief at all times, why did you need the Kleenex?

seth (2009-08-15 14:08:03)

Carried a handkerchief at all times when I left the house.

Seth's blog » Blog Archive » Beijing Air: Not Dirty Enough (2009-08-31 15:39:10)

[...] In Berkeley, as I blogged earlier, a few months ago I noticed that my nose was no longer runny. My Kleenex consumption, which had been about one box of Kleenex every month or so, was reduced to almost zero. (A reader of this blog had a similar experience.) No doubt this was due to eating much more fermented food. The runny-nose-absence has continued in Beijing. [...]

## **Dietary Self-Selection by Young Children (2009-08-16 08:45)**

In the 1920s and 30s, a Chicago pediatrician named Clara Davis did a remarkable experiment/demonstration: [1] Letting young children choose their own food. About eleven children chose from a list of 30 little-processed foods – including sour milk, the only bacteria-rich food on the list – and could eat as much of each one as they wished. The choices included peaches, beef, carrots, beets, barley, bone marrow, pineapple, cabbage, lettuce, potatoes, and sweet breads. Many of the foods were supplied both raw and cooked. The experiment lasted about 6 years.

The main result was that the children were very healthy:

There were no failures of infants to manage their own diets; all had hearty appetites; all thrived. Constipation was unknown among them and laxatives were never used or needed. Except in the presence of parenteral infection, there was no vomiting or diarrhea. Colds were usually of the mild three-day type without complications of any kind. There were a few case of tonsillitis but no serious illness among the children in the six years.

Some of them were malnourished at the start of the experiment; all recovered. One had rickets and was offered cod liver oil. He drank a little bit of it while sick but after he recovered never drank it again.

Davis's observations support the idea that we have inborn desires that help us choose what to eat. Davis emphasized that there was great variation from one child to another in what they ate – as Weston Price noted a great variation from one healthy community to the next in what they ate. She didn't give details, however. The notion that our desires, given Stone-Age surroundings, help us choose a healthy diet is what led me to the umami hypothesis. It started with the idea that in the Stone Age our liking for complex, sour, and umami flavors caused us to eat food with more bacteria than fresh food. High-bacteria food tasted better than low-bacteria food; it was more sour, more umami, and had a more complex flavor. Suggesting that we need to eat bacteria to be healthy.

Nadav Manham (2009-08-16 09:57:10)

Seth, What do you think are the main institutional reasons why remarkable experiments from so long ago like this one don't "catch on," and instead seem to be forgotten by the scientific mainstream, only to be rediscovered decades later by people who care enough to look? "Good Calories, Bad Calories" is a prime example: Gary Taubes simply went back and looked at the studies that had been done before the current consensus on obesity was formed, which led him to challenge that consensus. Thanks, Nadav

seth (2009-08-16 12:15:54)

Nadav, that's a great question but I don't have time to answer it now. I'll respond to it in the coming weeks in a post.

michael vassar (2009-08-16 13:25:32)

Thanks. Great reference. One thing I think is that scientists are taught to believe that all work before the careers of their thesis advisers is worthless.

Evelyn (2009-08-16 13:49:38)

I suspect a scientist would never get ethics committee permission to serve raw beef to children today.

Nadav Manham (2009-08-16 14:20:11)

Thanks, Seth.

Aaron Blaisdell (2009-08-17 08:08:22)

Ralph Miller told his class about this experiment in the class Learning and Conditioning I took with him as a graduate student.

Wilbur (2009-08-17 09:46:48)

Read [1]this article and see if you still think this was such a great study. I know Seth will, because Davis' methodologies are comparable to his own. But in an absolute sense, the research is garbage.

1. <http://www.cmaj.ca/cgi/content/full/175/10/1199>

seth (2009-08-17 10:31:05)

"The research is garbage." Whereas I believe there is something to be learned from it.

Wilbur (2009-08-17 15:29:37)

If "Big Pharma" performed research to the standards of this study, corporate executives would be charged with murder.

Jim (2009-08-20 10:31:41)

Nadav, The US has a long history of discarding really good ideas that come back to us as "foreign mystery" and are wildly popular.

1. Deming and quality movement was invented in the US. Japan adopted his techniques and kicked US manufacturing butt. 2. The Beatles and Rolling Stones took US Blues and repackaged it for the US. There's two points, I can draw a straight line on my graph.

Nan Singh Bowman (2009-08-21 07:06:38)

We have come to think that anything not "controlled" by us is suspect. Therefore we have lost our ability to trust our instincts and intuition and depend on man-ufactured processes to keep us safe and healthy. We've changed so much but I think we can still draw on that universal inner voice for much of our well-being. But we need to eliminate a lot of the useless input that bombards us every waking minute. Then we will be able to listen.

### **How to Avoid Infection: Something I Didn't Know (2009-08-17 12:49)**

A book called [1]Survival of the Cleanest (2005) by Jacob I. T. Van Der Merwe is about how to avoid infection. As far as I could tell from Google Books, it says nothing about how to boost your immune function. It is all about avoiding public bathrooms, frequent handwashing, and pointing out the many ways in which we can get infected (e.g., touching shopping carts). It is heartfelt but I didn't find it persuasive. There was almost no data about the efficacy of the book's thousands of suggestions.

Here is something I couldn't find in the book. A few months ago, I noticed that my eyes itched. Apparently I had some sort of infection. My eyes almost never itch and this happened to coincide with something else very rare: I hadn't changed the pillowcases on my bed in a few weeks. So I started changing my pillowcases more often. The itching went away and hasn't returned. My explanation: The pillowcases were acting as staging areas for the bacteria. Ordinarily my immune system would fight them off but on the pillowcases they were safe. The pillowcases shifted the balance of power.

Survival of the Cleanest does say "correctly laundering clothes kills germs and drastically reduces the risk of infection" but since this particular bit of vague advice (what's "correctly"?) is mixed with a thousand other bits of advice, such as avoiding doorknobs, it doesn't get the attention it deserves. For what it's worth, when I do laundry I do a second cycle without soap, in order to get a really good rinse. I'm less interested in killing germs than I am in washing them off.

1. [http://www.google.com/url?sa=t&source=web&ct=res&cd=11&url=http%3A%2F%2Fbooks.google.com%2Fbooks%3Fid%3D8Nr53hSC0zsC%26dq%3DJacob%2BI.%2BT.%2BVan%2BDer%2BMerwe%26printsec%3Dfrontcover%26source%3Din%26hl%3Den%26ei%3DItaASuHcNonUsQ0r20zvCA%26sa%3DX%26oi%3Dbook\\_result%26ct%3Dresult%26resnum%3D11&ei=ItaASuHcNonUsQ0r20zvCA&usg=AFQjCNFOU0jwANFIRDN\\_VSp-Lu-SX9eaRA&sig2=6eMqpzPqxuaiwNbmzwnZTw](http://www.google.com/url?sa=t&source=web&ct=res&cd=11&url=http%3A%2F%2Fbooks.google.com%2Fbooks%3Fid%3D8Nr53hSC0zsC%26dq%3DJacob%2BI.%2BT.%2BVan%2BDer%2BMerwe%26printsec%3Dfrontcover%26source%3Din%26hl%3Den%26ei%3DItaASuHcNonUsQ0r20zvCA%26sa%3DX%26oi%3Dbook_result%26ct%3Dresult%26resnum%3D11&ei=ItaASuHcNonUsQ0r20zvCA&usg=AFQjCNFOU0jwANFIRDN_VSp-Lu-SX9eaRA&sig2=6eMqpzPqxuaiwNbmzwnZTw)

---

bennetta (2009-08-17 13:24:03)

If you haven't read it already, Seth, you may find *The Coming Plague*, by Laurie Garrett, interesting, as it may be the antithesis of this book. It was also required reading for the History of Infectious Diseases class I took at UC Davis in their microbiology department. The book is essentially an account of changing patterns of infection over the past 50 years, much

of which is attributed not to living in an environment with too much bacteria, but rather, living in an environment where all bacteria is killed. This is especially true in modern hospitals where the worst nasties are found, often in the form of usually benign or even helpful bacteria. I'll never forget the last day of the class, when our instructor said "OK folks, so if you get one thing out of this class, what should it be? The next time you drop a sandwich on the ground, wait a few seconds, and then pick it up." Of course, this doesn't mean you should live in filth, but rather, that you shouldn't live in an environment that is too sterile. Your body needs the good bacteria to keep the bad bacteria out, and trying to kill the bad bacteria off usually only results in killing off the good bacteria and making the bad, worse. Western society almost always leans in the latter direction (being overly sterile), rather than the former.

NE1 (2009-08-17 14:45:51)

I used to have itchy eyes too, and ascribed it to past irresponsible contact lens use. At times I thought pillowcase washing was correlated. One over-the-counter claritin (which I hadn't taken since moving out of my parent's house) cured me of both disillusions. You seem very fixated on bacteria. A more conventional explanation might be an allergy to dust mites and their allergens. Have you tried taking an anti-histamine? In any case, if washing your pillowcases works, there's probably no need to take a pill.

Dale (2009-08-20 10:48:42)

Do you wash your pillows? Or leave them in the sun? I've been itchy the last week or two, so I'll try washing pillow slips and pillows – or maybe there's some pollen around at this time??

### **Fifteen-Thousand-Page Theorem (2009-08-17 21:51)**

Did you know that [1]a certain math proof runs 15,000 pages? It's about the classification of finite simple groups. [2]A shorter version should be about 5,000 pages. It began when someone proved that the number of simple groups was finite. Such a proof is more like a railroad network than a book. No one verifies the whole thing, just as no one rides the entire railroad network.

### **The Financial System and the Immune System (2009-08-19 13:10)**

In [1]this interview, Nassim Taleb says, as he has often said, that booms and busts are a fact of financial life, what we should do is make the financial system robust against them. He put it like this:

Capitalism will always produce shocks and crashes. I want a society that has a buffer against shocks.

Likewise, I say bacteria are a fact of life. To be healthy we need to make our bodies resistant to them – which means having a well-functioning immune system.

These are not subtle or difficult points. What interests me is the difficulty that experts have appreciating them. To repeat a story I've told before on this blog, a few years ago I noticed that the UC Berkeley School of Public Health had a wide-ranging epidemiology course taught by someone I knew. I phoned him. "Will the course cover what makes us more or less susceptible to infection?" I asked. "No," he said. I wasn't exactly surprised – I have never seen this topic covered in any epidemiology textbook or even any epidemiology research paper – but still it is an amazing omission. They know we have an immune system, they just don't think it matters! There's an elephant in the room, and they're ignoring it.

The parallel point about the financial system is that there is no study of what makes a financial system robust against shocks. Somehow finance professors, like epidemiology professors, haven't grasped that something is missing.

Here are two more vast areas of ignorance:

1. Scientists know a lot about how to test ideas. They know almost nothing about how to come up with ideas worth testing. When a good way to generate ideas comes along – such as self-experimentation – they are dismissive. This is truly crippling: In an experimental science, for example, interesting new experimental effects aren't discovered. Experimental psychology suffers from this problem. Experimental psychologists could self-experiment, but they don't.

2. Economists know very little about how to generate new businesses – what makes the rate of new-business generation high or low. I came across a 500-page introductory economics textbook that had three empty paragraphs on the topic. Without new businesses to solve the problems created by old businesses (such as pollution), your society is in real trouble. The problems will pile up unsolved. This is what Jane Jacobs saw so clearly in *The Economy of Cities* and Jared Diamond completely missed in *Collapse*.

1. <http://news.bbc.co.uk/2/hi/programmes/newsnight/8209681.stm>

---

Jeff (2009-08-19 13:53:42)

I am studying public health (at Emory) and risk factors for infection are discussed constantly within the field. Age (both young and the elderly), HIV positive status, smoking, vaccination, etc. are mentioned constantly and others depending on the infection in question. These are all examples of factors that effect the immune system. Maybe that wasn't relevant to the specific course you asked about but I would assume public health students at Berkeley hear about it. I would agree that this could be discussed more but it is not being ignored. "I have never seen this topic covered in any epidemiology textbook or even any epidemiology research paper" but still it is an amazing omission" Do you mean you have never seen exposure to bacteria and the immune system in a research paper or that you have never seen a research paper covering how the immune system is affected by external sources of any kind? Because there are many many papers on the latter. Any disease studied in detail will have papers "Risk factors for disease X" some of which will relate to immune function. Jeff

seth (2009-08-19 16:51:47)

Thanks, Jeff. "Risk factors for infection" is broader than what I'm talking about, but you're right, it may include factors that make the immune system weaker or stronger. (It also includes dozens of things that have nothing to do with immune system strength.) HIV status is too obvious to be helpful; age is too vague (a thousand things change as we get older) to be helpful. Smoking is included just because it is always included. Maybe you see what I mean here – epidemiologists don't see that immune system strength is a specific question worth asking, they just do their usual "risk factor" analyses which are a blunt tool. It doesn't make sense to study each infectious disease separately (which is what is done) since the immune system fights off all of them. As for the lack of papers, you've seen more than I have. Can you tell me one review paper about what factors make the immune system weak or strong? Presumably it would aggregate data from several infectious diseases.

Nathan Myers (2009-08-19 17:32:22)

Seth, you've repeated often that scientists "know almost nothing about how to come up with ideas worth testing". I've never heard of a scientist at a loss for projects to apply for grants for. Is "worth testing" the meat of your statement? Do most scientists waste their careers on unworthy ideas?

CCS (2009-08-19 19:15:43)

Seth, I have just picked up a book \_Deep Nutrition \_ by Catherine and Luke Shanahan and I thought of you because it talks extensively about the benefits of fermented food. She refers to fermentation as one of the "four pillars" of wold cuisine.

seth (2009-08-19 21:43:40)

Nathan, a certain distinguished professor in the Berkeley psychology department gave a talk in which he described testing a certain idea six different ways. Two or three tests would have been enough. I asked, "why so many tests?" "Just because" was the essence of his answer. He had enormous difficulty coming up with new ideas – so he kept testing old ones. Confirming what we already knew. The other strategy is to do rococo variations on what's already been done. CCS, thanks, I didn't know about that book.

Nathan Myers (2009-08-19 23:07:26)

It sounds like you're saying, then, "*psychologists know almost nothing about how to come up with ideas worth testing*". What we need, then, is a clearinghouse: psychologists who have too many worthwhile ideas to test post their extras, and psychologists at a loss read and test them. However, I'll bet the ones who are competent to test ideas are the same as the ones who have too many ideas, and the rest would better do something else with their lives. But that's just a guess.

seth (2009-08-20 05:57:20)

Nathan, no, it's almost all scientists. I just gave an example to answer your question. The next time you meet a scientist, ask what methods he or she uses to come up with new ideas worth testing. Or look at an introductory statistics book. Count how many pages are about how to come up with new ideas.

Aaron Blaisdell (2009-08-20 07:34:09)

I agree with Nathan. But then I'm an experimental psychologist at a university. I really don't agree with Seth's perspective on this. My guess is that he's railing against dogmatism (which is a human affliction) as it affects what scientists are willing to consider (theoretically) and which thus hampers what they consider looking at (experimentally). Also, I'm guessing he (sorry to speak about you in the third person, Seth) had some bad experiences at Berkeley, such as an unmotivated, unproductive, and/or unappreciative set of colleagues who likely were disdainful of his self-experimentation approach that happened to be around him which colored his opinion of experimental psychology, science as it's currently practiced, and universities. My experiences and thus my view of experimental psychologists, scientists, and universities is about the polar opposite of Seth's. Seth is a good friend, and we've done (and are still doing) some excellent creative work together. It's been a real pleasure getting to know him personally and intellectually. But there are a few things to which we have different opinions. Fortunately, neither of us is dogmatic or offended by disagreement. It is sad when a scientists becomes offended by dissent as it stifles his/her productivity and creativity. I do know many scientists like that, but I also know even more who are open, curious,

creative, fascinating people. As one of my great former psychology professors said in class to us: "Science is a human endeavor."

justin (2009-08-20 08:57:07)

"The parallel point about the financial system is that there is no study of what makes a financial system robust against shocks. " Keynesian economics is all about trying to apply monetary theory to smooth out the cycles/shocks/booms/busts, and Keynesian economics has dominated (er "stagnated") the economic and financial landscape for the past century. It's the utter failure of the paradigm put forth by Keynes that makes me skeptical that a "study" needs to be performed. As I see it, functional, decentralized economies are innately made up of tens of thousands of studies on human behavior all working dynamically together. It is hard or impossible to predict what solutions can "save" a busting economy – a diversity within the system thus provides a slew of solutions, many of which probably won't work, but a few of which likely will. The analogy here is diversity in lifeforms providing numerous solutions to unforeseeable calamities - like a meteor hitting the planet and wiping out the dinosaurs but not the rodents. As I see it, the key to keeping complex economies robust is to avoid systemic centralization (which could also be called stagnation), which destroys diverse solutions to complex and dynamic problems. Unfortunately, government is necessarily a force for centralization that gets worked on by successful individuals and businesses to protect their dominant positions from being overthrown. Run this simple model a million times over a few decades and throw in a central bank and you've got our current economic, dangerously fragile, situation.

aretae (2009-08-20 09:35:56)

Seth, You write fabulously interesting stuff, and this is the first time in your writing that I've found a case where I think I'm more informed than you. I will not argue with you that MOST people/scientists have not become aware of creativity-enhancing techniques. However, that's not to say that they aren't there. There has been substantial work done on Creativity. The most interesting of these items to me are the step-by-step creativity methods. TRIZ, by [1]Altshuller is probably the best of these. However, it's not the only one. Murray Davis's 1971 article: That's Interesting! in Philosophy of the Social Sciences is in the same space. Work on writing/brainstorming like that of [2]van Oech is also moving in the space. Now, I can't say that most scientists are using this kind of approach. But the approach is out there....

1. [http://www.amazon.com/exec/obidos/search-handle-url/ref=ntt\\_athr\\_dp\\_sr\\_1?%5Fencoding=UTF8&search-type=ss&index=books&field-author=Genrich%20Altshuller](http://www.amazon.com/exec/obidos/search-handle-url/ref=ntt_athr_dp_sr_1?%5Fencoding=UTF8&search-type=ss&index=books&field-author=Genrich%20Altshuller)

2. [http://www.amazon.com/Whack-Side-Head-More-Creative/dp/0446404667/ref=sr\\_1\\_1?ie=UTF8&s=books&qid=1250786065&sr=8-1](http://www.amazon.com/Whack-Side-Head-More-Creative/dp/0446404667/ref=sr_1_1?ie=UTF8&s=books&qid=1250786065&sr=8-1)

Hap (2009-08-20 11:28:28)

I like this kind of cross-discipline thinking. I suspect that using body and mind functioning as one map for exploring how more abstract systems function could be very useful. Moshe Feldenkrais, developer of a sophisticated approach to body-mind awareness through subtle movement, had an unusual definition of "health": The ability to live out your avowed – and unavowed – dreams; and the ability to recover from shock. (Feldenkrais was a Judo master, so knew, for example, how to fall.)

James (2009-08-20 11:59:47)

"The parallel point about the financial system is that there is no study of what makes a financial system robust against shocks. " Sure there is! This is why we have capital requirements (reserve ratios) for banks, the FDIC, et cetera. Its possible that we should have a better insulated system, but you merely proclaim your ignorance by saying that none of this insulation against systemic financial risk (or even any studies about it) exists.

seth (2009-08-20 12:06:25)

Aaron, count the number of pages in any statistics textbook in your office devoted to how to come up with new ideas. Then divide by the total number of pages. My belief that scientists are poor at coming up with new ideas has nothing to do with my experiences or their personalities, including the personalities of experimental psychologists (which I happen to like, by the way – it is a credit to and comment on the whole profession that Surviving Terminal Cancer was written by an experimental psychologist). It has to do with lack of tools.

seth (2009-08-20 12:17:20)

James, I'm not saying that insulation doesn't exist. I'm saying there's no or almost no academic study of what makes an economy more or less vulnerable to shocks. The FDIC and reserve ratios don't exist in their current form because of academic research; they exist in their current form because of the Great Depression. (The FDIC was created in 1933.) I would be happy to find out I'm wrong: Could you tell me one person who has emphasized how to build a shock-resistant economy in his or her research? It isn't Keynes. Keynesian theory is about preventing shocks and recovering from them – it is like the study of antisepsis (killing bacteria before you get sick) and antibiotics (killing bacteria after you get sick). Not like the study of the immune system.

Nathan Myers (2009-08-20 14:43:20)

Seth: As I understand it, the major use of theories by scientists is precisely to generate worthy hypotheses. (Engineers, by contrast, use them to approximate reality for design purposes.) The best theories suggest hypotheses that have interesting implications whether they prove correct or wrong. Bad theories produce hypotheses that can be shown to be wrong with existing data, or that can't be tested, or that if tested are uninformative. Scientists who cling to a theory that has no (or even negative) experimental support must be doing it because otherwise they would have nothing to work with.

Nathan Myers (2009-08-20 14:59:01)

Oh, and about *Collapse*: the societies he identified that avoided collapse didn't do it by growing new businesses. In Japan the Shogunate imposed a moratorium on tree harvesting of any kind until they could devise and impose, top-down, a strict rationing scheme. Certain tribes of the New Guinea highlanders created woodlots and thrived; other tribes that copied them also thrived, those that didn't weakened and lost their territory. You might say that NG tribes correspond to companies, but nobody started a tribe to grow woodlots; that happened within established tribes, also top-down. I'm not sure what lesson about businesses we are expected to draw here.

Nansen (2009-08-20 16:41:35)

I think it's inaccurate to say Diamond "completely missed" the idea of new businesses to solve piled-up problems. See Chapter 16, "One-liner objections", under "Technology will solve our problems", paragraphs 1 and 3. Whether you agree with him is a different point.

seth (2009-08-20 18:04:07)

I don't have a copy of Diamond's book here in Tokyo. I do remember it, however (the audio version) and nowhere did he say that societies collapse because they stagnate economically – because they fail to develop new ways of doing things that avoid the problems (and resource depletion) of the old ways. But thanks, when I eventually see a copy of his book I'll look at that.

aretae (2009-08-21 07:56:30)

Seth, On creativity.... There's some more stuff that you may have seen out on the inter-tubes today. While the post is unimpressive, the comments [1]here are very insightful, and link to [2]books. Elsewhere (wherever got me to half-sigma) I found comments linking [3]this and [4]this.

1. <http://www.halfsigma.com/2008/05/what-is-creativ.html>

2. <http://www.halfsigma.com/2008/05/what-is-creativ.html?cid=115464176#comment-6a00d8341bf6ae53ef00e552605d828834>

3. [http://photoncourier.blogspot.com/2004\\_01\\_01\\_photoncourier\\_archive.html#107352982748110888](http://photoncourier.blogspot.com/2004_01_01_photoncourier_archive.html#107352982748110888)

4. <http://digitalcommons.ilr.cornell.edu/articles/27/>

seth (2009-08-21 19:26:23)

Nathan, that's true about theories, I agree, they are one way to generate new predictions. Calling a new prediction a new idea is not exactly wrong but influential new ideas in science haven't been new predictions of old theories; they have been new phenomena (that need to be explained) or new theories to explain new phenomena. In psychology, the number of new ideas that have been predictions of theories is close to zero. Psychology mainly develops by discovery of new experimental effects.

xrellix (2009-08-23 01:05:17)

Seth, aren't Vaccinations a form of immune-resistance solution you speak of? Were you implying we need a vaccination type solution for all diseases? Are immune systems capable of fighting off Cancer? The economy is a larger problem. Ultimately, proper checks and balances ensure a robust economy - but how do we maintain checks and balances for everything not yet known (as with the immune system)? All we can do is create checks and balances for everything we know so far. No one can predict what "evil" future brilliant minds might conceive - unless we could create a closed-system where all variables were known and fixed forever.

Nathan Myers (2009-08-23 19:20:48)

Seth: I guess it would be fair to say that means psychology has few good theories. That's probably because psychology is an overwhelmingly more difficult subject than, e.g., physics. Anybody who doesn't think so probably isn't qualified to do either. Any psych department where students get better grades than they would have (or did) in the physics program is probably a fraud. I could go on.

### **Noseclipping Diary (2009-08-19 22:03)**

On the Shangri-La Diet forums, David, who is 6' 4" and about 340 pounds, [1]wrote about his recent experience with the diet. He wants to lose about 120 pounds. Sugar water and oil didn't work very well. Low carb didn't work. Then he tried nose-clipping:

Last Friday, August 14th, I tried nose clipping.Â The relief was immediate.Â The hunger subsided and I even lost a couple of pounds.Â On Saturday I decided to try clipping every time I ate anything.Â By evening I could not eat my entire dinner.Â When I tried, I got nauseous.Â I actually thought I was going to vomit for awhile.

I am very curious what happens next.

1. <http://boards.sethroberts.net/index.php?topic=7243.msg90096#msg90096>

---

Dennis Mangan (2009-08-20 13:52:57)

I'm curious as to what's going on biochemically here. Obviously something is, perhaps hormones. Maybe eating while nose-clipped blunts the insulin response and that means hunger is reduced.

griff (2009-08-21 19:31:41)

I am not refuting the noseclipping effect. However, I have noted that when I am very congested (e.g. I cannot breathe through my nose at all), I am extremely uncomfortable eating due to the inability to breathe well while chewing. In addition, I also often either get nauseous or feel full early, and my belief was it was because I was swallowing air in the awkward process of trying to eat and breathe through the same passage.

## **The Shangri-La Diet in Japan (2009-08-21 13:23)**

A few months ago a popular Japanese TV show ran a long (30 minutes?) piece about the Shangri-La Diet, some of which you can see [1]here. It is very odd to see my work talked about and not know what's being said. It's like being a fly on the wall, taking into account that flies don't understand English. The show is long enough that some of what they're saying must be new to me. One of the panelists (there is a panel of one man and two women) appears to be Tetsuko Kuroyanagi, whose book [2]Totto-Chan: The Little Girl at the Window I love, have read dozens of times, and mention in The Shangri-La Diet – at least the English version. I first came across Totto-Chan at the Mill Valley Public Library. Even though I was living in Berkeley, I checked it out. Driving home I was so entranced I read the book at stoplights while waiting for the light to change.

---

## **Tourist Humor (2009-08-22 06:24)**

I believe that books for tourists are filled with inside jokes. A booklet for tourists called Welcome to Tokyo published by the Tokyo Metropolitan Government says the following about a place called Nakamise:

Both sides of the 250 m street from [A] to [B] are lined with about 90 stores dating from the Edo Period.

[1]The Edo Period ran from 1603 to 1868, which few readers will know. The street is actually lined with stores selling the usual tourist stuff.

1. [http://en.wikipedia.org/wiki/Edo\\_period](http://en.wikipedia.org/wiki/Edo_period)

---

Jeremy (2009-08-24 03:00:09)

I wonder whether this is a possible defense against plagiarism. Atlases, too, contain fictitious town and other features, and I believe some encyclopedias do too. The point being that if someone copies the facts – the street is 250 metres long – they could have done the research themselves independently. If they copy the fiction – lined with shops from the Edo period – they must have plagiarized.

## **PayPal, the [Empty Promise] Way to Pay (2009-08-22 13:08)**

A few minutes after I sent gamesinwelt.com credit-card payment for a Wii via PayPal, I phoned PayPal asking them to cancel the transaction. Your payment did not go through, I was told. "Did not". So there was no need to cancel it. I was safe. To warn others, I wrote [1]my earlier post about this.

Well, I was misinformed. My payment was not unauthorized, i.e., dead – it was, rather, not-yet-authorized. When I phoned PayPal, it could have been canceled but it wasn't. A few days later it went through. Maybe I am easily amazed but this is amazing. At PayPal customer service, the account history screen seen by employees does not distinguish between two meanings of unauthorized: "authorization failed" and "not yet authorized". What is this, 1960?

I was pissed. I called PayPal and was told in part that this was somehow my fault. I should have known [something]. To file a dispute I must call another number. I called that number. I filed the dispute. You're safe, I was told. Will I have to call again? I asked. No, I was told.

Well, I wasn't safe. Although I won the dispute, there was no money in the seller's account. A possibility that hadn't been mentioned. Too bad for me.

So I phoned my credit card company. I was told I should get my money back from either PayPal or the credit-card company. Fearing [2]more untrustworthiness from PayPal, I emptied my PayPal account.

Bonus PayPal helping scammers, from [3]the comments:

Same story! \$300 for a Wii and a Nintendo DS! The day after my husband ordered I tried to go back to the website and order some games. I got a message saying the company "could not accept PayPal at this time". I then emailed PayPal's customer service and asked them if this meant that they were not a reputable company that I should not do business with. PayPal said, and I quote, "It does not mean that they are not reputable, they could be experiencing problems with their internet connection to PayPal."

3. <http://www.blog.sethroberts.net/2009/08/02/gamesinweltcom-scam/>

---

Seth's blog » Blog Archive » Gamesinwelt.com Scam (2009-08-22 13:11:02)  
[...] The story continues. [...]

Tom (2009-08-22 16:24:18)

Paypal is a giant scam...a huge, unregulated, Wild-West pseudobank that would have been reined in years ago but for the enormous sums eBay (its owner) funnels into Washington through its army of lobbyists.

Charles (2009-08-22 17:20:40)

So I got a PayPal "one-use-only" credit card number. Used it once. Except then a couple of months later, someone else used it again. (It was a known scammer than makes small charges for web design.) Emailed PayPal, went round-and-round-and-round. Never got a straight answer as to why a one-time-only number could be used more than one time. I finally got my money back, but then they dropped the issue completely. They did not want to know how it happened, would not look into it further. I still use them because it's convenient, and easier (and I think, safer) than throwing my CC # around the web, but I monitor it more closely. And I think it is probably a better idea to use the credit card companies. They at least look into fraudulent charges a little more closely. Usually, anyway.

## Cool New Products in Tokyo (2009-08-23 06:05)

1. Three-dimensional TV. Via polarized light. Not for sale yet
2. Pens with erasers. You can erase the ink.

---

karky (2009-08-23 06:38:54)

[http://www.staples.com/Paper-Mate-Erasermate-Pens-Medium-Point-Black-Dozen/product\\_302158?cmArea=SEARCH](http://www.staples.com/Paper-Mate-Erasermate-Pens-Medium-Point-Black-Dozen/product_302158?cmArea=SEARCH) Papermate has been making ink pens that are erasable for years.

Glen Raphael (2009-08-23 11:21:46)

Eraseable pens have been around in some form in the US since 1979. How do the new pens differ from the Papermate Erasermate line?

seth (2009-08-23 13:29:08)

Huh. I didn't know about the Papermate pens.

karky (2009-08-23 15:38:05)

My grandma always used them to work crossword puzzles. :)

Tom in TX (2009-08-24 05:09:08)

Also really cool are the erasable highlighters, e.g. <http://reviews.officedepot.com/2563/344629/reviews.htm>

Glen Raphael (2009-08-24 07:21:04)

I've actually seen 3D TV without glasses here too, but only at trade fairs as a technology demo. This was at the Consumer Electronics Show in Vegas a few years ago. (brief google search...ah, here we go): <http://www.technologyreview.com/computing/20892/?a=f> So where did you see this? Were you at a trade show, or just bumping around akihabara?

seth (2009-08-24 08:14:23)

The 3D TV I saw used glasses. It was in the Sony Building.

Nathan Myers (2009-08-24 10:58:48)

3D TVs that need glasses are old stuff, and nobody has even tried to sell them because, it seems, nobody would buy them. At NAB I saw several attempts at no-glasses screens (panasonic, phillips); all were unsatisfactory – blurry, muddy, jumpy. I saw one that was perfect in every way. However, it required five times the video data fed to it that a normal screen takes, and live action would need to be shot with multiple cameras and heavily processed. Synthetic content (e.g. Pixar) would snap right in, if you could deliver the frames fast enough. Once Blu-ray data disc drives are commonplace, the market might be ready for it. Probably by the time that happens, movies that could benefit from 3D will be synthetic anyway, with all the "live action" shots synthesized, perhaps from actors wearing skintight outfits with dots on the joints, and sparkle gel on their faces, cavorting in front of greenscreens.

Tom (2009-08-24 11:21:48)

The Papermate pens smudge – any abrasion would rub off the marks – and the ink has a faded color even when it's brand new. The FriXion pens are amazing – colors are rich. They erase with heat – what looks like "erasing" is really heating the paper so that the ink becomes invisible. (Interestingly, it will re-appear if you put the paper in the freezer.)

## Japanese Ice Ouca versus Bi-Rite Creamery (2009-08-23 15:29)

[1]Bi-Rite Creamery in San Francisco has the best ice cream I've had. The ice cream at [2]Japanese Ice Ouca in Tokyo is maybe 95 % as good but the presentation is so much better than Bi-Rite I was stunned. The prices are about the same at the two places. At Ouca you get a choice of three flavors (versus two at Bi-Rite). The three flavors are mixed in an attractive pattern. You get a pretty round wafer to add crunch. And you get a little bit of salty chewy seaweed to eat after you're finished. Ouca doesn't stand out from other high-end Japanese food, which is full of these sorts of effective small touches. In Iceland I met a Japanese teacher of English who said, "I like everything about America except the food." American food is like barbarian food – except worse.

When she was a teenager, Jane Jacobs visited a relative of hers in isolated rural Pennsylvania. Her aunt had moved there to oversee the building of a church. The inhabitants had forgotten that buildings could be made out of stone. American cooking reveals a similar vast forgetting.

2. <http://www.ice-ouca.com/>

---

Tali Lehari (2009-08-24 12:49:43)

You're a great writer!

seth (2009-08-25 21:50:51)

thanks, Tali

## Gamesingate.com Scam (2009-08-24 01:55)

The old scamming website was gamesinwelt.com; the new one is gamesingate.com. [1]More details. If you are pissed at them please recall that when you click on their ad they pay Google.

1. <http://www.blog.sethroberts.net/2009/08/02/gamesinweltcom-scam/>

---

marc (2009-08-24 15:24:25)

hey man.. im glad you posted this up. My sister found them through Amazon.com but she asked me if i thought the site was legit. After some research I found this: <http://answers.yahoo.com/question/index?qid=20090823075846AA2WAbM> but thanks for looking out.. hopefully people find this blog before they order from that site

noel (2009-09-09 12:04:29)

Hey the new name for this company is myshoppingsun.com It is the same company you guys are talking about up top. Gamesingate, gamesinwelt same company different name SAME SCAM

Seth's blog » Blog Archive » Myshoppingsun.com Scam (2009-09-09 17:00:21)  
[...] See here for details. [...]

Nancy (2009-09-21 10:38:38)

I recently ordered from this site (GAMESINGATE) and guess what? I am still waiting on receiving the product or assume I have been SCAMED. I can't believe how people can say they have these products, take your money, and leave you with NOTHING. I hope they are found out and someone prosecutes them.

Marilyn Wilson (2009-09-21 17:28:59)

I purchased a Wii system from them and paid w/PayPal. A month later, I have nothing. Interestingly, even through Paypal, the seller has the ability to take the money and run.

Megan (2009-09-22 08:40:10)

I too ordered from Gamsingate.com. My own fault I didn't google it until after I had made my purchase and found your blog. Fortunately it was only \$12 for a video game that I never got. I have put in a dispute with paypal but who knows if I'll see my \$12 again :( I feel bad for all those who actually spent some real money on these people!

Scott (2009-09-26 18:26:15)

I purchased a Wii system from Gamsingate.com and paid w/PayPal. They took 247.00 dollars and gave me nothing nothing can you believe that? They have come up again the new web site is [www.myshopinsun.com](http://www.myshopinsun.com). I hope this helps others from getting SCAMMED.

Jason Chalky (2009-09-28 21:09:45)

I ordered from [www.myshopinsun.com](http://www.myshopinsun.com) also and paid 231 through pay-pal and then found this..Needless to say i was not to happy.So i email the company(scam artist) and said i wanted a refund because they are a scam and gave him my information for the order.I filed a pay pal dispute and also sent a email to pay pal to let them know.This was today and less then 6hrs i was able to have the funds returned into my account by them.They must know that they don't want to screw up their paypal.

john (2009-10-01 18:57:08)

[www.myshopinsun.com](http://www.myshopinsun.com) is a cheating website, I paid money and they dont respond to phone number even they dont respond to emails. I lost my money too, I found the below details releated to the website and trying to file a complain against him. As I got the details on domain lookup. Please if any one has some websites to complain please do it so that others will not get suffered as I am suffering. Please some one help in filing a case, he is creating mulple websites and cheating. He registered the website on sep 10, 2009 for cheating people showing low prices and not responding after paymnt.. Lets not allow this to happen other people

MissM (2009-10-01 19:11:39)

"If it sounds too good to be true, it is.â€ I was looking for nintendo dsi today and found them [www.myshopinsun.com](http://www.myshopinsun.com), so I read under "shipping policy" and found this "Estimate Delivery Time Before your order is shipped, gamesingate has to process" they forgot to delete the last scam store name.. sorry about my poor english grammar!!! I'm trying to help! COME ON PEOPLE DO SOMETHING ABOUT IT! CHECK OUT this! <http://www.fbi.gov/majcases/fraud/internetschemes.htm>

Michelle (2009-10-01 19:24:40)

I ordered over 60.00 from gamesinwelt. com for my 8yrs sons birthday and still have not received any products. I have disputed w/ paypal and they claim they cannot recover my funds. Please warn others before they make the same mistake. These people need to be found out.

Meg (2009-10-02 06:18:35)

I was stupid and let Wii fever get the best of me. I too ordered from myshopinsun.com on Sunday night. I found this website last night so, thanks to Jason Chalky, I e-mailed [service@myshopinsun.com](mailto:service@myshopinsun.com) as well as PayPal and I filed a dispute with them. I did not receive any verbal response from the seller whatsoever yet I was refunded promptly as of this morning. I then e-mailed PayPal first thanking them since I was refunded, even though I believe it was thanks to my wording to "li jingjing" via the response center. Then I asked them to look into this seller since there are many being scammed. I am just fortunate to have gotten my money back and I have definately learned a valuable lesson. TO those of you who have not taken the same steps in trying to get your money back, I strongly recommend doing so. It has worked for at least two of us.

Dave (2009-10-02 08:34:50)

How do they get away with this shit? I bought a Wii from them at 166 bucks and didnt get shit. I saw that they used paypal so I figured they had to be legit, and I talked to paypal and they said theres nothing they can do and I cant have my money back, WTF?

Dave (2009-10-02 08:36:52)

MEG, thats what they do for some reason, they refund you a couple days later then they take it out again a week or so later so hopefully they don't do that to you but thats what happened to me.

Tim (2009-10-02 09:48:57)

myshopinsun.com sounds like a complete and total scam, I am waiting for my 203 bucks to be refunded back into my account. Once I found this blog and some stuff on Yahoo I was convinced I got scammed. I am in the same boat as Meg, but I haven't yet received my money back from "li jingjing." I filed a dispute w/ paypal, and they replied last night that my case was closed, because "Either you have reached a resolution with the seller or the dispute has been open for more than 20 days." Well...still waiting for the money to be returned to my account, expecting the worst, but hoping for the best. This situation is wrong, Paypal should be receiving a handful of complaints, warnings and disputes regarding "li jingjing" and 'myshopinsun' - I hope they do something about it so that more people don't fall for this. Paypal should have some kind of intelligence to protect its users from these websites after just one claim. When will they start sending us warnings that the seller has been flagged, or complained about?

Tim (2009-10-02 09:53:52)

Dave, if I get refunded, I wonder if canceling my Paypal account would protect me against these a-holes taking out the money again in a week, that's so wrong.

Raja (2009-10-17 18:38:43)

Myshopinsu...is totally FRAUD FRAUD FRAUD... whoever lost money we should SUE on PAYPAL....as they aware about this situation but still they didnt close MYSHIPINSUN...and more and more people are losing their hard \$ \$ \$ \$ if anyone intrested or find some info...we should proceed legal against paypal..as we all have our order confirmation with dates....to prove in court that paypal well aware about this vendor...but they fucker didnt fix anything.. some one needs to take lead....who are ready ??

chris (2009-10-21 11:39:08)

Message to paypal.....lets see what the response is Recently you advised that u were unable to recover funds from this fraudulent seller. the seller is still using the paypal verified logo to accept payments, that are being processed through your system. Paypal are therefore allowing this fraud to continue, despite numerous complaints regarding this seller, so it is not 'recent'. There is a clear and unambiguous failure on behalf of paypal in the due diligence process, the sellers full details - including domain name, server info, registered address, etc are in the public domain, so to rely on the defence of unable to locate the 'seller's info are not sustainable. Either paypal is allowing this fraudulent site to continue to use the paypal link knowingly, in which case paypal are culpible in the fraud, or unknowingly, in which case there is a failure of due diligence. Irrespective of the terms of the user agreement, paypal are liaible under various sections of Australian Consumer Protection laws, and i suspect other national laws as well. We request response within a reasonable time, and hereby put you on notice that we are holding paypal liaible for loss of funds, and also any consequential damages that may occur should we decide to progress this further. Please also note that there are simultaneous (across several countries) class actions pending from all those who have lost money due to the failure of paypal to take appropriate measures.

Chris (2009-10-22 22:30:02)

Re my last message ... it would appear that most of the people that have been scammed by myshopinsun.com are USA based. Here in Aus (where I am) maybe we are a little different and will not let things go. It is virtually impossible to get your money back though the trader - however please all take note: My company (of which I am principal) does a lot of work regarding maritime fraud and well aware of the various international laws and jurisdiction issues that can be problematic. The Chinese authorities are actually quite good, if they feel that the image of their country is being tarnished, and they do not take it lightly...they execute people for such things. In any event Paypal are completely culpible in this case (AFTER ADVICE FROM OUR LEGAL TEAM) as they are taking fees from the transactions, yet are aware that the site is fraudulent (there is enough anecdotal evidence to support this, so paypal cannot claim ignorance). Following is my latest message to Paypal, I would suggest that all those that HAVE BEEN SCAMMED, go through the paypal website, make reference to the case - despite the fact that Paypal have closed the case (a joke) and go through the fraud bit in making a complaint. Appreciate those that have requested someone to take a lead, but once it is in the hands of the AFP then it is Paypal that have to answer. We in Aus WILL NOT ACCEPT bullying by large and powerful corporations, and our laws allow us to progress legitimate issues. this is the latest comms with paypal. qt I have since taken legal advice on this matter, and the question of paypal still accepting fees from an account that they are aware is fraudulent. a) paypal are accepting fees b) They know that the account is being operated in a fraudulent manner (which should be obvious due to the number of complaints found in the public domain) then paypal are also culpable in the fraud. My legal advisor has suggested I forward the details to the Australian Federal Police, who will have (i have been advised) no hesitation in commencing an investigation, and also a prosecution of paypal, should the above 2 circumstances be shown to exist. While the AFP are not able to take action against the trader, being based in China, they can do so against paypal being an entity in Australia. It is quite likely that selected individuals will be investigated. Please expect similar events to occur in other countries, where you have allowed this fraud to perpetuate. If paypal are successfully prosecuted, then it is probable that private suits will follow, as there will be a implied obviaton of the paypal user agreements. All those that have been scammed by this outfit, aided and abetted by paypal, please contact me on marinesurveyors@bigpond.com STAND UP TO THESE BASTARDS !!!!!

pam (2009-10-23 05:16:05)

Sept. 30th I placed a \$267 order. On the 8th I saw this blog and called Paypal. I specifically asked if they knew about Myshopinsun or Gamesingate. Ferrell said no. He put in the case file so isn't that supposed to mean that no funds be released to myshopinsun? On the 19th I called and was told by Amber there was no \$ in their account. So from the 8th-the 19th no money could've gone out so logic dictates that no money went in right? I was told by Amber that I would be "wasting my time" to call paypal back and keep checking on my refund! That pissed me off so badly that I hung up on her. Aren't they supposed to get a tracking number before releasing funds? I need someone to tell me they put in a claim before sept 30th so that I have a case against paypal.

mike phillis (2009-10-26 11:45:13)

hey guys, 1st of all sorry to hear about all you guys, having lost the money to the scammers at myshoppinsun.com. im glad i came across this blog, because TBH my partner was looking at gwtting a Wii and the Wii fit accessories, from myshopping-sun.com. today i tried to search for the site in google.co.uk and nothing came up. remembering it was a chinese trading company \*COUGH\*COUGH!! i thought i would try and search for it on china's google site, thats when this came up. so i would like to personally thank this blog for the information, and ask how far the proceedings have gone towards paypal??? no1spot@hotmail.com for any updates people have available cheers

Chris (2009-10-27 12:33:29)

It would appear that the site has now vanished..i wonder if the pressure on paypal has prompted action by them..i am sure they have a registered company in China. Doesn't take away the fact that they were still collecting fees during the time that the scam was running - and also aware of it, going by the number of complaints that they had received. Thanks to those who have contacted me, I am astonsished at the dismissive attitude that paypal have taken so far. I understand (unofficially) that some of paypal's business practices are viewed with concern by (various undisclosed authorities) in Aus...anyway keep up the contacts, the more evidence that can be passed over to the AFP the better.

Pam (2009-10-28 19:11:45)

I was also scammed and paypal said no money to refund. I am out 210.00. I called paypal the day I ordered to be sure I would be covered if this was a fraudulent company and was assured that my purchase was safe. I would like to be involved if anyone pursues this with paypal. Paypal is owned by ebay and they make enough money to pay up back.

Robert Kren (2009-11-06 15:03:32)

I too was scammed by 'myshopinsun', and yes, I paid through Paypal. I filed a complaint with them after the website closed and they investigated. They concluded that I was scammed but they denied responsibility and will not reimburse me for the \$203.00 I paid through them. With all the complaints I have seen, It seem irresponsible (to put it as kindly as possible) that Paypal would continue to process payments for this site. One would suspect that the continuation of the payments may have been profit motivated. Paypal assures me that they are a safe, secure, payment site. The loss of over \$200.00 makes me feel somewhat insecure, and casts doubt on their claim to making safe transactions. I would expect restitution from the party who processed this payment—knowing full well that the payee has had so many complaints filed against him.

Robert Kren (2009-11-06 18:35:30)

Update. I went online and found the NEW website that myshopinsun.com is operating. The setup is identical, they are selling the same products, and even the misspellings and setup are identical. They show the same Wii gaming system that I had purchased and it even has the same item number. The new site is " Jiaweishop.com".

D (2009-11-09 15:15:10)

I came across this site Jiaweishop and wanted to do some research on the site...I came across this blog (thankfully) I was about to be out 250 bucks... I am sorry for all of you that haven't recieved your money back and wish you good luck...

charleen bechtold (2009-11-13 22:28:52)

Thanks for the info. I came across this site,Jiaweiship, and was going to order some gifts, but thought I better do some checking. Sorry that you were scammed and I wish you the best.

warhar (2009-11-14 07:33:24)

thanks for the info , I was about to fork out over \$400 dollars to Jiaweisop and thought I better check . The Prices are really tooo good to bo true. Ebay better get a grip on these scammers . Another way people might get there money back is if they used a credit card they would probably have fraud protection.

Daniel (2009-11-17 12:00:52)

<http://jiaweishop.com> is the scammer's new website, the Domain details are slightly different but company name and billing address are the same.

christian collette (2009-11-24 07:44:18)

hmmm... it looks like the finally shut down that website:D I tried to get to it and the url is a bad request. I am so glad.

Nacho (2009-12-08 21:03:46)

Do anybody purchased goods from [www.lightsinshop.com](http://www.lightsinshop.com)? It is very likely a new scam website, is it possible to be same person? Gamesingate, Myshopinsun, Lightsinshop, same type, same merchandise, same price!!

Virgil Daniel (2009-12-09 08:20:40)

I read a blog from Seth saying that this site was a scam.Has anyone ever dealt with them?They have unbelievable prices on Wii's & games.If you have had a bad experience with them,pleas let me know!I called Paypal,to ask them,since you pay through them & they said it was a good site.So,I'm confused!! Please...if you have any info.on this sit let me know? Thanks alot, The site is ([lightinshop.com](http://lightinshop.com))

Nacho (2009-12-09 19:38:45)

Well, It turns out to be that the website [lightinshop.com](http://lightinshop.com) is a scam! So please careful on it.

Lisa (2009-12-20 09:35:30)

I had purchased \$526 US from [myshopinsun.com](http://myshopinsun.com) using PayPal and I too was scammed.I ordered Sept.29,2009 and by mid Oct. had found this blog with all these reports of scam. I contacted PayPal immediately, filed a complaint and though they found in my favor, none of my money was recovered/refunded.I did go ahead and file a complaint with [ic3.gov](http://ic3.gov) but don't feel like it did any good.After finding out that there were new websites from the same vendor, again backed by PayPal, I decided to try filing a complaint with the better business bureau. I filed against Paypal for knowing that people were being scammed and still allowing other transactions instead of suspending them until investigation was complete. Don't know if it will do any good, but I'm trying. There has got to be some way for us to get our money back. PayPal cannot get away with this. At the very least, they should refund their cut of our money they received from the vendor. Why should they be allowed to keep money from a bad transaction? There has just got to be a way. I also filed a report on [econsumer.gov](http://econsumer.gov) against the vendor. Again, just hoping that somehow something will work. We can't give up.

Sally (2010-01-13 11:40:34)

I too got scammed . I paid through Pay Pal and they did nothing.Theses people are getting rich because of us....

vicki (2011-12-16 13:50:07)

I too was recently scammed. I ordered a NFL Jersey from [lightinstore.com](http://lightinstore.com) and have never received the Jersey. I have emailed them with no response. Wish I would have seen this post before I got scammed!

ksh (2011-12-16 19:23:34)

i think that [lightinstore.com](http://lightinstore.com) just scammed me... i ordered a jersey on 12/6 got charged on the 7th. its the 16th now and I hae yet to receive my jersey. there is NO phone number and the customer service email that i wrote to only returns my emails stating that there is "no such user here" anyone else have this problem and know what to do???

Justin (2011-12-17 06:59:44)

Looks as though I have been scammed as well. I ordered a jersey on [lightinshopping.com](http://lightinshopping.com) on 12/9 and here it is 12/17 and nothing. I have emailed them numerous times and have gottten no response. There is no phone number avail. Would love to know if anybody else has gotten anywhere with these people.

sandra crace (2011-12-20 18:35:02)

Looks like I have been scammed as well by lightinstore.com. Ordered Green Bay jersey early in December and have not received as of the 20th. I sent 2 emails to their service center and 1 to a Paul Zhang who has corresponded with me prior to placing the order with NO RESPONSE. However, I did use credit card and hopefully they can reverse the charges.

sandra crace (2011-12-21 13:24:00)

I must correct my last review for lightinstore. Received my jersey today. I also received reply from Paul Zhang with tracking number today. So I was NOT scammed.

Amanda (2011-12-23 10:28:43)

did you really get it sandra? i still haven't and the website looks sketchy. i should've checked that out before i ordered...

Andrea (2012-02-05 21:45:41)

Has anyone heard of or ordered from lightinshopping.com? Eerily similar to lightinstore.com.....I think my bank (thankfully) denied the charge, but it all sounds just like the latest comments.

Doug (2012-02-16 14:41:21)

I ordered a jersey from lightinshopping.com recently. I was not scammed! I ordered on Jan 24, got a tracking number a week later, and got my jersey today. So it does take a long time from order date to receiving the jersey (approx a month), but I did get the jersey for a great price! I can give any more details if you want them. Just ask.

Seth Roberts (2012-02-16 16:07:07)

How do we know you are not scamming us with this comment?

Doug (2012-02-18 20:10:14)

Well I have the documentation and I can take pictures of the jersey. But since there is not a way I can upload any of this information to this blog, I do not know how to convince you. I can send you the information to an email address or if you have a way to verify in some other way, I would be more than happy to do so.

Seth Roberts (2012-02-18 21:15:06)

Please explain why you care about this.

Doug (2012-02-21 17:35:55)

I am not gaining anything from my posts. I am simply stating that I received my jersey from the website mentioned in your blog. Is that not the point of this blog subject? I know it is hard to convey tone with words, but I am in no way trying to be disrespectful. Please do not take any of my comments in a negative way.

Seth Roberts (2012-02-21 18:36:46)

"I am not gaining anything from my posts." You are if you are the person/persons perpetuating this fraud.

Doug (2012-02-21 18:59:37)

You could say the same for Sandra by that logic. She said she was not scammed by a similar store. Is there a particular reason that you feel that I am representing a scam site, rather than someone who posted an experience from a store, as others have done?

Seth Roberts (2012-02-21 20:29:33)

I feel you are representing a scam site because of your incredible persistence here and your utter lack of evidence. Ordinary customers wouldn't care so much. You care too much.

Doug (2012-02-22 15:08:39)

Point taken. I will desist and enjoy my jersey

### **Signage Features of the Toyko Subway System Inexplicably Missing Elsewhere (2009-08-24 02:17)**

I've been in about 15 subway systems. Only in [1]the Tokyo system have I seen these helpful features:

1. Walking distances. The signs within a station that show where to go to get to Line X (the platform where you catch Line X trains) include distances (in meters). How far you have to walk to get there. A nearby platform might be 100 m; a distant one 250 m.
2. Station-to-station distances in minutes. In several places you are told how many minutes (on the train) it takes to get to each station. Most stations are about 2 minutes apart. The nearest station is 2 minutes away, the next is 4 minutes, etc.
3. Letter-number names for each station. In addition to the usual names for each station (e.g., Ginza) each station has a letter-number name. The letter is the line; the number is the position on the line (1, 2, 3, etc.). For a north-south line, for example, the southmost station is 1, the station just north of it is 2, and so on. On the Akususa Line, for example, the stations are named A1, A2, A3, etc., in addition to the usual names. This makes it easy to figure out how far you are from your destination. If you're going to Station A15 and you're now at Station A12, you have 3 stops to go.

1. [http://en.wikipedia.org/wiki/Tokyo\\_Subway](http://en.wikipedia.org/wiki/Tokyo_Subway)

---

meerkat (2009-08-26 15:27:23)

The Osaka subway system has #3 too.

Dan (2009-10-07 20:19:47)

I live in Tokyo and I love the signs for the trains. I barely ever had a chance to use the subway in America, but I knew when I got here that the Japanese system must be special. Though from what my UK friends tell me, #2 would be impossible in London, for example, because you first need a system that is on time. If you have a cell phone in Japan, you can mark a #4 for the continually updated web service that gives arrival and departure times, travel time, station distances, and price. Also searchable with a wide variety of parameters including cost, quickest time, fewest transfers and whether to include buses/subway/bullet train/etc.

### **The Appendix and the Umami Hypothesis (2009-08-25 21:41)**

Your appendix – a kind of cul-de-sac off your large intestine – can be dangerous. [1]A British man was recently rushed to the hospital with a burst appendix three weeks after he'd had an operation to remove it. Surgeons have routinely removed it – seemingly without problems. Is the appendix an evolutionary vestige, as Darwin believed, or does it do something beneficial?

In the last few years, two articles – one in [2]Journal of Theoretical Biology, the other in [3]Journal of Evolutionary Biology – by William Parker, a professor of surgery at Duke, and others have argued that the function of the appendix

is to harbor bacteria. If diarrhea washes out your intestines, bacteria safely hidden in the appendix can repopulate them. (A theory supported by the position of the appendix – roughly in the middle of your intestines.) That makes perfect sense.

The connection with my umami hypothesis is that both assume that the foreign bacteria within us are precious and endangered. (My umami hypothesis says we need to consume plenty of bacteria to be healthy and that our food preferences help us do so.) The precious part is widely accepted; it's the endangered part that's new. If we need bacteria so much, why should they be endangered? We need our eyes; they aren't endangered. My answer is that to protect bacteria carries a cost: The most hospitable the digestive system becomes to bacteria, the less effective it will become at everything else, including digestion. And bacteria were/are cheap. Rather than protect them, the system has been shaped to require them. Just as gas-guzzling cars evolved when gas was cheap. Making cars more gas-efficient will make them less efficient at other functions, such as signaling status.

Thanks to Kathy Tucker, James Andrewartha, and James Lucoff.

Craig (2009-08-26 07:12:12)

"A British man was recently rushed to the hospital with a burst appendix three weeks after he'd had an operation to remove it. " I know this may be a stupid question, but can a person have two appendix?

Tom in TX (2009-08-26 10:45:29)

œ. A British man was recently rushed to the hospital with a burst appendix three weeks after he'd had an operation to remove it. œ Another great moment in British socialized medicine, no doubt.

seth (2009-08-26 14:33:52)

"Can a person have two appendix?" No. It is a mystery what happened during the first operation.

Seth's blog » Blog Archive » If You Have Carpal Tunnel Syndrome... (2009-08-26 16:45:17)

[...] I Recommend The Man Who Would Be Queen by Michael Bailey Mindless Eating by Brian Wansink The Shangri-La Diet by Seth Roberts « The Appendix and the Umami Hypothesis [...]

Chris (2009-08-27 02:25:29)

Interesting. a quick search also turned up this link of people having digestive problems after an appendectomy. Folks there are recommending probiotics <http://ehealthforum.com/health/bowel-problems-after-appendectomy-t137299.html>

Deb Slane (2010-03-23 14:23:03)

My step-dad just had "2" appendix removed Sunday night. The doctor said it is very rare. One was where it was supposed to be and the other one had attached itself to his bowel!

Tim McCormack (2010-07-24 20:32:18)

Digestive problems after abdominal surgery? Doesn't surprise me.

### **If You Have Carpal Tunnel Syndrome... (2009-08-26 16:45)**

. . . you should have your thyroid level checked. There's [1]a strong correlation:

Nineteen patients (73 %; 31 hands [68 %]) displayed symptoms of CTS; of these, 16 patients (25 hands) had clinical examinations consistent with CTS. Only 6 of the 16 patients with clinical CTS (7 of 25 hands) had electrical studies that supported a diagnosis of CTS. All these symptomatic patients were biochemically euthyroid. All control subjects had normal electrical study results and normal sensibility testing. Two [control] subjects had positive clinical [CTS] examinations, giving a [CTS] false-positive rate of 4 %.

Apparently treatment of the thyroid condition can make CTS – often treated with surgery – go away, speaking of [2]misguided operations.

Hypothyroidism is so common I suspect an environmental cause, just as the fact that acne is common suggests an environmental cause. One kind of evidence for such a thing would be finding a group of people living unusual lives (e.g., New Guinea highlanders) with unusually low or unusually high rates.

---

Charles (2009-08-26 22:41:53)

Two things: Vitamin D deficiency and Iodine deficiency. Google either one and you'll find a lot of references. I've been taking thyroid for years for hypothyroidism. When I upped my Vitamin D intake to 2,000-4,000 IU/day, I found I could cut my thyroid dose in half. (And I've also not been sick in over two and one-half years, to which I attribute the D.)

Dennis Mangan (2009-08-27 05:42:31)

Yes, iodine deficiency. The incidence of hypothyroidism and autoimmune thyroiditis (Hashimoto's) has apparently dramatically increased in the U.S. over the past 100 years. Guy Abraham M.D. has written a lot about the connection.

seth (2009-08-28 02:12:04)

Thanks, Charles and Dennis. That's very important.

Dentsits Lakeland (2009-08-28 02:34:02)

I was also diagnosed with hyperthyroidism recently, so I have been taking medications and stuff. After a few months, I will undergo a series of tests to see if it all worked out or if i need surgery.

Charles (2009-08-28 21:44:33)

Fear of salt (iodine deficiency = hypothyroidism) + fear of fat (increased refined carbohydrates = obesity, diabetes, heart disease, etc.) + fear of the sun (Vitamin D deficiency = depressed immunity, depression, hypothyroidism) + fear of bacteria (depressed immunity) = pretty sucky health for modern humans. And if you look at the iodine and Vitamin D effects on thyroid, then combine that with the increased sugar-based calorie increase...that;'s not a good combo. We've created a perfect storm here, doncha think? It would be hard to design an environment that would more efficiently lead to bad health.

Seth's blog » Blog Archive » What Causes Hypothyroidism? (2009-09-19 06:08:08)

[...] In an earlier post I wrote, "Hypothyroidism is so common I suspect an environmental cause." In fact, I suspect that all common diseases are caused (= made much more likely by) differences between modern life and Stone-Age life. Since then, thanks to comments and email, I have learned more about hypothyroidism. According to Dennis Mangan, it has become a lot more common during the last 100 years, which implies an environmental cause. The most common type of hypothyroidism is called Hashimoto's thyroiditis. It is an autoimmune disorder where the immune system attacks the thyroid, damaging it. A reader with hypothyroidism wrote me: When I was first tested for thyroid levels, part of the test (which I think is standard protocol) was to test the level of antibodies to thyroid. My levels were off the charts. [...]

### **"Kombucha Reconsidered" (2009-08-28 02:51)**

At Cancer Decisions RWM has written two posts called "Kombucha Reconsidered". After drinking kombucha for a while, he decided to stop. One reason was [1]lack of evidence of benefit:

When I began investigated the actual medicinal properties of Kombucha tea, I thought I would be overwhelmed with information. Not so. For something that has been around for so long, there are only 38 scientific articles in PubMed on the topic of kombucha. Most of these are technical studies on the nature of the bacteria and yeast in the brew. Only a few of these are clinical.

In particular, [2]no evidence of benefit for cancer:

But I am unaware of any credible data linking kombucha consumption to the prevention of either recurrences or metastases. (PubMed yields just two articles on the topic of kombucha and cancer, both of them negative.) This is a poor basis on which to make health decisions.

He also found two case reports, one from 1995, the other from 2009, where kombucha might have caused illness. In the 1995 the evidence is weak; in the 2009 report the connection is more plausible – but the sick person had HIV. The authors nevertheless generalize to everyone: "Consumption of this tea should be discouraged."

This is a reason self-experimentation is important: So you can ignore inane statements in research articles. After I found that flaxseed oil improved my balance, I could ignore research that supposedly showed poor conversion of short-chain omega-3 (in flaxseed oil) to long-chain omega-3 (used by the brain). Had RWM managed to measure the effect of kombucha on himself, he would have a vastly better basis for deciding whether or not it helped him.

This is also a reason that theory is important. John Tukey, the statistician, spoke of "gathering strength" when analyzing data. It is rare that a single body of data tells you how to analyze it, he said. (For example, what transformation to use.) You should use similar data sets to help decide. Scientific theory has the same effect. Before I started drinking kombucha, I didn't have obvious digestive problems ([3]unlike a friend) and my immune system seemed to work well. So it wasn't easy to measure its effect. Yet I drink it and am untroubled by the evidence that worries RVM because I have a theory: the umami hypothesis (that we need a steady intake of bacteria to be healthy). This allows me to assess the effect of kombucha – whether it is likely to be good or bad – with the help of evidence from other bacteria-rich food (yogurt, natto, etc.) and much different data ([4]the effect of bee stings on arthritis, [5]hormesis, [6]epidemiology, [7]the effects of turmeric, etc.). Because the umami hypothesis appears to be true, apparently bacteria intake is beneficial – and kombucha has lots of bacteria.

Thanks to Tom George.

Probiotics - how to? (2009-08-28 06:43:32)

[...] Seth Roberts often writes article like this in favor of probiotic food. \_\_\_\_\_ I am always open for feedback on my posts. If your feedback would go offtopic feel free to send me a Personal Message. My posts generally don't contain medical or legal advice, if you have a problem seek the opinion of an expert Talking about this in terms of "bad news" or "bad judgment by business leaders" seems archaic. It's like describing World War One as "a serious diplomatic concern." Bruce Sterling about the financial crisis. [...]

peter (2009-08-29 08:17:58)

my experience with Kombucha is that too much is bad (i feel slightly ill), but that i can take 2 table spoons about every other day and one of many sources of fermented food. (i really don't know if it's doing me any good; but based on what i've read i probably does). to take a lot of one thing on a daily basis probably is not a good idea. i'm guided by the principle that one should seek a variety of sources of fermented foods in moderate amounts; the same can probably be said of other foods as well.

Melissa (2009-08-31 14:15:06)

I like the way it tastes and actually it's gotten me into more sour foods. Yesterday I attended a tasting of wild-yeast fermented beers. Fans of kombucha will love these sour brews.

Donn (2009-09-22 08:16:57)

Interesting article on some of the science behind fermented foods. <http://coolinginflammation.blogspot.com/2009/09/cure-for-inflammatory-disease.html>

raka (2009-10-02 04:00:47)

Quote from abovr comment: [[my experience with Kombucha is that too much is bad (i feel slightly ill), but that i can take 2 table spoons about every other day...]] Then you have serious internal systemic issues. I don't know if you are just whining like

alot of people do. You can probably drink 10 cups of coffee daily w/o a problem but a mere 2 tablespoons makes you ill????!! This is just nonsensical rhetoric. Most people consume a bare minimum of 4 oz when STARTING, and progress from there. There is no upper limit, it is how your body reacts. Some drink up to a gallon. The average for most is probably 16-32 ounces daily.

### **Spectacle Practice (2009-08-28 18:47)**

Late last night, on my way home, I came across a huge crowd of Tsinghua students next to the campus stadium. More than a thousand. There was no event at the stadium. All of them were dressed in a casual uniform, in varying colors. "What's this about?" I asked one of them. "It's a secret," she said. Another one told me they were practicing for the upcoming National Day (October 1), which is China's Fourth of July. This particular National Day will be the 60th anniversary of the beginning of the current system so there will be an especially big celebration. The uniforms said "60" on the shirt. There were going to be at least 9 practices. This particular night was the first night they would practice in Tiananmen Square, where the event would take place. Every one of them had a square with different colors on the two sides; like a giant LED display they would make different displays. "It lasts all night," the student told me. "It ends at 6 am. We don't sleep."

And, indeed, at 5:30 am the next morning, a police-escorted convoy of 45 buses, each with about 60 students, came through the campus gate near my apartment. [1]An article about the Tiananmen practice says it involves about 200,000 people. That's a lot of buses.

1. [http://www.chinadaily.com.cn/china/2009-08/29/content\\_8631088.htm](http://www.chinadaily.com.cn/china/2009-08/29/content_8631088.htm)

---

cremes (2009-08-28 19:41:59)

While I'm certain this is exciting to a degree, I must ask if the Chinese are really this ignorant of their own recent history as this suggests? Personally I find it somewhat macabre.

DJ\_Magic (2009-09-03 04:40:08)

“they were practicing for the upcoming National Day (October 1), which is China’s Fourth of July” that is a really good explanation for American who do not know National Day ,hehe, joking

### **Hormesis Revisited (2009-08-29 18:32)**

There are several ways to realize the vast implausibility of – and thus the vast amount of information conveyed by – radiation hormesis. If you are not an experimental scientist, you may not realize how incredibly hard it is to find a treatment that substantially improves something complex. Think how hard it would be to make your laptop work a lot better. Not by redesigning and building a different laptop – but by doing something to the carefully-designed laptop you have now. Has such a thing ever happened in the whole history of engineering? Probably not. Or consider the possibility that shooting a bullet at your laptop (or any other complex machine) will make it work a lot better.Â Absurd. Couldn't possibly happen.

Yet that is exactly what happens in radiation hormesis: Small amounts of radiation improve health. [1]This review article gives a wide range of examples. Experimental:

Bhattacharjee in 1996 showed that when the mice preirradiated with just adapting doses of 1 cGy/day for 5 days (without a challenge dose), thymic lymphoma was induced in 16 % of the animals (Bhattacharjee 1996). Interestingly, when preirradiated mice were exposed to a 2 Gy challenge dose, thymic lymphoma was induced again in 16 % of the animals. However, the challenge dose alone, induced thymic lymphoma in 46 % of the mice.

Epidemiological:

Cancer frequency among [United Kingdom] nuclear power plant workers was lower than the national average (Kendal et al. 1992).

(I've never heard anyone complain there wasn't enough radioactive radon in their basement, but in some cases that's true.) Thomas Luckey, the discoverer of the effect, wrote [2] a book about it, reflecting the vast number of examples.

What does it mean? Obviously it supports my umami hypothesis. Life evolved in a world of junk and damage; that junk and damage was used to make things work better. Think of a police force. They function best spread over a city, travelling here and there. When there's a crime, someone will already be close and get there quickly; many crimes will be stopped in progress. A low crime rate is better than a very low crime rate because it gets the police out of the police station and allows them to practice their skills. With too little crime, the police spend most of their time in the police station. When a crime occurs it takes longer to reach the scene (so small problems become big ones) but also, having nothing else to do, they overreact: treat small problems as big ones. That our body's defense mechanisms are slow to react means infections and cancers become bigger than necessary (and sometimes lethal); that they overreact means we get autoimmune diseases.

Anderw Gelman (2009-08-30 01:23:12)

You mention radon, which is an area Phil and I've worked on. According to Phil, there has been some discussion of the potential protective effects of radon at low levels, but there's no convincing evidence of this. As you say, it makes some sense, but it also makes sense that even low levels can hurt.

Glen Raphael (2009-08-30 10:50:45)

"Cancer frequency among [United Kingdom] nuclear power plant workers was lower than the national average (Kendal et al. 1992)." I'm at least as enthusiastic about the idea of hormesis as the next guy but I have to object to that example as evidence for it. I strongly suspect that nuclear power plant workers are exposed to a lot \*less\* radiation than average workers. Nuclear power plant workers wear radiation tags, spend much of their time in a shielded environment and have people around them at work who are on the lookout for unusual levels of radiation; most workers don't. Because the danger is so obvious they are *overprotected* against it, in much the same way that houses in snowy climates are extra-well protected against cold with insulation. If you want to look for people likely to be exposed to *extra* radiation by their jobs, try dentists. Or coal miners. Or

people who work outdoors.

seth (2009-08-30 17:20:43)

Glen, your argument is interesting but it sounds, forgive me, completely armchair. Completely speculative. Especially the idea that the reduced exposure is "a lot" less. I would really like to know of any evidence that supports your claim.

Glen Raphael (2009-08-31 10:53:16)

*Glen, your argument is interesting but it sounds, forgive me, completely armchair.* I was wrong. People living near a nuclear power plant are protected to the degree I implied; people working in one aren't. According to James P Hogan's essay "Know Nukes" (which I read ages ago), the granite in New York's Grand Central Station naturally emits more radiation than a nuclear plant is allowed to emit, so people who work there are getting a significant annual dose of radiation, but because we're not \*afraid\* of granite, they don't wear radiation tags. I was extrapolating from that and a few other half-remembered factoids. So let's get some real numbers in here. A little googling finds these more-precise claims: Background radiation (the radiation load from "living on earth" is about 200 mrem. The legal limit on workplace radiation exposure (for nuke workers, x-ray techs, etcetera) is 5000 mrem above background; the NRC claims average industry exposure is about 240 mrem over background; the exposure from being an employee at Grand Central Station is only half that, or 120 mrem. The average exposure from being an airline attendant or pilot is closer - 160 mrem. Medical X-ray technicians average 320 mrem, which is more than the average for nuke workers but not as \*much\* more than I expected it to be. So there are some other professions that are in the same ballpark, but nuclear plant workers do get significant extra exposure relative to "average workers". I withdraw my objection.

## **Student Power (2009-08-30 17:09)**

Ah, the rest of the world is catching up with me. [1]This long article in the NY Times describes a middle-school English teacher who lets her students read what they want instead of having every student read the same thing. I started doing something similar six years ago. There was always an assigned reading, but students always had a choice: They could do the assigned reading or they could find something else on the topic (e.g., bipolar disorder) that they preferred. About three-quarters of the students did the assigned reading.

My criticism of American higher education is two-fold: 1. Students in a class are treated all alike. They're not. All hear the same lecture, read the same texts, do the same homework assignments, take the same tests. I came to realize that my students differed greatly in their talents and career goals. I can't remember meeting a Berkeley prof who seemed to be aware of this. When a professor would describe a student to me, it was almost always on one dimension: more or less smart, which meant more or less good at doing the sort of tasks professors are good at. I think the diversity of talent and career interests I saw in my students is no accident or exception (which is supported by the fact that a middle-school English teacher saw the same thing); I think it's at the core of human nature and it's at the center of [2]my theory of human evolution. 2. Professors teach how to be professors. Most students don't want to be professors. Every Berkeley prof I ever met was extremely good at research; a few were extremely good lecturers. And every one of them sounded like an idiot the moment they started talking about how they taught "critical thinking" or whatever grand-sounding term they had for it. "Teaching students to think" was a common way to describe teaching students how to be professors. To say such a thing to a psychology professor is like saying to a chemistry professor that the world consists of four elements (earth, air, fire, water). "Are you aware how stupid you sound?" I felt like saying. But instead I would say that there are many kinds of thinking.

Giving students more power over what they learn solves, or at least reduces, both problems.

1. <http://www.nytimes.com/2009/08/30/books/30reading.html?em=&pagewanted=all>

---

Anderw Gelman (2009-08-30 23:06:02)

Hey, I wish you'd told me that I "sounded like an idiot" – I had no idea! But I was definitely aware that "students differed greatly in their talents and career goals," even if I have struggled (and continue to struggle) with how to deal with this.

seth (2009-08-31 01:42:53)

Andrew, if I remember correctly you never said anything about "teaching how to think" to me. And you are right, my statement about nobody being aware of student differences is too strong. I have modified it. I suppose the more important point is how little allowance is/was made for student differences. The only obvious and widespread example I know of is for those labeled learning-disabled – then you got more time on tests.

michael vassar (2009-08-31 09:20:18)

Seth: It's politically incorrect to have explicit beliefs about differences between students in ability if those beliefs have enough detail to make them actionable. Honestly, understanding the differences between people's kinds of thinking is a whole academic specialty, a field of psychology but not seriously touched in "education" or "educational psychology" so it's unsurprising that most people are unfamiliar with it. Also, there are many kinds of thinking, but do you seriously not think that there is something distinctive about the kind of thinking that professors do that makes it appropriate that it be taught, if at all possible, in schools? People have ALWAYS had many kinds of thinking, but the rise of science created one very distinctive very novel sort of world, largely by cultivating the synthesis of philosophical/mathematical and mechanical/empirical thinking. Everyone knows that human brains don't need to be taught how to think in general, but they do need to be taught how to think scientifically, hence every culture has thought but only some have science. Finally, all children think, most adults mostly pattern match instead, which generally works better. I wish that nerdy adults who knew how to think were given good instruction in how to act, play chess, and do other types of pattern matching.

Douglas Clegg (2009-08-31 12:05:23)

While I had a handful of good professors in college, the best were from Dr. George Ray and Dean Pusey (at Washington & Lee University). Why the best? Dr. Ray had the direct studies – we went to the U.K. to study classical British drama for a course on it. So, we saw the historical places first hand, got lectures directly from Shakespearean actors, and watched at least three dramas a week – from among the great playwrights. And Dean Pusey? In his 80s when I took the class in Russian lit, he first gave us a questionnaire where each student filled in our interests, aspirations, dreams, etc. Then, every test was geared toward where our minds were likely to head. I thought at the time I'd become either a writer or filmmaker (I became a novelist, later), my tests were filled with "what key scenes would you choose to keep in if you were to make a movie of this story, and what would you throw out – and why?" and various other permutations. It made me realize what I'd been missing out on in college – someone who actually looked at where I put my energies and found a way to draw them out from me into the subject matter, and also match that subject matter with my deepest interests. It was, hands down, the best class I ever took in my life, I thought more deeply about the subject and the work at hand than I did for nearly any other class.

bennetta (2009-08-31 16:58:56)

And ironically, the more prestigious the institution is, the more pedagogically stale it tends to be – you may disagree with me on this, Seth, but that has been my experience. Of the three institutions I've been to (UC Davis, Sonoma State University, and the Santa Rosa Junior College), "prestige" was inversely proportional to the quality of education. At times, I honestly wondered how many professors at UCD were actually there to teach or were genuinely concerned about their students, particularly undergrads. Probably relatively few, I'm guessing. The best instructors I had usually had only masters degrees, as well. I taught Special Education (light to moderate) and have a learning disability, myself, so I'm extremely (perhaps overly) sensitive and understanding to the problems that arise when the two brains involved on the opposite ends of a learning

process are wired completely differently, want different things, or have different expectations. What I experienced at Davis vs. the JC was like night and day. So in what ways did the two differ? The JC gave me much greater freedom to learn in a way that was appropriate for me and provided much greater interaction between teacher and student. The thousand-person lecture hall format isn't exactly flexible, nor does it lend itself well to multiple styles of learning. I can't help but think those who think it's actually effective are either insensitive to people's needs or just plain don't care.

Anthony (2009-08-31 17:07:10)

@Bennetta said "The thousand-person lecture hall format isn't exactly flexible[.]" Right. What is the purpose of 1,000 person lecture halls, nowadays - why not just provide a lecture accessible on the web? Then you could also provide a transcript or lecture notes at the same time. This seems much more convenient, flexible, and useful to me.

Bryan (2009-08-31 18:08:54)

For law school, point #2 can be modified to, "Professors teach how to be appellate clerks. Most students do not want to be appellate clerks."

Why The Future Is Now: An Interview with Alex Mann | Certification Map (2009-11-16 05:07:21)

[...] The biggest setbacks in education include the access gap to technology and the bureaucratic, unionized culture. A classroom has been historically viewed as a single learning entity because teachers don't have the resources to treat student needs individually. One solution could be personal computers, that with the aid of a teacher, would allow students to learn at their own pace, method and style, rather than matching the classroom average of the same factors. It's a costly endeavor, but a shift that needs to be enforced technically, culturally and politically. [...]

## **National Fisheries Institute: Stop Misleading Us (2009-08-31 03:22)**

After [1]Jeremy Piven won a legal decision saying yes, he may have had mercury poisoning from sushi, the National Fisheries Institute, a seafood industry group, issued a statement. Its crux was this:

Despite the fact that the arbitrator ruled in Piven's favor, NFI cautions reporters and editors to continue to treat Piven's statements with skepticism. It is important to note that no peer reviewed medical journal has ever published any evidence of a case of methylmercury poisoning caused by the normal consumption of commercial seafood in the U.S.

Excuse me? Surely they know about [2]Jane Hightower's work. I suspect this is why they used the term medical journal. Hightower's work on mercury poisoning was published in Environmental Health Perspectives, which is peer-reviewed. Hightower is a doctor. So what if EHP isn't a medical journal? This statement, although literally true, is completely misleading. Hightower's article is [3]here. It supports exactly what Piven claims.

Here's [4][5]a quote from Hightower:

I think I provided a missing piece of the puzzle: That this [excessive mercury] exposure is coming from fish that we purchase at the grocery stores and restaurants. . . . Some people are eating so much of the commercial, high-mercury fish that they are over the mark for tolerable allowances set by the Environmental Protection Agency, the FDA, the Agency for Toxic Substances and Disease Registry and the World Health Organization.

---

Gavin (2009-09-08 09:15:06)

Seth, Rest assured the National Fisheries Institute is not misleading you. Perhaps you are confused about Hightower's research. Hightower's peer reviewed published work, medical journal or not, simply does not reach the conclusion you suggest it does. Hightower's published work concludes that eating fish that contain mercury can raise a patient's mercury levels—that's it. That's a simple known fact, nothing ground breaking or arguable there. If you believe she reaches other peer-reviewed conclusions about mercury toxicity perhaps you should read her book. Throughout her book, Hightower writes about the fact that her own colleagues express skepticism about her work because, "there isn't much here, and there is not enough cause-and-effect data that is significant" (p 39). She even admits just that in relaying a discussion about her own patient survey. She recalls a conversation with then-EPA official Kathryn Mahaffey. Hightower remembers Mahaffey saying "just stick to the numbers" because "we know people have symptoms, but this [cause and effect] was harder to prove" (p 84). So, here she is highlighting the fact that her own survey does not succeed in linking elevated mercury levels to the symptoms she claims they cause. Her survey merely concludes that eating fish that contain mercury can raise a patient's mercury levels. If you are under the impression that Hightower's peer-reviewed work concludes anything else further research on your part may be in order. Gavin Gibbons National Fisheries Institute

seth (2009-09-08 13:37:58)

Gavin, You say Hightower found that "eating fish that contains mercury can raise a patient's mercury level" and "that's it". That's wrong. You and I and everyone else already knew that eating food with mercury raises mercury levels. That's obvious. If her work merely found the obvious it wouldn't be interesting. Her work is interesting because it suggested something that wasn't obvious at all: You can get too much mercury from eating a lot of store-bought or restaurant-bought fish. So what if her colleagues "express skepticism"? You'll hear skepticism about any new conclusion, right or wrong. Perhaps you take Kathryn Mahaffey to be a disinterested observer but I don't. I'm sure she had pressure on her to reach certain conclusions that had nothing to do with the truthfulness of those conclusions. Telling a scientist to "stick to the numbers" is ridiculous; it's like saying, "don't reach any conclusions from your research". Hightower thought her work was important enough to write a book about it. (Which I don't have, so I can't discuss in detail.) She would have been crazy to write a book about something as obvious as "eating fish with mercury can raise mercury levels". If you disagree with her conclusions it would be interesting to know why, but all you do is quote others disagreeing with her. That's not persuasive, to say the least. I can find people who disagree that the earth is round. The "fish that contain mercury" you keep referring to – where do you think Hightower's patients obtained it? From the same place most people get their fish – stores and restaurants? Or somewhere else? And, while they were eating it, did they realize it could cause mercury poisoning? Seth

Gavin (2009-09-09 11:04:36)

Seth, I understand your incredulity over the fact that Hightower's peer-reviewed, published work does not succeed in linking elevated mercury levels to the symptoms she claims they cause but that is simply a fact. Feel free to review her article or her book and you will find that her work, as you put it, "merely found the obvious." And I agree it isn't particularly interesting. Here's something I do find interesting. You've spent quite a bit of time in Asia and we all know many Asian cultures eat as much as, if not more than, 10 times the amount of fish Americans do why, do you theorize, that those populations do not show signs of mercury poisoning? Gavin

seth (2009-09-09 16:56:08)

Gavin, Please. I have no "incredulity" about Hightower's conclusions. As you must know. Perhaps you could tell us why her research does not show what I say it shows? Failure to answer this simple question – what is the problem with Hightower's conclusions? – is making your employer look bad. They really seem to have no case; if they did, surely you would have made it by now. Flat statements ("is simply a fact") are not an argument. But surely you know this. As for Asia, they eat less fish – and the wrong fish – than needed to get mercury poisoning. It's rich Americans that eat lots of tuna. Very little tuna is eaten in China. Too expensive. Seth

Roy Palmer (2009-09-17 15:30:17)

Seth So how do you explain the health of the Japanese and the Inuits? Checkout the facts and make the linkages about their seafood consumption. There are truckloads of evidence to show that mercury in seafood is a furphy - why dont we have a daily notice in the newspapers about the daily deaths of mercury from seafood consumption? Because there is no story there - its a myth. I would worry more about crossing the road or getting out of bed in the morning.... Every time you and others put fear into eating seafood you are doing more harm than good Get the information from specialists who are doing constant research on these matters - there are many of them in the world Hibbeln, Strain, Sinclair, Crawford, Ralston, etc etc Roy

seth (2009-09-18 03:25:30)

The Japanese & the Inuits eat a lot of fermented food. Far more than we do. That's how I explain their health. Check out my posts about the umami hypothesis. As for "a furphy" – that's not even close to true. Read Hightower's paper. You have to eat a lot of high-mercury fish to get easy-to-notice mercury poisoning, but it's not at all a "myth". It's possible that eating less fish produces hard-to-notice mercury poisoning. I have no idea what these "specialists" are coming up with that you want me to read. I don't know what "these matters" are. If seafood is perfectly safe I can't imagine why its safety is the subject of "constant research". Really, I have no idea what you're talking about.

## **Beijing Air: Not Dirty Enough (2009-08-31 15:39)**

I've been back in Beijing a week. I've been eating lots of fermented food, which is easy to get, including fermented eggs (10 for \$1.50) sold at a stand in a shopping mall. There is a bigger yogurt selection here than in Berkeley. Tsinghua University sells its own perfectly good yogurt (20 cents a serving). Every supermarket has a big pickle selection.

In Berkeley, [1]as I blogged earlier, a few months ago I noticed that my nose was no longer runny. My Kleenex consumption, which had been about one box of Kleenex every month or so, was reduced to almost zero. (A reader of this blog [2]had a similar experience.) No doubt this was due to eating much more fermented food. The runny-nose-absence has continued in Beijing.

Last year in Beijing, I had a runny nose. I used about one tissue packet per day. I ate almost no fermented food. So far so good. The interesting twist is that dirty city air has been [3]linked to less runny nose. Air pollution, in other words, can have the same effect as fermented food. Last year, apparently, Beijing air wasn't dirty enough to get rid of my runny nose.

I'm not joking. After I realized this, I felt a lot better about Beijing's air, which I have long said is the worst thing about living here. Someday I will blog about the [4]health benefits of smoking, which suggest the same conclusion.

1. <http://www.blog.sethroberts.net/2009/08/15/this-blog-reduces-sinus-congestion/>
2. <http://www.blog.sethroberts.net/2009/08/15/this-blog-reduces-sinus-congestion/>
3. <http://www.pubmedcentral.nih.gov/articlerender.fcgi?&pubmedid=1486303>
4. <http://www.quit.org.au/quit/fandi/fandi/c03s14.htm>

---

NE1 (2009-08-31 17:16:24)

The runny nose is probably allergies, which can vary in severity from year to year (and continent to continent). But if more smog fixes it, I'd say the cure is worse than the disease, seeing as how it reduces life expectancy by up to a couple years.

seth (2009-08-31 17:30:25)

Smog "reduces life expectancy by up to a couple years"? Where did you learn that? I heard a talk a year ago about the effects of air pollution. It was really hard to show any effect. The only clear effect was for people who lived close to a highway and they had increases on the order of 30 % in respiratory illnesses. That is a long way from a 2-year reduction in life expectancy. I told the speaker I was moving to Beijing. Unlikely to be harmful, he said.

Tom (2009-08-31 22:52:03)

off-topic, Seth, but it deals with self-experimentation, so I thought you'd be interested:  
<http://www.rawpaleoforum.com/journals/lex's-journal/>

Eric Meltzer (2009-09-01 02:03:52)

yo, if the eggs in question are pi-dan 皮蛋 be careful about eating too many; some are very high in zinc due to shortcuts in the fermentation process. others supposedly even have lead. they're really delicious though—I almost want to go through a few brands and have a chem lab test for the aforementioned so i can eat them in peace.

Chris (2009-09-01 22:18:44)

This is probably the most discussed recent publication on the subject: <http://content.nejm.org/cgi/content/full/360/4/376>  
The finding is that up to 15 % of the increase in life expectancy in the US is attributable to better air quality. They compared particulate levels across cities. With your background, I'd love to see your critique of the method used.

## 4.9 September

### Revenge is Sweet (2009-09-01 16:02)

In 2006, Julie Powell, the blogger now on screen in Julie & Julia, reviewed The Shangri-La Diet in the Washington Post

I'm almost 95 percent sure that Seth Roberts . . . is a snake-oil salesman. [Later true. Snake oil is high in omega-3] . . . He brings a whole lot of pseudo-science to the table, as diet-book-writing PhDs tend to do.

Now, from [1]a review of Julie & Julia by Laura Shapiro, author of a book about Julia Child:

There's no question that Powell had a great idea for a blog. What she didn't have was anything interesting to say about cooking her way through Mastering. Her writing is hollow, narcissistic, and unforgivably lazy—qualities so foreign to Julia that it's not at all surprising that she once said she [2]couldn't abide Powell's work.

Curious that revenge ("sweet", "a dish best served cold") is associated with food.

1. <http://www.gourmet.com/food/2009/08/julie-julia-movie>

2. <http://www.publishersweekly.com/article/CA6671678.html?nid=4599&source=link&rid=840626276>

---

Nathan Myers (2009-09-02 10:03:19)

Speaking of "a dish best served cold"... The earliest written record Google Books can find is in a French potboiler from 1841. At the time, the expression seems to have been a stratagem to trick a hotheaded friend into putting off revenge until mature wisdom can get a word in edgewise. The notion of revenge as an esthetic experience to be accompanied by a good Chianti had to wait for Hollywood. On the literal merits, we might say that revenge is a lot like jello, which is almost certain to be disappointing warm.

### **Infectious Disease Specialist Ignores the Immune System (2009-09-02 16:04)**

A new book called *Rising Plague* by Brad Spellberg, a UCLA professor of medicine specializing in infectious disease, at County Harbor-UCLA Medical Center, is about the increase in drug-resistant bacteria. From [1]an article about the not-yet-published book:

In the United States, more than 300,000 people die each year from infectious diseases such as influenza and pneumonia, often caused by drug-resistant bacteria.

"The scary thing is that many of these were healthy, young individuals," said Robert Guidos, vice president of public policy and government relations for the Infectious Disease Society of America. "There are very few drugs, if any, to treat these bacteria, and there are almost none in the pipeline."

I believe it is very likely that these "healthy" young people weren't eating enough fermented food and thus had poorly-functioning immune systems. The article continues:

[Spellberg], however, argues in his book that drug companies are not solely responsible. Blame for the decline in antibiotics should also not be aimed at physicians for over-prescribing these drugs, nor hospitals for lacking sufficient standards in cleanliness or drug distribution.

"This problem is complex enough that it is not accurate and not helpful to blame any one group," Spellberg said. "What we need to do is focus on solutions."

Public awareness will go far in spurring change, he argues. Ultimately, legislators, drug companies, hospitals and doctors will have to devise a way to spur more production of new antibiotics, which become obsolete as bacteria change to survive.

"Will have to". As if there is no other alternative. The possibility of strengthening the immune system is not considered. Just as [2]UC Berkeley epidemiology professors (along with the rest of their profession) ignore the immune system, here is a doctor ignoring it. Here is [3]a longer statement by Spellberg that ignores the immune system. He's a specialist in infectious disease. He's repeating the conventional wisdom of his profession. UCLA is a top-ranked medical school. This is mental blindness on a massive scale with awful consequences.

Gerry (2009-09-02 19:57:38)

Dr. Art Ayers has an interesting post on his blog tonight about a Cure for Inflammatory Diseases. I may need to read the post several more times to really understand it but thought you might be interested. <http://coolinginflammation.blogspot.com/>

Nathan Myers (2009-09-02 23:48:58)

I hesitate to pass this on from fear that you will take it as confirmation for some crackpot theory. Anyway: <http://schaechter.asmblog.org/schaechter/2007/08/microbial-endoc.html> [http://www.sciencedirect.com/science?\\_ob=ArticleURL & \\_udi=B6TD0-4B3NMNV-1 & \\_user=4429 & \\_coverDate=01 %2F31 %2F2004 & \\_rdoc=1 & \\_fmt= & \\_orig=search & \\_sort=d &view=c & \\_acct=C000059602 & \\_version=1 & \\_urlVersion=0 & \\_userid=4429 &md5=20213584b5d4446a6c7ab5350b778030](http://www.sciencedirect.com/science?_ob=ArticleURL&_udi=B6TD0-4B3NMNV-1&_user=4429&_coverDate=01%2F31%2F2004&_rdoc=1&_fmt=&_orig=search&_sort=d&view=c&_acct=C000059602&_version=1&_urlVersion=0&_userid=4429&md5=20213584b5d4446a6c7ab5350b778030)

Nathan Myers (2009-09-03 18:06:49)

I'd like to emphasize that I meant "crackpot" in the most affectionate possible way.

Seth's blog » Blog Archive » Does H. Pylori Cause Stomach Ulcers? (2009-09-10 17:41:20)

[...] More. What goes unsaid, and maybe unnoticed, in the debate about health care, is that it is hard to have decent health care (that is, decent health) when those in charge don't know what they're doing. The stomach-ulcer-etiology problem is a small example of a big thing. In case I'm not being blunt enough, let me be even more blunt: This example illustrates that the average doctor, the average med school professor, and at least two Nobel-Prize-winning med school professors (not to mention those who award Nobel Prizes) are unable to correctly interpret simple facts. My previous example of the infectious-disease expert (a med school professor) who overlooked the immune system is yet another example of astonishing cluelessness. It's hard to get good health care from people whose understanding of health is terribly incomplete yet don't realize this. [...]

Seth's blog » Blog Archive » Who is "Totally Healthy"? (2009-10-30 17:44:20)

[...] Totally healthy. This is the bigger delusion: That the average American who appears healthy is healthy. I believe that practically all Americans have grossly-impaired immunity. Their immune systems work much worse than they could. The poor performance is due to suboptimal sleep and far too little bacteria in their diet. The football player was near death because he had two infections. That's how poorly his immune system was working. And a very high CDC official called him "totally healthy"! Apparently she has no idea that people's immune systems can vary in how well they work. This is even worse than the UCLA medical school prof specializing in infectious disease who also failed to understand this. Schuchat is one of the top public health officials in America! Public health is about prevention! [...]

## Cooking in China (2009-09-02 20:19)

The kitchenware section of a large supermarket near me in Beijing, which has many bowls, cups, salt-and-pepper shakers, knives, food-storage containers, and rice cookers, doesn't have a single measuring cup, measuring spoon, or timer.

---

PS (2009-09-02 22:45:47)

They're not big bakers, and most home cooking is either too fast [fried] or slow [stocks] to warrant a timer. [An observation from Taiwan]

DJ\_Magic (2009-09-03 04:16:56)

where are you living? you can choose the supermarket in THU, there is what you want

seth (2009-09-03 05:17:07)

thanks, I will look there.

## Why Do Cats Lick Themselves? (2009-09-03 18:10)

The usual answer, of course, is: To clean themselves. There are [1]other answers:

Some people think it is used as a way to control their temperature - it keeps their fur smooth, which in the winter traps heat. In the summer, it spreads saliva on the fur and cools them down and can also loosen fur so that they shed more easily. Others think it is a natural way of reducing parasites like fleas or ticks.

Perhaps cats lick themselves to ingest more foreign bacteria and dirt, which they need to be healthy. Test of this proposal: Feed a cat more fermented food, it should lick itself less. (Just as I became [2]less of a foodie when I ate more fermented food.)

[3]The value of evolutionary explanations.

1. <http://www.fleascontrol.com/why-do-cats-lick.htm>

2. <http://www.blog.sethroberts.net/2009/05/04/less-of-a-foodie/>

3. <http://www.blog.sethroberts.net/2007/09/13/modern-veblen-the-less-than-obvious-value-of-evolutionary-explanations/>

---

Nathan Myers (2009-09-03 20:09:55)

Then why do they lick their kittens? In my experience the best determiner of how much grooming a cat does is how nervous it is.

wcw (2009-09-04 00:03:10)

Yeah, no. I love you, man, but you are wrong here. As Nathan says, cats will clean more when stressed, but really, it primarily is to clean their fur. Ever see a cat who cleans too little? Matted fur central. It's not pretty,

david (2009-09-04 05:11:56)

There's got to be a "why do dogs lick themselves" joke in there somewhere...

Stuart Buck (2009-09-04 07:57:12)

From the inimitable Dr. Boli (a humor blog): "A cat's fur contains all the nutrients the cat needs to survive, which is why cats spend so much time licking themselves." <http://drboli.wordpress.com/2007/06/29/from-dr-bolis-encyclopedia-of-misinformation-2/>

Rachael (2009-09-04 08:03:09)

I have read that animals produce vitamin D in their fur and ingest it through licking. Human vitamin D lingers on skin and is slowly absorbed, but I always assume that's what my pets are after when they lick me. Can't remember the source, sorry.

Wilbur (2009-09-04 09:15:06)

Hey, that reminds me of a joke! Two drunks are walking down an alley and see a dog licking its private parts. One of them says "Boy, I wish I could do that." The other one says, "Maybe you should try petting him first."

MC (2009-09-04 09:23:11)

I always thought the reason pets lick people is to absorb the salt and minerals that linger on skin due to perspiration.

justin (2009-09-04 09:54:22)

I had also read the thing about Vit D and cats; however, I'm skeptical as my own cat tends to lick himself the same if not more when he's allowed to go outside. I think the grooming function of cats is probably more akin to general cleanliness – insuring that not too much bacteria/bugs/dirt gets lodged in their fur, which could cause infection. This might be somewhat akin to why you need to wash your sheets – there's a balance here. Cats also have raspy, comb-like tongues, which I think has been argued is because they evolved to be able to lick marrow out of bones, but perhaps its also to manage the fur. Anyway, I feed my cat fermented foods regularly and my cat food also has probiotics in it IIRC. I also regularly give my cat yogurt or kefir. However, my cat is neurotic as hell about licking himself. He licks his fur right off in some areas and I've been trying to self-experiment my way into figuring out what the problem is. Most recently, I've taken him off crappy cat food and put him on a no-grains, high protein based food and that \*may\* be causing an improvement – have to wait a couple more weeks to see if his fur really is coming in across his whole body (it definitely is in certain areas, but too soon to tell if its a complete cure).

Nick (2009-09-05 02:47:04)

You can hypothesize about many explanations but as others have said self-dosing with vitamin D is almost certainly the main reason. I had this exact same discussion with a colleague a few years ago (I'm an ethologist), a few studies had been done and he was contemplating seeking funding to investigate further. I'm in the UK where UVB is absent for the winter months and much depleted in the autumn/fall and spring. Here there is a noticeable shift in behaviour from summer to winter; in general cats are fairly laid back during the summer, sleeping lots and not getting upto much; during the winter they sleep less, become more agitated and hunt much more. If you exclude the late spring high when there are lots of fledgling birds and young mammals around which present easy prey for cats there is a distinct increase in prey brought home by domestic cats during the winter months compared to the low of the late-summer/autumn. Looking at the remains of these prey items and usually what is eaten is the head and "guts" (the liver probably being the desired morsel) – the main concentration of vit. D is found in these parts. Looking at my cat's behaviour and there are some distinct types of grooming. It is the ritualised, almost neurotic, licking of paw, rubbing ear & temple, licking paw again – that I suspect is the main "vitamin D dosing" type of grooming. Of course vitamin D is produced throughout the cats fur but this specific type of grooming is much more noticeable/frequent during the winter months with my cats and I take this to indicate that they are getting/are deficient in D3.

Unfortunately I don't think the study ever went ahead (bigger and better things came along), it was hoped/thought that by getting cat food manufacturers to supplement foods with D3 that it would reduce the impact cats have on the native fauna. @justin – you may like to try supplementing your cats food with D3 or even rubbing some D3 oil on your cats ears/temples. It would be interesting to see if this results in noticeable behavioural changes.

Margreet (2010-05-08 13:15:40)

Since cats don't synthesize Vitamin D (run a search on NLM Gateway if you need the research), so that's not why they lick their fur. If they groom more in winter, maybe they're just fidgety.

Peter (2011-05-14 03:30:56)

WOW! I never realized there were so many diverse opinions on a subject as simple as this. It's simple.... Most home in America don't have kitty showers built in.

livex (2011-09-16 15:51:53)

I read somewhere that cats groom constantly in order to minimize their own odor so that it won't give them away to the prey when they do their solitary hunting. Dogs (wolves, really), unlike cats, evolved to hunt in packs, and use their natural scent to keep track of where other pack members are, so that function overrides / makes unnecessary minimizing their own scent (pack hunting techniques mean it doesn't matter if the prey smells the hunters once the hunt is on). Just another hypothesis, I guess.

## **This Blog Reduces Sinus Congestion (continued) (2009-09-04 17:09)**

Tim Beneke writes:

After 21 days of eating a lot of yogurt [more than 16 ounces/day] and then 15 days of acidophilus pearls – 2 a day for the first 5 days and then 1 a day since, it's very clear that I can breathe substantially better through my nose. This has been obvious for at least a couple of weeks – it still seems to be improving gradually. I feel it clearly when I breathe. And, rather dramatically, my sense of smell has returned. I got a severe sinus infection in 1972; since then, my nose has been fairly stuffed and my sense of smell weak. Now I'm living in a different olfactory universe.

For a few years, I've cleaned up 4 or 5 times a week after a bunch of feral cats that I feed. Until the last 3 weeks or so, I only used my eyes to spot the cat poop. Now I use my sense of smell a lot and often smell it before I see it. Another unpleasant example – I don't flush my toilet after peeing to conserve water; by the end of the day it looks pretty funky, but I could barely smell its funkiness in the past. Now I smell it quite vividly and am more prone to flush it.

[1]Earlier post on the subject.

1. <http://www.blog.sethroberts.net/2009/08/15/this-blog-reduces-sinus-congestion/>

Nansen (2009-09-07 13:27:18)

So the minimum effective dose for him was more than 16 ounces/day of yogurt?

seth (2009-09-07 16:32:51)

Nansen, no, that's just the dose he started with – to make sure he got enough. Then he lowered it. I suspect that any dose will have some effect; the question I'm most interested in is how much do you need to eat to get the maximum effect. I'm pretty much in the dark about that except that at the moment two servings of yogurt per day is my best guess, for what it's worth.

## The SLD Effect (2009-09-04 18:13)

After three days of the Shangri-La Diet, [1]kitty-cat did a little experiment:

I tried something last night. I really tried to eat much of sweets and chips and stuff like this ... I couldn't!!! I had a little bit and then quit because I felt ... I don't know ... full - more than

As far as I know, the Shangri-La Diet is the first weight-loss method to produce this effect quickly. Most diets, such as the Atkins Diet, ban "sweets and chips and stuff like this"; early in the diet you would have no trouble eating them. After a long time on the diet you won't want to eat them but only because they're no longer familiar.

Long before SLD, [2]Michel Cabanac did experiments about a related laboratory phenomenon. As you eat, Cabanac found, food becomes less and less pleasant. That's why you stop eating. You say "I feel full" to explain why you stop eating but your stomach isn't actually full. Cabanac also found that this effect depended on your set point. If your set point was high, the decrease in pleasure slowed down. It took longer to reach zero (= no pleasure) so it took longer to stop eating.

It follows from Cabanac's work that if your set point is unusually low – lowered by SLD, for example – then you will stop eating unusually soon, as happened here. The paradox is that you can feel "more than full" from a tiny amount of attractive food.

1. <http://boards.sethroberts.net/index.php?topic=7172.msg88102#msg88102>

2. [http://www.fmed.ulaval.ca/ap/francais/chercheur/chercheurs/CABANAC\\_Michel.htm](http://www.fmed.ulaval.ca/ap/francais/chercheur/chercheurs/CABANAC_Michel.htm)

---

wcw (2009-09-04 21:13:51)

As long as we're noting anecdote: a man who has never worried about his weight (runs in the family: I have 5-10 years left, then I get a paunch), I can eat 2 or 3 dinners if I want (and often have two, only rarely three). All three if I have that many are tasty, but at a certain point in each, even the first, I have had enough of what I am eating, period. The second or third had to be different.

Igor Carron (2009-09-05 03:01:43)

Seth, Here is another side effect which you may have noticed: <http://nuit-blanche.blogspot.com/2009/08/scent-of-glass-of-wine.html> Cheers, Igor.

## How Things Begin: The Fleming Fund (2009-09-05 18:57)

Better to light a candle than curse the darkness, the saying goes. What if there are no candles?

Ken Rousseau, a software manager in Silicon Valley, went to Caltech in the late 70s. He didn't have a good time. He was a physics major. He took a required course on electricity and magnetism where the average score on the final was 15 out of 100. As he took it, he thought, I guess I can't be a physics major. He got a 16 – a solid B. That a professor would design such a demoralizing test revealed, he believed, that the professor didn't care about students. At Tech, lack of caring for students was shown in big things and small. Every building on campus was air-conditioned except the student houses, and Pasadena gets really hot in the summer. The graduation rate around that time – the fraction of entering students who graduate in four years – was 59 %. At MIT it was 80 or 90 %. When a student drops out of Tech, it's a lost opportunity on both sides, Rousseau felt. It was/is very difficult to get into Tech. To send 41 % of admitted students away struck him as a terrible thing.

He did graduate. For many years, when Tech would ask him for money, he would say no, sometimes with a letter about why. But he kept in touch with other students who had lived in the same undergraduate house (Fleming House), one of the seven student houses. Every year, a bunch of them would have a weekend-long beach party. At one of them the idea arose: Let's start a Fleming Fund. To help the students buy beer, that sort of thing. Tech is a tough place, let's help them get through it.

In the 1990s, Rousseau got a letter from the president of Caltech that made him angry. Tech was #4 in the U.S. News rankings, it said, mainly because of the low fraction of alumni giving. Let's make Tech #1 by giving more, wrote the president. Rousseau responded with a five-page letter that made one simple point: Alumni giving is so low because the people in charge cared so little about students. Their lack of concern is being reciprocated.

By 2003 or 2004 Rousseau had enough money that he got a personal visit from the development office. His visitor knew his wife's name, the approximate ages of his children, and the high points of his professional career. Rousseau told him of his residual bitterness. "You've obviously benefited a lot from your Tech experience," said the development officer. "Why have you only given \$163 over the years?" He had it wrong, Rousseau said. He had given \$1. His wife, who had also gone to Tech, had given \$162.

He told the development officer he was interested in helping Tech students – particularly Fleming House residents. In essence, he wanted to bring the Fleming Fund into existence. Around this time, Frank Bernstein, another Caltech alum who was working as a patent attorney in Silicon Valley, was also solicited. "Frank, I'm looking for a really significant donation," said the same development officer who had approached Rousseau. Bernstein, who'd also lived in Fleming, told Rousseau about the conversation and they again resurrected the idea of the Fleming Fund.

The development officer came back to them with ideas. Maybe you could fund a lecturer, he suggested. Or graduate student salaries. Helping undergraduates was clearly a new and difficult concept for the development office. They were looking for contributions that, in their words, "directly benefited the Institute." Bernstein pointed out to them that this was a narrow and self-defeating view. They want alumni to contribute. They want to get them in the habit of contributing. A Fleming Fund will help with that.

Because Rousseau's daughter, a high school student, was considering going to Tech, Rousseau visited the campus in 2006. He met with Tom Mannion, the administrator for student affairs, and came to believe that the administration cared more about students than they had in the past. A new incoming president, Jean-Lou Chameau, appeared to genuinely care about undergrads. (Later events have validated that view. Chameau has made a point of discussing

student life in his public discussions and has started to push administration officials to discuss what they're doing with regards to student life.) After that, Rousseau and Bernstein met with the development officer who had solicited them and started working on the details. The Institute set a minimum of \$100,000. Once the fund reached this level, income from the fund would be given to the students to spend.

In 2008 the details were hammered out. There would be two sort of restrictions: 1. Obvious limits on what the money could be spent on (no bail, no illegal drugs, etc.). 2. An oversight committee of three people, including the past president of Fleming House. The oversight committee only gets involved when the amount of money is more than the house's usual budget. The income, at least at first, would be about \$10,000 year for a house of about 120 students.

In May 2009, the fund was announced during a Fleming House reunion dinner at Tom Mannion's house. Many undergrads came up to Rousseau and told him it was a "really cool idea." They were touched that someone out there cared about them. The Institute is thinking of repeating it with the other student houses.

---

Mary (2009-09-06 06:09:03)

Heartwarming story, but how does the endowment manage to pay out \$10K per year on a fund with \$100K in donations? That's an awfully high spending ratio for an endowment. Given Caltech's precarious finances and low returns on investments, that spending rate will not be sustainable for very long. A July 2009 Bloomberg news story ([http://www.bloomberg.com/apps/news?pid=20601109&sid=aQn\\_Cxyu99xY](http://www.bloomberg.com/apps/news?pid=20601109&sid=aQn_Cxyu99xY)) said this about Caltech's financial situation: "CalTech, in Pasadena, was downgraded in June by Moody's [bond rating service] because of endowment losses and increased debt that is likely to total \$469 million. Caltech issued \$80 million in fixed-rate bonds earlier this month to take advantage of long-term rates to fund capital projects, said Sharon Patterson, the school's associate vice president for finance."

### **Art Imitating Life (Jane Jacobs Edition) (2009-09-06 04:28)**

In Episode 4 of the first season of *Leverage*, a priest is brutally attacked on his way to a city council meeting where he was going to beg to save his church from a developer. His attackers, it turns out, were hired by the developer: "Get rid of the activist priest."

Pure fiction, right? That sort of thing doesn't actually happen . . . or does it? From *Wrestling with Moses: How Jane Jacobs Took On New York's Master Builder and Transformed the American City* by Anthony Flint (pp. 157-8):

One evening [Father Gerhard] La Mountain informed Jacobs that he would not be able to come a critical Board of Estimate hearing on the [Lower Manhattan Expressway] project, saying he had to visit a sick friend in Massachusetts. But in fact he had been summoned to a meeting at an archdiocese office behind St. Patrick's Cathedral in midtown, where a church administrator informed La Mountain that he should lower his profile in the fight against the Lower Manhattan Expressway. He was ordered not to breathe a

word of this instruction. No one could ever prove how the silencing of the unruly priest came about, but Moses did have close ties with the archbishop of the diocese, Francis Joseph Cardinal Spellman.

---

Les Jones (2009-09-08 06:58:15)

So this is proof? Intimation and suspicion are now considered proof? Love ya, Seth, but your standards of evidence are often shockingly low.

seth (2009-09-08 13:13:40)

Les, my main point is that an activist priest was silenced. Obviously someone was behind it. It wasn't an accident. It doesn't have to be Moses for my point to be correct.

### **The Dimensionality of Tsinghua Students (2009-09-06 16:51)**

Tsinghua students vary a lot, said my friend, who has been a Tsinghua student for five years. How so? I asked. She explained:

Dimension 1. Some students spend most of their time studying, others spend most of their time on activities. It's best to have a balance, she said.

Dimension 2. Some students are rich, some poor. Rich students have better cell phones than poor students. As freshmen, they are much more familiar with computers. (My friend, whose family is poor, hadn't used a computer before college.) In the campus store, rich students will buy items that cost 15 or 20 yuan ( \$2 to \$3). Rich students will sometimes eat off-campus. There are a lot of rich students at Tsinghua. Do they get in the usual way? I asked. (Doing extremely well on a national test.) Maybe not all of them, my friend said, but if they get in other ways it's a secret. (Unlike [1]the University of Illinois.)

Dimension 3. Students vary in how much they cultivate their own interests. Some do, some don't. Students with wide interests are the happiest, my friend said. They are less controlled by how well they do academically. This was a mistake she had made: paying too little attention to her own interests.

1. <http://www.chicagotribune.com/news/watchdog/chi-college-clout-storygallery,0,3664823.storygallery>

---

Aaron blaisdell (2009-09-07 08:08:24)

Sounds just like the students at Stony Brook, where I did my undergraduate.

## What One American Thinks of Beijing (2009-09-07 19:19)

She loves it:

1. The vibe. It reminds her of New York and London.
2. The range of Chinese food. You get food from all over China here. (At all price points, I might add.)
3. The atmosphere. The air isn't so bad. She spent two years in another Chinese city, never saw a sunrise.
4. The bike lanes. You can walk comfortably. In the Chinese city where she lived before there were no bike lanes and no bikes. Everyone had a motor scooter, which you were constantly dodging. (The bike lanes also make it easy to bike, I might add.)
5. The balance between international and Chinese. Shanghai is basically all international, you can get around without a word of Chinese. Poorer cities are all Chinese. Beijing isn't the only city with a balance, it's just done especially well here.
6. The people. Strangers are friendly, if you ask for directions, they'll make sure you get there.
7. The vast amount of culture. The 798 art district, for example.

She doesn't like the weather; it gets really cold in the winter and the air is very dry (bad for your skin).

---

Angeline (2009-09-07 21:24:26)

Ha ha.. seems you have well understood about Americans as well as the speciality of Beijing... I have been to Beijing.. It's an awesome place.. Very different lifestyle..!

denshil (2009-09-09 07:46:09)

The 7th, I think she meant 798 art district. I love the balance between international and Chinese, too. :>

seth (2009-09-09 18:36:44)

thanks for the correction, Denshil.

denshil (2009-09-11 09:49:21)

Oh, I find that I make a mistake, too... "meant", right ? I heard that there are a lot of shows or parties opened in 798 art district on weekend:> You can go and join in sometimes:>

seth (2009-09-11 16:38:16)

right, "meant" not "meaned". that's a good idea about the parties, thanks.

denshil (2009-09-14 07:06:28)

I e-mailed you the official website of 798:>

### **New Yorker Slackers (2009-09-08 14:58)**

I once read a Briefly Noted review in The New Yorker that revealed that the reviewer had only read a quarter of the book. A friend told me that reviewers got about \$100 for those reviews so there was a certain inevitability to this deception. [1]This abstract, of Calvin Trillin's best-ever article, about an American student who goes to China, blossoms, gets sick, and dies, is another example of the same thing. The abstracter clearly didn't read the article – but you should.

1. [http://www.newyorker.com/archive/1985/10/07/1985\\_10\\_07\\_061\\_TNY\\_CARDS\\_000343123](http://www.newyorker.com/archive/1985/10/07/1985_10_07_061_TNY_CARDS_000343123)

---

### **Myshoppingsun.com Scam (2009-09-09 17:00)**

This site (myshoppingsun, myshoppingsun.com) is a scam. See [1]here for details. If you want to make this harder for them, simply click on one of their Google ads (which you can find with a Google search). Each click costs them.

1. <http://www.blog.sethroberts.net/2009/08/24/gamesingatecom-scam/>

---

christie (2009-09-29 17:58:47)

They have yet a new website. myshopinsun.com has the same layout and same grammar errors etc on their page. I got scammed by them and am still trying to find a way to get my money back. I am furious with them.

Julie (2009-10-01 01:05:57)

Looks alot like gamesinwelt.com. Bad, bad, bad. I ordered from gamesinwelt and paid with paypal, paypal refuses to refund my money because they cannot collect from gamesinwelt.

Booker (2009-10-01 14:51:23)

Does anyone know anything about this site cotome.com? I ran across it while pc shopping, their prices are very good. I'm trying to find out if it is a scam.

Tim (2009-10-01 16:08:56)

I got scammed on this too, just this morning, by the time I realized what I did, only 4 hours later, there is nothing I can do but, take it up with the seller, which I don't think is going to get me anywhere. I was trying to buy a wii. Have you been able to

recover your lost \$?

Booker (2009-10-02 05:15:26)

I got an invoice on a mac pc...I told them (cotome.com) that I would send the payment within 24 hrs. Then I decided that I had better check to see if I could find anyone else who had done business with them before I come up off of \$800.

Dawn (2009-11-08 13:54:59)

Glad I found this before I ordered that wii for the kids for Christmas thanks.

b crilly (2010-02-08 18:57:00)

paid for psp never recived it paypal wouldnt refund beware of same

### **Med School Profs As Drug Company Lackeys (2009-09-09 17:13)**

What a cesspool. I mean the dirty work medical school professors do for drug companies. The profs make the drugs appear better than they are. Let me count the ways:

1. [1]I blogged earlier about Duke professor Charles "Disgraced" Nemeroff taking huge amounts of money – which he then failed to disclose – to encourage doctors to give dangerous poorly-tested drugs to children. Nemeroff is (or at least was) considered a top psychiatry professor!

2. When the practice of drug companies ghostwriting articles for professors was revealed, New York University professor of obstetrics and gynecology [2]Lila Nachtigall, the nominal author of a ghostwritten article, [3]told a reporter (contrary to evidence supplied by Wyeth) that she had written all of her 1000 articles and 3 books. And she said this:

If they [Wyeth] came up with the idea or gave me an outline or something, I donâ€™t remember that at all. It kind of makes me laugh that with what goes on in the Senate, the senatorâ€™s worried that somethingâ€™s ghostwritten. I mean, give me a break.

It made her laugh. Yes, why should anyone care about the dishonesty of med school professors? What cave has Nachtigall been living in?

3. [4]About half of published clinical trials were not properly registered, a new study showed (abstract [5]here). A large fraction of these studies were drug-company-funded, I'm sure. (More than half were "industry" funded.) And the authors were often med school professors. Failure to register your study means you can distort the results to make them closer to the outcome you prefer by changing the "endpoint" (the dimension you use to measure whether the drug worked). Even among the registered studies, one-third used a different endpoint than the registration said. It is hard to avoid the conclusion that a lot of misleading results – making drugs look better than they really are – are being published. The level of cheating appears to be incredibly high – perhaps more than half of published papers.

Aaron Blaisdell (2009-09-10 06:51:46)

I know one psychopharmacologist at UCLA who stopped taking drug company money to fund his research. He said it was too difficult to maintain his scientific objectivity when they kept pressing him for certain results and progress. If only more medical scientists could do the same, but alas the lure of money is probably too much for many people to overcome. I guess they'd rather give up (or change) their ethics instead.

seth (2009-09-10 16:25:35)

Aaron, that's a good example.

Seth's blog » Blog Archive » More Med School Profs Behaving Badly: Professor Lila Nachtigall (2009-09-11 06:33:32)

[...] New York University professor of obstetrics and gynecology Lila Nachtigall, whom I mentioned recently, said nice things about estrogen replacement therapy to a Newsday reporter. The story fails to say that she gets money and ghostwriting from Wyeth, which makes the pill used in that therapy. [...]

Health care reform « N=1 (2009-09-12 07:27:22)

[...] It was recently estimated that 46 % of treatmentsÂ have unknown effectiveness.Â Â Â There are all kinds of ways that treatments might look more effective in research publicationsÂ than they really.Â Â See here, here and hereÂ for a few examples.Â This suggests to me that we are probably spending way too much on useless treatments.Â Based largely on the RAND experiment, Robin Hanson argued that medical spending could be cut in half.Â The RAND experiment found that people randomized to the full health coverage group spent 40 % more on health care, but did not have better outcomes.Â While variations in health care spending do not seem to explain differences in outcomes, other types of variations do (lifestyle, environment).Â Phillip Longman has a very interesting essay on the topic:Â A child born today can expect to live a full 30 years longer than one born in 1900. Improvements in medicine, however, played a surprisingly small role in this achievement. Public health experts agree that it contributed no more than five of those 30 years. This may seem counterintuitive given the attention society pays to medical breakthroughs. But the changes in living and working conditions over the last century are the real reason. American cities at the turn of the last century stank of coal dust, manure, and rotting garbage. Most people still used latrines and outhouses. As recently as 1913, industrial accidents killed 23,000 Americans annually. Milk and meat were often spoiled; the water supply untreated. Trichinellosis, a dangerous parasite found in meat, infected 16 percent of the population, while food-borne bacteria such as salmonella, clostridium, and staphylococcus killed millions, especially children, 10 percent of whom died before their first birthday. [...]

## **Does H. Pylori Cause Stomach Ulcers? (2009-09-10 16:34)**

In [1] a previous post I said that the Nobel Prize to Barry Marshall and Robin Warren – for supposedly showing that H. pylori causes stomach ulcers – was a mistake. Because half the world has the bug in their stomach, and only a tiny fraction of them get ulcers, the true cause of those ulcers lies elsewhere, probably with an impaired immune system. Marshall famously drank a flask full of H. pylori and didn't get an ulcer, yet took this to support his theory. A classic example of self-deception.

Recently Lam Shiu-kum, a former dean of medicine at the University of Hong Kong, was [2] convicted of a giant fraud. He siphoning millions of dollars of medical fees into his own pocket:

Dr Lam, 66, brought a 39 year association with the university, his alma mater, to an abrupt end in March 2007 when the investigation into billing irregularities began. He is a distinguished gastroenterologist who

conducted pioneering research into chemoprevention of stomach cancer through the eradication of *Helicobacter pylori*. His team also conducted the first double blind, controlled study into curing peptic ulcers by *H pylori* eradication.

I suppose this supports my case. As far as I know, almost all doctors and med school professors believe *H. pylori* causes stomach ulcers; I have never heard dissent about this.
