	The Ecology of New Ideas (2006-05-21 23:55) . . . . .	100
	Ford vs. Roberts (2006-05-26 14:52) . . . . .	101
1.2	June . . . . .	104
	Will It Live? (2006-06-02 11:45) . . . . .	104
	My First Reading (2006-06-16 22:52) . . . . .	106
	Meal Skipping: Good or Bad? (2006-06-22 09:15) . . . . .	106
	A Little Bit of Paris (2006-06-27 23:18) . . . . .	109
	Winery Alert (2006-06-30 14:39) . . . . .	111
1.3	July . . . . .	112
	Brain Food (2006-07-05 19:50) . . . . .	112
	Spices: A New Kind of Vitamin? (2006-07-10 16:20) . . . . .	117
	Blogger Alert (2006-07-11 22:04) . . . . .	118
	Brain Food (part 2) (2006-07-19 21:33) . . . . .	119
	Brain Food (part 3) (2006-07-20 23:48) . . . . .	120
	Brain Food (part 4: measuring balance) (2006-07-26 22:59) . . . . .	122
	The Wisdom of Strangers (2006-07-27 08:20) . . . . .	124
	Brain Food (part 5: a little progress) (2006-07-29 10:16) . . . . .	124
	Brain Food (part 6: a little more progress) (2006-07-31 22:44) . . . . .	126
1.4	August . . . . .	128
	Brain Food (part 7: looking for a steady baseline) (2006-08-03 22:30) . . . . .	128
	Brain Food (part 8: a little more baseline) (2006-08-08 23:23) . . . . .	131

	Brain Food (part 9: supporting data, and a problem) (2006-08-13 22:46) . . . . .	133
	Seymour Benzer (part 1) (2006-08-20 23:14) . . . . .	136
	Seymour Benzer (crippling the Salk Institute) (2006-08-22 08:50) . . . . .	137
	How Well Does the Shangri-La Diet Work? (part 1: breakdown by starting weight) (2006-08-27 16:59)	138
1.5	September . . . . .	140
	Four Great Modern Books (part 1: description) (2006-09-06 23:48) . . . . .	140
	Seymour Benzer (crippling medical school research) (2006-09-22 16:25) . . . . .	141
	The Annotated Woman's World article (2006-09-24 22:19) . . . . .	141
1.6	October . . . . .	142
	The Writing Cure (2006-10-11 03:54) . . . . .	142
	David Jenkins on the Shangri-La Diet (2006-10-17 10:49) . . . . .	143
	Too Few Riders, Too Many Stolen Bases (2006-10-22 21:54) . . . . .	143
	More Reason to Crazy-Spice (2006-10-24 21:48) . . . . .	144
	The Trouble With Rigor (2006-10-29 23:48) . . . . .	145
1.7	November . . . . .	146
	Amazon Rank: The Poor Man's BookScan (2006-11-01 20:39) . . . . .	146
	How Well Does the Shangri-La Diet Work? (part 2) (2006-11-05 20:38) . . . . .	147
	More Evidence That Fat Is Not Bad For You (2006-11-07 16:03) . . . . .	151
	Grass-Fed Beef, the Shangri-La Diet, and the Future of Food (2006-11-09 16:15) . . . . .	151
	Tea, Wine, and Chocolate: A Puzzle (2006-11-11 07:32) . . . . .	152
	Tea, Wine, Chocolate – and Coffee (2006-11-12 22:00) . . . . .	153
	CIA Fun Facts (2006-11-14 22:45) . . . . .	154
	Crazy-Spicing 3.0: Fava Bean Crostini (2006-11-21 02:52) . . . . .	154
	Ranjit Chandra Update (2006-11-23 12:51) . . . . .	155
	Brian Wansink on Research Design (2006-11-26 08:04) . . . . .	156
	The Wisdom of Experts: John Chambers on Research Design (2006-11-30 06:53) . . . . .	158
	Philip Weiss Appreciation (2006-11-30 15:06) . . . . .	159
1.8	December . . . . .	159
	On Scientific Method (2006-12-01 08:05) . . . . .	159
	More Weight-Loss Data from the Shangri-La Diet Forums (2006-12-04 07:28) . . . . .	160
	The Truth Is Out There (2006-12-04 16:59) . . . . .	164
	The Invisible Made Visible (2006-12-05 07:06) . . . . .	164
	American Haiku (2006-12-06 08:29) . . . . .	165
	Varieties of Shangri-La Diet Experience (2006-12-07 08:43) . . . . .	166
	Science Versus Human Nature (2006-12-08 04:48) . . . . .	167

Books Were the First Open-Source Software (2006-12-09 06:30) . . . . .	168
Stephen Marsh on the Shangri-La Diet (2006-12-12 11:20) . . . . .	169

### Week of Long Walks (2006-05-08 13:04)

"How are you doing, after such an exciting week?" my sister asked. Well, I took several long walks – my idea of a big treat. To let the good news wash over me.

Have you heard of Blockbuster, a book by Patricia Marx and Douglas McGrath? Published in 1988? They wrote about the new-author experience in *Spy*: "Our book came out to whatever is the opposite of great fanfare." They decided to hire their own publicist. One candidate told them "our book could become known only if we became known. . . . Just one day after Aeschylus died, the publicist said, his play *The Suppliant Women*, which had been sparsely attended and about to close, was sold out." Another person told them, "Even if I could get you publicity for the book, which is highly, highly doubtful, what's the difference? . . . Nothing lasts." And nothing changes, either, at least in 18 years. Recently I asked Diane Reverand, an editor at St. Martin's Press, what was the worst thing about being a writer. "How difficult it is to get attention for what you have done," she replied. "So few books get any attention at all."

Which is why, when *SLD* was published (April 25), I was nervous. Two factors loom large in how well a book does: (a) how many people buy the book in the beginning; and (b) how much each buyer recommends it. The first depends more on the author's fame than anything else; the second depends on the quality of the book. These two factors roughly multiply to determine sales. Big initial audience x poor book = poor sales. Small initial audience x good book = poor sales. People in the movie industry make a similar calculation; they look at (a) size of first-weekend audience and (b) dropoff from Week 1 to Week 2.

In terms of initial exposure, *SLD* had two strikes against it: I wasn't famous; and the diet was absurd ("If you had to cook up the ultimate stereotype of a wacky fad diet for use in a comedic novel or film, the Shangri-La Diet would fill the bill," wrote [calorielab.com](http://calorielab.com)). For most media, the mental equation is publicize absurdity = lose credibility. On the other hand, *Freakonomics* authors Levitt and Dubner, my agent (Suzanne Gluck), my publisher (Putnam), my editor (Marian Lizzi), and the book's two publicists (Stephanie Sorensen and Katie McKee) did a fantastic job of turning just about every possible lever in the book's favor – so many levers I won't even start to describe them.

Their efforts – and the support of Ann Hendricks, Stephen Marsh, and, yes, [calorielab.com](http://calorielab.com) – have already begun to pay off. The book is #31 at [amazon.com](http://amazon.com) – and I'm alive. On Wednesday, Dennis Prager, of the Dennis Prager show,

interviewed me for an hour. Mr. Prager was extremely positive about the book. He almost never covered diet books, he said, but he was making an exception for this one. To discuss SLD was "a public service." A public service! He himself was doing the diet, it was working for him, he was amazed how little hunger he felt. He corrected Dubner's comment on the cover about the book helping "a few million people." "A few billion" would be more accurate, he said. After that interview, the book soared to #2 at amazon.com, where it stayed for two days. How did you do that? fellow editors asked Marian Lizzi in amazement.

Will those who buy it recommend it? Well, Kathy Sierra, co-author of Head First Java and popular blogger, didn't buy it but did recommend it – in [1]better-than-glowing terms. She summed up her opinion in an email to Marian, who had sent her a copy: "This book may be nothing less than a miracle." (Ah, shucks.) It also seems to me that almost all of the forum contributors would recommend the book. And the forums are growing rapidly.

That was the good news last week.

Berkeley Public Library Watch: The Shangri-La Diet, 3 holds on 1 copy. The Omnivore's Dilemma by Michael Pollan, 96 holds on 7 copies. Website Watch: Distinct hosts served at sethroberts.net, latest 24-hour period: 883. One week ago: 452. Distinct hosts served is close to the number of different visitors.

## Is the Spread of an Idea Like an Epidemic? (2006-05-16 04:49)

I watched a TV movie last week about a bird-flu pandemic. Starts in China, whole neighborhoods closed off, food runs out, Penn Station giant hospital, millions of deaths, vaccine, baby on the way, ambiguous ending. Not bad, but not good, either. My mind kept drifting to the spread of The Shangri-La Diet.

It is like a contagious disease in the sense that it can be spread person-to-person: Person A reads the book, tries its weight-loss methods, loses weight or at least appetite, tells Person B about it, Person B reads the book, and so on. It is unlike a contagious disease in the sense that it can be spread by media – newspaper article, radio interview, etc. After spiking to #2 on amazon.com after an interview on the Dennis Prager show, the amazon.com rank has drifted down to about #100.

A contagious disease spreads faster and slower: faster when people are close together (subway), slower when they are apart (sleeping). But with a weight-loss idea the variations of rate of transmission are much larger. At one extreme (slow), someone tries it and then three weeks later someone else notices her weight loss and asks about its source and (if I'm lucky) decides to try it – one person "infected" in three weeks. At the other extreme (fast) is something on national TV, where hundreds of thousands of people become "infected" in minutes.

To get some idea of how the idea is spreading, I have been tracking the growth of the forums at sethroberts.net. Here are graphs of the total number of posts, topics, and members (upper graph) and the rates of their growth (lower graph).

There has been little publicity since the Prager interview about two weeks ago, so the recent growth level of about 5 % per day presumably reflects word of mouth/blog. The interesting fact is that the growth appears steady at about 5 %.

Berkeley Public Library Watch: The Shangri-La Diet, 4 holds on 1 copy. The Omnivore's Dilemma by Michael Pollan, 110 holds on 7 copies. Website Watch: Distinct hosts served at sethroberts.net, latest 24-hour period: 948. One week ago: 875. Distinct hosts served is close to the number of different visitors.

Ethesis (2006-05-18 19:35:28)

There are a number of modeling and predictive tools available in applied economics for this sort of thing.

### **Scenes From the Life of a Best-Selling Author (2006-05-18 07:50)**

I think of it as the bestseller no one has heard of. The Shangri-La Diet is on a NY Times bestseller list. And now is #11 at amazon.com. Really. I am not making this up. Nevertheless . . .

A few days ago I was scheduled for a radio interview by phone from my apartment but at the appointed time no one called. I reached the host. "You've written a book?" he asked. Yes, it's called The Shangri-La Diet, I said. He hadn't heard of it.

Yesterday I ran into two of my former students. They asked how I was doing. "A book I wrote has just been published," I said. They were surprised. I told them the title. They hadn't heard of it. They did remember I was interested in weight control.

Yesterday I went to the bookstore closest to where I live, a very nice independent bookstore. I offered to sign any copies of my book they might have. The woman behind the counter hadn't heard of it. She looked it up on the computer, found that they didn't have any copies. You might want to carry it, it's on the New York Times best-seller list, I said. "Can you come in tomorrow?" the woman asked. "Talk to Nick, he'll be here tomorrow."

Berkeley Public Library Watch: The Shangri-La Diet, 4 holds on 5 copies. The Omnivore's Dilemma by Michael Pollan, 110 holds on 7 copies. Website Watch: Distinct hosts served at sethroberts.net, latest 24-hour period: 4667. One week ago: 874. Distinct hosts served is close to the number of different visitors.

---

archer59y (2006-05-18 14:28:38)

I have asked for it at several Barnes & Nobles. They seem clueless.

Ethesis (2006-05-18 19:34:54)

I'm very impressed at how fast the internet traffic has grown. Good show.

## **The Ecology of New Ideas (2006-05-21 23:55)**

A curious feature of the Shangri-La diet is how much its spread has been helped by things that did not exist a few years ago.

First, open access. My [1]article with the data and ideas behind the diet was published in an "open-access" journal and stored in an "electronic repository." Thus anyone with Internet access could read the article. The [2]repository now has about 12,000 articles; mine was Number 117.

Second, blogs. Interest in this article was greatly amplified by blogs. My friend Andrew Gelman [3]blogged about it. His post was read by Alex Tabarrok, who wrote about it at [4]Marginal Revolution. His post was read by Stephen Dubner and led to a Freakonomics column in the New York Times – a great way to get book publishers' attention. After the column (sadly eclipsed by Hurricane Katrina), a few blogs focussed on the diet and helped me weave a fuller view of its effects into the book I soon got a contract to write. When the book was published, quite a few bloggers had already heard about its main idea, which rendered its very strange concept slightly less strange, i.e., more acceptable. Now it is being discussed and tried in several blogs (see Blogroll)

Third, forums – the Shangri-La diet forums at sethroberts.net. At a talk about user interfaces a few years ago, I heard a famous designer say that new devices went through three stages of use: (a) hobbyist; (b) expert; and (c) mass market. Departments of electrical engineering, he said, were good at providing products for the first two stages, but were poor at making mass-market products. As far as the Shangri-La diet is concerned, this is what the sethroberts.net forums have done so well: made the diet acceptable to almost anyone. They have made the oil easier to drink, answered all sorts of common questions, and provided reassurance (it may sound crazy but it works), expert advice, and support.

Recently I heard Yochai Benkler, a professor at Yale Law School, speak on [5]"The wealth of networks: How social production transforms markets and freedom" at an MIT symposium. This example supports his general point that new network-related products (such as open access) are empowering the little guy – the little guy here being me, who never got a large grant to support this research.

Why did these three new things (open access, blogs, and forums) all start at roughly the same time? Of course all of them were made possible by the growth of the Internet but so were a billion other things that haven't yet come to pass. I have been working on [6]a theory of human evolution that says language evolved because single words helped people trade. I think the growth of the Internet has been caused by the modern version of just that – better connection of buyer and seller. But open access, blogs, and forums have nothing to do with commerce. I think all three arose from another basic human tendency: a desire to share our enthusiasms. During the early days of electronic discussion groups (called bulletin boards), I was greatly disappointed that not one was devoted to Spy magazine. Why did we evolve this basic tendency? Because it led to the beginning of science – the intertwined growth of knowledge. So it makes quite a bit of sense that these three new things together acted in a kind of scientific way, bringing an effective weight-loss method out of darkness.

Berkeley Public Library Watch: The Shangri-La Diet, 4 holds on 5 copies. The Omnivore's Dilemma by Michael Pollan, 116 holds on 7 copies. Website Watch: Distinct hosts served at sethroberts.net, latest 24-hour period: 1494. One week ago: 888. Distinct hosts served is close to the number of different visitors.

newrulespower (2006-05-23 08:08:44)

Apparently internet advertising can work effectively too. That's how I found out about the book (specifically from an ad on [www.thesuperficial.com](http://www.thesuperficial.com)) and I hardly ever respond to ads. What caught my attention was the quote from Steven Dunbar, which I surprised to see on a diet book since he known for Freakonomics.

### **Ford vs. Roberts (2006-05-26 14:52)**

Dr. John Ford, a professor at the UCLA medical school, recently posted a [1]criticism of me. Here is my reply.

An obvious problem with Dr. Ford's critique is lack of evidence. Dr. Ford seems to be saying that "The Shangri-La Diet" is dangerous but on its face this is absurd. My book suggests that people consume vegetable oils or sugar water. Billions of people already consume these substances in amounts larger than what I recommend. Compared to the drugs that Dr. Ford prescribes every day, they are extremely safe and well-studied. If Dr. Ford is implying that these foods have dangers that he knows about but the rest of us do not, he should be explicit about it: Say what the hidden dangers are, and provide evidence for his claims.

Other problems are less obvious:

First, Dr. Ford has ignored facts that do not support his conclusions. If you search the Internet for people who are trying my weight-loss ideas, you will find many for whom it is working, often very well, and only a few for whom it has failed (harmlessly). Dr. Ford says nothing about this.

Second, factual mistakes. (1) "Self Roberts were truly interested in investigating his approach, he should have subjected it to . . . peer review" "implying that I did not. In fact, my [2]Behavioral and Brain Sciences article, which contained my weight-loss theory and support for my weight-loss methods, was peer-reviewed. So was a [3]related article in Chance, which I told Dr. Ford about by email while he was writing his critique. Two is not zero. (2) He says I "present[ed] a highly speculative idea as proven science." I did not. If he reads my book, he will see that I present a theory, a weight-loss method based on that theory, and promising early results. (3) He says my Behavioral and Brain Sciences paper is "not about validating his hypothesis or conclusions [but] a speculative commentary on the use of self-experimentation." Actually, it is a long empirical article with a great deal of data "to call it "commentary" is misleading. The evidence in that article supports the theory of weight control on which my diet is based because the theory helped me discover new and surprising ways of losing weight. (4) He claims that self-experimentation is not "accepted methodology." In fact, the [4]2005 Nobel Prize in Medicine was awarded for work on ulcers in which self-experimentation played a key role. Awarding someone a Nobel Prize constitutes acceptance of their methodology. As does publication in an oft-cited peer-reviewed journal."

Finally, Dr. Ford is a medical school professor. For a long time, medical school researchers have contributed no useful ideas to our understanding of how the average person can lose weight. At best, they have tested ideas that others have come up with. Could Dr. Ford's rigid methodological beliefs have a downside? At UC San Francisco, my local medical school, the last time I looked at their online curriculum, about five years ago, medical students were being told to tell patients that weight loss is a matter of calories in versus calories out, therefore eat less, exercise more. Such advice was popular among doctors in the 1950s. It was no better advice then than it is today; it is based on a seriously-incomplete understanding of weight control. If that were my track record – failure for more than 50 years – I would be more open to new approaches.

I agree with Dr. Ford that my weight-loss ideas are not "proven science" and that "seasoned experts" (including medical school professors) may help the rest of us, including me, evaluate them. But I also believe strongly that non-experts can help the rest of us evaluate them. This is why I consider the Shangri-La Diet forums at [sethroberts.net](http://sethroberts.net) "full of non-expert views and observations – to be very important. Dr. Ford and I probably differ here. I suspect he considers these forums useless, or nearly so, for what he calls "scientific" or "clinical" purposes. Time will tell which of us is correct.

rod (2006-05-26 18:15:27)

As a skeptic, but one who is doing Shangri-La nonetheless, I'd be a lot more comfortable if perhaps you could list out what scientific research is currently going on – either directly into, or inspired by, the Shangri-La diet. At the moment, I'm "tracking my own progress(Following Shangri-La)":<http://following-shangri-la.com/>, but of course, this data is purely anecdotal. If I were an outsider, I'd be claiming the Hawthorne effect was the primary explanation for any weightloss. Thanks.

KRH (2006-05-27 01:17:15)

Can you imagine this doctor talking to a cancer patient: "Well, chemotherapy works, and if it doesn't cure you, that's your fault." I am really disappointed to see that the medical educational establishment reacts this way to anyone with a new idea in the area of weight reduction. This area really is one of their most obvious, disappointing failures: it's one of the most critical issues they are facing today, but they don't have any ideas, and, apparently, they aren't looking for any, either.

Mark (2006-05-27 07:53:28)

I think you misrepresent Dr. Marshall's Nobel Prize. He drank the bacteria culture in the process of formulating a hypothesis. The Nobel Prize was awarded in light of his later proof of the hypothesis via extensive lab work that isolated the bacteria in large numbers of ulcer sufferers, and failed to find the bacteria in those without ulcers.

seth (2006-05-27 20:16:30)

If Ford had said that self-experimentation is "not completely accepted" or "controversial," that would have been accurate. To say it "not accepted" is overstating it – it is to say that nobody who matters takes it seriously. And that isn't true because a Nobel Prize winner in Medicine obviously matters. Self-experimentation was not the reason Marshall got a Nobel Prize, as you say – he got it because he was right.

Dave Pollard (2006-05-28 11:07:55)

This is really an issue of what George Lakoff calls 'frames'. To the scientific establishment, self-experimentation is unthinkable, threatening, even heretical. Seth, you've just got to let it run off you – they are never going to 'get it'. Because of the Internet, self-experimentation's time has finally come, and it will be up to the next generation of scientists to appreciate its superiority as a method of achieving useful results. About 85 % of the comments I've received on my self-experimentation articles (e.g. <http://blogs.salon.com/0002007/2006/05/23.html#a1535> ) have been positive – it's very empowering for people to overcome the learned helplessness that says they are too stupid to know how to manage their own bodies. About 15 % have been almost hysterically negative. These are from very conservative people who believe fiercely in *authority* – it gives them comfort, something to follow, something to believe in. Anything that would seem to undermine authority is seen as subversive. There is a famous saying: You can accomplish anything as long as you don't care who gets credit for it. You're too far ahead of the curve to get credit from those in authority, but what you are accomplishing is unstoppable. Thanks for being a pioneer.

TCUDD (2006-05-31 15:30:56)

Dr. Ford's criticism sounded to me a bit arrogant, I read the Shangri la diet and understood it for what it was. A new idea, there were no promises and it was not the least bit misleading. I felt insulted by Dr. Ford's attitude that average (Non-Doctors) people like me couldn't think for themselves or interpret new ideas. I don't need years of expensive studies I have tried the diets based on the careful academic studies and years of trials and guess what, none of them worked. After reading the book and carefully considering all the facts I see no risk in the diet and a possibility of a payoff. If the diet doesn't work I am out 20.00 for a book and I will go on to try other diets and exercise regimens until I find one that works (I guess that would be self experimentation. I am starting it today and am looking for a place in the blogosphere to record the results if you have any suggestions let me know.

think mojo » Seth bites back on Shangri-La (2006-06-01 01:08:49)

[...] Not surprisingly, Ford's remarks have left Seth Roberts taking umbrage at this review of his work. [...]

think mojo » Humility - Seth Roberts style (2006-07-26 05:05:24)

[...] Following the link I ended up here - Seth Roberts acknowledging that he might have had a little more grace in his initial reply to John Ford's critique of his theory and book, the Shangri-La Diet. [...]

AaronSw (2006-07-27 10:15:25)

Congrats! Anyone who's earned an attack from TCS is obviously doing something right.

Catherine Johnson (2006-07-27 11:12:57)

I'm a little taken aback by Dr. Ford's essay. First of all, the book is quite clear that the diet is based in a hypothesis or theory, not a fact or even a "finding." The evidence for the diet is also clearly stated: 1. Seth Roberts' successful weight loss experience 2. the successful weight loss experiences of 2 or 3 of Seth Roberts' friends and family members 3. converging lines of evidence in the form of peer-reviewed animal and weight-loss research consistent with the sugar-water regimen Second, many or perhaps most physicians treat individual patients, not categories or classes of patients who can be studied in large double-blind trials. Expert physicians conduct "medication trials" - that is the term of art - with individual patients, trying drugs alone or in combination and evaluating the results based on patient report. One of our family doctors tells us that prescribing medication is "an art, not a science." She doesn't say this to denigrate her profession; she's describing a core truth about treating patients whose conditions science does not yet understand. Obesity is certainly a condition science does not yet understand. Treating physicians and overweight individuals must conduct "medication trials" like Seth Roberts' sugar water regimen until such time that science does understand it and has effective treatments to offer.

Mike Lambert (2007-04-10 13:59:25)

I came across Seth Roberts paper "What Makes Food Fattening? A Pavlovian Theory of Weight Control" long before the Shangri-La book came out. I wasn't actively looking to lose weight but his theories seemed plausible. I began consuming

fructose water at work. (I sit at a computer all day.) I lost 50 pounds and like Roberts himself had to put some back on as people started asking me if I was sick! I am completely confident that I could effortlessly "dial up" any weight I care to. Regardless of what Mr. Ford thinks, it works and it doesn't get any easier than this. Dropping the extra weight lowered my cholesterol and blood pressure probably adding years to my life. Thank you Dr. Roberts!

Russell Nelson (2007-04-25 11:13:30)

Nobody caught Ford's denigration of the rat obesity studies by calling them "old". A study which has not been disproven is not made worse by age, but instead better. Nice try, Ford! Go back to making cars.

### Will It Live? (2006-06-02 11:45)

Mr. Tanguay, my beloved seventh-grade science teacher, did an unforgettable demonstration one day. "Class," he announced, "we're going to see if we can create life." Into a graduated cylinder he poured a lot of water. Because the human body is 95 % water. He added a few more chemicals – salt, a few others. Finally he added a mystery ingredient. The mixture began to swirl. (Maybe the mystery ingredient was vanilla extract.) "It's coming alive!" said Mr. Tanguay. Then the swirling stopped, as I knew it would. It was a brilliant demonstration not because it taught us biology (it didn't) but because it showed that Mr. Tanguay had a nice sense of humor. I actually looked forward to his class.

Watching The Shangri-La Diet progress, I thought of that demonstration. I saw swirling – would there be life? Books, or the ideas within them, live and die. Word of mouth is primitive book life. It resembles replication if listeners buy the book or repeat what they've heard. Life is more than replication, of course; books can produce descendants (sequels), mutations that fill a new ecological niche (e.g., a teaching guide for Freakonomics), and new goods and services (such as movies).

At a micro level, the SLD forum activity – more than 4000 posts – seemed to me a kind of pre-life. Not because of the success – many diets work for short time, and how representative are those posting? – but because of the emotion ("after the very first day, I finally for once in my life had real hope") and the inventiveness and fruitful observation. New and better ways to drink oil, tests of whey protein and random ("crazy") spicing, the observation that quitting smoking has become easier are examples. No other diet has had this much user improvement, as far as I know. However, the forums involve a miniscule number of people (about 500 members) compared to the size of the world in which a diet book would live (hundreds of millions of overweight people).

I wondered if there were larger signs of impending life. Right now SLD is #29 at amazon.com but does this tell the whole story? Or is it different from other books with similar sales? I started to look at this about two weeks ago. From the top 100 best-selling books at amazon.com and barnesandnoble.com, I sampled 20 (10 from amazon, 10 from barnesandnoble) whose titles were unique enough to use as search terms. On May 20 I found the number of Google results for each title. On May 28 I redid this calculation. Because a book, to live, must "grow," at least in the beginning, I looked at the change from May 20 to May 28. Below is the change in Google results as a function of days since publication (log scale).

X

SLD stands out, although not as much as The World Is Flat. After I did this analysis it occurred to me that blog mentions might be a good measure to examine because they resemble word of mouth. Was SLD blogged about more than books with similar sales? Although it would have been better to measure the change from May 20 to May 28, all I had were the values for May 28 so I computed blog mentions per day since publication.

Again, SLD appears at least somewhat special. The World Is Flat stands out in this analysis as well and so does Beautiful Lies, which I know nothing about.

We already know that The World Is Flat is an unusual book by virtue of being a best seller for more than a year. It is encouraging that SLD has World-Is-Flat tendencies. And watch out for Beautiful Lies.

Ethesis (2006-06-04 18:26:45)

Seth, My congregation has at least thirty people on the diet. There have been about five books purchased (not counting misc. books I've bought for people outside of the group). Three I gave to people in the congregation and two people bought on their own. Of that group, at least twenty friends are also in the diet. So, the diet is currently propagating, at least in that group, in numbers vastly beyond the book sales or internet connections (two people have read the on-line material I put up, none have posted, both contacted me personally). In people I knew who were doing Atkins or South Beach, the ratio was 3 books for every 4 people on the diet.

losing-it (2006-12-09 19:02:37)

“Class,” he announced, “we’re going to see if we can create life.” - Mr. Tanguay, 7th Grade Science  
===== Even Life itself (and therefore, God, perhaps) seems Self-experimental. When you think about it, and most of us may not have yet come to this kind of realization, are we are not our own experiments, by virtue of being human, at least to some degree? What you are when born may be a given. We don’t have (scientifically speaking) recollection or knowledge if we had any choice in that matter, although a few claim to have pre-birth knowledge & recall. What you are becoming is largely a matter of experimental and/or experiential life choices. Once it is realized that you are creating yourself, or at least that you are a co-creator in the process, it’s possible to mentally somewhat detach from your named-self, and to view it as an experimental subject for those things which you wish to build into yourself - experience, wisdom, knowledge, understanding, character qualities, memory, languages, skills, enhanced creativity & talents, physical qualities, etc. In the process, of course, there are obstacles, questions and challenges to overcome, naturally. Glad you are self-experimental and have developed a balance of unconventional thinking skills with conventional. Or maybe you’re thinking is finely unbalanced - tilted toward the unconventional when it comes down to it...a good, healthy mix for creativity, I think. OK, For tonight, I’m done reading your thought provoking blogs and leaving haiku for you to ponder. losing-it ===== gazing into Dad’s old microscope, I wonder how small God is cocooned mothâ” underneath, the sky unravels from a raindrop DW Bender From a Haiku Editor’s Desk, World Haiku Review (Dec. 2005) [http://www.worldhaikureview.org/3-2/editorsdesk\\_dwb1.shtml](http://www.worldhaikureview.org/3-2/editorsdesk_dwb1.shtml)

## My First Reading (2006-06-16 22:52)

Yesterday I did my first bookstore "reading," at Stacey's Bookstore in San Francisco. Having seen several hundred such events on Book TV (C-Span 2), it was quite a thrill. Like one's first day as professional baseball player. It wasn't hard to fill 20 minutes; professors have been known to take longer than that to clear their throat. And I had a 20-year story to tell. I didn't read anything from The Shangri-La Diet but I did quote liberally from Ann Hendricks' repositioned [1]blog now devoted to reporting "happenings in the Shangri-La diet e-world" in order to summarize the 6000-odd posts in the forums. All the seats were full (all 20 of them), if I remember correctly, and there were plenty of questions.

On the way to the reading area I saw a book about Jane Jacobs that I hadn't known existed: [2]Jane Jacobs: Urban Visionary by Alice Alexiou. Amazon.com says it has not yet been released but there it was. After my talk, I wanted to buy it. Unfortunately the store had just one copy and although it had been on display since Jacobs's death six weeks ago (she died the day my book was published) during my talk that copy was sold. When it rains, it pours.

## Meal Skipping: Good or Bad? (2006-06-22 09:15)

Many people find that the Shangri-La diet makes it easy to skip meals. It is natural to ask: How does meal skipping affect overall health? Having eaten one meal per day for the last six years, let's just say I care about the answer.

For more than half a century it has been clear that calorie restriction is a powerful way to increase the lifespan of rats and at least a few other species. [1]An experiment with monkeys seems to be headed for the same result: calorie restriction increases lifespan.

Calorie restriction is a complex treatment. Calorie-restricted rats eat less, they lose weight, they may eat less often, they eat less protein, they eat less carbohydrate, and so on. Which of these changes cause the health benefits? A researcher at the National Institute of Aging named Mark Mattson has been asking this question. He and his co-workers have discovered that the benefits of calorie restriction can be achieved by eating less frequently, even when there is little or no weight loss. The implication is that skipping meals, if anything, is likely to be beneficial.

One [2]study, published in 2003, compared four groups of mice. One group (ad lib) got all the food they wanted every day. Another group (calorie restriction) got 60 % of the amount of food that the first group got. A third group (intermittent fed) got all the food it wanted but only every other day. A fourth group got the same overall amount of food as the intermittent-fed group, but without a one-day "fast" between feedings. After 20 weeks, the calorie-restriction mice weighed about half what the ad-lib mice weighed; the other two groups weighed about 90 % of what the ad-lib mice weighed. The most interesting measure was what happened when kainic acid (which kills neurons) was injected

into the brains of the mice. The measure was how many neurons survive. The results were not easy to completely sum up but they did show that intermittent feeding was more protective than ad lib feeding, and at least as protective as calorie restriction. In other research from Mattson's lab, intermittent feeding has been found to be healthier than ad lib feeding in other ways – for example, [3]a rat study found protection against heart-attack damage. [4]A review article by Mattson concluded that "both caloric (energy) restriction (CR) and reduced meal frequency/intermittent fasting can suppress the development of various diseases and can increase life span in rodents."

What about humans? In January I was contacted by Dr. James Johnson, Dr. Donald Laub, and Sujit John, who had been studying the effect of intermittent feeding on humans – starting with themselves. Johnson had tried to lose weight via an on-day-off-day diet: One day you eat normally, the next you eat 20 % of what you would usually eat. I think he based this diet on Mattson's results. Eating only every other day – the usual regime in Mattson's experiments – was just too hard but Johnson found that eating a percentage on the order of 20-30 % of usual intake on the off days was just bearable and did produce weight loss. Johnson found that not only did it produce weight loss, it had many other beneficial effects, such as an improvement in asthma symptoms. He first noticed these improvements when he tried the diet himself (he wanted to lose weight); later he saw similar improvements when his friends did the diet, the same path I followed with SLD. Johnson, Laub, and John have just published [5]an article in Medical Hypotheses about their ideas. They were interested in my weight-loss ideas as a way of making the on-and-off regime more bearable – to reduce the hunger involved. "The oil and sugar water seem to work well," Dr. Laub wrote me recently.

Here is the abstract of their Medical Hypotheses paper:

Restricting caloric intake to 60-70 % of normal adult weight maintenance requirement prolongs lifespan 30-50 % and confers near perfect health across a broad range of species. Every other day feeding produces similar effects in rodents, and profound beneficial physiologic changes have been demonstrated in the absence of weight loss in ob/ob mice. Since May 2003 we have experimented with alternate day calorie restriction, one day consuming 20-50 % of estimated daily caloric requirement and the next day ad lib eating, and have observed health benefits starting in as little as 2 weeks, including insulin resistance, asthma, seasonal allergies, infectious diseases of viral, bacterial and fungal origin (viral URI, recurrent bacterial tonsillitis, chronic sinusitis, periodontal disease), autoimmune disorder (rheumatoid arthritis), osteoarthritis, symptoms due to CNS inflammatory lesions (Tourette's, Meniere's) cardiac arrhythmias (PVCs, atrial fibrillation), menopause related hot flashes. We hypothesize that other many conditions would be delayed, prevented or improved, including Alzheimer's, Parkinson's, multiple sclerosis, brain injury due to thrombotic stroke atherosclerosis, NIDDM, congestive heart failure.

Our hypothesis is supported by an article from 1957 in the Spanish medical literature which due to a translation error has been construed by several authors to be the only existing example of calorie restriction with good nutrition. We contend for reasons cited that there was no reduction in calories overall, but that the subjects were eating, on alternate days, either 900 calories or 2300 calories, averaging 1600, and that body weight was maintained. Thus they consumed either 56 % or 144 % of daily caloric requirement. The subjects were in a residence for old people, and all were in perfect health and over 65. Over three years, there were 6 deaths among 60 study subjects and 13 deaths among 60 ad lib-fed controls, non-significant difference. Study subjects were in hospital 123 days, controls 219, highly significant difference. We believe widespread use of this pattern of eating could impact influenza epidemics and other communicable diseases by improving resistance to infection. In addition to the health effects, this pattern of eating has proven to be a good method of weight control, and we are continuing to study the process in conjunction with the NIH.

Huh. My question is: Am I skipping enough meals?

---

heatherlyn (2006-06-23 09:37:04)

Maybe I'm just working from common-belief here, but I've always heard that skipping meals slows down your metabolism-like your body goes "uh oh, food is scarce, better conserve while I can!"... How does this belief fit in with the calorie-restriction/skipping meals idea? I've been on the SLD for 5 days now, and have been eating fewer meals (used to eat 5 small meals a day, now eating about 3 small)... and I'm GAINING weight. With less calories eaten. Wonder what that's all about? I'm wondering (perhaps stupidly, but who knows) if it's my body slowing down my metabolism to conserve the food that I AM taking in.....

raina (2006-06-26 11:49:20)

I'm very interested to see you post about this, as intermittent fasting has been another "diet" interest of mine for several years. I have never been able to stick to the regimen for very long, although it does work great when I can do it. I might give it another try with SLD. You might be interested in checking out this site. <http://everyotherdayfast.blogspot.com/> It's the blog of a guy who has been fasting every other day for 6 months and has lost over 40 lbs. Heatherlyn, what you say is indeed what they tell us. However, numerous studies have found that daily meal frequency has no effect on metabolism. I don't know if the results also extend to bi-daily meal frequency, but at the very least I wouldn't be worried about eating 3 meals a day instead of 5. My personal belief is that forcing yourself to eat when you're not hungry is the very worst thing an overweight person can be doing - you're just teaching yourself NOT to listen to your body. See this post for more info: [#msg1158](http://boards.sethroberts.net/index.php?topic=232.msg1158) Many people who have started SLD have seen the reduced appetite come in before they started losing, and have even gained weight first. Give it a couple of weeks for things to balance out.

Leo Pharmacy (2007-01-28 17:17:18)

Who really now is engaged in the control of health? To mine it neglected the large pharmaceutical companies and the medical centers. There should be a centralized management WBR LeoP

losing-it (2007-02-01 18:19:46)

Having recently read about Johnson's interesting method, and having consumed oils with SLD (consuming 1200 - 1500 average daily calories) for 2 months with -8 lb and -11 1/4 " losses to date, I'm going to give the Johnson UpDayDownDay method a try along with the SLD tasteless (oil) calories. I'm going to experiment and try not using the oil on the UpDay, rather, only consuming it in one dose on the DownDay, but I will probably return to using it on the UpDay, especially if there are measurable results (I've been in plateau according to the scale, but not according to the measuring tape). I've wanted to do some kind of fasting for a time, but have previously not had the willpower, but have had headaches trying it. I think the SLD, which has maintained my previous weight losses and continued losses through the 8 lbs and 11 1/4", while providing very good appetite

suppression, just might give me the appetite suppression to handle the DownDay of Johnson's modified intermittent fasting plan. Thanks for bringing us the Shangri-La Diet / SLD (not diet). losing-it

Seth's blog » Blog Archive » Eating Less (2007-02-09 16:11:29)

[...] Yoffe mentions the UpDayDownDay regime studied by NIH researcher Mark Mattson. There is now a website for an associated book and diet. (My earlier comments.) I asked Donald Laub, a Stanford professor of medicine who is doing this regime, to ask if he was still taking olive oil to make the low-calorie days easier to endure. He said he was. [...]

Jack Prime (2007-07-13 03:42:54)

A lot of it comes down to personal preference and lifestyle factors, but restricted calorie intake does affect quality of life in my opinion. Man has been eating for pleasure and satisfaction for generations and even though it's abused nowadays due to food abundance this aspect is often overlooked. It's important to also distinguish between "weight" loss and "fat" loss, as a loss in muscle has other detrimental affects on metabolism, well-being and lifespan.

Patri Friedman (2008-04-27 12:29:32)

I quit SLD because regular use of oil was making me nauseous, but I'm going to try it again as part of a fasting regimen, where I use oil on the "undereating" days to help reduce appetite. I'm planning to fast 1-2x/week as suggested by Eat. Stop. Eat, with the "fasting" being a few hundred calories in 24 hours.

Louis Leonard (2009-03-31 12:22:20)

Why don't you just pay the skinny people for doing the right thing in the first place...

Derek (2009-04-24 12:02:56)

I think the science is conclusive on meal skipping in the short term. There's no harm in doing it.

### **A Little Bit of Paris (2006-06-27 23:18)**

Yesterday was a little milestone. The SLD was so easy and fun that I did it too much. I couldn't eat my one meal of the day. Part of my brain said: You really should eat something, if anything you're too thin. Like a parent to a child. But I didn't. (And woke up this morning not hungry at all.) Was I testing the power of the SLD and went a little too far? No: it was an accident. Which is why it is interesting.

This has never happened before. I discovered the basic idea of the SLD and got down to my current weight six years ago. Since then I have eaten one meal per day, including any number of meals I could have easily skipped. The thing is: I didn't skip them. The part of my brain that said eat even when I wasn't hungry was powerful enough to overcome my lack of hunger. Yesterday, for the first time, it wasn't. It reminded me of being unable to eat in Paris, which led to my discovery of the SLD.

After six years, why now? Because of the SLD forums. In two months they have injected enough new ideas into the diet (e.g., take oil with water, oil improves sleep, crazy spicing is worth pursuing) to make it too much fun. (For me.) Hard to believe, I agree. Here is what I ate yesterday:

1. Early in the morning, a cup of tea (unfamiliar flavor) with one sugar cube. I've done this a thousand times. 15 calories.
2. A few sticks of gum. I've done this thousands of time. 0 calories.

3. Around 11 am I drank some walnut oil (Spectrum). I bought it a few days ago because of a forum post about its benefits. I drank 2 tablespoons of it with water – testing my friend Carl Willat's suggestion that he drew from the forums. I don't have trouble drinking oil but the oil/water mixture is even easier, a curious texture. This was slightly different than usual: I have been drinking 1-2 tablespoons oil/day for the last 3 years but (a) I have always drunk 1 T in the morning and 1 T later in the day, sometimes forgetting the second dose and (b) I have tried many different oils but not walnut oil because it has some flavor. The water seems to eliminate or greatly reduce the flavor. 240 calories. So far: 255 calories.

4. More gum. Thousands of times. 0 calories.

5. A few small pieces of excellent dark chocolate. Thousands of times. 50 calories? So far: 305 calories.

6. Small amounts of several cheeses. Thousands of times. 100 calories? So far: 405 calories.

7. Half a bottle (8 oz., whole bottle is 16 oz.) of Healing Springs Raw Watermelon Kambucha. An associated website ([www.honeysweetdrinks.com](http://www.honeysweetdrinks.com)) is non-functional. I almost never drink strange soft drinks because I'm afraid they will ruin my appetite, as they did in Paris six years ago. But in Paris I drank about two per day. This time I drank half a bottle – surely too little to matter, I thought. Such an interesting flavor, honey-sweetened. No indication of how many calories. 60 calories? So far: 465 calories.

8. Protein drink. Curious about tasteless protein drinks, I tried to follow a recipe from Sean Curley. My drink contained 1 tablespoon each of 3 different protein powders. To improve the taste I added one sugar cube, a package of Splenda, and some random spice blends. 75 calories. So far: 540 calories

9. 10 flax-oil capsules. A week or so ago I slept unusually well and somewhere around that time I had taken about 6 flax-oil capsules. Forum discussion led me to think the flax oil might be responsible. I took 10 capsules to see if I could repeat the experience. 100 calories. So far: 640 calories

10. Chai ice blend. To make swallowing the flax-oil capsules enjoyable I made a chai drink to wash them down. I blended together sugar-free chai mix, 4 oz. half-and-half, water, and ice. I'd had about 10 cups of this mix before. To make the flavor more interesting, I added a couple shakes of two random spice blends. 212 calories. So far: 852 calories.

At this point I decided I didn't want dinner and took a long walk instead.

11. Two sugar-free chocolate-chip cookies. New-product sample left at my house. 100 calories. So far: 952 calories.

12. Two Emer'gen-C (vitamin) packets mixed with 3 tablespoons half-and-half. Makes a lovely mousse-like concoction. Vaguely-familiar flavor. 90 calories. So far: 1042 calories.

Total flavorless calories: 340. Total unfamiliar-flavor calories: 347. Whereas normal values would be roughly 240 flavorless calories and <100 unfamiliar-flavor calories. So I had at least doubled my usual intake of these hunger-suppressing foods. Not because I was trying to lose weight, though, but because of forum discussions, because I found combinations of random spice blends intriguing, and because I wondered if flax oil caused better sleep. Not a long-term healthy diet but v v filling and v v easy.

I woke up the next day having slept unusually well. For me, it was an unusual form of good sleep. Many times I have slept extremely well after standing 9 or 10 hours but in these cases I woke up feeling scrubbed clean of tiredness. In this case, however, I didn't feel scrubbed clean of tiredness (and I hadn't stood 9 or 10 hours) but my brain felt very clear when I awoke. I'd been drinking oil for years – this wasn't produced by my usual oil intake. If it was cause and effect (oil caused better sleep), something found more in walnut oil and/or flax oil than in canola oil or ELOO or safflower oil or grapeseed oil (oils I had had many times in the past) was responsible.

---

strophica (2006-07-06 13:25:19)

dear seth, oh this entry made me feel like a million bucks! not only was it a tiny "map" that I could follow throughout the day, but it gave me a great insight as to your own personal pursuit of this whole diet. thank you! I actually have a silly question: what type of gum do you chew? I checked mostly everywhere and I only see gum that's 5 calories a stick. thanks! Strophica

seth (2006-07-06 16:24:02)

I like Extra and Orbit gum. The number of calories is too small to matter.

Coy57 (2006-11-17 04:48:56)

Coy57... I have enjoyed reading your article, thanks....

Greg (2010-01-11 00:52:34)

Hi. I'm french. Your post can interest lot of people in France. So, if you re ok, i can copy it on a french blog. ;-)

## **Winery Alert (2006-06-30 14:39)**

I wince when I hear someone say that he or she couldn't possibly drink olive oil. "Gross!" is how it is usually put. I'm sorry to hear something culturally learned treated as a timeless truth. So I was pleased when my friend Aaron Blaisdell reminded me that wineries are beginning to have olive oil tastings. What is learned can be unlearned. The more accepted olive oil drinking becomes, the less I will have to hear "gross!" when it is suggested.

[1]Here is a NY Times article about these tastings. If anyone doing olive oil tastings reads this, I hope you will post about your event in the announcements section of the SLD forums. I suspect many forum readers are becoming oil connoisseurs.

1. <http://travel2.nytimes.com/2006/05/19/travel/escapes/19olive.html>

## 1.3 July

### Brain Food (2006-07-05 19:50)

On the Shangri-la diet [1]forums, many dieters have reported better sleep. ("Woke up feeling like I could fight tigers. Have not felt this way since 2003. . . . I would stay on this method just for the sleep benefits," [2]wrote bekel.) To learn how widespread this was, I did a [3]poll. Forty-two people answered. Two-thirds of them reported better sleep (half "much better" sleep, half "slightly better" sleep). Only one-tenth of them reported worse sleep (all "slightly worse", none "much worse"). Almost all of them were doing SLD with oil, implying that the improvement was due to a few tablespoons of oil per day.

This was exciting. A small, almost trivial dietary change seemed to be causing a big important improvement. I had switched from sugar water to ELOO about three years ago and had not noticed any sleep improvement. Perhaps this was because the improvement is due to omega-3 fatty acids, of which ELOO has much less than other oils. And because I ate a few servings of fatty fish (such as salmon) per week, I might have been less omega-3 deficient than most. Thinking about the poll results, I remembered I had slept unusually well about a week or so earlier. At roughly the same time, for reasons I can't remember, I had taken six or seven flax-oil capsules. This vague correlation was curious. It raised the possibility that a large dose of omega-3's might have a noticeable effect.

To test this idea, I made two changes: (a) I started drinking 2 tablespoons/day of walnut oil. Walnut oil (12 % omega-3) is a much better source than olive oil (1 %) or canola oil (7 %). (b) I started taking 10 flax-oil capsules/day (= 100 calories/day). Flax oil (58 % omega-3) is an especially good source. (I drank Spectrum refined walnut oil, which has little flavor, and I mixed it with water to reduce its flavor. Another walnut oil I have tried, International Collection, has a strong walnut flavor.)

It seems to make a difference. Three differences, actually: (a) Better sleep. I wake up more clear-headed, less foggy. (b) Better mood. My overall mood is slightly better, in a hard-to-describe way. (c) Better balance. For the last two years, I have often put on and taken off my shoe-laced shoes while standing; even after two years of practice there was plenty of room for improvement. Suddenly this became much easier. All three changes began the day after the dietary change (about a week ago) and since then have not only persisted but if anything have gotten stronger.

Do these bits of data – survey and self-experimentation – mean anything? I think so. Consider other facts:

1. SLD dieters using oil report many other improvements that seem unrelated to less hunger or weight loss. Most of them fall into three groups: (a) Skin. Everyone reports softer skin. In addition, spacehoppa's eczema and keratosis pilaris (permanent gooseflesh) got much better "It's like I'm correcting a major nutritional deficiency," she [4]wrote. [5]Shrinkingbean found her eczema improved after only 10 days. [6]Carol's acne has gotten much better. (2) Mood. [7]Easier to give up smoking and coffee. [8]More libido. (3) Stiffness. "I have been a person who gets stiff when sitting too long, ever since I was in high school. . . . Sitting in one place for 15 minutes would cause me to stand up from the chair like a 90 year old. . . . It just dawned on me that that is no longer true!!!!" [9]wrote Ann. Two others noticed similar effects.

2. Several studies of patients with mood disorders have found their symptoms improved when they were given fish oil (high in omega-3) compared to a placebo group. A [10]review of these and similar studies notes that "the marine-based omega-3 fatty acids primarily consist of eicosapentaenoic acid (EPA) and docosahexaenoic acid (DHA) and appear to be highly biologically active. In contrast, those from plants (flaxseed, walnuts, and canola oil) are usually in the form of the parent omega-3 fatty acid, alpha-linolenic acid. Although dietary alpha-linolenic acid can be endogenously converted to EPA and DHA . . . research suggests that this occurs inefficiently to only 10 %-15 %."

3. Several [11]surveys of the elderly have found an association between (a) reduced risk of Alzheimer's disease and less cognitive decline and (b) greater fish consumption. At the other end of life, omega-3 fatty acids are necessary for proper development of our brains, a point made [12]here. The effect of an essential nutrient is likely to be clearest in those who are most vulnerable (such as babies, the elderly, and the mentally ill).

What makes the overall idea – we need more omega-3 than most of us get – even more plausible is that a pre-existing theory makes sense of these facts. That theory is [13]the aquatic-ape hypothesis, the idea that humans became big-brained primates while living near water and eating lots of fish. In 2005, Sir David Attenborough, whose nature documentaries I love, made [14]a fascinating radio show about this theory. The end of the show provides new supporting data that I find especially persuasive.

If our brains grew big while eating lots of fish, it makes perfect sense that they would work better when we eat lots of fish. More precisely, too little fish (or too little of fish's crucial nutrients) should harm the portions of our body that evolved during that period (shaped to work well on a high-fish diet) much more than older portions (shaped to work well on a low-fish diet). The improvements associated with omega-3 fatty acids – reduction of cognitive decline in the elderly, mood improvements in the mentally ill – fit that prediction well. So does the conclusion of [15]a recent meta-analysis that omega-3 does not clearly reduce heart disease or cancer.

And so do the benefits of oil (presumably from omega-3) suggested by the SLD forums and my self-experimentation. Sleep: [16]My earlier self-experimentation suggested that sleep is influenced by morning conversations and amount of standing, implying considerable differences between our sleep and the sleep of other primates. Skin: Human skin has fat attached, like marine mammals but unlike the skin of other primates. (This fact inspired Alistar Hardy to think of the aquatic ape hypothesis.) In addition, we have much less hair than other primates. Stiffness when standing up and balance on one foot: Unlike other primates, we are bipedal.

How to measure my sense of balance? . . .

Jeremy Cherfas (2006-07-06 21:57:37)

Oh dear. I'm all for scientific iconoclasm, one reason I like the whole approach of SLD and the BBS paper, but I worry that you seem to have espoused Morgan, Hardy and Aquatic Apes so thoroughly. This is not the place for a detailed rebuttal of the ideas – which had to be considerably changed after new fossils brought the human-African ape split so much closer. I do think, however, that this is going to help mainstream, blinkered scientists to ignore some of your ideas. Maybe we do need an explanation of why omega-3 does seem to have so many cognitive benefits. Maybe we don't. and I'm all for speculation. But I do not think Aquatic Ape holds enough water to make it worth using for this purpose.

BenekeMethod (2006-07-06 23:35:18)

Seth's posting on Omega 3s and effects of the oils is fascinating. In addition to depression and Alzheimer's, there is research suggesting the EPA fatty acids in the omega 3 in fish oil helps neck and back pain: [http://blog.spinaprogram.com/2006/05/fish\\_oil\\_reduce.html](http://blog.spinaprogram.com/2006/05/fish_oil_reduce.html) ADHD in young people: <http://nutritionalconcepts.blogspot.com/2006/06/more-support-for-omega-3-calm-ing-adhd.html> Bipolar disorder: <http://www.cassmd.com/library/fish.oil.bipolar.study.html> A therapist friend treating a client who is mildly bipolar says that fish oil is on a standard list of mood stabilizers for manic depression that includes lithium and the other standard drugs. It is recommended for clients where the depressive side is pronounced. Chronic Fatigue Syndrome (Known at the time (1990) as "Post- viral fatigue syndrome") [http://www.1stvitality.co.uk/health/cfs\\_me/puri\\_cfs\\_sept6\\_2002.htm](http://www.1stvitality.co.uk/health/cfs_me/puri_cfs_sept6_2002.htm) Andrew Stoll, the Harvard psychopharmacologist who has pioneered the omega 3 research, <http://www.amazon.com/gp/product/0684871386/103-4598179-8318241?v=glance&n=283155> in an interview says he starts depressed people out on 1 gram of EPA, (an omega 3 fatty acid in fish oil) and waits a week or two to see if there is improvement. If not he goes to 2 grams a day and has almost never had to go higher than 6. [http://www.findarticles.com/p/articles/mi\\_m1189/is\\_3\\_277/ai\\_n13684165](http://www.findarticles.com/p/articles/mi_m1189/is_3_277/ai_n13684165) Stoll claims positive effects for borderline personality and Huntington's disease as well. That's a wide range of research, but there are not a lot of studies in any one area, so we need a lot more. I started taking 3 grams of EPA a day – 18 capsules of the GNC fish oil product – about a month ago and had two surprising effects. First, after 3 days, I noticed that I had a lot more energy on my morning walks. Second, after about 5 days, I started spontaneously getting up about an hour and a half earlier, from 8:45 to 7:15 in the morning. This amazed me because I have always had to work hard to reset my circadian rhythms. I saw research showing that piglets who received fish oil had more serotonin in their brain. Serotonin is tied to circadian rhythms. The fish oil does appear to help my sleep. Also, I persuaded a friend who for several years has suffered from serious Chronic Fatigue Disorder (low energy, poor concentration, "foggy brain", and forgetfulness, muscular aches and pains upon exertion, and more) to take 1.5 grams of EPA (9 capsules of GNC fish oil) a day and after 5 days, he is reporting less anxiety and better concentration... People may also be sleeping better because they are eating less and giving their digestive systems a rest, and are feeling a sense of "Shangri-La" hopefulness after realizing that they can reduce their hunger at will as long and as much as they want.

Food News 2 at Another Blasted Weblog (2006-07-10 21:23:30)

[...] Thursday 6 July: Seth Roberts, onlie begetter of the Shangri-La diet, has been marvelling about the "side effects" enjoyed by some people using different kinds of oil in their diet, particularly effects on the brain. This is my comment on Seth's blog: [...]

Seth's blog » Blog Archive » Brain Food (part 2) (2006-07-19 21:33:13)

[...] Do omega-3 fatty acids improve brain function? I blogged earlier that switching from olive oil (low omega-3) to walnut oil (high omega-3) and flaxseed-oil capsules (very high omega-3) caused my sleep, my balance, and maybe my mood to improve. If you are interested in duplicating what I did, here are details: [...]

Brice (2006-07-26 21:48:24)

In regards to flavor of walnut oil, how about pinching your nose closed while swallowing the oil? I remembered from high school that smell affects taste significantly. I've found that when swallowing olive or other oil while pinching my nose closed

and chasing that with a mouthful of water that I don't taste anything. Shouldn't this work? Heck, shouldn't I be able to eat other "tasty" foods this way and lose weight?

Seth's blog » Blog Archive » Brain Food (part 4: measuring balance) (2006-07-26 23:00:04)

[...] Speaking of standing on one foot . . . I devised a way to measure my balance. (To recap: I want to measure my balance to see if omega-3 improves it. When I increased my omega-3 consumption via walnut oil and flaxseed oil, it suddenly became much easier to put on my shoes while standing, which I'd been doing for years. The omega-3 also improved my sleep. Maybe omega-3 makes much of the human brain work better, especially the most-recently-evolved portions. Maybe this effect happens within hours.) [...]

richardinmadison (2006-07-30 08:58:44)

I too experimented with switching to all walnut oil + flaxseed oil caps and found that my sleep was affected, but not so positively: instead I experienced intense vivid dreams and awoke each morning feeling far less refreshed. After 2 weeks this effect did not modify and so I switched back to ELOO + flaxseed oil caps and immediately experienced more peaceful sleep. Has anyone else experienced something similar? I'm curious.

Cathy W (2007-03-11 12:55:45)

I was just googling flaxseed oil and dreams, and found your website. I have started taking flaxseed oil, and have found an unexpected pleasant side effect in the vivid dreams that I have been experiencing. I recently was away on travel and didn't take my flaxseed oil with me and I didn't have any of these dreams (or that I could remember) while I was away. I didn't immediately begin taking the flaxseed oil when I got home as my new little habit had been interrupted, but when I started taking it again yesterday, I had a dreamfilled night last night! Of course this is not scientific but I do believe I have discovered a correlation between the flaxseed oil and either increased dreams or the ability to recall them.

seth (2007-03-11 13:45:21)

I think I had much more vivid dreams at first – when I started drinking flaxseed oil. But now the effect has gone away. I tried googling flaxseed oil and dreams and didn't get my website. Did you google flaxseed oil and sleep?

Cathy W (2007-03-13 05:15:23)

I just tried googling it again ... your website actually comes up on the 4th page of results. Thanks for your response to my post. I had more of my vivid dreams last night, and I guess I will just enjoy it while it lasts!

Seth's blog » Blog Archive » Omega-3 and Dental Health (2007-03-28 20:39:28)

[...] This research means better gums is very good news — for which I thank SLD-forum posters, who sparked my interest in omega-3. [...]

ShackDaddy (2008-03-05 00:47:21)

I just started taking a couple of Omega-3 capsules a day for mood last week, and the first three nights afterward I woke up completely remembering vivid dreams. That never happens to me. In the past I've known that I must have dreamed, but never remember anything. I didn't have vivid dreams again after those first three nights, even though I've continued to take the capsules, so there must be some sort of initial spike that happens to cause that.

Tom M (2008-03-20 14:16:17)

Today I Googled 'Omega 3 dreams' as, since I began taking Omega 3 fish oil tablets four days ago I have had the most astonishingly vivid dreams. I am an artist and illustrator and have always had vivid colorful dreams but very rarely anything like these. Three in a row just before dawn. Since Omega 3 is the only change in my diet I wondered if there might be a connection. Sad to read they might end soon. Oh well.

Jim Andrews (2008-10-15 15:00:39)

I too have noticed an increase in vivid dreams while taking flaxseed oil capsules. This is especially true if I take a capsule before bedtime. I began taking the supplement based on the recommendation of my pharmacist, who suggested that flaxseed oil would help my asthma. It has helped my asthma. So, long story short, I feel good and I sleep well. I will surely continue to take flaxseed oil.

song from a distant planet » Blog Archive » fish dreams (2008-10-27 09:41:47)

[...] Till this week. Three nights in a row I woke up remembering all the details, for what may be the first time in many years. The only thing I can link it to is that I started taking Omega-3 capsules the day prior to the first night. I did a search and found this site and other people are reporting the same phenomenon. [...]

Ranger (2009-01-24 09:21:58)

For four nights in a row now I've had unpleasant, violent dreams that I can recall when I wake up, which I've never been able to do. I've been taking a Fish, Flax, Borage Oil Supplement for the past 5 days. I suspected there might be a connection, but after reading all of the above posts, I'm convinced there is. I just wish the dreams were pleasant. I wish a medical professional would weigh in on this thread to assure me that the benefits of this supplement will outweigh these scary nights.

Junior Pruette (2009-12-20 01:29:03)

I had to try two times this afternoon to access your blog. Are you having problems with your hosting account? Or is it on my end?

Roy (2009-12-21 00:58:53)

Last night I took an Omega 3 pill before I slept and have had vivid dreams of my childhood. They were all happy memories of myself and my brother; interesting to note is that the memories were in chronological order, starting from when I was around 3 years old (yes i do remember a few things) to 5, 7 years of age... They were kind of memories with a little twist to them; since in the dream I (as a by-stander) was watching myself and my brother ride the bicycle together, swimming and playing in the

pool, etc... any medical thoughts on this ? Maybe I have experienced near-death !!

Eric (2011-09-14 15:15:31)

After 3 days of taking 2 T of ground whole seeds every morning my desire to smoke has also decreased. It's day 5 and my desire has not returned. This is especially impressive because my smoking is tied to when I take my prescription for Adderall. Somehow methamphetamine no longer triggers the urge to smoke. I commented on this to my wife yesterday, calling it 'weird.' And I just made the connection now, after reading this post. Very interesting.

### **Spices: A New Kind of Vitamin? (2006-07-10 16:20)**

For Shangri-La dieters who randomly spice their food, the current issue of the American Journal of Clinical Nutrition (July 2006) has very good news. Spices are a better source of antioxidants than any other food group, according to a [1]survey of popular American foods.

There are many reasons to think antioxidants are beneficial. Oxidative damage, which antioxidants reduce or prevent, seems to play a role in many major diseases, including heart disease. Yet large trials in which people were given a few antioxidants, such as alpha-tocopherol and beta-carotene, did not find health benefits. Maybe the reason for these failures is that you need a suite of antioxidants; maybe antioxidants, "which cooperate in an integrated manner in plant cells [to reduce oxidative damage], also cooperate in animal cells," the authors write. "A network of antioxidants with different chemical properties may be needed for proper protection against oxidative damage." A very plausible idea.

To test this idea, it would help to know the antioxidant content of everyday foods. This is what the researchers tried to find out. They used a chemical assay to measure the total antioxidant content of 1113 popular American foods, chosen based on a careful national survey.

Here are the top ten foods by antioxidant content (per gram): cloves, oregano, ginger, cinnamon, tumeric, walnuts, basil, mustard, curry powder, pecans. Here are the next ten: baking chocolate, parsley, molasses, pepper, artichokes, dark chocolate, blackberries, whole-grain cereal, cranberries, chocolate pudding mix. Chocolate is also high in antioxidants - more good news. Red wine was #30. (White wine was low.)

Lowest on the list were animal products. "In general, plant and plant products in the diet have a much higher antioxidant content than do animal products," the authors wrote. Oils, such as canola oil and olive oil, were higher than animal products, but less than other plant products. Cooking (heating) increased the antioxidant activity of plant foods such as carrots, tomatoes, and spinach.

The end of the paper describes evidence that higher intake of antioxidants is associated with lower risks of stomach cancer and lung cancer.

Could vitamins plus fiber plus spices provide most of the health benefits of fruits and vegetables? It is entirely possible. If so, it would be a major nutritional advance. Spices would be a new kind of vitamin. Good nutrition would include at least one heavily-spiced meal per day.

Seth's blog » Blog Archive » More Reason to Crazy-Spice (2006-10-24 21:48:23)

[...] Spices are good for you, I blogged, because they are high in anti-oxidants. A new study, done in Singapore with elderly subjects, supports this conclusion. It found that curry-eaters do better than others on a mental test. The abstract: Curcumin, from the curry spice turmeric, has been shown to possess potent antioxidant and antiinflammatory properties and to reduce Aβ-amyloid and plaque burden in experimental studies, but epidemiologic evidence is lacking. The authors investigated the association between usual curry consumption level and cognitive function in elderly Asians. In a population-based cohort (n = 1,010) of nondemented elderly Asian subjects aged 60-93 years in 2003, the authors compared Mini-Mental State Examination (MMSE) scores for three categories of regular curry consumption, taking into account known sociodemographic, health, and behavioral correlates of MMSE performance. Those who consumed curry "occasionally" and "often or very often" had significantly better MMSE scores than did subjects who "never or rarely" consumed curry. The authors reported tentative evidence of better cognitive performance from curry consumption in nondemented elderly Asians, which should be confirmed in future studies. [...]

David (2006-07-12 08:39:07)

Seth, Take a look at what Hugh MacLoed ([www.gapingvoid.com](http://www.gapingvoid.com)) is doing with stormhoek wine ([www.stormhoek.com](http://www.stormhoek.com)). They have sponsored 100 "Geek Dinners" and enlist bloggers to set them up, they send the wine, and the bloggers blog about the wine, good or bad. Maybe you could set up 100 oil tasting parties...

iportion1 (2006-07-12 16:37:10)

I am the owner of and lead blogger [www.iportion.com](http://www.iportion.com) and I would love to read and review your book. I will email you in private as well. My blog is to help people get healthy and feel good inside and out.

Ethesis (2006-07-15 20:51:19)

That is neat. I'm glad your editor is still on board with you and is giving your book time to grow on its own.

## Brain Food (part 2) (2006-07-19 21:33)

Do omega-3 fatty acids improve brain function? I blogged [1]earlier that switching from olive oil (low omega-3) to walnut oil (high omega-3) and flaxseed-oil capsules (very high omega-3) caused my sleep, my balance, and maybe my mood to improve. If you are interested in duplicating what I did, here are details:

Supplies. I take (a) 2 tablespoons/day walnut oil (Spectrum Organic refined).[2] Store locator at [www.spectrumorganics.com](http://www.spectrumorganics.com) will help you locate this. Total 240 calories. (b) 10 1000-mg capsules/day of flaxseed oil (Longs cold-pressed softgels). Longs drugstore house brand, which is only available at Longs drugstores. Total 100 calories. I store both in the refrigerator but they are in stores at room temperature (reasonably enough, since walnut trees and flax plants live at room temperature). Procedure. I take both between meals. I divide the walnut oil into 2 doses of 1 T each that I take at least several hours apart. I take 80 % of this stuff after noon. I spread the flaxseed capsules out throughout the day, take about 3 at a time. But read on for more helpful info – you may not want to start with exact duplication.

With the new oils, my sleep was consistently and unusually good for about two weeks, making it was clear that the improvement was caused by the new oils (or more precisely, the difference between the new oils and the oil they replaced). Less clear was what aspect of the dietary change made the difference. I switched to walnut oil and flaxseed oil because they were high in omega-3; but they differ from olive oil in other ways as well.

It would be great to know more – both to maximize the effect on myself and to help others get the effect. The wonderful thing about finding a food component that improves sleep – if that isn't wonderful enough – is that it is likely to improve the brain in all sorts of other ways, too. (In contrast to [3]my previous sleep research on the effects of non-food-components, such as standing and breakfast, where the improvements were probably specific to sleep.) The data about omega-3 support this view: A wide range of improvements in mental function have been observed. Assuming omega-3 causes a single change in the brain, that change causes (a) a reduced rate of Alzheimer's, (b) less depression, and (c) better sleep – so it is likely to be widespread in the brain.

Since my earlier post, I've gathered some new and helpful data.

First, a Shangri-La-Diet forum [4]poll found that most people who used olive oil for the diet had better sleep (10 out of 12), even though olive oil is relatively low in omega-3. Can even a small amount of omega-3 improve sleep? (Small compared to my current dose. SLD dieters consume large amounts of olive oil compared to everyone else.) Or is some other component of olive oil causing the change?

Second, after reading my earlier post, Catherine Johnson [5]remembered that "I realize that I started sleeping miserably when I stopped taking Omega 3s."

I trust that sort of thing. I had had a similar now-I-understand experience. After [6]figuring out that lots of standing improves sleep, I remembered that several years earlier I had sleep very well the night after visiting lots of art studios during an [7]Open Studios day. At the time I had guessed that it was all the art-inspired thinking that had caused my much-better-than-average sleep. But it was also a day with much more standing than usual.

Third, I reduced my flaxseed-oil intake by half: I took 5 capsules instead of 10. To my great surprise, I woke feeling as I felt with the olive oil. I hadn't felt that way in weeks. The next day I went back to 10 capsules and again woke up feeling great. Obviously this strengthens the plausibility of omega-3 -> better sleep because the crucial ingredient is apparently in high quantities in the flaxseed oil capsules.

The stunning thing, the reason I was so surprised, is this: I didn't expect the flaxseed change to make a difference so quickly. When someone ate a zero-folate diet to learn about the effects of folate, it took months for the effects to become clear. Although I had noticed the sleep improvement caused by the new oils the very next morning,

I had assumed that was because I was quite deficient – like someone with scurvy noticing fast improvement with Vitamin C. Someone who is not Vitamin-C-deficient will have to go without Vitamin C for months before scurvy occurs. I had expected to wait weeks before seeing sleep degradation.

If you read about why omega-3 is important, you will read endlessly that our brains are made of it – the fraction of our brain that is omega-3 fatty acids is 10 % (Wikipedia?), 60 % (a Whole Foods employee), whatever. That is what I had assumed: that omega-3 is a structural element of our brains. Which is no doubt true. I have never heard that it is a metabolic element of our brains. Cars are "made of" carburetors, fan belts, computers, tires, and the like (structural elements); they "run on" gasoline and electricity (metabolic elements). Structural elements are parts. Metabolic elements are fuel. Failure to replace a perfectly good carburetor or other structural element will eventually cause trouble, but it may be several years. Failure to replace gasoline or electricity will cause trouble much sooner. Thus my little experiment suggested that omega-3 was a metabolic element.

If an effect can be turned on and off quickly it is much easier to study than if it takes weeks or months to turn on or off. Upcoming attractions: How I am studying it.

## Brain Food (part 3) (2006-07-20 23:48)

In [1]Brain Food (part 2) I found that when I reduced my flaxseed-oil intake my sleep got worse that very night. (Presumably because I reduced the amount of omega-3 fatty acids in my diet and therefore my blood.) Several people, including me, have found that their sleep improved the night after taking more omega-3 – that is, hours later. For example, if the omega-3 was begun Monday afternoon, they slept better Monday night.

How could the effect turn on and off so quickly? An [2]article in the current issue of Journal of Nutrition supplies an answer:

Of the lipids found in the brain, polyunsaturated fatty acids (PUFAs) play an important role, serving as a major component of the phospholipids that form cell membranes, being precursors of signaling molecules such as prostaglandins and leukotrienes, modulating gene expression through the activation of transcription factors, and forming the microenvironment around membrane-bound proteins.

In other words, omega-3 has several effects in the brain, with vastly different sensitivities to changes in omega-3 blood levels. Changes in cell membranes probably happen very slowly; changes in "the microenvironment around membrane-bound proteins" could happen very quickly.

That a necessary nutrient (omega-3) could have fast-acting changes (within hours) is counter-intuitive. It doesn't agree with previous experience. Other necessary nutrients take much longer for a deficiency to become apparent. And it doesn't agree with common-sense design notions. Evolution builds our bodies out of what is in our blood. Human design is quite different – cars are not built out of what flows around them (oil and gas). Nor is anything else. There isn't a everyday analogy that shows that a deficiency of a construction element can have fast-acting effects. If all the raw metal in the world disappeared, your car would run fine for a long time. Nor does it fit with general trends in nutrition research. Nutrition researchers study the whole body, most of which changes slowly by comparison to the brain. Sure, food can change the brain – make you sleepy, make you alert (caffeine), but these are not changes that interest most nutrition researchers, who usually emphasize optimal functioning. During the Stone Age, our diets did not contain much caffeine so it is obviously not a necessary nutrient, even if it can improve memory. No dietician tells clients to consume more caffeine. There are hundreds of substances like caffeine that change mental functioning, of course, and with the right definition of improvement all of them can be considered to improve mental functioning. But none of them interest nutrition researchers, with the exception of [3]Adelle Davis (fascinated by LSD). An experimental psychologist, on the other hand, . . .

## Brain Food (part 4: measuring balance) (2006-07-26 22:59)

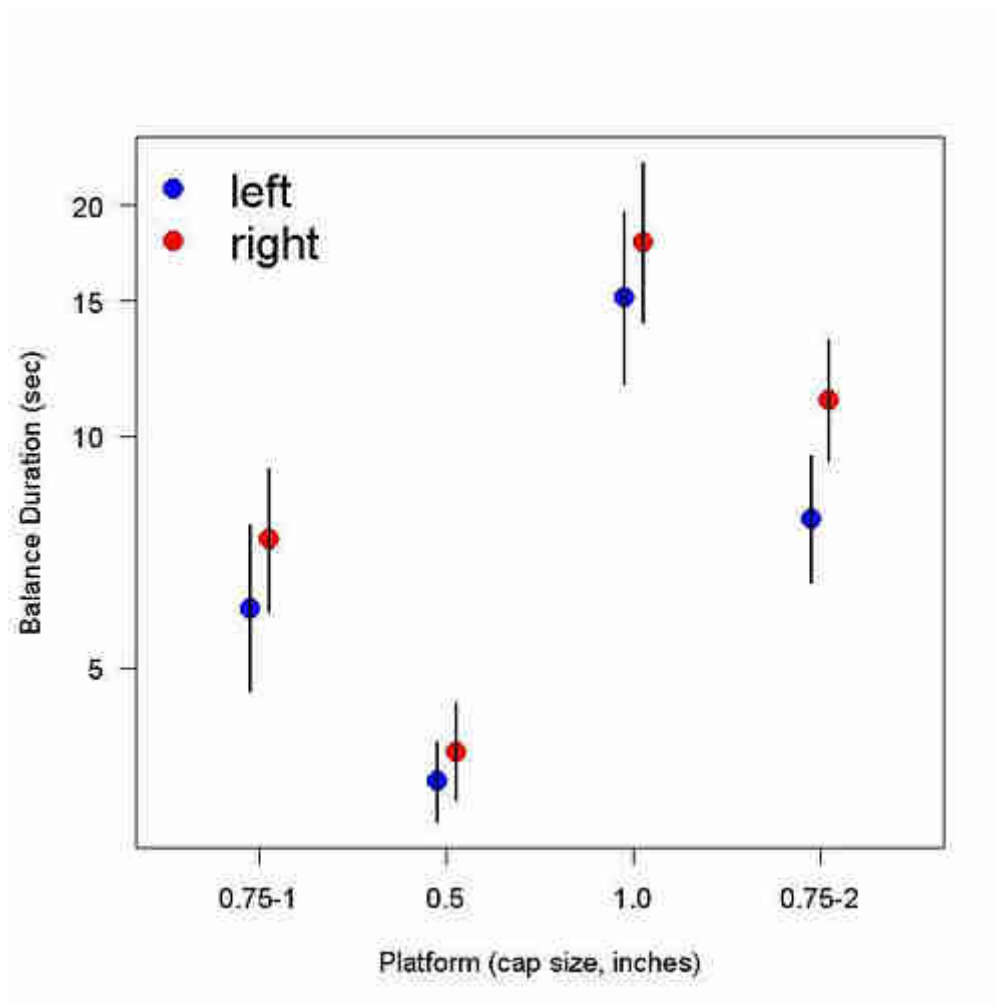

Why is now a great time to be alive? Because Philip Weiss, one of my favorite writers, has a [1]blog. [2]Today's entry mentioned a [3]story about teaching the Torah while standing on one foot.

Speaking of standing on one foot . . . I devised a way to measure my balance. (To recap: I want to measure my balance to see if omega-3 improves it. When I increased my omega-3 consumption via walnut oil and flaxseed oil, it suddenly became much easier to put on my shoes while standing, which I'd been doing for years. The omega-3 also improved my sleep. [4]Maybe omega-3 makes much of the human brain work better, especially the most-recently-evolved portions. [5]Maybe this effect happens within hours.)

Here is the method. Equipment. At a hardware store I bought a series of 6 pipe caps, caps for 0.5 inch pipe, 0.75 inch pipe, 1.0 inch pipe, 1.25 inch pipe, 1.5 inch pipe, and 2.0 inch pipe (total \$24). At a new-age pharmacy I bought a thick foot-sized cutting board (made of bamboo, \$15). Below is a picture of these items and my stopwatch, which measures times to 0.01 second. Procedure. I put the board on one of the caps and balance on the board on one foot. I measure with a stopwatch how long I can balance on it before putting the other foot down. After 30 seconds, the trial stops – 30 seconds is the maximum possible score. I stand on my left foot for several trials (e.g., 12), then switch to my right foot for several trials.

The reason for six different caps – six different platforms – is to be able to adjust the difficulty so that it is neither too easy nor too hard – if either were the case the measurements wouldn't be telling me much. With a little trial and error, the 0.75-inch cap seemed to be best. Below is data from that cap and the smaller and larger caps. With each foot I balanced 12 times; the graph shows the means and standard errors on a log scale. The sequence of conditions was: (1) 0.75-inch cap, (2) 0.5-inch cap, (3) 1.0-inch cap, (4) 0.75-inch cap. I balanced on each foot 12 times in each of the 4 conditions.

The results make sense: the smaller the platform, the less time I could balance on it. There appears to be a practice effect – better scores with more practice. I hope with more experience this effect will go away. The next step is to do these measurements several times per day for several days so that I can get some idea of how much they vary “naturally” – what the background variation is.

In the spirit of frank and unsolicited advice, it was an interesting essay but it took me 1.5 reads to figure out what it was saying. I think you need to be a little more careful about structure, so that the readers can see the connections and understand the conclusions. [1]This paper explains how scientists can do this, based on research done into how people read.

## Brain Food (part 5: a little progress) (2006-07-29 10:16)

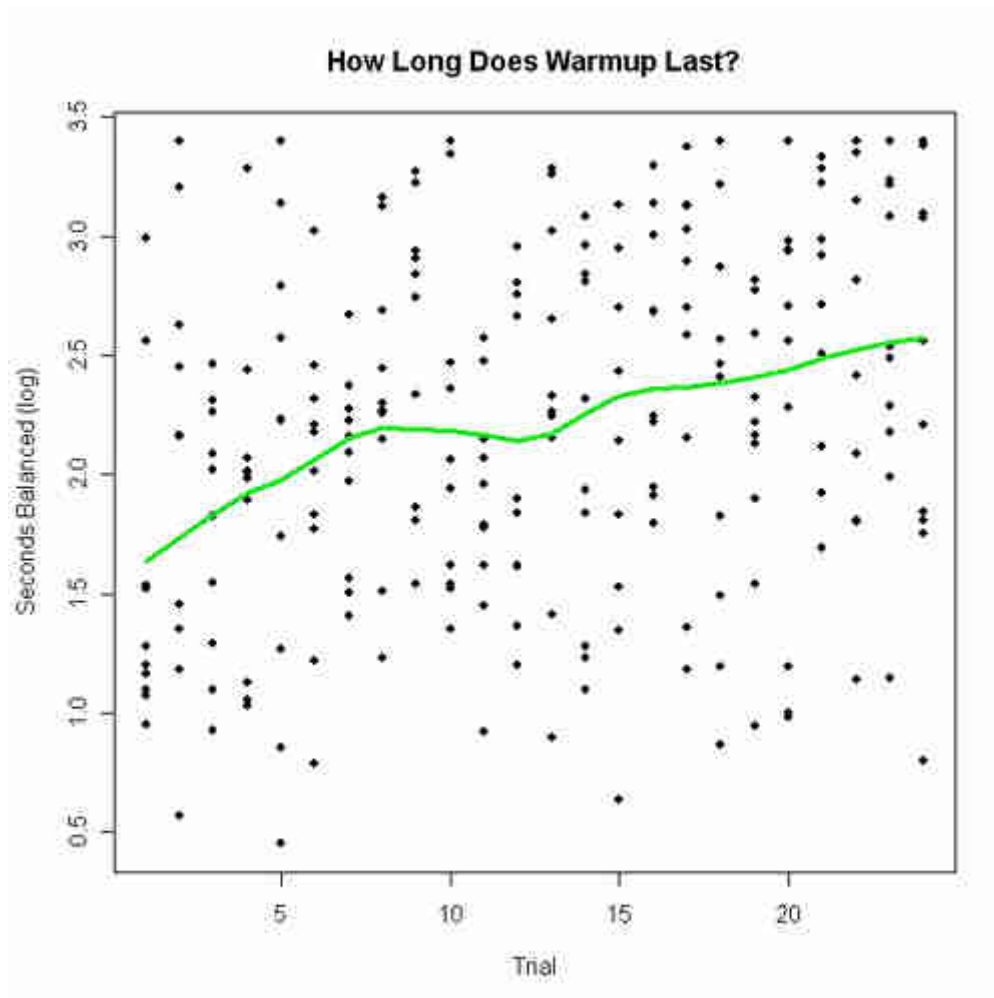

I've been doing small experiments on my balance to learn what affects it. Most research using new tools follows a progression. Step 1: you learn what people already knew. Step 2: you find new information that isn't very interesting. Step 3: you find interesting new information. [1]Earlier I found that I could balance on one foot longer on a wider platform – Step 1.

Now Step 2. I've done a few experiments comparing different footwear (sandals, shoes, barefoot). In each experiment I ran several conditions, each consisting of 12 trials standing on my left foot followed by 12 trials standing on my right foot. These trials had gaps of seconds between them. Different conditions (different footwear) were separated by at least 10 minutes and usually more.

The right-foot average was always more than the left-foot average. You can see examples of this in [2]my earlier results. I doubt that the right foot/leg is actually better than the left so this suggests there is a substantial warmup effect, as there is in most tasks.

To make measurements more precise, it would help to have a warmup period before collecting the main, more stable data. How long should it be? The graph below shows data from many of the conditions I have run arranged by trial number, with a lowess summary line.

The y axis is in log seconds, not seconds; I used a log transform to make the distribution of the data more symmetrical. The maximum time was 30 seconds. ( $\text{Log}(30) = 3.4$ .) If I kept my balance for 30 seconds, I stopped, and recorded the result as 30 seconds.

The graph shows an early warmup period that lasts 6-8 trials long, followed by a slow improvement that lasts at least 24 trials. Here is something new and not very interesting: details about the warmup effect.

## Brain Food (part 6: a little more progress) (2006-07-31 22:44)

I did two balance experiments with a warmup of 8 trials. In one, the order of feet (which foot I stood on) was left, then right; in the other, right, then left. In both experiments I did much better (i.e., balanced longer) on my right foot than my left foot,  $p < 0.001$ . This surprised me; I had never heard of such an asymmetry. The difference was so large that the platform size (0.75 inch) good for the left foot was too easy for the right foot.

To make things as simple and easy as possible I decided to stop testing both feet and to only measure balancing on my right foot (and to use a 0.5-inch platform to make it more difficult and avoid a ceiling effect). I tested my balance (a) in silence and (b) listening to a book. The results were similar so I decided the standard condition will be listening to something. I want to make my balance test fast and pleasant.

I came across several promising related facts:

1. On the Shangri-La Diet (SLD) forums, spacehoppa [1] said she felt "solid on [her] feet" – which may mean her balance has improved. If so, the improved balance that I noticed may be widely true. She also said "my mind feels clearer," another effect I noticed from omega-3's, and more reason to think omega-3 improve brain function.
2. On the SLD forums, porkypine [2] wrote, "I have a very strong reaction to the 1500 mg of OmegaBrite that I have begun taking in the morning. . . . During the day, I am not just happier, but actually chipper, which is not a normal state for me. I have wondered if I am getting too much Omega-3." This supports one of the assumptions behind my upcoming tests of the effects of omega-3 on balance: the effects of omega-3 on the brain happen quickly. It also highlights an advantage of measuring balance rather than something else, such as mood – namely, it is reasonable to assume that the better your balance, the better your brain is working. As this quote shows, the mapping between mood and goodness of functioning is not so clear.
3. In a book about neurology (Defending the Cavewoman by Harold Klawans), including Creutzfeldt-Jacob disease, I read: "A [Fore] woman in late pregnancy who was unable to walk easily across a narrow tree trunk bridging a gorge knew from that change in her balance that she had kuru and that she would die of it. The physicians examined her and thought she was normal, but in less than one year, she was dead." This shows that balance is an especially sensitive measure of brain function, at least under demanding conditions. It's relatively easy to notice worse balance.

Balance is also much easier to quantify than many other measures of brain function, such as mental clarity.

---

bekel (2006-08-02 14:40:24)

One thing about balance is that I was told by my doctors that balance has three areas that control that function: vision, inner ear, and the brain. If at least two of those areas are functioning normally, your balance will function properly. If two or more areas are not functioning normally, your balance will be impaired. I would submit that for you folks, the impact of omega-3 on the brain may be creating the improvement. I'm envious—all three of those areas are impaired for me. I have not seen any improvement in my balance even with the omega-3 from the flaxseed. It hasn't gotten worse either, so that's something. I do plan on trying fish oil, since there are elements of omega-3 that are not available in large quantities in flaxseed oil that are available in fish oils. Perhaps that will impact my balance for the good. Thanks for all of your work.

barleyblair (2006-08-02 21:54:14)

A bit of personal history to show why I was so interested in Seth's finding about omega-3s and balance: I was born with a very slightly deformed left foot, nothing crippling, but noticeable if I was barefoot or wearing sandals and uncomfortable, right on the edge of painful, pretty much all the time. I had had three surgeries to correct the bunions that resulted from the anomaly, but they did no good; the bunions just came back and the foot became more and more trapezoidal. Then in 1997 I learned about a new surgery to correct the underlying problem; my new foot doc said I should decide whether to have it pretty soon because they won't do it on people over 60. I hemmed and hawed and finally, in January of 2003, six months before I turned 60, I had the new procedure, which was actually four surgeries, two in January and two the next September. Yadda yadda, months in bed, foot six inches above heart, blah blah blah. The upshot was I got a new foot, and it's great. It never hurts even a tiny bit, and I can walk from here to Sunday with a big smile on my face. What I couldn't do was balance on one foot. Balancing on the old left foot would have been impossible, and since I couldn't do it on the left foot I never did it on the right foot either. There's nothing wrong with my inner ear or my vision – I can ride a bike, no sweat – but my feet had never learned how to balance independent of each other. I would try to stand on my right foot; the folks in rehab always tell you, "Do the good one first; then the good one can teach the other one." But my right foot had no more idea how to stand alone than the left one did. So since September of 2003 I've had it as a goal to put my socks on standing up. Teeter-teeter, teeter-teeter ... BANG. Teeter-teeter ... SMASH. I didn't give up, but I also never seemed to make much progress. Both feet were equally bad. It was like a funny little game I'd play with myself every morning. Kind of funny, kind of sad. Last Thursday, having read the first of Seth's Brain Food posts, I chucked some flax and borage oil in my first Crazy Shake. Friday, Saturday, the same. Sunday I took some fish-oil capsules too. Monday, again, the flaxseed oil, again some fish-oil capsules. Tuesday morning I put my socks on standing up. This morning I put my socks on standing up. Then I got all cocky and put my \*/shoes/\* on standing up – something that had never been a part of my wildest ambitions for myself. I tied the knots standing up, not needing to steady myself against my dresser. I stood on one foot waiting for the bus, then on the other. Downtown I walked up an escalator no hands – wow! Then I walked \*/down/\* an escalator no hands. Wow! Wow! Oh man, this foot-balancing thing is fantastic. Now of course, it's easy for the dubious viewer to see that I am a dupe of the Seth Roberts Evil Empire. The Omega-3s are nothing but magic feathers, and I could have put my socks on standing up all along if I weren't such a wimp. So the dubious will say. But as for me, I'm switching from canola oil and ELOO to walnut oil, swishing the flax oil into my Crazy Shakes, chucking down the fish oil pills, and eating massive quantities of salmon and sardines. You'll recognize me easy, I'm the little old lady at the bus stop, standing meditatively, first on one foot and then on the other, smiling my secret smile.

bekel (2006-08-03 06:31:44)

Considering that now that I have deep restful sleep from flaxseed oil I have nominated Seth for sainthood. If I can put my socks (heck-if I can put my pants) on standing up again I will nominate Seth for Ruler of the World. The brain injury people need to be looking at this protocol to use as a part of rehab.

pauls (2006-08-03 09:29:58)

Seth: How about testing your balance with your eyes closed? Here's a standard protocol: <http://www.realage.com/WorkoutCenter/articles.aspx?aid=10318> RealAge has a cited this protocol as a way to assess your brain's age.

### Brain Food (part 7: looking for a steady baseline) (2006-08-03 22:30)

Thanks a lot to those who commented on my [1]previous post, very helpful comments. Barleyblair [2]said that after greatly increasing her omega-3 intake she too found her balance greatly improved – not only could she put her socks on while standing she could put her shoes on while standing, which she hadn't even dreamed of being able to do. Bekel [3]said her sleep is deep and restful because of flaxseed oil. Pauls referred me to [4]a Real-Age test of balance where you stand on one foot with your eyes closed. I tried it. It was way too easy: After two minute I opened my eyes and stopped the test. The table that tells you what the results means only goes up to 28 seconds. If the table is not completely bogus, then my balance is much better than average. Which is consistent with my working hypotheses that (a) the average American gets far too little omega-3 and (b) my brain function – indexed by my ability to balance – greatly improved when I increased my omega-3 intake. Keep in mind that according to conventional recommendations I ate plenty of fish (several servings per week) before increasing my omega-3 intake.

Before doing a simple test of the effects of omega-3 on my balance, I would like to establish a steady baseline and get an idea of what normal variation is. If possible, I would like to reduce normal variation – reduce background noise, in other words. With this goal I have measured my balance 13 times under roughly the same conditions: barefoot, listening to a book (a fascinating book, by the way: *Cod: A Biography of the Fish that Changed the World* by Mark Kurlansky) while doing the test, 20 trials per test. Each trial consists of standing on one foot on the cutting board on the 0.5-inch platform (see equipment [5]here) and measuring how long until my other foot touches the ground. Each test takes about 10 minutes. I like the book so I enjoy the tests.

Below are the results from all 13 tests as a function of trial number. They show that there is a warmup period lasting 5 trials.

That just refines warmup measurements I posted [6]previously. This is completely new:

The x axis shows when the test was done; points that are close together on the x axis were done close together in time – e.g., an hour apart. I hoped for a steady baseline so that I could go on to more interesting stuff. That is not what I found. I did a one-factor F test to see if there was significant heterogeneity. I used only the last 15 trials of each test, dropping the first 5 “warmup” trials. There were 13 levels (the 13 tests) of one factor. There was a highly reliable ( $p = .003$ ) effect of test, meaning the variation from one test to the next was too large to be sampling error. And this test did not take into account the obvious clustering – tests close in time had similar results. The clustering makes it even more likely there were real differences in balancing ability from one test (or rather cluster of tests) to the next.

Apparently my balancing ability can change substantially in several hours! (For example, the time between the last test and the next-to-last test, the last in a cluster of three, was 7 hours.) And my test is sensitive enough to detect this! Forgive the exclamation marks. Nothing in my knowledge of psychology makes it obvious or even likely that this would be true – that a measure of quality of brain function would vary so much in hours that it could be detected by single measurements. Or that single measurements would be precise enough to detect such a change. Of course brain function (e.g., alertness) may get worse as you get sleepy but in this case my balance was much better in the evening than in the morning. The differences in my scores had no correlate that I could notice – I didn’t feel noticeably different when I did worse than when I did better.

What might be causing the differences? Body temperature or other circadian rhythm: Unlikely, because one would expect best performance when body temperature is highest, around 4 pm, which does not fit the results very well. More plausible: blood concentration of omega-3. It will be relatively low in the morning because while I was asleep I took no flaxseed oil or walnut oil. It will rise during the day as I consume these. This is consistent with the high

measurements in the early evening.

Whatever the cause, these data suggest that something in ordinary life (which includes omega-3 consumption) can improve brain function within hours. If you, dear reader, know of other data that suggests this conclusion please let me know. Drugs and alcohol can quickly change brain function but they are not involved here. Nor am I listening to music, also believed to improve brain function (slightly). I am going to try to reduce fluctuations in omega-3 blood levels and see if I get more uniform measurements. I had a cup of tea with caffeine this afternoon; caffeine consumption is something else I will better control (by eliminating it).

## **Brain Food (part 8: a little more baseline) (2006-08-08 23:23)**

As I mentioned [1]earlier, while measuring my balance I've been listening to a book called *Cod: The Fish that Changed the World*. Around Hour 4 of the book I realized it was related to what I was doing: fish, brain food. Duh!

Each test of balance consists of 5 warmup trials followed by 15 regular trials. Each trial generates one number, a duration: how long I stand on one foot before the other foot touches the floor. It's a bit like surfing—balance, balance, balance, balance, balance, wipe out. (Surfers, skateboarders, skiers, snowboarders, gymnasts . . . this may interest you.) I enter the stopwatch times directly into my laptop. Each test lasts about 12 minutes. Because of the book, they're pleasant.

I made several more baseline measurements of my balance with two changes:

1. To reduce fluctuations in the concentration of omega-3 in my brain, I did my best to take the flaxseed oil capsules as evenly spaced as possible. The general rule was to take 1 every 2.4 hours (= 10 per day). I didn't take the capsules with me when I left home but I did follow that rule when I was home (not waking up to take them, however).

2. To make the distribution of (log) balance times more Gaussian (normal), I raised the maximum possible time from 30 seconds to 60 seconds. Previously I had stopped the test at 30 seconds; now the cutoff was 60 seconds. The problem was 30 seconds was too common – my balance was too good. Before the change, 3 % of baseline measurements (6 out of 210) were 30 seconds. After the change, 12 % of measurements (25 out of 210) were between 30 and 60 seconds and <1 % (1 out of 210) were 60 seconds.

The graph below shows results (mean & standard error) for 28 sessions.

The early problem (first 10 tests), discussed in [2]my previous post, was that the means were fluctuating too much. A one-way ANOVA, with each test a different level, gave  $F(9, 140) = 2.6$ ,  $p = 0.008$ . This is why I started trying to evenly distribute the flax capsules over the day. This seemed to work. For the last 18 tests,  $F(17, 252) = 1.0$ ,  $p = 0.4$ . Unfortunately there is obviously an upward trend but that is okay because the change I am going to make – much less omega-3 – should if anything impair balance.

sbean (2006-08-09 10:35:34)

Aren't you worried that your expectation of worse balance will skew the results?

Seth's blog » Blog Archive » Brain Food (part 9: supporting data, and a problem) (2006-08-13 22:46:29)

[...] But, as you can see, there was a problem: My balance rapidly improved during the low omega-3 condition. Although the results support my original idea, they don't support it as strongly as they might. A comment on a previous post was "Aren't you worried that your expectation of worse balance will skew the results?" No, I'm not I thought when I read it. I had several reasons for not worrying about the effect of expectations, and now another has come along: Surprising results, which imply that expectations have little effect. I did not expect significant improvement from practice. I had believed that because I balance everyday for hours while standing and walking, there would not be a large practice effect. I was wrong. [...]

pisces (2006-09-05 16:58:22)

Seth, what made you decide to use flax and walnut oils instead of fish oil for this experiment?

seth (2006-09-06 08:29:35)

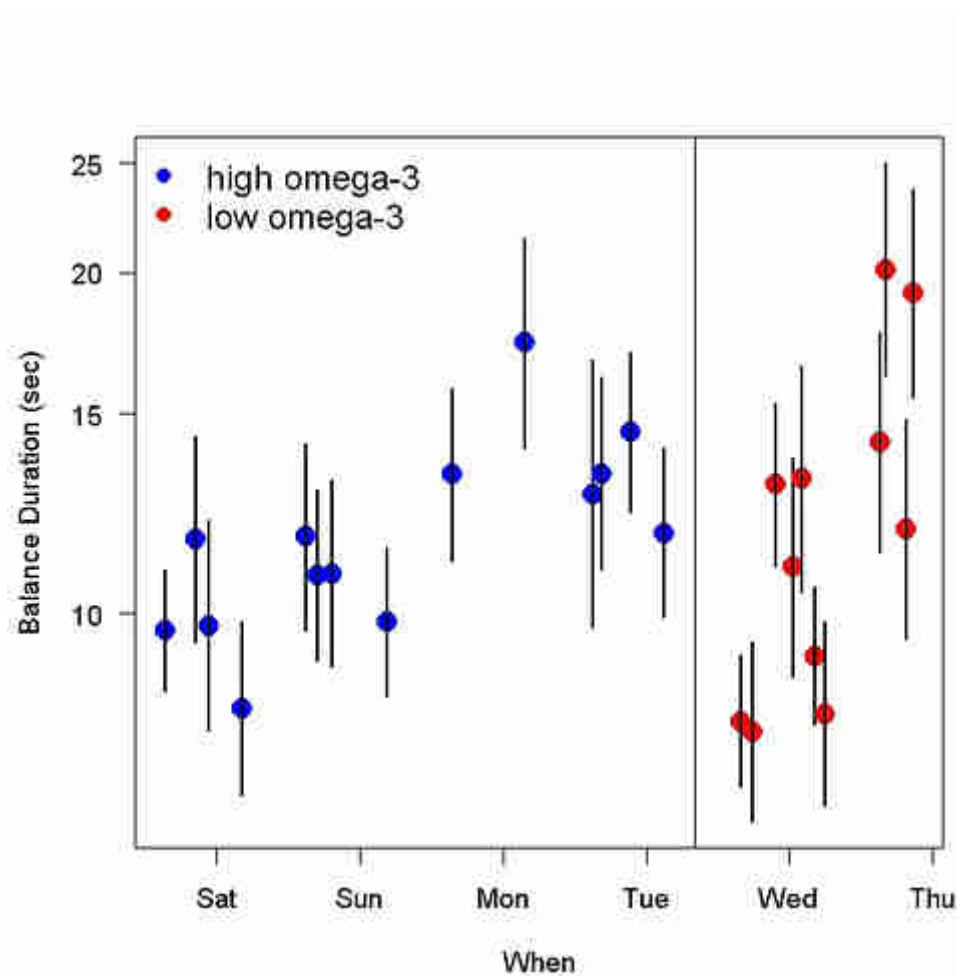

I tried fish oil one day and got a headache the next morning. Maybe I took too much. Or maybe my fish oil was bad. I'll try again.

Seth's blog » Blog Archive » Yet More about Omega-3 (2007-01-15 04:34:57)

[...] I have done more self-experimentation about omega-3s and will describe the results in a week or two. Previous posts about omega-3 [here](#), [here](#), [here](#), [here](#), [here](#), [here](#), [here](#), [here](#), [here](#), and [here](#) [...]

## **Brain Food (part 9: supporting data, and a problem) (2006-08-13 22:46)**

I reduced the amount of omega-3 in my diet. I stopped taking flax-seed oil capsules (I had been taking 10 1000-mg capsules/day) and started drinking extra light olive oil (2 tablespoons/day) instead of walnut oil. I made the change at midnight: Tuesday high, Wednesday low. The graph below shows measurements of my balance.

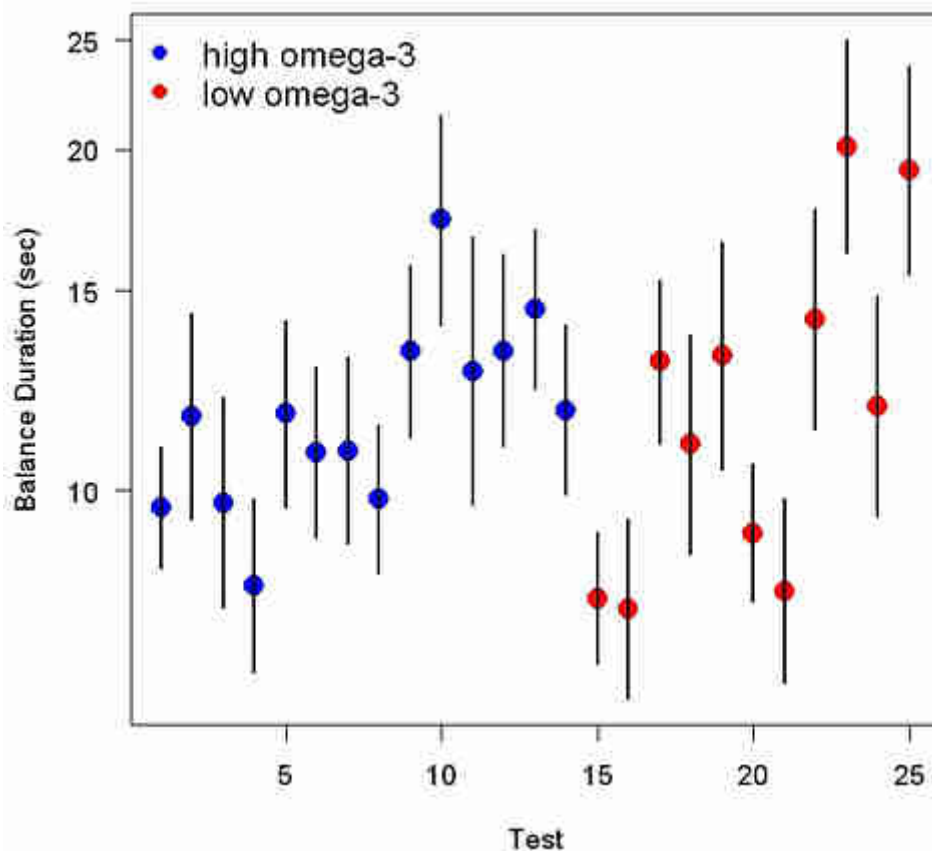

From Saturday through Tuesday, and preceding days, my intake of omega-3 was high; on Wednesday and Thursday it was low.

My balance was worse Wednesday morning than expected by extrapolation, which supports the idea I started with: omega-3 affects my balance. The time course of the change (the impairment was clear in hours) resembles the original observation: I could put on my shoes while standing much more easily the morning after the day I increased my omega-3 consumption.

But, as you can see, there was a problem: My balance rapidly improved during the low omega-3 condition. Although the results support my original idea, they don't support it as strongly as they might. A [1]comment on a previous post was "Aren't you worried that your expectation of worse balance will skew the results?" No, I'm not I thought when I read it. I had several reasons for not worrying about the effect of expectations, and now another has come along: Surprising results, which imply that expectations have little effect. I did not expect significant improvement from practice. I had believed that because I balance everyday for hours while standing and walking, there would not be a large practice effect. I was wrong.

Psychologists don't know much about motor learning. There are few well-established empirical generalizations about what makes motor learning faster or slower. Another gap in our knowledge is about the nature of the underlying change. When you get better with practice, how does your brain change?

After I shifted to low omega-3, I was surprised not only by how much I improved but also by how quickly. Was my improvement due simply to more tests? I plotted my scores versus test number:

This graph suggests that I improved more per test (greater slope) during the low-omega-3 condition than during the high-omega-3 condition. I think it is a spacing effect: During the low-omega-3 condition, I tested more often. During the high-omega-3 condition, I did 14 tests in 3.5 days – 4.0/day. During the low-omega-3 condition, I did 11 tests in 1.2 days – 9.1/day. I tested more often because I wanted to track the decrease. I think this difference in test rate is the reason for the slope difference. This effect is the opposite of the usual spacing effect in learning experiments, in which close-together (“massed”) practice is less effective than widely-spaced practice.

Relevant to the theme of [2]inspiration via self-experiment, these results and my experience gave me several new (at least to me) ideas about motor learning. One was the existence of this spacing effect. Another was that practice changes the brain by increasing how much of the brain is devoted to the task. (The areas used for other tasks shrink.) Practice increases accuracy because more neurons become involved. The output, the action, is an average from a larger sample. One reason I thought of this is that after lots of practice, and I became quite accurate, the circular area on which I was balancing seemed larger. The notion that the brain area used by the task gets larger helps explain the spacing effect. Spacing is important because the brain doesn’t care how often you have done something in the distant past; what matters is how often you are doing it now. Thus the spacing effect helps make efficient use of scarce resources (neurons). The spacing effect occurs because neural activity causes an increase in something (call it X) that slowly fades away. If later activity happens while X is above a threshold, neural rewiring occurs.

The big practice effects and the idea that practice is more powerful when more frequent should interest anyone

who wants to improve their balance (and probably other motor skills), from athletes to the elderly. In a simple cheap easy safe way I got better quickly–too quickly, actually. What happened reminds me of Little League: My batting got much better when I started swinging a bat in my backyard.

The lesson for my experimental design is that I should reduce and keep more constant how often I test.

bekel (2006-08-14 14:19:22)

When I was in physical rehab after my accident, one of the things that the folks told me was that if I chose to use a cane constantly, my balance would not get better. The expectation was not to use my cane in the home and areas where I felt safe walking. There is a device where you stand on it and it records the data in software numerically as well as pictorially (it shows how your weight shifted from one area of your foot to another during the test). I noticed an improvement from beginning to end of each test as well.

### **Seymour Benzer (part 1) (2006-08-20 23:14)**

I found [1]a long interview with Seymour Benzer, a biologist at Caltech, who is one of my favorite scientists – [2]lots of creative and important work. I was pleased to learn he is a foodie. During a 1956 trip to Japan he had sushi for the first time. "One of the greatest things about the trip," he said in 1990 (when the interview took place), presaging a future in which every upscale American supermarket sells sushi. (For dinner tonight I made salmon tartare.) When I was a student at Caltech I knew the other students liked him, but I never met him.

Benzer began the use of fruit flies to study behavior. At Woods Hole I took a course called Neural Systems and Behavior with a fruit-fly segment taught by Laurie Tompkins. She had met Benzer at a party. When she told him she studied fruit-fly mating, Benzer asked if they have orgasms. Very early in his work on behavior, he gave a talk to Roger Sperry's lab about his plans. After his talk there was a lot of debate about it. Some people thought it was very promising; others thought it was nonsense.

Interviewer: Why were people so skeptical?

Benzer: Why? A lack of imagination.

Excellent answer. I would have said: People are always skeptical.

1. [http://oralhistories.library.caltech.edu/27/00/OH\\_Benzer\\_S.pdf](http://oralhistories.library.caltech.edu/27/00/OH_Benzer_S.pdf)
2. <http://benzerserver.caltech.edu/pages/cv/BenzerFullCV%209-04.htm>

john.howes (2006-08-21 17:19:48)

Really? I would say very few people are skeptical enough.

seth (2006-08-22 07:55:00)

By "people" I meant the sort of people in Roger Sperry's lab. The typical audience for a talk by a scientist to other scientists.

losing-it (2006-12-09 18:24:43)

Interviewer: Why were people so skeptical? Benzer: Why? A lack of imagination. Excellent answer. I would have said: People are always skeptical. ===== Probably because they've never tried sushi. All things being relative, that is. ("They" being "the typical audience for a talk by scientists to other scientists.") P.S. Does Benzer need any more fruit flies? I've got a nice colony started on some bananas :^D P.P.S. To Benzer's thought processes, one might liken the following 3 haiku (excepting the pond & over-matured sushi, which could be "they," perhaps... old pond a frog jumps in sound of water Matsuo Basho (1644-1694) Translation At the over-matured sushi, The Master Is full of regret. Yosa Buson (1716-1784) Translation I eat alone & pass the salt for myself Michael McClintock (1950-Present) "Man With No Face"

### **Seymour Benzer (crippling the Salk Institute) (2006-08-22 08:50)**

One of the most fascinating stories in Benzer's [1]oral history interview is about construction of the Salk Institute in La Jolla, California:

Benzer: Louis Kahn [the architect] asked Salk, "How much money have you got to put into the building?" And Salk said, "Ten million for endowment" – this was all from the commitment from the March of Dimes – "and a million dollars a year for operating expenses in perpetuity." So Kahn went home and designed a building for \$20 million. In fact, he bragged about this at some dinner he had in La Jolla. He talked about other buildings he had designed and he said it was always his policy to make the building for twice as much as the money available, because you could always count on the fact that people scurry around to find the extra money.

Salk went for that idea on the argument that later on it would cost much more to build it. That was absolutely true. But at the time it had the effect of liquidating the endowment. And everything suffered from then on. The institute . . . was always worrying about where the next buck was coming from.

. . .

Interviewer: So they liquidated their entire endowment to construct a more expensive building?

Benzer: Yes.

Kahn knew a general principal about human nature that I do not. Why do backers reliably "scurry around to find the extra money"? Something powerful is at work here.

1. [http://oralhistories.library.caltech.edu/27/00/0H\\_Benzer\\_S.pdf](http://oralhistories.library.caltech.edu/27/00/0H_Benzer_S.pdf)

Carols (2006-08-22 14:29:20)

That's an old sales trick. Show them the super duper model and they will never be satisfied with the car they can actually afford unless they've firmly planted in their mind that they don't need all those extras. Who wants a crummy 10 million dollar building when they can have the really nice 20 million building? If there is a way, it will be found if the desire is sufficient. So in this case better is the enemy of the good enough.

iportion1 (2006-08-22 17:56:38)

I would rather have what I asked for.

Catherine Johnson (2006-08-25 06:48:54)

In for a nickel, in for a dime!

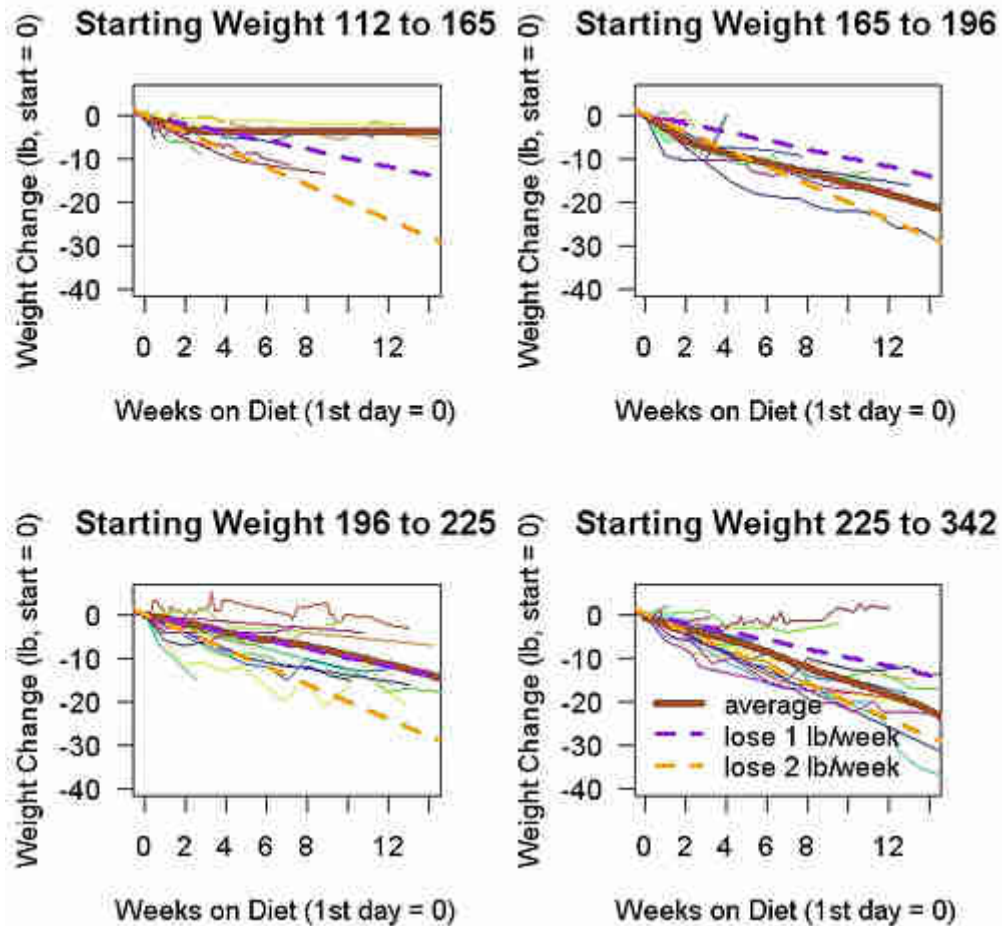

Catherine Johnson (2006-08-25 09:23:55)

Almost 20 years ago, on a Fourth of July weekend in Studio City, my husband and I saw an ad in the paper for brand-new \$10,000 dollar Camrys at our local Toyota dealership. I had my husband call to make sure they actually had \$10,000 Camrys on the lot. They did. When we got there the place was mobbed with people not buying \$10,000 Camrys. We said we'd come for the \$10,000 Camry. The salesman told us we didn't want the \$10,000 Camry because the \$10,000 Camry had a standard transmission. I said standard transmission gave you "more power." The salesman looked at me for a second, then turned and walked away without another word. Obviously the guy figured that if the *wife* was saying a standard had more power, it was hopeless. We went home with a \$10,000 Camry. The guy who finally found the car & sold it to us threw in a set of fancy wheel rims for free. Our nanny owns the car now, and is still driving it.

## **How Well Does the Shangri-La Diet Work? (part 1: breakdown by starting weight) (2006-08-27 16:59)**

The most basic question about the Shangri-La Diet is how well it works. As the host of The Amazing Race might say, there are many ways to answer this question, each with their own pros and cons. Thanks to Rey Arbolay, we can answer this question in a new way: by looking at the data in the [1]Post Your Tracking Data Here section of the [2]Shangri-La Diet forums, where more than 80 people have posted.

The goal of SLD, of course, is weight loss. The problem with just plotting pounds lost as a function of time on SLD is that a loss of 10 pounds is quite different to someone who starts at 120 pounds and someone who starts at 300 pounds. To deal with this I have divided the results by starting weight. In the graphs below, the ranges of weights were chosen so that there would be roughly the same number of people in each graph.

Starting weight makes a big difference – at least, between the two extremes. Many of the people who aren't losing very fast are in the lowest quartile. There are still a few outliers – people at the higher starting weights who are losing slowly if at all – but not many.

The next step is to do an analysis that estimates the effect of starting weight and somehow removes it. It might be better to divide people by BMI rather than starting weight, and maybe the y axis can be improved.

2. <http://boards.sethroberts.net/index.php?action=collapse;c=1;sa=collapse;#1>

---

Andrew (2006-08-28 18:11:54)

I'd try a model of the form,  $\log(y_{jt}) = a_j + b_j t + \text{error}_{jt}$ , where I'm using the notation  $j$  for persons and  $t$  for time. I'd then model the intercept  $a_j$  as a regression, including height and sex as predictors, and then  $b_j$  as a regression, including  $a_j$ , height, and sex as predictors. Ideally of course you'd also have a matched set of people who aren't on the diet, but perhaps that's too much to hope for... P.S. Excellent use of multiple graphs per page. My only suggestions here are: (i) make the lines a little thinner (`lwd=.5`), (ii) keep the color but get rid of the guide lines at  $-1/\text{wk}$  and  $-2/\text{wk}$ ; these overwhelm the pictures, I think. I'd also arrange in a  $4 \times 2$  grid: the 4 weight classes you have, but 2 columns, one for the men and one for the women.

sophistry (2006-09-20 14:15:46)

Before we take out the arsenal of regressions Are the people who lost a lot of weight more likely to post about it?

seth (2006-09-20 14:22:08)

Are the people who lost a lot of weight more likely to post about it? Well, no, that is not a problem because it is a prospective study – people post their weights as they go along. The better question is: are people who are going to lose a lot of weight more likely to post about it?

## 1.5 September

### Four Great Modern Books (part 1: description) (2006-09-06 23:48)

Last week I read [1]Send In The Idiots by Kamran Nazeer. It was so good – so fresh, clear, and moving – it made me wonder how it came to be. In other words, where do great books come from? Asking what several great books have in common should suggest answers to this question.

Among books published in the last 40-odd years these are the best I have read:

[2] The Economy of Cities (1969) by Jane Jacobs. Why and how cities grow or fail to grow. How new goods and services arise. They almost always begin in cities – the book starts with a discussion of how agriculture began. [3]Cities and the Wealth of Nations (1984) by Jacobs is also great but too similar to Economy to be worth separate discussion.

[4]Totto-Chan (1981) by Tetsuko Kuroyanagi. A memoir of the author's primary school days at a progressive Tokyo private school. (Mentioned in The Shangri-La Diet.)

[5]The Man Who Would Be Queen (2003) by J. Michael Bailey. What scientists, especially Bailey (a psychology professor at Northwestern University), have learned about the causes and effects of male homosexuality. One chapter is about male transsexuals, who are not always homosexual.

[6]Send In The Idiots (2006) by Kamran Nazeer. The beautiful subtitle is Stories From the Other Side of Autism. When he was a child, Nazeer attended a school for autistic children. This book is about the adult lives of several of his classmates.

In later posts I will explain why I like these books so much and try to ferret out the secrets of their greatness.

ursula (2006-10-07 06:29:39)

Economy of Cities is great. Will have to check the rest out. Thanks!

ursula (2006-10-07 06:30:26)

Economies of Cities = GREAT! Will have to check the rest out.

Zoo Books (2008-02-27 21:36:06)

I'll have to check out Send in the Idiots.

### **Seymour Benzer (crippling medical school research) (2006-09-22 16:25)**

In [1]an interview, Seymour Benzer, the great Caltech biologist, told a story that I think explains a lot about medical-school research, including UCLA medical school professor John Ford's [2]complaint about The Shangri-La Diet:

Harold Brown [president of Caltech 1969-1977] made himself quite conspicuous by . . . trying to develop a medical school relationship. . . . His idea was for Caltech to pair up with UCLA to make a medical school. We would do the first two years of basic education of the medical students, and afterwards they would be guaranteed two more years of clinical experience at UCLA. And then they could be doctors. . . . In the Biology Division, it went over like a lead balloon: Why should we be knocking ourselves out teaching these guys, and then they go away elsewhere and don't even do research – they become doctors? What's in it for us?

Some things are hard to learn by reading. Saul Sternberg, now a professor of psychology at Penn, once spent a quarter at Berkeley and was around when Stanford grad students and faculty in cognitive psychology came up to Berkeley to present their research. One of the grad students told Sternberg about a reaction-time experiment she had done about mental something or other (mental rotation?) in which the conditions compared varied in what the subject saw. Sternberg pointed out that it would be better to keep constant what the subject sees. This is the beginning of wisdom in the design of cognitive psychology experiments, but you won't find it written down anywhere.

### **The Annotated Woman's World article (2006-09-24 22:19)**

The next issue (Oct 3) of Woman's World, already available many places, has a lovely cover story (pp. 18-19) about the Shangri-La Diet with the funny title "Instant Willpower!" The article is very accurate and reasonable but I have a

few comments.

"Lose 7 lbs a week!" (cover and p. 19). Average weight loss is 1-2 lbs/week.

"Makes your body release stored fat!" (cover). Clever. I would have said something plodding like "lose body fat."

"Roberts says refined walnut oil and light olive oils are best" (p. 18). Refined walnut oil is hard to find. I buy Spectrum refined walnut oil at Whole Foods. The Spectrum Organics [1]store locator will find stores that carry Spectrum products but not all carry refined walnut oil. In Berkeley, most don't. You may want to call ahead.

"When reading scientific journals to prepare for a lecture, Roberts had a eureka moment. . . Turning this interesting idea into practical weight-loss advice took lots of trial and error. . . . In short order, he was 35 pounds slimmer" (pp. 18-19). I lost 35 pounds using sugar water, not oil. It took three months. The turning point in going from theory to practice was a strange experience in Paris, described in the book. Also crucial was Emily Mechner's observation that if my theory was correct, flavorless oils should work as well as sugar water. All in all, though, this is a good summary.

[to make this plan work even better] "Stick with your normal foods" (p. 19). No, I think the diet works better if you start eating foods that are new to you – foods with unfamiliar flavors.

"Avoid flax, unrefined walnut and extra virgin olive oils, which have strong flavor, says Roberts" (p. 19). You can drink these oils if you close your nose (using a noseclip for example) while drinking them. That will eliminate the flavor.

---

ursula (2006-10-07 06:27:52)

Can't get the Spectrum link to work. I'm going to wild oats Market today to see if they carry it. Thanks!

## 1.6 October

### The Writing Cure (2006-10-11 03:54)

I wonder how many bloggers know about [1]this – research about the beneficial effects of journal writing. [2]James Pennebaker, a professor of psychology at the University of Texas Austin, has done a lot of research in this area. [3]Here is a list of studies. [4]This article sums it up nicely: "Writing about important personal experiences in an emotional way for as little as 15 minutes over the course of three days brings about improvements in mental and physical [!] health. This finding has been replicated across age, gender, culture, social class, and personality type."

I'm guessing this research started as a search for the crucial ingredients of psychotherapy. What happens during psychotherapy that helps people? Early research found that the therapist's training made no detectable difference. This suggested that just telling one's story was therapeutic. Journal writing is another step in the same direction: You tell your story without anyone listening. Next step: studying the health effects of blogging.

judy (2006-10-15 13:14:46)

It's nice to see this area getting some recognition. Following my example as a blogger, several of my friends in my online widow support group found that blogging has helped them as they move through their grieving journey.

The Anonymous Mama (2007-03-07 10:56:41)

Oh, this is so true! I've journaled for a long, long time, and it always seems to help iron out my "mental wrinkles." I keep one of those little Moleskine journals on me all the time. It's easy to keep up on it if you have it on you wherever you go.

### David Jenkins on the Shangri-La Diet (2006-10-17 10:49)

David Jenkins, a professor of nutrition at the University of Toronto, invented the glycemic index, probably the most important nutritional innovation of the last thirty years. The glycemic index helped me permanently lose 6 pounds (see Example 7 of [1]this paper). While preparing her [2]CBC piece about the Shangri-La Diet, Sarah Kapoor interviewed Jenkins. [3]Here is a partial transcript of what he said.

### Too Few Riders, Too Many Stolen Bases (2006-10-22 21:54)

I heard two excellent talks last week. [1]Bent Flyvbjerg, a professor of Planning at Aalborg University, Aalborg, Denmark, spoke on "Survival of the Unfittest: Why the Worst Megaprojects [subways, airports, bridges, tunnels] Get Built." Why? Because of false claims. Cost estimates turn out to be much too low and benefit estimates (such as

[2]ridership) much too high. Boston's Big Dig, for example, has already cost more than three times the original estimate. Cost estimates were too low in 90 % of projects, Flyvbjerg said. The tools used to make those estimates have supposedly improved a great deal over the last few decades but [3]their accuracy has not improved. Lovaglio and Kahneman have argued that the underlying problem is "[4]optimism bias"; however, Flyvbjerg believes that the problem is what he now calls strategic misrepresentation – when he used the term lying people got upset. The greater the misrepresentation, the more likely the project would be approved – or rather the greater the truth the more likely the project would not be approved. That is a different kind of bias. An everyday example is me and my microwave oven. Sometimes I use my microwave oven to dry my clothes. I've done this dozens of times but I continue to badly underestimate how long it will take. I guess that a shirt will take 8 minutes to dry; it takes 15 minutes. I know I underestimate – but I keep doing it. This is not optimism bias. Microwaving is not unexpectedly difficult or unpredictable. The problem, I think, is the asymmetry of the effects of error. If my guess is too short, I have to put the shirt back in the microwave, which is inconvenient; if my guess is too long the shirt may burn – which corresponds to the project not being approved.

Incidentally, Flyvbjerg has written [5]a paper defending case studies and by extension self-experimentation. He quotes Hans Eysenck, who originally dismissed case studies as anecdotes: "Sometimes we simply have to keep our eyes open and look carefully at individual cases – not in the hope of proving anything but rather in the hope of learning something." Exactly.

The other excellent talk ("Scagnostics" – scatterplot diagnostics) was by [6]Leland Wilkinson, author of The Grammar of Graphics and developer of SYSTAT, who now works at SPSS. He described a system that classifies scatterplots. If you have twenty or thirty measures on each of several hundred people or cities or whatever, how do you make sense of it? Wilkinson's algorithms measure such properties of a scatterplot as its texture, clumpiness, skewness, and four others I don't remember. You use these measures to find the most interesting scatterplots. He illustrated the system with a set of baseball statistics – many measurements made on each of several hundred major-league baseball players. The scatterplot with the most outliers was stolen bases versus age. Stolen bases generally decline with age but there are many outliers. Although a vast number of statistical procedures assume normal distributions, Wilkinson's tools revealed normality to be a kind of outlier. In the baseball dataset, only one scatterplot had both variables normally distributed: height versus weight. These tools may eventually be available with [7]R.

### More Reason to Crazy-Spice (2006-10-24 21:48)

Spices are good for you, I [1]blogged, because they are high in antioxidants. A [2]new study, done in Singapore with elderly subjects, supports this conclusion. It found that curry-eaters do better than others on a mental test. The abstract:

Curcumin, from the curry spice turmeric, has been shown to possess potent antioxidant and antiinflammatory properties and to reduce  $\beta$ -amyloid and plaque burden in experimental studies, but epidemiologic evidence is lacking. The authors investigated the association between usual curry consumption level and cognitive function in elderly Asians. In a population-based cohort (n = 1,010) of nondemented elderly Asian subjects aged 60-93 years in 2003, the authors compared Mini-Mental State Examination (MMSE) scores for three categories of regular curry consumption, taking into account known sociodemographic, health, and behavioral correlates of MMSE performance. Those who consumed curry "occasionally" and "often or very often" had significantly better MMSE scores than did subjects who "never or rarely" consumed curry. The authors reported tentative evidence of better cognitive performance from curry consumption in nondemented elderly Asians, which should be confirmed in future studies.

Tze-Pin Ng, Peak-Chiang Chiam, Theresa Lee, Hong-Choon Chua, Leslie Lim and Ee-Heok Kua. Curry Consumption and Cognitive Function in the Elderly. *American Journal of Epidemiology* 2006 164(9):898-906

### **The Trouble With Rigor (2006-10-29 23:48)**

This is an easy question: When writing down numbers, when is it bad to be precise? Answer: When you exceed the precision to which the numbers were measured. If a number was measured with a standard error of 5 (say), don't record it as 150.323.

But this, apparently, is a hard question: When planning an experiment, when is it bad to be rigorous? Answer: When the effort involved is better used elsewhere. I recently came across the following description of a weekend conference for obesity researchers (December 2006, funded by National Institute of Diabetes & Digestive & Kidney Diseases):

Obesity is a serious condition that is associated with and believed to cause much morbidity, reduced quality of life, and decreased longevity. . . . Currently available treatments are only modestly efficacious and rigorously evaluating new (and in some cases existing) treatments for obesity are clearly in order. Conducting such evaluations to the highest standards and so that they are maximally informative requires an understanding of best methods for the conduct of randomized clinical trials in general and how they can be tailored to the specific needs of obesity research in particular. . . . We will offer a two-day meeting in which leading obesity researchers and methodologists convene to discuss best practices for randomized clinical trials in obesity.

"Rigorously evaluating new treatments"? How about evaluating them at all? Evaluation of new treatments (such as new diets) is already so difficult that it almost never occurs; here is a conference about how to make such evaluations more difficult.

This mistake happens in other areas, too, of course. Two research psychiatrists have [1]complained that misguided requirements for rigor have had a very bad effect on finding new treatments for bipolar disorder.

## 1.7 November

### Amazon Rank: The Poor Man's BookScan (2006-11-01 20:39)

Calling all authors!

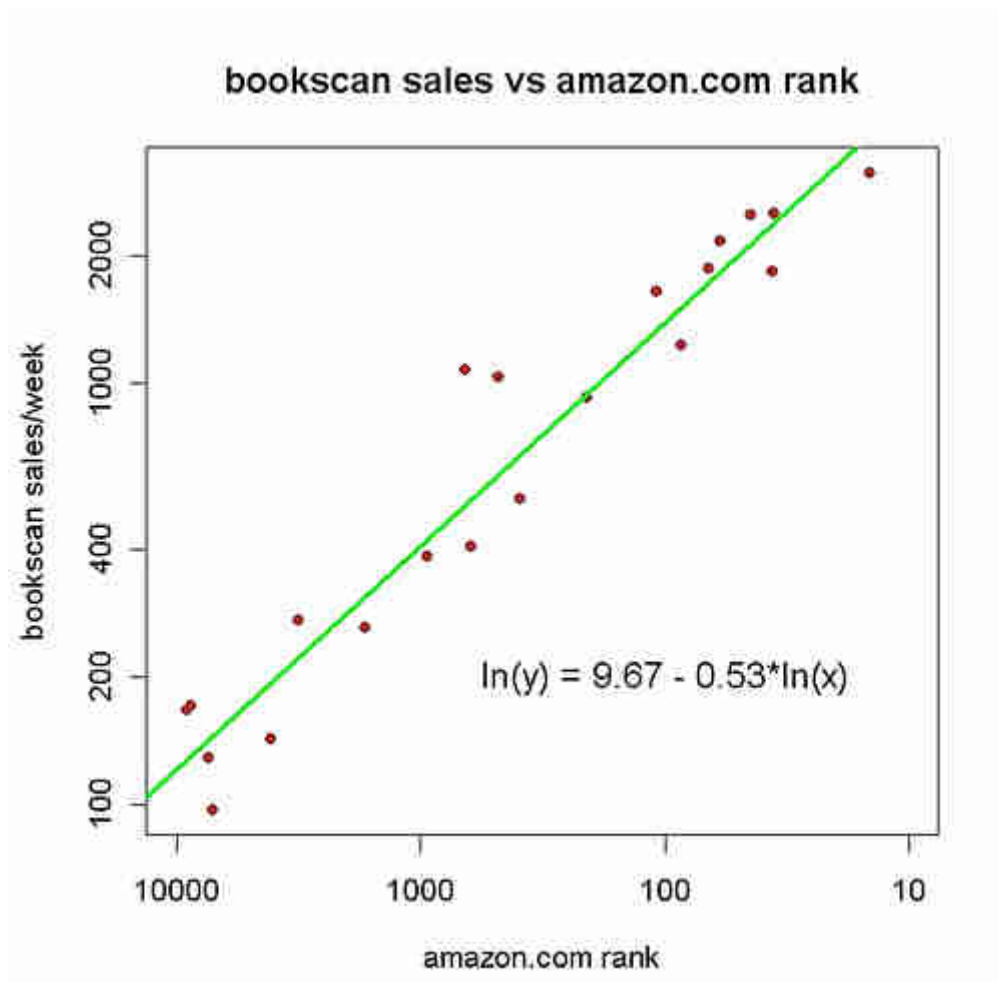

If you have written a book, you have probably wondered: What's the connection between amazon rank and number of books sold? Well, wonder no more. Below is a graph based on The Shangri-La Diet. The copies-sold information is from Nielsen BookScan. Their [1]website says:

Most of the nation's major retailers for books are included in our panel of reporting book outlets: Borders and Walden, Barnes & Noble Inc., Barnes & Noble.com, Deseret Book Company, Hastings, Books-A-Million, Tower Music and Books, Follett College stores, Buy.com and Amazon.com. Weekly sales information is also tracked from Mass merchandisers like Target, Kmart and Costco, along with smaller retail chains and hundreds of general independent bookstores.

The graph shows that the relationship between books sold and amazon rank is linear on a log-log scale (as so many things are – the physicist Per Bak wrote a whole [2]book about such relationships). Each point is a different week. To illustrate the formula of the line,

$\ln(\text{copies sold/week}) = 9.67 - 0.53 * \ln(\text{amazon rank}),$

the amazon rank of Send In The Idiots: Stories From the Other Side of Autism by Kamran Nazeer, a masterpiece about the adult lives of autistic children, is now 35,758. Predicted sales is 61 books/week.

---

Ben Hyde (2009-10-27 07:04:26)

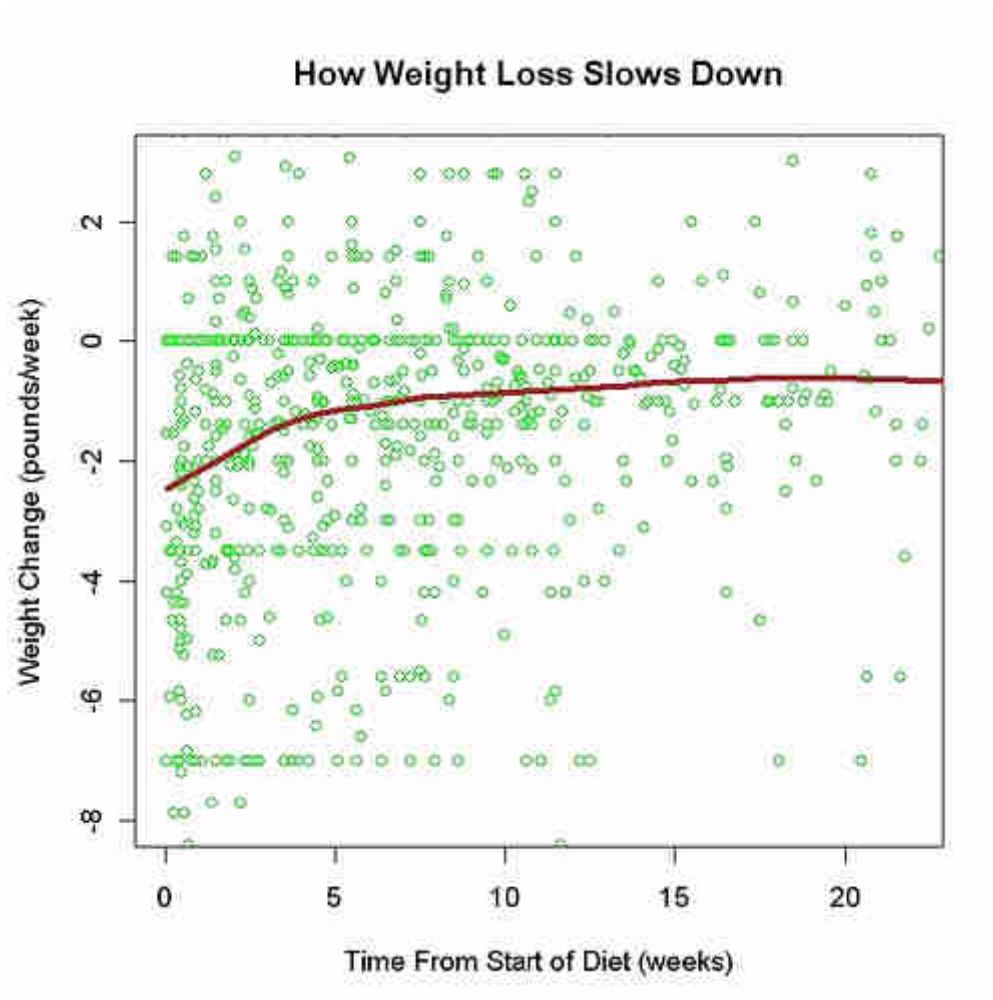

Sweet. To first order I see how this works. But. The total volume of sales must have tremendous seasonal variation. e.g. I'm flux'd that a rank of 100 in late November would sell the same number as the a rank of 100 in late January. I wonder if that might explain some portion of the variance? So I predict many of the points below the line are in quiet seasons and those above are in the holiday season. Coming at it from the other direction, I wonder if you can use your data to discover in what months diet books move. I bet people rarely give diet books as christmas presents :).

### How Well Does the Shangri-La Diet Work? (part 2) (2006-11-05 20:38)

The Post Your Tracking Data Here section of the SLD forums now contains lots of data. In addition to the weight-vs.time graphs on the [1]home page and in the [2]forums, I have now analyzed this data in other ways. The graphs below (based on data up to November 2) show how the rate of weight loss varies with (a) time on the diet and (b) weight.

For each person reporting weights, I computed a rate of weight loss for every interval in their data. For example, if someone reported her weight at three different times, then there are two intervals: from Time 1 to Time 2, and from Time 2 to Time 3. For each interval I computed a rate of weight change. The scatterplots below are based on 820 intervals. Each point is a different interval.

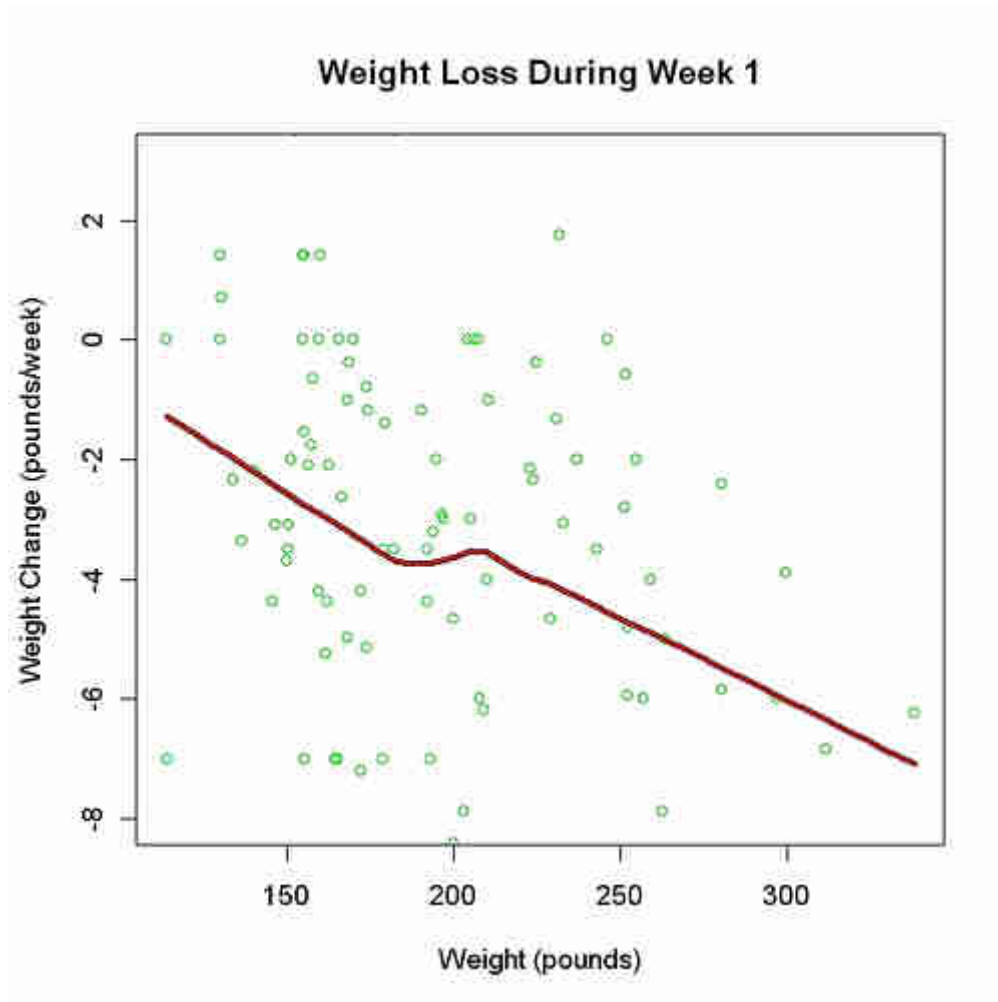

The first graph shows how the rate of weight change varied with how long you have been doing the diet.

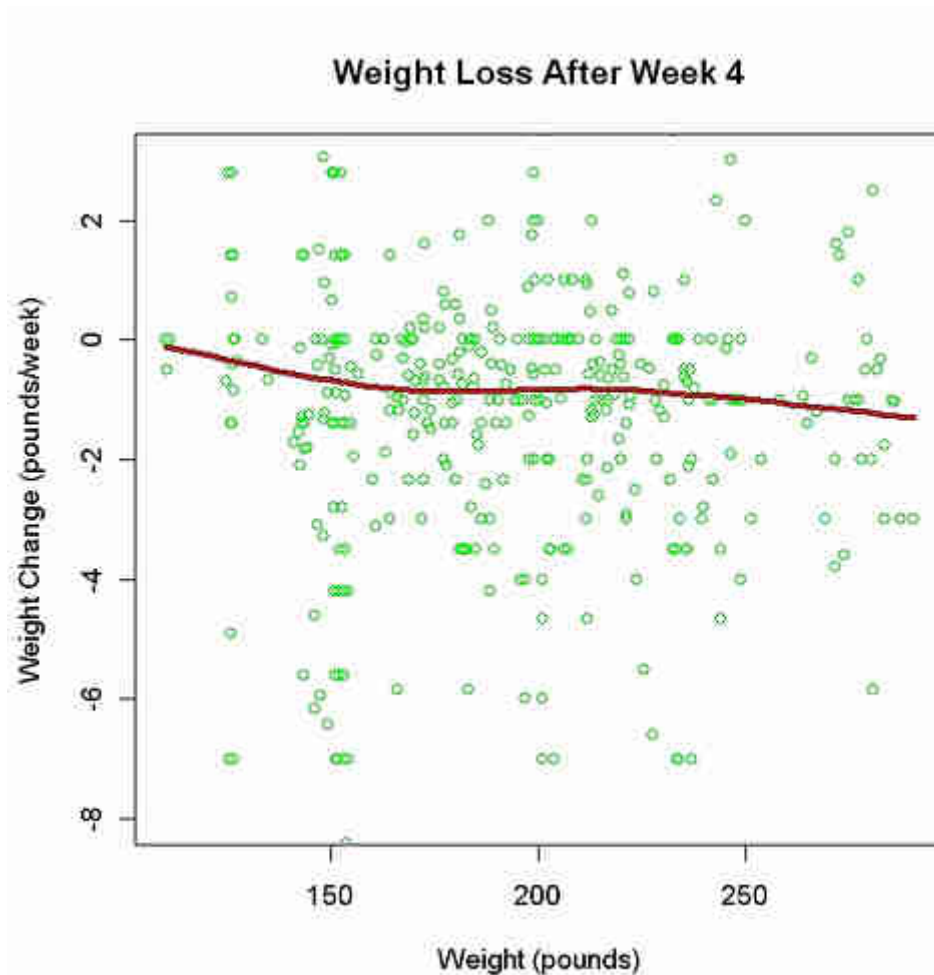

This shows that average weight loss slowed down from about 2.2 pounds/week to about 1 pound/week during the first few weeks and didn't change much after that.

Another obvious factor that might affect weight-loss rate is weight: Perhaps people who weigh more lose faster. Because rate of weight loss changes during the first few weeks, I looked at this question two ways: using only data for Week 1 on the diet (early loss); and using only data after 4 weeks on the diet (later loss).

The top graph (early loss) shows that during Week 1, your weight has a big effect on your rate of weight loss. People who weigh more lose faster. The bottom graph (later loss) shows that after 4 weeks, your weight has much less effect on how fast you lose.

My explanation: During the first week or so of SLD, most of the weight loss is not fat or water but the food in your digestive system. Because the diet has reduced your appetite, you are eating less each day. But the speed (inches/day) at which food travels through your digestive system does not change; so relatively full digestive system is slowly replaced by a relatively empty one. After this replacement – which takes about one week – is complete, further weight loss is all due to loss of fat. You comfortably lose fat at the rate at which your set point goes down. The long-term rate of weight loss is about 1 pound/week because the set point is going down about 1 pound/week.

Data analyses like these have never been published for any weight-loss method. Not that they're sophisticated or clever or surprising – they're not. Given (a) the amount of damage caused by obesity and (b) the amount of money spent on health research (2006 NIH budget: \$28 billion), it's quite a gap. Possibly related to the misguidedness I discussed [3]last week.

---

Ethesis (2006-11-07 06:01:04)

I think that most diets don't work long enough to create data sets like this.

Eliezer Yudkowsky (2009-03-28 03:21:06)

The "last week" link is currently broken.

seth (2009-03-28 04:01:17)

Thanks, Eliezer. I fixed it.

### **More Evidence That Fat Is Not Bad For You (2006-11-07 16:03)**

In the most recent issue of American Journal of Epidemiology (15 November 2006) is an article about whether there is a connection between dietary fat and breast cancer. They found no connection. Part of the [1]abstract:

Dietary fat in midlife has not been associated with breast cancer risk in most studies, but few have followed women beyond one decade. The authors examined the relation of dietary fat, assessed by repeated questionnaires, to incidence of postmenopausal breast cancer in a cohort of 80,375 US women (3,537 new cases) prospectively followed for 20 years between 1980 and 2000. The multivariable relative risk for an increment of 5 % of energy from total dietary fat intake was 0.98 (95 % confidence interval: 0.95, 1.00). Additionally, specific types of fat were not associated with an increased risk of breast cancer.

### **Grass-Fed Beef, the Shangri-La Diet, and the Future of Food (2006-11-09 16:15)**

A recent Slate [1]article compared beef from different sources. "We sampled rib-eye steaks from the best suppliers I could find. The meat was judged on flavor, juiciness, and tenderness and then assigned an overall preference."

The winner: grass-fed beef, which was also the least expensive ( \$22/pound). The highly-convincing tasting notes:

Never have I witnessed a piece of meat so move grown men (and women). Every taster but one instantly proclaimed the grass-fed steak the winner, commending it for its "beautiful," "fabu," and "extra juicy" flavor (that "bursts out on every bite." The lone holdout, who preferred the Niman Ranch steak, agreed that this steak tasted the best, but found it a tad chewy.

The grass-fed beef was probably the highest in omega-3, by the way. What the writer found wrong with grass-fed beef was lack of consistency:

One grass-fed rancher I spoke to refused to send me any steak for this article because, he said, it sometimes tastes like salmon. Restaurants and supermarkets don't like grass-fed beef because like all slow food, grass-fed beef producers can't guarantee consistency-it won't look and taste exactly the same every time you buy it.

From the standpoint of the Shangri-La Diet, of course, variable flavor is a plus – a big one. I expect a similar result with other foods – the more variable foods taste better. As any engineer knows, the less you have to worry about keeping a variable (such as flavor) constant, the more you can do to maximize it.

Thanks to Clyde Adams for the link.

1. <http://slate.com/id/2152674/>

---

losing-it (2006-12-09 16:58:37)

I'll bet the umami of an A5 cut of Kobe steak rives the set point way up there...unless umami is a variable taste, too...  
<http://en.wikipedia.org/wiki/Umami>

### **Tea, Wine, and Chocolate: A Puzzle (2006-11-11 07:32)**

Last night I went to the opening of the lovely [1]Teance store on Fourth Street (Berkeley). Teance specializes in Asian teas, with some Indian teas as well. They used to be elsewhere in Berkeley, but their lease ran out. At the new location, they replace a gift shop, which makes sense: Fourth Street is foodifying. Teance fits well with the other upscale food stores in the area, such as the Pasta Shop.

But enough about small business. At the opening, someone from a local tea appreciation society gave a brief talk. Two things he said made me think. One was: "We drink tea for fun. The health benefits are just a bonus." The other was a comparison of tea and wine. Tea is now where wine was thirty years ago. Since then there has been a vast increase in wine appreciation. "Thirty years ago if it was a special occasion you drank a bottle of Blue Nun. Now every kid on a skateboard knows the difference between merlot and cabernet sauvignon."

Wine has health benefits, of course. A few weeks ago I went to a little tour/talk/demonstration at [2]Charles Chocolates in Emeryville, where a few of the fine points of making chocolates (the candies, not the raw ingredient) were explained. Chocolate, too, has health benefits, as the makers of [3]Cocoavia will be happy to explain. (Charles Chocolates has partnered with Teance to produce a line of tea-flavored chocolates, which were served at the opening.)

Three foods with intense connoisseurship action, three foods with substantial health benefits:

1. Wine

2. Tea

### 3. Chocolate

A coincidence? Or meaningful? Will cheese turn out to have health benefits? As a general rule, connoisseurship and health are unrelated: That hand-painted Italian flatware is no better for you than K-Mart's finest (at least before the partnership with Martha Stewart, who called their customers "K-Martians".)

I became interested in connoisseurship because of [4]my interest in human evolution. Connoisseurship evolved, I believe, because it supported high-end craftsmanship. Skilled craftspeople were the main source of technological innovation. Connoisseurs happily pay more for high-end, carefully-made stuff. The tea spokesman was right: We drink it for fun.

### Tea, Wine, Chocolate – and Coffee (2006-11-12 22:00)

[1]Jacob Grier, who works in a coffee shop, has written to say that coffee deserves to be on my list of connoisseur-type foods with health benefits (previous entries: tea, wine, and chocolate). For the health benefits of coffee, read [2]this and [3]this. Thanks, Jacob. In Berkeley, Peets (coffee) and Scharfenberger (chocolate) have created several products together. Let's see: Peets and Scharfenberger, Teance and Charles Chocolates . . . the wine/chocolate category seems underpopulated. By eerie coincidence, today I watched an episode of Weeds (Season 1, Episode 3) in which the heroine goes to a cannabis club (dispensing medical marijuana) where she learns about fancy grades of marijuana she never knew existed.

Jeff Winkler (2007-11-29 19:50:22)

Chowhound has done a fantastic set of interviews that they call Obsessives. See my blog post at <http://jeffwinkler.net/2007/11/02/obsessive-food-videos-from-chowhound/> . They cover coffee, tea, and other things like bread.

## CIA Fun Facts (2006-11-14 22:45)

Tonight, at a panel discussion at UC Berkeley that was part of The New Yorker College Tour, I learned two things about Central Intelligence Agency headquarters in Langley, Virginia:

1. There are scales in the bathrooms (according to Lawrence Wright).
2. There is a gift shop that sells CIA golf balls and the like. By the register is a notice: "If you are a covert operative, don't use your credit card" (according to Jeffrey Goldberg).

The big shock, however, was neither of these. It was, as Hilary Goldstine pointed out, that there were almost no undergraduates in the audience. Which speaks volumes about UC Berkeley. It was a great discussion. Jane Mayer was the third discussant and Orville Schell the moderator.

---

CharlesMerriam (2006-11-27 01:45:53)

Could you clarify the line "almost no undergraduates there"? Do you mean at the talk? No B.S. degrees at the CIA?

seth (2006-11-27 05:03:17)

By "almost no undergraduates there" I meant at the talk.

## Crazy-Spicing 3.0: Fava Bean Crostini (2006-11-21 02:52)

Here is another way – in addition to ELOO, refined walnut oil, other flavorless oils, sugar water, nose-clipped smoothies, crazy-spiced smoothies, and nose-clipped food in general – to get "SLD calories" – by which I mean food that raises your set point much less than usual. I love this dish.

How to make crazy-spiced fava bean crostini:

1. Soak dried fava beans for 12-24 hours. I make about 1 pound at a time. One pound of beans makes about 6 servings.
2. Skin the beans. I make a small tear along the rim of the bean and then push the inside out. Takes a few seconds per bean. Discard the skins.
3. Cook the beans. I put them in a crockpot on high for 3 hours covered in water but any cooking method is okay.
4. Mash the beans, adding finely chopped onion and your favorite oil. I usually use flaxseed oil. The onion is for texture. At this point I have several meals worth. I store it in the refrigerator.
5. Slice a ciabatta-like bread into long thin pieces. Toast.
6. Add random spices to the beans. I use 4 or 5 Penzey's spice blends. If the beans have been refrigerated I

warm them in the microwave before this step.

7. Spread the bean mixture on the toast.

8. Add an interesting topping, which can be almost anything. I have used tomatoes, cooked mushrooms, and chopped arugula.

Background. Crazy spicing means adding randomly-chosen spices (say, 10-20) to your food so that the flavor is unrecognizable. The theory behind the Shangri-La Diet predicts that this will cause weight loss. No flavor recognition = no set point increase = lower set point = weight loss. The closest thing to a test of this prediction – making the flavor of food less recognizable will cause weight loss – was an experiment done by Alan Hirsch, a Chicago neurologist. A few hundred people sprinkled flavor crystals on all of their food for six months – one flavor for savory foods, another for sweet. The flavor crystals changed once a month. The subjects lost a substantial amount of weight.

The problem with adding random spices to ordinary food is the feeling of loss – “Alas, my beloved X.” Crazy Spicing 2.0 – crazy-spiced smoothies – solved this problem by putting the spices in a homemade smoothie, which does not have an expected taste (so no feeling of loss) and can also be made to taste good in ways that do not involve flavor recognition (sweet, salty, creamy, cooling, and thirst-quenching). Smoothies, however, do not look like ordinary food nor are they crunchy and chewy – something I’ve noticed I especially want now that I eat less. The fava bean crostini look fine – I had something similar at Chez Panisse – and have a great texture. They are wonderfully crunchy and chewy. Toppings can make the texture even better.

Notes. 1. I have tried less expensive, less glamorous beans just once; the texture was less appealing. It is not far from hummus (garbanzo bean paste), however. I have not tried garbanzo beans. 2. Add the spices once per meal. Each meal a new set of spices, in other words. If you add the spices just once and then eat the result many times, it becomes a ditto food. 3. Beans have a low glycemic index, another good feature of this dish. 4. To make it more nutritious, you can add protein powder or almost anything else you would add to a smoothie. It already has lots of fiber. 5. This is something I make far in advance. Make it on Sunday, eat for the rest of the week, for example. The only lengthy step – skinning the beans – I actually enjoy. 6. Why do I love this dish? Because of the full-bodied crunchiness and chewiness. Because it looks as good as restaurant food. Because the toppings allow room for creativity. Because once I have made a batch, it takes just a few minutes to make a meal’s worth (toasting the bread is the most time-consuming part). Because I’ve always liked fava beans.

---

### **Ranjit Chandra Update (2006-11-23 12:51)**

If you have been following [1]the strange case of Dr. Ranjit Chandra, you may be interested to know:

1. He has sued the CBC (Canadian Broadcasting Corporation) because of [2]a documentary they ran last year titled “The Secret Life of Dr. Chandra”. A lawyer for the CBC told me last week the lawsuit is at a very early stage.

2. A [3]paper about Dr. Chandra’s research by Saul Sternberg and me has been accepted by Nutrition Journal, an

open-source journal. Our third and final paper on the subject.

The [4]Wikipedia entry for Chandra has a good summary of the story so far.

### **Brian Wansink on Research Design (2006-11-26 08:04)**

An experiment in which people eat soup from a bottomless bowl? Classic! Or mythological: American Sisyphus. It really happened. It was done by [1]Brian Wansink, a professor of marketing and nutritional science in the Department of Applied Economics and Management at Cornell University, and author of the superb new book [2]Mindless Eating: Why We Eat More Than We Think (which the CBC has called "the Freakonomics of food"). The goal of the bottomless-soup-bowl experiment was to learn about what causes people to stop eating. One group got a normal bowl of tomato soup; the other group got a bowl endlessly and invisibly refilled. The group with the bottomless bowl ate two-thirds more than the group with the normal bowl. The conclusion is that the amount of food in front of us has a big effect on how much we eat.

There are many academic departments (called statistics departments) that study the question of what to do with your data after you collect it. There is not even one department anywhere that studies the question of what data to collect – which is much more important, as every scientist knows. To do my little bit to remedy this curious and unfortunate imbalance, I have decided to ask the best scientists I know about research design. My interview with Brian Wansink (below) is the first in what I hope will be a series.

SR: Tell me something you've learned about research design.

BW: When I was a graduate student [at the Stanford Business School], I would jog on the school track. One day on the track I met a professor who had recently gotten tenure. He had only published three articles (maybe he had 700 in the pipeline), so his getting tenure surprised me. I asked him: What's the secret? What was so great about those three papers? His answer was two words: "Cool data." Ever since then I've tried to collect cool data. Not attitude surveys, which are really common in my area. Cool data is not always the easiest data to collect but it is data that gets buzz, that people talk about.

SR: What makes data cool?

BW: It's data where people do something. Like take more M & Ms on the way out of a study. All the stuff in the press about psychology – none of it deals with attitude change. Automaticity is seldom a rating, that's why it caught on. It's how long they looked at something or how fast they walked. That's why I've been biased toward field studies. You lose control sometimes in field studies compared to lab studies, but the loss is worth it.

The popcorn study is an example. We found that people ate more popcorn when we gave them bigger buckets. I'd originally done all that in a lab. So that's great, that's enough to get it published. But it's not enough to

make people go "hey, that's cool." I found a movie theatre that would let me do it. It became expensive because we needed to buy a lot of buckets of popcorn. Once you find out it happens in real theatres, people go "cool." You can't publish it in great journal because you can't get 300 covariates; we published it in slightly less prestigious journal but it had much greater impact than a little lab study would have had.

One thing we found in that study was that there was an effect of bucket size regardless of how people rated the popcorn. Even people who hated the taste ate more with the bigger bucket. We asked people what they thought of the popcorn. We took the half of the people who hated the popcorn the most – even they showed the effect. But there was range restriction – the average rating in that group was only 5.0 on a 1-9 scale – not in the "sucky" category. Then we used old popcorn. The results were really dramatic. It worked with 5-day-old popcorn. It worked with 14-day-old popcorn – that way I could say "sitting out for 2 weeks." That study caught a lot of attention. The media found it interesting. I didn't publish the 5-day-old popcorn study.

I'm a big believer in cool data. The design goal is: How far can we possibly push it so that it makes it a vivid point? Most academics push it just far enough to get it published. I try to push it beyond that to make it much more vivid. That's what [Stanley] Milgram did with his experiments. First, he showed obedience to authority in the lab. Then he stripped away a whole lot of things to show how extreme it was. He took away lab coats, the college campus. That's what made it so powerful.

SR: A good friend of mine, Saul Sternberg, went to graduate school with Milgram. They had a clinical psychology class together. The professor was constantly criticizing rat experiments. This was the 1950s. He said that rats were robot-like, not a good model for humans. One day Milgram and my friend brought a shoebox to class. In the box was a rat. They put the box on the seminar table and opened it, leaving the rat on the table. The rat sniffed around very cautiously. Cautious and curious, much more like a person than like a robot. It was a brilliant demonstration. My friend thinks of Milgram's obedience experiments as more like demonstrations than experiments. But you are right, they are experiments consciously altered to be like demonstrations. Those experiments were incredibly influential, of course – it supports your point.

BW: When we first did the soup bowl studies, we refilled the soup bowls so that we gave people larger and smaller portions than they thought had. We heated the soup up for them but gave them 25 % more to see if they would eat more than they thought. You could put that in an okay journal. The bottomless soup bowl would be more cool. Cool data is harder to get published and it's much more of a hassle to collect the data, but it creates incredible loyalty among grad students, because they think they are doing something more exciting. It's more of a military operation than if they are just collecting some little pencil-and-paper thing in the lab. It makes research more of an adventure.

Another thing: field experiments are difficult. There's a general tendency in research to be really underpowered with things [that is, to not have enough subjects]. Let's say you're doing the popcorn bucket study. Is the effect [of bucket size] going to come out? Rather than having too many cells and not get significance, it's a good idea to have fewer cells – replace a manipulated variable with one or two measured variables. For example, instead of doing a two-by-two between-subjects design we might have a design when one factor is measured rather than manipulated. If the measured factor doesn't come out you haven't lost anything; you still have all the power. With the popcorn study we knew the study would work with the big bucket [that is, we knew there would be an effect of bucket size] but we didn't know if there would be an effect of bucket size if we gave them [both good corn and] bad corn [thereby doing a two-by-two study] and only 200 people showed up [leaving only 50 people per cell]. So when we did the field study for the first time, we gave them all popcorn 5 days old. We measured their taste preference for popcorn then used it as a crossing variable. We used scores on that measure to divide the subjects into two groups.

SR: Let's stop here. This is great stuff.

### The Wisdom of Experts: John Chambers on Research Design (2006-11-30 06:53)

John Chambers, a retired Bell Labs statistician and one of the persons most responsible for [1]R, the free open-source data analysis package I use, told me an interesting story yesterday. AT &T used to make microchips. The "yield" of chips – the percent of chips that were defect-free – was very important. Chambers and other Bell Labs statisticians were asked to help the chip makers improve their manufacturing process by increasing the yield. At the chip factory, the people Chambers and his colleagues spoke to were chemists and engineers. They wanted to do experiments that varied voltage, temperature, and similar variables. Chambers and his colleagues had a hunch that the operator – the person running the fabrication machines – was important, and this turned out to be true.

I like this story because it has a wisdom-of-crowds-but-not-exactly twist: the supposed experts at one thing (data analysis) turned out to have useful (and unpredictable) knowledge about something else. We don't think of statisticians as experts in human behavior but in this case they were at least more expert than the chemists and engineers. I mean: who were the experts here? And when we deal with someone, which is more likely: We overestimate how much they can help us with our problem? Or we underestimate (as in this story, where the chip makers underestimated the statisticians)? And if we have no idea which it is, how might we find out?

I told Chambers that statisticians were hurt by the name of their department: statistics. It puts them in too-small a box. John Tukey's term data analysis (in place of statistics) was an improvement, yes, but only a bit; it would be a lot better if they were called how-to-do-research departments. Yes, Chambers said, that would be an improvement.

I am fascinated by the similarity between three things:

1. Data analysis. Much of data analysis consists of putting data together in a way that allows you to extract a little bit of information from each datum. These little piece of information, added together, can be quite informative. A scatterplot, for example.
2. [2]Wisdom-of-crowds phenomena. For example, many people guess the weight of a cow. The average of their guesses is remarkably accurate, even though the variation in guesses is large.
3. Self-experimentation. The new and interesting feature of [3]my self-experimentation was that it involved my everyday life. From activities I was going to do anyway (such as eat and sleep), I managed to extract useful information.

In each case it's like extracting gold from seawater: You get something of value from what seemed useless. Are there other examples? How can we find new examples? Chamber's story suggests one direction: Making some small change so that you learn from your co-workers about stuff you wouldn't think they could teach you about.

## **1.8 December**

### **On Scientific Method (2006-12-01 08:05)**

When I visited George Mason University recently, I asked Tyler Cowen, "What's the secret of a successful blog?" Cowen and Tabarrok's [1]Marginal Revolution is the most successful blog I know of.

His answer: "Three elements: 1. Expertise. 2. Regularity. 3. Recurring characters, like a TV show." By regularity he meant at least 5 times/week.

I saw I had considerable room for improvement. Since then, I've tried to post at least twice/week. With this post I am adding scientific method to the subtitle, which I hope makes me appear more expert. A Berkeley philosophy professor named Paul Feyerabend wrote a book that I thought is called On Method but that I see is actually called Against Method. He was at Berkeley when I arrived. I remember two things about him: 1. He gave all his students A's. 2. He ate at Chez Panisse every night.

1. <http://www.marginalrevolution.com/>

---

tom s. (2006-12-03 09:08:14)

I never met Feyerabend, although he did lecture at Sussex before I got there. His book is wonderfully provocative. One slight correction - although he lectured at Berkeley, he also lectured at many other places. See his Wikipedia entry for some biography: [http://en.wikipedia.org/wiki/Paul\\_Feyerabend](http://en.wikipedia.org/wiki/Paul_Feyerabend)

AaronSw (2006-12-20 12:55:29)

The blog Crooked Timber has had some interesting discussions about Feyerabend.

### **More Weight-Loss Data from the Shangri-La Diet Forums (2006-12-04 07:28)**

Here are more graphs of the data in the Post Your Tracking Data Here section of the Shangri-La Diet forums. An overall summary of that data is:

Persons posting data for at least 1 week: 92

Total weeks of data: 930

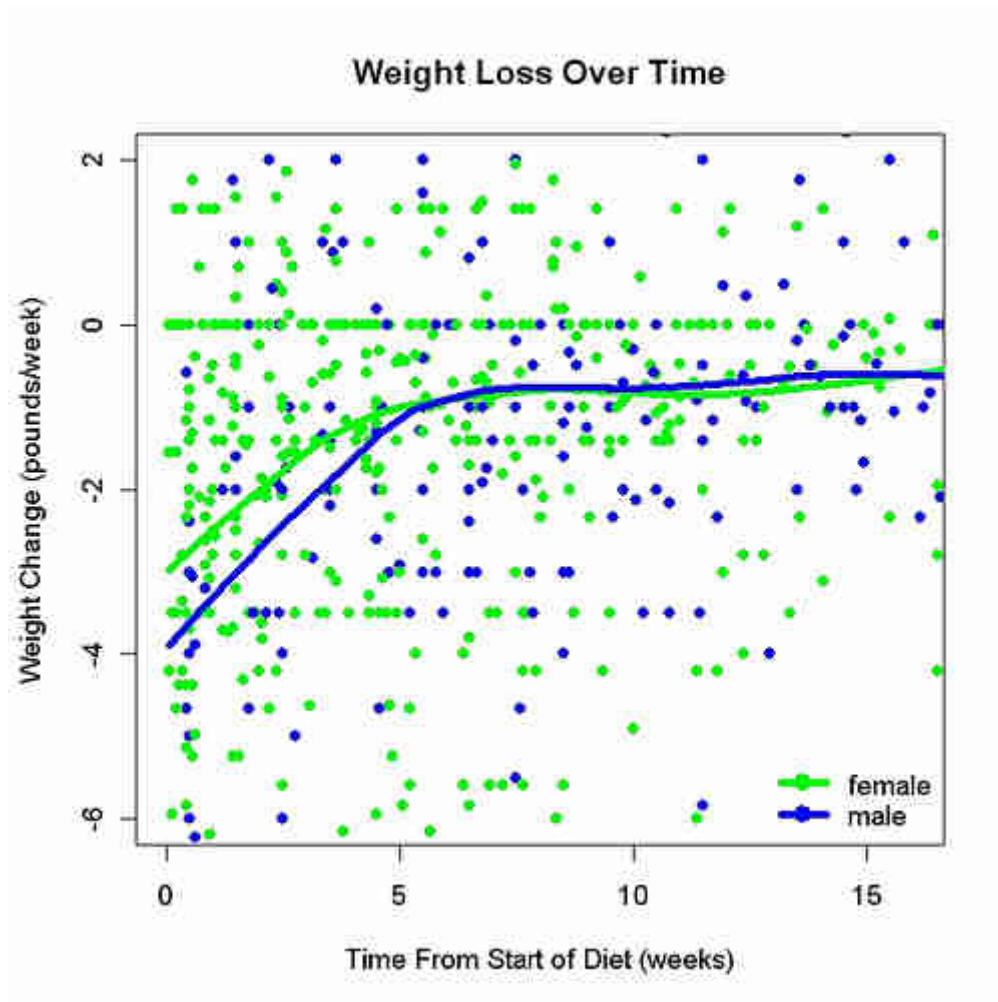

Persons posting data for at least 4 weeks: 57

Persons posting data for at least 12 weeks: 31

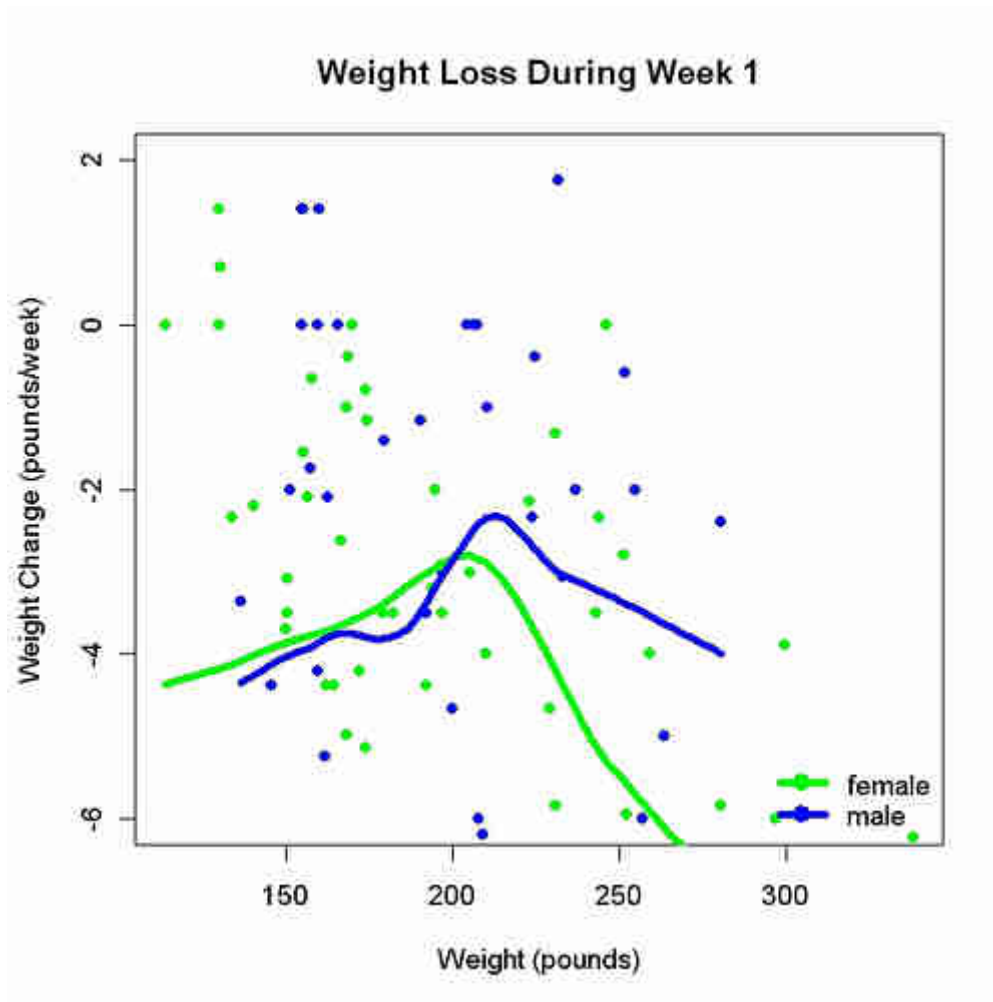

Total weight change (lb): -985

Average rate of change (lb/week): -1.1

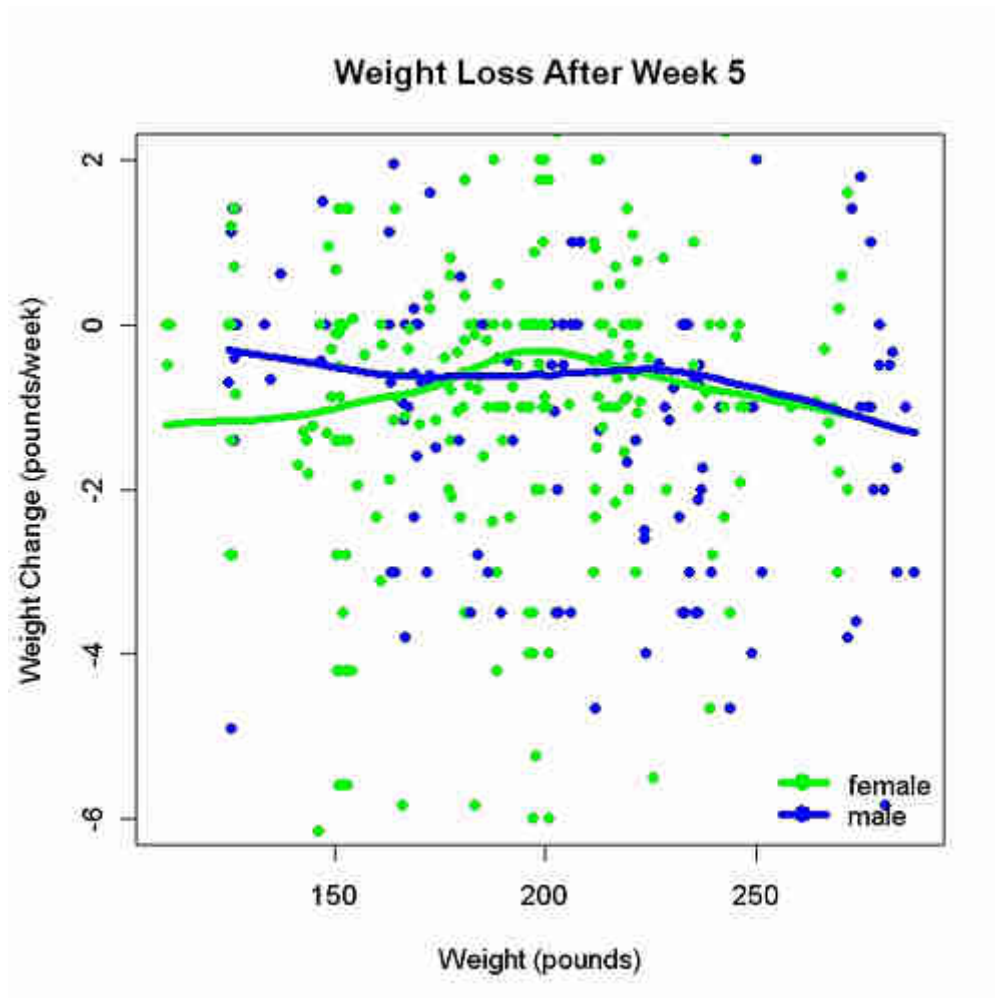

The graphs below show analyses similar to those I have done previously now divided by sex.

Weight loss slows down during the first five weeks of the diet. After that it is about one pound per week. In the beginning men lose weight more quickly than women but this difference disappears after five weeks or so.

During the first week of the diet, weight loss depends on how much you weigh: The more you weigh the more you lose, at least if you weigh more than 200 pounds. This graph compares men and women equating for weight – and when that is done there is no clear difference. The male/female difference seen in the first graph may be entirely due to weight differences: Men weigh more than women.

After Week 5 there is little difference between the sexes and little difference between people of different weights.

For easy comparison with earlier analyses see [1]my Flickr page

The results support the popular idea that men lose weight more easily than women but also argue that this may be because men weigh more than women.

1. <http://www.flickr.com/photos/86225480@N00/?saved=1>

---

David (2008-04-22 07:18:12)

Seth, Do you have any data, especially average weight loss data on other weight loss programs and diet pills?

seth (2008-04-22 15:05:25)

No I don't.

## The Truth Is Out There (2006-12-04 16:59)

I was very pleased to read [1]this on the [2]Shangri-La Diet forums:

Hi everyone! My name is Cindy. I'd learned of this in quite the ironic way. Killing time on YOUTHINK.com, I came across the question, "Would you ever try the Shangri-La Diet?" Having never heard of it before, I decided to google it. 5 hours later, I was sold. The recurring thing I kept reading in blogs, reviews, etc, was amazement that this actually worked.

That is a limitation of the [3]statistics I posted today: They don't express amazement.

## The Invisible Made Visible (2006-12-05 07:06)

An artist, UC Santa Cruz professor of art history [1]Mary Holmes would say, is someone who makes the invisible visible. Does that make the Internet an artist? These examples of the invisible made visible impress me:

1. [2]Security footage of a man stealing two chairs. (Thanks to [3]HuntGrunt.)
2. [4]Tracking data at the Shangri-La Diet forums reveal what weight loss is like for other people.

I think the other extreme – the very visible made extremely visible – is also art. Here is an example: [5]David Caruso one-liners. Too funny not to be art.

1. [http://www.maryholmesbook.com/about\\_1.html](http://www.maryholmesbook.com/about_1.html)
2. <http://www.youtube.com/watch?v=Zyg4Rj1M3rU&mode=related&search=>

5. [http://www.youtube.com/watch?v=\\_sarYH0z948](http://www.youtube.com/watch?v=_sarYH0z948)

---

losing-it (2006-12-09 15:27:07)

You might enjoy reading about an interactive art/internet experiment done by Japanese artist, Katsuhiko Hibino, where participants were invited to step beyond themselves. And the work of artist, Noriyuki Tanaka (who joined Hibino in that experiment). Also, you may enjoy the Renga interactive art project conceived of by artists Toshihiro Anzai and Rieko Nakamura. Professor of School of Letters, Arts and Sciences at Waseda University, Machiko Kusahara's paper, ON ORIGINALITY AND JAPANESE CULTURE, Historical Perspective of Art and Technology: Japanese Culture Revived in Digital Era was reprinted by permission in Volume 5, Issue 1, Spring-Summer 2005 in the World Haiku Review: [http://www.worldhaikureview.org/5-1/whcj/essay\\_kusahara.htm](http://www.worldhaikureview.org/5-1/whcj/essay_kusahara.htm)

### **American Haiku (2006-12-06 08:29)**

The American version of haiku, I submit, is a [1]Priceless ad. My contributions:

The Shangri-La Diet: \$15 (including shipping)  
bottle of grapeseed oil: \$6  
additional groceries each month: - \$200  
not worrying where your next Yodel is coming from: priceless

Note to SLD dieters: The reference to grapeseed oil dates this. I now drink refined walnut oil and flaxseed oil (nose-clipped).

smaller pants: \$60  
blush I use as excuse for better-looking skin: \$8  
blood test for improved lipids: \$80  
migraine-free TOM: priceless

Short blog posts are a little like haiku.

Update (7 Dec 06): [2]funny coincidence.

1. <http://www.priceless.com/>
2. [http://blog.juliaallison.com/2006/12/back\\_from\\_vacation.html](http://blog.juliaallison.com/2006/12/back_from_vacation.html)

guaif1 (2006-12-06 12:33:45)

Flax Seed Oil Actually Increases Prostate Cancer While Fish Oil Decreases It [http://www.mercola.com/2004/jul/21/flax\\_seed\\_oil.htm](http://www.mercola.com/2004/jul/21/flax_seed_oil.htm)

losing-it (2006-12-08 20:01:28)

Technically, the 2 "American Ad-ku" are a tad more closely related to "zappai" :^D the dog overweight and the cat, tooâ€" I go on a diet 2 much fun... losing-it

### Varieties of Shangri-La Diet Experience (2006-12-07 08:43)

The theory behind the Shangri-La Diet suggests several new ways of losing weight. As far as I can tell, they all work at least some of the time. To get an overview of the new methods, I asked users to rate them on power and ease of use. (Thanks to [1]Brian Wansink for this suggestion.) Here are the average ratings (so far):

The two scales were defined as follows:

Power

- 5 = very powerful
- 4 = quite powerful
- 3 = somewhat powerful
- 2 = slightly powerful
- 1 = not powerful at all

Ease of Use

- 5 = very easy/convenient
- 4 = quite easy/convenient
- 3 = easy enough
- 2 = quite difficult
- 1 = too difficult to ever do

The cluster in the top corner consists of "flavorless oil" and "nose-clipped oil".

I like to think this little diagram predicts the future of SLD: lots of people drinking flavorless oil, lots of people drinking nose-clipped oil, fewer people drinking sugar water, etc. A friend of mine showed me a photo of her when she was 2 years old. Another 2-year-old was in the picture but I could tell which one was my friend.

I collected the data [2]by Web. Maybe I should have used [3][www.surveymonkey.com](http://www.surveymonkey.com) (as my students have) but it was incredibly easy compared to other data-collection methods.

1. [http://aem.cornell.edu/faculty\\_content/wansink.htm](http://aem.cornell.edu/faculty_content/wansink.htm)

### Science Versus Human Nature (2006-12-08 04:48)

Last weekend I saw the writer [1]Thomas Cahill on [2]Book TV. He mentioned his book [3]*How The Irish Saved Civilization*. The real contribution of the Irish, he said, wasn't that they saved the sacred texts, it was that they brought humor to their study. "They brought irreverence to reverence," he said. "That was entirely new."

This reminded me of [4]Brian Wansink's comments about [5]cool data. His notion that research designs should be judged on their coolness was entirely new to me. I'm not the only one; the Wikipedia entry for [6]scientific method says nothing about it. Using cool and research design in the same sentence is quite a bit like bringing irreverence to reverence. Once somebody says it, though, it makes sense. I remember being thanked after an interview; I replied that there's no point doing the research if no one ever learns about it. Coolness obviously plays into that - influences the chance that other people will learn about it.

I think most scientists will agree with Wansink, that coolness matters. I think you don't find his idea in books and articles about scientific method not only because there is so little written about research design (at least compared to the amount written about data analysis) but also because it appears undignified. "I'm important, I shouldn't have to worry about being cool" is the (very human) unspoken attitude.

2. <http://www.booktv.org/>
3. <http://www.amazon.com/Irish-Saved-Civilization-Hinges-History/dp/0385418493>
4. [http://aem.cornell.edu/faculty\\_content/wansink.htm](http://aem.cornell.edu/faculty_content/wansink.htm)
5. <http://www.blog.sethroberts.net/2006/11/26/brian-wansink-on-research-design/>
6. [http://en.wikipedia.org/wiki/Scientific\\_method](http://en.wikipedia.org/wiki/Scientific_method)

---

Andrew (2006-12-10 17:48:18)

Hi, Seth. This seems to contradict something you told me over 10 years ago when we were talking about psychology teaching. We were discussing in-class experiments and you were saying they weren't so great. I mentioned some classic examples (for example, the "United Nations" demonstration of anchoring (see page 88 of this article: <http://www.stat.columbia.edu/gelman/research/published/smiley11.pdf>), and you replied that, yes, these demos are "cool," but students don't really see the point of them. Your take on things was that students are more interested in things that are useful (in their sphere of interests, which include studying, grades, friendships, and relationships) but not so interested in the things we think are "cool," such as cognitive illusions. Regarding your last point above about coolness: well, yeah, one of the good things about cool is that it's available to people of low status.

## **Books Were the First Open-Source Software (2006-12-09 06:30)**

Here is [1]Aaron Swartz on Wikipedia:

When you put it all together, the story becomes clear: an outsider makes one edit to add a chunk of information [to a Wikipedia entry], then insiders make several edits tweaking and reformatting it. In addition, insiders rack up thousands of edits doing things like changing the name of a category across the entire site – the kind of thing only insiders deeply care about. As a result, insiders account for the vast majority of the edits. But it's the outsiders who provide nearly all of the content.

(Correcting Wikipedia's founder, by the way.) When I visited my editor, Marian Lizzi, at Penguin, I realized that book publishing is exactly the same: Outsiders write the books, insiders edit them.

The curious thing about book publishing is similar to what Swartz noticed in a different realm: The content, the crucial stuff, is entirely from amateurs. No other industry, with the possible exception of craft shows, is like this. If I run a deli, I buy supplies and food from people who make their living selling supplies and food. If I make clothes, I buy my cloth from professional cloth makers. If I make cheese, my milk comes from professional farmers. Only book

publishers endlessly deal with amateurs.

[2]continued

1. <http://www.aaronsw.com/weblog/whowriteswikipedia>

2. [http://www.huffingtonpost.com/seth-roberts/books-were-the-first-open\\_b\\_35844.html](http://www.huffingtonpost.com/seth-roberts/books-were-the-first-open_b_35844.html)

---

Andrew (2006-12-10 17:56:25)

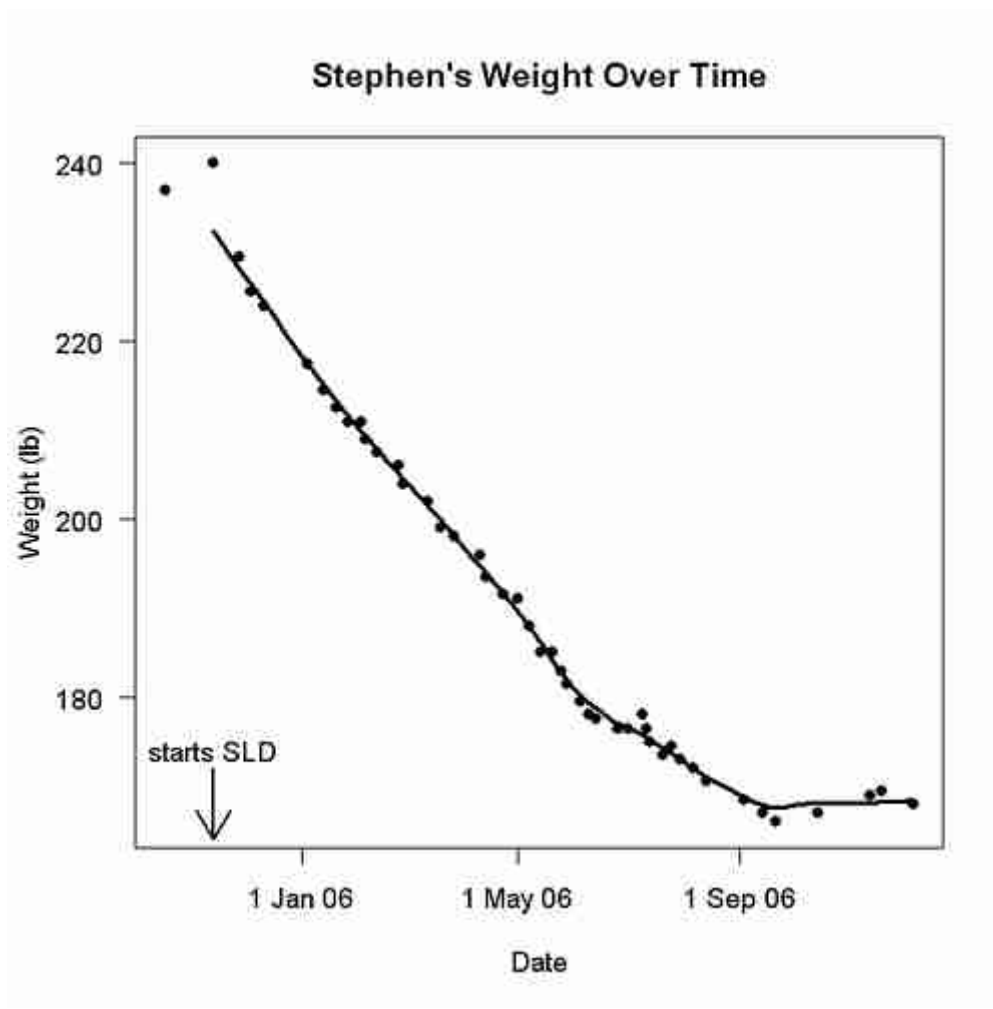

Seth, I know what you're saying, but when it comes to writing, we're the professionals and it's the book (and journal) editors who are amateurs. As an author of 3 books and a zillion articles, I actually think I have a lot more experience than these editors. I call it the pinch-hitter syndrome; see here: [http://www.stat.columbia.edu/cook/movabletype/archives/2005/01/the\\_pinchhitter.html](http://www.stat.columbia.edu/cook/movabletype/archives/2005/01/the_pinchhitter.html) P.S. I was going to leave a comment at the other site until I found out that to register I had to give them my household income. I mean, I could've just made something up, but I object to the concept of having to reply to such a question. Especially in a discussion of open-source software! Perhaps you could use your influence to do something about this...

seth (2006-12-21 16:28:15)

"When it comes to writing, we're the professionals and it's the book (and journal) editors who are amateurs." Journal articles and trade books are different. In the case of journal articles, I sort of agree with you – we are professionals (because that's basically what professors at research universities are paid to do – write journal articles). The journal editors are not amateurs – they make their living doing it – but they often have less experience than the authors. In the case of trade books, almost no one makes a living writing them. Whereas book editors do make a living doing their job. I guess it's possible for a professor to have more trade-book experience than his or her editor, but it's hard to imagine. Take Deborah Tannen. University professor, lots of trade books (five?). But surely she has a very experienced editor, commensurate with her great sales.

### **Stephen Marsh on the Shangri-La Diet (2006-12-12 11:20)**

For the paperback edition of The Shangri-La Diet, I made a graph of [1]Stephen Marsh's progress this morning. Here it is:

Stephen sent me a fax of pages from his notebook. It was thrilling to type the dates and weights into my computer. Here was someone slowly returning to health. Eventually the rest of the world would find out about it.

[2]More about his progress.

1. <http://ethesis.blogspot.com/>

2. <http://boards.sethroberts.net/index.php?topic=188.0>

---

Ethesis (2006-12-12 20:22:59)

I can only say it was a return to life, not just health.

BenekeMethod (2006-12-12 23:34:39)

It's heartening to see such dramatic weight loss and return to life and health. It's now 7 years and 42 days since I started actively applying Seth's theory, and I can report that I've lost 30 pounds and kept it off for more than 6 years; 70 pounds for 2 years 8 months; and 90 pounds for a year and a half. I'm currently 95 pounds lighter than I was on November 1, 1999, going from 280 to 185. I've gotten rid of high blood pressure, high cholesterol, and incipient diabetes. I sleep an hour and a half less each night, have a huge amount more energy and enjoy having a body a lot more than I once do. I also enjoy life more. So I'm in debt to Seth's ability to grasp some deep truths about biological and psychological reality, particularly about the relationship

between taste and hunger, and his willingness to share what he learned. I hope and expect that within a few years, what he figured out will be widely recognized and applied... Cheers, Tim Beneke

Stephen M (Ethesis) (2008-07-04 08:48:02)

BenekeMethod – now that this might get revived with the link I have to say that your story really inspired me and gave me hope. I'm currently around 180. I'd adjusted my weight up a little, but it has slipped down some. I've got a cushion I keep because I've known to many people who slipped in to anorexia and for other reasons, but I had the same feelings: **I've gotten rid of high blood pressure, high cholesterol, and incipient diabetes. I sleep an hour and a half less each night, have a huge amount more energy and enjoy having a body a lot more than I once do. I also enjoy life more. So I'm in debt to Seth's ability to grasp some deep truths about biological and psychological reality, particularly about the relationship between taste and hunger, and his willingness to share what he learned. I hope and expect that within a few years, what he figured out will be widely recognized and applied**! Thank you Tim, for having been there when I needed an example.

### **Jimmy Berenson on the Shangri-La Diet (2006-12-13 10:19)**

When Catherine Johnson, co-author of *Animals In Translation*, saw *The Shangri-La Diet* in a bookstore, she remembered the [1]Freakonomics column about me. Her 19-year-old son Jimmy Berenson is autistic. Because of his autism, he takes a drug that causes weight gain. Over the last few years, it made him obese. In July 2006, Catherine started him on SLD (first 1, then 2 tablespoons of ELOO/day). Here is what happened:

Seeing is believing: One of Catherine's neighbors was skeptical about SLD, even when told of Jimmy's results. Only when she saw Jimmy's results, as graphed by Catherine, did she decide to try it. There is more information at Catherine's [2]blog.

Thanks to [3]Andrew Gelman for his comments on this graph.

1. <http://www.nytimes.com/2005/09/11/magazine/11FREAK.html?ei=5070&en=885eba950a1a7544&ex=1133154000&pagewanted=all>
2. <http://kitchentablemath.blogspot.com/>
3. <http://www.stat.columbia.edu/~gelman/blog/>

---

Catherine Johnson (2006-12-14 14:11:51)  
wow! That's beautiful!

Catherine Johnson (2006-12-14 14:30:53)

The other terrific aspect of Shangri-La is that we're managing to stick with it through the holidays and winter months. It's as difficult to "diet" another person as it is to diet yourself, perhaps more so. At various points over the years of Jimmy's weight gain we've tried to put him on a calorie reduction diet and keep him on it. Always, we've failed. The winter months sap our energy and motivation, and we found ourselves getting sloppy with the ELOO, forgetting on weekends, seeing the return of nighttime eating .... When Jimmy's weight loss leveled off we feared the worst. But we were able to muster the energy & conviction to adapt. That would not have happened with a more complicated regimen. We fiddled with the ELOO doses, switched to sugar water, dumped the sugar water & returned to ELOO....all this while operating on reduced-battery strength. Shangri-La is a forgiving regime. Jimmy's still losing!

## Secrets of a Successful Blog (part 2) (2006-12-20 10:28)

[1]Aaron Swartz is an excellent software developer (co-founder of [2]reddit), a creative and interesting [3]writer, and a successful [4]blogger, judging by number of comments. I asked him what makes a blog successful. Three things, he said:

1. Persistence. Readership builds over time.

2. Frequency. The more often, the better. It is pure operant conditioning (although Aaron, a fan of anti-behaviorist [5]Alfie Kohn, did not use that term): When people check your blog and find new content they are rewarded, and keep checking. If they check and find nothing new, they stop checking. Although Aaron uses an [6]aggregator (which does the checking), only about 15 % of blog readers do so, he said. (I use Sage, a Firefox add-on.) Aaron posts every day or so.

3. A distinct voice. When people visit your blog they should know what to expect. When he started he blogged about all sorts of things but has become more consistent from one entry to the next.

Part 1 ([7]Marginal Revolution co-author Tyler Cowan's view) is [8]here, with comments [9]here.

## Web Trials (2006-12-21 08:32)

Thanks to Rey Arbolay, at the [1]Shangri-La Diet forums, the eternal question "will this help?" is being answered in a new way. The specific question is "will the Shangri-La Diet help me lose weight?" The new way of answering it is that people are posting their results with the diet in the Post Your Tracking Data Here section of the forums. What they post is standardized and numerical enough that ordinary statistical methods can be used to learn from them. I'll call this sort of thing a web trial.

It's a lot better than nothing or a series of individual cases studied separately. I learned a lot from [2]my most recent analysis – for example, that people lose at a rate of about 1 pound per week after Week 5. I couldn't have done a good job of predicting where any of the fitted lines on the scatterplots would be or the size of the male/female difference. Nor could I have done a good job predicting the variability – the scatter around the lines.

It's a lot worse than perfection. It would be much better if a comparison treatment (in the case of SLD, a different way of losing weight) was being tested in the same way. Then results from the two treatments could be compared and you would be closer to answering the practical question "what should I do?" (That modern clinical trials – very difficult and expensive – still use placebo control groups although placebos are not serious treatment options is a sign of . . . something not good.)

I can imagine a future in which people with a health problem (acne, insomnia, etc.) go to a website and enroll in a web trial. They told about several plausible treatments: A, B, C, etc., all readily available. They are given a choice of (a) choosing among them or (b) being randomly assigned. They post their results in a standardized format for a few weeks or months. Then someone with data analysis skills analyzes the data and posts the results. As for the participants, if the problem hasn't been solved they could enroll again. This would be a way that anyone with a problem could help everyone with that problem, including themselves. The people who set up the trials and analyze the results would be like the [3]book industry or [4]Wikipedia insiders – people with special skills who help everyone learn from everyone.

Andrew Sidwell (2007-01-14 06:48:26)

Why does this have to be in the future? I'm interested in self-experimentation and I'm also a programmer... I'd be happy to work with people to put together a website where this could happen. This could happen soon rather than later.

Mary (2007-02-03 11:51:56)  
This is very interesting site...

## Why I Like Self-Experimentation (2006-12-23 13:07)

Self-experimentation, like blogs, Wikipedia, and open-source software (and before them, [1]books) gives outsiders far more power. This took me a long time to figure out. For years, I liked [2]self-experimentation for five reasons:

1. It worked. It [3]reduced my acne, improved my sleep, and enabled me to lose plenty of weight. This surprised me. I am a professional scientist. My professional experiments, about animal learning, generally worked, but never had practical value.
2. It had unexpected benefits. I discovered accidentally that seeing faces in the morning improved my mood the next day. Better sleep (from self-experimentation) improved my health.
3. It was easy. What I did never involved more than small changes in my life. Even standing 8 hours per day wasn't hard, after a few days.
4. My conclusions fit what others had found – usually, facts that didn't fit mainstream views. For example, the fact that depression is often worst in the morning and gets better throughout the day doesn't fit the conventional view that depression is a biochemical disorder but does fit my idea that depression is often due to a [4]malfunctioning circadian oscillator. Self-experimentation seemed to be pointing me in correct directions.
5. My conclusions were surprising. That breakfast is bad (for sleep), the effect of faces on mood, and the [5]Shangri-La Diet are examples.

Recently, though, the rise of blogging, Wikipedia, and open-source software, showed me the power of a kind of multiplicative force: (pleasure of hobbies) multiplied by (professional skills). Blogging, for example: (people enjoy writing) multiplied by (professional expertise, which gives them something interesting and unusual to say). In other words, expertise and job skills used in a hobby-like way. My self-experimentation, I realized, was another example: I used my professional (scientific) skills to solve everyday problems. My self-experimentation was like a hobby in that I did it year after year without financial reward or recognition. It was its own reward. The hobby aspect – persistence, freedom to try anything, no need for recognition or payment – made it powerful. I could go in depth where professionals couldn't go at all.

But I was still missing something – something obvious to many others. The power of blogging isn't

(hobby) x (job skills).

That's just one person. The total power of blogging is

(hobby) x (job skills) x (anyone can do it)

Which is very powerful. Finally I saw there was a sixth reason to like self-experimentation:

6. Anyone can do it.

As [6]Aaron Swartz has said, there are a lot more people than scientists. We will make a lot more progress if

everyone, not just scientists, can contribute. Mendel and Darwin were amateurs. The amateurs may rise again.

If you are interested in doing any self-experimentation, feel free to contact me for help. Also, let me know the results; I would like to publicize other people's self-experiments in this blog.

## Christmas: An Evolutionary Explanation (2006-12-24 08:51)

In a kitchenware store a few years ago I came across the [1]Rotary Nutcracker, a futuristic-looking device that cracks nuts in a new way. The girl at the cash register gave me a few walnuts to test it. It didn't crack any of them. This was a curious product, I thought. Who would buy it? The salesperson told me that they'd stocked it for less than a year. I was the first person to test it. It had sold well during holiday season. Now I understood: people didn't buy it for themselves, they bought it as a gift. As a gift, it mattered much less how well it worked – "it's the thought that counts." No wonder I was the first to test it.

Here, I saw, was [2]my theory of human evolution in . . . well, a nutshell. At least part of it. Humans are the only animals with occupational specialization – we specialize, and trade. It started with hobbies. Hobbies became part-time jobs. Part-time jobs became full-time jobs. To support full-time jobs – to generate enough demand – there has to be enough expertise, which builds up slowly. To build up expertise, our brains changed so as to cause creation of special events like Christmas, Japanese New Year, Spring Festival (in China), and a thousand other examples around the world. Such events increase the demand for high-end craftsmanship, thus helping the most skilled craftsmen – the ones most likely to advance the state of their art – make a living. Christmas increases the demand for Christmas cards (fine printing) and Christmas-tree ornaments, for example. Traditional gift-giving has the same effect: It increases demand for "the better things in life." Most gifts, if you follow the usual norms, are (a) not something you would buy for yourself and (b) not something the recipient would buy. (As [3]Alex Tabarrok has noticed.) They are harder to make – and thus reward skilled craftsmen more – than the stuff we buy for ourselves, just as Christmas ornaments are harder to make than common household objects and Christmas-card printing is more difficult than most printing. Weddings, with the gifts, finery, invitations, etc., are another example. The Rotary Nutcracker didn't work in my tests but it almost worked. If enough people bought it as a gift, that would finance the research needed to improve it.

[4]Marginal Revolution and [5]James Surowiecki have recently written about the "deadweight loss of Christmas" – about how gifts tend to be worth less than their cost. I think they see this as bad thing but I see it as a good thing – at

least, in our evolutionary past it was a good thing. Likewise, the denizens of [6]The Devil Wears Prada appear slightly defensive about the social value of fashion. They seem to believe that fashion is less useful than "curing cancer" (by which they mean doing research to learn how to cure cancer). Actually, high fashion, with its hard-to-make skirts, belts, and accessories, is the same as curing cancer – they're two ways of increasing the human skill set. Art is the old Science.

Megan Hevron (2006-12-26 15:17:03)

I agree. A similar case is women having botox injections, which facilitates research in this area. Now it is used to help kids with cerebral palsy so they can walk. God bless those wax work dummies.

kathleen fasanella (2006-12-27 14:42:44)

Thanks for letting us off the hook Seth! My primary assertion of the value of my work in the fashion industry has always been supporting domestic manufacturing and job creation. Thanks to you, now I have another one. But just so you know, deep down, few of us will ever let ourselves believe you.

### Previously On/Next On Seth's Blog (2006-12-26 08:51)

Veronica Brown is a hot fashion designer, making a living off the virtual lingerie and formalwear she sells inside the online fantasy world Second Life.

This Washington Post [1]article about property rights in Second Life neatly combines the subjects of [2]my last post (fashion, etc., as engines of economic growth) and [3]my next post (harnessing the power of games).

1. <http://www.washingtonpost.com/wp-dyn/content/article/2006/12/25/AR2006122500635.html>
2. <http://www.blog.sethroberts.net/2006/12/24/christmas-an-evolutionary-explanation/>
3. <http://www.blog.sethroberts.net/2006/12/27/science-in-action-procrastination/>

A month ago I had lunch with [1]Greg Niemeyer, a professor of art at UC Berkeley whose medium is games. His games have appeared in [2]art galleries all over the world. He asked me if games had been studied by psychologists and pointed out some of their psychological properties – the power to make you concentrate for a long time, for example.

This was fascinating. He was so right – games are powerful in several ways. I wondered how that power could be (a) studied and (b) used. My first question was whether games could be a stimulant, like caffeine. I emailed Greg about this; he suggested I try Bejeweled and Sudoku. But I found them tiring – they require concentration. My next idea was that maybe I could use games as a reward. I used to enjoy Tetris and Freecell. If I do X (something I wouldn't otherwise do), then I get to play a game. This contingency causes me to do X. There are dozens of rewards you could use this way (listening to music, eating a piece of chocolate, etc.); the advantages of games include their number and variety, the care put into them, the lack of satiation (you can play the game many times and it remains pleasant), their harmlessness (if I avoided getting addicted), their low cost, the ready supply (you can play a computer game whenever you have a computer), and the short duration of some of them. The reward for a 5-minute task should not last 4 hours.

I have wondered for a long time about procrastination – what causes it, what to do about it. I like to think I've figured out [3]a few things but even so certain things I should do seem to go undone . . . well, forever.

For example, a month ago I had 40-odd emails in my inbox, some a few months old. I never got around to clearing it out. Bejeweled was no fun but [4]Sudoku (Easy level) was okay. I never played Sudoku for fun but it was slightly enjoyable. Maybe I could play a game of Sudoku as reward for answering email. If I made the requirement – the amount of email that I needed to answer – small enough, it might work.

It worked. When I made the requirement tiny – deal with 3 email (which might take 10 minutes) – that was small enough. And I was able to do it again and again: handle 3 email, play Sudoku, handle 3 email, play Sudoku, etc. Progress was slow – I spent more time playing Sudoku than dealing with email – but slow progress was far better than no progress. I was a little stunned it was actually working. After about 10 cycles (which took 3 or 4 hours), my inbox was as empty as I could make it. It hadn't been that empty in years. To gather some data about the whole process I wrote some R programs for recording what the task was, how long it took, etc.

Then I started spending all my time revising The Shangri-La Diet for the paperback edition. A few days ago I finished that. My inbox had gotten full again and again I used Sudoku to clear it out.

I want to learn more about this way of getting things done. Does it work with other chores besides email? Here is the kitchen table in my apartment:

It isn't usually this messy but it hasn't been completely clear for years. Can I use Sudoku to clear it off?

tlundeen (2006-12-27 12:28:54)

There are a couple of good books re procrastination, keeping current, etc. you might enjoy: Getting Things Done by David Allen, and Sink Reflections by Marla Cilley. I'm glad you're writing a blog!

tlundeen (2006-12-28 07:00:05)

I just saw this on <http://www.gradschoolstory.com/archives/95/how-to-get-started-on-anything> and had to add it - it will appeal to self-experimenters: From the blog post: I usually work on multiple projects at the same time, and whenever a new project comes along, I find it really difficult to actually get started. Once I've begun making progress, I'm able to move smoothly without any problems. It's the getting started that's really difficult, especially if it's something I'm not really interested in. At an intellectual level I know I have to get started, but I'm not able to summon up the motivation to begin. For the last few months, the most reliable technique I've found to help me get started is to take the work to a coffee shop and begin while sipping coffee. I've found that this allows me to get excited about whatever is in front of me at that time. My brain appears to misattribute the physiological response to coffee as excitement about whatever I'm working on at that time. Of course, once I've started on the project, I get into a state where I'm chugging along well after the coffee has worn off. The interesting thing is that the excitement remains.

## Science in Action: Procrastination (results) (2006-12-28 14:38)

[1]It worked. [2]This became:

The clearing took about 40 minutes of work and three games of [3]Sudoku. Now to test the [4]broken-windows theory of neatness, which says that things stay decent (say, a few items on a table) so long as the disorder stays below a certain threshold. Below that threshold, a natural tendency keeps things neat. Above that threshold, it malfunctions.

1. <http://www.blog.sethroberts.net/2006/12/27/science-in-action-procrastination/>

---

Megan Hevron (2006-12-29 00:15:13)

You haven't eaten your persimmons. They would be an excellent reward.

Catherine Johnson (2007-01-24 06:59:24)

hmm.... I think I've tried the "Broken Windows" theory of procrastination.... I'll have to start paying attention. I'm pretty sure the Broken Windows theory of crime reduction turned out to be false, though (yes?)

## Going Flavorless (2006-12-29 11:27)

Gary Skaleski, the Wisconsin counselor who came up with [1]nose-clipping (= eating food with your nose closed, especially with a swimmer's nose clip), has tried eating all his food that way:

The last time I wrote to you I had started gaining again and not following the SLD as I should have been (off and on). However, since then I have been eating everything, all day long, without tasting anything (even coffee, diet soda)-avoiding [flavor] completely, but eating well. After a couple of days, the appetite suppression came back with a vengeance and am losing again.

What was the most interesting was the difficulty I had starting this, and the sense of loss/regret and avoidance I had to doing it, and not being able to [smell] anything. While I recommended this procedure for others, I avoided it myself. But now I am on day 3 of [flavorlessness] and am doing well. . . . Interesting new needs come up-need for something crunchy, something smooth tasting, etc. . . . does help one focus on the feeling of different foods while eating, as well as becoming more sensitive to real hunger feelings (amazed at how much taste runs one's eating).

He believes, as do I, that this may be useful in extreme cases. Let's compare gastric bypass surgery (GSB) and eating like this (NC, for nose-clipping) on several dimensions. Dangerous? GSB: very. NC: no. Reversible? GSB: no. NC: yes. Adjustable? GSB: no. NC: very. You can do it every other day, for example. You can nose-clip some foods but not others. Cost? GSB: \$20,000 or more. NC: \$5 (swimmer's nose clips).

## Christmas in China (2006-12-31 14:38)

A Chinese friend of mine wrote to me a few days ago:

In China, there are many people who do not believe in God, but commercial here is ....( I don't know how to express), they launch beautiful ad and some discount for people to make them spend more money and feel more happy than the Christians.

Wise observations. I think Christmas moves so easily to a country with few Christians because it derives from [1]deep-seated features of human nature. I also agree that [2]ads are often beautiful. These [3]Hershey's Kisses ads, by my friend [4]Carl Willat, for example.

## 2. 2007

### 2.1 January

#### Is Drinking Olive Oil Healthy? (2007-01-01 20:50)

In *Cities and the Wealth of Nations*, Jane Jacobs wrote about an isolated North Carolina hamlet that her aunt visited in 1923:

One of my aunt's tasks there was to see to construction of a church. . . One of the farmers donated, as a site, a beautiful knoll beside the river and my aunt suggested the building be made of fine large stones which were already quarried, as it were, needing little dressing, there for the taking in the creek and river beds. No, said the community elders, it was a pretty idea but not possible. . . . Entire walls and buildings of stone would not be safe.

These people came of a parent culture that had not only reared stone parish churches from time immemorial, but great cathedrals.

Likewise, nutritional wisdom is forgotten. Drinking olive oil now seems absurd to some people. But it was practiced in at least one place in the not-so-distant past:

In a mountain village in Crete, [[1]Ancel] Keys saw old farmers working in the field who drank only a glass of olive oil for breakfast; he later verified that one of them was 106 years old.

From Todd Tucker, *The Great Starvation Experiment*, p. 204. There is a whole organization ([2]Oldways) devoted to preserving ancient foodways and using them for nutritional guidance. The best practitioner of this approach has been [3]Dr. Weston Price, a dentist, whose work is nicely summarized [4]here. Dr. Price traveled the world looking for economically-primitive societies ("native peoples") with ancient eating habits and excellent health. Their diets, especially the common elements, would suggest what a healthy diet must have.

Two of Dr. Price's conclusions are relevant to the Shangri-La Diet:

1. "All native peoples studied made great efforts to obtain seafood." This supports my comments about the [5]importance of omega-3 fats, found much more in seafood than in other foods.
2. "The last major feature of native diets that Price found was that they were rich in fat, especially animal fat." The animal fat in native diets would be high in omega-3 because the animals were eating grasses and other plants, not corn.

When I wrote my [6]long paper on self-experimentation I divided it into two parts: one titled "Stone-Age Life Suits Us" (the common thread of the five examples), the other about weight control (the research behind SLD). The two parts struck me as quite different. Drinking sugar water to lose weight was definitely not a return to a Stone-Age lifestyle.

But the big improvements in SLD since I wrote that paper – from sugar water to ELOO, and from ELOO to oils high in omega-3 – brought SLD much closer to the Stone-Age-Life-Suits-Us theme, I now see.

Alfred Chew (2007-01-19 21:16:02)

To be exact, everything in moderation will be beneficial...

william hung (2007-03-06 11:09:00)

Like mercury?

Jon Cook (2008-03-14 07:09:01)

so drinking olive oil is healthy. ^.^

Genital Warts Treatment Web (2008-07-11 18:08:29)

Drinking olive oil would be exactly the same as eating it. The taste and feel of olive oil on your tongue is a little yucky though!

Eric (2008-09-26 13:05:37)

Im currently taking 100ml each day, hopefully to get my HDL cholesterol up from 80 % to over 100 % it fell from 90 %, I am sure that was because I was eating less fish. First thing I noticed I do not feel so hungry. Second, it took about 20 days before I began to like it. Third, ever since I have been taking Olive Oil my bogey drops are a lot cleaner, honest before that sometime I would think I would need a whole roll of toilet paper before I was happy, now I just need two lots of toilet paper, one to clean up and to make sure it is clean. Have you ever heard of the joke "How do you cook toilet paper?" Brown it on one side then throw it in the pan. well now I hardly ever get any "Browning" I only hope my next blood test shows up good results.

veronica (2008-09-30 00:31:14)

i am severely anemic and need to take iron supplements. also i am 40 years old and began to notice the beginning of arthritis in my hands. my aunt ruby who is 87 years old suggested drinking olive oil for the bowel movement issue (iron causes constipation). so i read up on it and learned the benefits to joints and minimizing inflammation. i have been drink about 10 to 12 oz every day now for about two weeweeks and feel great. i agree with the toilet paper entry, great side effect. so, i highly recommend it. the trick is to have a glass of water handy and drink the water immediately after you swallow the oil, sometimes even same mouth full. this is how i do it and i have not any problem. also, do not drink after too much food is in your tummy, you will get sick. it is best on an empty stomach., and you will not be hungry for hours.

Eric (2008-10-09 22:41:52)

so Google tells me 1 US fluid ounce = 29.5735296 ml. so that would be a big cup full, at 250ml per cup. One other thing, before I started to drank Olive Oil I used to rip my skin all the time, & was always catching my finger or hand at work on something, in fact I used /(still do) keep a couple of plasters in my wallet, I frequently had a plaster on my hand or finger, but now I dont in the three months or so I have been drinking Oliver Oil. In fact a google search on "drinking olive oil" tells you on one of the web site (somewhere).

Eric (2008-10-15 11:07:51)

....whoops.....sorry to be back so soon. There seems to be a terrible misconception that once you start drinking olive oil you will spend a lot of time in the "Bog House" getting rid of "bogeys", I found there is no truth in this claim at all or maybe I was not constipated to start with, so I am very sure I don't take any extra trips to the bog house since I started drinking Olive Oil, so don't drink it thinking it is a horrible tasting laxative (or you might be disappointed?) This just about completes my range of entries on the subject of "drinking Olive Oil" apart from go for "extra virgin" and buy it in tins or very dark bottles (it goes off with exposure to light)

Eric (2008-12-18 23:05:04)

OK so I tell a little fib now and again (I am back again to say more) ..... and the joke is on me, helped by google. And Doc Martin (UK TV series) is right, don't practice to be a rogue doctor from what you read on internet. I plugged into google "increase HDL cholesterol" and up popped a few articles, like Olive Oil & a lady who drinks 250 mL (a glass) of Olive oil everyday, and some other study. So I gave 100mL a go for the past six months. So a couple of weeks ago I went to see the doctor on another problem and asked him nicely if I could have an early blood test, I got the results today and I don't think Olive Oil has offered anything like a miracle cure to increase the good HDL cholesterol. However there is an interesting trend on my Triglyceride less than half (not too sure if that is due to Olive Oil or not) as in the past month or so I got the huff with lunch bars and I don't get there any more for my work lunch. Blood test results 13 December test result, name of variable, 26 April test result, (ideal). 0.9\*, HDL cholesterol (good), 0.8\*\*, (>1.0) 3.0\*, LDL cholesterol (bad), 1.9, (<3.0) 1.4, Triglyceride, 3.8\*\*, (<2.0). I wonder how my next test comes out like in a year or so from now. I hope this works

eva (2009-01-17 16:35:54)

How are you doing, Eric? I am going to start olive oil diet and I am a bit scared :) I would like to read more about others' experience.

Eric (2009-01-22 00:12:18)

Hi Eva, I gave it up (drinking Olive Oil) and lost the 2Kg I put on when I first started drinking it. My doctor told me to have "evening primrose oil" 1000mg \*4 tablets (even though the instructions say 3\*tablets).

diane (2009-02-22 16:45:28)

I just tried a tablespoon of olive oil, yuk. I still feel sick in the stomach. What's a good way to try this? diane

seth (2009-02-22 19:19:31)

Mix it with water. See [boards.shangriladiet.com](http://boards.shangriladiet.com) for lots of other suggestions.

bretto (2009-03-03 15:24:18)

I've tried it a couple of times and I find it hard to swallow. I can only take a small amount like 25ml any more and I puke.

Tom in TX (2009-03-04 12:25:24)

I have been taking extra light olive oil (ELOO) for the Shangri-La Diet lately - 4 T per day, all at once. (At other times I have taken it 2 T, 2x/day) When I take it by itself, I feel queasy for a while. I found this tip on the SLD forum and have tried it for the past couple of days. I take it with some milk. The details: Pinch nose shut. Drink 4 T ELOO. Drink small cup (about 4 oz) of milk. Drink some water to rinse everything out of mouth. Unpinch nose. The ELOO is in my tummy, my taste buds never knew about it, and I don't feel queasy. Too early to report how this affects the appetite suppression.

bretto (2009-03-10 23:50:52)

I found the best way. Pour oil into shot glass and tip a few drips of lemon juice (preferably cold). The lemon juice stays to the bottom and doesn't mix. When you drink it all you taste is the lemon juice.

ashley (2009-06-04 16:26:27)

i am thinking of trying the olive oil thing, i have a huge appetite ad i would like to control it any suggestions

seth (2009-06-04 16:38:59)

I suggest you visit [boards.shangriladiet.com](http://boards.shangriladiet.com) for lots of help and examples of how people do the olive oil thing.

Mala (2009-07-06 18:21:35)

I close my eyes and I swallow two tablespoons and then drink warm water. I don't feel any after taste.

Tom in TX (2009-07-07 06:42:25)

An update: I went back to taking my ELOO 2T, 2x/day. I pinch my nose and drink some water to rinse my mouth. No milk now. I am not feeling an queasiness. So I conclude that 4T of ELOO is too much for my tummy all at once.

Joanne (2009-08-04 21:06:41)

Would like to know if taking Extra virgin olive oil helps stomach ulcers. How much should I take and how often. Have tried everything! Thanks so much!

seth (2009-08-04 22:03:23)

Joanne, I doubt EVOO helps stomach ulcers. I suggest you try some fermented foods, such as yogurt or kombucha. See my blog for many posts about fermented foods.

Dervish (2009-08-11 08:57:49)

I have been drinking Olive Oil for a couple of years now and I have definitely felt and seen the health nefeits. My throat and nose are clean and free now, my skin is more supple, my hair is more curly, my whole digestive tract is much smoother. I used to smoke tobacco and Marihuana, which gave me a constant clogged up nose and thick unyielding mucus membranes. All the negative side effects of smoking have disappeared. I drink a few sips of Olive Oil in the morning on an empty stomach. And during the day I sometimes drink a few swigs. Olive oil dissolves non-water-soluble substances that are 'stuck' in your mucus. I havent needed to go to the doctor for twenty-some years now and a physician friend of mine has checked me up and said I have no signs of deterioration due to smoking. Even the normal physical deterioration due to my age of 41 years are less than expected, he said. I have to add that I am a vegetarian now for twenty odd years and the beneficial effects of this diet are aplenty. Stay away from sugar, tobacco, unnatural drugs and medicine, eat meat only sparsely; like we used to do in times before. Dose up on vegetables, fruits and raw foods, eat anti-oxidant rich foods. You'll live the longer for it and much healthier. And therefor happier.

Mazzie (2009-08-14 13:10:24)

Hi, My relative suffered from constant asthma. She drank about a teaspoon of olive oil everyday and has been drinking for about 12 years now and her asthma is completely better...not a single asthma attack!

Henry Mertern (2009-10-25 05:10:17)

Hi! I just tried to swallow 150ml olive oil and it went down alright - lovely flavour, hasn't it?! :-) but a few moments later I was so sick! I think my stomach has to get used to digesting over 1000cals all at once...

Jeff (2009-11-09 10:00:10)

I heard of a diet that consisted of taking a tablespoon of safflower oil after eating. This women who did it lost much weight. I wonder if it would be better to substitute olive oil?

Ricky (2009-11-11 23:12:48)

Drink it with 2/3 Cup Squeezed Grapefruit Juice and 1/2 cup Cold Processed Olive Oil.

MufaMaxer (2010-02-26 11:19:52)

I add a few tbsp's of extra virgin olive oil to my protein smoothie and this actually calms my large appetite for several hours and I feel full & satisfied. My protein smoothie consists of: 1 Scoopy of Vanilla Whey protein powder, 1/2 cup fat-free milk, and any kind of fruit you desire (bananna, peaches, blueberries). Add a few ice cubes and mix in a blender. The olive oil really enhances the flavor.

Shariq (2010-03-02 05:13:18)

Hi, i have been thinking of drinking Olive Oil for sometime as a friend is a regular at it now. I was waiting for a free day as I was worried that I would feel sick and did not want to throw up in front of my students in the iddle of the class(I am a tutor at University). But I had to dare it one day and I wake this morning and had my first taste of it, one tea spoon (slightly bigger actually). What feeling, yuck, the moment it went inside my system I felt, awww!!!. I ran to the bathroom thinking that I will vomit, but i didn't. I picked up the toothbrush and started brushing and the good smell of toothpaste helped. I just finished my class and I am feeling better. Not even the thought of throwing up came when I was in the class. Sure I am determined to take it regularly from now on. For those who are just thinking of starting, my suggestion is don't straight away for a 100ml or something. Start with a tea spoon, let your body get used to it and then slowly increase your dose. Fingers crossed, it will be beneficial. Also, I need a suggestion from someone. My 3 year old son has just been potentially diagnosed with Asthma (tests awaited). I read above that someone had a positive affect on Asthma after drinking Olive Oil. I was wondering how can I give it to such a little boy. I know he will throw up in dislike and will never take it again. Please share any ideas or experiences.

Riley (2010-03-18 10:57:47)

I am glad I found this page! I am a thin guy, and for the past few weeks I found I had no appetite, and I was losing weight and it was scary! I am too skinny to lose more weight. Someone suggested I am not getting enough fat in my system. I replied that I simply can't eat enough to gain any weight. Then they suggested drinking olive oil!! I have only been drinking it (1-2 shot glasses per day) for about a week, and I'm already noticing positive results! Is it bad for your heart though? I think I may have heart problems, and I don't want to be having a heart attack!

Kimberly (2010-03-21 08:02:26)

Hiya, I was wondering if any amount of olive oil a day matters. Most people are saying they intake 100ml-150ml... So would a tablespoon be enough? I just drank it about 20 minutes ago and it was HORRIBLE! I drank it and then quickly washed it down with water. I still felt rather sick! My head kind of hurts because I keep thinking about how strange it felt! After reading all of this and understanding how everyone else drank it, I can hopefully drink it with ease tomorrow! Shariq, try mixing it with milk or juice? He wouldn't even notice! Riley, I'm no doctor so I am not 100 % sure, but probably not. All these other people are taking it and they seem fine! (other than disgusted from the taste!)

The Golden Branch (2010-05-31 12:19:18)

From my experience coming from a mediterenian country and cooking with nothing but with extra virgin olive oil and drinking it every morning in an empty stomach its health benefits are apparent from with in and out. mentioning a few below: one looks younger then the actual age,your joints are always strong,one doesnt feel tired,no backache,no constipation,and the sexual stamina is there always even if you are making love daily:),again this is from my own experience and definitely it will benefit any1 regardless of race and place. Be a doctor to yourself with natural ways,come in south east europe and see the men who consume it glowing and full of vitality regardless of age. One doesnt need to drink it like watter, mind you that,best is moderation,our tradition is 2 to 3 tablespoons every morning,some take it 1 tbspoon morning and 1 evening,i know one old folk 117 years old doing this all her life and is walking and talking as if she is a healthy 60 years old.what more one can say abt this elixir of longevity. i hope every1 will make use of this God bleesed elixir and be healthy. Best Regards Olive man

Barbara Knutson (2010-06-03 10:27:15)

I'm trying 2 tablespoons daily as per a Mediteranean diet I read on the internet. I mix it with 8 oz of Simply Orange orange juice in my Magic Bullet. I do 1 tablespoon in the AM and 1 during the day. No weight gain yet. Labs won't happen for another 6 months or so. I can't really taste it in the o.j. (Use extra virgin. It is the best for you.) Hopeful.

sirvarht (2010-07-06 14:05:56)

I have been eating foods prepared with olive oil from childhood-I am now 55, getting older, etc. I began taking 1 teaspoon per day and still use olive oil with food as a rule. I was having trouble sleeping and a few aches (I'm sure arthritis with age) but since I have added the extra teaspoon orally on a daily basis I sleep like a baby, my aches are dissipating and my hair & skin are fabulous. Even though they say it is good to put on your hair & skin taken internally is far more nourishing to your entire body.

grace (2010-07-08 08:52:12)

Anyone ever considered tying the olive oil capsule? its a lot better than the trauma of the oily taste in the mouth.

Kathleen Fitzpatrick (2010-07-14 07:24:04)

I have a girlfriend who takes a couple of teaspoons of olive oil each morning for one reason only - her hair. And I must say the "proof is in the pudding", as she has a beautiful, shiney mane of thick hair. I pour extra virgin olive oil on just about everything, but I never thought of drinking it straight. Will try though, beginning with a teaspoon. I have oodles of bottles of flavored extra virgin olive oils, and I would bet that they are more palatable. Bottoms up!!

Redsash (2010-11-11 15:31:24)

I have tried applying olive oil on my skin especially on my face. Wow! my skin is tighter and smoother now. According to studies olive oil helps eliminate wrinkles. You can really see and feel the difference. I also take 1 tbsp. of olive oil first thing in the morning.

Janice Marie Foote (2010-11-14 17:12:13)

I'm gonna mix the olive oil in my smoothies to make it easier to swallow :) Plus as a late coming burgeoning singer-songwriter, I'm sure it'll do me extra good more ways than I can imagine :) I'm happy to find all this good o.O information here :)

Raul (2010-11-15 10:29:56)

I think you guys are really overdoing it. For Olive oil just two table-spoons daily is more than enough. And you can add it to anything you eat, so there is nothing to worry about taste. Just purchase the Extra virgin olive oil. Thanks.

Rheter (2011-03-26 19:43:22)

Try mixing a tablespoon of olive oil with tomato juice or green vegetable juice. I enjoy it this way. Hope you do too.

Terry (2011-05-04 15:22:29)

If you will get VIGO (in red) olive oil. It is not extra virgin olive oil. On the label it has VIGO then in smaller print on what looks like a blue ribbon it says IMPORTED. Then under that in red it has 100 % Pure. Under that in larger yellow letters it has OLIVE OIL. Under that in smaller white letters it has MILD TASTE. The background of the label is from top to bottom a yellow/gold with a picture of olives (green) at the bottom. On the side it says Product of Italy, Spain and Turkey. VIGO IMPORTING CO. TAMPA, FL. 33614. This olive oil is very mild and very easy to drink. There is no bitter taste at all. I get it in the 17 FL. OZ. size at the Publix grocery store here in Alabama. I hope this will be helpful to some of you that find the olive oil that you are trying to drink hard to deal with. Try this olive oil; I think that you will be pleasantly surprised.

Pam (2011-05-19 13:50:31)

I love EVOO with vinegar, apple and balsamic; always drink the residue from a salad and lemon and olive oil shaken together if I drink it. It's great tasting that way and all are good for your health.

the flower (2011-11-10 20:40:34)

can someone pls tell, whether drinking olive oil reduces acidity? Thns

the flower (2011-11-24 02:12:35)

hi guys, i started taking olive oil in the morning, empty stomach. I just take 1 tsp and immdtly i eat 2 lives with it . so its going

fine. just one week i started taking it, and really am feeling the difference. i had a severe acidity, and i used to take antacids everyday before bed. but since i started drinking olive oil , i havn't taken any atacids, its great!!!!!!:-)

steve (2011-12-10 00:16:18)

Tried drinking it yesterday - it had peppery taste and not easy to drink. No pleasure! Thought I would mix it with Balsamic vinegar and dip bread into it. So that's what I'm going to try. May come here again and tell you the result (if I ever find this page again!)

Gee (2012-02-29 03:18:48)

its now 2 months since i started using Extra Virgin Olive Oil. I usually drink 1 teaspoon after supper and also apply on my body from face to toe. Its really doing me miracles. I will start taking it on my empty stomach now after reading some of your comments. Thanks

### **The Decline of Harvard (2007-01-02 15:39)**

In high school, I learned a lot from [1]Martin Gardner's Mathematical Games column in Scientific American. I read it at the Chicago Public Library on my way home from school while transferring from one bus line to another – thank heavens transfers were good for two hours. In college, it was long fact articles in The New Yorker. Now it's [2]Marginal Revolution, where I [3]recently learned:

Harvard has also declined as a revolutionary science university from being the top Nobel-prize-winning institution for 40 years, to currently joint sixth position.

The full paper is [4]here.

What should we make of this? Clayton Christensen, the author of [5]The Innovator's Dilemma (excellent) and a professor at the Harvard Business School, has been skeptical of Harvard's ability to maintain its position as a top business school. He believes, based on his research and the facts of the matter, that it will gradually lose its position due to down-market competitors such as Motorola University and the University of Phoenix, just as Digital Equipment Corporation, once considered one of the best-run companies in the world, lost its position. A few years ago, in a [6]talk, he described asking 100 of his MBA students if they agreed with his analysis. Only three did.

How would we know if Harvard was losing its luster? Christensen asked a student who strongly disagreed with him. Harvard business students (except Christensen's) are taught to base their decisions on data. So Christensen put the question like this: If you were dean of the business school, what evidence would convince you that this was happening and it was time to take corrective action?

When the percentage of Harvard graduates among CEO's of the top 1000 international companies goes down, said the student.

But by then it will be too late, said Christensen. His students agreed: By then it would be too late to reverse the decline.

Christensen's research is related to mine, oddly enough – we both study innovation. For explicit connections, see the Discussion section of [7]this article and the Reply to Commentators section of [8]this one.

### Someone Has Been Reading This Blog (2007-01-02 21:46)

According to [1]this USA Today article, "omega-3 is in". That is, in many new food products to be introduced in 2007, such as a new orange juice. Omega-3, says the article, is "the hot ingredient" and "the miracle food." The article delicately calls omega-3 a "fatty acid" rather than a fat. My many posts about omega-3 include [2]this and [3]this. More to come.

1. [http://www.usatoday.com/money/industries/health/2007-01-01-omega-3-usat\\_x.htm](http://www.usatoday.com/money/industries/health/2007-01-01-omega-3-usat_x.htm)

### **Procrastination (cont.) (2007-01-04 07:13)**

A just-published [1]review article (abstract only) on procrastination, which looks good, and an interesting [2]talk by the author of the review, Piers Steel, a professor of business at the University of Calgary. No mention of an [3]evolutionary explanation.

Update of [4]my earlier post about procrastination: To keep my email In Box un-jammed and my kitchen table un-embarrassing, I now realize I must play a few games of Sudoku every day.

---

Andrew Sidwell (2007-01-04 15:42:53)

From the end of the abstract: "Continued research into procrastination should not be delayed". I hope that's meant to be ironic.

seth (2007-01-04 15:47:08)

Maybe the author will tell us.

pdf23ds (2007-01-06 13:51:56)

I think you shouldn't neglect the possibility that stimulating tasks like Sudoku, by raising your dopamine levels temporarily, simply make things done very shortly afterwards seem more interesting than they would otherwise. (Not to deny that the reward mechanism is part of it, too.)

seth (2007-01-07 07:25:22)

"research into procrastination should not be delayed": The author tells me that yes, this was meant to be humorous. pdf23ds, before I started using Sudoku as a reward I wondered if just playing it would be helpful. It wasn't: Playing it left me feeling like I had wasted my time. I think I find Sudoku mildly pleasant under some conditions. The curious thing about my findings is that making a little deal with myself (do this stuff then you can play a game of Sudoku) gets me started on an unpleasant task where otherwise I would go do something else. That can't be due to the aftereffects of Sudoku.

## Annals of Self-Experimentation: How to Fall Asleep Faster (2007-01-04 17:57)

Evan Dumas, our self-experimenter, does IT support in Portland, Oregon. He is 26 years old. As far back as he can remember, he has had trouble falling asleep. After he went to bed and turned off the light, it take an hour or more to fall asleep.

About a year ago, he tried a new solution: exercise just before bedtime. He had noticed that he fell asleep more quickly when he was tired (and of course exercise was tiring); and it was hard to exercise earlier in the day. He wondered if the standard advice don't exercise close to bedtime was true. (For example, "finish your exercise at least three hours before bedtime," [1]says the National Sleep Foundation.)

His exercise consisted of slow push-ups, crunch-style sit-ups, and some static yoga positions that use the side muscles and back muscles. He continued until he was tired. In the beginning this took about 10 minutes; now it takes about 20 minutes.

The very first night he tried this, he fell asleep within minutes. Same with later nights: After exercise, he fell asleep "instantaneously," he says – by which he means within about 5 minutes. Any doubt it was cause and effect was removed by evenings when he omitted the exercise, just to see if it was necessary. Without exercise, it again took him more than an hour to fall asleep. He also noticed that the exercise caused him to sleep less and wake up feeling more rested.

A great discovery. Surely we need far fewer sleeping pills.

To repeat what I said [2]earlier: If you are interested in doing any self-experimentation, feel free to contact me for help. Also, please let me know the results; I would like to publicize other people's self-experiments in this blog.

1. <http://www.sleepfoundation.org/hottopics/index.php?secid=9&id=31>

2. <http://www.blog.sethroberts.net/2006/12/23/why-i-like-self-experimentation/>

---

Buck (2007-01-05 15:18:29)

I thought my visitors might like your blog. Posted at link here. [1]Seth Roberts

1. <http://fastamber.com/blog/2007/01/05/seth-roberts/>

pdf23ds (2007-01-06 13:54:07)

There's already one proven treatment for people with delayed or advanced sleep phase syndrome: light therapy. If you didn't have to go to sleep and wake up during the same half of the day every day-if you could sleep whenever you felt like it-would you end up having a 27 hour day, or a 21 hour day? Then light therapy can help you.

## Methodological Lessons from Self-Experimentation (part 1 of 4) (2007-01-05 14:33)

On Tuesday (January 9) I am giving a [1]talk about [2]my self-experimentation to a group of interface designers who I hope will be interested in the broad methodological conclusions to be drawn from it. An audio file of the talk and the PowerPoint will be available but I think the most interesting stuff will be clearer and more accessible if I write it down. So here it is.

Usually we learn from our mistakes. This is the rare case where I learned from success – I expected my self-experimentation – to improve my sleep, to find effective ways to lose weight – to fail and was surprised and impressed when I was wrong. The seven lessons that follows (divided into four posts) are the broad conclusions I draw from what happened.

1. Do something. I started the long-term self-experimentation that led to [3]my paper because I didn't want to wake up too early for the rest of my life. I expected my little self-experiments to fail, and they did fail, but I didn't realize that I would slowly learn from failure. I learned how to record my data, for instance, and how to analyze it. The effect of that learning was that my self-experimentation got better and better and after many years of failure I got somewhere. I think American culture teaches that success is good and failure bad, but the truth for scientists is that failure is good in the sense that you learn from your mistakes.

2. Keep doing something. I learned the value of drudgery. The research took many years. After my initial failures I continued not because I could see I was learning stuff – the learning was too slow to be perceptible – but for the same reason I started: I didn't want to wake up early for the rest of my life. One of my students had been a classical musician. She said that her job had been athletic, not aesthetic. It involved great repetition of the same movements, like manual labor. Likewise, scientists often see science as something intellectually wonderful. I came to see it differently. Perhaps a question has one answer and there are 100 plausible alternatives. To find the answer you may just need to test each of the 100 possibilities. No way around it. That was roughly the position I was in trying to improve my sleep: There were many possibilities and no alternative to simply testing them one by one. (More complex experimental designs, such as factorial designs, were impractical.) There was nothing intellectually wonderful about it. "One thing nobody tells you about being a postdoc is that stuff that used to be fun for its own sake becomes tedious when you've done it hundreds or thousands of times," [4]blogged a postdoc.

Part 2 is [5]here.

## Methodological Lessons from Self-Experimentation (part 2 of 4) (2007-01-06 09:11)

3. Be minimal. In other words, do the easiest, simplest thing that will tell you something important and new, that will provide significant progress. This I learned by failure. In the early days of my self-experimentation – and of my rat research, too – I constantly tried to do experiments that broke this rule, and again and again they failed to work. (Slow learner.) The more complex the design, the more untested assumptions it makes. And untested assumptions, at least mine, are often wrong. I've been good about following this rule in my own research in recent years so to give an example of how it is broken I will describe someone else's research. I sat in on a planning session for an experiment about asthma at a highly-ranked school of public health. The experiment was expensive – the grant to pay for it was many hundreds of thousands of dollars. There were to be about 50 families in the treatment group and 50 families in the control group. They had done some pilot work involving three families. They proposed to begin the full experiment. I suggested that they do a larger pilot experiment – maybe four families in each group. There were several professors and several more people with Ph.D.'s at the meeting. No one agreed with me. Several people explicitly disagreed: "I don't think we need to do any more pilot work." As it turned out, I was right. They began the full experiment and it failed miserably because recruitment turned out to be far more difficult than expected.

Almost all proposed research I hear about breaks this rule, which is fascinating in a train-wreck kind of way. I have never seen a book about research design that makes this point. As a result, I suspect that books about research design are often counter-productive: The student would have been better off if he or she hadn't read them. The textbook teaches this or that complication to people who can barely do basic stuff. The poor student wastes time using complex designs that fail in cases where a simpler design would have succeeded.

Part 1 is [1]here. Part 3 is [2]here. You no longer need to register to comment.

## A Curious Academic Career (2007-01-07 08:10)

From Wikipedia:

He had no talent for teaching. He was dismissed by [Johns Hopkins University] after one semester. . . . On leaving JHU, he took a position . . . at Brown University in Providence, Rhode Island, where it became clear that he was no better at teaching advanced students than freshmen. . . . He was let go by Brown, being hired after a trip to Europe by Yale University . . . He quickly showed at Yale the same traits he had at JHU and Brown: he . . . was incapable of giving a lecture at a level that a student (even a graduate student) could comprehend. He was also unable to direct the research of graduate students . . . At age 70, [he] was involuntarily retired.

Which makes me want to learn more about the physical chemist [1]Lars Onsager, who won a Nobel Prize in 1968.

1. <http://en.wikipedia.org/wiki/Onsager>

### **Methodological Lessons from Self-Experimentation (part 3 of 4) (2007-01-07 21:49)**

4. There are serious defects in the way science is usually done. I found a new and powerful way of losing weight – yet I'm an outsider to that area. Although obesity is a huge problem, and hundreds of millions of dollars go into obesity research every year, I was completely outside that group of people and resources. If science is being done properly, there should be a relation between input and output – the more input, the more output. That failed here. Professional obesity researchers, given vast input, failed to discover this; whereas I, given zero input, managed to do so. You might say this was a weird fluke except the same thing happened again with mood: I discovered [1]a powerful way of changing mood, even though I was an outsider to the study of mood. Depression is a huge problem, vast resources go into trying to do something about it.

What the serious defects are has no simple answer. After the next lesson learned I'll try to explain what I think is wrong.

5. There are serious strengths in the way science is usually done. I relied heavily on conventional science and could never have gotten where I did without it. Ramirez and Cabanac did brilliant research. I say there are serious strengths in conventional science because I used conventional scientific methods and conclusions to find a new solution to a serious problem – obesity is a serious problem. I didn't just use conventional scientific tools; I also used self-experimentation, which is unconventional. But self-experimentation alone wouldn't have gotten very far, I'm sure. The turning point in my weight control research was reading a paper by Ramirez about rat experiments. Not only did I use a vast number of conclusions from conventional science, I also used conventional experimental designs and standard, common tools for data analysis, such as programs for plotting data.

To say that science is glorified common sense has a lot of truth to it. To say that science is a collection of methods to help us understand and control the world also has a lot of truth to it. But science is far more than a collection of tools; it is a whole community and culture, with beliefs as well as tools. Like any culture, many of its beliefs are based on faith.

Here is a story to illustrate what happens. It's pure human nature. Suppose someone gave you a power saw. Your first thought is: Wow, I have a power saw. There are many things I can now do that I couldn't do before. It seems like a pure benefit. No negatives. You learn how to use the power saw and you become better and better at using it. Eventually you start to make a living using the power saw – other people, who don't have a power saw, pay you to saw stuff for them. You become a power-saw professional and, along with other professionals, you establish rules about how to use power saws. To save the public from bad power saw usage, you establish a licensing test to become a power-saw professional. Your view of yourself is: I know how to use a power saw. And if there is a problem to be solved, you try to solve it with your power saw – that's what you know how to do best. All this makes perfect sense to you. Hundreds of professions have followed this path. What is hard for you to notice is that in certain ways you have become weaker – if a problem doesn't call for power-saw usage, you are less likely to find the solution. Because you are too busy making a living using your power saw.

I hope my point is obvious. Budding scientists go to graduate school where they learn a bundle of specialized research methods that varies from one research area to the next. That is their power saw. After graduate school, they make a living using the techniques that they have learned. After graduate school, they are in better shape to make a living; but they are in worse shape to solve problems for which the techniques that they have learned are not appropriate. Conventional scientific methods could go part of the way toward finding the Shangri-La Diet; but they could not go all the way. Other techniques were needed – very simple ones, pre-power-saw. So conventional science never found it.

In [2]Dark Age Ahead, Jane Jacobs gives another example of this. During a recent heat wave in Chicago, two nearby neighborhoods, similar in many ways, had very different death rates. A good explanation of the difference was provided by a graduate student in sociology, who used very simple very low-cost methods. In contrast, a task force of scientists from the Centers For Disease Control, with vast resources and great methodological sophistication, failed to explain the difference. They were blinded by their expertise. They failed to see that their methods weren't working.

Read [3]Part 1 and [4]Part 2. Part 4 is [5]here.

---

adventurer (2007-01-08 08:36:42)

hey seth! i love how you're putting more blog entries! i enjoy all of them. i know you've done some really groundbreaking research in the area of mood: improving depression, in addition to your cutting edge research in weight loss. Will you be going back to improving your findings regarding faces and trying to publicize it, as you have with SLD? Keep the entries coming! You're doing a great job! And enjoy tomorrow night's talk! I wish I could be there.

seth (2007-01-08 10:12:20)

Yes, I will improve and publicize my findings about faces and mood. I will write about them in a book about self-experimentation that I am writing now.

willy (2007-01-08 14:04:01)

adventurer or anyone can you please post the links to the improving depression posts and mood/face?. Or are they in the forum?. I don't find them. Thanks.

willy (2007-01-08 14:12:07)

Do you mean this: <http://www.blog.sethroberts.net/2006/12/23/why-i-like-self-experimentation/> and <http://www.blog.sethroberts.net/2006/12/23/why-i-like-self-experimentation/> ? I didn't get why breakfast is bad Do you have to see real faces or can you turn on the TV?

seth (2007-01-08 14:27:12)

My mood research is described here: <http://repositories.cdlib.org/postprints/117/> see Example 2. Breakfast is bad because it interferes with sleep – causes early awakening.

pdf23ds (2007-01-09 17:31:49)

There certainly are serious strengths in the way science is usually done. One of them is that scientists have access to very expensive data collecting instruments. If I could take an fMRI of myself three times a day (or even just EEG), I could probably find a lot of neat correlations.

## **Methodological Lessons from Self-Experimentation (part 4 of 4) (2007-01-08 18:29)**

6. Curiosity helps – because it provides a wide range of knowledge. Pasteur made a similar point when he said luck favors “the prepared mind” by which he meant the well-stocked mind. To come up with my theory of weight control you needed to know both obesity research and animal learning because the theory is based on basic facts about weight control and basic facts about Pavlovian conditioning. I knew the weight control facts because I had taught introductory psychology and lectured on weight control. I knew the basic facts about Pavlovian conditioning because my graduate training was in animal learning. It was unusual to know both sets of facts. Few obesity researchers knew much about animal learning; few animal-learning researchers knew much about weight control. The same thing happened with my mood research: Facts that I had learned from teaching introductory psychology showed me that my findings made sense and were important. I had taught introductory psychology because I was curious about psychology.

These two examples (weight control, mood) surprised me. I may have heard this point made a few times but I didn’t know any examples. Since then, however, I have come across examples not involving me that make the same point. [1]Luca Turin is a biophysicist who has come up with a far better explanation of how the nose works than any previous theory. His recent book *The Secret of Scent* tells the story. “In order to solve the structure/odor problem,” he wrote, “you need to know at least three things: (a) biology, (b) structure and (c) odor. Each of these three things taken individually is not difficult” (p. 166). The problem had gone unsolved because no one before Turin knew all three.

7. Publish in open-access journals. Because [2]my long self-experimentation paper was published in an open-access journal, anybody could read it within minutes. My friend Andrew Gelman [3]blogged about it, which caused Alex Tabarrok at [4]Marginal Revolution to [5]mention it. This brought it to the attention of Stephen Dubner, who with Steven Levitt [6]wrote about it in their *Freakonomics* column in the New York Times. That led to a contract to write two books – one about weight loss, the other about self-experimentation in general. That anyone could download my paper made it spread much faster. In the old days, with photocopies and libraries and mailed reprints . . . no talk tonight.

A summing-up, if you want to figure something out via data collection: 1. Do something. Don’t give up before starting. 2. Keep doing something. Science is more drudgery than scientists usually say. 3. Be minimal. 4. Use scientific tools (e.g., graphs), but don’t listen to scientists who say don’t do X or Y. 5. Post your results.

Read [7]Part 1, [8]Part 2, and [9]Part 3. You no longer need to register to comment. [10]My talk Tuesday night (tomorrow Jan 9) 7:30 pm at PARC (Palo Alto) is open to the public.

Phil Joy (2007-01-09 08:35:40)

That the experts don't take much notice of a gigantic breakthru on a problem of national importance is something I have seen before. I have several confirming instances that ionic forms of silver bound with delivery agents like citrate are in fact powerful broadband infection fighters that reduces/eliminates viral and bacterial infection both internal and external. They are also ridiculously cheap to manufacture. Thus, experts have little interest. Here is something that has potential as Hep-C, HIV, and birdflu life saving powers and where are the government and university leaders, the doctors, the AMA? Well, I think you said it Dr. Roberts, they are out playing with their power saws.

### **Near-Celebrity Near-Endorsement (2007-01-09 13:45)**

People have often told me that what the Shangri-La Diet needs is endorsement from a celebrity. I agree. From the current (2007-01-15) issue of Star magazine, here is a step in that direction. Not quite an endorsement but close; and on the same page as two celebrities.

# Winners & Losers

**WINNER!**  
DEC. 3, 2006  
123 lbs.

**ELLWEGER, 37**  
10 of diet, strength training and cardio. Sign & sound! (Source: *Source: Harley Productions*) "Eat in small meals a day. Each meal should have fat, protein, healthy carbs, fiber, minerals and water."

**MARCH 8, 2003**  
155 lbs.

**CLAY AIKEN**

Could a pair of shoes have led Clay, 28, to put on a few pounds in 2003? Who could blame him? The crooner "It's Not Me, It's You" gym routine and his on-air spat with Kelly Ripa last month made the 5'11" singer hit the scales (a since he...)

**LOSER!**  
SEPT. 26, 2006  
175 lbs.

After L.A. failed to the start Michael George says stress causes cortisol levels to rise, making the body retain fat. Is Right (and wrong). George suggests exercise. And if he's on tour, (he can't get the hotel's gym!)

## You Can Lose It, Too!

Want to get to the lean side of your life and reach your ideal weight? The biggest secret is this: You have to get your metabolism started with 30 to 60 minutes of exercise five to six days a week. Also, eat less meat. (Source: *Source: Harley Productions*)

**Your On A Diet.** Dr. Michael Rosen and Dr. Mehmet Oz (of *The Oprah Winfrey Show*) reveal the cutting-edge biological secrets that will help you shed pounds, including:

- Don't diet! If you eat more than 400 calories a day, you'll end up gaining weight. Cut 100 calories instead!
- The five ingredients to always avoid? Hydrogenated oil, sugar, high-fructose corn syrup, enriched flour and bleached flour.

Now, clinically sound weight-loss products RapidSlim SX and Cylaris are available at Walmart, GNC, and other fine retailers. Here's some important info about both:

- **RapidSlim SX** - Formulated with Hoodia...

**The Shangri-La Diet:** The No Hunger, Fat-Busting Weight-Loss Plan by Seth Kibben, Ph.D. has been derided as everything from "the olive oil diet" to "the strongest way to lose weight." Here's why:

- It requires you to drink 100 to 400 calories of sugar water and/or flavorless edible olive oil daily, at least an hour before or after your meals. This makes your stomach feel full.
- Once you've had your water and/or oil, you're free to eat anything you want!

It's been believed to act as an appetite suppressant, which makes you less hungry. The product is designed for rapid weight loss.

- Research shows that Cylaris, which contains an extract from the Asian plant *Cissampelos grandis*, can help dieters shed large amounts of weight. In one eight-week study, participants lost an average of 13 pounds!

**us people group, over \$18.95**

**YOU CAN LOSE IT**  
simonays.com, \$25

**MORE**

I am giving [1]a talk tonight (Tuesday, January 9, 7:30 pm) at PARC (Palo Alto) about self-experimentation that is open to the public. Audio and PowerPoint will be posted.

1. <http://www.baychi.org/calendar/20070109/>

larry (2007-01-10 00:57:50)

Thanks for the presentation at BayCHI. Your delivery was well-paced and engaging. The content was inspiring. One quibble: your slides were old-school, mostly a summary of the spoken message, summarized in text. Instead, consider those as your private notes, and show only the visual aids like graphs, using the former slides as your private notes. (This philosophy can motivate one to find visual aids for key points, in an attempt to eliminate the summary text.) Also, I'm confused by the Figure 2 graph in the "Surprises" paper that you also showed during the talk. After reviewing it many times, I think I understand it, but at first I thought that the intervention timing (when you saw faces) was running along the X axis. Also, the typography is hard to read because of pixelation (looks like a 4th generation photocopy). Again, thanks for the talk, which was educational and motivating. I'm off to read your book (is another on sleep forthcoming? please?). larry

pdf23ds (2007-01-11 18:02:41)

Wow. 175 lbs for a 6' 1" guy being too big? WTF? He looks tons better at 175. Reminds me why I never read celeb mags.

seth (2007-01-11 18:13:36)

speaking of WTF, on last week's Ugly Betty, Daniel and Betty are both looking at their paychecks. It's Betty's first paycheck.

Daniel: "What the . . . ?" Betty: "F.I.C.A.?"

## **From the SLD Forums (2007-01-10 20:15)**

Today paulkimelman posted [1]this:

I reached my target weight and have easily held it for >4 months now. I dropped the amount of oil to 1 Tbs from 2, but otherwise it is the same. Many people have been shocked more by the fact that I have effortlessly held the weight than that I lost it (23 pounds in 4-1/2 months). I do note that it is now effortless, as I do not worry about food at all (I eat what I want and when I want, except in the 2 hour window). Sometimes when I am snacking on almonds, I think I really should cut back, but it does not affect my weight, so I am learning to stop worrying. One interesting thing I have found in maintenance is about a 3 pound variance. What is nice, is that when it jumps up 2 pounds, I do not do anything different, as I know it will be down the next day. The other is that I know that if I have a few drinks of alcohol, my weight will be up 1 to 2 pounds the next day (1 if I drink enough water, 2 if I do not). But, again, it just drops off by the next day. I think it is simply retention of water. The calmness of not worrying about what the scale says has been a great feeling. At some point, I may shoot for losing another 6-7 pounds (I am at the top end of normal BMI, and this would take me to the low end). As you can guess, I have got a lot of people started on this diet, most have been successful (so far). So, for anyone who is not sure, I can report that I have been fully successful on this.

I now return to regular blogging...

1. <http://boards.sethroberts.net/index.php?topic=3668.msg33836#msg33836>

---

Andrew Sidwell (2007-01-11 04:31:37)

It stuns me that people who criticise the diet never take into account that it's known to change your perception of food in such a way as to make you want to eat less. When I see suggestions of "someone should use the oil but keep everything else the same", the suggesters never seem to understand that with the oil, dieters don't \*want\* to keep things the same. Scientists spend too much effort on trying to prove everything objectively and exhaustively, which is very useful when you're trying to find the behaviour of gas or model "dark matter". Self-experimenters are much more interested in subjective experience, and when studying individuals (who are complex and unpredictable), it's impossible to produce infallible proof. (I think I was trying to get at a slightly more profound difference between the two than I expressed above, but I'm sure I'll figure out how to say it eventually.) The only way the mainstream science will accept SLD or self-experimentation is through sheer numbers – at least, as far as I can see. Reports like the above are always good, because every new story makes it harder and harder to say "it

might be an expectation factor", "it's because they've been posting on a message board" or "it might be because the person is becoming more aware of their eating habits" in response. Good work.

### **Robin Hanson on Web Trials (2007-01-11 18:44)**

I recently asked [1]Robin Hanson, a professor at George Mason University, what he thought of [2]web trials. Web trials are a way to learn how to solve difficult health problems (e.g., acne, obesity). By web trial I mean a web-based collection of data that compares different ways of solving a problem. People with the problem would go to a web-site, sign up for one of the treatments, follow the directions, and report the results in a standardized format. For example, a site might compare three acne treatments (treatments that anyone can try, such as dietary changes or over-the-counter medicines). The cumulated results would gradually show which treatment works best – a thousand times more efficiently (sooner, cheaper, more easily) than a clinical trial (which no one would finance because there is no profit to be made). Web trials are halfway between clinical trials and the data collection now going on at the [3]Shangri-La Diet (SLD) forums, where [4]people post their progress on SLD.

I asked Robin because he has pioneered a similar improvement: [5]Prediction markets are often far better than what they replace. And his core political affiliation is "I don't know."

Here is a summary of what he said.

1. A selection effect is a big concern. Do people wait to report back until after it works? There is always going to be the issue of sampling, selection bias for people who stay with it.
2. How could you get people to allow you (the website) to choose for them which treatment to do? That would be the hard thing. Perhaps the website could say: "would you like to see what our advice for you is?" At most you could get randomization for your advice.
3. It doesn't have to be restricted to health problems. It could be used to test all sorts of advice. You could just get data about what happens when people do or don't follow some advice – romantic advice, for example. Very rarely do we have randomization in choices. When we do, we call them natural experiments. In medicine, researchers have used practice variation (variation from one doctor to the next) to look at effectiveness.
4. Perhaps you could get people to commit to this the way they do to Wikipedia. The goal would be: Let's understand humanity – a noble cause. Let's be part of a grand project to do this.

Robin blogs at [6]Overcoming Bias. Tomorrow I will comment on Robin's comments.

### Robin Hanson on Web Trials (my comments) (2007-01-12 18:21)

Yesterday I posted [1]Robin Hanson's comments on [2]web trials. My comments on his comments:

1. I think Robin is right that it would be hard to get most people to allow themselves to be randomized. But I also think it doesn't matter much. The important thing is to improve on existing methods of evaluation. Randomization of subjects to treatments isn't an end in itself, of course. The goal is to reach the right answer: Learn which treatment works best. I think if you have what might be called a "level playing field" or a "fair comparison" (the various treatment alternatives are presented "equally" – e.g., as equally likely to work, equally attractive, equally high on a list) it will be hard to imagine how the results will be on average worse than nothing. The site can record data about each subject (age, sex, etc.) and the results can be analyzed using those factors – another way to equate subjects across treatments and to help each person decide what would be best for him or her.
2. Excellent point that web trials could be used for evaluation of any advice. Maybe it would be better to start with a non-health problem. Something where the effects are quick and easy to measure.
3. I like the Wikipedia comparison. All-to-all institutions – institutions that help connect everyone to everyone – are ancient and have been very important. Markets and money may have been the first. If I pay Sam \$5 for X, and then Sam pays Peter \$5 for Y, Peter and Sam have traded X and Y. Money has made this much easier. Democratic institutions allow everyone to govern everyone. Banks allow everyone to loan money to everyone. Books allow everyone to teach everyone. Wikipedia makes all-to-all teaching much easier. Web trials allow everyone to help everyone solve any problem where data would help. As Robin says, Wikipedia suggests that people will participate in all-to-all institutions when there is no obvious reward for doing so.

1. <http://www.blog.sethroberts.net/2007/01/11/robin-hanson-on-web-trials/>

2. <http://www.blog.sethroberts.net/2006/12/21/web-trials/>

---

pdf23ds (2007-01-13 21:25:37)

I would specifically worry about people losing interest when the thing they try doesn't work, but reporting back when it does. Perhaps based on the proportion of people who sign up for a particular treatment but don't report back, you could estimate that for a greater number the treatment wasn't effective. And you'd have to deal with confounding factors. What about people who try multiple possible solutions at once? Who confuse the causality? (Maybe that would be noise? But you'd want to watch out for where there could be a bias there.) You might ask people to list other things about their life, and see if you can find correlations. Maybe remedy X doesn't work for people with more stress in their lives, or who are taking medication Y, but remedy X works for most other people. I'm not sure what a good way to do this would be.

seth (2007-01-13 22:33:58)

"I'd worry about people losing interest and not reporting back." That's what's nice about comparing two treatments at the same time – if the reporting rates differed for the two treatments, that would tell you something. I think you'd want to restrict the data to people who try one treatment at a time.

## Yet More about Omega-3 (2007-01-13 23:55)

Perhaps inspired by [1]USA Today, the New York Times [2]discusses DHA, an omega-3 fat sold as a food additive. "Magical or overrated?" is the question posed by the headline. According to Marion Nestle, overrated:

“My experience in nutrition is that single nutrients rarely produce miracles,” said Marion Nestle, a professor in the department of nutrition, food studies and public health at New York University and the author of “What to Eat,” published last year. “But it’s also been my experience that companies will put anything in their food if they think the extra marketing hype will help them sell more of it.”

Single nutrients rarely produce miracles? There is a long history in nutrition of just that: The story of the discovery of vitamins. One single-nutrient miracle after another. Given that history, the claims for omega-3 are plausible. If Nestle has an alternative explanation for the many results that point to the benefits of omega-3, that would be interesting to hear. It wasn’t provided in the article. “Companies will put anything in their food if they think the extra marketing hype will help them sell more of it”? Well, B vitamin supplementation of flour has cut the rate of neural tube birth defects roughly in half, a huge benefit, a huge amount of averted misery. Given that success, it is reasonable to think that other supplementation might also be helpful – to everyone. I discuss derogatory treatment of food companies (“will put anything in their food if . . . hype will help them sell more of it”) in the last chapter of *The Shangri-La Diet*. Curiously enough, Jane Jacobs once said, you can only change something if you love it.

I have done more self-experimentation about omega-3s and will describe the results in a week or two. Previous posts about omega-3 [3]here, [4]here, [5]here, [6]here, [7]here, [8]here, [9]here, [10]here, [11]here, and [12]here

## Ripe for Change (movie) (2007-01-14 18:29)

Last night I saw the excellent documentary *Ripe for Change*, about new developments in food in California. It is part of a four-part series called [1]California and the American Dream on PBS several months ago (to my horror, I missed it). The showing was hosted by [2]Slow Food San Francisco; I learned about it because I am a member of [3]Slow Food

USA, "an organization devoted to preserving [4]traditional foodways" (from their website description).

One of the producers was at the screening and spoke at length about outreach, meaning screenings. PBS misses lots of people, he said. As I say about research, no point doing it if no one learns about it. He can't post the whole thing on Google Video because PBS owns the broadcast rights for three years. Ugh. First, PBS funds it, then prevents people from seeing it.

The film covers the [5]Edible Schoolyard in Berkeley (aerial photo above) and attempts in Berkeley to improve school lunches. While writing *The Shangri-La Diet*, I looked into school gardens as a way to help kids eat better. I visited the Edible Schoolyard, where I was sorry to learn that the ten-year-old program receives \$200,000/year in grants (a crucial fact I can't find on their website) with no end in sight. When I talked with them, they seemed uninterested in reducing this dependency. Not very sustainable, much less repeatable. The Berkeley school lunch program is also [6]in poor shape, although you wouldn't know it from the film, one of its few shortcomings.

In contrast, farmer's markets are doing great. The crucial step, said the film, was legalization, which happened while Jerry Brown was governor. Farmer's markets are spreading everywhere, supporting thousands of small farms and artisanal producers, and providing healthier food. (Not to mention their social, entertainment, and educational value.) Could this be telling us something about how to improve school lunches? I think liberalization of the school kitchen laws and allowing lots of small producers to try to make a profit by providing healthy school lunches (giving kids vouchers, say) might go a long way. The current efforts are too top-down and too few brains are involved, I believe.

Before the film there was a short clip of Naked Chef Jaime Oliver trying to improve British school lunches. In what we saw, he was having trouble: the kids wouldn't eat the food. (Just like in Berkeley.) Jaime Oliver, meet [7]Antonia Demas, whom I wrote about in the last chapter of *The Shangri-La Diet*.

### **The Benefits of Theory: Crazy Spicing and B. F. Skinner (2007-01-16 09:18)**

Someone has written me that she is doing well with the Shangri-La Diet by doing only crazy-spicing – adding random spices to everything. She's not doing anything else – no oil, no sugar water, etc. My reaction is: Take that, B. F. Skinner!

In 1950, Skinner published a paper called "[1]Are Theories of Learning Necessary?" which revealed that he did not understand the value of theories. In 1977, he wrote a similar paper called "[2]Why I am not a Cognitive Psychologist," which showed he still did not understand their value. In the later paper he wrote:

I am equally concerned with practical consequences. The appeal to cognitive states and processes is a diversion which could well be responsible for much of our failure to solve our problems.

The value of crazy spicing would never have been discovered without a theory. Without a theory, you'd never try it. It would never be discovered by accident.

### **Charles Murray vs. Charles Murray (2007-01-17 22:11)**

[1]The Bell Curve (1994) by Richard Herrnstein and Charles Murray, which argued that IQ is destiny, was the most IQ-glorifying book since . . . well, ever. Now Mr. Murray has taken a big step away from his position in that book, yet he continues to glorify IQ. In today's Wall Street Journal, Mr. Murray wrote an op-ed piece ([2]"What's wrong with vocational school?") with which I mostly agree. His main point is that for most students, college is a waste of time. As a college teacher (at Berkeley), [3]I have seen that all too clearly. Mr. Murray has an unfortunate way of stating his position. "A four-year college education teaches advanced analytic skills and information at a level that exceeds the intellectual capacity of most people." I'd put it differently: A four-year college education teaches analytic skills and information at a level that exceeds the interest of most people. I am sure that if my students or anyone's students were more interested in the material, they would learn it better. That most college students are not interested in the same things as most college professors is a good thing, economically speaking. A healthy economy is a diverse economy; a diverse economy requires a wide range of skills and knowledge, much wider than the narrow skills and knowledge possessed and taught by college teachers. But it is a bad thing for the students and teachers, who are trapped. They have to be there. I feel worse for the students, of course – they are paying to be there. It isn't complicated: IQ tests

were designed to predict school performance. They do. People with higher IQs do better in school. To believe in the value of IQ is to believe in the school system it reflects. To glorify one is to glorify the other. Now Mr. Murray has taken a step away from one (the school system) but not the other (IQ). Well, nobody's perfect. Were I grading *The Bell Curve*, I would give it a B. The sad truth is that its basic conclusion, that a high IQ is really helpful, is entirely correct. A better book would have replaced the wacky genetic chapter with an attempt to understand why IQ matters so much. In a world where we place less weight on successful completion of college – the world that Murray now advocates – IQ will matter less. In *The Nature of Economies*, Jane Jacobs pointed to the stultifying effects of discrimination. "Macho cultures typically have pitiful, weak economies," she wrote. "Half their population, doing economically important types of work, such as cooking and food processing . . . are excluded from taking initiatives to develop all that work [e.g., open a restaurant] – and nobody else does it, either." IQ discrimination is also stultifying. If our society did a better job of helping students who are not good at college – helping them find jobs where their abilities shine, instead of wasting four precious years of their lives – the entire economy would benefit.

Half Sigma (2007-01-22 12:20:34)

Don't understand why a chapter explaining how intelligence is hereditary is "whacky."

Steve Sailer (2007-01-22 17:59:03)

IQ has validity for predicting plenty of non-academic outcomes in life. That's why the U.S. military began using IQ tests in 1917 and spends a fortune on IQ testing of would-be enlistees and correlating the results with their performance during their military career. Higher IQ soldiers are less likely to die in combat, to die in truck driving accidents, to drop bombs accurately on targets, etc. From 1992 through 2004, only 1 % of new enlistees were allowed into the military with IQ scores on the AFQT from the bottom 30 % of the IQ distributions. The new data in the long second part of *The Bell Curve* was delivered to Murray by the chief psychometrician of one of the services.

seth (2007-01-22 20:01:46)

Why was the IQ/heredity chapter wacky? Because it ignored the implications of the Flynn effect. That effect implies that environmental effects on IQ can be just as large as the effects that the authors wanted to explain. The army data are interesting. Many people, including Herrnstein and Murray, seem to take the predictive value of IQ as permanent, whereas I believe that in a different society – ancient Sparta, say – its predictive value would be less. In a world where we don't force everyone to go to college, its predictive value would probably be less, for example.

Steve Sailer (2007-01-23 18:51:12)

Considering that Herrnstein & Murray coined the term "Flynn Effect," I don't think they ignored its implications. The problem with the popular theory that the Flynn Effect will solve everything is that very little convergence has been observed in group average IQ scores over the last 90 years. For examples, see the graphs in: [http://www.vdare.com/sailer/060423\\_lynn.htm](http://www.vdare.com/sailer/060423_lynn.htm)

seth (2007-01-23 20:14:00)

"I don't think they ignored its implications." If I remember correctly, here is what Herrnstein & Murray ignored. The Flynn Effect implies that there are one or more powerful environmental effects on IQ. They can raise or lower IQ on the order of 20 points. For simplicity, let's say there's just one factor, Factor X. If you are high on Factor X, your IQ will be 20 points higher than if you are low on Factor X. Herrnstein and Murray speculated on the possible genetic cause of Black/White differences and other group differences without knowing (a) what Factor X is and (b) where Whites, Blacks, and other groups fall on this factor. Once those two pieces of info were known, there might be nothing left to explain. Differences in Factor X might entirely account for

the observed group differences.

Steve Sailer (2007-01-24 16:01:22)

Once again, I believe Herrnstein and Murray coined the term "Factor X." Finding Factor X was a huge obsession of American social scientists from the 1960s into the 1980s, when they started to give up out of frustration with repeated failures. For a lot of subtle reasons besides the repeated failure to find Factor X, the black-white IQ gap doesn't look much like it's caused by Factor X. It looks more like a larger version of the genetic driven differences in IQ found among biological siblings raised in the same households. Perhaps you should review what Murray has actually written before denouncing him?

seth (2007-01-25 11:47:09)

The Flynn Effect implies that Factor X exists. If American social scientists failed to find it . . . they failed to find it. That failure doesn't affect the point I'm making. "Perhaps you should review what Murray has actually written." I read The Bell Curve. As far as I can tell from your comments so far, my criticism of that book is correct. I am happy to be corrected however; if you would tell me on what page of The Bell Curve the authors refute or even show an understanding of my point about the Flynn Effect I would be happy to look at it.

TGGP (2007-12-18 12:11:42)

Karl Smith hypothesizes that the genetic component of IQ is preference [1]here. That would gel with Seth's "exceeds the interest" comment.

### **Economics and SLD (2007-01-18 15:21)**

I got a phone call today from a woman in Los Angeles who had some questions about the theory behind the Shangri-La Diet. It was an unusual book, she said.

"What did you like about it?" I asked.

"The cover. It's warm and inviting," she said.

I said that was the publisher's doing, not mine. She also said that it was unusual in that it paid attention to how much things cost. Most diet books don't, she said. I think my mom would be pleased to hear that.

---

### **How Good is Food in Berkeley? (2007-01-18 18:59)**

From an interesting NY Times [1]article about difficult people comes this:

"She's a superior human being, and she comes from a superior area" Berkeley, Calif., Ms. Rothman said. "She has told me many times that there are only two places to get good food. One of them is Berkeley, and one of them is France. And France is only second to Berkeley."

Huh? I love Chez Panisse but otherwise that makes no sense at all. San Francisco has more great food than Berkeley. So does Los Angeles.

1. <http://www.nytimes.com/2007/01/18/fashion/18difficult.html?em&ex=1169269200&en=9c412ae51b907411&ei=5087%0A>

---

losing-it (2007-01-18 20:50:50)

Mother Superior has obviously never lived and dined in Kansas City.

### **How Important is IQ? (2007-01-19 14:55)**

I teach at UC Berkeley. A few years ago I had an eye-opening experience about college teaching and evaluation. I was teaching an undergraduate seminar on depression. For the term project, I allowed/required students to do anything they wanted related to depression, so long as it was off campus and not library research. One student chose to give a talk to a high school class about depression. This would be unremarkable except that she had severe stage fright. The thought of speaking in front of any group terrified her. Every step of planning and doing the talk was very hard. But she managed to do it. In her term-project paper she wrote, "I learned that if I really wanted to, I could conquer my fear, and do what I needed to do" – among the most stirring words I have ever read.

Her work until then – class participation, writing assignments – had put her in the bottom half of the class. Yet her term project showed her to be resourceful (using the term project assignment in a useful way) and courageous (making herself do something that scared her). She chose the assignment that revealed these qualities. Ved Mehta, the writer, who is blind, spent his early years almost entirely within a small school compound. One day he was taken to the beach. He was astonished how freely he could run around. "The school compound . . . suddenly shrank in my mind, like a woollen sock . . . which became so small after [the housekeeper] washed it that I could scarcely get my hand in it," he wrote in *Vedi*. As I read my student's description of what she had done, I saw how narrow and restricted my usual assignments and my usual way of evaluating students had been.

I am sorry that Charles Murray, Bell Curve coauthor, has apparently never had a similar experience. In an op-ed ([1]"Aztecs vs Greeks") in Thursday's Wall Street Journal, alas, he made clear his belief that persons with a high IQ are more important economically and culturally than persons with a lower IQ. "We live in an age when it is unfashionable to talk about the special responsibility of being gifted," he wrote – "gifted" meaning "high IQ." He used the phrase the gifted. The gifted? If there are thirty or fifty or a thousand different useful sets of abilities, to single out one of them – the one that produces a high score on an IQ test – makes no sense. It's like referring to the sentence. That makes no sense. There are many useful sentences. We need all of them.

Persons with a high IQ do better at certain jobs, no doubt; but Murray fails to realize that such jobs are a tiny fraction of our economy and that discrimination against any group – failure to help any group develop their skills – is economically damaging because it reduces economic diversity (Jane Jacobs' point). Murray thinks we should treat high-IQ kids better. He fails to see that it is not people with high IQs who are under-served by the present system; it is everyone else – everyone with other gifts. Plenty of jobs demand resourcefulness and courage, for example, qualities that are probably uncorrelated with IQ, as my student emphasized to me. Both resourcefulness and courage are required to start a new business, which is the most economically important job of all.

Andrew Gelman's [2]reaction to similar ideas. [3]More about Charles Murray, IQ, and education. [4]A paper of mine

about encouraging diversity in learning.

4. <http://www.freakonomics.com/pdf/whatdostudentswant.pdf>

---

Andrew Gelman (2007-01-19 16:02:41)

I think Bill James would agree with you. He's written a lot about the ability of good managers to get the best out of their players rather than focusing on a single skill. (He also labeled intelligence and foot speed as the two attributes that are helpful both in offense and defense.)

Sean (2007-01-19 21:06:30)

People who possess Factor X, believe that Factor X is important.

Tim Lundeen (2007-01-19 22:19:26)

Your example is an inspiration, but I think you push it too far as a contra-IQ argument. My guess is that most of the students at UC Berkeley have an IQ of 120 or more (top 10 % or better). To say that a student with a presumed IQ of 120+ conquered her fears and did something wonderful is, in Murray's words, "an underachievement story, not the story of someone at the 49th percentile of intelligence." The best (and also saddest) case I've seen for the overall importance of IQ is at La Griffe de Lion, where he supports his claim that "In market economies, per capita GDP is directly proportional to the population fraction with verbal IQ equal to or greater than 106." See <http://www.lagriffedulion.f2s.com/sft2.htm>

Laura (2007-01-19 22:48:39)

Boalt, the law school at UC Berkeley is now conducting a study in a similar vein. They are testing, checking references, etc., of law grads, to see which qualities make the best lawyers--and how they correlate (or don't) with grades and standardized testing. Public education and (more so) private education is almost entirely focused in getting high school students into college. We're in the information age, so maybe that's good. But nobody is paying attention to the kids (and the rest of us) who would be better served by students learning and practicing necessary skills and vocations that don't require a college degree. Thanks for sharing your thoughts on this. Also, what Sean said in the previous comment. It speaks volumes that you live in that Factor X world and appreciate the value of our diversity.

doug (2007-01-19 23:56:02)

Murray is one of those who sees growing entitlement liabilities leading to national bankruptcy and civil disorder later in the century. I think you've got to interpret these articles through the prism of examining an entitlement program, with every young citizen entitled to tens of thousands of dollars of extra education and removed from the tax-paying workforce for an additional 4 years (important because of demographic narrowing also expected to occur, with each worker supporting one retiree through the social system).

losing-it (2007-01-20 06:35:12)

"One of the strongest characteristics of genius is the power of lighting its own fire." -John W. Foster And, there is a difference between genius and high IQ which might not be recognized on such as a bell curve. The first cannot be measured by stick or stone, whereas the second might be graphed through (artificial) testing. The first is creative spirit, the open beach, the sight of one who is blind; the second is mere intellect, a school compound, the spatial qualities of a sock in the hand of a housekeeper (which needs the quality of the first to be alive). Your timid student lit her own fire that day and even warmed her teacher's heart

with it. She and her teacher experienced another kind of IQ that is born of the nobility of spirit, courage : "Inspiration Quota." Poor Charles Murray. To me, Ved Mehta's experience beach experience speaks more about "the encouragement of wisdom" than powering up and elitizing "the gifted" could begin to achieve. Years ago, I was employed in a public school's administrative offices for a year or two, working with, among others, the administrator for the "gifted and talented" program. Although my son qualified for that program ("gifted" classes were newer in concept at that time), I decided against his participation, not because I wished to hold him back in any way, but because of the sense of elitism that I saw in the administrator, which is an insidious and ultimately destructive kind of self-esteem. To me (and at that time) it appeared that most gifts and talents, other than those charted by IQ, were not recognized or addressed in the program. On the other hand, making fun and stimulating "imagination classes" or workshops available to any interested student can bring young creative geniuses out darkness and into light – and inspire "mediocre" thinkers to new heights. By providing integrative experiences that encourage creative thinking and doing – learning how to think and apply ideas in original ways, searching out what "wisdom" really is with practical application; exploring how various talents, skills, countries, cultures, eras, age groups, jobs, and so on, can integrate together or complement each other and bring about a wholeness. Such "classrooms" need be led, rather than taught, by those of that sort of genius, themselves. And would probably best be conducted at the beach...and at the mountains, ice cream parlours, animal shelters, art studios, labs, libraries, places of worship and shopping malls...

losing-it (2007-01-20 16:11:26)

Ah, well, to the embarrassment of losing-it. 'Twas meant to be one less "experience" and rather to say, "Inspiration Quotient." \*\*\*\*\* As far as the laws of mathematics refer to reality, they are not certain; and as far as they are certain, they do not refer to reality. -Albert Einstein while reading e-mail I phone my daughter's number on the calculator (senryu)-dwb

seth (2007-01-21 05:04:53)

"best be conducted at the beach and at the mountains, ice cream parlours, animal shelters, art studios, labs, libraries, places of worship and shopping malls." I agree completely. That was the idea behind my do-anything-off-campus assignment: That there was a lot to learn in the off-campus world, that it was educational just being there. I think what happened – how much the students learned and how enjoyably they learned it – showed that this idea was right. The other thing I learned from my assignment, which isn't reflected in what I wrote above, is that every student was different. An effective educational system I believe will allow great individualization of what is learned. I think that was the other reason my assignment worked so well. Reason 1: off campus. Reason 2: different for every student.

Half Sigma (2007-01-22 12:31:40)

I don't understand what the story of the timid student has to do with IQ. Except maybe that our primary and secondary education failed her because despite being smart enough to get into Berkely she was afraid to talk in front of a classroom. Which tends to reinforce Murray's point that we aren't doing a good job of educating the gifted.

seth (2007-01-22 19:51:21)

What does the story of the timid student have to do with IQ? Because school performance and IQ are closely correlated, and she was a relatively poor student, she probably had a relatively low IQ. But that relatively low IQ did not do her justice – she had outstanding useful abilities.

losing-it (2007-01-23 14:09:04)

Seth, you might find this an interesting read (on the brain "IQ/Genius/Learning/Appetite), as well as the other articles on the site: "Balancing Act: Controlling Your Limbic Brain's Control on What You Can Do" by Win Wenger, Ph.D. "http://www.winwenger.com/limbic1.htm http://www.winwenger.com/limbic2.htm -D W Bender

misc (2007-04-09 13:12:30)

I don't see any point in referring to IQ as a special set of skills. Being smart won't make you small, ugly or clumsy. And even the social skills normally increase with IQ.

seth (2007-04-09 13:17:14)

misc, I don't follow your argument. Could you expand on it?

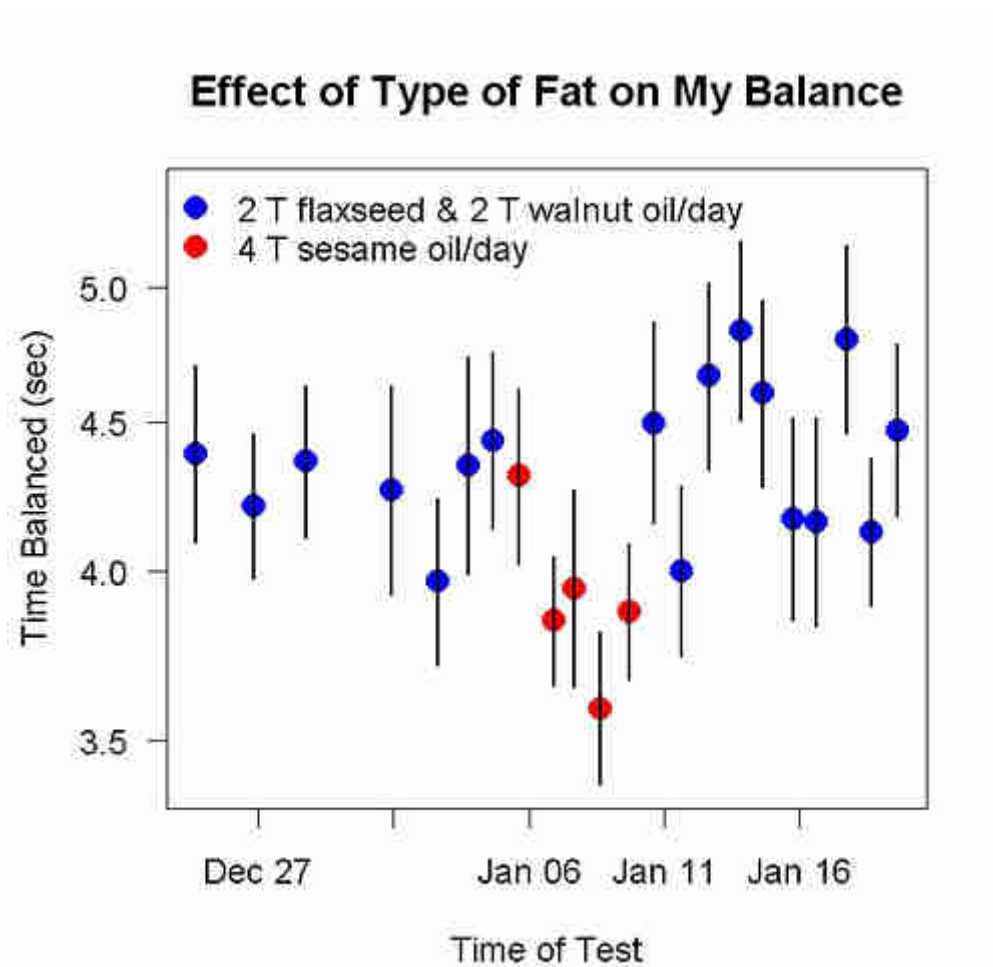

### **Science in Action: Omega-3 (balance results) (2007-01-20 15:41)**

Because many SLD dieters reported better sleep, [1]I wondered if omega-3 improved sleep. I increased my omega-3 intake by switching from olive oil, which has little omega-3, to walnut oil and flaxseed oil, which have much more – especially flaxseed oil. The amount of oil stayed roughly the same. The night after the change, my sleep got better. To my surprise, so did my balance. The next morning, I found I could more easily put on my shoes while standing up. I had been putting on my shoes standing up for 2-3 years and it had never been this easy. (I put on my shoes standing up because I thought it might improve my balance.)

I devised a simple measure of balancing ability. I stood on one foot on a platform balanced on a small metal cylinder (a pipe plug). (I will post pictures.) The parts were easy to find. I tried cylinders of different sizes until the balancing was neither too easy nor too hard. The measure was how long I could stand on one foot on the platform, which measured with a stopwatch. I made these measurements in blocks of 20 (the first 5 were warmup, leaving 15).

My early attempts had two problems: (1) The dose was too low. I had been taking the flaxseed oil as capsules (10 1000-mg capsules/day). I started taking 1 T/day in liquid form (much faster). Then I increased the amount of flaxseed oil/day from 1 T to 2 T. My sleep improved: I woke up more rested. Because the sleep effect was now perfectly clear, I thought measuring the effect on my balance would be a good idea. (2) Practice effects were too large. How well I could balance depended on how often I measured my balance. To avoid practice effects, I measured my balance no more than once/day.

I did a baseline period of several days; then I replaced the walnut oil and flaxseed oil with the same volume of sesame oil, which is low in omega-3. I continued this period until the effects seemed beyond doubt. Then I did another baseline period with the original amounts of walnut and flaxseed oil.

Here are the balance results. Each point is a geometric mean over 15 trials. The bars are standard errors. After one day, my balance got worse with sesame oil. When I returned to the high-omega-3 oils, my balance returned to its baseline level. To measure the clarity of the effect, I compared the 17 baseline days with the last 4 sesame-oil days. This gave  $t(19) = 4.1$ . A very clear effect.

I made this graph in a cafe. The person sitting next to me asked what I was working on. I showed her the graph. I explained that I measured my balance as a way of measuring how well my brain was working. The results suggested that the type of fat in my diet affected how well my brain worked. She said the results were very interesting because most people will have diets closer to sesame oil than walnut oil and flaxseed oil. Many people will be interested in these results, she said. I hope so, I said.

I will post later on the background of these results, the questions they raise, and procedural details. If you can't wait, read the posts in the omega-3 category. If you are interested in doing a similar experiment, please let me know.

---

Tim Lundeen (2007-01-20 18:57:07)

It would be interesting to repeat this but substitute EPA/DHA supplements instead of the flax/walnut oil. Presumably it is the conversion of the omega-3 FA in these oils to EPA/DHA that is the active agent in your sleep/balance. 2T flax plus 2T walnut translate to about 48g of oil with about 32 % alpha-linolenic FA. At a conversion rate of about 10 % to EPA/DHA, this results in about 1.2g of EPA/DHA (varies considerably per person and as a function of omega-6 FA levels). The concern with 4T of flax/walnut oil is that this is a very high load of polyunsaturated fat on a long-term basis, I've seen recommendations for about 4 % of calories to be from polyunsaturated FAs, and 4T would put you way over this. The other issues are the uncertain conversion of alpha-linolenic FA to EPA/DHA, and finally whether it is this that is changing sleep/balance or some other component. So I would be very curious :-). I'm currently taking 400mg/day of DHA, and have noticed an improvement in sleep and mood, but I made so many concurrent changes to get here that it is hard to break of the effect from just the DHA. But I might try increasing it to 1g/day and see if that has an effect.

seth (2007-01-21 04:51:42)

EPA/DHA supplements: Yes, I will certainly try other sources of omega-3. "This is a very high load of polyunsaturated fat on a long-term basis": I'm going to try to find the type & amount of fat that makes my brain work best, measured by sleep, balance, and perhaps other things. Whether that is best for the rest of my body is of course unsure. But so is the 4 % recommendation you cite. What is the 4 % recommendation based on? 400 mg/day of DHA: When I increased the flaxseed oil from 1 T/day to 2 T/day, my sleep suddenly improved. No question that it was cause and effect. Nothing I had read had suggested that would happen. Then I realized how little we know about all this and on what weak evidence current ideas are based. It isn't a minor issue. Omega-3 is believed protective, in a big way, against heart disease, the #1 killer. If 2 T/day is twice as protective as 1 T/day, that would be good to know. Greenland Eskimos, with high omega-3 consumption, had about a tenth the rate of heart disease as Danes, with low omega-3 consumption.

peter (2007-01-21 11:14:34)

Flax Seed Oil Actually Increases Prostate Cancer While Fish Oil Decreases It; [http://www.mercola.com/2004/jul/21/flax\\_seed\\_oil.htm](http://www.mercola.com/2004/jul/21/flax_seed_oil.htm) you have to add lignan's to the mix to avoid this tendency. I've read this in other sources. when i take flax seed oil (in a capsule) i take at least one spectrum flax oil with lignans, which hopefully offsets the adverse effects of straight flax seed oil.

Tim Lundeen (2007-01-21 12:55:05)

The 4 % number comes from an article by Enig/Fallon at <http://www.westonaprice.org/knownyourfats/skinny.html> #poly, they reference Lasserre, M, et al, Lipids, 1985, 20:4:227. (Enig has a PhD in biochemistry and did some of the first research on the effects of trans fat on metabolism. The Weston A Price site is on the natural foods/historical foods end of the spectrum in terms of dietary recommendations, but whenever I've checked the original research they cite it has supported them, so they do try to be science/research based.) The concern with high levels of PUFA is that they are less stable than SFA OR MUFA, so are more prone to oxidize and cause problems. There is some basis for thinking that the PUFA in atherosclerotic buildup is the trigger for clots/heart-attacks/strokes, because it is more prone to oxidation and then triggers buildup of inflammation, which then causes the atherosclerotic plaque to break off. My understanding is that omega-3 fats are not equivalent, that the brain selectively prefers DHA and that this is the important supplement in terms of brain health (mood, memory, sleep, balance, etc). It would be interesting to see a study of the difference in the value of flax oil between people who produce the D6D (delta-6 desaturase) enzyme that converts to EPA/DHA vs those who do not, but I couldn't find any via google :-). (Because of the effects you see from flax oil, it seems pretty clear that you have this enzyme.) Flax oil/flax seed is clearly good for you in a variety of ways, and I use flax oil in salad dressings as well as the DHA supplements I take as capsules. But I try to limit total PUFA levels, and keep a good balance between omega-3/omega-6 PUFAs. Actually pretty easy to do if you avoid modern oils (corn, soybean, canola, soy) and eat enough flax, fish and/or DHA supplements.

Josh Mangum (2007-01-27 14:10:33)

From looking around on the net it looks like 1 Tbl of oil is about 12-,000-14,000 mg. Is that about right? I'm doing the calculation because i already have the capsules and thought I'd try the bigger dose. 10 capsules or 10,000mg hasn't had a dramatic affect for me on sleep. Certainly nothing like the dramatic affect on hunger. I was curious about our aquatic ape ancestors or eskimos. Assume they got 80 % of their calories from fish. Rda for calories is about 2000 per day (although they probably needed more). There are about 150 calories per 100g of fish. And .5 to 2 grams of omega-3s per 100 grams of fish.  $1750/150 = 11$  servings of 100g of fish = 5.5 to 22 grams of Omega-3 If Seth's flaxseed oil is similar to mine it's about 52 % omega-3s. So his 2 tablespoons are 14g of omega-3s. Right in the range. Even 3 or 4 tablespoons would be near how eskimos and ancient aquatic apes lived every day. Did the Danish and more recent studies use high levels of omega-3s (more than 14g) or the smaller levels (less than a gram) that Tim is talking about? omega-3 per 100 grams of fish references here <http://www.annecollins.com/dietary-fat/fish-oils-fatty-acids.htm> <http://www.americanheart.org/presenter.jhtml?identifier=3013797>

seth (2007-01-27 18:13:25)

Thanks, Josh, that's a helpful calculation. Yes, 1 Tbl of oil is about 14,000 mg. The Danish studies were surveys. I don't have the details here but I will try to find them. However, I'm sure they involved high levels of omega-3.

### **The Half-Measure (2007-01-23 00:06)**

Today I attended a two-hour class associated with the San Francisco Fancy Food Show called "Tradition + Technique + Terroir = Taste of European Traditional Foods." The class covered four hams, five cheeses, three olives, and two beers. The general idea was to explain how great these foods are so that the students – mostly food retailers – can successfully sell them. One of the cheeses was a cheddar. There is a town in England called Cheddar, I learned.

I asked a question: "When an American cheese maker makes a cheese and calls it a cheddar, what are they doing?"

"It doesn't taste the same!" said the American retailer who was in charge.

This irritated me. "When an American cheese maker makes a cheese and calls it a cheddar, it isn't a joke," I said. "There's a reason for it." Then the process called cheddaring was explained.

The people who make English cheddar cheese (the original), the people who make Greek feta cheese (the original feta), and many other food producers would like no one else to be able to use the names cheddar, feta, etc. Inside the European Union, that is often the case: Only Greek feta can be called feta, for example. A new EU program labels foods with "Protected designation of origin" or "Traditional specialty guaranteed" as a way to help consumers know that they are getting the traditional original product.

This is a half-measure. I am in favor of anything that helps preserve the diversity of what we eat, so I am in favor of this program. I am in favor of telling the stories behind English cheddar, Greek feta, and so on. But this sort of thing is a half-measure because the best way to ensure the survival of a food is to ensure it tastes better than similar foods. A labeling program does not do that. Not in the slightest. Perhaps future efforts should be focussed on how to make customers more discriminating. Here is the truth: Traditional products often taste very good. Here is the half-truth: They taste very good because they are traditional. Here is the (implicit) lie: Non-traditional products taste worse because they are non-traditional.

losing-it (2007-01-23 08:56:14)

Better Mousetraps? Advertising is all about traps isn't it, to get potential buyers to notice and buy? And traps are imaginative deceptions. "Bait and switch," "Build a better mousetrap," etc. Giving the product a sense of glamor. And apparently, that is why sex, status, beauty and youth "sells" – models are hired to (yes, deceptively) present a product and appeal to the buyer's hidden desires, those deep down, but can't s/he obtain by buying that or any other product, because a product cannot provide human or divine acceptance, admiration, respect, joy, wealth, radiant health, ultimate satisfaction. Glamor doesn't represent reality, but rather, intentionally misrepresents it. We are gullible, and sometimes willingly so. Why should we be surprised? Gazing upon the smart packaging of an expensive, authentic olive oil from Italy or tasting an imported gruyere from Switzerland, we are imaginatively transported to places we'd like to visit or be at right now – and by thinking magically, and in being happily lured by the appeal to our physical senses and psyche, we so willingly suspend our disbelief (as when we watch movies and read novels, or worse, tabloids). Nothing new or original. Kind of like when the snake sold Eve on the fruit of the knowledge of good and evil; the Satan appealed to her with an underhanded but well-crafted lie based on partial truth in order to get her to buy the deal he was selling. She suspended her disbelief and got what he wanted. And she ended up losing her assets. (Must be why we look on salesmen with suspicion, but gaze at the product with increasing fascination.) Anyway, tastes and smells, being strongly accompanied by associative mental images and emotional feelings, provide an atmospheric sense that may make flavors seem to taste better in many instances, albeit particular to the individual. Perhaps the effect of triggered associations might be compared to eating the identical food served in two different locations : one location is a fine restaurant with beautiful appointments, cozy ambience, attentive hosts, fine wines. The other is a self-serve, noisy hospital cafeteria, lacking in glamorous atmosphere. The food in question may seem to taste much better, or at least enjoyed more, at the fine dining establishment. In a sense, there may be a similar tendency with one's own mother's traditional meatloaf. Only Mother's meatloaf tastes "the best," and even if Mother-in-law makes it exactly by the same recipe, because of the mental and emotional associations, it will probably never taste the same or as good as Mom's, even if both are served up with the label "Mom's traditional American meatloaf." Unless, that is, one samples both in a blindfold test. I wonder how many people, blindfolded, would be able to tell the difference between an authentic English cheddar, and a good American cheddar, especially if the samplers haven't a clue as to what they are tasting? From some tests I've seen (long ago on t.v., not in scientific sorts of trials), many people couldn't distinguish between foods such as mashed bananas, mashed apples or avocado when blindfolded. [http://en.wikiquote.org/wiki/Talk:Ralph\\_Waldo\\_Emerson](http://en.wikiquote.org/wiki/Talk:Ralph_Waldo_Emerson) <http://www.takeourword.com/TOW125/page2.html> choices, choices a school of guppies veers right, veers left -dwb Being an inquisitive layperson, not an academic or scientist, I can only speculate from personal experiences, observations and from what I think I know or understand...which may, in reality (whatever that actually is), be a dangerous precipice to speculate from :^D

### Science in Action: Omega-3 (background) (2007-01-25 11:40)

The omega-3 story began with the circulatory system. In the 1960s, two Danish scientists wondered why Eskimos rarely die of heart disease. Could the answer explain the sharp decrease in heart disease mortality in Norway during World War II? In spite of this promising beginning, the heart and mortality benefits are still not clear. [1]A 2006 meta-analysis of heart disease studies concluded that "omega 3 fats do not have a clear effect on total mortality, combined cardiovascular events, or cancer."

You can find [2]lots of recommendations to consume omega-3 fats in various forms – fish, supplement, and so on. On the other side, Marion Nestle, the author of What To Eat, seems to believe the advantages claimed for omega-3 are "[3]hype." Most researchers are less certain. From a recent New York Times [4]article about Martek, a company that makes an omega-3 food supplement:

"A lot of the claims made for DHA [a form of omega-3] are in the realm of hypotheses," said David Schardt,

senior nutritionist at the Center for Science in the Public Interest, an advocacy organization based in Washington. "They are certainly worth pursuing, but there's not yet enough proof to warrant telling people to go out of their way to take DHA."

The exceptions, Mr. Schardt said, are people with a history of heart disease and premature infants, who need an extra boost of DHA for proper brain and eye development to compensate for their early exit from the womb.

Martek's scientists, when pressed, generally agreed with Mr. Schardt. The data showing any health benefits of DHA beyond those related to the heart or premature infants, while encouraging, is not quite conclusive, they say.

The typical experimental study of omega-3 takes two groups of people with a pre-existing problem, gives one group omega-3 and the other group a placebo, and measures outcomes several months later. [5]A 2005 study in Pediatrics, for example, compared two groups of children (n = about 60/group) with Developmental Coordination Disorder. Most of them had ADHD. One group was given an omega-3 supplement; the other group was given a placebo. The children were tested before treatment and after three months of treatment. (The reading, spelling, and behavior scores of children in the supplement group improved more than the scores of children in the placebo group.) Studies like this are hard.

In summary, there is considerable uncertainty about the effects of omega-3; and the methods used to reduce that uncertainty are slow and difficult. This is why self-experimentation might help.

[6]My recent data. [7]The Queen of Fats (2006) by Susan Allport, a science writer, is an excellent introduction to the subject.

---

Tim Lundeen (2007-01-25 13:09:34)

I'm surprised to hear about this NY Times article. There is a lot of evidence that the omega-3 fatty acids EPA and DHA help reduce depression, if nothing else. For example "Geographic areas where consumption of DHA is high are associated with decreased rates of depression." at <http://www.biopsychiatry.com/dhaomega.htm>. Also "The consequence of dietary omega-3 deficiencies under experimental conditions has yielded remarkable findings related to brain physiology. For example, omega-3 deficiency alters the levels and function of mood-regulating neurotransmitters, including serotonin and dopamine.", with numerous other references, at <http://physician-assistant.advanceweb.com/Common/editorial/Editorial.aspx?CC=81518> There is also good evidence that EPA/DHA lower blood serum triglycerides, which are a risk factor for heart attacks, so you would think that they are likely to reduce actual heart attacks, even if we don't have definitive studies. I'm not surprised by your experiments

This shows the size of the pipe plug:

I put the booklet on the floor and put the pipe plug in a cut-out hole in its center. The hole goes about halfway into the booklet (e.g., 10 pages out of 20).

Then I balance the cutting board on top of the pipe plug:

I stand on my right foot on the cutting board; the measure is how long I can balance on it before my left foot touches the floor.

2. To vary the amount of omega-3 in my brain, I used these oils:

Walnut oil and flaxseed oil are high in omega-3 fats; sesame oil is low.

If you are interested in doing similar experiments, feel free to contact me.

### **Self-Experimentation = Old Buildings (2007-01-27 18:35)**

In *The Death and Life of Great American Cities*, Jane Jacobs wrote, "Old ideas can use new buildings, but new ideas need old buildings." New ideas need old buildings because old buildings are cheap. New ideas cannot be expected to be especially profitable, or profitable at all, at first. This is why self-experimentation should have a permanent place in the ecology of science: It provides a cheap way to develop new ideas.

## Bruce Springsteen on Education (2007-01-28 08:29)

In an interview, Bruce Springsteen said:

I wasn't quite suited for the educational system. One problem with the way the educational system is set up is that it only recognizes a certain type of intelligence, and it's incredibly restrictive – very, very restrictive. There's so many types of intelligence, and people who would be at their best outside of that structure [get lost].

Yes! That's what I'm saying [1]here, [2]here, and [3]here. The [4]quote is from [5]David Shenk's great new blog about talent and how to nurture it.

1. <http://www.freakonomics.com/pdf/whatdostudentswant.pdf>

5. <http://geniusblog.davidshenk.com/>

---

pdf23ds (2007-01-28 12:09:28)

I would \*not\* say that, just because some students are very poorly served by the educational system (and I do think it sucks badly, overall), that there are different types of intelligence. Do you believe in the 7-odd type of intelligence theory? (I forget whose.) I think there could be two or three main different areas of intelligence, with several more different minor abilities (like perfect pitch) that don't have much to do with a good, general education. The diversity in ability even among top students is more easily explained by narrow learning disabilities (like ADHD or Asperger's) and differential skill development. Which isn't to say that it's just as important to recognize these differences. But obscuring their nature isn't helpful.

seth (2007-01-28 12:47:30)

Howard Gardner and Robert Sternberg have both proposed theories of multiple intelligences – about seven of them, yes. They are certainly improvements over the single-intelligence idea but no I don't take them seriously. The IQ test was developed to predict school performance. You would need a different test to predict performance of anything else. People make their living in thousands of different ways. Each way requires different abilities. For each way you could make a separate test. Usually those specialized abilities (needed for one particular job but not other jobs) improve with practice so as a person becomes more skilled in a narrow area it becomes harder and harder to predict his or her performance based on a measure of any one or seven general intelligences.

Tim Lundeen (2007-01-28 14:12:04)

Yes, exactly right, and well said! This doesn't mean that IQ and g is irrelevant, though. The point of an IQ test is that it is highly correlated with g, which is highly correlated with all of these various abilities you cite. So an IQ test is a good "rough handle" on someone's ability level, but does not predict whether they will have a very high ability level on some particular given set of abilities. IQ tests have various subtests, and one of the main differences is between verbal and performance subtests. E.g., some people have better verbal than math scores. Sometimes people have specific minor flaws, and do much worse on some subtests than on the rest of the test, bringing down their overall score (as noted by pdf23ds above). So someone with high verbal and lower performance will have the same overall IQ as someone with lower verbal and high performance. The higher verbal person would do better in a profession where verbal skills are more important, and the higher performance person would do better in a profession where logic/math are more important, both with the same raw IQ score. This doesn't mean that IQ is meaningless – it can be useful in a variety of ways, but it certainly does not define the limits of what a given individual can do, or the fields in which they might excel. Some examples of where IQ is useful: The military uses IQ as a screening device, to limit the percentage of enlistees who have low IQs, and this has proven very successful for them. They may reject some candidates who would be successful, but they also eliminate a large number who would not work. So as a filter it is good. Programs for gifted children often use IQ tests as screening filters, and they may also reject some kids who would be well served by the program, but the kids they accept are definitely well-served and the material taught is appropriate for their ability level. I would like to see us go back to using IQ tests to normalize school results. If the kids in a school have an average IQ of 85, it is simply not reasonable to expect them to have the same achievement scores on the same tests as kids in a school with an average IQ of 115 (unless you lower the achievement level required down to the point that an IQ of 70 is all that is required to be able to learn the material, in which case almost all the kids at both schools will get perfect scores – there is a more detailed analysis of the effect of test difficulty on "performance improvements" at <http://www.lagriffedulion.f2s.com/gap.htm>)

pdf23ds (2007-01-28 16:12:00)

IQ does predict [1]plenty beyond school performance, though. (See also [2]here.) It isn't obvious that a test designed to measure such a narrow ability would turn out to be so useful and cross-correlated with other abilities, but it appears that it *is* the case.

1. <http://www.udel.edu/educ/gottfredson/reprints/1997whygmatters.pdf>

2. <http://www.udel.edu/educ/gottfredson/reprints/>

pdf23ds (2007-01-28 19:57:01)

Time, I don't know that it's clear that *early* education (as in the first few years of school) can't affect a child's ultimate IQ scores, so I'm not sure that such normalization would be desirable until middle school or beyond, if at all.

### **Secrets of a Successful Blog (part 3) (2007-01-28 17:18)**

Brad DeLong, Berkeley economics professor and [1]very popular blogger, on what makes a blog successful:

1. First-mover advantage. Brad's was one of the first economics blogs.
2. Regularity of posts. Brad said he writes several posts during one hour in the evening to be posted at intervals the next day. At least that is the ideal, he said.
3. Communicate effectively on things people want to learn about.

[2]Tyler Cowen and [3]Aaron Swartz on this topic.

I learned this last week when Aaron Swartz and I stopped by Brad's office. I had put the odds of him being there at 50 to 1. Speaking of supposedly-low-probability events, yesterday at the Berkeley Farmer's Market someone rec-

ognized me from the photo on my book. The previous day I had said that would never happen.

### **Amory Lovins on Self-Experimentation (2007-01-29 22:01)**

[1]Amory Lovins is an engineer with many new ideas about how to save energy. In a recent [2]interview, he made these comments relevant to self-experimentation:

[Edwin Land] said that people who seem to have had a new idea often have just stopped having an old idea.

Experimental psychology began with self-experimentation – the memory research of Ebbinghaus. I stopped having the idea, dating from around 1910, that there was something wrong with self-experimentation.

Small resources like solar cells or wind turbines have less financial risk than giant power plants that take many years to build.

Self-experimentation, the smallest and cheapest research of all, has less financial risk than other research, including large experiments that take years to do.

1. [http://en.wikipedia.org/wiki/Amory\\_Lovins](http://en.wikipedia.org/wiki/Amory_Lovins)

### Science in Action: Omega-3 (discussion of balance results) (2007-01-29 23:47)

[1]My recent omega-3 results encourage more self-experimentation to see if they can be repeated and extended. I'd be very surprised if they turn out to be due to expectations ("placebo effect"). First, the effect of going from high omega-3 to low omega-3 was different than what I expected. I did not expect the one-day lag. Second, the improvement from low omega-3 to high omega-3 repeated results that surprised me. When several months ago I increased my intake of omega-3 I was surprised to notice the next day it was easier to put on my shoes standing up.

My general plan is to find what omega-3 intake produces the best balance and then compare many other fat intakes to that. If omega-3 really improves my balance, I would like to know:

1. What is the effect of omega-6 fats? Do they reduce the effect of omega-3, as often claimed?
2. What is the relative potency of different forms of omega-3? Fish oil omega-3 is supposedly more potent than flaxseed oil omega-3 but I worry about degradation during the trip from fish to store shelf.
3. Does omega-9 have any effect?
4. What other mental functions are affected?

1. <http://www.blog.sethroberts.net/2007/01/20/science-in-action-omega-3-balance-results/>

---

peter (2007-01-31 21:17:41)

those interested in increasing balance might want to try the relatively new "ubiquinol" form of coenzyme Q10 that is sold by life extension foundation. After taking this I found that my balance increased (i do tai chi, in part, with my eyes closed, which requires considerable balance, and noticed an immediate improvement). In addition, my father, who is pushing 90, has vertigo. After he started taking the ubiquinol form of co-q10 his vertigo diminished by 80-85 %. I would be interested in the experiences of others who take the ubiquinol form of coenzyme Q10.

### **Saul Sternberg on Research Design (2007-01-30 17:27)**

No one has had more effect on how human experimental psychology is done than [1]Saul Sternberg, a retired professor of psychology at the University of Pennsylvania. In the 1960s he introduced a memory-scanning task in which the subject responds as quickly as possible whether a probe item (usually a digit) is on a short memorized list. The main measure was reaction time (RT) – the time between when the subject saw the item and his response ("yes" or "no"). The linearity of the RT-vs-set-size function and the equality of the "yes" and "no" slopes suggested that search of the memorized list was serial and exhaustive (exhaustive meaning that the whole list was searched even when the target was found before the end). Before this heavily-cited work (published in [2]Science and [3]American Scientist), RT experiments were rare; after it, they were common.

SR: Where did your first ideas about research design come from?

SS: While I was a graduate student [(at Harvard in the 1950s)] I read William James' Principles of Psychology, which increased the curiosity I had developed about mental processes from my introspections. Although I wasn't working on those questions when I was a grad student, I became interested in them. I wrote down ideas for experiments – experiments on short-term memory, for example. Experiments to answer questions about things I observed about my mental processes while engaged in writing and reading and other everyday activities. At the time I was doing theoretical work on learning models that apply to both animals and people. [Stochastic Models for Learning by Bush, Sternberg's advisor, and Mosteller was published in 1955.] I didn't collect much data as a graduate student, after my interests turned to learning models. Earlier I had collected data in social psychology. I recall putting a lot of effort into an experiment on small group interactions. What was novel was that we were recording interaction events in real time by punching IBM cards.

I learned how to be an experimental psychologist during my first teaching appointment that started in 1960 at Penn, when I co-taught a laboratory course on experimental psychology. I taught it with Bob Teghtsoonian and Jack Nachmias, who became my teachers. In those days, many students took a lab course after Psych. 1. The course required us to develop experiments for undergraduates to do. Questions that arose in those experiments went beyond available knowledge. And these questions led to some actual research. In 1962 Bob Teghtsoonian and I gave a paper at EPA on all-or-none versus gradual learning of response components, in which we reported tests of two models. And in 1963 Jack Nachmias and I gave a paper at the Psychonomic Society in which we reported our application of signal detection theory to data on recognition memory that we had collected.

SR: You started your memory-scanning experiments after that course?

SS: That's true. I started them during my second year at Penn. I was still working on learning models. I was also supervising a graduate student whose research had to do with short-term memory. Not RT experiments, however. What got me interested in RT experiments was work by Ulric Neisser measuring search times. He measured visual search times as a function of number of targets for which you search. [Neisser's subjects searched a visual display – e.g., of digits or letters – for the presence of one or more digits or letters. The main measure was how long it took to search the whole display.] It's like a crude RT experiment. You're not measuring how long it takes to make one decision, you're measuring the time to make many decisions. I was skeptical about his conclusions so I thought it would be worth measuring how long it took to make a decision about one visual item. That led to the memory-scanning experiments. I did several of them, to help choose among alternative interpretations, before I reported the results. I gave a paper on those experiments at the meeting of the Psychonomic Society during the summer of 1963.

### Michael Pollan vs. Processed Food (2007-01-31 08:18)

The problem with Michael Pollan's [1]latest food piece in the New York Times is that it isn't very . . . nutritious. It doesn't contain a story with new and interesting facts – like the story of Joel Salatin, a brilliant Virginia farmer, well told by Pollan in *The Omnivore's Dilemma*. Instead it contains many broad generalizations, the evidence for which is never given in any detail. Long ago we ate food (i.e., unprocessed food), says Pollan, and it was better for us than the processed food products we eat today. Long ago we listened to stories, say I, and it was better for us than the expert statements on which much of modern journalism is based. If I taught journalism (as Pollan does), I would tell my students the best thing is a story of success (e.g., Salatin) because we can always learn from it. Next best is a story of failure because we can always learn from that, too. Worst is to quote experts (e.g., Pollan quotes Marion Nestle). For two reasons: 1. Experts are often wrong. When they are, it is worse than learning nothing – we are actively misled. 2. Experts – at least in standard journalism – never say the facts on which their claims are based. Even if they are correct, what the reader learns from quoting them is shallow.

Misled by experts, apparently, Pollan repeats Marion Nestle's recommendation to "eat less" (to reduce obesity). Why it is helpful to repeat failed advice that the rest of us have heard a thousand times is not explained. Nor is it made clear what ancient foodway – Pollan is basically saying we should return to long-ago ways of eating – we would be following if we tried to "eat less." As far as I know, the answer is none of them.

Several big important stories contradict Pollan's conclusions. One is the story of B vitamin supplementation of flour and other processed food, which greatly reduced neural birth defects. I heard a dean of a public health school tell a room full of new students that this one advance, which averted so much suffering, fully justified all the money spent on schools of public health. I agree. Processing food is not always bad. Sometimes it can be very good. When you

process food based on a correct theory, that often happens. Food sterilization, refrigeration, and preservation via additives – all based on a correct theory, the germ theory of disease – have had many benefits. It's when you process food based on a wrong theory – such as the theory that fat causes obesity – that you can easily do more harm than good.

There is no turning back. We can't avoid processed food. To move forward, we need better theories to guide the processing. Anyone who reads this blog regularly knows I think ancient foodways are a good source of evidence with which to build theories (e.g., [2]Weston Price) but of course there are many other good sources of evidence.

-----

Usually [3]CISSP professionals prefer doing [4]N10-003 as it helps them in their [5]SY0-101 later. A small number however is content with [6]70-649 too.

1. [http://www.nytimes.com/2007/01/28/magazine/28nutritionism.t.html?\\_r=2&ref=health&oref=slogin&oref=slogin](http://www.nytimes.com/2007/01/28/magazine/28nutritionism.t.html?_r=2&ref=health&oref=slogin&oref=slogin)

-----

Blair (2007-01-31 11:03:08)

I understand what you're saying, but many additives that are in processed foods can cause cancer.

Scott (2007-01-31 11:06:03)

I agree with most of Pollan's points. Yes, the science of nutrition is certainly useful in many ways, but at the same time many of us do seem to be over-obsessed with nutritional details. Adding specific nutrients back into foods that are crappy for us to begin is a step in the right direction, but why not just eat the foods that naturally come with these nutrients to begin with?

Tim Lundeen (2007-01-31 21:58:54)

The "eat less" recommendation seems consistent with what we are learning about calorie restriction and life expectancy, and that higher metabolic activity from more food are coorelated with a lot of different health risks. I agree that it was not well presented :-)

Katlen (2007-02-01 08:25:07)

I am very frustrated with the "eat less" mantra. I eat 800-1200 calories a day and in two weeks I haven't moved off my set point. My size makes doctors think I eat a lot more than I do. Since in a previous attempt to "eat less" I've already ended up in the emergency room from not eating, I am well aware of the dangers of not eating enough. So when I hear "eat less," I want to scream!

Sam Penrose (2007-02-01 17:24:26)

I think you and Pollan are talking past each other. Pollans is generalizing about the American diet as a whole: McDonalds and Coke and General Mills' breakfast products. I don't believe he has a problem with pasteurized milk or iodized salt.

Sam penrose (2007-02-01 17:25:57)

On caloric restrictions, with particular relevance to your research on smellable calories:  
<http://arstechnica.com/journals/science.ars/2007/2/1/6857>

Shawn (2007-02-07 08:04:14)

I'd like to point out that your example of fortifying flour (white flour, actually) is not really that great, since in this case they are simply adding back some (but not all) of the nutrients that were destroyed in processing. Whole wheat flour does not have to be fortified because it has those nutrients to begin with – which actually supports Pollan's arguments against food processing.

## 2.2 February

### An Unexpected Benefit of Self-Experimentation (2007-02-01 07:31)

A few days ago I ate a handful of peanuts. Uh-oh, I thought, will this make my brain work worse? Peanuts are high in omega-6. As regular readers of this blog know, when I increased my omega-3 intake several months ago, my balance got better. More recently, when I replaced high omega-3/low omega-6 oils with a low omega-3/high omega-6 oil, my balance got worse; when I returned to the high omega-3/low omega-6 oils, my balance went back up. (Details [1]here.)

To measure the effect of different fats on my brain I have been [2]measuring my balance every morning. The morning after I ate the peanuts, my balance score was within normal limits. Meaning my brain was working no worse than usual. This was reassuring – an unexpected benefit of self-experimentation.

In ten years, will there will be websites that people regularly visit to take a few mental tests? The tests would be a quick and easy measure of brain function. The sites would remember all your scores and would graphically compare your current score with your previous scores. One more way to procrastinate – but it would be good procrastination.

1. <http://www.blog.sethroberts.net/2007/01/20/science-in-action-omega-3-balance-results/>

2. <http://www.blog.sethroberts.net/2007/01/26/science-in-action-omega-3-materials/>

---

Ken Dyck (2007-02-01 10:08:16)

I don't know about websites, but there's already a popular game for the Nintendo DS called [1]Brain Age that purports to measure your brain health and mental ability. It keeps two months of data that it can display on a graph (but is otherwise inaccessible).

1. <http://www.brainage.com/>

Tim Lundeen (2007-02-01 13:12:07)

Glad to hear about the non-effect of peanuts, I'm rather partial to them :-)

## Mr. Dezenhall, Meet Mr. Orwell (2007-02-02 15:30)

To deal with the threat posed by open-access journals (which I [1]praise and have [2]published in), a group of scientific publishers including Elsevier has hired Washington public relations consultant [3]Eric Dezenhall to help them. According to [4]this article, Mr. Dezenhall has

encouraged his clients to "develop simple messages," such as "public access equals government censorship"

Orwell's 1984 includes long excerpts from a fictional book with chapter titles such as "War is Peace." The book explains the term doublethink like this:

Applied to a Party member, it means a loyal willingness to say that black is white when Party discipline demands this. But it means also the ability to believe that black is white, and more, to know that black is white, and to forget that one has ever believed the contrary.

## The Israeli Paradox (2007-02-02 21:50)

You've heard of the French Paradox (140K Google hits), the fact that the French have little heart disease in spite of a diet high in saturated fats (the supposedly bad fats). You haven't heard of the [1]Israeli Paradox (<1K Google hits), which may be more important. (The French Paradox may be an [2]historical accident.) The Israeli Paradox is the fact that Jewish Israelis have very high rates of heart disease, diabetes, and cancer in spite of a diet low in total fat, high in polyunsaturated fats (the supposedly good fats), and low in saturated fats.

The best guess is that the Israeli Paradox is due to a high intake of omega-6 fats (from soybean oil). Non-Jewish Israeli citizens have rates of heart disease, diabetes, and cancer roughly half the Jewish rate. The non-Jews consume lots of olive oil (low in omega-6) rather than soybean oil. This is not an omega-3 effect; olive oil is low in both omega-3s.

"Replacing saturated fats with unsaturated fats [such as omega-6] is a safe, proven, and delicious way to cut the rates of heart disease," wrote Walter Willett, the Harvard epidemiologist, in [3]Eat, Drink, and Be Healthy (2001, p. 71). The Israeli Paradox shows that this way of reducing heart disease is anything but safe and proven.

3. <http://www.westonaprice.org/bookreviews/eatdrinkbehealthy.html>

---

OrenT (2007-02-03 01:07:11)

The linked article about the Israeli Paradox is more than 10 years old. In the last decade the Israeli diet has started to shift from soybean to canola oil and the consumption of olive oil in the jewish population has increased dramatically. I wonder if this is starting to show in the statistics.

Tim Lundeen (2007-02-03 12:19:56)

Fascinating links, thanks. A complex subject to be sure... Re red wine, there is more and more evidence that resveratrol (one of the components of some red wine) does very good things re metabolism. See <http://ouroboros.wordpress.com/2006/11/1-3/resveratrol-lifespan-and-an-unhealthy-diet/> and <http://en.wikipedia.org/wiki/Resveratrol>. I started taking a very low dose (20mg/day) about a month ago and noticed an immediate effect on my glucose metabolism, which went from low-grade diabetes to high-end of normal within a week (monitored via a home glucose meter). I am going to try increasing my resveratrol intake at some point, but first want to bump up my omega-3 levels from 600mg/day to 1g/day, based on what you've experienced re sleep/balance. BTW, my experience with the Shangri-La diet (based on the original paper), is that you have to be eating a relatively low glycemic-index diet for it to work. I would suggest that people who are not seeing effects try low-GI diet with is (which also lowers weight 10-15 % as you note).

JR (2007-03-13 10:25:36)

Updated article from pubmed, which I can't find a copy of. World Rev Nutr Diet. 2003;92:81-91. Links Omega-6/omega-3 fatty acid ratio: the Israeli paradox. \* Dubnov G, \* Berry EM.

Joe (2010-09-02 19:13:32)

The so-called "French Paradox" is no paradox...they have low rates of heart disease BECAUSE they eat more saturated fat! Saturated fat has long fallen under the curse of "guilty until proven innocent". Despite there being virtually no evidence that saturated fat causes heart disease, as well as lots of evidence that it PREVENTS heart disease, it's still considered the "bad fat". Wanna live longer and healthier? More saturated fat, less omega-6. Eat butter, not margarine. Eat fatty meat, not lean meat. Cut your carb intake to less than 20 % of your daily caloric intake, and try to eat a few eggs a day.

## Science in Action: Omega-3 (methodological improvements) (2007-02-03 12:51)

I realized (in both senses) several ways to improve my omega-3 self-experimentation:

1. Simpler treatment. I had been drinking both [1]walnut oil and flaxseed oil. For the sake of simplicity, I stopped the walnut oil. I continued to drink 2 tablespoons/day of flaxseed oil. I will vary the amount of flaxseed oil.
2. More controlled measurement. Instead of balancing on any part of my right foot, I started balancing on only the balls of my right foot.
3. More measurement. I measure my balance once/day. During that one session I had been measuring my balance 20 times (measuring how long I could stand on a [2]platform before falling off – 20 durations). The first 5 durations were warm-up, leaving 15 durations that counted. I increased the total number of trials to 30. It was still easy; the whole thing takes about 10 minutes.

4. A new measure. Anything that affects balance is likely to affect other mental abilities, I believe. To test this belief, I will start measuring my brain in a new way: a [3]pencil-and-paper version of [4]Saul Sternberg's [5]memory-scanning task. It will take about 5 minutes.

I started #1-3 about a week ago and will start #4 today.

---

John (2007-02-04 11:37:56)

While I appreciate your overarching message of valuing bringing experimentation into more people's lives, at first glance (I just came to your blog, and this is the first entry I've read) this particular experiment you've designed seems fraught with problems. Going from least concerning to most: There's the issue of respondent/participant bias, with your own vested interest in finding change/results. Also, you didn't just come across this intervention randomly, and that same belief or hunch that led to you choosing this intervention (and the implied hypothesis being tested) also begs the worry of placebo effect. In short, there are both conscious and unconscious ways in which you're likely to distort your own results. More troubling is the obvious role that "practice effect" can play here. I'd fully expect your balancing ability to improve as you continue, as there are countless anecdotal examples of human balance skills where people improve their skills through repetition practice. And while adding another measurement may be handy for your conceptual validity, it's yet another measure that is subject to the practice effect. (Sternberg used control groupings, which you aren't.)

seth (2007-02-04 12:33:56)

Practice effects are dealt with by the experimental design: You continue the measurements until the improvement stops. Then you begin the new treatment. As for the placebo-effect explanation of improvement, that's an explanation I plan to test.

John (2007-02-04 13:32:50)

Just to be clear, are you saying that, prior to beginning any treatment with the flackseed oil and/or walnut oil, you kept this identical regiment of balance measurement up until your rate of improvement stabilized? Really? You never mentioned that in your description. Moreover, you've very clearly described that you're currently mid-treatment and have now thought of adding this new memory instrument--so certainly no designed control of the practice effect there. Moreover, while these steps would at least be a nod to the problem of practice effect, they're not a viable solution. Do you have any data that show that learned improvement around your balancing challenge and the memory instrument is continual? There are plenty of cases of learning, both cognitive and physical, where plateaus and spurts are common. How do we know that any plateau really represents an end to change attributable to practice-based learning? Short answer: we don't. I think it's wonderful to find creative ways to bring research into our individual lives. But let's also remember that, as scientists, we don't design control groups in on a lark. It's expensive, resource intensive, you name it. And this case is quickly striking me as an example of why sometimes that additional work, away from anecdotal single-case experience, is needed.

seth (2007-02-04 15:29:15)

"There are plenty of cases of learning, both cognitive and physical, where plateaus and spurts are common." I don't know of a single example where a motor task (such as balance) suddenly improves after reaching a plateau. What's an example? These

experiments also involve sudden decrements in performance, which of course cannot be explained as a practice effect.

John (2007-02-04 16:33:52)

I'd say that most attempts at improving motor tasks—be it balancing on a board, learning to juggle, etc. are typified by nonlinear progress. It's certainly the case with physical rehabilitation of motor skills (though of course there's a question if that's analogous to learning). Plateaus, and even dips, etc. are common. Moreover, as a researcher, the burden of proof is yours. You're choosing a novel instrument/test for data, it's up to you to either test how the practice effect plays out with that instrument, or—more sensibly—control for the learning.

seth (2007-02-04 17:01:57)

Could you give a specific example, not involving physical rehabilitation, of a motor task where somebody observed sudden improvement after a plateau? With a reference, hopefully, so that the rest of us can find out about it?

### **Web Trials Update (2007-02-04 15:43)**

At the [1]Shangri-La Diet forums, SLDers – more than a hundred of them – have been [2]posting their weight for many months, thanks to Rey Arbolay. No similar data is available for any other weight-loss method, as far as I know.

The main weakness of the SLD data is lack of comparison. This led me to propose [3]web trials – a hybrid of the SLD data collection and a clinical trial, where there is always a comparison (at least two treatments, or treatment and control). After I [4]interviewed Robin Hanson about them, a British student programmer named [5]Andrew Sidwell contacted me and offered to set up a website to allow web trials to be done.

How exciting! A website that does web trials will allow cheap, easy, testing of many solutions to many problems. Although clinical trials usually involve medical problems, web trials can be used to study anything, as Robin pointed out. Andrew and I plan to start with procrastination.

1. <http://boards.sethroberts.net/index.php>
2. <http://boards.sethroberts.net/index.php?board=14.0>
3. <http://www.blog.sethroberts.net/2006/12/21/web-trials/>
4. <http://www.blog.sethroberts.net/2007/01/11/robin-hanson-on-web-trials/>
5. <http://entai.co.uk/>

---

Andrea (2007-02-04 16:25:30)

That's very exciting Seth! I'm glad things are rolling along well for you

Carlo (2007-02-04 23:45:54)

If you start with procrastination it will take longer.

pdf23ds (2007-02-05 21:03:30)

How are you planning on handling the case where what you're tackling turns out to be two or more different conditions (that respond to different treatments)? I'm thinking that once you have good data on a few different treatments, and one or more of the treatments seems to have a multimodal distribution of efficacy, then you'd form hypotheses about different causes and have all the participants fill out custom-designed questionnaires to tease out the different causes. So for instance, for

some people procrastination might be helped most by ADD meds, and for others it would be helped most by a change in life circumstances (because whatever they're procrastinating about isn't what they \*really\* want to do). So you see that ADD meds help a third of the people, and re-evaluating one's goals helps another third, and you find that 90 % of the first group answer "no" to a question about life goal dissatisfaction, and 90 % of the second answer yes. Then you can use that question to better direct treatment.

pdf23ds (2007-02-07 17:37:04)

How will this compare to [1]RemedyFind?

1. <http://www.remedyfind.com/>

seth (2007-02-09 11:30:23)

Compared to RemedyFind: It will involve more types of measures. RemedyFind is based on efficacy ratings alone. And the comparisons will be more equal – e.g., will be collected at the same time. RemedyFind is a fascinating site, thanks for telling me about it. How to handle the case where what you're tackling turns out to be two or more different conditions: Yes, you would expect (a) a bimodal distribution of effectiveness and/or (b) that a person's characteristics predict what will happen.

### **Jane Jacobs on Scientific Method (2007-02-05 10:19)**

You try, if you can, to get people to look at the specific thing that is happening and not try to generalize it as an ideology. Ideologies, no matter what kind, are one of the greatest afflictions, because they blind us to seeing what is going on, or to what is being done.

From [1]this interview.

1. [http://www.newcolonist.com/jane\\_jacobs.html](http://www.newcolonist.com/jane_jacobs.html)

---

### **Paperback SLD (2007-02-06 13:39)**

I have just finished correcting the proofs of the paperback edition of The Shangri-La Diet, due out in May. The paperback edition has much less about drinking sugar water, and more about omega-3s, nose-clipping, and lessons learned from the SLD forums. The first three interludes (case studies) are different.

All of the changes are due to user feedback. In This Film is Not Yet Rated, Fred Von Lohmann, an attorney for the Electronic Frontier Foundation, says

Everyone always forgets . . . that Sony thought the VCR would be primarily used for time-shifting. We all know that's not what it's good for; it's good for going to Blockbuster and renting movies, right? It took some time in the hands of consumers for that device to sort of find its highest and best use.

Perhaps someday everyone will forget that SLD was originally based on drinking sugar water.

---

vee (2007-02-06 18:41:59)

Just when I thought I was seeing, on the forums, a small shift back toward sugar water.

Timmmmyboy (2007-02-09 18:25:52)

This is interesting, I hadn't realized you were shifting your thoughts away from sugar water. Any reason? I'm curious if an aspect of your diet works, why would you want people to forget it? Obviously oil seems to work better for most, but I wouldn't discount the importance of sugar water to some.

seth (2007-02-09 21:32:28)

The decreased emphasis on sugar water is because (a) most people, given a choice between sugar water and oil, chose oil and (b) oil has benefits that sugar water does not. The right oils have huge benefits in addition to weight loss.

diarist (2007-02-16 17:48:32)

Is the Shangri-La Diet a higher-fat diet? **FAT IN SHANGRI-LA DIETS** The typical American diet in recent years has consisted of 33 % calories from fat, 52 % calories from carbohydrates, and 15 % calories from protein. It has been observed that this distribution reflects a recent substantial decrease in fat intake. In the middle of the twentieth century the average American diet had contained 40 % or more calories from fat. It is often further observed that the decrease from 40 % fat to 33 % fat has been accompanied by increasing rates of overweight and obesity. (Basic factual information of this kind is discussed in Walter C. Willett, *Eat Drink and Be Healthy* (Free Press, 2001), mentioned by Seth Roberts in *The Shangri-La Diet*.) The Shangri-La Diet proposed by Seth Roberts uses what seems like an unexpected mechanism: if you dose yourself with two Tablespoons of flavorless olive oil a day (not eating or experiencing any flavor for an hour on each side of the oil dose), you'll find that your appetite decreases so you can eat less, and lose weight without great hunger. (Call taking oil in this fashion "Shangri-La oil"—other oils, such as those high in Omega-3s, may be substituted for olive oil.) Now one effect of the Shangri-La Diet when practised with olive oil is to increase the proportion of calories from fat back to the dietary levels of 50 years ago (though now with what we believe are healthier fats). This is really not much of a discovery, it's just basic arithmetic. Here's the arithmetic. Assume that someone eats 1800 calories per day on the typical current American diet: No Shangri-La Oil Calories: 1800 Fat: 594 (33 %) Carbs: 936 (52 %) Protein: 270 (15 %) Such a diet provides 594 calories a day from fat (33 %), 936 calories a day from carbohydrates (52 %), and 270 calories a day from protein sources (15 %). Now add two Tablespoons per day of olive oil, which has 120 calories per Tablespoon, a total of 240 calories, with all the rest of the diet remaining the same: Two Tbsps Oil Calories: 2040 Fat: 834 (41 %) Carbs: 936 (46 %) Protein: 270 (13 %) But increasing the total calorie intake by 240 extra calories per day is not a technique for weight loss—quite the contrary. The point of adding the olive oil is to suppress appetite and thus decrease the amount of other food eaten. Note that the Shangri-La olive oil does not directly replace other fats in the diet—you don't put olive oil on vegetables in place of butter, for instance. The olive oil has to be consumed separately, not in connection with any other food or flavor. So the other food which is subtracted will not be fats only, but some combination of calorie sources. Most simply (though other possibilities could be considered) all other food will be decreased in proportion to how much of it is ordinarily eaten. For instance, take the case of a dieter who has been consuming 1800 calories per day and who adds two Tablespoons of olive oil (240 calories), and subtracts 240 calories of other foods distributed over the diet in proportion to the prior distribution, totalling the same 1800 calories: Two Tbsps Oil Calories: 1800 Fat: 755 (42 %) Carbs: 811 (45 %) Protein: 234 (13 %) To achieve this result, the dieter has added 240 calories of olive oil, and subtracted 79 ( $240 \cdot .33$ ) calories of other fats, 125 ( $240 \cdot .52$ ) calories of carbohydrates, and 36 ( $240 \cdot .15$ ) calories of protein daily. The net effect of adding two Tablespoons of olive oil is to increase the proportion of fat in the diet from 33 % to 42 %, to reduce carbohydrates from 52 % to 45 %, and to reduce protein from 15 % to 13 %. To take a further case, suppose that a dieter consuming 1800

calories per day adds two Tablespoons of olive oil, and with the resulting appetite suppression manages to reduce total calories to 1600 per day, again distributed over the total former diet. Two Tbsps Oil Calories: 1600 Fat: 689 (43 %) Carbs: 707 (44 %) Protein: 204 (13 %) To achieve this net reduction of 200 calories per day (implying a weight loss of under half a pound per week), the dieter has added 240 calories of olive oil and subtracted a total of 440 calories, divided into 145 calories of other fats, 229 calories of carbohydrates, and 66 calories of proteins. Thus, the 1600-calorie diet with two Tablespoons of Shangri-La olive oil has a distribution not very different from the 1800-calorie diet with oil, and the proportion of fat is increased from the current average American diet, from 33 % fat to 43 % fat. This is a large enough shift that some result would be expected. The reader can easily experiment with other examples, using just pencil and paper. For instance, suppose that a dieter starting from 1800 calories per day increases Shangri-La oil to three Tablespoons per day (360 calories), and with the increased oil dosage manages to suppress appetite to eat only 1400 calories per day. Three Tbsps Oil Calories: 1400 Fat: 703 (50 %) Carbs: 541 (39 %) Protein: 156 (11 %) This 1400-calorie diet, compared to the original 1800-calorie diet with no oil, adds 360 calories from olive oil and subtracts a total of 760 calories, distributed as 251 calories from other fats, 395 calories from carbohydrates, and 114 calories from protein. The dieter will be eating only 1,040 calories in all meals daily, plus the 360 calories of oil taken separately. At this rate of loss, nearly a pound a week, the fat intake has increased from 33 % to 50 % of the total diet, quite a large numeric change. The dieter, apart from the three Tablespoons of olive oil, has not increased other fats, but is just eating less of the normal distribution of food sources. (Seth Roberts suggests not exceeding 400 calories a day from Shangri-La oil, so some value around 50 % of calories from fats would be about the maximum.)

**DISCUSSION** People who follow Seth Roberts's Shangri-La Diet, and who discuss it in his forums, frequently talk about the phenomenon of "appetite suppression" as being a distinctive feature. Various reasons for the appetite suppression have been suggested, by Roberts and by others, but I suggest there may be partly an additional and simple reason: the Shangri-La use of olive oil suppresses appetite by increasing fat as a proportion of the diet. Some people have reported that a higher level of fat in the diet acts to reduce appetite and a lower level of fat acts to increase appetite (hence, it is sometimes claimed, the apparent historical correlation of lower-fat diets with more obesity). Most proponents of low-carbohydrate diets claim that substituting fat for carbohydrates will permit a dieter to eat fewer calories with less hunger than on a lower-fat diet. The fact that the Shangri-La Diet with olive oil pretty much has to increase fat in anyone's diet might contribute to its ability to suppress appetite. Obviously, a change in the proportion of dietary calories from fat need not be the only factor in growing obesity or the only way that the Shangri-La diet promotes weight loss; all the other factors discussed by Seth Roberts in his book may well play a significant role, perhaps a dominating role. But a diet which has the effect of shifting people's proportion of fats from 33 % to 42 % or 50 % of total calories should expect some result from that. It's also interesting that many of the people on the Shangri-La website find that drinking sugar water acts very differently for them from taking olive oil, and that more and more people (including Seth Roberts, to judge from this blog post) seem to find that olive oil is the more generally effective option.

## More about Pollan and Processed Food (2007-02-07 11:26)

A reader named Shawn made an interesting comment on [1]Michael Pollan vs. Processed Food:

I'd like to point out that your example of fortifying flour (white flour, actually) is not really that great, since in this case they are simply adding back some (but not all) of the nutrients that were destroyed in processing. Whole wheat flour does not have to be fortified because it has those nutrients to begin with" which actually supports Pollan's arguments against food processing.

That's true, it does support Pollan's argument against food processing. More detail will help make my underlying logic clearer. Flour is milled for several reasons, the details of which don't matter; let me just say that white flour is more profitable than whole wheat flour, thus can be sold at a lower price. In terms of price, milling is win-win: the supplier makes more profit and the customer gets cheaper flour. But when you consider nutrition – milled flour less nutritious than unmilled – it is not clear at all that milling is win-win. B vitamin supplementation, by cheaply replacing what the

milling took out, moves us back to win-win. Not milling is not win-win: It is nothing-nothing.

When you process food based on a correct theory – an accurate understanding of how our bodies work – the result is often win-win. When you process food based on a wrong theory, it is much harder to reach that result. This is what Pollan didn't understand. As usual, Jane Jacobs said it best. In response to people who said that Problem X or Problem Y was due to overpopulation – just as Pollan is anti-food-processing – Jacobs said the problem is not too many people, the problem is the undone work. In the case of food, the problem is not too much processing, the problem is the undone work – the undone work of coming up with good theories to guide the processing.

1. <http://www.blog.sethroberts.net/2007/01/31/michael-pollan-vs-processed-food/>

---

pdf23ds (2007-02-07 17:39:06)

"the undone work of coming up with good theories to guide the processing" Things like including lost omega-3? Say, what do you think about magnesium? Isn't it considered to be deficient in the same way omega-3 is in American diet?

seth (2007-02-08 12:52:17)

Coming up with good theories – well, the theory behind the Shangri-La Diet, for example. If food has been processed in a way that caused weight loss, Pollan would have much less an argument. But yes also the work of figuring out better how much omega-3 we need and how to measure its benefits. Making a more convincing case for it. don't know about magnesium, thanks for mentioning it.

Raina (2007-02-09 11:04:21)

The best point I thought the article made was that there is so much we don't know about nutrition. It's ridiculous to think that we have identified all of the important nutrients that we obtain from food, and until we have, less processed food is going to be better than more processed food. As you say, the problem is the undone work. It's not as simple as that makes it seem, though, we don't really know how much remains to be done and we won't really know when we're finished until well after that point. I really doubt we're finished now though, so until we are, I'm going to try to stick with the less processed food that our bodies have evolved to use.

seth (2007-02-09 11:21:29)

I agree, "there is much we don't know about nutrition" is the best point the article made. Given that it started and ended with nutritional recommendations, it didn't make that point very clearly. When it comes to processing, I make distinctions: packaged food, no; refrigerated food, yes; cooked food, yes. I suspect you agree with me here.

## **How Often Should I Weigh Myself? (2007-02-08 10:14)**

I dislike weighing myself. But the recent [1]Fancy Food Show left me with a fabulous collection of beautiful rare chocolates and I have gained weight. [2]This essay by Bill McKibben about the value of knowing your gas mileage and [3]this great piece by Atul Gawande on the value of a birth-outcome score (the Apgar score) have made me realize:

1. Weighing yourself is an act of courage.
2. Weighing yourself is always beneficial. No matter what the scale says.

1. <http://www.specialtyfood.com/do/Home>
2. <http://www.oriononline.org/pages/om/03-1om/McKibben.html>
3. [http://www.newyorker.com/printables/fact/061009fa\\_fact](http://www.newyorker.com/printables/fact/061009fa_fact)

---

longdaysjourney (2007-02-08 11:38:19)

I'm not sure I agree with you. Weighing yourself is always beneficial, if and only if you can see the measurement as just a simple data point. But there are a lot of people who can't do this. I can't tell you how many weight-loss bloggers I read who are obsessed with the scale, weighing themselves multiple times a day, getting really depressed if their weight fluctuates by just 2-3 lbs from one day to the next. The number defines their whole day. I tend to think that these people should only weigh themselves once a week, if not once a month, particularly if they're actively losing weight. They are not helping themselves with the mental trauma of daily weigh-ins

Jeff Thomas (2007-02-08 12:08:22)

True. I've often seen it recommended that you only weigh yourself once a week while on a diet. This is presumably so you don't get discouraged by daily fluctuations. However, if you weigh yourself every day a bad weigh in will naturally be followed up quickly by a good weigh in, and you will not only see the overall trend shaping up, but you may learn something from the fluctuations.

seth (2007-02-08 12:50:05)

More than once/day seems pointless, I agree with you. But as the articles I linked to show, knowing the weight does exert a downward pressure. Some people might not need that downward pressure. Or it might come at too high a price.

Matt (2007-02-08 12:55:20)

Although I don't follow any of the actual diet advice contained within (especially after SLD), [1]The Hacker's Diet contains a bevy of useful information about how the human body actually works and what weight your significance has to it. Since I read HD two years ago, I have weighed myself once a day, in the morning after I urinate, stark naked. I use a spreadsheet similar to the one John describes within to calculate a "moving average" based on the past two weeks or so of weights, that helps smooth out the day-to-day fluctuations you will often see. This helps me notice trends (good or bad) before I notice them otherwise. However, I don't think that weighing yourself more than once per day is really beneficial, and if you weigh yourself once a day like I do, it has to be under the same circumstances every day. Doing it first thing helps eliminate a lot of variables: I've tried weighing myself at various points throughout the day and have noticed HUGE fluctuations (up to six pounds) based on what I've eaten, if I've recently had a bowel movement, etc, etc, and trying to keep track of all those variables and the effect they have is just too much.

1. <http://www.fourmilab.ch/hackdiet/www/hackdiet.html>

losing-it (2007-02-09 14:16:24)

Concerning weighing-in during weight reduction; personal experience: All of the above are valid, even if differing perspectives I've done it both ways. Not judging by the scale means rather, judging by either the tape measure or by size and fit of clothes and changes in physique. For me as a woman, the tape measure presents a more accurate picture than scale of what is going on. Who knows why, but it seems inches may be shed when the scale numbers appear to be at a standstill or bouncing upward and downward a few pounds for weeks. Truthfully, even when greatly encouraged by tape-measure results, I still long to see downward scale movement. At one time of weightloss efforts, I refused to view the scale except once monthly, along with my scheduled tape measurement. I was avoiding emotional discouragement – all the while rationally understanding that a body's mass is continually affected by host of variable influences. I psychologically wanted to get an invigorating boost and increased motivation from seeing a larger drop "all at once" than is experienced with sometimes-confusing up and down daily weights. Add to that, in places like internet fora, when Venus and Mars compare their progress, it can also be a source of disheartenment

for women even though they full well know why men, on the whole, shed fat and weight more quickly and consistently, then tone more easily :^D With SLD, I am weighing in every day, even if timidly after a larger than normal meal, or when I have an overnight-5 pounds+ episode of edema. Or when the weight doesn't seem to be changing. Medically, I am supposed to weigh in every morning, although I don't really want to, and don't consistently do so, other than during this weightloss effort. It can be scary to look into the dark light of the scale. For many, daily weigh-ins CAN be an act of courage. They might more gently be done for oneself in a mildly self-disassociative state, while chanting a sweet, lullabye-rhythm'ed and new-agey mnemonic mantra to the effect that: "While I am beautifying my body, mind and soul with loving care and health, I kindly remind my heart and mind that the scale cannot be entirely accurate concerning the body's actual weight" – or better – "While I am renewing my body, mind and soul through good nutrition and health, I lovingly remind my heart and mind that, while excess fat is quietly and consistently being shed, the body's daily mass increases and decreases, due to a variety of inconsistent circumstances." :^D Hmm. Maybe I could put those affirmations into poetry and tunes and chant them on binaural soundwave CDs. Ah, although we may know and believe facts in our heads, it doesn't necessarily make them feel good or even believable in our hearts. Most of us are topsy-turvy: more creatures of heart over brain, me'feels. ...I am. But, daily weighing-in can be beneficial, nonetheless: On the positive side, for me, it does track the long, almost horizontally-angled downward trend and sheds more light for trying to realistically determine what makes my weight fluctuate or stall. It's helpful, especially comparing measures with caloric and macronutrient consumption records- both of which measuring and recording can be of value, too, particularly when beginning a nutritional plan – even SLD. The tracking of any and all of these, though somewhat a disciplinary nuisance imho, can make one diligent to examine what else might be considered and implemented – or not – or what to discontinue – in order to continue shedding unwanted fat and working toward improved health. This is, after all, the West where I've been born and living. When it comes to nutrition and eating, would that I might have been born in a culture with a long-traditional, healthy diet consumed and unquestioned by the aged elders and shamans and where there is no messing around with it by the political elite's regulatory commissions. Or, to be one of those people who are lucky with SLD and don't seem to need any of the above. I need this oil...This cup and this oil. That's all I need...and this tablespoon. I need this tablespoon... (please overlook any myopic typos)

Jay (2007-04-23 16:02:42)

Seth, Question. How does the body see the calories? Is it only by way of the mouth? I ask because I find the oil really easy to do during the week when I am at the office, but hard to keep protable on weekends. Would a capsule of oils, fish oils, any caloric laden property work just as well as long as the mouth did not taste the contents of the capsule when it was taken>? I am thinking about how they keep people in hospitals feed with intravenous feedings. If the mouth wasn;t detecting any food at all, wouldn;t it starve itself?

seth (2007-04-23 19:12:35)

yes, any form of calories should work just as well if you can't taste it. In fact, it appears to be enough to not smell it, which you can do by holding your nose while you eat whatever it is.

## **Eating Less (2007-02-09 12:30)**

Emily Yoffe has a [1]fascinating piece in Slate about going on a "CRON" (calorie-restricted optimal nutrition) plan. She eats 1500 calories/day. I was struck by three things: 1. Roy Wolford, apparently the first person to try something like this for a long time, did not live to be unusually old. He was 79 when he died. This is very helpful self-experimentation: CRON didn't work, at least for life expectancy. One data point is much better than none. 2. Hunger is a huge problem. 3. In spite of the hunger, Yoffe is continuing the plan after the allotted 2 months have finished. Her sleep is still poor, etc., but she likes being thinner.

Yoffe mentions the UpDayDownDay regime studied by NIH researcher Mark Mattson. There is now a [2]website for an associated book and diet. (My earlier [3]comments.) A few weeks ago I asked Donald Laub, a Stanford professor of medicine who is doing this regime, if he was still taking olive oil to make the low-calorie days easier to endure. He said he was.

2. <http://www.johnsonupdaydowndaydiet.com/>
3. <http://www.blog.sethroberts.net/2006/06/22/meal-skipping-good-or-bad/>

---

Edward O'Connor (2007-02-09 14:03:37)

Peter Voss, who's been CRONning for many years now, has notes on it here: <http://optimal.org/peter/cronindex.htm>

peter (2007-02-09 19:05:46)

according to Wikipedia, Dr. Walford died of Lou Gehrig's disease; does being thin cause or contribute to this disease? your comment suggests that CR contributed to his death and that's not clear.

seth (2007-02-09 21:34:04)

I'm not saying CR contributed to his death; I'm saying that in his particular case, the main supposed benefit of CR – longer life – failed to happen.

Peter Merel (2007-04-07 05:24:23)

If Walford had been hit by a car would you say the same? It is very regrettable that Walford's life was cut short in this way, but neither he nor anyone claims that CR will prevent death by serious disease, accident, or genetic predisposition. The main supposed benefit of CR, at least as commenced by adult humans, is not longer life - it is longer average lifespan. This is because to obtain a longer maximum lifespan, as in the experimental animals, you'd have to commence CR before puberty. And likely wind up a very long lived 4 foot tall simpleton as a result. Read the experiences of folk on your own forums, Seth. Less illness, increased energy, youthful appearance - these are common experiences of practitioners of CRON. The really nice thing about SLD is that, for the first time, it makes CRON practical for a huge population. The social effects of this may be very dramatic. When most young adults today can live to be illness free centenarians with nothing but an easily achieved and aesthetically beneficial diet change ... how will the world look then?

seth (2007-04-07 07:21:15)

What's the difference between "longer life" and "longer average lifespan"?

### **Omega-3 Facts of the Day (2007-02-10 13:22)**

1. In the 1960s, Greenland Eskimos ate a diet very high in omega-3s.
2. In the 1960s, Greenland Eskimos had very low rates of psoriasis. The Danish rate of psoriasis was 20 times the Eskimo rate.
3. High omega-3 intake reduces inflammatory intercellular signals.
4. Psoriasis [1] is beginning to be considered an autoimmune disease.

It's not the same type of fact but on the SLD forums spacehoppa [2] reported her rheumatoid arthritis was in remission, apparently from omega-3s, for the first time in the 18 years since it was diagnosed. Her balance was also better.

1. [http://www.ehealthmd.com/library/psoriasis/PSO\\_causes.html](http://www.ehealthmd.com/library/psoriasis/PSO_causes.html)

## What Should "Correlation Does Not Imply Causation" Be Replaced With? (2007-02-10 23:42)

I shed an invisible tear whenever I hear "correlation does not imply causation" which the otherwise excellent [1]swivel (a website about correlations) emphasizes. Of course, there's truth to it. It saddens me because:

It's dismissive. It is often used to dismiss data from which something can be learned. The life-saving notion that smoking causes lung cancer was almost entirely built on correlations. For too long, these correlations were dismissed.

It's misleading. In real life, nothing unfailingly implies causation. In my experience, every data set has more than one interpretation. To "imply" causation requires diverse approaches and correlations are often among them.

It's a missed opportunity – namely, an opportunity to make a more nuanced statement about what we can learn from the data.

It's dogmatic (see [2]"Jane Jacobs on Scientific Method"). Some correlations, such as those from "natural experiments," imply causation much more than others. I suspect it does more harm than good to lump all of them together.

1. <http://www.swivel.com/>
2. <http://www.blog.sethroberts.net/2007/02/05/jane-jacobs-on-scientific-method/>

---

Tim Lundeen (2007-02-11 10:13:49)

Well said. In the end, all we really have is correlation – all scientific models are based on correlation of model predictions with observations. If our observations don't match model predictions, then the model is abandoned or changed. And you are exactly right that correlation is a good starting point for looking for cause/effect models. So I suppose the phrase should really be "correlation does not imply that there is a cause-effect model that will stand up to other experiments or analysis".

seth (2007-02-11 13:03:57)

Yes, that would be an improvement. My candidate would be something like "Correlations are generally – not always, but usually – less persuasive evidence for causality than experiments." To make explicit the implied comparison.

pdf23ds (2007-02-11 23:50:09)

Well, if you're asking for a catchy replacement phrase, I think that "correlation suggests causation" isn't bad. It can be used to reply to people saying "correlation doesn't imply causation". You can say "but it \*does\* suggest it".

pdf23ds (2007-02-12 01:20:24)

The swivel people, on their blog, link to [1]this description of correlation on Good Math, Bad Math, which seems to get it about right.

The catch – and it's a big one – is that correlation does strongly suggest a causal relationship. (There's a Yale professor of statistics who's famous for saying something close to "Correlation is not the same thing as causation –

but it's a darn good hint!". ) It may not be the case that X causes Y or Y causes X - but if there's a strong correlation between them, you should suspect that there's a causal relationship

So if they agree with the post they approvingly linked to, then it sounds like they understand the issues. And given that their site seems to be mainly concerned with public data gathered from uncontrolled circumstances, in most of the use-cases of their site, much caution *\*is\** needed when inferring causality, so their approach to it might be justified by their (presumably statistically naive) audience.

1. [http://scienceblogs.com/goodmath/2007/01/basics\\_correlation\\_1.php](http://scienceblogs.com/goodmath/2007/01/basics_correlation_1.php)

seth (2007-02-12 05:09:55)

The statement "correlation does strongly suggest a causal relationship" strikes me as too strong. It's too easy to think of exceptions. The Good Math, Bad Math essay you link to goes on to say:

To show causation, you need to show a mechanism for the cause, and demonstrate that mechanism experimentally.

This does not describe how scientists in my field (experimental psychology) act. Usual behavior is to infer X causes Y if every time you (intentionally) change X, Y changes. The author is a computer scientist; that explains the lack of familiarity.

pdf23ds (2007-02-12 06:51:46)

Yeah, that point about inference based on manipulating random variables was brought up in the comments. But do you really think that statement goes too far? I mean, a case could be made that correlation virtually always implies a causal relationship, just not necessarily a direct one. If X and Y are correlated, and both caused by Z, they have a causal relationship with each other--and indirect one via Z. So saying that "correlation does strongly suggest a causal relationship" seems to me just to mean that when you see correlation, you should definitely look for the causal relationship, but it doesn't tell you to assume that it's a direct relationship. (Or if it is, which direction it's in.)

seth (2007-02-12 07:29:07)

I am not familiar with the concept of an "indirect" causal relationship. If I were, I might agree with you. To me, "causal relationship" means what you call "direct causal relationship."

Dmitry Dimov (2007-02-12 17:02:57)

Seth, great post, you are spot on. We basically whimped out after we launched Swivel after all the barrage of protests from academics and data vigilantes about our correlation meters. Even the Wikipedia article about correlations says something along the lines of, "correlation doesn't always mean causation but it sure is a hint." And when some say, well, maybe two trends are correlated because there's something else that's causing both to change, that's great: it made you think about what that third thing could be. So, I took out the link from our code just now, and it will disappear after we refresh our site. We're not some kind of anointed data gatekeepers trying to protect people from the dangers of correlation. People, look at the data and make up your own mind. That's what Swivel is about.

Bob V (2007-02-12 17:43:16)

*In the end, all we really have is correlation* Tim, this isn't entirely fair to say. In many fields (and in mine in particular) all we choose to look at are correlations. However, we also have temporal precedence. If one thing doesn't precede the other thing, it is hard to argue for a causal relationship no matter how nicely the correlational analysis works out. *a case could be made that correlation virtually always implies a causal relationship* If X and Y are correlated, it suggests at least two models, (1)  $X \rightarrow Y$  and (2)  $Y \rightarrow X$ , one of which is probably wrong. This is before considering any common causes of both.

seth (2007-02-12 19:12:18)

Thanks, Dmitry, I really appreciate that comment. You should know. That you got a "barrage of protests from academics and data vigilantes" is interesting. There's something backwards about that. Surely the point of data collection and analy-

sis is to learn something. Just like you say, it makes a lot more sense to emphasize what you do learn rather than what you don't.

pdf23ds (2007-02-13 02:06:38)

An indirect relationship is where  $X \rightarrow A \rightarrow B \rightarrow Y$ , or  $A \rightarrow B \rightarrow X$  and  $A \rightarrow C \rightarrow Y$ . Of course, there's a limit to how indirect it can be before the limited correlation between each of the steps multiplies together making the effect of A, B, and C on X and Y less negligible. If that path doesn't explain all the correlation, you look for additional mechanisms.

Tim Lundeen (2007-02-14 14:43:33)

I happened to see this quote from Jensen just now: Of course, a statistical correlation between two variables doesn't imply direct causality of the one variable by the other, nor does it imply the absence of causation. A lack of correlation, however, is more apt to imply the absence of causation. Investigation can't afford to eschew correlations as clues to causation, which of course must be established by other kinds of analysis. At an exploratory stage of investigation, reciting the "correlation is not causation" mantra is a premature criticism. <http://psycprints.ecs.soton.ac.uk/archive/00000019/> Seth, Jensen says that inspection time is highly g-loaded, looks like another possible metric for measuring mental acuity re omega-3 intake...

seth (2007-02-14 15:59:04)

Re the Jensen quote: I was once interviewing a job candidate in my office. She said something like "but of course correlation does not imply causality." I said, "wait a minute. it's not that simple. doesn't the absence of correlation suggest the absence of causality?" She thought about it, and agreed with me. Re inspection time: That wouldn't be a good measure. To determine inspection time you show stimuli very briefly (e.g., 200 msec) many times. If a whole trial takes 4 seconds, then only a small fraction of it (200 msec/4000 msec) involves brain work. That's the opposite of what I want.

Jack (2008-02-13 20:31:44)

It seems to me that the statement "correlation does not imply causation" is not meant to be dismissive (in general), but to note for a public unfamiliar with the subject that just because one factor tends to follow another, you should not immediately assume one to be the cause of the other. Imagine if every time someone noticed two factors that tend to follow each other, they began to cry 'causation!' You might have people believing that just because the numerals of a clock climb as the day becomes lighter, that the clock causes the change of the day. If observing the clock and the day outside were all the consideration they ever gave it, the clock might seem to control the day. However, you need merely to reset the clock to see that this action has no effect on the day outside, and the theory is broken. The further investigation that this quote begs would disprove the idea of causation between these two, and the correlation as well, for that matter. Further investigation would reveal that it was the passage of time itself which lead the clock to move (when properly set :) and the days to turn. Returning to the point, this phrase doesn't mean (in my opinion) that two factors are not related, but merely that correlation alone isn't enough to reach a satisfactory conclusion about the matter. Other evidence is needed before a conclusion should be made. When used in the wrong way, I can see how it could turn into undue criticism, but, I also think it serves a good point in asking people to think twice about a given example, rather than take what could merely be coincidence as fact.

seth (2008-02-14 00:18:09)

I don't mind educating the public. I mind unbalanced views of evidence. To say what's bad about evidence without also saying what's good is misleading. Which is bad education.

Phlebas (2012-01-04 12:33:42)

This is nothing more than a confusion over the word "imply". Logical implication means that something is undoubtedly entailed as a consequence of something else. However, "imply" is often used in common speech as a synonym of "suggest". The confusion is cleared up by noting that the intended meaning of "correlation does not imply causation" is that correlation does not logically entail causation; an aphorism intended to correct the simple but common error of supposing that any correlation between two or more things is \*necessarily\* evidence that a causal relationship exists between them. On the other hand, as Mr. Roberts has pointed out it is quite absurd to say that in general "correlation does not suggest causation", because it very often does.

## Blogging and Stone Age Life (2007-02-11 20:19)

"Blogging, of course, is one of the ultimate forms of self-experimentation," [1]Tyler Cowen wrote me. I wasn't quite sure what he meant. He explained: "Your blood pressure, how your brain is working, what new ideas you have, how your attention span has changed, how you now read other people's work differently, who you find yourself liking more (and less), etc. I believe those effects [of blogging] are often quite striking."

A fascinating idea. As I blogged [2]earlier, [3]James Pennebaker, a professor at UT Austin, has done many studies of the therapeutic effects of keeping a journal. A [4]book on therapeutic journaling gives "examples of how expressive writing can improve the immune system and lung function," according to its website. Do blogging and keeping a journal supply something important to human health and happiness present in Stone Age life but now usually missing? My [5]self-experimentation about faces suggests Stone Agers had a lot more face-to-face conversations in the morning than most of us. Could they have been more listened to than most of us?

Addendum: Right after I wrote this, I read a [6]post about interviewing people for a book. "They don't have to be prompted; they're utterly compelled to tell their stories," the interviewer wrote. For a term project, one of my students interviewed homeless people. He noticed something similar. Whatever the solution to homelessness, he concluded, it would involve a lot of listening.

pdf23ds (2007-02-12 00:03:15)

Other interesting things to explore about blogging: what is the effect on the blogger of fawning commenters? Contentious (but respectful) commenters? [1]Me-too commenters?

1. <http://pooflingers.blogspot.com/2007/02/censorship-at-wordpress.html>

Bob V (2007-02-12 17:28:46)

I started my blog 2.5 years ago when I left my job and started grad school, so it is hard to parse out why the following happened:

- I write higher quality first drafts.
- I have a better sense for what others will find interesting.
- My short term memory for interesting stories to tell others has improved.
- My tolerance for reading something that doesn't make its point in the first two sentences is now zero.

sags (2007-02-13 06:47:23)

It certainly makes you better person. Its gives a chance to all those intovert people to makes thier voices heard, develop senseof confidence in them. Helps them face the world in a better way. It is a established fact that public spekers, stage artists and leaders enjoy a more confidnet life style than others , blogging gives every one a option to develop this confidence.. i call this virtual reality..

seth (2007-02-13 08:50:46)

"Develop a sense of confidence." Maybe so. If you write about whatever you want and people continue to read . . . Another thing is that with a blog, all your readers are sympathetic – there are a billion other things (literally) they could be reading.

Hap (2007-03-03 12:27:07)

The MSNBC show "Lockup" goes into the nastiest, most non-rehabilitating kinds of prison environments you can imagine. But when they actually interview these hardened criminals, many seem quite human and with important things to say. So, yeah. Listen...

seth (2007-03-03 12:55:34)

Great comment.

MIMI WIESENFELD (2007-12-26 14:40:20)

Hi Seth-I am the lady who met you on the bart shuttle a number of weeks ago. Well.I have been eating 2 tsp of flax oil a day-though not that regularly, I actually stopped for about 2 weeks. I also repurcahsed the omega 3 pills and try to do that daily too, but I have this problem that I hate taking pills. I do it when I can, which is sometimes:-) Have not noticed any difference yet in my tennis elbow problem, but also have not been doing it daily, so maybe that is why. But hey-a girl has to be careful-1 TBL is 130 calories-that is alot for a supplement. I am a little concerned as to whether it is worth the calories-but I willl go as long as to finish my 8 oz bottle from 'whole paycheck' because you were raving so! Hope you are having a nice holday season. Cheers, mlmi

### **Science in Action: Omega-3 (more data) (2007-02-12 13:16)**

This experiment isn't finished but these results are too fascinating not to share:

Each point is a mean of 25 trials. The bars are standard errors.

Every evening around 9-10 pm I drank 2 or 3 tablespoons of flaxseed oil (with my nose clipped shut). Every morning around 7-8 am I measured my balance – how long I could balance on one leg on a small platform. ([1]My balance-ometer.) I drank 2 tablespoons of flaxseed oil for 7 days then switched to 3 tablespoons.

The morning after the first 3-tablespoon dose was magical. From the very first trial I could tell my balance was better. It had always been hard to balance for much longer than 4 seconds. Now, all of a sudden, I could balance for 6 seconds, and even longer. More impressive to me than the conclusion that omega-3 (flaxseed oil is high in omega-3) had improved my brain function is (a) how easy it was to detect the difference between 2 and 3 tablespoons and (b) a fairly high dose (2 tablespoons/day of flaxseed oil contain about 14 g ALA, the shorter-chain omega-3) was less than optimal. Flaxseed oil labels recommend 1-2 Tablespoons/day.

[2]Earlier data.

1. <http://www.blog.sethroberts.net/2007/01/26/science-in-action-omega-3-materials/>
2. <http://www.blog.sethroberts.net/2007/01/20/science-in-action-omega-3-balance-results/>

Tim Lundeen (2007-02-12 15:51:05)

Wow! I just increased my daily DHA supplement to 600mg, I guess I will up it some more :-)

diarist (2007-02-12 16:21:14)

Exactly what is being compared when a dosage of "14g omega-3" daily is said to be an amount that "everyone would consider a very high dose"? Flaxseed oil contains about 7g of alpha linolenic acid (ALA) per tablespoon, fair enough. But what counts is the conversion of that ALA in the body into long-chain eicosapentaenoic acid (EPA) and docosapentaenoic acid (DHA). The standard literature suggests that such conversion is "unreliable and restricted", and usually no better than 5 % to 15 % (and in some people, especially men, close to 0 %). That rate of conversion would yield: 2 Tbsp flaxseed oil => 14g of ALA => 0.7g-2.1g EPA+DHA (or less) A daily dose of 0.7g to 2.1g of combined EPA and DHA is a very standard recommendation for distilled-fish-oil supplements, with package inserts recommending up to twice that much (and other sources still more). Not knowing your personal conversion efficiency, is it not possible that 2 or even 3 Tbsp of flaxseed oil would give you amounts of EPA and DHA less than a standard dosage of marine-source capsules? And that the dramatic change in your data for 2 Tbsp vs. 3 Tbsp is further evidence for that possibility?

John (2007-02-12 16:57:03)

I've sincerely enjoyed reading your blog, but I'm still baffled that someone with your solid training in experimental design would report this data—with the lack of controls and unexplored measurement tool—as being meaningful. If you were a doing peer review on an article with this research design, would you honestly green-light it for publication?

seth (2007-02-12 17:01:13)

that's a good point, diarist. I don't trust those conversion ratios because the more of something to digest, the more the body makes the enzyme necessary to digest it, and the conversion ratios may have come from short-term feeding studies. Thus they would underestimate the conversion rate with long-term intake. But I haven't looked at them. I read a paper about omega-3 requirements that recommended about 4 g/day – but they did not include ALA in that, I now see. I will fix the text.

seth (2007-02-12 19:02:01)

"If you were reviewing an article with this research design, would you honestly green-light it for publication?" This particular design is incomplete, as I said in the first sentence. Your comment is a bit like asking what's the use of a newborn baby. I intend to add many more conditions to aid in the interpretation. However, ABA designs or ABABA or ABCDA or similar designs (of which the data I give could be a part) are common in the field of animal learning. Peer-reviewed articles in the best journals. In my field (experimental psychology) few papers contain a single experiment. You do multiple experiments to answer the questions of interpretation that a single experiment usually raises. There's no need for any experiment to be perfect. Because very few experiments stand on their own.

Tim Lundeen (2007-02-12 20:42:38)

Lots more to be done – but this is an amazing result. Who would have thought that there would be such a short-term, dramatic benefit from increasing omega-3s? Congratulations on finding this. You mentioned that you were going to do some tests of mental acuity as well as of balance – how are these looking?

bsand (2007-02-12 20:55:24)

Perhaps your balance got better because you have been practicing every day for a week? May be you should alternate 2 tbsp /3tbsp days and see if that makes a difference for you? Or start with 3 tbsp then go to 2 tbsp and see if your balance decreases. Or better yet, have someone else administer it alternating 2 tbsp of flax oil + 1 tbsp olive oil vs. 3 tbsp flax, etc...

seth (2007-02-12 21:15:55)

The practice explanation is unlikely – my balance suddenly got quite a bit better. Practice improvements are more gradual. Yes, I plan to do many more tests with different designs. I'm still in the preliminary stages of the mental acuity measurements.

pdf23ds (2007-02-13 02:01:40)

What about using something like chess for mental acuity? Unless you play regularly, it's probably not suitable, but if you do, you might have reached a skill plateau, and that would make it suitable. You don't have to go just by win/loss ratio, either. There are lots of chess programs that will give detailed number ratings for each move you make, which could probably be used to get a continuous performance number. What's the difference between flaxseed and fish oil? I note that my fish oil bottle says each gram tablet has 340 mg of omega-3, including 180 mg EPA and 120 DHA.

OrenT (2007-02-13 02:17:44)

I don't know how long it takes to replace enough of the lipids in the brain membranes to make a difference. I have a feeling it's much more than one night, though. The placebo effect definitely cannot be ruled out here. You can improve this experiment by making it effectively "double blind": Prepare doses of the omega-3 oil and a suitable placebo in small containers labelled with random numbers, mix them up and put the "decoding key" away until you have completed a trial run. You might want to put them in pairs where you only switch randomly within each pair, using the two doses of each pair on consecutive days.

seth (2007-02-13 03:28:58)

Chess is a good idea. It requires heavy continuous computation, which is what I'm looking for and which most cognitive tests lack. I don't think it's practical because of the time-consuming opening game, unfortunately. I want something that will take no more than 20 minutes per testing session. Some other game? Flaxseed oil has lots of the shorter-chain omega-3, ALA. Which is converted in the body to the longer-chain omega-3s, such as EPA. Fish have lots of EPA. "I don't know how long it takes to replace enough of the lipids in the brain membranes to make a difference. I have a feeling it's much more than one night, though. The placebo effect definitely cannot be ruled out here." The initial improvement in my balance was a total surprise and cannot be due to a placebo effect. The other part of this comment – shouldn't it take longer than one night to replace enough of the lipids to make a difference? – is what I thought. It is what all experimenters have thought, apparently, because these day to day measurements have never before been made. This is part of what is so interesting here, that the effects are much faster than expected.

pdf23ds (2007-02-13 03:43:03)

Well, you could always use short time controls. On internet chess servers, twenty minute games (ten per player) are actually considered kind of long. If you're not used to fast play like that, it might take a bit of getting used to. Blitz games, which are very popular, are 5/5 or 5/0 (five minutes per player, plus another 5 seconds per move, or 0 seconds per move). But if you use computer analysis to rate the quality of your moves and give you a score that way, it doesn't matter whether you finish a game (or get beaten early, and start another). It doesn't even matter as much whether you win. So you could play for ten minutes at a stretch and not worry about finishing. The way you'd do that is to have your chess engine think for some standard amount of time for each move, say ten seconds, and it would tell you who it thinks has the better position after (1) your move and (2) its favorite move. You'd subtract the scores to get the difference, and add up the difference over the whole game. The closer to 0 you get, the better. I think I could pretty easily set up an engine to do this to an arbitrary game with some scripts.

Tim Lundeen (2007-02-13 14:14:13)

Another possibility for mental acuity metrics is to time the arithmetic sets in "Train Your Brain" by Kawashima. These take under 2 minutes per day and have been pretty stable for me once I got up the learning curve. (I had my best times ever the last couple of days since I increased my DHA supplements.) He also has some Stroop tests in this book, which could also be a useful metric and take less than a minute. For the arithmetic sets, I just xerox them and start over after I get to the 60th one, seems to work ok.

OrenT (2007-02-14 00:03:05)

Any comments about the idea of doing a blinded self-experiment?

seth (2007-02-14 04:57:15)

These are all excellent ideas. 1. Computer chess might be fun. That would be a big advantage. of course. Other pluses: lots of mental computation; easy to describe. Minuses: Most people don't play chess. Unclear how to deal with speed/accuracy tradeoff issue (if I take more time my moves improve). 2. Arithmetic sets. Pluses: easy to describe, easy to generate (I assume),

easy to measure performance, little worry about speed/accuracy tradeoff (because accuracy always close to perfect). Minuses: Less fun than chess. 3. Blinded self-experiment. Pluses: More convincing. Minuses: Requires swallowing a lot of capsules.

aaron\_m (2007-02-18 10:25:14)

"The practice explanation is unlikely - my balance suddenly got quite a bit better. Practice improvements are more gradual." I do not get your argument here. When it comes to balance you can dramatically improve your results during a single session. Trying to balance on a beam 5 times in a row most people with normal physical health will have a significant improvement from the 1st try to the fifth try. Going from 4 to 6 seconds should be no problem. I would expect something like, for example, 4 seconds to 30 seconds for the unathletic types and 30 seconds to 1.5 minutes for athletic types, if you get my drift. Your general claim that practice improvements are gradual if we are talking about big improvements does not tell us anything about the specific case at hand. A fifty percent improvement is big if we are talking about a change in how fast you can run 100 meters, but not if we are talking about balancing on a beam. A big improvement in the latter case might be on the order of 500 %

seth (2007-02-18 10:52:27)

The improvements I am talking about are between session, not within session. I have been measuring my balance for months. I have done it thousands of times. And then it suddenly got better. This is not how practice works. Between-session practice effects - such as the improvement from Day 1 to Day 2, or from Day 2 to Day 3 - get smaller as practice continues. For example, the improvement from Day 1 to Day 2 will be much larger than the improvement from Day 100 to Day 101. At the time this experiment began, the day-to-day improvements were quite small, as the slope of the lines shows.

aaron\_m (2007-02-18 16:50:31)

OK But why do you think that you demonstrated such poor improvement when you had practiced the task thousands of times. I am sure you almost always get the comment that your own expectations are affecting the results of the experiment (and that you are tired of hearing it), but with these kinds of physical tasks the degree to which you believe that you should be able to do it or to improve can make a huge difference. And this confidence factor can often explain a big jump in performance. I think most climbers will tell you that they have had both periods of gradual improvement and leaps in performance, the latter having to do with attitude changes. I am sure you are also aware of this potential explanation, but I just do not understand how you are controlling for this factor. Can it be done, or is attempting to demonstrate a link between Omega-3 and something as attitude dependent as balance not the kind of thing that can be shown with any confidence via self-experimenting. Again here it makes a big difference whether or not a jump from 4 seconds to 6 seconds is big for a person with your physical capabilities, i.e. not for you specifically but the average for all people with comparable physical capabilities to you since we want to rule out your expectations about what your body can do. Could one have a control where you try to think that you will be able to do 8 seconds tomorrow and visualise yourself actually doing it and honestly try to build confidence that you can do it. Such a control might also require trying to convince yourself that your Omega-3 results are not real but due to an attitude change, and it is not obvious that it would be easy to detach yourself from previous results in this way.

seth (2007-02-18 17:29:59)

"demonstrated such poor improvement when you had practiced the task thousands of times" - don't understand. Changing the dose from 2 T/day to 3 T/day did not change my attitude. And balance is remarkably unconscious. Wanting to balance better has no effect, as far as I can tell. Throughout my balance testing I have always tried to do the best I could possibly do. To minimize the possibility of effects due to changes in motivation.

Barbara P (2007-02-23 03:07:28)

I noticed your comment in a recent (Feb 13) posting - "The problem is that it is extremely hard to measure the functioning of our immune system or our circulatory system or most other parts of our body." If you are diagnosed by a traditional Oriental acupuncturist or someone well-trained in naturopathy, you will get a reading of separate body systems. Here in North Carolina, I have been getting yearly exams (and homeopathic remedies) from such a practitioner for over 30 years. I'm 65. As a result of these checkups and a generally sensible lifestyle, my health is good because my doctor can see conditions and imbalances such as inflammations and pre-cancerous areas before they become problems. In the Bay area, it should be very easy to find

such a practitioner. These kinds of exams might make your self experimentation more trackable and fun. Thank you for your good work.

### **The Hidden Relevance of Experimental Psychology (2007-02-13 15:12)**

I used to teach introductory psychology. As I skimmed introductory psych texts, I could sense the disinterest that almost all the authors of these books had for my field – experimental psychology. Pavlov, memory – that was boring. What did that stuff have to do with everyday life? the authors seemed to be saying.

The Shangri-La Diet was built on thousands of experiments about Pavlovian learning. Empirical generalizations from that data helped me make the mental jump from experiments by Israel Ramirez to a new theory of weight control. A conceptual understanding of Pavlovian learning (what makes an association weak or strong) allowed me to use the new theory to find new ways of losing weight. Suddenly that boring stuff was relevant.

My omega-3 findings (such as [1]this), if they hold up, would do the same thing for two other areas of experimental psychology. The experimental designs I use, such as ABA, are straight from [2]Skinnerian psychology. Although I am now measuring my balance – not part of experimental psychology – my guess is that most of the measurements will eventually be more "mental." I assume that omega-3s improve my whole brain, not just the balance-related part. Experimental psychologists have spent 100 years developing simple and effective measures of many mental functions; all that measurement work should help us figure out how much omega-3 and omega-6 we should consume. Too little omega-3 and too much omega-6 appear to cause [3]a vast range of health problems, including the most serious. The problem is that it is extremely hard to measure the functioning of our immune system or our circulatory system or most other parts of our body. It is even hard to measure how well our mood-regulating system is working. (Too little omega-3 appears to increase the risk of bipolar disorder.) It is much easier to measure memory.

Experimental psychology can be divided into two parts – human (Part A) and animal (Part B). Part B can be subdivided into B1 (Skinnerian) and B2 (associative learning). Part B2 can be subdivided into B21 (Pavlovian learning) and B22 (instrumental learning). If you know the field you know these are the natural divisions. All my mainstream work has been in B22. I have managed (or hope to manage) to show the relevance of every area of experimental psychology except my own. Curious.

### **Jane Jacobs on the Food Industry (2007-02-14 16:14)**

According to Paul Goldberger in the [1]NY Sun,

[Jane Jacobs] regretted the construction of more and bigger buildings, and the enormous power held by the real estate industry, Mr. Goldberger said. "But she was also a realist," he said. "She was not Utopian, and I think that was the thing that distinguished her from many other intellectual and urban thinkers. She believed that the world we had was actually pretty good, if only we would learn to understand it, appreciate it, and handle it right."

Exactly. That is what I was saying in my comments on Michael Pollan ([2]here and [3]here). Our food world – which is mainly a processed food world, very little food is unprocessed – is actually pretty good. Some food processing is done according to wrong theories – the wrong theory that fat per se is fattening, for example. The newest food processing gets the most attention because it is still noteworthy (e.g., low-fat foods) but it is new theories that are most likely to be wrong. This is why "processed food" gets a bad rap. Most food processing, which is no longer advertised and we no longer notice because it is so common, is done according to correct theories – the main examples being cooking, refrigeration, freezing, and other forms of germ reduction. The germ theory of disease is correct. The poor health of many Americans reveals plenty of room for better understanding; I think the theory behind the Shangri-La diet is an example of better understanding. That theory suggests new types of food processing, as I explain in the last chapter of the book.

## **The Secret History of Innovation (2007-02-15 05:35)**

In the 1960s, [1]Eric von Hippel, now a professor of management at MIT, was a first-year graduate student in psychology at Berkeley. He had been having a hard time getting in touch with his advisor. One day, in Tolman Hall, he saw his advisor go into his office. This is my chance, he thought. He went into his advisor's office. No one was there! He realized his advisor must be hiding behind his desk. It would have been too embarrassing to confront him, so he left the office (which might now be my office).

He left graduate school, too, became an inventor, and started a company. His company needed a certain type of fan. He went to a fan company and asked them to make it. It can't be done, they told him. What you are asking for violates the laws of physics. So he went to engineers at Princeton, who designed the fan for him. He went back to the company with blueprints. They agreed to make the fan if he would pay all the new-equipment costs and buy 10,000 of them. To the company's surprise, other people wanted this fan, too, and it became a popular product. The fan company placed ads in a trade publication with the headline "They said it couldn't be done."

Von Hippel studies where innovations – specifically, new products and services – come from. He [2]argues that they come from users far more than manufacturers appreciate. Just as I believe self-experimentation is a more powerful source of biomedical progress than mainstream scientists appreciate. I learned of his work only yesterday (he gave a talk here) but I'm sure it has a lot to teach me.

## Omega-3 and Arithmetic (2007-02-16 06:17)

After I posted my [1]recent omega-3 results, Tim Lundeen, a Bay Area software developer, commented that his scores on an arithmetic test had improved after he had increased his omega-3 intake because of my results. I invited him to guest-blog about this:

For the last year [Tim wrote] I've been working on feeling better, trying to recover some of the energy and mental acuity that (I like to think) I used to have. As part of my program, I got Dr. Ryuta Kawashima's book, [2]Train Your Brain. His MRI studies have shown that simple arithmetic problems, done with time pressure, improve overall brain function. His book has 60 problem sets, each with 100 simple arithmetic problems such as  $7 \times 9$  or  $13 - 5$ .

Here are my results from 90 days of tests, including several breaks of 1 to 3 weeks (lower numbers are better):

I started out at about 110 seconds per problem set, improved to 80-82 seconds per set, and got stuck there. Each time I took a break due to travel or other distractions, I would start up at about 95 seconds and quickly come back down to my 80-82 second range.

Until the last 4 days. As part of my program to feel better, I started taking a DHA supplement. (DHA is found in fish oil. It is an omega-3 fatty acid that is preferred by the brain). I started taking 200 mg/day of DHA about 4 months ago, and didn't notice any effects, good or bad. So two months ago I increased the dose to 400 mg/day. Again I didn't notice any effects. After reading about the effects of Seth's omega-3 supplements, I increased my DHA by 400 mg/day to 800 mg/day. The supplements, plus omega-3 eggs, some flax oil (partially converted in the body to DHA), and some fish and oysters, put me well over the 1g/day recommended level. (When I have fish or oysters I take only 600 mg of

DHA instead of 800mg.)

I do the arithmetic test about 8 am every morning. I take the DHA supplement about 9 am. The effect of the 400 mg increase was immediate: The next morning my score dropped to 76-77 seconds, about 5 % better than I've ever seen on a regular basis. I made the change 5 days ago. The last 4 days are 4 of my 5 all-time best scores. It is fascinating to have another data point connecting brain function with omega-3 supplements.

The [3]supplements I take are from [4]iNutritionals. They are \$0.58/200 mg capsule ( \$35/bottle). They are from algae and are tasteless/odorless. No aftertaste or unpleasant effects. I tried a fish oil supplement a couple of years ago and couldn't take it because of the fishy taste and aftertaste.

About me: I'm CEO of [5]Web Crossing, Inc. My best-known product is Microsoft Works for the Macintosh, which sold millions of copies.

pdf23ds (2007-02-16 14:38:12)

I've been taking fish oil supplements for the past couple weeks (and seeing some subjective improvement). I actually sort of enjoy the mild fishiness. How many fish oil capsules would equal what you're taking, Seth? (With 340 mg omega-3, inc. 180 mg EPA, 120 mg DHA) I had the impression that you were totalling much more than a gram of omega-3, but maybe my math was wrong, or maybe the other omega-3 form isn't absorbed as efficiently?

seth (2007-02-16 15:52:14)

I don't know - it depends on the conversion rate of shorter-chain omega-3 to longer-chain omega-3. Little is known about the conversion rate. I will eventually test fish oil to see what amounts produce equivalent effects. I have been taking about 21 g of shorter-chain omega-3 (ALA). DHA and EPA are longer-chain omega-3. The shorter-chain ALA has the advantage not only of working but also of supplying the SLD calories I want.

Sean (2007-02-18 10:04:51)

Hate to advertise, but since I saw that Tim was paying 60 cents per 200mg capsule...I buy my fish oil capsules (300mg of Omega 3 - 180mg EPA and 120mg DHA) from the Daily Vita eBay store: [http://stores.ebay.com/DailyVita\\_Essential-Fatty-Acids\\_W0QQcolZ4QQdirZQ2d1QQfsubZ5QQftidZ2QQtZkm](http://stores.ebay.com/DailyVita_Essential-Fatty-Acids_W0QQcolZ4QQdirZQ2d1QQfsubZ5QQftidZ2QQtZkm) For 500 capsules I paid \$12.50 plus \$6 shipping. So a total of \$18.50 or 3.7 cents each - with 100mg more Omega 3 than Tim's. The delivery is also pretty fast, and the fish oil is good (one important thing to do with each new fish oil shipment: taste the liquid of a capsule for yourself to make sure the batch isn't rotten...this HAS been known to happen).

seth (2007-02-18 10:47:55)

what a big difference! thanks for telling us. one reason I find this research so promising is that it should allow testing on yourself of how effective this or that batch or brand is. No longer will you have to take someone else's word for it. No doubt the seller of the more expensive omega-3 will say it is better; but you can simply see for yourself.

Jeff Winkler (2007-04-17 19:27:23)

This looks like a good interactive math quiz to test mental agility - [http://maxi.kabutz.net/maths\\_gwt/Maths.html](http://maxi.kabutz.net/maths_gwt/Maths.html). The quiz is random..it's time and you're scored for correctness. I haven't seen the book Tim references, but this sounds like a good replacement for pre-printed worksheets.

## Two Ways of Thinking About Self-Experimentation (2007-02-17 10:25)

Self-experimentation (at least, [1]mine) is an example of what larger category?

My self-experimentation was very practical: I improved my sleep, mood, and health (went from average number of colds/winter to no colds/winter), and lost weight. My [2]omega-3 self-experimentation has improved my balance. From this point of view self-experimentation looks like engineering. > 99.99 % of engineering is making things better. The entirely new thing (e.g., the transistor) is very rare. The connection with [3]Eric von Hippel's work (who finds that product users do a lot of innovative engineering) is pretty clear. I "used" (applied) scientific research – for example, mood research.

Yesterday, however, Tyler Cowen, who [4]knows ethnic restaurants, posted [5]this:

Four chairs, one table, A+ decor, and the best Asian food in D.C. Nothing nearby comes close. Staff = 1, so you must call not only for reservations, but indeed hours in advance with an actual order so he can start making your food. I loved the salmon in red curry sauce, the pad thai, the larb, and some amazing chicken dish with the guy's last name on it; the drunken noodles are recommended as well. But I am not not not saying the other dishes are worse. 515 Florida Avenue, NW.

I'll never view the theory of the firm in the same light again. Monitoring doesn't work, and who needs division of labor anyway? The coolest place in DC right now, by far.

This is an example of what might be called the stunning single case – in this instance, drawn from everyday life. A stunning single case is an observation that casts doubt on a well-respected theory or leads to a new theory.

Another view of self-experimentation is that it is a way to learn from – take advantage of – stunning single cases in everyday life. Which is science (more precisely, theory building), not engineering. For example, one morning I woke up and felt much better than usual. This one event launched several years of self-experimentation that led to a new theory of mood.

The Shangri-La Diet was suggested by a single event (loss of appetite in Paris) but the theory behind the diet, which helped me learn from that event, was already there. (It was inspired by rat experiments.) The Paris event had a small effect on my theory but a big effect on how well I applied the theory. If all applications of theory count as engineering, the post-Paris development of SLD was engineering.

(Incidentally, I didn't notice the "not not not" in Tyler's post until the third or fourth reading, an example of repetition blindness.)

## Human Nature vs. Self-Experimentation (2007-02-18 15:53)

In all modesty, [1]here is Tyler Cowen's recent post about self-experimentation, especially [2]mine. I don't know enough about philosophy to comment on the philosophical stuff but I agree with the rest of it – especially the reference to [3]Robin Hanson, who [4]argues that our biases badly distort our reasoning. Sure, self-experimentation doesn't fit the usual research model. It doesn't need grants or graduate students. It doesn't generate publications quickly. But what if you are a scientist and you sleep badly, or you're depressed, or you want to lose weight? Why not self-experiment to try to find a solution? Your career won't suffer; you can do it in your spare time. Your life might benefit. Why this has not happened is the puzzle.

Tyler mentions status-quo bias. I would add two more. They are hedonic biases rather than cognitive ones: biases in what we enjoy. They are restricted to men; women are quite different:

Big things are more enjoyable than small things. This is rationalized into a belief that big things are more important, more worthy of study and support, than small things. I live on a steep street. One day a really big truck got stuck. When I came upon it, there were fifteen-odd people on the street just standing there, looking at it. Not a female among them. Treating big things better than small things I call bigism. Tyler's view that [5]a tiny restaurant had something to teach him is the opposite of bigism.

Admission of weakness is unpleasant. It is undignified. It is un-stoic. It is too personal. Taken to extremes, it is humiliating. I self-experimented on sleep and weight because I slept poorly and weighed too much. Telling others what I had done was an admission of weakness. Unavoidable, of course, but I too have this bias. Whenever anyone says I self-experimented with mood because I was depressed I quickly correct them.

Tom Myers (2007-02-20 09:52:44)

"This video has been removed by the user"; are you maybe talking about the fairly-famous Lelouch 1976 (1978?) race at [1]YouTube - GRIIP.NET Claude Lelouch 1976, "An 8-minutes high speed run in a Ferrari through the early morning streets of Paris to meet a girl."; but it will probably disappear; I believe there's a copyright claim.

1. <http://www.youtube.com/watch?v=ht6CBM7LTY0>

seth (2007-02-20 10:08:20)

Yes, that's it. Thanks for the new link.

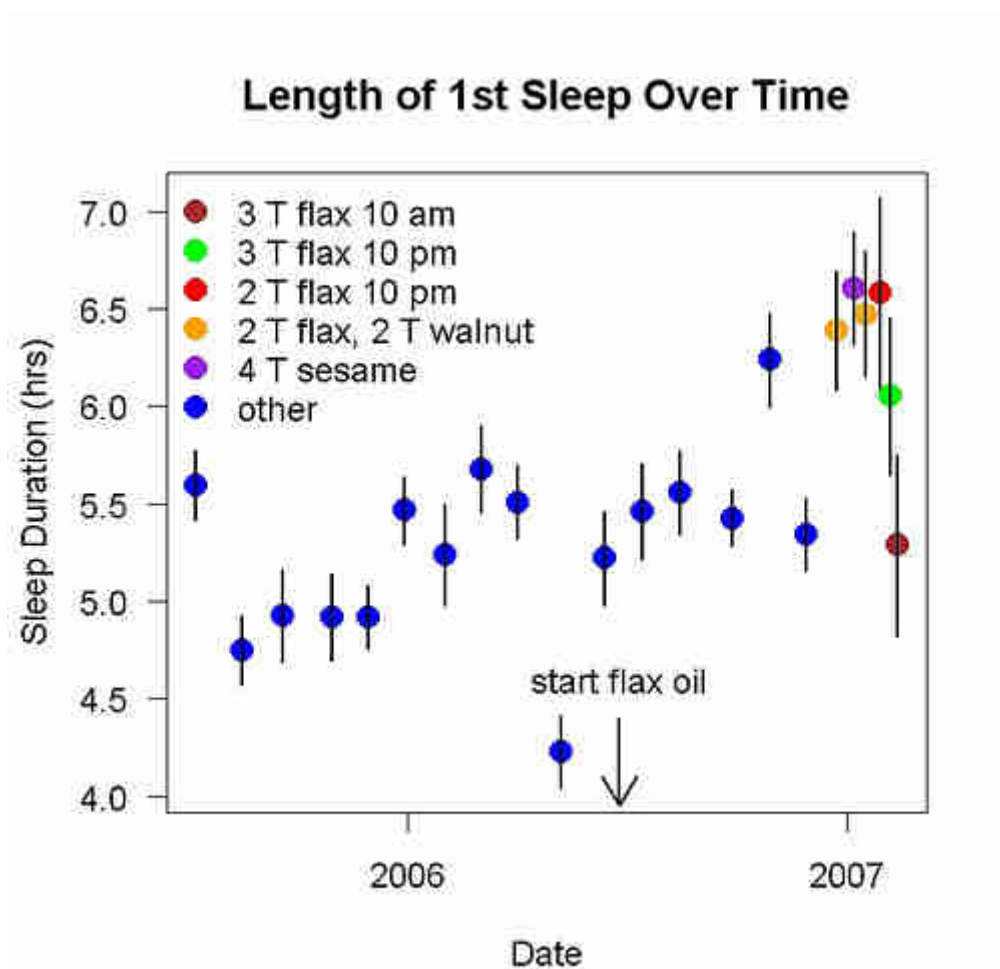

## Science in Action: Omega-3 (sleep data) (2007-02-21 11:32)

When I started taking omega-3 the rationale was not crystal clear. Many Shangri-La dieters reported better sleep; the diet involves drinking fat; omega-3, a fat, may affect the brain; sleep is controlled by the brain. I had not noticed any change in my sleep when I switched from sugar water to ELOO. Maybe this was because ELOO was low in omega-3, I thought, and this is what prompted my interest in omega-3. Later, a fly in the ointment: [1]a poll of SLDers found that ELOO was as likely to produce better sleep as other oils. Implying that it is not omega-3 that is producing better sleep. I was puzzled, but continued my omega-3 investigations, which by then were motivated by an unmistakable improvement in my balance. My sleep did seem to improve somewhat when I started taking flaxseed oil capsules (a good source of omega-3).

Now I think I understand. I recently changed the time of day that I take 3 tablespoons of flaxseed oil. I had been taking it around 10 pm every evening; I switched to 10 am every morning. I wondered if the change would affect my balance, which I test around 7 am every morning.

To my surprise the change affected my sleep: I started waking up earlier. That is, I slept fewer hours before I woke up. This was not good – in general, the longer I sleep in one continuous stretch at night, the better. I was waking earlier and less rested. My impression was that my sleep was reverting to an earlier, lower-quality state.

To confirm this, I entered a lot of my sleep data into my computer and made a graph of how the length of my sleep (my "1st" sleep, to distinguish it from sleep when I fall back asleep a few hours after waking up) varied over the last two years. Here is the graph:

T = tablespoon. The labels give the daily dose - e.g. "3 T flax" means 3 tablespoons/day of flaxseed oil. Each point is a mean. The error bars are standard errors. This graph shows that in recent months I had been sleeping longer. I had noticed this change: it was especially clear when I switched from 1 T/day flaxseed oil to 2 T/day. I thought the improvement was due to omega-3 - ignoring the fact that a switch to sesame oil (low in omega-3) didn't eliminate it.

Now, with a third fact contradicting my original idea (the first two were the poll and the sesame oil results), I have finally managed to change my mind. It is fat in the evening that causes longer sleep. Not only omega-3 fat - perhaps any fat has this effect. Now all sorts of things make sense.

When I started drinking ELOO my sleep didn't improve because I drank most of the ELOO during the day.

When I started the flaxseed oil capsules they had only a little effect on my sleep because I swallowed them throughout day as well as in the evening.

When I switched from 10 flaxseed oil capsules per day to 1 Tablespoon of flaxseed oil per day my sleep got longer because I always drank the tablespoon in one shot - around 10 pm. When I switched to 2 Tablespoons/day, I continued to drink it all at one time, around 10 pm. I attributed the improvement to the increase in omega-3; it was really due to the increased evening intake of fat.

ELOO and other fats helped many SLDers sleep better because they drank them in the evening. If you want to try this, note that the effect was bigger with 2 tablespoons at 10 pm than with 1 tablespoon at 10 pm. To be continued.

Sam (2010-01-11 16:50:46)

Has anyone on your forums ever found a way to make oil filled capsules? Just thinking, with some of the research showing saturated fat is better for you than polyunsaturates (like the [polyunsaturates + (alcohol or fructose)]=liver cirrhosis, but [saturated + alcohol] = no cirrhosis, butter might be a better oil for use with your diet. (I've had fatty liver before) And since you want to avoid flavour, the butter would need to be in capsules. I'm not convinced coconut oil is good for the liver either because no coconut oil gets into the chylomicrons, so it's all processed in the liver - a possibly worse situation than Fructose, IMHO

Mark (2010-07-31 23:10:47)

Wish I had time to contribute some more scientific data at this point, but for what it's worth: I've just started using ground flaxseed in my diet. I'm on a liver detox at the moment, so I'm acutely aware of what I'm eating and when I'm eating it. I'm also a lifelong insomniac, so I'm pretty finely attuned to my sleep quality and patterns. Last night at 10:30pm I took 2 tbsp of freshly ground flaxseed in 3 tbsp of water (actually, I ground them together into a totally unappetizing but not altogether unpleasant goo, like a warm alien pap). I had an incredible sleep last night. So good that after I got out of bed, I was all, "OK, WTF did I do right yesterday." I mean, in truth, I did everything right: I'm on a detox diet. But I haven't been sleeping like this. The last thing I did before bed was the flaxseed bit, so I googled flaxseed and sleep and ended up here. That's my data!

Mark (2010-08-02 07:35:59)

Sorry, when I made my above comment I hadn't looked at the rest of your blog. I now see that you don't really need any more random data from strangers (->).

Graham (2010-09-27 05:14:55)

Nobody has mentioned an issue of hrs taken before sleeping. Seth you say that you take your oils at 10pm but what time do you actually go to bed? Assuming that you went to bed at 1am (i.e. 3hrs before sleeping) then the fats might be used for another process (assuming that they are being stored as a fuel source) and therefore you mightn't notice the same affect!! Thoughts??

Graham (2010-09-27 05:33:35)

For profiles of the Oils consumed refer to the following: Walnut: <http://nutritiondata.self.com/facts/fats-and-oils/589/2> Olive: <http://nutritiondata.self.com/facts/fats-and-oils/509/2> Cod Liver Oil: <http://nutritiondata.self.com/facts/fats-and-oils/628/2> Flaxseed: <http://nutritiondata.self.com/facts/fats-and-oils/7554/2> Sunflower: <http://nutritiondata.self.com/facts/fats-and-oils/572/2> Coconut: <http://nutritiondata.self.com/facts/fats-and-oils/508/2> Sesame: <http://nutritiondata.self.com/facts/fats-and-oils/511/2> Change the SERVING SIZE to 1 TBSP. Notice the difference in the Omega-6 and Omega-3 profiles of the Oil in the fat Section. Based upon the profiles and your results it would appear that consumption of Omega-6 produces the best results. Do you suppose there is a limit to how much of any type of fat the body can store in one go?

Syed waqar (2012-01-15 12:39:56)

Dear all, I have Sleep problem. I go to bed mostly at 12:30 am and get into sleep within half an hour or less but awake after three hours. My age is 52. After awake at 4 am what should I do, because I have to go to my office at 10: am. I was very much upset. My doctor gave me relexant and told me that I have business problem. Therefore I should have sleep through medicine. This does not work situation remain the same. One day I went to market and find some traditional sweets for me that were flex seed balls join with small sugar. I took two balls by chance and ate these. Next day I noticed that went to sleep and did not get up until 9 am. Next day I repeat the same and slept till 10 am. I mean nine to ten hour sleep. Today is the third day and I took the same and will let you know tomorrow about the results. Right now I just wanted to see the effect of flexseed through Internet and found that there are few more people wha are already feel the effectiveness of flex seed for sleep. Let see today the effect. If it works I will try for many days. But before regular start I will get a complete blood reports before regular start. Then after few week I will again check the effect of these seeds on the blood picture. I will paste the results. Best regards, Syed Waqar.

## Science in Action: Omega-3 (sleep data, discussed) (2007-02-22 04:45)

This is a discussion of the facts and ideas in my [1]previous post. In summary, several observations, involving both me and others, suggest that a few tablespoons of oil (at least olive oil, sesame oil, and flaxseed oil) in the evening improve sleep.

I'm not yet sure of this conclusion, even for myself. But several things are already worth pointing out:

1. It took several facts to change my mind (I originally thought the sleep improvement was due to omega-3 fat and had nothing to do with when I ingested it) but it did happen. Strangely enough, it happened when I was studying something else: The effect of omega-3 on my balance. I switched the time I drank flaxseed oil from 10 pm to 10 am to see if this affected my balance. (I don't yet know the answer.)
2. The conclusion that a few tablespoons of fat late in the evening improves sleep is remarkably isolated. I have never read anything similar in the scientific or self-help literature. Most of my self-experimental conclusions, however odd they may strike outsiders (such as my recommendation to skip breakfast), are supported by many mainstream scientific results. (The breakfast conclusion, for example, is supported by dozens of studies of anticipatory activity in animals.)
3. It's a big effect – one more hour of sleep per night. No wonder most Shangri-La dieters [2]noticed it.
4. The long-term records of my sleep, which I had kept for no particular reason, came in handy. They made it clear that something had recently caused me to sleep longer each night. Which implied that it couldn't be fat per se that caused the improvement – I'd been drinking ELOO (extra-light olive oil) for the past two years. The term self-experimentation doesn't obviously encompass keeping such long-term records; they are better suggested by the term self-observation or even numerical self-observation. But whatever the term, they don't have an obvious correlate in more conventional science. Experiments with yourself as the subject are just conventional experiments writ small and personal, you could say. But there is no part of conventional science that tracks people closely year after year. It makes scientific sense; it would be a way of getting new ideas. You might track 100 people (say). When someone's health markers got suddenly better or worse you would investigate. This could be done; it isn't.

Sara (2010-07-01 09:35:35)

Omega 3 makes me fall asleep and my memory didn't improve at all.

Weedgelay (2010-09-02 10:54:48)

Where i can read all news on this forum? from 2009 year i make project in school.

x'x<sup>TM</sup>x<sup>TM</sup>x<sup>a</sup> x<sup>TM</sup>x<sup>a</sup>x<sup>TM</sup>x<sup>TM</sup> (2011-01-08 21:24:36)

there are no side effects in taking omega3.

Chris (2011-03-11 11:33:17)

I have been taking 2 tablespoons of oil about one hour before bed for about a month now and have not experienced any improvement in sleep. I have no problem falling asleep but I have vivid dreams that keep me in a half sleep half awake state somewhere from 4 am to 6 am resulting a poor quality sleep. I started with flax oil and after a couple of weeks switched to 1T flax oil and 1T cod liver oil. I have noticed that my gums have been feeling better (they weren't a real problem though) and I have had less bleeding when flossing. I will continue with the oil until my supply of flax oil runs out and then I will continue taking cod liver oil daily.

Seth Roberts (2011-03-11 16:00:07)

Chris, since I wrote this post I've discovered that animal fat produces a big easy-to-notice improvement. Now I eat 1 stick of butter per day. 2 T/day flaxseed oil should produce even better results than 1 T/day. I've never tried cod liver oil.

?????? (2011-04-08 19:57:38)

1T flax oil and 1T cod liver oil. I have noticed that my gums have been feeling better (they weren't a real problem though) and I have had less bleeding when flossing. I will continue with the oil until my supply of flax oil runs out and then I will continue taking cod liver oil daily

MumnTunkaniny (2011-06-11 15:23:59)

just examined the thread. great job.

Thedreamers (2011-10-10 15:58:36)

Recently and for about one year now, I have been experiencing hard time with my sleep, as sometimes, I can't go to sleep at all, and other times, I have enough sleep after 3 hours and a half. I don't sleep really deep sleep, and wake up many times. Most of the time and after a long day of work and studying, after I sleep, I wake up after half an hour suddenly, I don't know what causes me to wake up even though I am very sleepy and tired, and it's really hard to go back to sleep. Today, I ordered lunch at work Salamon fish, and after I had my lunch, I felt so sleepy I tried to hold my self four hours until I got home, then the story

of the deep sleepness started, I slept 7 straight hours and I noticed that my sleep was really really deep. if it wasn't my son who woke me up, I wouldn't wake up, and felt so relaxed. Really, I haven't had this nice sleep long time ago. I think Omega 3 in Salamon made me sleep for sure because it relieves stress. I decided to have that once or twice a week.

???? ???? (2011-10-17 15:23:34)

Hey huts just eat fish no need for all those omega 3 supplaments.

### **Pregnancy and Omega-3 (2007-02-23 04:55)**

A new study has found that mothers who eat more fish (high in omega-3 fats) during pregnancy have smarter, better-behaved children. Many expected the opposite: They assumed more fish = more mercury = more damage. [1]Here is a newspaper story about it.

The study, which appeared in The Lancet, has an odd title: "Maternal seafood consumption during pregnancy . . . " - as if paternal seafood consumption during pregnancy could affect the fetus. It involved about 10,000 pregnant women. The seafood/better-brain correlation was seen with several measures, including IQ scores at age 8. The authors tested the explanation that low seafood consumption was simply a marker for an unhealthy diet by taking dietary quality into account in various ways; this had little effect on the results, the authors say.

Current [2]Food and Drug Administration advice to limit seafood consumption during pregnancy may be harmful, the authors note.

Thanks to Timothy Beneke for the pointer.

michael vassar (2007-02-24 16:24:23)

I really hope they controlled for parental IQ. Just controlling for SES isn't enough. Do you know if they did?

seth (2007-02-24 16:46:48)

That's a good point, although I'm pretty sure it would have been impossible - too much work. They did control for "maternal highest educational attainment." In one analysis they controlled for paternal seafood consumption and the maternal effect was still present.

Susan (2007-03-04 16:03:55)

Is it the Omega-3 or the fish? I think the DHA. I took DHA throughout my pregnancy because of studies I had read about in the book Tomorrow's Baby - that taking DHA during pregnancy produces larger brain size and smarter children. Now this fish study comes out...wonder who sponsored it! Why not take Neuromins, an algae-form of DHA, and avoid the mercury risk? This from Wikipedia - A study[6] found that preterm infants fed baby formulas fortified with DHA derived directly from algae gained weight faster than infants fed formula fortified with DHA from fish oil. Additionally, there are no risks of harmful contaminants such as methyl mercury or dioxins, which are present in fish and fish oils.[citation needed] This is especially important for pregnant and nursing women and young children.

seth (2007-03-04 16:21:26)  
Good point.

Giving Birth World (2007-09-10 10:13:33)

I am a vegetarian and as such do not eat meat. Not because I have any morals to uphold, but simply because I don't like the taste. Anyway, this leaves me somewhat limited in terms of food to eat. Fortunately I love fish, so when I was pregnant that was pretty much all I ate. Needless to say my son is a child genius. Well not quite, but he has above average intelligence for his age; coincidence?

Aaron (2007-12-14 07:22:51)

Fish oils definately is good for mother and child. However, moderate intake should be practised as too much of DHA has been proven to actually imbalance the immune system for the infant. Once again, the intelligence of a child do depend on how well the brain is stimulated and not soplely on DHA

Sam (2008-04-04 07:26:07)

Scientists have discovered disturbing brain abnormality in young babies - [1]check it out

1. <http://www.rickrolled.co.uk/>

solar (2009-09-14 15:52:20)

I guess in every intake of food, be it fish or supplement, there ought to be an balance, in moderation with gynae's advice. There are many different kind of fishes and certain are definitely have to to be avoided like swordfish... I guess fried fish isn't healthy to eat as well, since fried stuffs are supposed to be one of the unhealthier range of food for consumption..

single mother (2011-04-05 08:26:21)

I just read a book that fish oil / omega 3 oils have a positive effect on the brain and behavior if taken in the right doses. The doctor actually cured some depression and anxiety problems in patients with just high doses of high quality omega 3's and fish oil supplements. If it works in them why wouldn't it work in children?? Tina

## **Omega-3 and Freakonomics (2007-02-23 11:42)**

Steve Levitt, co-author of Freakonomics, has done me the great favor of bringing my omega-3 self-experimentation to a wider audience in [1]this post. He thinks my results might be due to my expectations. I posted this comment:

Thanks, Steve, for writing about this. Here's why I think the balance improvements I've noticed are unlikely to be due to expectations:

1. I first noticed the effect putting on my shoes the morning after I started taking flaxseed oil. I had been putting on my shoes standing up for two years; until that morning, I had always had trouble. Every morning. (I had expected it to get much easier "practice effect" but it didn't.) The sudden improvement was a complete surprise. I had never heard of such an effect. I had hoped that flaxseed oil would improve my sleep.
2. The sudden improvement I saw when I switched from 2 tablespoons/day to 3 tablespoons/day was also a surprise, although I realize this may be harder to believe.

3. When I switched from flaxseed oil and walnut oil to sesame oil, I expected my balance to get worse. It did, but not when I expected. (It took 2 days to see a change; I expected to see it on the first day.)

Which is not to say I'm sure. If the effects I've seen are repeatable, I'll test myself not knowing what oil I've ingested.

And forgot to sign my name. Oops.

My reading of the data (such as [2]this) is that placebo effects sometimes exist but are vastly overrated – like many dangers.

Addendum: Stephen Dubner, Levitt's co-author, [3]blogged today that

nearly everything we've written about, either in the book or our journalism or the blog, has some element of people worrying too much about something

---

Paul Brentano (2007-02-26 08:43:13)

There were some interesting comments from on the freakonomics blog about the differences between omega-3 obtained from plants and omega-3 obtained from animals. Have you thought about testing the differences? I wonder if the delay (2 day now right?) would be less if you used the fish oil supplements.

seth (2007-02-26 17:45:44)

With the flaxseed oil it takes hours, not 2 days, for the effects to become apparent. I will eventually test different types and sources of omega-3, yes.

## **Omega-3 Greatest Hits (2007-02-24 06:21)**

anon (2007-02-24 20:14:19)

how many g's of omega-3 would you recommend taking per day? do you think it matters what form it comes in (flaxseed oil, fish oil supplements, real fish, etc.)?

seth (2007-02-24 20:16:38)

I haven't gotten far enough to answer your excellent questions. I can only say that 3 tablespoons/day of flaxseed oil seems to produce better results than 2 tablespoons/day.

peggy (2008-07-25 07:27:31)

seth, Are you looking at the ratio between omega-3 and omega-6? Since omega -6 helps the blood clot and is part of the inflammatory process (CHD), I am interested in the ratio. Do you test both? What methodology do you use? have you heard of Mondello or Michael Pollan?

seth (2008-07-25 08:04:40)

See the post called The Israeli Paradox for information about omega-6. I haven't yet deliberately varied omega-6 but I expect to in the future. I've heard of Michael Pollan but not Mondello.

Brian (2008-09-06 17:21:47)

I have found taking omega 3 fish oil supplements more effective when taken with salty food than when taken with unsalted food. If I take fish oil with a salty meal, the improvement in my concentration, articulacy and mood is noticeably larger than when I take fish oil with a zero salt breakfast of muesli and full fat milk. I have noticed this effect many times. Anyone else?

### **Self-Experimentation on TV (2007-02-25 22:43)**

The BBC is now running a four-part series on medical self-experimentation called [1]Medical Mavericks. The examples have almost nothing in common with what I do. Here are some differences between what might be called "classic" self-experimentation (e.g., Weinberger, Marshall) and "slow" self-experimentation (what I do).

1. Classic SE: Improves medicine. Slow SE: improves my life.
2. Classic SE: few if any numerical data. Slow SE: Lots of numbers.
3. Classic SE: self-experimenter starts with strong opinion. Slow SE: self-experimenter starts without strong opinion.
4. Classic SE: lasts hours or days. Slow SE: May last years.
5. Classic SE: Demonstrative. Slow SE: Exploratory.

Long live both types.

1. <http://www.bbc.co.uk/bbcfour/documentaries/features/medical-mavericks.shtml>

## Science in Action: Omega-3 (new measures) (2007-02-26 18:48)

My balance measurements, such as [1]this, [2]this, and [3]this, have come close to convincing me that flaxseed oil improves my balance. If a nutrient improves one part of my brain, it will probably improve other parts, too. So I've added three more measures of brain function to my daily tests:

1. Memory scanning. A paper-and-pen task. After studying three digits (e.g., "3 7 9") for a few seconds, I go through a block of digits marking each one "in" (equal to 3, 7, or 9) or "out" (not equal) as fast as possible. Each test consists of 5 blocks of 100 digits. Duration: 5 minutes. Pluses: Similar to a well-studied task (Sternberg's memory-scanning task). Minuses: Requires a little bit of equipment (sheet of digits).

2. Digit span. I see a series of digits on my laptop screen then try to remember them. The number of digits goes up and down depending on my accuracy. Duration: 4-6 minutes. Pluses: A well-studied task. Quite different than balance, memory scanning, and speeded arithmetic (below). No special equipment. Minuses: Little computation involved, unlike balance.

3. Speeded arithmetic. I do 100 simple arithmetic problems (e.g.,  $4 + 8$ ,  $3 * 5$ ) as fast as possible. Duration: 2 minutes. Pluses: Tim Lundeen [4]found an effect of fish oil on this task. No special equipment. Measures long-term memory retrieval, unlike other tasks. Intense – the 2 minutes are full of mental activity. Minuses: No obvious ones.

One of these may emerge as a better way to study the issue than balance measurements. The biggest problem with balance measurements is strong practice effects. The more often I measured, the better I became. (The area of my brain devoted to the task seemed to increase. The tiny balance platform seemed to grow.) Perhaps practice effects will be less of a problem with at least one of these tasks. Perhaps one of them will show clearer effects of flaxseed oil.

In a comment on an earlier post, someone suggested using chess as a measure. A fun test would be a good addition. Chess has two big problems: 1. Openings are time-consuming and quite different from the rest of the game. 2. If you take longer to make a move you can make a better move. So the amount of time allowed per move must be fixed. Which is less fun.

1. <http://www.blog.sethroberts.net/2006/08/13/brain-food-part-9-supporting-data-and-a-problem/>

2. <http://www.blog.sethroberts.net/2007/01/20/science-in-action-omega-3-balance-results/>

---

Mike (2007-02-27 11:19:56)

Based on this blog, I upped my daily dose of Omega-3. Previously, I was taking 1 tablet per day of Costco (Kirkland \_ brand fish oil Omega 3. These tablets contain 1000 mgs, with 180 mg being EPA, 120 being DHA, and the balance unspecified. After reading about Seth's experiment's, I started taking two pills per day. I noticed an immediate depression effect on my mood. After a few days of this, I took two days with no pills, and my depression lifted. I am now back on one pill and I seem to be fine. I do not take any anti-depressants or other medication.

seth (2007-02-27 11:56:00)

That's good to know, Mike. Thanks for commenting.

Jeffrey Miller (2007-02-28 05:12:58)

It seems likely that you will improve through practice in any activity that you choose. You can, as you have previously remarked, reduce the effect of this drift by alternating your omega-3 in time. You could also subtract out the linear term in your fit to the data, and compare only the intercepts. (Assuming of course that you fit on contiguous data during which the dosage was constant - as you did in some earlier plots). If I were doing this, I would be tempted to try somewhat harder arithmetic problems. You remember what  $5 + 8$  equals, but you probably have to calculate (in your head) what  $329 + 846$  equals. I'd imagine a different part of your brain comes into play. By the way, I've been on your oil diet for about a month and have lost about 3 % of my weight. So far so good!

seth (2007-02-28 08:53:49)

That's a good suggestion about trying harder problems. I may eventually do that. With harder problems, it is more difficult to stay at the same place on one's speed/accuracy tradeoff function. But that doesn't mean they aren't worth a try. When I analyze my data I do subtract the linear drift. I will post examples. That's good news about my diet.

pdf23ds (2007-02-28 22:52:39)

Here's something that might make chess measurable: <http://chess.emerald.net/Welcome.php> Chess tactics problems. Each one is rated based on its difficulty (according to how hard it was for other chess problem solvers). Each has one right answer, and times how fast you get the answer right. I'm not sure how easy it would be to grab the data off of their pages to put into your analysis, but worth looking into, maybe.

seth (2007-03-01 12:30:29)

That's a lot closer to what I need, thanks.

Neanderval (2007-03-03 10:12:14)

How about trying something like Escapa! <http://www.iol.ie/~dluby/escape.htm> I find it extremely addictive.

seth (2007-03-03 11:19:50)

Very good suggestion, Neanderval.

Alex (2007-04-25 09:38:10)

Thank You

## Science in Action: Omega-3 (results with new measures) (2007-02-28 10:06)

Yesterday I blogged about three new measures of mental function that I have recently started to use. Here are the first results.

### 1. Memory-scanning.

Each point is a mean; the error bars show standard errors. I expected a within-session warm-up effect (Trial 1 slower than Trials 2-5) but there isn't one so I use variation across the 5 trials (100 digits each) to get a standard error.

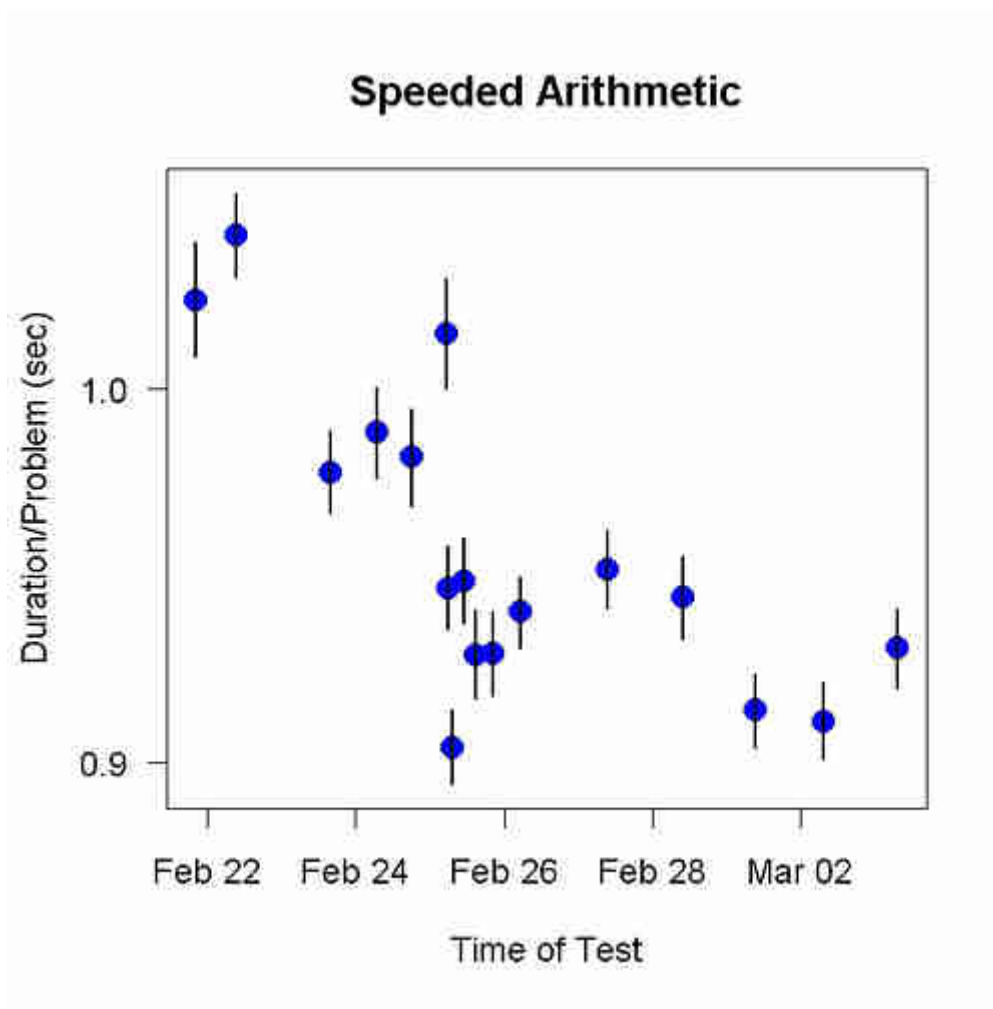

2. Digit span.

The program increases the number of digits to remember by one when I'm right and decreases that number by one when I'm wrong. The test continues until there have been six reversals in direction of the number of digits (e.g., the sequence 5, 6, 7, 8, 7, 6, 7, 8, 9, 8 contains three reversals). Each pair of reversals is averaged to get an estimate of digit span; I use between-average variation to get a standard error.

Digit span slowly improves with practice, other researchers have found. The increase is slow, however – [1]one digit for every two hours doing the task.

3. Speeded arithmetic.

The questions differ greatly in how long they take ( $7 \times 9$  much slower than  $1+0$ ) so I fit a model to remove obvious effects and use the variation of the residuals to get standard errors. I think these results are so erratic because I did the test in several different places and in some cases I corrected mistakes (which is very slow). Now I don't correct mistakes.

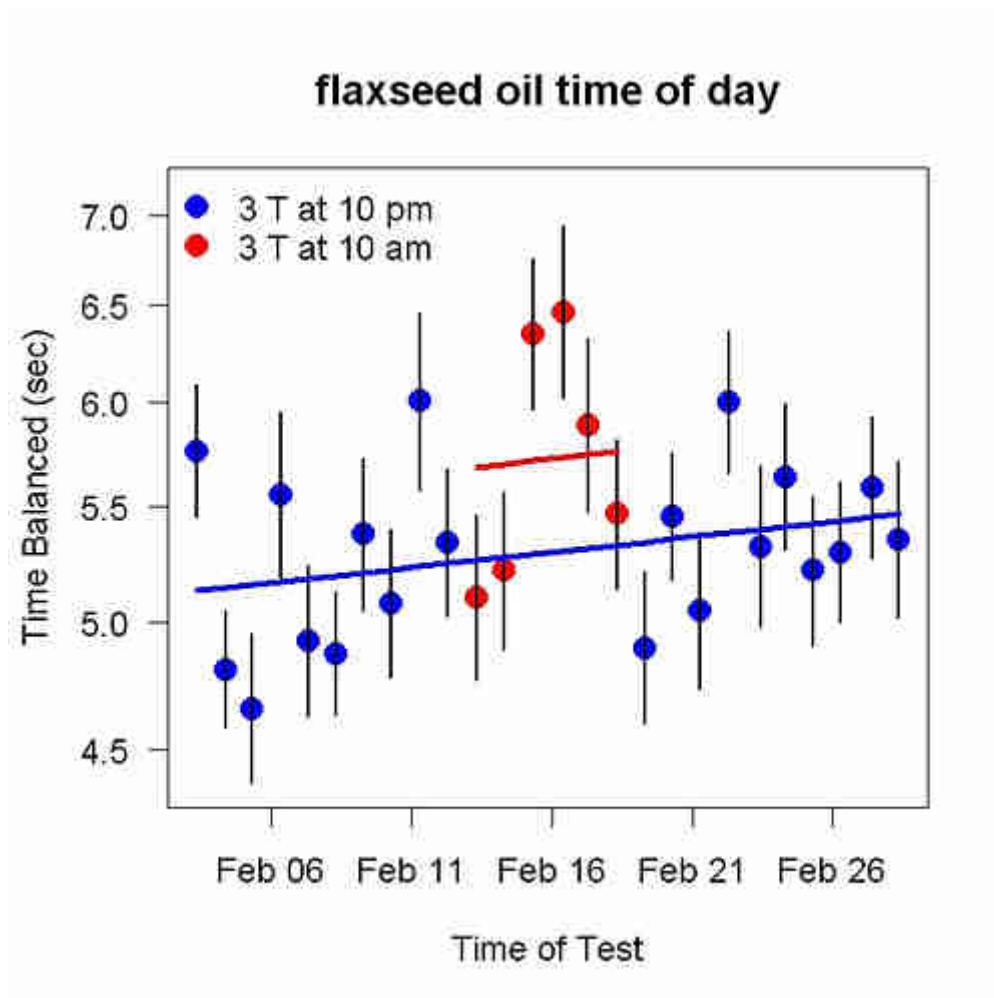

1. [http://www.indiana.edu/~jkkteach/P335/shanks\\_expertise.html](http://www.indiana.edu/~jkkteach/P335/shanks_expertise.html)

## 2.3 March

### Science in Action: Omega-3 (time of day effect) (2007-03-01 21:31)

Flaxseed oil seems to have detectable effects within hours. For example, I increased the dose in the evening and my balance was better the [1]next morning. To get some sense of the time course of the effect, I varied the time of day that I took the flaxseed. I usually took it around 10 pm; I tried 10 am instead. I continued to test my balance around 7 am.

Here are the results from an ABA experiment.

Taking 3 tablespoons at 10 am produced better results than taking the same amount at 10 pm. I fit lines with equal slope to both the A (10 pm) and B (10 am) treatments, as the graph shows. The two lines had different intercepts,  $p < .05$ .

Although 10 am produces better balance, it produces [2]worse sleep – more evidence that the sleep improvement and the balance improvement are due to different mechanisms. I want both improvements, so I am going to split my dose – half in the morning, half in the evening.

Of course, the fact that time of day of flaxseed oil matters is more reason to think that presence/absence of flaxseed oil matters. It is very hard to explain these results in terms of expectations: I had no reason to expect one time to be better than the other.

1. <http://www.blog.sethroberts.net/2007/02/12/science-in-action-omega-3-more-data/>

2. <http://www.blog.sethroberts.net/2007/02/21/science-in-action-omega-3-sleep-data/>

---

Matthew (2007-03-02 01:40:25)

I notice these positive effects you have been talking about as well. I also like how I tend to sleep better when I take the oil in the evenings. However, I wonder if this does not hamper my weight-loss efforts by inhibiting the production of growth hormone. I have heard (I believe it is a prominent cycling training manual) that going to sleep on an empty stomach will trigger more production of HGH to help with weight loss. But I am not sure if fat alone will hinder this process or if it is only carbs that hinders it. Any thoughts?

seth (2007-03-02 08:11:44)

I have never seen any data that supports the idea that more production of HGH helps with weight loss. If there is zero data, I wouldn't worry about it.

Joe Cho (2007-10-13 00:43:24)

never seen any data huh? there's tons of data! <http://content.karger.com/ProdukteDB/produkte.asp?Doi=65488>

Bill Younger (2007-12-12 18:34:18)

I think fish oil is better than Flaxseed oil for the Omegas. Bill

### **A New Way to Quit Smoking? (2007-03-03 11:57)**

A few days ago on the Dean Edell radio show, I'm told, Dean Edell told his listeners that nicotine patches don't cause any addiction problems; people just don't get addicted to them. To anyone who has read The Shangri-La Diet this will sound eerily familiar: Dr. William Jacobs, a professor of psychiatry and addiction researcher at the University of Florida, told me that no one gets addicted to unflavored sugar water, although lots of people get addicted to Coke, Pepsi, and other forms of flavored sugar water.

These examples suggest that it isn't the drug (sugar, nicotine) that causes addiction, it's the signal of the drug – the conditioned stimulus (CS), to use animal-learning jargon. No signal, no addiction. In the case of sugar water, it's very clear: Digestion of calories provides little or no pleasure. Ingestion of sweet-tasting things provides just a little pleasure. Ingestion of a flavor that has been paired with calories many times, such as the flavor of Coke, provides a lot of pleasure. The pattern with nicotine may be similar: Nicotine itself provides little or no pleasure. It is learned signals of nicotine – events repeated followed by nicotine – that can be very pleasant.

The practical application is that you may not need nicotine patches to quit smoking. It may be enough to hold your nose while you smoke. (The nose-clipping that [1]SLD forum readers are familiar with.) When you smoke, the smell may become the CS. With this way of smoking you could have cigarettes whenever you wanted. You'd just come to want them less and less.

Likewise, it may be possible to get rid of an addiction to coffee by holding your nose while you drink it.

Thanks to Carl Willat.

---

Peter (2007-03-03 12:43:16)

What's the CS for injected heroin?

seth (2007-03-03 12:54:02)

The situation – the place, the injection details, maybe music and smells at the time. Shepard Siegel, a psychology professor at McMaster University, and his colleagues did a study that showed that many heroin addicts who die of "overdoses" actually die because they changed the CS. Without the right CS, they lost their tolerance and a dose that was formerly tolerable became deadly.

peter (2007-03-03 15:33:41)

taste is governed by the shape of the molecules, whereas smell is governed by the vibration (i.e., the number of electrons). See, Luca Turin (who has published a book on this, as well as Chandler Burr, who wrote "Emperor of scent etc.. (which is about Turin). I'm not sure what to make of this and am just presenting it for you to consider. As a layman, i would think that smell may be a stronger stimulus than taste. But clearly, the two are different.

seth (2007-03-03 15:54:07)

It's likely that smell can be a CS, but not taste, at least not pure taste. Because you'd only have a few possible signals (6?). Whereas there are thousands of possible smells.

david (2007-03-03 17:25:17)

Should be easy enough to test the idea with caffeine addiction. Google for "caffeinated water".

peter (2007-03-03 18:37:25)

sweet, salty, sour, and bitter; A fifth taste, umami; (from answer.com) It's not clear to me why taste cannot be a cs; because there are so few of them? Sugar has no smell; certain oils have no smell; i suppose that makes sense. i don't know if you could find anything that was either bitter or sour that did not have a smell. i'm just musing.

seth (2007-03-03 21:51:18)

right, taste makes a poor CS because there are so few of them. Lotta confusion – one bitter thing has calories, another bitter thing does not. You need delicate machinery to distinguish thousands of potential foods; and to have delicate machinery it has to be in a safe place (the nose), not in direct contact with pieces of the outside world (the mouth).

Judy (2007-03-05 17:18:38)

I have no sense of smell, yet i can taste things quite well, and can distinguish various foods with my eyes closed that other people who have on noseclips and eyes closed can't see to do. I've read that something like 10 % of people have no sense of smell. I'm just wondering how not having a sense of smell plays into this whole CS idea. The conventional thing I've always heard is that having no sense of smell means I should not be able to taste things very well, but my experience is the opposite - I am very tuned in to how things taste. I just have NO sense of smell at all (and have no idea why - have been this way since childhood - I had a head injury when I was a baby and have always wondered if that may have caused it).

seth (2007-03-05 17:28:13)

Judy, are you addicted to smoking or coffee?

Jarno Virtanen (2007-03-06 00:24:40)

I'm just musing also, but I was reminded of something when I read this idea. See, a lot of smokers, if not all, report that they don't yearn that much for smoking when they have caught a flu [1]. Most say that cigarettes "don't taste" good when they're in flu. People tend to attribute this to the condition, say, to a slight fever; that it just doesn't taste the same when you're a

bit sick. But in a usual flu, your smell is severely impaired. Your nose is typically congested with liquid (that I cannot find an English word for) and you can't pretty much smell at all. Also, the taste aspect of smoking has always seemed somehow over-emphasized. Smokers tend to "speak of a taste of a good cigarette" although everyone seems to think that the nicotine is what they're after. Furthermore, every smoker who has stopped smoking for more than a month, reports that the taste of the first cigarette after the break is awful, but that will pass usually pretty soon. (After a day or two.) Just make things clear: would it be the case that a smoker's brain associates the smell of cigarette with those rare occasions of a real nicotine high (most of the cigarettes a typical smoker has during the day don't cause any physical feeling whatsoever)? (By the way, I personally have been a smoker, but this is not just something I've noticed in myself.) [1] I'm not quite sure how the terminology is in English. By flu, I don't mean some aggressive high-fever Influenza that puts you in bed. Just a regular flu with perhaps a slight fever and snivel coming out of your nose. (I don't if "snivel" is just the right word, but I hope you understood.)

pdf23ds (2007-03-07 20:00:27)

Maybe Judy has the smell equivalent of blindsight.

pdf23ds (2007-03-07 20:01:28)

I wonder how this insight on addiction could apply to other, non-substance forms of addiction, like video games or internet or shopping or gambling.

Susana Wolfertz (2010-06-05 18:07:51)

I started cancer sticks when I was in my teens. It was the hugest wrong move I've made. Now I'm much older I have found giving them up is harder than you can imagine. I used all of the stop smoking gadgets but none did the trick. Then I found the e-cigarette. The e cig uses a nicotine liquid that has only nicotine. No toxic substances at all. They have luckily improved my life. No more inhaling cancerous substances feels great!

## **The Trouble With College (2007-03-04 21:49)**

Yesterday I heard something – a very ordinary bit of info – that neatly summed up the trouble with college. Someone told me about a friend of hers who was a graduate student in English at Berkeley. Her friend taught a small class of freshman and sophomores. He was enthusiastic about what he was teaching, but his students were not. He couldn't make them enthusiastic, even a little. They just sat there. When I started teaching at Berkeley, I had a similar experience. My first class was introductory psychology. Over the first few months, I came to see that my students, almost all of them, had different interests than me. I thought X and Y were fascinating; they didn't.

No one is at fault here, of course. It's perfectly okay that the grad student enthused about something that leaves his students cold. It is perfectly okay that I liked Research X and Y but Research X and Y bored my students. Nothing wrong with any of this – in fact, we need diversity of thought and knowledge, which grows from diversity of interests. We need diversity of thought and knowledge because we have many different problems to solve.

At fault is a system (Berkeley and similar colleges) that fails to value that diversity. (In fact, it doesn't even notice the diversity, except in a one-dimensional way: how much students resemble their professor.) Even worse, the system tries to reduce diversity of thought because it tries to make students think like their professors. Why should the 20 (or 800) students in one class be forced to learn the same material? The students vary greatly. Forcing all of them to learn the exactly same stuff is like forcing all of them to wear exactly the same clothes. It can be done, especially if rewards and punishments (i.e., grades) are used, but it's unwise. Just as feeding children a poor diet stunts physical growth, forcing college students to imitate their professors, instead of letting them (or even better, helping them) grow in all directions, stunts intellectual growth.

I wrote about these issues [1]here and gave [2]a related talk about human evolution. [3]Aaron Swartz and I have

ideas about a better way, and how to get there, which I will blog about. I will tell a 10-minute story about this as part of the [4]Porchlight story-telling series on March 26 (Monday), 8:00 pm, Cafe du Nord, 2170 Market Street, San Francisco ( \$12 admission).

Ruth Heasman (2007-03-05 14:22:43)

Hi Seth, I couldn't agree with you more. My degree was in Philosophy and within that my favourite subject was the Philosophy of Mind. I remember studying both Daniel Dennett and John Searle. I enjoyed both immensely, but I agreed with Searle. Unfortunately, my professor was a follower of Dennett and through pride, I suppose, I wanted to get a 'first' mark in at least this one subject so in the exam I espoused Dennett's argument rather than Searle's. It hurt me to do it, but I got my 'first'. Years later, I bumped into Daniel Dennett at a book signing and somehow felt compelled to tell him all this... The poor guy, he must have thought I was an idiot! It just goes to show that I still carry that shame around with me to this day. Heck - here I am confessing all over again. Something is definitely wrong with the system though, when you know you must agree with your professor to get the desired grades. I always imagined that a Philosophy degree would be about thinking for oneself, but it turns out, it is just as hide bound as everything else.

Sean (2007-03-06 00:11:51)

Great post, Seth - as a college freshman, I must say that I wholeheartedly agree. However, the diversity of teaching styles, doctrines, and course subjects needed to create a new college experience would only be possible through extensive use of the Internet and outsourcing (e.g. off-site Indian TAs/assistants). Unfortunately, universities and the politicians/bureaucracies that control them are loathe to implement these two components - especially the second - into university education. Until then, I'll be stuck with a terrible (for me) Business Communications professor - I only had 2 choices in professors, and only one that fit my schedule. As Ruth pointed out, going against my true beliefs about good business communication habits to get an "A" instead of a "C" does me no good in the long run, and only makes me hate college and business school. BTW Seth, I ran across this article from 2003 on creatine and number memorization/IQ tests in Australia. Maybe a future self-test? As soon as I save some cash, I plan to try it out. <http://news.bbc.co.uk/2/hi/health/3145223.stm>

seth (2007-03-06 04:51:55)

Thanks, Sean. I didn't know that about creatine. Yes, maybe a future self-test.

Jez (2007-04-05 16:12:43)

I think I was lucky on my course, you were able to put your own arguments forward, as long as you demonstrated an understanding of what you were taught, and put a balanced argument forward, you could introduce your own ideas.

### **Andrew Gelman on Web Trials and the Shangri-La Diet (2007-03-05 20:52)**

[1]Andrew Gelman is a professor of statistics at Columbia University. Years ago we co-taught a seminar about left-handedness. His [2]blog. This interview took place via instant messaging in February, 2007 and has been edited slightly.

SR I want to ask your opinion of web trials. People go to a website where they choose or are randomly assigned a treatment. Then they come back and report the results.

AG Then the records of their choices and outcomes are made publicly available.

SR Yes. And there would probably be some summary of the results prepared by experts. It wouldn't be just raw data.

#### COMPARING TO CURRENT STATE OF THE ART IN MEDICAL RESEARCH

AG We could compare to the current state of the art in medical research, which I think is to have some moderately large randomized clinical trials, each of which is published in a journal, followed by a meta-analysis of these trials. A difficulty with the current state-of-the-art is that sample sizes in clinical trials seem to be simultaneously too small and too large. Too small in that results tend to be just barely statistically significant (and often not significant for subgroups), so that you can't really put your faith in one study, hence the need for meta-analysis. Too large in that each study is unwieldy, takes a huge amount of effort and doesn't allow for much learning and experimentation during the study.

SR. A famous epidemiologist [Richard Doll] once said that if the effect is strong, you don't need a big study.

AG In some way the high cost is a good barrier in that people have to think seriously and justify what they want to do. On the other hand, within any particular research plan, it would seem to limit the possibility for innovation.

Speaking generally, a challenge is to integrate clinical judgment (including ideas of experimentation and trying different things with different patients) with scientific goals such as replicability.

Also, there are well-known cognitive illusions in clinical judgment, which is what motivates the evidence-based-medicine movement (for randomized trials, public records of data, etc.) in the first place.

SR How do web trials fit into the picture you have drawn?

AG Ideally, web trials are intermediate between controlled randomized trials on one hand, and full recording of observational data on the other. If people are really volunteering to be randomized, then they follow the protocol, then this is a clean randomized expt (albeit not blinded, an issue I'd like to raise with you). In practice there will be lots of selection, dropout, measurement error, etc., which moves it toward an observational study. The dispersed nature of the data collection is similar to (in fact, more dispersed than) the idea of individual clinicians recording their experiences and outcomes into a centralized databased. That is, the data collection is dispersed, the database is centralized.

SR A web trial would have more regularity – less variation – across subjects than observations collected from individual doctors. Because everyone would get the same instructions. Whereas different doctors are obviously going to give different instructions (for the same nominal treatment).

AG Yes. That's why I said the web trial is in between.

#### DIFFICULTIES WITH BLINDING

SR In the area of blinding I think a web trial would be better than the conventional double-blind clinical trial. If the goal is to guide practice. In practice patients are not blinded. Blinding is a tool to equate expectations. Better

to equate expectations by comparing different treatments both believed to be effective.

AG One of the difficulties with your self-experimentation is that there's no blinding at all. Similarly with these trials. Some of it is the nature of your treatments, but perhaps with some effort you could come up with blinded versions.

SR In my self-experimentation the expectations are equal in the different conditions, in many cases.

AG For example, consider the recent self-experiment that you describe on your blog, where you try different oils and measure your balance. I'd believe these results a lot more if you blinded the treatments.

SR Sure, blinding would help in that case, I agree. I plan to do something like that. But blinding is not necessary to equate expectations. For example, I tried many ways of losing weight. In every case I expected it to work. Some ways worked much better than others. It is this comparison of the effects of different treatments that is interesting. In general expectations cannot be very powerful or there would be no problems left to solve. Expectations are powerful in a few areas and seem to have no effect in many areas. I don't mean we should ignore them; but to emphasize them as a big deal is not what the evidence suggests. In any case in web trials the participants would only be randomized (or choose) treatments they thought might work

AG There's some work by Rubin and other statisticians on "broken randomized trials" which can more generally be thought of as experiments that have partial randomization.

SR I think of web trials as giving "entrants" (or subjects) a choice: to be or not to be randomized. Then when it's all over you compare the two groups.

AG That makes sense. You'll still have some problems: 1. People not following protocol. 2. Non-blindness of treatments. 3. Other problems, I'm sure, which I can't think of offhand.

SR Well, these are equal for all conditions so they shouldn't distort anything

AG In a controlled trial you can deal with some of these things: 1. In a controlled trial you can have more interactions with the experimental subjects, thus maybe more likely they'll follow protocol. 2. In a controlled trial you can (sometimes) ensure blindness. In general, I don't think you can get away with assuming that biases cancel out.

#### ANALYZING DATA FROM WEB TRIALS

AG Your web trials should give us a big juicy source of data that can be thrown at a stat Ph.D. student as a thesis project, perhaps! My intuition as an amateur sociologist of applied statistics is that an exemplary applied analysis is a good way to kick-start the study of a statistical problem.

SR What's an example of such a kick-start? That's an interesting point.

AG I'm thinking of the hierarchical models that were fit by Lindley, Novick, Rubin, and others in the late 1960s thru early 1980s to educational data. These provided examples for people to follow-templates-as well as demonstrations that these methods really worked. There were various interesting discussions of these models in the stat literature, in particular I'm thinking of a paper by Rubin on law school validity studies in J. Amer. Stat. Assoc. from 1980 that had several discussants.

SR Yes, it is true that the data from web trials would be complex and interesting in new ways and accessible to everyone.

AG Yes, having available data is another plus—that's really a new feature which should help. Now back to the warnings. A very well known example is the Nurses Health Study, an observational study that found that taking post-menopausal drugs was associated with lower heart-attack risks (and lower death rates). But when a big randomized expt was done, no association was found. Actually, taking the drugs slightly increased cancer risk, I believe. See [3]here.

I talked with various people about this, and there are different potential explanations for the discrepancies. One story is that the women who took the drugs were otherwise healthier, more health conscious, etc.—even after controlling for whatever pre-treatment variables they controlled for. Another story is that the populations of the 2 studies were different (in particular, in their average ages), and perhaps the drugs are beneficial for some ages but not others. (Incidentally, the drugs were not originally intended to reduce heart-attack risk. This was an unexpected effect (or non-effect), I believe.)

Anyway, the people I trust on these matters (notably John Carlin) believe that the difference is because of "selection", i.e., the drugs don't really reduce heart attack risk. But the observational study led people to recommend the drugs. So this is a big example where the obs study was misleading.

SR: Did the randomized study conclusively rule out the effect size seen in the correlational study? or did it simply find no effect?

AG I'm not sure. My impression is that the expt actually contradicted the obs study—a stat signif negative effect for one, and a stat signif positive effect for the other—not just that there was significance for the expt and no signif for the obs study—but I never really looked into it.

SR I'd like to return to the issue of blind vs don't blind. You believe any experiment where subjects are not blind to the treatment has a problem?

AG Yes, if knowledge of the treatment could affect the outcome (for example, through motivation). I worry about it for your diet and depression studies.

SR Well, in much research the first question is whether there is a useful effect. later experiments deal with mechanism. I was under the impression that what matters is to equate expectations across conditions and that blinding is just one way to do this.

AG Maybe you're right, I'm not actually up on this literature. I know that Paul Rosenbaum has written about it.

\* MORE ON BLINDNESS: CONSIDERING THE SHANGRI-LA DIET \*\*

AG My knowledge of it is not particularly sophisticated. For your diet and depression studies, there are obvious stories based on motivation.

I wouldn't go so far as some people and simply dismiss your results. But the concerns are natural, I think. It's a little different than the problem with the Nurses study. Here I'm worried about motivation, there the issue was selection.

Although there's a possible selection problem in your study too, in that the people (including you) doing the Shangri-La Diet might be those who are ready to try something new and lose weight.

SR There are a lot of people who are always ready to try something new and lose weight.

AG Again, this could be tested with a blinded study. For example, half the people get the oil apart from a meal, half get the oil with the meal. Not that this would solve all problems of interpretation. . . .

For example, Caroline thinks that your diet works, but that the reason why it works is that it stops people for snacking for a 2-hour period (before and after the oil) and also focuses people on their snacking.

SR If anyone thinks that — and it is a perfectly reasonable thing to think if you are just starting to learn about it — then they can replace the oil with water and see if they continue to lose.

AG To answer your comment ("there are a lot of people who are always ready to try something new and lose weight"): yes, I remember you saying this before, and this is a big reason I wouldn't dismiss your results immediately. But, still, people willing to try this wacky new thing might be special (on average). To put it another way, I expect there were similar successes with people trying Scarsdale, Atkins, etc.

SR I'm sure that people who try my diet are unusual early adopter types. I think Atkins has some truth to it — some reasons it would actually work. I don't know enough about Scarsdale to comment. My theory says that merely changing what you eat (to foods with unfamiliar or at least less familiar flavors) should lower your set point.

AG Sure, but you had another point which was that these were people for whom nothing worked before. I was just using these diets as examples of other things that worked when nothing worked before. It relates to the historical perspective of new diets as things that will work for a few years before burning out. Possibly because the new diets can motivate people.

SR I tend to think they burn out because the new food becomes familiar.

AG I'm not saying that this is necessarily true of your diet—yours might be different—I'm just giving a historical control to give insight as to how there could really be motivational issues.

SR That's true, research to distinguish my explanation of the burn out and a motivational one could be done but of course hasn't been.

AG Your story, "they burn out because the new food becomes familiar", is plausible. It's also plausible that it's easier to motivate yourself with a plan that's new and different.

SR I hope there will be studies of whether the theory behind my diet is correct. These would essentially be studies that test the prediction that familiarity matters. This is a prediction that other theories do not make.

AG Yeah, based on reading the appendix to your book, there's still some research synthesis that needs to be done (presumably with the help of animal studies).

SR I agree.

## BACK TO WEB TRIALS

SR Web trials are relatively early in the research chain and they are relatively practical. In these cases you don't worry a lot about mechanism, you worry much more about efficacy — is there an effect?

AG Regarding the analysis of web trials, it would be interesting to look at other examples of partially random-

ized experiments. Rubin and Hill and others worked on a study of school choice where they looked into some of these issues. It was a study that randomized some aspects of which kids went to which schools, but parents had some choices too.

In medicine and also in economics/public-policy, there has been a lot of interest in recent years in trying to get inside this sort of study rather than just relying on the "intent to treat" or explicit randomization.

SR "get inside this sort of study"—what do you mean?

AG: I mean, look at what treatments are actually chosen by the individuals in the study, not just looking at what treatments they were assigned to.

SR Could you sum up why you like the idea of web trials?

AG 1. Lots of data. 2. Motivates people to randomize, to apply the treatment, and to record results. 3. More generally, gets people involved in the project as participants, not just "subjects"

SR Those are good points, thanks.

AG Thank you for giving me the opportunity to think about these things. I'm still struggling with the question, "Are medical experiments too small or too big (in number of subjects)?" As discussed [4]here.

4. [http://www.stat.columbia.edu/~cook/movabletype/archives/2005/05/im\\_all\\_confused.html](http://www.stat.columbia.edu/~cook/movabletype/archives/2005/05/im_all_confused.html)

---

Jeffrey Miller (2007-03-06 12:52:58)

One could eliminate any "expectations" bias by testing the predictions of the SLD on mice. The hypothesis of the SLD (as I understand it) is that if you fed mice some amount of flavorless sugar water each day, their weight set point would drop, they would eat less, and they eventually would weigh less than the control group. One could perhaps implement the experiment by providing the mice in the experimental group only some fixed amount of sugar water to eat or drink and the control group only water during a few hours of the day. During the rest of the day, both groups could eat whatever they want. Obviously you'd have to make sure that the mice were drinking the sugar water, but that should be possible.

seth (2007-03-06 13:36:22)

Yes, that's a reasonable test. You just have to make the sugar water available at a different time than food. If they are available at the same time the sugar water can make the regular food a better signal for calories.

## **Andrew Gelman Interviews Me About TV and Mood (2007-03-06 21:13)**

Andrew did this interview for [1]Stay Free!, a magazine about media and consumerism, in 2000. They didn't publish it.

AG Why don't you start by describing your method of using TV watching to cure depression?

SR To feel better, you watch faces on TV in the morning and avoid faces (televised and real) at night. TV faces are beneficial in the morning and harmful at night only if they resemble what you would see during an ordinary conversation. The TV faces must be looking at the camera (both eyes visible) and close to life-size. (My experiments usually use a 27-inch TV.) Your eyes should be about three feet from the screen. Time of day is critical--if you see the TV faces too early or late they will have no effect. The ave contact with other people has a big effect on when we are awake; and (c) there are many connections between depression and circadian rhythms. Depression is closely connected with insomnia, for instance.

AG I generally think of TV as an evil, addictive presence in American life. Do you think there's something dangerous about giving TV this "badge of approval" as a medical treatment?

SR It's not quite a "badge of approval." Seeing faces on TV at night--which of course is when most people watch--is harmful, my research suggests, if the faces are close to life-size. And they often are. Maybe TVs will be made with variable picture sizes--one size for morning, another size for night. When I watch TV at night (very rare), I stay as far away as possible.

AG I mean, if this method really worked, I could imagine the Depression Network running talk shows in the morning that are basically infomercials for Prozac or whatever. Would you worry about that?

SR No. I watch faces on TV every morning and would appreciate more choice. I suspect the morning shows would not be Prozac infomercials, however, because the people watching would not be depressed.

One thing that bothers people about your plan is the idea of TV as a substitute for human contact. I think that most of us--even people who spend a lot of time watching TV--find this idea upsetting. It's like "Brave New World" and virtual reality. Are you at all bothered by recommending to depressed people that they sit inside watching TV?

"Substitute for human contact"? True, but why is that so bad? Reading--which TV critics, many of them writers, seem invariably to like--is also a substitute for human contact, of course. Agriculture is a substitute for hunting and foraging. Vitamin pills substitute for food. Civilization is all about substitutes--about being able to fulfill needs in many ways.

Still, I think watching faces on TV in the morning is only a partial solution to the problem of depression, just as nutritional supplements (e.g., iodized salt, folate added to flour) are only partial solutions to the problems caused by a poor diet. A fuller solution would include changing when most people work. The usual pattern is work (morning and afternoon) then socialize (evening). A better pattern would be socialize (early morning) then work (late morning to early evening)--and go to bed early. I do my little bit for the revolution by inviting friends to brunch rather than dinner. The revolution would also include picture phones with life-size faces.

I heard you say once that depression is ten times as common now as it was 100 years ago. Where do you get that information from?

Many articles have made that point. One of them is: Klerman, G. L., & Weisman, M. M. (1989). Increasing rates of depression. *Journal of the American Medical Association*, 216, 2229-2235.

If depression is a consequence of modern life, do you think there's something strange about seeking a technological solution for it? It's sort of like saying, people are too atomized, so let's solve the problem with

even more solitude?

It is one of many technological solutions to problems caused by “atomization” — people being farther apart. Telephones, air travel, and email are other examples. So it isn’t strange. If my subjects are any guide, watching TV for an hour every morning would not increase the solitude of most depressed persons. They are already alone during that time.

Would listening to the radio be OK?

No. You have to see faces.

Have you ever tried to get your research sponsored by TV stations or networks or, for that matter, a publication like TV Guide?

No, but I once put a “TV is good” ad (ABC) on my bulletin board.

1. <http://www.stayfreemagazine.org/>

---

Willy (2007-03-07 15:18:03)

I wonder if this effect of TV on depression explain the success of morning programs where I live (they are very new). Most programs are light and try to be fun, like the only reason to watch them is to watch people. I turn on the radio when I wake up and listen to news programs, rather depressing. I will try TV.

seth (2007-03-08 12:14:07)

Ordinary TV doesn’t have enough faces of the right size to make a difference. But I think people are hungrier for voices in the morning than at other times – they get more pleasure from hearing voices. I think just hearing voices reduces the unpleasant feeling of loneliness. A friend of mine spent several months on an island by himself. A radio made it much more bearable.

### **Jane Jacobs on College (2007-03-08 10:34)**

Jane Jacobs, the urban and economic theorist, [1]wrote:

Only in stagnant economies does work stay docilely within given categories. And wherever it is forced to stay within prearranged categories — whether by zoning, by economic planning, or by guilds, associations or unions — the process of adding new work to old can occur little if at all.

In the case of college, the "work" is post-high-school education. College students are not forced to join a union but the need for credentials forces them to attend college, where, as Jacobs correctly predicts, a narrow range of subjects is taught in a narrow range of ways. Take my department (psychology at UC Berkeley). As one of my students, a psychology major, asked, why isn't there a course about relationships? That's what's really important, he said. Yes, why not? There has never been such a course at Berkeley nor, to my knowledge, at any other elite university. What a curious omission. And why do practically all classes involve lectures, reading assignments, and tests? Aren't there a thousand ways to teach and learn? I think Jacobs has the answer: Work has been forced to stay within prearranged categories – categories that seem increasingly outdated. The pattern of chapters in almost all introductory psychology textbooks (which cost about \$100) derives from the 1950s!

[2]An earlier post by me about college. [3]Other people's comments. Jane Jacobs on [4]the food industry and [5]scientific method.

Tim Lundeen (2007-03-08 12:03:08)

Well said :-) My son is a freshman in college, and it is not a good fit at all. Seems like a high price to pay for the credential.

pdf23ds (2007-03-08 19:41:49)

This, while it was only one of the several reasons I didn't finish college, is perhaps the primary reason why I'm not planning on returning to college.

## **How Good is the Atkins Diet? (2007-03-09 22:23)**

[1]A new study, just published in JAMA, compares several popular diets: Atkins, Zone, Ornish, and LEARN (a conventional-wisdom-type diet based on "national guidelines," according to the paper). The Atkins diet did much better than the other three. The results were quite a bit more positive for Atkins than [2]an earlier comparative study where compliance was poor, weight loss was minimal, and no diet was clearly better than the rest. The Atkins Company, not surprisingly, is pleased with the new study; they have put it in their [3]research library.

Here is what the researchers concluded from their data: "A low-carbohydrate, high-protein, high-fat diet may be considered a feasible alternative recommendation for weight loss" (from the abstract – the meaning of "alternative" is not explained).

However, a graph in the paper (Figure 2 for those of you with access) makes a very important point that the researchers don't mention: Persons on the Atkins diet weighed more after 12 months on the diet than after 6 months. After 6 months, in other words, the lost weight was coming back. The regain is not small: From Month 6 to Month 12 the Atkins dieters regained about one-quarter of the weight they had lost. At the end of the study (Month 12), they had lost about 10 pounds.

My interpretation is that the Atkins Diet works for two reasons: 1. The food is new. The flavors of the new food are not yet associated with calories. The novelty wears off, of course. This is why some of the lost weight was regained. 2. High-glycemic-index foods (such as bread and potatoes) are eliminated. This produces permanent weight loss, but not a lot. When I started to eat low-glycemic-index foods I lost 6 pounds, which I never regained. A 6-pound loss is not terribly different from the 10 pounds (average) lost by study participants.

In a [4]newspaper article, the study's lead author mentioned the regain:

As the study progressed, [Christopher Gardner, an assistant professor of medicine at the Stanford Prevention Research Center] said, some dieters put back on some of the weight they had lost early in the year.

That's misleading. It wasn't "some dieters" – it was a trend shown by the whole group. But at least he (kinda) mentioned it.

Sean (2007-03-10 09:09:58)

Do all these studies only measure weight and not percent body fat? Adding 5 lbs of muscle is healthier than adding 5 lbs of fat.

seth (2007-03-10 23:10:11)

The most recent study measured percent body fat.

## How To Do Experiments That Generate Ideas (2007-03-10 22:36)

A few days ago a graduate student in economics asked me what I thought of behavioral economics. On the positive side, I said, some of the phenomena are impressive. For example, [1]the endowment effect, which is so strong I would demonstrate it in class. On the negative side, none of the researchers use experiments to generate ideas. They don't merely not do it; they seem unaware of the possibility of doing it. The graduate student wondered how it can be done. I said there were three main ways:

1. Do something extra. Do a little more than necessary so that your experiment tells you about something that isn't the focus of interest. For example, vary a factor that you think is not important. This is [2]Saul Sternberg's idea. I did this in my peak-procedure experiments: measured how long rats held down the bar. This was irrelevant to the

purpose of the experiments, which was to understand how rats measured time. These measurements greatly surprised me. For years, I misunderstood them. Eventually they led to [3]a new line of research about the control of variability.

2. Measure a function, not a point. Ask how your treatment changes a whole function, not just this or that numerical measure. This is what I did in my peak procedure experiments: The experiments generated for every condition an entire function showing response rate as a function of time. I saw how treatments changed the entire function. [4]This talk describes some of the new ideas this led to.

3. Make your experiment easy and fast. The easier and faster it is, the more you can do it in lots of variations. Our ignorance of behavior being great, some fraction of these are likely to generate unexpected - and therefore inspiring - results. This is one reason self-experimentation is [5]good for generating ideas: It is easy and fast.

I am not aware of any other written answers to this question, strangely enough.

---

David Zetland (2007-03-12 15:40:56)

I suggest spending a lot of time looking at patterns in the raw data using graphs and spreadsheet analysis. Do subjects react in the same way? in a non-linear way? Regressions are so brute force that you lose a lot of subtle details at the individual level. Also compare your results to those of others and try to understand the variation. I am working on a paper because of this: my subjects saw more data in a cooperation (PG) game - they were less "cooperative" and more "reciprocal" - relative to the other experiment. My result fits the literature better and so I'm excited to push it ahead.

seth (2007-03-12 15:58:19)

Yeah, I agree. That's advice about what to do after the experiment is over, however. My comments are about what to do before that - while planning your experiment, for example.

### **Is Sugar Fattening? (2007-03-11 14:50)**

In 1987, Dr. Israel Ramirez, a researcher at the Monell Chemical Senses Institute, whose research led to the theory behind the Shangri-La Diet, [1]questioned the prevailing assumption that sugar causes obesity in humans. Rat experiments did not support such a simple idea, he pointed out.

The [2]most recent issue of the American Journal of Clinical Nutrition has a [3]review article that agrees with Ramirez (but, alas, does not cite him). Now there is clinical evidence that Ramirez was right. From the abstract:

Numerous clinical studies have shown that sugar-containing liquids, when consumed in place of usual meals, can lead to a significant and sustained weight loss

Maybe the Shangri-La Diet isn't so crazy.

### **Omega-3 and Bone Health (2007-03-12 22:55)**

The [1]current issue of the [2]American Journal of Clinical Nutrition, which I mentioned [3]yesterday, also has [4]an interesting article about the effects of omega-3 on bone health. (Most recent issues of AJCN have something about omega-3.)

The researchers measured the bone density of about 80 teenagers and remeasured them about 5 years later. They found that bone density was positively correlated with the amount of omega-3 in the blood. A low correlation (0.3) but significant. Rat experiments support this connection. Again, it's not just that omega-3 is good; omega-6 is bad – see the [5]Israeli Paradox.

### **The Berkeley School Lunch Program: Correction (2007-03-13 16:31)**

After I mentioned that the Berkeley lunch program was [1]in poor shape, [2]Ann Cooper, the chef in charge, invited me to visit – to set the record straight. It was quite an opportunity; the Berkeley lunch program, some hope, will become a model for the whole country. This is why there was [3]a long New Yorker article recently about what Cooper is doing.

Spending about \$1/day more per student, Cooper has shifted the lunch menu far away from the heavily-processed and factory-made food of most school lunches. Far more of the food is cooked in the district kitchens, albeit days in advance in some cases. I took Cooper's word for it that the students actually eat the new food. This is a great improvement, in my opinion. The big questions are whether these changes are sustainable and what effect they will have.

The single best thing you can do for your health is to eat healthy food (the exact nature of which has yet to be determined, but you get the idea). Obesity, diabetes, heart disease, cancer, stroke – all the big American health problems are made much worse by the crummy diet of most Americans. Will Cooper's improved lunches cause her lucky diners to eat better as adults? If so, \$1/day is a great bargain compared to health care costs. (She estimated these changes will cost \$2/day across the country.) Will Cooper's improvements reduce obesity and diabetes? That is obviously the hope.

I wouldn't say the Berkeley school lunch program is in trouble or in poor shape; I would say it is in limbo. Four things are big question marks:

1. Cooper seemed to be working very hard and not quite enjoying it. Even after a year on the job. This is not a good sign. Her salary is being paid by the Chez Panisse Foundation – not a good sign. She struck me as incredibly dedicated but how much failure and frustration can she and the Chez Panisse Foundation bear? This sort of thing is often much harder than anyone imagines in the beginning.
2. Obesity is a big big issue. Whether the new food will help is unknown. Cooper seems to take it on faith that her food will be less fattening. I am less sure. As anyone who has read *The Shangri-La Diet* knows, I believe that American food became really fattening not because it was processed or "unhealthy" but because of the increasing popularity of foods that tasted exactly the same each time (e.g., microwave entrees). If she cooks the same recipes again and again, the hoped-for weight loss may not happen. If it doesn't, will the program continue? Or will \$1/day be seen as better spent on something that hasn't yet failed, such as more physical ed?

3. The effects of Cooper's changes are going to be measured by UC Berkeley School of Public Health researchers. As far as I could make out, the comparison will be between Berkeley students and students in another school district. You have  $n = 1$  (1 school district) in the experimental group and  $n = 1$  (1 school district) in the control group. This is better than nothing but, given the importance of the question – can better school lunches improve health for the rest of a student's life – and our great ignorance as to its answer, it is scary bad. It will be so easy to reach the wrong answer. Researchers with this sort of design often act as if they have hundreds of subjects in each group – each student is treated as a different and randomly-assigned subject. This isn't just false, it's misleading.

4. While I am sure the researchers can measure obesity, I am less sure they will do a decent job of measuring changes in attitudes toward food. It is not a typical public health question.

I am very optimistic about the future of food – and therefore health – in America, but it's because of (a) the Food Network, (b) the growth of farmers' markets, and (c) the success of Whole Foods and similar stores. Not to mention Rachael Ray. Americans are becoming food connoisseurs, starting to catch up with a large chunk of the rest of the world, such as China. The American increase in connoisseurship is trickle-down – from rich people to everyone else. Like cell phones, like TVs, like literacy, like many things. Whereas Ann Cooper is working in a school district that has lots of poor people. Not a good place to start this sort of revolution.

Addendum: This [4]article in New York magazine reminded me that Ann Cooper's previous job was at an expensive private school. So maybe it is another case of trickle-down after all.

2. <http://www.chefann.com/>
3. <http://www.chefann.com/blog/?p=397>
4. <http://nymag.com/news/features/29724/>

---

Peter (2007-03-15 19:45:55)

I don't know, Seth. This idea of trickle-down from rich people as a precursor to being a connoisseur seems a bit misleading. Cellphones started out very expensive, so only rich people could afford them. There may have been some "status" pull because they were associated with rich people, but the rest of us got cell phones because they're convenient and became affordable. I don't see how the literacy argument works at all, at least in this country. Why should poor people be less inclined to like good food if it's available in the cafeteria?

seth (2007-03-15 21:45:30)

Cell phones became affordable because rich people paid the development costs. If something about cell phones required them to start with poor people, they might not have gotten very far. To return to school lunches, Cooper is trying to do something very difficult – and on a tiny budget. If she had more money, as she would in a richer school district, it would be easier. She would have more money to spend, she could do a better job, the health effects could therefore be larger and more convincing, and she would have more time to do it – her salary wouldn't be paid by a foundation.

Peter (2007-03-16 09:03:56)

Richer school districts don't necessarily have more money for lunch. Most of the money that doesn't come from parents is from the federal government. You can't ask those on a free lunch program to eat a worse lunch than full-price students, and even in a rich district, parents won't tolerate their children's lunch money subsidizing other people's. A very rich district could subsidize the cost of everyone's lunch out of its general budget (or get Alice Waters' foundation to help out, as Berkeley does) but for the most part, districts don't seem to go much past the free lunch subsidy as the amount they will spend on the average lunch. There's no multibillion dollar infrastructure buildout required to get better lunch food, just more per-student funding, and that is something that has to be done collectively, probably at the federal level.

seth (2007-03-16 10:58:45)

Let me make a prediction: The next school districts to try to provide much better lunches – as Cooper is doing in Berkeley – will be rich districts, even though childhood obesity is a much bigger problem in poor districts. This will happen before the federal government does anything.

Dr.Susan Rubin (2007-03-16 19:09:33)

Better School Food is on its way thanks to the soon to be released documentary on school lunch called "Two Angry Moms". This is not just a movie, it's a movement. The tipping point is closer this year with the farm bill up for renewal. This film will have a huge impact in the discussion of what we are feeding our kids and why. To learn more, visit [www.angrymoms.org](http://www.angrymoms.org) Dr. Susan Rubin ( Angry Mom)

Kaylyn (2007-03-22 06:25:20)

I think schools NEED better choices for lunch, because I have seen students that can't even fit in the desks!

Adam Zauder (2007-03-25 21:55:59)

While I agree that wealthier school districts will generally be on the leading edge – generally because moms in those districts have more time to voice their concerns and spend a lot more time in Whole Foods – we've found three charter schools exclusively serving underprivileged communities (95+ % of students qualify for the Federal free & reduced lunch program) who are adamant about working with our company to get natural and organic lunches in their schools. Students in those schools

are partnering with us to find communtiy and national businesses to subsidize the Federal lunch program. Interestingly, we a higher percentage of students in those schools choose our lunches than what we generally see in richer neighborhoods. More information is available at [www.brownbagnaturals.com](http://www.brownbagnaturals.com)

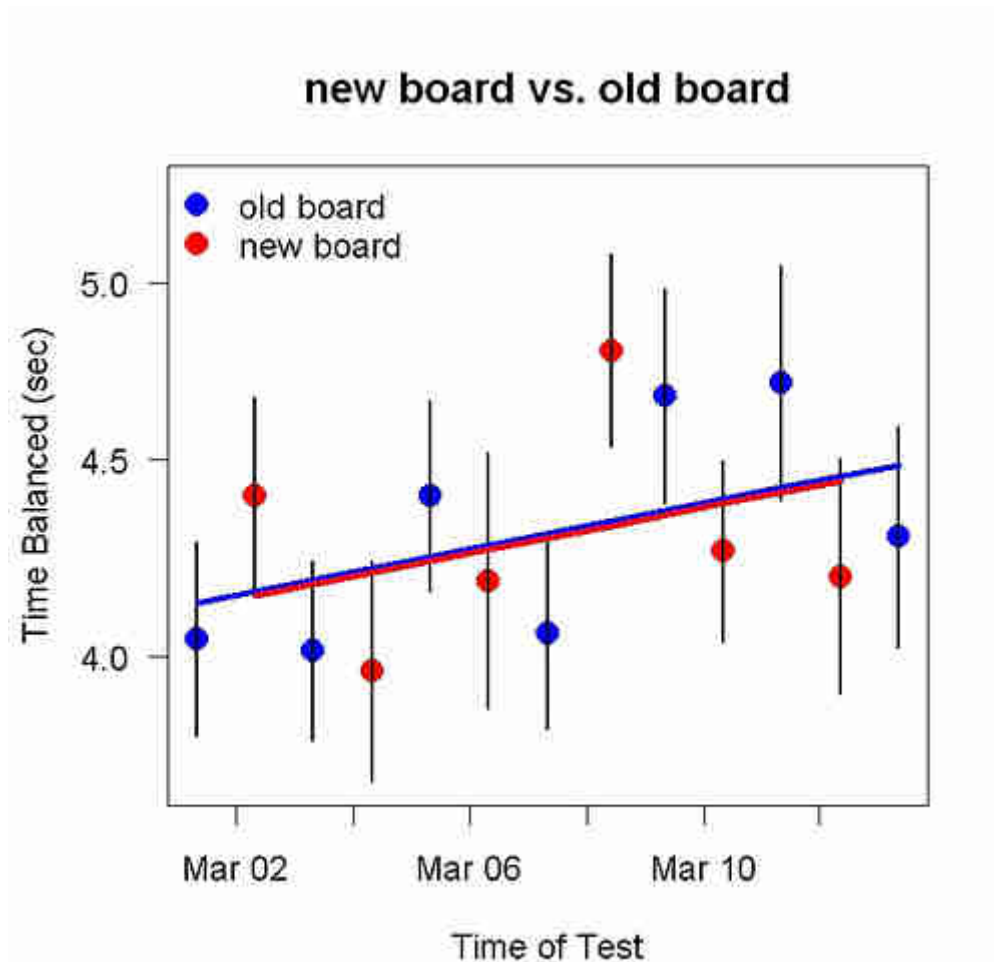

### **Science in Action: Omega-3 (measurement improvement) (2007-03-15 12:55)**

I've learned a few things. As some of you may know, I've been measuring my balance by standing on a board that is balanced on a tiny platform (a pipe plug) – pictures [1]here. Now and then the board would slip off the platform. I supposed this was a failure of balance but I wasn't sure, especially if it happened as soon as I stood on it. So I got another board into which my brother-in-law kindly drilled the perfect-size hole so that the plug will never slip:

To see if this made a difference I did an experiment with a design I have never used before but that I really like: ABABABAB... (one day per condition). In other words, Monday I tested my balance with the old board, Tuesday with the new board, Wednesday with the old board, Thursday with the new board, etc. Simple, efficient, well-balanced. Here are the results:

The red line is fit to the red points, the blue line to the blue points. The two lines are constrained to have the same slope.

Well, that's clear. I expected my balance to be better with the new board, actually.

Speaking of the unexpected, I made another measurement improvement that truly surprises me – the surprise is that I never did it before. When I looked at my early balance data (the first 10 or so days of data) I saw that my balance improved for the first 5 trials and was roughly constant after that. Each session was 20 trials so I dropped (excluded) the first 5 trials from my analyses – considering them "warm-up" trials. I took the mean of the last 15 trials. That seemed very reasonable and I thought nothing of it.

Recently I asked again how performance changes over a session. The answer was a bit different: I found that performance improved for the first 10 trials. Now there are 30 trials in a session, so dropping the first 10 of them seemed okay. And that's what I did.

But then I looked at how variability changed over a session. I expected the earliest trials to be more variable than the rest but the data didn't show that. Variability was pretty constant from the first trials to the last. Hmm. Maybe I am losing valuable information by not including those early trials in my averages. It occurred to me: why not allow for the warmup effect by modelling it, rather than by excluding it? (Modelling it meaning estimating it and then subtracting it.) I did that, and then I looked at the size of the standard errors of the means (standard errors based on the residuals from the fit) for the most recent 40 days – essentially, the error in measurement. Here is what I found. Median standard errors:

First 10 trials (out of 30) excluded: 0.073

First 5 trials excluded: 0.064

First trial excluded: 0.061

No trials excluded: 0.059

My eyes opened wide when I saw these numbers. Oh my god! I was throwing away so much! A reduction in error from 0.073 to 0.059 – that's 20 % better.

1. <http://www.blog.sethroberts.net/2007/01/26/science-in-action-omega-3-materials/>

---

Tim Lundeen (2007-03-15 13:42:08)

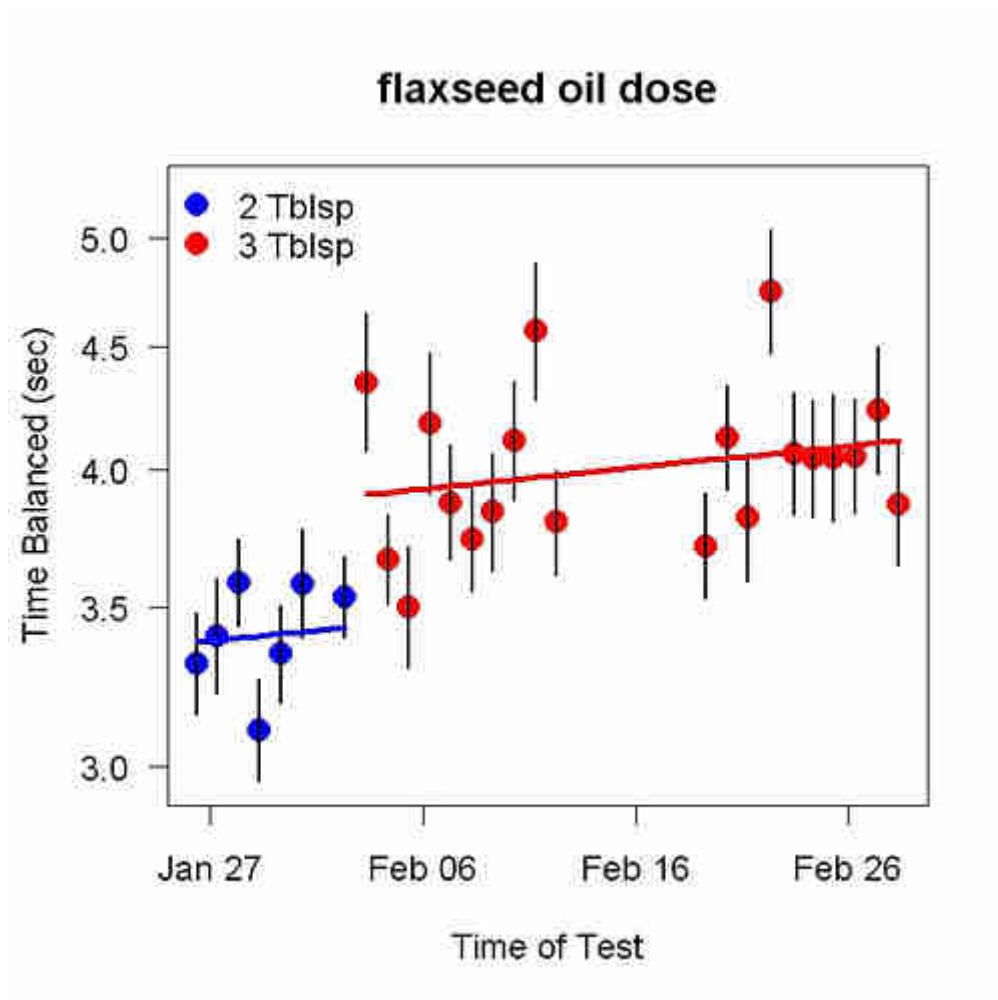

Fascinating, both the consistency of the results with/without slippage, and the standard error reduction.

seth (2007-03-15 14:29:18)

Thanks, Tim. It was your arithmetic results that led me to the standard error reduction. Your arithmetic results led me to do a very similar task, as you know. I didn't want to place constraints on the 100 simple arithmetic problems I did each session (it was just too complicated – too many things that might be important) so instead I did my best to equate different days by modelling – by estimating and removing the effects of this and that. That gave me the idea of doing it here, too.

### **Science in Action: Omega-3 (what's the best dose?) (2007-03-16 20:59)**

With a [1]better understanding of how to measure balance, I looked again at my data about the effects of flaxseed oil. Here is a new, improved comparison of 2 tablespoons/day and 3 tablespoons/day:

Very clear difference: one-tailed  $p = .004$ .

Here is a messy comparison between 3 and 4 tablespoons/day:

I compared 3 tablespoons/day at 2 different times with 4 tablespoons/day divided between those 2 times. I didn't want to take 4 tablespoons at one time and I wanted to have at least 2 tablespoons in the evening because of the [2]sleep benefits. The graph shows that 4 tablespoons/day has about the same effect as 3.

The big picture: [3]Earlier data convinced me there is probably an effect. Before doing more subtle, convincing, publishable experiments, I have been trying to make the effect as large as possible. For two reasons: 1. To make the effect as clear as possible. 2. To have the most beneficial possible baseline (a baseline to which I will return many times). I foresee doing an experimental design like this: baseline (n days), something else 1 (n days), baseline (n days), something else 2 (n days), baseline (n days), something else 3, and so on. During those many baseline days I want the effect to be as strong as possible.

1. <http://www.blog.sethroberts.net/2007/03/15/science-in-action-omega-3-measurement-improvement/>

2. <http://www.blog.sethroberts.net/2007/02/21/science-in-action-omega-3-sleep-data/>

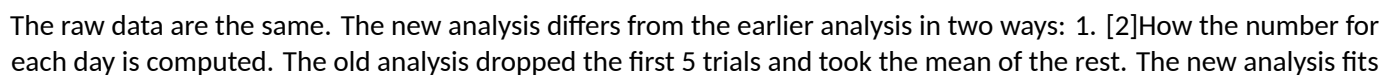

3. <http://www.blog.sethroberts.net/2007/01/20/science-in-action-omega-3-balance-results/>

Seth, may I ask what brand of flax oil do you use?

Spectrum Organic (Original Formula)

Hi seth, I am just starting reading your book. I wonder if taking omega-3 oil as capsules has any effect? You do not taste it then either. I have beend doing this for about 8 months (but skipped some days) and I lost some weight but not much. It is one clothes size even though I maintained everything else. I have never beleived in dieting. The capsules which contain flaxseed are very small. I took the oil for its beneficial effects on the brain. Thank you Claudia

A few months ago I did [1]a little experiment to test my belief that omega-3 was affecting my balance. I replaced fats high in omega-3 (flaxseed oil and walnut oil) with a fat low in omega-3 (sesame oil). Here is a new analysis of the data:

a regression line to balance as a function of trial to estimate an effect of trial and subtract it, then takes a mean of all the trials. 2. Allowance for improvement. The new analysis, as the graph shows, fits a slope to all the data. The improvement over days is subtracted from each day's score before the two conditions are compared.

The old analysis gave  $t = 4.1$  ( $p = \text{very tiny}$ ). The new one gives  $t = 6.3$  ( $p = \text{very very tiny}$ ). Big improvement!

[3]Directory of my omega-3 posts.

---

peter (2007-03-19 15:04:03)

Seth, have you notice any difference in the quality of dream recall after taking more omega-3?

seth (2007-03-19 15:37:24)

In the beginning, my dream recall may have improved. But if it did I stopped noticing or it went away.

Chapman (2008-11-28 20:19:30)

After a high-cholesterol/triglycerid report, about two weeks ago I began a high Omega-3 diet (vitamin and dietary supplements, snacks, etc.). I've begun remembering vividly my dreams, and goggled "omega-3 dreams" to see if anyone else has experienced the same and found your blog. Just thought I'd share.

Hugh's house (2008-11-29 06:55:06)

Six of us staying at Hugh's house had some omega 3's before bed last night. We had 1000 mg pills (max recommended 3 / day), Hugh had 5 the rest of us have 1 or 2. We all had some hella crazy dreams. Tonight Hugh had 5, Richard and I (Alex) had 4, Ed had 2 because he is a pussy, Chris had 2 but decided to man up and have another one and Ali is going to have 3 (maybe, she is pretty sleepy but Hugh might force her). We're all about 70 kg's except Ali (weight unknown). We expect crazy dreams tonight. We'll report back tomorrow.

Hugh's house (2008-11-29 18:12:34)

So..uh...no weird dreams today. Except Chris is going to talk about his dream from last night: "I dreamed I was held up at knifepoint by one of my old school mates Jess Bingham. When he realised who I was he relented but somehow my shoe fell into a ravine. I spent the rest of my night searching for my shoe in a ravine." This dream was about a 17.56 % as crazy as the dreams from the previous night according to the published peer review journal articles. Hugh is pretty proud of his HealthyLife 200 pills / bottle double pack for \$AUS20. Their makeup: - 300 mg Omega-3 Marine Triglycerides as: - Eicosapentaenoic Acid 180 mg - Docosahexaenoic Acid 120 mg ...expect more entries.

September (2009-08-23 08:45:08)

I have begun taking Omega 3. I never eat any fish, flax, etc. so I thought it might be time to add Omega 3 to my vitamins. After taking it, I noticed I began having bizarre dreams, better sleep and better dream recall. When I forget to take my Omega 3, I do not experience these kinds of dreams. I have just started taking it and do not know how long the effects will last.

## At the Berkeley Farmers' Market (2007-03-18 22:07)

Yesterday I went to the Berkeley Farmers' Market and had a very interesting conversation with one of the vendors.

1. Whole Foods had called her and asked her if she would like to put her product in their stores. No thanks, she said. "Are you kidding?" they said. No, she said. She didn't want to put her product in their stores because she didn't want that sort of volume. She was more interested in supporting smaller stores. She told me that Whole Food's increased interest in local vendors had come about because of Michael Pollan's criticism of Whole Foods in *The Omnivore's Dilemma*. (Pollan had coined the term Big Organic and wondered which side – the more virtuous or the less virtuous – Whole Foods was on.)

2. The vendor next to her, [1]The Fatted Calf, who sell salami, beef jerky, sausage, duck confit, and other meat products, had been forced to stop selling to stores and restaurants when someone called the USDA to complain that they didn't have an office for the USDA inspector. That's right: no matter how small your business, you must have an office for the USDA inspector. It's an absurd burden to put on a small business. As I have heard others say, big businesses welcome government regulation. Because they can afford it and their potential future competitors, now tiny, cannot. Supposedly the regulation protects consumers; it may or may not but it certainly protects big businesses. (Does requiring an office for a USDA inspector protect consumers? I think not.) We need organic consumer protection. The current version is like heavy-duty insecticide. It kills small businesses.

1. <http://www.fattedcalf.com/>

---

Daublin (2007-03-19 09:31:20)

On #2, absolutely. However, what is the point of the USDA if it only applies to large organizations? As you say, though, maybe the cost is more than the benefit, and so the whole thing should be cut back. As you point out, the regulatory burden is no big deal for existing large organizations, but can easily be a big deal for a newcomer. #1 sounds like someone has lost perspective from reading too many blogs. :) What percentage of Whole Foods shoppers have ever heard of Michael Pollan?

seth (2007-03-19 12:30:55)

It's not that the USDA shouldn't regulate small businesses; it is that their regulations should be "scalable" – produce the same regulatory burden on large and small businesses. As it stands, they are far more damaging to small businesses. The vendor who made that point about Pollan and Whole Foods doesn't read a lot of blogs. I think she's probably right. I'll post some evidence to that effect at a later date.

## Life is Complicated (2007-03-20 04:58)

Yesterday morning I listened to Ira Glass. Yesterday evening I listened to [1]Bill McKibben. And I reflected:

1. Bill McKibben wrote a whole book, *The Age of Missing Information* (1992), about the malign influence of TV. He spent a year watching a single day's output of the 100-odd channels of one cable company. TV makes people self-centered, he decided.

2. Ira Glass said we are living in a Golden Age of Television and listed a handful of current shows – including *The*

Wire, The Daily Show, Colbert, Friday Night Lights, Project Runway, Entourage, House, and "anything with Ricky Gervais" – in support of his claim. He has just spent a year starting a TV version of [2]This American Life.

3. Bill McKibben wrote an [3]article (in The Nation) praising This American Life to the skies.

I think of McKibben and Glass as the two Boy Geniuses of American intellectual life. (Curiously I cannot think of any Girl Geniuses.) Both of them did great work while really young. When McKibben was in his twenties, he wrote a long series of editorials in The New Yorker that were inspiring. (They were unsigned. I found out who wrote them by writing to the magazine.) His first book, The End of Nature (1989), about global warming, was prophetic. I think it was the very first general-audience book on the subject. As for Glass, This American Life was terrific right from the start, twelve years ago. He was 36 when it started.

1. <http://www.billmckibben.com/>

2. <http://www.thisamericanlife.com/>

3. <http://www.thislife.org/pages/trax/text/mckibben.html>

---

Andrew Gelman (2007-03-23 09:22:27)

I wouldn't say that 36 is "really young."

### **An SLD Milestone! (2007-03-21 05:39)**

Yesterday there were more than 10,000 hits to the [1]Shangri-La Diet forums. (There were [2]11,061 hits, up from about 8000 the day before.) The last time there were more than 10,000 hits was November 22. Unlike all previous >10,000 days, this one wasn't due to an article or interview, as far as I know.

It feels like reaching a new level in [3]this strange but addictive game.

1. <http://boards.shangriladiet.com/>

3. <http://www.albinoblacksheep.com/games/boomshine>

---

Stephen M (Ethesis) (2007-03-22 18:16:04)

Doesn't it? Kind of neat though.

Carolyn Follmer (2007-03-23 08:26:24)

Hey.. I've been talking via lowcarbfriends about the SLD..We have people who are trying it and losing weight..already..So, I think it was "US"..:)

seth (2007-03-23 10:23:32)  
Aha!

{self-experimentation, Internet, . . .} (2007-03-22 06:48)

For the non-set-theorists, I'm using braces to express set membership:

pets = {cats, dogs, . . . }.

A week ago self-experimentation and the Internet struck me as wildly different. Self-experimentation is a tiny method of inquiry. The Internet is a gigantic physical network. Self-experimentation: one person alone. The Internet: everyone together.

But then I read this fresh [1]essay by Rishab Aiyer Ghosh, managing editor of the on-line journal [2]First Monday. Thanks to Ghosh, I now see two similarities between self-experimentation and the Internet:

1. Both are growth media. They encourage things to grow. Self-experimentation helps develop new ideas about health. The Shangri-La Diet is an example; so are [3]my ideas about mood. The most influential example is diabetes self-monitoring, which grew from self-experimentation by [4]Richard Bernstein. The Internet, of course, has helped many things grow, especially new businesses (Ebay, Google), new forms of interpersonal communication (blogs, forums, chat rooms, MySpace), and new forms of collaborative work (Wikipedia, open-source software).

2. They encourage the growth of similar things. Self-experimentation doesn't equally encourage all ideas about health; it especially encourages very low-cost ones. My self-experimentation led me to realize the benefits of skipping breakfast (improves sleep), seeing faces in the morning (improves mood), and standing a lot (improves sleep). The Shangri-La Diet costs almost nothing – less than nothing if you count the money saved on food. Ghosh points out that the Internet has especially encouraged the rise of businesses where the basic transaction does not involve money. Stuff is "given away" (that is, no money changes hands); payment is in terms of reputation. Both self-experimentation and the Internet are focusing intellectual attention on how people lived and thrived many thousands of years ago.

## Omega-3 and Mood Disorders (2007-03-23 05:52)

I subscribe to the [1]Arbor Clinical Nutrition Updates. It is a nice way to slowly learn more about recent nutrition research. A partial subscription is free. Last week's topic was omega-3 and mood disorders. The update summarized three articles:

1. Appleton KM. et al. Effects of n-3 long-chain polyunsaturated fatty acids on depressed mood: systematic review of published trials. *Am J Clin Nutr* 2006;84:1308-16. This meta-analysis of 12 clinical trials found that omega-3 fats significantly reduced depression.

2. Frangou S. et al. Efficacy of ethyl-eicosapentaenoic acid in bipolar depression: randomised double-blind placebo-controlled study. *Br J Psychiatry*. 2006 Jan;188:46-50. This experiment found that an omega-3 fat helped persons with bipolar disorder.

3. Hallahan B. et al. Omega-3 fatty acid supplementation in patients with recurrent self-harm: Single-centre double-blind randomised controlled trial. *Br J Psychiatry*. 2007 Feb;190:118-122. This experiment found that omega-3 fats reduced a depression score.

I recently reviewed an article for the American Journal of Clinical Nutrition that found that omega-3 fats did not reduce depression scores. Unfortunately the article was not accepted for publication. I hope it gets published somewhere else.

1. <http://www.nutritionupdates.org/cnu.html>

---

peter (2007-03-23 13:00:43)

you might be interested in Amarin corp. (list stock) and it's lead product, which is a highly refined form of EPA. <http://www.amarincorp.com/page.cfm?pgname=miraxiondev> Miraxion is a semi-synthetic, highly purified ( 97 %) derivative of (all-cis)-5,8,11,14,17-eicosapentaenoic acid (ethyl-EPA). It is a long chain highly unsaturated fatty acid (often written in short as 20:5n-3 or 20:5 $\omega$ 3).

pdf23ds (2007-03-23 19:29:03)

Did they say what kind of depression was helped? Any differences in unipolar vs bipolar? Any specific symptoms that were more affected? (For instance, low motivation, anhedonia, and sadness are all different aspects of depression.)

seth (2007-03-23 19:47:29)

The studies used composite depression scores; I don't think that analysis was done.

Ted Hutchinson (2007-03-24 02:58:53)

You have previously blogged on the beneficial effect of Omega 3 on Bone strength and this <http://www.nutraingredients-usa.com/news/ng.asp?n=75128-omega-dha-blood-pressure> is reporting on the benefits of omega 3 on blood pressure. While there is lots of evidence that omega 3 may be helpful in depression there are also meta analysis like this one <http://press.psprings.co.uk/dtb/February/dtbfefb.pdf> that are skeptical. It worries me that some of the meta-analysis are including in their evidence reports that common sense tells us won't have any chance at all of having an impact. Is it likely that a body that has been starved of omega 3 since before conception respond in 6 weeks to an amount of DHA less than half the amount most experts think is the daily requirement? If you are programmed to spend \$4000 a day will paying into your bank account \$200 correct your overdraft? Clearly there are nutritional research scientists who think it possibly will.

## Agrees With Me About College (2007-03-24 20:48)

According to [1]Bryan Caplan, "our [higher] educational system is a big waste of time and money." He is writing a book about this – yay! He attended college at the place I know the most about – UC Berkeley. Here is why it is a big waste of time. Professors can only teach what they know. All they truly know how to do is how to be a professor. At a research university, that mainly involves doing research. Berkeley professors can teach how to do research, sure, but that has little to do with what most Berkeley students will do after they graduate. So a lot of time is wasted. It is most unfortunate to (a) require all students to imitate professors and (b) to rank them according to how well they do so.

In response to Caplan, [2]Catherine Johnson says her undergraduate education was useful. But she became a nonfiction writer – very close, in the big world of work, to what professors do. That's one of those exceptions that prove the rule.

I think practically everyone learns well if any of three conditions are met:

Apprenticeship. You want to be good at doing X, you will learn by watching someone skillful do X. Effortlessly.

Guru. If you think of so-and-so as a guru, you will learn from him or her. Effortlessly.

Stories. Stories teach values. Things associated with the hero become considered good and desirable; things associated with the villain become considered bad and to be avoided. Effortlessly. Most university classes, however, fulfill none of these conditions. On the face of it, university classes teach; but crucial details are missing. It's like butter and margarine. Margarine is supposed to be as good as butter but it's not. There is a superficial resemblance but margarine lacks crucial vitamins that butter contains. Because university classes lack crucial elements, they are forced to use grades, tests, and fear of failure as motivation. These motivators don't work very well, as [3]Alfie Kohn among others has pointed out. Sort of for the same reason Humpty-Dumpty couldn't be put back together again.

2. <http://kitchentablemath.blogspot.com/2007/03/how-i-used-my-college-education.html>

3. <http://www.alfiekohn.org/>

---

Tim Lundeen (2007-03-25 08:40:17)

I agree with you about the value of stories. Have you read the recent book "Made To Stick", which makes the same point among other? Highly recommended.

seth (2007-03-25 11:06:01)

No I haven't read it. Thanks for recommending it.

pdf23ds (2007-03-25 19:10:54)

One thing about college that I'm not sure how you'd get in an alternative system is that you meet a lot of people in your major and the associated social circles that are much more like you, on average, than anyone you'll ever meet anywhere else. This is a great place to find a wife or husband, and a great place to form contacts you could use in the future. You can meet business partners to start a company with. I certainly don't like most aspects of college, but the social aspects are very important for some people.

seth (2007-03-25 19:34:15)

I agree, those are important benefits. You'd get them in an alternative system by having students live together.

Willy (2007-03-26 06:47:14)

Goog article. The problem with Apprenticeship and Gurus is to find one and get accepted by them. How to enter the social group you are interested in would be a good subject. many times it is not so easy as just asking them or showing interest.

Kathleen (2007-03-26 12:41:26)

Pdf brings up a good point, associated circles altho my take on it is a little different, not social related as he intends it. Maybe if you're already middle class and exposed to a range of experiences and knowledge, college is a wash. However, if you're from the other side of the tracks with diminished social experiences and opportunities, college is a great leveler. It gives you opportunities you'd never had known otherwise. I wasn't going to find my guru cleaning sewers. In the end, college is only what you put into it and what you take away; it's a smÅŕrgÅsbord and I couldn't eat enough.

seth (2007-03-26 16:24:02)

I agree that college acts as a leveler – that's a good point. I think all education has that effect. A better college – a college that did a better job of educating – would have more of a levelling effect, I believe.

pdf23ds (2007-03-28 16:10:23)

If the paul graham essay you link in a more recent post is right (about a major economic shift to most people being self-employed), then college-as-credentials-for-resumes would cease to be a major factor, and thus be less important for leveling. (Most information you learn in college can be learned more efficiently in other ways, so self-employed people would prefer those other ways.)

seth (2007-03-28 16:57:57)

Good point. I doubt that "most people [will be] self-employed" within the next 100 years but I do believe that businesses will become smaller on average. I think credentialism thrives in big businesses because it protects the person doing the hiring – the acronym is CYA.

Ruvell (2011-12-12 14:29:23)

An intelgient point of view, well expressed! Thanks!

### **For the Skeptics (2007-03-25 20:15)**

From the [1]Shangri-La Diet forums:

This is week 5 for me, and I have lost 7 pounds so far.

I am a 37 year old mother of two – 5'6" and started at 191 – the heaviest I have ever been in my non-pregnant life, with a BMI that fell in the "obese" category. I heard about Shangri-La from another woman, whom I dislike. I thought the whole thing sounded ridiculous, so I set out to prove her wrong. I replaced the two sodas I used to drink each day with two cups of sugar water, each 12 oz and 140 calories, exactly the same as the soda. This meant I was not changing my diet at all (other than removing the caffeine, sodium, colors and flavoring in the soda). I didn't purposely reduce my calorie intake, and I didn't change my exercise habits.

I'm amazed at the results. I'm much less hungry. I don't crave sweets or soda (the way I have my entire life) – in fact, I haven't had a soda in weeks now and I don't miss it. I'm eating a reasonable portion size at meals and it's easy.

It is an experimenter's dream, by the way, to produce a big effect with tiny change, and a theorist's dream to have a counter-intuitive prediction confirmed.

1. <http://boards.sethroberts.net/index.php?topic=4183.msg39282#msg39282>

---

Carolyn Follmer (2007-03-28 14:28:51)

Congratulations!!! I'm doing the SW, too..but I'm so impressed with you swapping SW for a Coke and losing weight..) That is wonderful

### **Language That Should Exist (punctuation) (2007-03-26 16:53)**

I showed something I'd written to Marian Lizzi, my editor at Penguin. She advised me not to quote someone: "It sounds like you're sneering at them," she said. She was right – it did sound that way, although I didn't want it to. Unfortunately, there was no alternative punctuation that conveyed neutrality or respect. It was sneer or nothing.

So here's my proposal: Let the number of apostrophes indicate degree of respect for the speaker. Like this:

1. Single quotes = disrespect. Example: 'Has a good chance of working'? You can't be serious.
2. Double quotes (normal American usage) = neutral. Example: "We're running out of working waterfront," said Jim Barstow.
3. Triple quotes = respect. Example: According to a recent research report, "40 % of the subjects failed to seek help."
4. Quadruple quotes = great respect. Example: According to Jane Brody, cataract surgery ""can be life-changing.""

---

losing-it (2007-03-28 06:01:42)

But then... What about the English (the British and their inverted commas)? [http://en.wikipedia.org/wiki/Quotation\\_mark](http://en.wikipedia.org/wiki/Quotation_mark)

seth (2007-03-28 16:02:34)

It would be one more confusing thing – like "boot" and "biscuit".

losing-it (2007-03-28 17:11:09)

Or "chalk and cheese." Or would that be 'chalk and cheese'? Note the punctuation inside and outside the quotation marks, also confusing differences between American and British English...and other English-speaking countries.

## Endearingly Simple Experimentation (2007-03-27 19:33)

In 2004, two 14-year-old New Zealand girls [1]found that a blackcurrant drink made by [2]GlaxoSmithKline, the giant company, contained almost no Vitamin C – contrary to advertising that boasted of its Vitamin C content. Today the company was [3]fined about \$150,000 (US).

## The Most Valuable Truths (2007-03-28 07:41)

[1]Paul Graham on start-ups:

For a while it annoyed me to hear myself described as some kind of irresponsible pied piper, leading impressionable young hackers down the road to ruin [via Y-Combinator, which helps young hackers start companies]. But now I realize this kind of controversy is a sign of a good idea.

The most valuable truths are the ones most people don't believe. They're like undervalued stocks. If you start with them, you'll have the whole field to yourself. So when you find an idea you know is good but most people disagree with, you should not merely ignore their objections, but push aggressively in that direction.

This applies to the Shangri-La Diet, of course: It proposes a way to lose weight that strikes most people as crazy. There's a lesson for me here. I have disliked being called a "[2]snake-oil salesman" and SLD being called "[3]absurd" and a "[4]fad diet". But now I realize Graham is right: These are good signs.

1. <http://www.paulgraham.com/notnot.html>
2. <http://www.washingtonpost.com/wp-dyn/content/article/2006/08/10/AR2006081001651.html>
3. <http://boards.sethroberts.net/index.php?topic=1477.msg10363#msg10363>

---

losing-it (2007-03-28 17:14:24)

Very good signs, indeed. Or they can be red flags. It depends on your perspective on the issue, and what you can perceive that others are not seeing. That kind of seeing is creative genius in the act... looking closely into green shadows, something stares back at me dwb

woodenfood (2007-03-28 20:21:31)

I've always found when I introduced a new concept or idea to the management team for approval the best factor for estimating the future impact of the idea is the number of "stunned deer in the headlights" looks in the audience. The first patent I ever got was for an idea where the manager flatly stated "it'll never f\*cking work" and it went on the ship tens of millions. Keep the fascinating articles coming.

## **Omega-3 and Dental Health (part 1 of 2) (2007-03-28 20:39)**

Today I had my teeth cleaned and was told my gums were in excellent shape, better than ever before. They were less inflamed than usual. "What causes inflammation?" I asked. "Tartar," I was told. I haven't changed my cleaning habits. The only thing I have deliberately changed since my last cleaning is how much flaxseed oil I drink. At the time of my previous cleaning I was drinking about 1 tablespoon/day; now I drink 4 tablespoons/day. The person who commented about my gums doesn't know about my omega-3 intake.

Omega-3 is believed to be [1]anti-inflammatory, so it is quite plausible that the change in my omega-3 intake is what improved my gums. There have been [2]a few studies of omega-3 and gum inflammation but none found impressive results. [3]Weston Price emphasized that dental health and overall health go together. [4]Lots of research connects gum disease and heart disease. The importance of omega-3s was first realized because of their effect on heart disease.

This research means better gums is very good news – for which I thank SLD-forum posters, who [5]sparked my interest in omega-3.

losing-it (2007-03-29 03:44:53)

Congratulations. Is there room for improvement? Time for Dr. R. to start oil-pulling, maybe, for a next dental report of "no inflammation?" (Coconut Oil works great for me - talk about an amazing lack of tartar when doing it with CO!). Did you give OP a try after all the discussion on the SLD forums?

seth (2007-03-29 05:40:08)

I think there isn't much room for improvement. I haven't yet tried oil-pulling. The discussion was fascinating but I want to keep my life relatively constant when it comes to oil to improve the clarity of my omega-3 self-experiments.

CD (2007-03-29 06:35:16)

Hi Seth, I can't remember if you've mentioned it elsewhere, but do you know roughly what % of your total calories are flaxseed oil? Thanks.

seth (2007-03-29 07:07:13)

1/4 to 1/3.

losing-it (2007-03-29 07:12:16)

Hmm, funny – seems to be getting cloudy out there today, Berkeley way. LOL one freckled hand half-hiding her smile” grandmother

peter (2007-03-29 15:13:22)

my dental hygienist has been asking me about why my teeth are so clean. i thought it was the different brand of green tea that i've been drinking, but maybe it's the oil i've been taking.

seth (2007-03-29 18:31:29)

peter, what's the oil you've been taking? and how much per day?

peter (2007-03-29 21:52:17)

I can't say; the connection (if it exists) just occurred to me when i read your post. during the period, as i recall, i took light olive oil, refined walnut, pine nut oil, virgin olive oil (w/nose clips) (not very consistently). I use to take 2 tablespoons Now, after reading your experiment with balance, i've settled on flax seed oil (w/ lignans), which, given the collateral effects that you've reported, i intend to take 3 tablespoons consistently. I'm thinking that it may not make much difference which oil is taken, altho i would think that one oil probably works better than others. I've just read about oil pulling, and i'm going to start doing that. I'm religious about my teeth; in the past i scheduled cleaning every 3 months, now i'm at 4-5 months; i'd like to move it to six and hope that oil pulling will do that.

losing-it (2007-03-30 07:56:41)

Consuming oil (I take several including ELOO, macadamia nut oil, flax seed oil, coconut oil, avocado oil) has been beneficial for appetite control (normalizing) and fat loss, per SLD, for me since December 2006. I'm sure it has had unexpected added benefits in a number of other ways, perhaps not immediately measurable or noticeable, including antioxidant effects (omega 3s, etc.) brain function, skin, hair, heart and dental health conditions. Peter, oil pulling (I use coconut oil), for oral health, in my experience, makes an immediate noticeable difference: extremely reduced in amount of plaque, a continual freshness of breath, healthy, supple pink gums (they don't bleed even when using a metal dental pick), less coating on the tongue, etc. I know coconut oil has antibiotic properties, which apparently contribute to the health of the tissues and teeth. I've not had a trip to the dentist since I started oil pulling, but I can personally attest to those benefits in one person's experience. Most recently I am using flax seed oil in a personal recipe I concocted for its external use on my skin. I have rosacea, and I've read that flax seed oil is beneficial for the condition. My skin, once oily, has become very dry and scaly from facial rosacea, aging, low-thyroid, sun damage and possibly, effects of heart medications. With all that in mind, I mixed the oil with several other ingredients known to be beneficial for the skin, including idebenone powder and hyaluronic acid. It has been like a miracle for me – much different than using over the counter lotions and oils – for the first time in years, my skin once again has the moisture and oil it needs to be healthy, supple and soft. I still have rosacea, which is possibly a vascular condition, but the scaling that occurs on my skin isn't apparant. The skin texture has quickly become amazingly like baby skin. I use it full body. I'm not sure if other oils besides flax seed oil would have the same effect, since I've not experimented beyond the one oil, yet.

arazonie (2007-07-19 03:10:09)

I feel I have a pretty good ear for truth. So when I heard of oil pulling I tried it, seemed logical. The first time I gagged tried again, same response. The third time, same day did it for 10 minutes, teeth were lighter the whites of my eyes lighter, dark circles under eyes lighter. By the third time I did it , on average I now do it every 3 days, my nails stronger no breakage, cuticles have no dry skin around them, no bad breath, skin less dry not using lotion except face prior to make-up, no plaque on teeth, no build up after eating, bump on top of head seems a little I see more results the next day. I use eye whitener and crest stripes for my teeth afterwards and they do 3x the job they did before. I give it the thumbs up. I'm a nurse assistant in a hospital and looking at most the elderly they are dehydrated from lack of oil I can tell it from their toenails (dry looking and fungal, cracked)

also their bowel movements are not regular after usually 3 days of no movement they'll pile in the hospital the solution I find that is inexpensive and actually good for you is drinking coconut oil. I know it goes against what your told but coconut oil is good for cardiovascular. I use two large tablespoons in my coffee with carnation french vanilla cream to taste, take the day off it will clean you out and I do about 3 cups a day like this. I repeat whenever I don't void in under 1 minute. That's how well it works

Jolene (2007-10-21 01:46:19)

I am curious....what is oil pulling? Thank You :)

seth (2007-10-21 02:13:34)

Oil pulling is putting an edible oil, such as olive oil, in your mouth and swishing it around for a while, like 5 minutes.

mike the dental defender (2007-12-12 00:58:16)

Hi Seth It was enlightening to read about the effect of flaxseed oil on gum health. I take 500mgs of fish oil a day to get my omega 3s would this improve gum health like flax seed oil? I know the fish oil is good for eye health as we age, the main reason I take it.

anthony (2007-12-28 01:40:41)

exactly how much mg's of 3 are you getting i swear ive seen the liquids with as low as 500 to 7500 per table spoon

Mo (2008-03-23 18:01:53)

The thing I can't get around is eating oil. It's just icky. Swallowing the tablespoons of oil just makes me queasy and the taste ain't all that great either. I was messing more with hemp oil than flax, and it's like drinking oily grass. Plus there's the whole mouth coated in oil thing that's a little nasty. But, looking at the oil pulling stuff, maybe I should reconsider that. Perhaps something that would be good to do before bed? Is it good to have the oil sitting in the mouth?

Gloria (2008-05-10 06:41:59)

I looked up more information on oil pulling when I read these posts and found some good info on exactly how to do it at this site <http://www.oilpulling.com/>. Although the person who wrote the article recommend oils other than coconut oil, I certainly can't see why you wouldn't use it. It's certainly great for you otherwise.

Tom (2008-12-22 22:47:49)

Just found this blog after searching for ways to heal inflamed gums. Exactly how do you Oil Pull with Coconut Oil and what's the best CO out there. At bedtime is good or bad to coat your gums with CO and leave it on all night?

seth (2008-12-23 00:52:17)

Tom, a better way to heal inflamed gums is with flaxseed oil. On the order of 2-3 tablespoons per day.

Tom (2008-12-25 21:59:50)

Seth, are you saying to just swallow 2-3 tbsps per day, is there a particular brand, does it need to be Organic OR do you mean Oil Pull ? I Have been using the VCO for a few days and it's not doing anything.

Tom (2008-12-25 22:26:56)

One other question, do you know happen to know what's the best for oil pull because I read the article on [www.oilpulling.com](http://www.oilpulling.com) and they recommend to use Sunflower Oil or Seasm Oil ? Thank you

seth (2008-12-26 03:38:44)

Tom, it isn't easy to answer these questions by typing. Please call me at 510.453.7097 after Jan 15th.

Tom (2009-02-05 20:11:54)

Seth, I would like to talk to you about the oil pulling but I get a recording when I try calling 510 453 7097 ??

seth (2009-02-05 23:10:20)

sorry, the correct number is 510.418.7753.

Hailey (2009-09-17 06:50:54)

Hi i'm a 51 year old woman in search for my youth and i greatly appreciate you doing this. Thanks a lot.

mayka (2011-05-27 13:42:47)

i've found oil pulling with coconut useful. chia seed is also good source of omega 3, and it doesnt have the same issues of rancidity that flax seed can. personally i use green pasture fermented fish oils - but not everyone might like that. i recently read the connection between gum health and q10. so i thought i might add the q10 thing in! declines after 30 :)

mayka (2011-05-27 13:45:10)

i also noticed there was a guy called dom who made a tooth paste that would form a film to protect your teeth from the acidity of cultured food - and i now wonder if that was coconut oil. and that oil pulling would help leave a protective film on your teeth

Ilona (2011-07-25 10:15:34)

Hi, I've recently come across the overall benefits of oil pulling. I have self-diagnosed myself to having periodontal disease. I just recently came back from the dentist who used up all of my insurance money for a root canal. He told me that I have a receding gum line and suggested that I brush my teeth in a more gentle manner. (NO mention of periodontal disease at all!) Now I cannot go to a periodontist for a more professional opinion due to my lack of funds. I am convinced that I have gum disease. Does anyone know of a natural way to reverse periodontal disease and stimulate gum re-growth? Is oil-pulling an effective solution? Does the type of oil matter? I recently came across an article suggesting that Omega 3 fish oil is excellent for oral health.

Seth Roberts (2011-07-25 11:17:02)

read this: <http://blog.sethroberts.net/2011/07/24/flaxseed-oil-cures-bleeding-gums-in-three-days/>

## **Omega-3 and Dental Health (part 2 of 2) (2007-03-29 21:14)**

I looked at my gums this morning. I had never seen them so pink (that is, non-red). They looked just like the picture of healthy gums at the dentist. As I explained [1]yesterday, my gums are in good shape because I am drinking 4 table-spoons/day of flaxseed oil, which contains a lot of omega-3.

Meta-analyses of the effects of omega-3 have had trouble finding an effect. A [2]meta-analysis about mood found a barely-reliable effect and concluded "the evidence available provides little support for the use of n-3 PUFAs to improve depressed mood." (They should have said "a little support.") A [3]meta-analysis about heart disease concluded "Long chain and shorter chain omega 3 fats do not have a clear effect on total mortality, combined cardiovascular events, or cancer." The effect on total mortality was close to significant and there was evidence of heterogeneity (i.e., studies varied) so their results were not completely negative, as the authors noted in response to comments. The effect is just weak, apparently.

In other words, after combining many experiments, each experiment with dozens or hundreds of subjects, meta-analyses can barely see an effect of omega-3. Yet I found a perfectly clear effect with one subject? An effect I wasn't even looking for? That seems discrepant, and worth trying to explain.

My explanation is this: What I had in my favor and all those other studies did not were the benefits of self-experimentation. In particular,

1. The effect on balance was so clear that I used it to find the best dose. I found that 3 tablespoons/day was better than 2 tablespoons/day and even at 3 T/day there was an effect of time of day. So I went to 4 T/day. It seemed no better than 3/T day, so I stopped there. Conventional studies have not been able to do anything like this.
2. The effect on balance was so clear that I could use it for quality control. If I happened to buy a bad bottle of flaxseed oil I would have noticed – the results would not have been consistent, starting from when I started the new bottle. (I have gone through about six bottles.) Previous studies have had little or no quality control. If half their omega-3 went bad, they would have had no way of knowing.
3. I was strongly motivated to take the flaxseed oil. I know it is beneficial. This is not the case in any double-blind experiment when treatment is compared to placebo. In such experiments, every subject has reason to doubt that taking the pill will make a difference.
4. Dosage in nutrition, as in these mood and heart disease studies, has been built around avoiding failure – for example, what dose will avoid heart disease? Whereas I was looking for the optimum. My brain does not fail in any obvious way if I don't have enough omega-3; it just functions worse. The amounts needed to avoid obvious failure are probably (a) different for different parts of the body and (b) less than optimal. For example, the amount of omega-3 needed to avoid dementia may be 1 T/day whereas the amount needed to avoid heart disease may be 2 T/day. The optimal amount, the amount needed for best performance, is likely to be greater than all of these failure thresholds. It is a better target.

Something else in my favor, not related to self-experimentation is that I studied the effect of omega-3 on my balance – how long before I lost my balance, a measure that can have many values. In contrast, most omega-3 research has involved binary measures like mortality or heart attacks. Someone either dies or does not die, for example. Binary measures tell you less than many-valued measures.

Given these advantages, it makes sense that I could find a much clearer effect.

---

Andrea (2007-03-31 09:10:10)

Has anyone reported success using fish oil (with a nose clip) to get the Omega 3 directly instead of through the conversion of flax? Sorry if the answer is in your book. I just bought it and have not yet read it.

seth (2007-03-31 10:59:30)

no, I don't think so.

CD (2007-04-02 06:51:15)

Hi Seth, A while ago, didn't you determine that your maintenance SLD dose was 120 cal/day? That was in the sugar water days, I believe. Did I remember that correctly? If so, now that you are consuming 480 cal/day of oil, has your set point fallen even more, or are there diminishing returns on the extra 330 SLD cal/day? Throughout these experiments, have you noticed a

change in appetite/set point as you have increased your SLD calories from 120/day to 480/day? Thanks much.

seth (2007-04-02 10:33:37)

120 calories was before I started eating lots of chocolate and drinking my share of wine. However the 480 calories (= 4 T flaxseed oil) I'm at now is because of what I have learned about the effect of flaxseed oil on my balance – 3 T is better than 2 T, I learned, so perhaps 4 T is better than 3 T. Whether 4 T is better than 3 T I don't know. whether 480 calories is really my maintenance dose now I don't know. My maintenance dose will depend on how much chocolate & wine I consume and those amounts aren't fixed.

mike the dental defender (2007-12-12 01:01:19)

Hi For andre,s benefit you don,t need nose clips, just the fish oil that comes in gel caps.

### **37signals and SLD (2007-03-30 20:09)**

[1]37signals is a Chicago software company that specializes in quick development and has been very successful. According to [2]Business Week, "the lesson [of their success]: Create a simple product as fast as you can, then get feedback from customers and make it better."

Hey, that was my philosophy with the Shangri-La Diet! One of the first managing editors of The New Yorker had a slogan: "Don't get it right, get it written". My philosophy with regard to SLD was similar: "don't get it exactly right, get it written, and get feedback."

Here are some ways the Shangri-La Diet has been improved by feedback (almost all from the SLD forums):

1. It is much clearer what rate of weight loss to expect.
2. The idea of nose-clipping. Which makes any food a weight-loss food.
3. With nose-clipping, you can use flaxseed oil to lose weight. The benefits of omega-3 have become much clearer.
4. Putting the oil in water makes it much easier to drink.

1. <http://www.37signals.com/>

2. [http://businessweek.com/magazine/content/06\\_13/b3977005.htm](http://businessweek.com/magazine/content/06_13/b3977005.htm)

---

OrenT (2007-04-01 04:17:38)

Emulsifying the oil with water makes it even easier to drink. A little lecithin as emulsifier and a few minutes at high speed in the mixer will do the trick. Texture is like milk - hard to believe it's 50 % oil.

seth (2007-04-01 10:28:38)  
That's good to know, thanks.

Oslo (2007-08-05 02:59:19)

"Here are some ways the Shangri-La Diet has been improved by feedback (almost all from the SLD forums): 1. It is much clearer what rate of weight loss to expect." – It is? I've been reading the forums and find conflicting and confusing info is all over the place. I'd love to have a clearer idea of what rate of weight loss to expect, and how that will be shifted by how much or little I reduce my caloric intake.

seth (2007-08-05 06:37:50)

yes, it is. Via averaging. see the graphs at [www.shangriladiet.com](http://www.shangriladiet.com) Average weight loss is about 1 lb per week after the first few weeks.

the diet guy (2008-06-11 20:31:17)

I'm glad i reread that a few times. I was gonna ask how you came to the conclusion that nose HAIR clipping helps makes any food a weight loss food :) Flax seed is awesome for a lot of things. Along with Grape seed oil and my favorite super healthy oil comma Hemp seed oil. I dont know if youve gotten to do any research on hempseed oil but its been shown to have one of the most perfect balances of omega 3 and 6 fatty acids as well as the highest percentage of EFAs at 75-80 %. Its also awesome in that it doesnt go rancid as easily or quickly as easily as flax seed oil. I know most health food stores like whole foods now carry it. you should check it out if you havent already. This is the first time I've stumbled upon the shangri-la diet. so more flavorless fatty oils are good>? I can dig it. I have read a lot about how the diets of odler generations were a lot higher in fat content. I'll check out the book!@

## **For Whom Do Colleges Exist? (2007-03-31 11:22)**

On Book TV last weekend I saw a discussion of the terrific-sounding new book [1]You Can Hear Me Now by Nicholas Sullivan, about how an ex-banker named [2]Iqbal Quadir started GrameenPhone, which helps poor people in Bangladesh get cell phones. From the discussion:

Someone from the UN: I hear that the UN should spend \$100 in a million places rather \$100 million in one place. But what else?

Iqbal Quadir: The UN should empower the people, not empower their governments. And if they cannot empower the people they can just shut it off. My point is that helping the wrong side is harmful. So if they cannot help the right side they should at least not help the wrong side. I'm not trying to say anything radical here, frankly. The governments belong to their people. You must make sure you don't disturb that relationship. If you change the incentive for the government, you are disturbing the emergence of democracy.

I had never heard it put so clearly. We can ask if governments exist: 1. To improve the lives of the governed. 2. To employ the governors. 3. To help other governments. Similarly, we can ask if colleges exist: 1. To teach the students. 2. To employ the teachers. 3. To help businesses who will eventually employ the students (the [3]signalling function of college).

Suppose we believe that the main function of colleges is to teach the students. How, then, should we improve colleges? By giving mini-grants to teachers (as is done at UC Berkeley, where I teach)? By giving awards to the best

teachers (as is done at UC Berkeley)? Or by doing something quite different?

Addendum: The [4]growing disillusionment of a University of Michigan student.

August (2007-03-31 12:40:03)

How do they define the best teachers? I like demand driven education. I like the "Fab Lab" idea that comes from MIT: <http://fab.cba.mit.edu/> With demand driven education, the students clearly want the knowledge, and make sure they get it. With our current model, students tend to want a good grade, which is why I wondered about the definition of "best teacher." Education was a luxury good, bought by only those who had enough money, time, and interest to take advantage of it. Now we have a model in which people are forced into it, don't want to be there, and don't care very much about the subject matter.

seth (2007-03-31 13:56:34)

I don't know what criteria are used to choose the "best" teachers. Here is a press release about them: <http://www.berkeley.edu/news/media/releases/99legacy/4-21-1999c.html>

Geoff Davis (2007-04-02 15:48:31)

College rankings have documented effects on school behavior (see, for example, Monks and Ehrenberg, [http://findarticles.com/p/articles/mi\\_m1254/is\\_6\\_31/ai\\_58178197](http://findarticles.com/p/articles/mi_m1254/is_6_31/ai_58178197) ). Rankings tend to be based on reputational measures presumably in part because these are easy to get ahold of. Ideally what you'd want is a greater emphasis on outcomes, since presumably good outcomes reflect good educations provided that you control for things like entering SAT scores, student socioeconomic characteristics, etc. I think the Spellings Commission is on to something in their emphasis on school transparency and outcome measures. Check out <http://www.insidehighered.com/news/2007/03/30/rankings> and <http://graduate-school.phds.org> for some ideas on how rankings might be restructured to better reflect student interests.

## 2.4 April

### How Bad is The Secret? (2007-04-02 22:20)

Not as bad as you think. The Secret, of course, is the huge best-seller (now #2 on Amazon) that claims you can get what you want by applying "[1]The Law of Attraction" – namely, that if you think about something it will come to you. According to Wikipedia, "there have been no widely recognized studies demonstrating that the [Law of Attraction] actually works." The book has been – not to put too fine a point on it – ridiculed, for example by the author [2]Barbara Ehrenreich.

I learned about The Secret last July from my friend Sarah Kapoor, who made a [3]CBC segment about the Shangri-La Diet. She told me about nine YouTube spots (Parts 1-9), each 10 minutes long, that together made a movie. I watched only [4]Part 1 (now unavailable). It wasn't enjoyable. It seemed like a parody of a film about science, and not a funny one. Sarah said it was growing like wildfire but at the time the segments had received only a few thousand views so I wondered what she was talking about. Time has proven her correct.

Is The Secret complete nonsense? It sounds like complete nonsense, the writers of Wikipedia apparently think it's complete nonsense ("no widely-recognized studies . . ."), Barbara Ehrenreich thinks it's complete nonsense (she calls it "mass delusion"), but I don't think it actually is complete nonsense. Around 1980, Robert Cialdini, a psychology professor at Arizona State, and Kathleen Carpenter, an undergraduate, did a remarkable study. They gave Tempe residents one of two paragraphs to read about the benefits of cable TV (a new thing at the time). One was a dry statement of the benefits; the other asked the reader to imagine partaking of the benefits ("take a moment and think of how . . . you will be able to spend your time at home, with your family, alone, or with your friends"). A month later, these residents were offered the choice of whether to get cable TV or not. Of those given the dry information, about 20 % subscribed; of those given the "take a moment" statement, about 50 % subscribed. A huge difference, with nontrivial monetary consequences, from what seems like a tiny treatment. The title of the published article, which appeared in Journal of Personality and Social Psychology (1982, vol. 43, pp. 89-99) was "Self-relevant scenarios as mediators of likelihood estimates and compliance: Does imagining make it so?" Imagining did make it so, in a surprising way. The effect is much too large to be dismissed. I don't think it has been repeated, although I'm not sure.

I learned about this study from the excellent new book [5]Made to Stick by Chip Heath and Dan Heath.

Dan Wood (2007-04-02 22:59:20)

I saw (not with my full attention, but close enough) the movie when it was circulating on YouTube recently. It was very slick - almost too slick - and certainly not brimming with science. However, I actually got a lot out of it. I don't believe that the universe will rearrange itself to your thoughts, but I know enough about Psychology (thanks to S.R. and some other professors @ Cal) and from my experience to know that some of it does make sense. Your thoughts and your attitude (for lack of a better word; I sound like a parent here) affect how your day is going to go, how perceptive you will be to opportunity and hazards, how people will treat you, and so forth. It doesn't sound quite as mind-blowing as the universe changing to conform to you, but I can see how one could extrapolate that out...

Phillip J. Eby (2007-04-03 09:48:48)

I myself am fascinated with the LoA from a \*psychological\* standpoint. I don't think it actually influences the outer world directly, but rather does so through self-fulfilling prophecy effects. If you believe you're going to succeed at something, you're going to invest more effort in it and be more willing to take the risks that are usually necessary to make something successful.

"The Secret" doesn't actually contain that much useful information, although it introduces the idea of the "emotional guidance system", as a way of moderating one's emotions by observing the thoughts that create them. I've found this to be an incredible tool for myself and my coaching clients, as it lets you directly identify illogical or less-than-optimal thought patterns, and improve them, with corresponding improvement in mood and personal effectiveness. The book "Ask and It Is Given" has a lot of useful information in it (including a wide assortment of techniques for altering mood and/or thoughts) as long as you can ignore all the stuff about beings on another plane of existence manifesting stuff in the physical universe and all that. If you just look at the parts that are about what's going on \*inside\* an individual person, it's surprisingly useful.

losing-it (2007-04-03 13:13:10)

Visualization, using the imagination, has been used to improve skill and technique in sports, and research is being conducted to see if it can increase muscle skill. Mind-body, in this case. Imagination and dream-mind is where creative art begins and issues forth, bringing vision into a facet of reality through canvas and paint, music, poetry, storytelling. What's equally interesting (at least in my experience) is when one is focusing daily for an answer to some question, for instance, potential answers begin to come into focus, or suddenly appear...and it feels like the same process as when I go into a focused and receptive mental state to write or draw, etc. It's a given, to me, that "it" will happen through that kind of receptiveness and expectation, especially with growing confidence as one is rewarded with inspiration. Maybe not scientific (?), but it is real in experience.

Janet (2007-04-05 14:55:20)

Do you have another example besides the cable TV? The study of cable TV dealt with an outcome that the people had control over themselves: to get cable, all you have to do is sign up. To get most other things like jobs, romantic relationships, children, you rely on other people.

seth (2007-04-05 17:14:18)

I don't think that result has been experimentally repeated. At a bookstore event I heard a little bit about Alice Waters and Chez Panisse. It was a little bit the same thing - Waters seemed to have a very strong vision of what she wanted and that helped bring it into existence. Of course the vision was far from enough by itself. But maybe it helped - I gotta read the book to be sure.

Esther (2007-04-17 20:11:16)

I just tried to view the video but Yitube already pulled it: This video has been removed due to terms of use violation

Myron Wiebe (2007-06-01 18:20:51)

I have been trying to contact Sarah Kapoor and haven't been able to find any current contact info. Is she still at cbc? I thought that she had her own production company. I saw her in the Past Life Investigation series and at the time I thought that she might be interesting in a documentary film idea that I had. Several years have past and now that I am ready to put my plans into motion I can't find out how to contact her. Can you help???? Myron

seth (2007-06-01 19:21:02)

I have forwarded your message and email address to Sarah.

Myron (2007-06-02 18:41:39)

I really appreciate it. Thanks My

Jim Cowan (2007-11-11 21:20:43)

I wonder if the Shangri La diet could be effective with the problem of alcohol consumption ? (Tell Sarah who was asking ...and wish her well) PS I hasten to add that I have no personal problem with alcohol ! Thanks.

## My Holocaust (2007-04-03 07:28)

I don't read many novels but I think I'm going to read [1]this one, which says that Holocaust denial is "the new heresy." Exactly.

---

For [2]70-431, there are a number of routes. You can either clear [3]70-297 first and then go for [4]70-294 or you can directly jump to [5]70-292 as well.

1. <http://www.ew.com/ew/article/0,,20016452,00.html>
2. <http://www.testking-questions.com/exam/70-431.htm>
3. <http://www.testking-questions.com/exam/70-297.htm>

5. <http://www.testking-questions.com/exam/70-292.htm>

---

Matt McIntosh (2007-04-03 11:57:17)

Uh, of all the various aspects of the book, why did you choose to zero in on that one? Some heresies are heresies because people in positions of influence are afraid of them being true. Others are so merely because they're almost solely espoused by the malevolent and/or stupid.

seth (2007-04-03 12:18:34)

That particular feature of the book is a neat expression of what I consider a basic but little-remarked truth about human nature: Disagreements have a funny way of being overreacted to. Calling this or that belief you disagree with a "heresy" is an example.

Matt McIntosh (2007-04-03 16:09:06)

Well, nowadays "heresy" is applied to a thesis primarily by its defenders, when they want to strike an iconoclastic pose.

Matt McIntosh (2007-04-03 16:10:34)

Which is not to say the socio-psychological phenomenon isn't still very much with us, merely that nobody calls it that anymore.

Andrew Gelman (2007-04-03 18:29:49)

Seth, There's an important distinction between disagreeing with a \_belief\_ ("heresy") and disagreeing with a \_fact\_ ("denial").

seth (2007-04-03 21:04:14)

I think the author of "My Holocaust" is saying that there are also similarities – similarities in how the people who disagree (the minority) are treated (by the majority). And I agree with her: there are similarities.

Andrew Gelman (2007-04-03 22:03:39)

Seth, Perhaps it's the tone of the blog entry that bothered me. I agree with commenter Matt that "heresy" nowadays is a complement (sort of like "delightfully irreverent" or "edgy")—it brings up images of heretics who were right, like Galileo. So calling something "the new heresy" sounds a lot like a compliment. I'd probably describe Holocaust denial not as a "heresy" but as a taboo, which is a little different—we all know that some taboos are there for a good reason. Nazi attitudes, Confederate flags, etc., have been "bad boy" accouterments for quite awhile, as a poke in the eye to the "establishment." And it's no surprise that most people react negatively to bad-boy types who are trying to rile them up. Of course, it's notoriously difficult to read

"tone" from written (as compared to spoken) words.

Mannstein (2008-10-20 02:46:33)

You can deny the existence of God, the divinity of Christ, but woe on to you if you deny the sacred mysteries of the holohoax. You will end up in jail in Israel and most European countries for such a transgression. Jefferson, Thomas (1743-1826), 3rd American President: "It is error alone which needs the support of government. Truth can stand by itself."

## **For Whom Do Colleges Exist? (continued) (2007-04-03 20:54)**

Yesterday on BART I saw someone reading The End of Poverty. It was an illegal Chinese edition of The End of Poverty by Jeffrey Sachs. I asked the person reading it what she thought of it. "Very ethnocentric," she said. "Very Jeffrey-Sachs-centric," I said. (For a good critique, see The White Man's Burden by [1]William Easterly.) America is not the only ethnocentric country, she said, so are other countries who give foreign aid, such as Japan. "What gives me hope is the growth of micro-finance," she said. "People have a great capacity for figuring out what they need." I agreed.

In the comments on my "[2]For Whom Do Colleges Exist?" post someone asked what I would suggest. In my opinion, almost all attempts to improve colleges have had the same core problem as almost all foreign aid: The helpers think they know better what to do than the people they wish to help.

My prescription for higher education is simple: Give students more control of what they learn. When I [3]did this in spades – more by accident than design – my students blossomed. I had never seen anything like it. It happened again and again. When I helped my students learn what they wanted to learn, as opposed to what I thought they should learn, they learned much more. Funny, huh?

Giving students more control of what they learn can be done in many ways, of course. At UC Berkeley, where I teach, here are two possible baby steps in that direction:

1. There exists a system of student-organized-and-run classes called [4]DeCal. Allow one DeCal class to go toward satisfying the Letters and Science college-wide [5]breadth requirement (seven classes, one from each of several areas). The DeCal class would replace any of the seven classes.
2. Allow – or, even better, encourage – admitted students to take a [6]gap year, as they do in England. A gap year is a year away from school between high school and college. (I proposed such a thing a few years ago to the previous UC Berkeley chancellor. My suggestion was given to an administrator who dismissed it. Too hard to administer, she said.)

Professors should like these suggestions. The DeCal proposal will reduce the number of students who take a class because they are forced to. The gap-year proposal will reduce the immaturity of freshmen. When I gave my students much more power to learn what they wanted to learn, my job got much easier. Funny, huh?

### Will It Last? (2007-04-04 22:08)

The graph below shows the daily number of hits to the [1]Shangri-La Diet forums since they began. "Adjusted for weekday" means I estimated the effects of day of the week (e.g., 10 % more hits on Tuesday) and then subtracted those estimates. This makes other effects easier to see.

Each point is a different day. The two sharp increases (May and October) were caused by publicity – the first (May) by an [2]interview on the Dennis Prager Show, the second (October) by a Woman's World [3]article.

The latest (current) increase looks different. It is much slower and not caused by any specific publicity. Apparently it is due to word of mouth.

Will it continue? Well, what's

infinity TIMES 1/infinity?

The number of potential users of an easy and effective method of weight loss is very large. That's the first infinity. However, the Shangri-La Diet sounds more than a little crazy. Many successful users don't want to tell anyone they're doing it. That's the 1/infinity (the probability of transmission). Theory aside, the very mild increase last July did not continue. The current increase, however, looks much stronger than the July increase.

### **Made to Stick (2007-04-06 06:06)**

I went to a panel discussion last night. A professor – with vast public-speaking experience – gave a long boring introduction. "If only he had read [1]Made to Stick!" I thought. The panelists were better but I wished they too had read Made to Stick.

MTS, by Chip Heath, a Stanford business professor, and Dan Heath, a corporate education consultant, tries to say what makes messages more or less memorable. They boil it down to six qualities. To be remembered, your message should be: 1. Simple. 2. Unexpected. 3. Concrete. 4. Credible. 5. Emotional. 6. Told with stories.

They complain that speakers and writers often "bury the lede" – fail to start with the most important compelling stuff. Well, their best story is buried in the middle of the book. Early in his class, Chip Heath has several students give brief talks. The class grades them. Ten minutes later everyone is asked what they remember from the talks. Hardly anything is remembered. The graded quality of the talk doesn't matter: The "better" talks are remembered just as poorly as the "worse" talks. What is remembered are stories. But hardly anyone tells a story.

In other words, Stanford business students – and by extension the rest of us – don't know how to give a good talk and don't recognize a good talk when we hear one. We don't know – and don't know we don't know. I agree. Our collective ignorance is enshrined in bad advice: Start your talk with a joke, for instance. MTS never says anything like that. It says: Start with a story.

Addendum: Seth Godin [2]demonstrates.

## Omega-3 and Cognitive Decline (2007-04-07 11:48)

It's the golden age of omega-3 research. The February 2007 issue of the A[1]merican Journal of Clinical Nutrition, perhaps the most prestigious nutrition journal, had two articles on the topic, the March issue seven (including four letters to the editor). The April issue has three (two research articles and an editorial), all on omega-3 and cognitive decline with age.

[2]One was from Holland. Data were collected in 1990 and 1995 on 200-odd men, who were 70-89 in 1990. Those who ate fish had less cognitive decline from 1990 to 1995 than those who didn't eat fish. A virtue of this paper is that the main results are shown graphically – a [3]most basic point that AJCN papers usually get wrong.

The [4]other study was done in Minneapolis. It looked at cognitive decline in about 2000 elderly men and women over a similar time period as the first study. Rather than asking subjects what they ate, this study measured blood levels of various fats. They did not find a reliable correlation between omega-3 levels and cognitive decline when considering all subjects but did find reliable (negative) correlations in subgroup analyses.

Both studies have selection problems. The first study looked at a small fraction of all the men in the study (total n = about 900) selected because of better health. I would have liked to see the results from the rest of the men. The second study did not correct for the vast number of significance tests done.

Both studies support – the second one quite weakly – the idea that omega-3s prevent cognitive decline. The main thing I notice is how difficult the research is. Data published 12 years after collection? Two thousand people studied twice, five years apart, with results barely different from noise?

## The !Golden Rule and Reed College (2007-04-07 21:25)

In the programming language R, ! is the negation function – !FALSE is TRUE, for example. The !Golden Rule, the opposite of the Golden Rule, is to treat others as you yourself do not wish to be treated.

An example comes from Colin Diver, the President of Reed College (my alma mater), who complains in [1]an Atlantic Monthly piece about college rankings. Reed has opted out of the U.S. News and World Report rankings. President Diver explains why:

Trying to rank institutions of higher education is a little like trying to rank religions or philosophies.

That's right: If different colleges have different goals, it is unfair and misleading to rank them on the same scale.

By far the most important consequence of sitting out the rankings game . . . is the freedom to pursue our own educational philosophy, not that of some newsmagazine.

Actually, you can pursue a singular educational philosophy in any case, rankings or no rankings. It's just that the rankings punish you for doing so.

This is an example of the !Golden Rule because what President Diver complains about happens in every Reed classroom. All the students in a class are graded on the same scale with the same requirements. Perhaps different students have different goals, just as different colleges have different goals? Perhaps this system of grading punishes students with unusual goals, just as the U.S. News ranking system punishes colleges with unusual goals?

1. <http://www.theatlantic.com/doc/200511/shunning-college-rankings/1>

---

c&d (2007-06-21 18:02:10)

Students choose the college and the particular class they are going to attend. Thus, they have consented to, or desire, the form of evaluation (at least on average, in the aggregate). Reed, the institution, is making its choice as to the propriety of US News's rankings, just as some students go to UC Santa Cruz and get written grades.

seth (2007-06-21 19:14:22)

They desire the form of evaluation they are going to get? I don't think they have a choice. There's a great deal of similarity from one college to the next in how students are graded.

Angelina (2007-11-03 11:53:49)

Perhaps this is why Reed hands back extensive written comments but not grades on papers and exams – to encourage students to focus on their own evaluation of their success/failure. I have friends from Reed that never saw their grades until they applied to graduate school years later. People absolutely focus on their own goals - the grades you get at Reed only matter when you choose to apply to another school (i.e. when you choose to conform to the graduate school's system of selecting you).

seth (2007-11-03 12:39:21)

Are Reed profs still doing that? I knew several people who were harmed because they didn't realize they weren't doing well. Extensive written comments are good, of course. But the importance of grades and the likelihood of graduate school – especially for Reed graduates – are facts of life. The profs are not actually living in a dream world where grades don't matter, I'm sure they realize it is a myth, a fantasy, one of those lies told to fool the public. A reasonable policy would be give extensive comments AND grades. Why don't they give grades? What's the real reason? I believe they don't give grades so that they won't have to defend them. It makes their lives substantially easier, in other words.

Steph (2008-03-02 00:51:40)

I go to Reed and wish to point out that Reed does give grades. Reed records them and the only difference is that the grades are undisclosed unless students request it (from their adviser or directly from the profs. in question).

seth (2008-03-02 08:44:11)

Thanks for the clarification.

Dida (2008-07-12 01:24:29)

Seth, when you asked, "why don't they give grades?" why didn't you do your homework instead of blurting out something you obviously hadn't enough info on. Also, careful when you say things like, "it's a fact of life" ergo grades matter... facts of life exist, yes, but it is up to colleges to think outside the box and put the focus where it needs to be - on learning and personalizing each student's experience. Slavery was a fact of life once... Women weren't allowed to vote either or earn the same amount of money as a man... all facts of life and all because someone first challenged the status quo. And why in the world would you think that it would make instructor's lives easier not to give out letter grades? Ever been to public high school? Letter grades are abundant there and very easy to dish out with little time spent elsewhere. When's the last time a student in public high school was required to sit down individually with a student to talk about the actual subject matter?

seth (2008-07-12 06:03:55)

There's a difference between ignoring a fact of life and challenging it. The Reed practice of not giving grades is the former. As far as I can tell, it has no effect on anyone outside Reed. "Why in the world do [I] think that it would make instructor's lives easier not to give letter grades?" Within a few years of teaching at Berkeley, it became abundantly clear. In other words, the answer to your question is: My experience as a college professor.

cheryl m. (2008-07-20 15:45:00)

I just would like to comment that my future was extremely adversely affected by a high school classmate who went to Reed two years 79-81. This school's philosophy is SCARY. I just read about it in an article entitled "Screwed" published in 1997. It really shows how bizarre Reed is. Now I know why this woman was so bizarre and irrational towards me! It was extremely scary reading, and the side notes at the left of the web article made my eyeballs pop out. [http://www.eweek.com/\\_/\\_/\\_ALL\\_OLD\\_HTML/cover102997.html](http://www.eweek.com/_/_/_ALL_OLD_HTML/cover102997.html) It teaches some really wicked things to its students such that they are above the law and can live a life of denial. I was just astonished at the free ticket life these people get who come out of this college that, as previously stated, doesn't really have a grading system (kind of like remaining in denial that things are too political that grades don't

matter, just that you pass). What a great school for someone that lets you choose your teacher (so obviously political), and where you don't have to see your grades unless you ask for them! Ms. Princess screwed up my future for many years with the methods she learned there. I'm sorry, I just think some of these colleges teach people how to be evil and do damage to others lives. It's scary reading.

Tyler (2009-04-30 15:00:09)

@cheryl, please get other points of view which aren't so blatantly inflammatory before trashing Reed. It operates on the honor principle, which states essentially that students shouldn't do anything to harm others. In my experiences at Reed I have found that the student body absolutely uphold the honor principle, and I don't believe I've ever been taught to be evil, unless by evil you mean not fitting into social norms.

## **Interview about Self-Experimentation (part 1 of 2) (2007-04-08 21:28)**

For a German magazine, I've been answering some questions about self-experimentation. Here are the first seven questions and my answers:

1. When and why did you came up with the idea of performing a self-experiment for the first time Mr. Roberts?

I started self-experimentation as a graduate student. My field of study was experimental psychology so it was important to learn how to do experiments. "The best way to learn is to do," I had read. So the more experiments I did the more I would learn. Self-experiments were easy and fast. So I started doing them to increase how quickly I learned about experimentation.

2. Now, self-experimentation must be considered as an inherent part of your scientific work " or is it rather a bauble?

Self-experimentation has been the most influential work of mine by far. Lots of surprises and practical applications.

3. Your self-experiments always deal with very personal concerns like sleep disorders, depressions, procrastination or weight control. Has self-experimentation changed your life?

Yes. Sleep, weight, mood, general health, brain " all better. And it is very satisfying to help people. Thousands of people have used my ideas (described in The Shangri-La Diet) to lose weight.

4. What is the role of coincidence in your self-experimentation?

Most of my self-experimentation has started with an unexpected change. I changed my breakfast; my sleep got worse. I started taking flaxseed oil capsules; my balance improved. I started to stand a lot and my sleep got better. I started walking outside in the morning; my sleep improved. I watched TV in the morning; my mood improved the next day. I drank unfamiliar soft drinks; I lost my appetite. Each of these surprises led to lots of self-experimentation.

5. By coincidence for example you found a relation between watching TV in the morning and your mood the following day. What made you looking at this?

I was hoping to improve my sleep. When we sleep is affected by when we have contact with other people. If you have contact with other people late at night, you will be awake later the following night. I knew about research that suggested that watching TV has the same effect on sleep as human contact. I wondered if my sleep was bad

because I didn't have contact with other people in the morning. Maybe TV could substitute for that, I thought. So I watched TV early one morning.

6. When experimenting on yourself, aren't you taking a big risk for your health? Have there been self-experiments you would now describe as risky?

Doctors have done risky self-experiments. I haven't. I have studied the effects of very common things " watching TV, not eating breakfast, standing a lot. Millions of people have done these things without harm. They're not dangerous.

7. Which of your experiments did you enjoy most?

Seeing faces in the morning. The effects are wonderful: I feel happy, serene, and energetic the next day. I've done several experiments about sleep. It feels great to wake up feeling very rested.

---

### **Durian and SLD (2007-04-09 19:50)**

The obvious connection between durian, the big smelly spiky Asian fruit, and the Shangri-La Diet is that both rely on flavor-calorie learning. We come to like the initially unpleasant smell and flavor of durian because we learn to associate it with the calories in the fruit. Here's what happens:

"To anyone who doesn't like durian it smells like a bunch of dead cats," said Bob Halliday, a food writer in based Bangkok. "But as you get to appreciate durian, the smell is not offensive at all. It's attractive.

From [1]an article in today's NY Times. The theory that led me to the SLD centers on flavor-calorie learning.

A less obvious connection is a principle that helped me discover that drinking sugar water causes weight loss. I was in Paris and lost my appetite – a rare event. The principle is that rare events are usually due to rare events. So I wondered what else unusual had happened. Well, there was something: I had been drinking several sugar-sweetened unfamiliar soft drinks per day. When I got back to Berkeley I started to test the possibility that sugar-sweetened water can cause weight loss and SLD was born.

For a fruit, durian has three rare properties:

1. very strong, unpleasant smell
2. very big

### 3. hard to handle (because spiky)

Following the Rare-Causes-Rare principle, these should have a common explanation. Lightning does not strike thrice in one place for different reasons. According to [2]Wikipedia,

The thorny armored covering of the fruit may have evolved because it discourages smaller animals, since larger animals are more likely to transport the seeds far from the parent tree.

That's a good explanation of #3 and it explains the other two rare features ( #1 and #2) as well. The reason for the strong smell ( #1) is so that the signal will be broadcast a long distance: Large animals are less dense than small animals. We think of the smell of ripe durian as very unpleasant but perhaps almost all unfamiliar smells are unpleasant; so any random strong smell will seem very unpleasant. Big fruit ( #2) means big tree and big tree means that seeds must be carried far away so as to be placed in soil where they will not compete with the mother tree. Coconuts are big and hard to eat. Pineapples are big and spiky.

The Rare-Causes-Rare principle also helped me discover [3]the effect of morning faces on my mood and the effect of omega-3 on my balance.

### Selenium, the Anti-Mercury (2007-04-10 19:27)

I've been worried about the mercury in tuna. I didn't know that [1]selenium protects against mercury damage. See [2]this paper, for example – see Table 1. Moreover, the same fish that contain mercury contain protective amounts of selenium. "It appears that selenium levels in fish are high enough to give protection against mercury toxicity," concluded [3]a review article. These important facts were missing from all discussions of the dangers of mercury in fish that I had seen, such as [4]this one.

I already take selenium supplements because selenium protects against cancer. An especially convincing bit of evidence for this effect is a map of United States [5]county-by-county colorectal cancer rates. There is a sharp separation of high- and low-rate areas along the Ohio and Mississippi Rivers. Attempts to explain the difference eventually decided it was due to selenium in the soil of the low-rate areas.

- 

## **Interview about Self-Experimentation (part 2 of 2) (2007-04-11 21:28)**

8. How do you verify your results?

Repetition – first by me, later by others.

9. It seems your whole life is nothing but a self-experiment – how can your friends handle this?

Well, I spend a few hours in the morning differently than anyone else. I go to sleep earlier and wake up earlier than most people around me. And I eat less than most people. I like to think I make up for it by being in a better mood.

10. How do your colleagues react to your self-experiments?

Most of them think self-experimentation is a mistake, a waste of time. A few think it is creative and important.

11. Your most recent research is dealing with the effects of omega-3 on dental health. What is this research exactly about?

It's not about dental health – that effect ([1]omega-3 improved my gums) was an accident. It's about the effects of omega-3 on my brain. I am varying the omega-3 in my diet in various ways and measuring how well my brain works in various ways. I began this research when I discovered that swallowing flaxseed oil capsules improved my balance. I was surprised but the effect makes sense: balance is controlled by the brain and the brain is more than half fat. Maybe you need the right fats in your diet if you want your brain to work as well as possible.

12. How did you get the idea of searching for the relation between omega-3 and dental health?

See answer to previous question.

13. How did you get the idea of taking oil to lose weight?

It was a three-step process. Step 1: I came up with [2]a new theory of weight control. Step 2: I accidentally lost my appetite during a trip to Paris. I guessed that the cause was the unfamiliar sugar-sweetened soft drinks I'd been drinking because of the heat. This led me to discover that drinking small amounts of sugar water cause a lot of weight loss. Step 3: A friend pointed out that my theory predicted that flavorless oil should be just as effective as sugar water.

14. Are you going to search for a medical explanation for the effects of omega-3 fats?

No. Just convincing most people that there are effects is hard enough. It will also take a long time to learn how to maximize the effects. For example, what oils are best? How much oil is best? Other people are in a better position than me to try to explain the effects. But I don't think it is terribly mysterious or surprising that dietary omega-3 should improve brain function: the brain is more than half fat. Surely the type of fat matters. My discovery is how big and fast the effect is. That's not obvious.

15. When you consider your work as a whole, what is the most important result of your scientific research via self-experimentation?

Discovery of the effect of morning faces on mood. I believe depression is a deficiency disease, caused by too little exposure to morning faces. (See [3]this paper for details.) No doubt that sounds very odd – even odder than the Shangri-La Diet – but consider this. In a wonderful book called [4]The Good Women of China, the author, a Chinese radio host named [5]Xinran Xue, wrote about her travels all over China to learn how different women lived. The last chapter is about visiting an extremely poor and backward community called Shouting Hill where an egg is a luxury and each women has multiple husbands because two or three girls are traded for a wife. She comes back to the radio station and tells her colleagues what she has seen. One of them asks, "Are they happy?" Another says, "Don't be ridiculous, how could they be happy?" Because they were so poor – very poor even by Chinese standards. Xue answered:

I said to Mengxing that, out of the hundreds of Chinese women I had spoken to over nearly ten years of broadcasting and journalism, the women of Shouting Hill were the only ones to tell me they were happy.

It is pretty clear they saw plenty of faces in the morning.

---

Bryan (2007-04-12 15:48:51)

Are you still doing the morning faces during your morning treadmill, Seth? If so, what time of the morning & for how long? What does the rig look like – is the tv set on a high platform? Would the same benefit be gained from watching the faces while sitting close to a 27" tv, sans treadmill?

seth (2007-04-13 14:53:55)

I no longer use faces on TV – I use my own face in a mirror, a few feet away. I listen to a book or radio show at the same time. I stand at the same time and part of the time do exercises that allow me to keep looking in the mirror. yes, I'm sure you'd get

the benefits sitting. That's how I studied the effect for several years.

## **Does the Type of Fat in Your Diet Affect Your Brain? (2007-04-12 17:37)**

Here's how a Ph.D. student at UC San Francisco doing research on neural stem cells answered that question:

If dietary fat affected the brain in a significant way, we would know about it. It would have been discovered. Which isn't to say it doesn't affect it in a trivial way. Not just an acute action – like if you drink a small amount of alcohol or the effect of a sugar high. I mean the long-term functioning.

Why?

Because a lot of people would have tested it. Fat gets a lot of money. It's a crowded area of research. People try to exploit it. It's an area with a lot of public interest. It's very popular to study anything related to fat. Also anything related to the brain. People are worried that they will lose their mind as they age. If there was something significant found it would have been a big story all over the New York Times.

She was very sure of this, it seemed to me.

[1]My main posts about omega-3.

John (2007-04-13 03:00:06)

Where do these quotes come from?

seth (2007-04-13 05:40:24)

A conversation. "Can I quote you?" I asked. She said yes.

michael vassar (2007-04-13 09:23:45)

She believes in a rational world and an efficient Jeffersonian market in ideas. I once did too. If I still did I'd probably be a PhD student like her instead of being in business.

RandomToad (2007-04-13 13:16:27)

Whether she is right or wrong - I dunno. But her thinking seems to fall victim to a variant of Ad Populum fallacy: if a lot of people don't (or do) think X exists, then X doesn't (does) exist. Not to go off topic, but I should also add this is the argument made by many for Global Warming — everyone/many says it exists, (i.e. there is 'consensus') therefore it exists. Whether or not it exists, is independent of how many people think it is true.

seth (2007-04-13 22:04:51)

She is wrong. For a reason that is easy for long-term academics to see but would be hard for a graduate student to see: People in nutrition know almost nothing about experimental psychology and never do such measurements. (When the nutritional scientist R. K. Chandra published a paper containing psychological measurements, he didn't realize how absurd they would appear to actual experimental psychologists – see the Chandra page of my website for details.) Likewise, professors of experimental psychology know almost nothing about nutrition and never do nutritional manipulations. So it is actually very easy for such effects to go undiscovered.

losing-it (2007-04-15 12:53:03)

What if, when asked the question, she became too fixated on what she "knows" to actually perceive what is there, or what might possibly be evident? Ask someone (especially a child, or someone who isn't an artist) to draw a self-portrait, and he will usually draw images from his brain, rather from his reflection in a mirror. If that correlation makes sense or is relevant to anyone but me...(?) An interesting something else concerning perception and value goes on at this link: <http://www.washingtonpost.com/wp-dyn/content/article/2007/04/04/AR2007040401721.html>

JR (2007-04-16 13:01:11)

Her comments remind me of the economist who won't pick up the \$20 bill lying on the ground since it must be counterfeit: if it were real, it would have been picked up already.

losing-it (2007-04-19 12:09:10)

JR Said: April 16th, 2007 at 1:01 pm "Her comments remind me of the economist who won't pick up the \$20 bill lying on the ground since it must be counterfeit: if it were real, it would have been picked up already." ...or maybe the starving philosophy student grappling with the question of the Toast in the Machine: [http://www.nearingzero.net/screen\\_res/nz136.jpg](http://www.nearingzero.net/screen_res/nz136.jpg)

## **Interview about Self-Experimentation (postscript) (2007-04-13 22:12)**

One of my favorite writers is [1]Vladimir Nabokov. When he was alive, I not only read all his books but tried to read every word he wrote (in English). I have a folder full of photocopied interviews from newspapers and magazines. Late in his career, after my folder had become thick, Nabokov did something surprising: Came out with a book of interviews (Strong Opinions – [2]here and [3]here are excerpts), which put into book form most of what was in my folder. He wrote his answers to interview questions so this made some sense. Yes!, I thought, these interviews are just as interesting as I've always thought. I'd already read each of them about five times; I read them a few more times in book form.

I was such a big fan of Nabokov, and I liked his written interviews so much, that posting my answers to interview questions ([4]here and [5]here) was not an emotionally-neutral event. Partly it was a huge thrill – like being on your favorite TV show. Like being Nabokov For a Day. And partly it was humbling: My answers were way way worse than his.

### Omega-3 and Arithmetic (continued) (2007-04-14 20:11)

Tim Lundeen, a Bay Area software developer, previously posted [1]here about what happened when he increased his daily dose of DHA (an omega-3 fat in fish oil) from 400 mg/day to 800 mg/day: The next day, the speed with which he did simple arithmetic (e.g.,  $7 + 3$ ) increased. At that point he had only four days from the high-DHA condition. Now he has two months. Here it is:

The y axis is the total time taken to do a set of 100 simple arithmetic problems.

Bottom line: The improvement continued, at roughly the same level. Very good evidence for an effect.

Tim had earlier found that doses of 200 and 400 mg/day of DHA had no apparent effect.

[2]My main posts about omega-3.

---

Matt McIntosh (2007-04-14 21:14:11)

How is he differentiating the effect of omega 3 from the effect of practice?

seth (2007-04-14 21:35:46)

The sudden improvement he saw when he started taking omega-3 couldn't be due to practice. The data show that by then further practice was having little or no effect.

Matt McIntosh (2007-04-14 22:34:45)

Sorry, didn't look at the previous post. My bad.

Doug (2007-04-15 14:16:52)

He might also try lowering the omega three, and seeing if the scores go back up.

Geoff (2007-04-16 09:30:31)

Why not do a hypothesis test rather than just eyeballing the data in a graph? Looks like you'd need to do a regression that included some time-based term to account for practice effects (surely there are some standard functional forms for this?) and one for dose. Doug's suggestion of modifying the dose over time is a good one - the current all-low-dose followed by all-high-dose structure would probably make any test fairly sensitive to the particular choice of practice term.

seth (2007-04-16 10:23:36)

I didn't do a hypothesis test because the effect strikes me as obvious. Very small p value. Are you saying the effect is not obvious to you?

Tom Moertel (2007-04-16 12:55:28)

Seth, Like Geoff, I see a time-based trend in the graph. I'm curious: how would controlling for time influence the DHA effect? Can you make the data set available? I'd like to drop it into R for a quick analysis. Cheers, Tom

Tom Moertel (2007-04-16 14:43:50)

Seth, As a follow-up to my previous post, I was able to extract Tim's timing data from the plot (using Engauge Digitizer). Using R, I fit the data to three models. I'll summarize my results below. Model 1: relative improvement is explained by taking more DHA. Result: taking more DHA corresponded to a 10 percent improvement in math-problem-set timings. Model 2: relative improvement is explained by practice. Result: each day of practice corresponded to a 0.15 percent improvement in timings. Model 3: relative improvement is explained by both practice and taking more DHA. Result: after controlling for practice, taking more DHA was no longer significant, and each day of practice corresponded to a 0.14 percent improvement in timings. So, at least by my cursory analysis, the data do not argue for an improvement effect when going from 400 to 800 mg/day of DHA. If you're interested in my models, results, or R code, please let me know, and I'll post them. Cheers, Tom

seth (2007-04-16 15:10:40)

How did you control for practice?

Tom Moertel (2007-04-16 16:22:06)

Seth, I used the day as a proxy for practice. That is, for day N, the model accounts for N days of practice, with the effect of each day's practice being multiplicative on the output. (In the model, all effects are multiplicative to model diminishing returns. The results were similar, however, when I used a linear model.) The model, in R syntax, is given as follows: `lm (log.timing ~ day + more.dha)` where `log.timing` is the natural logarithm of the timing data from Tim (to model multiplicative effects), `day` is the day upon which the timing was taken, and `more.dha` is a binary factor indicating whether 800 mg of DHA was taken on that day instead of 400 mg. Fitting the data to the model, the coefficient of `day` was -0.0014 (95 % CI = [-0.0019, -0.00084], p

seth (2007-04-16 18:39:46)

I would fit the same model you did but not use all the days – the effects of practice are obviously nonlinear if you use all the data. I'd 1. start at Day 40 (to get rid of the obvious nonlinearity at the beginning) 2. omit the 4 blue outliers after Day 40, which correspond to the first days back from trips. I think if you do that analysis you will see a big effect of DHA.

Tom Moertel (2007-04-16 20:30:08)

Seth, If I fit the model I mentioned earlier to the subset of the data you suggest, I do indeed get the results you expected. Practice (as modeled by elapsed days) is no longer a significant predictor of the problem-set timings. Increased DHA, however, is significant: increasing the daily DHA dosage from 400 to 800 mg corresponds to a 4.7 percent decrease in timings (95 % CI for the effect is [1.4, 7.9] percent). But is it reasonable to exclude the first 40 or so days? I think so, if we assume that the task is subject to an initial learning effect that plateaus at some point. Judging from the plot, day 40 is into the plateau stage and makes for a reasonable inclusion cutoff. Cheers, Tom

seth (2007-04-16 21:02:51)

Thanks for doing the suggested analysis. A vast amount of data shows that practice has much larger effects early in learning than later in learning, even when performance is measured on a log scale. It's not just this data set that makes me want to exclude a bunch of early days, it's all that other data, too.

Geoff (2007-04-18 09:25:47)

Seth, No, it's not obvious to me. If I ignoring the first 20 days or so, my eye sees a set of points that looks like it is clustering around a linear, downward sloping line. Maybe there is a discontinuity around the color change, maybe not. With the first 20 days thrown in, I see some kind of exponential-like decay that approaches a linear asymptote. Some kind of A-B testing would make this a lot more convincing since it does look like there is a fairly pronounced time component. Interesting stuff, though. Geoff

## **New Way to Lose Weight? (surgical) (2007-04-15 22:35)**

During the recent PBS special on obesity [1]Fat: What No One is Telling You, a segment about surgery included this voiceover:

Until recently it was believed that the tiny stomach [that the surgery produces] is what forces the patient to eat less and lose weight. The surprise came when researchers learned that what makes surgery work so well is the cutting of some nerves in the bowel, which changes signals which flow between the gut and the brain.

I'm not surprised the researchers were surprised. The obvious function of nerves from gut to brain is to tell the brain food is present in the gut; and when enough food is present, to cause satiety. If this view of what the nerves do is correct, you would think that cutting those nerves reduces satiety signals and thus increases how much people eat at

each meal – and thus causes weight gain. But the opposite is what happened.

The [2]theory behind the Shangri-La Diet, however, easily explains the weight loss: Cutting the nerves reduced the calorie signal from food, thus reduced the strength of the flavor-calorie association. (After nerves are cut, your brain thinks that a 300-calorie food only has 150 calories. So the flavor-calorie association becomes weaker.) The weaker the flavor-calorie associations of your food, the lower your set point. The observation supports the theory so well that I will try to track it down to include in a revision of my paper.

The implication is that weight-loss surgery could consist of cutting some of those calorie-signalling nerves and nothing more. It would be relatively painless: Food would still taste good, especially in the beginning. (Because cutting the nerves does not change the memory stored in the brain.) Food would gradually taste less good as the flavor-calorie association become weaker. As flavor-calorie associations become weaker, your set point goes down. Causing weight loss without effort.

1. <http://www.pbs.org/wgbh/takeonestep/fat/>

2. <http://sethroberts.net/about/whatmakesfoodfattening.pdf>

---

Doug (2007-04-16 16:45:56)

"Cutting the nerves reduced the calorie signal from food, thus reduced the strength of the flavor-calorie association. (After nerves are cut, your brain thinks that a 300-calorie food only has 150 calories. So the flavor-calorie association becomes weaker.)" I think that fits in well with my post in the forum yesterday about trying "calorie-less flavor" instead of or in addition to flavorless calories in order to induce appetite suppression.

seth (2007-04-16 18:41:42)

It would depend on what those calorie-less flavors are. If they are the same flavors that are sometimes paired with calories – yes. If they are different than the flavors paired with calories, no. I consume a fair amount of calorieless flavors in the form of gum but the gum flavors I use are not flavors that are paired with calories at other times.

### **Birth of a Website (2007-04-16 21:05)**

Several months ago I got this email from someone at the Seed Media Group:

Thank you for your interest in being hosted by ScienceBlogs. In the last couple of months, we have received well over a hundred queries from bloggers representing an impressive breadth and depth of science expertise. However, as we are trying to maintain a sense of community at ScienceBlogs, we are able to extend only a small number of invitations at a time. . . . In light of the very limited number of spaces we have to offer, we regret to inform you that we cannot extend you an invitation at this time.

This was sent to about 50 people. Their email addresses were visible. One of the recipients thought that we, the rejectees, could form our own umbrella website and wrote to us about this. I replied:

I love the idea of a form rejection letter leading to the founding of a competitive website – count me in!

Four months later I got an invitation to join the result, [1]www.scientificblogging.com. It is now a well-functioning website with lots of interesting stuff.

1. <http://www.scientificblogging.com/>

---

Andrew Gelman (2007-04-17 04:45:54)

I occasionally get emails from organizations saying they want to link to my blog and asking me to link to their blog too. One of these was affiliated with Scientific American magazine, I think. I always respond saying thanks for linking to me, and I'll link to their stuff if it's appropriate to my blog. It's funny how they want to set up deals like this. I guess it makes more sense for people who are doing this as a business.

Cash (2007-04-17 14:04:59)

Seth, I think you're confusing us with this group: [1]Indy Science Blogs. We tried last year to get them to come into our site instead but they prefer keeping their own individual banners and making a newsfeed link on that common URL. It's a shame too, because they have some great stuff over there and it would be good for everyone to get them more exposure. Thanks for the publicity! We are just about to start a public beta and we'll let everyone who likes to write about science have their own column and get paid to do it.

1. <http://www.indyscienceblogs.org/>

seth (2007-04-18 19:03:58)

Oh, my. Even a renegade website didn't want me.

### **Omega-3 and Arithmetic (evaluation) (2007-04-18 06:30)**

When I read an empirical scientific paper I ask four main questions:

1. How clear is the effect or correlation? Generally measured by p values.
2. How clear is the cause of the effect?
3. How much can we generalize from this?
4. Assuming we can generalize, how much will this change what anyone does?

The overall value is something like the product of the answers. Most research gets a modest score on #1 (because a high score would be overkill and, anyway, the low-hanging fruit has been picked) and a low score on #4. Experiments get a high score on #2, surveys a low score.

[1]Tim Lundeen's little experiment that I described a few days ago, in which he found that a higher dose of DHA improved his arithmetic ability, gets a very high score:

1. The effect is very clear.
2. It's an experiment. Because the variation was between two plausible doses of a food supplement, I doubt it's a placebo effect.
3. The subject, the treatment, and the test are "ordinary" – e.g., Tim does not fall into a special group that might make him more likely to respond to the treatment.
4. Who wouldn't want to improve how well their brain works?

From the point of view of a nutrition scientist, I'd guess, the effect is shockingly clear and direct. Experimental nutrition with humans almost always measures correlates of disease (e.g., correlates of heart disease) rather than disease. To me, an experimental psychologist, the results are shockingly useful. Practically all experimental psychology results (including mine) have little use to most people. The clarity of the effect does not quite shock me but I'm very impressed.

1. <http://www.blog.sethroberts.net/2007/04/14/omega-3-and-arithmetic-continued/>

---

### **Omega-3 and Arithmetic (several analyses) (2007-04-18 21:38)**

In a [1]recent post I described Tim Lundeen's arithmetic data. He found that increasing his daily dose of DHA seemed to increase the speed at which he did simple arithmetic. Here is the graph:

I didn't bother to do any statistical tests because I thought the DHA effect was obvious. However, someone in the comments said it wasn't obvious to them. Fair enough.

If DHA has no effect, then the scores with more DHA should be the same as the just-preceding scores with less DHA. There are practice effects, of course, so I analyzed the data after practice stopped having an effect: After about Day 40. (And I left out days preceded by a gap in testing – e.g., a day preceded by a week off.) Thousands of learning experiments have found that practice makes a difference at first and then the effect goes away – additional practice doesn't change behavior.

If I do a t-test comparing low-DHA days (after Day 40) with high-DHA days, I get a huge t value – about 9. If you're familiar with real-life t values, I'm sure you'll agree that's a staggeringly high value for a non-trivial effect. The model corresponding to this test is indicated by the lines in this figure:

The red ("more DHA") points don't fit the line very well, which suggests doing an analysis where the slopes can vary:

There is still a huge effect of DHA, now split between two terms in the model - a difference-in-level term ( $t = 4$ ) and a difference-in-slope term ( $t = 3$ ).

But this analysis can be improved because based on thousands of experiments I don't believe that the less-DHA line could have a positive slope, as it does in the model. Or at least I believe that is very unlikely. So I will constrain the less-DHA line to have a slope of zero:

Now I get  $t = 8$  for the difference in slopes and  $t = 4$  for the difference in level. This is interesting because it implies that more DHA not only caused immediate improvement but also opened the door to more gradual improvement (indicated by the slope difference). DHA changed something that allowed practice to have more effect.

That's a new way of thinking about the effects of omega-3 – actually, I have never seen any data with the feature that a treatment caused a practice effect to resume – so I have to thank the person who claimed the difference wasn't obvious.

1. <http://www.blog.sethroberts.net/2007/04/14/omega-3-and-arithmetic-continued/>

---

Geoff (2007-04-19 07:34:17)

I'm glad to see that fitting some regression lines was helpful. It looks like the positive slope you find so strange is largely due to the two outliers toward the end of the 400 mg/day period. If you toss those or switch to some form of robust regression, the slope will probably flatten out. (But that point you will have thrown out quite a bit of data)

Tim Lundeen (2007-04-19 13:38:02)

Seth, fyi the last photo in this post gets a "this photo is currently unavailable" error from flickr. I had also noticed that my scores seem to be improving over time since increasing DHA, and my sense is that this will continue; partly because I don't get "hung up" on individual problems as much, and I am able to pipeline more effectively (e.g. look ahead and start the next problem while writing down the answer to the current one). The only other change I've made in the same period is to start taking 20mg/day of resveratrol from Life Extensions, which I started about 60 days before the increase in DHA. So seems like the improvement in learning rate is due to either DHA (most likely) or resveratrol (which, because it improves blood glucose management, could improve brain function over time). Anyway, it is certainly nice, and I am subjectively more effective in my work as well.

Janet (2007-04-20 07:01:46)

Your analysis is provocative, and it's convincing enough to make me try it myself. To really be convinced, though, I would want to see the trial periods shortened to a few weeks instead of a few months, the order of the trial periods randomized, a placebo oil to substitute for lower dose of flaxseed if he didn't do that this time, and blinding as to which dose of flax seed in each time period. Since the trial periods are so long, the effect could be explained by some type of seasonal variation (e.g., daylight length, some other difference in the experimenter's life during the two 3 month periods), and since that he expected better results on higher dose, and we know that people improve their test performance if they expect they'll do better (e.g., stereotype threat), blinding would prevent that. Btw, what R command do you use to fit the two lines for different range of the x axis?

seth (2007-04-20 07:47:29)

Those are good points, except how can someone expect an effect (namely, the downward slope with more DHA) that has never been seen before? (Not by me and not by Tim, at least.) Re R. I got the fit with `fit = lm(time day)` and plotted it with `lines(day,fit$fitted.values)`

## **You Can't Change Something Unless You Love It – Jane Jacobs (2007-04-19 15:43)**

I think very highly of [1]Philip Weiss and rarely disagree with him. But I certainly disagree with [2]this:

My first feeling seeing the crapulous tape on the news last night was, Burn it. What more are we going to learn about this sick monster [the Virginia Tech shooter] from his first-person maunderings? O.K., archive it, let criminologists study it, but why give him the attention he so craved? Wipe his name from history. Did you notice he honored Dylan Klebold and Eric Harris of Columbine in his statement? Why not erase their names too.

I have not yet found the interview in which Jane Jacobs says something like "It's a funny thing. You can't change something unless you love it." But I did find an [3]interview in which she said:

You can't prescribe decently for something you hate. It will always come out wrong.

The longer you hate the Virginia Tech shooter, as Mr. Weiss and many others do, the longer it will be till you understand what to do about him – how to prevent such things in the future. It was a fundamentally decent thing that the shooter did by sending that stuff to NBC. Like everyone, he wants to be listened to. As I blogged [4]earlier, one of my students did a project that involved visiting homeless people in People's Park. He was surprised by how much they

wanted to talk to him. The solution to homelessness, he was pretty sure, would involve a lot of listening.

Addendum: A forensic psychiatrist named Michael Weiner argues the opposite (that showing the videos does no good and lots of bad) [5]here. Jacobs' view is supported by a wealth of evidence. I can't tell if any evidence supports Weiner's view.

losing-it (2007-04-20 08:18:50)

Thanks for sharing your thoughts on these questions, Dr. R. It is something I often ponder...realizing that human beings are influenced by so many factors, for better or worse, and that we share a common nature. I feel that, although some people may be stronger willed or better educated or lovingly nurtured than many others, not one of us is completely exempt from the possibility and probability of making poor and even dangerous choices (having free will) or from being manipulated or inadvertently harmed by industrial product, environmental factors, psychological influences etc. It can seem difficult at times to distinguish the perpetrator from the crime s/he has committed, with one's emotional response. On the subject of media attention and publicity, I'm sure whether it is beneficial or harmful depends on the state of the watcher, which means it could be either. I for one, think the media attention goes far overboard too often in reporting, but especially in analyzing those who are accused or convicted of crimes. On a "lighter" note (being an "SLDer"), I would think that the idea of not being able to truly change something until we love it would apply to our bodies (and therefore to excess weight) as well. It might not mean having to feel a love the excess fat, but rather purposefully and intelligently loving our amazing and complex bodies as they are created, realizing their functions and purposes which may make fat storage and reduction problematic for a myriad reasons were originally developed for health and survival. And then, with that perspective, to seek out and apply the most beneficial ways of caring for the body, perhaps viewing it as if it were a little child in order to nurture it back to health and fitness, rather continually convicting oneself of guilt.

### **Effects of SLD and Flaxseed Oil (2007-04-20 04:51)**

A reader (Josh Mangum) writes:

The flavorless calorie diet lets me drop weight whenever I need to. I was usually 10-15 lbs overweight and up to 25 lbs when under stress. Both my parents are overweight so I was worried that I would put on weight under stress and not take it off. My dad especially has followed the pattern of gaining a few pounds a year his whole adult life and is now about 75 lbs overweight. Besides the obvious advantages

of losing weight now it's really nice that I don't have to worry about being very overweight in the future.

Flax oil is more subtle. I think it's improving my sleep and mental ability. For sleep I've noticed being rested and having more vivid dreams. There seems to be a dosage effect. One night I tried 6 tbs of flax oil, had very vivid dreams and felt very rested the next day. The other thing that seems consistent with it working is that I can go back to sleep for a couple hours after waking at 7 am if I'm still tired. Previously I was never able to go back to sleep whether I woke at 2 am or 7 am.

I write software and notice that it seems easier while I've been using flax oil. It seems to be easier to hold large problems in my head and work through them than previously. I don't notice much effect on how often I'm "insightful" or "clever" though. So rather than being smarter it seems like being adequately smart more often. This is subtle though and it could be the phase of the project or my outlook or just better sleep. Maybe the effects are just the result of coming out of the shorter foggy San Francisco winter days.

---

### **What Should I Learn About Writing From This? (2007-04-20 08:05)**

I think could read the New York Times for a hundred years and not come across anything as well-written as [1]this gem of a blog post by Joyce Cohen, who writes The Hunt column in the Times. I love her column – but this is better. It's about something I don't even care about, New York real estate.

By incredible coincidence, [2]Nicholas Kristof's most recent blog entry (April 17, 2007) is also better, in my opinion, than essentially everything that appears in the Times (or any other paper). Kristof reprints a letter to him from a student that makes an extremely important point about Africa coverage in the Times (and, probably, all other Western newspapers): It is unceasingly focussed on failure. I wonder why.

1. <http://huntgrunt.blogspot.com/2007/04/langston-literary-culinary.html>

2. <http://kristof.blogs.nytimes.com/>

---

Andrew Gelman (2007-04-20 15:33:14)

Seth, Apparently, tastes differ. I'm far more interested in New York real estate than you (for obvious reasons) but I still found that blog post completely uninteresting (and not particularly well written). In contrast, I see lots of interesting things in the Times.

seth (2007-04-20 16:31:34)

It is the quality of the writing that impressed me, not the content. The writing was warm, relaxed, evocative, and appreciative. In contrast, the student letter that Kristof quotes is not especially well-written – I'd give it an A-. I'd give the thought behind it an A+. I found it extremely interesting.

Jeremy (2007-04-23 04:47:53)

As I am not a subscriber to Times Select, nor can I afford to be, I have no way of knowing whether I agree with you or not Seth. My question; is there anything that gives access to this material like the Permalinks to ordinary NYT articles?

seth (2007-04-23 08:09:14)

Sorry. I should have paid more attention to my sister, who had the same complaint. I have posted most of it. <http://www.blog.sethroberts.net/2007/04/23/what-loren-berlin-a-student-at-the-university-of-north-carolina-wrote-nicholas-kristof/>

Jeremy (2007-04-24 04:57:41)

Thank you. You're right. It is a wonderful piece of writing. And as someone who works for an organization that is trying to improve the lives of poor people around the world – not just Africa – I can fully agree. Good news has almost no value. Never has had. Never will have. People want strife and despair and cruelty and wrong, not for themselves, but to read with their breakfast muffin.

### **Too Much Emphasis on Failure (2007-04-20 22:09)**

In [1]his blog a few days ago, as I mentioned [2]earlier, Nicholas Kristof printed a letter from a University of North Carolina graduate student about why she was not going to enter Kristof's contest to go to Africa with him. Kristof wrote too much about failure, she said:

[Quoting Kristof:]“I’m hoping that you’ll be changed when you see a boy dying of malaria because his parents couldn’t afford a \$5 mosquito net, or when you talk to a smart girl who is at the top of her class but is forced to drop out of school because she can’t afford a school uniform.” . . . The story of Africa in turmoil is the African narrative that many Americans - and certainly those who read The New York Times - already know. It is virtually the only type of reporting that Western news outlets broadcast about the continent. . . . Americans don’t need any more stories of a dying Africa. Instead, we should learn of a living one. Kristof and his winners should investigate how it is that Botswana had the highest per-capita growth of any country in the world for the last 30 years of the twenty-first century.

I believe she is correct. The Times and – I’ll take her word for it – “Western news outlets” in general have made a serious mistake in their Africa coverage: Far too much coverage of failure relative to success. An especially curious misjudgment because generally journalists like feel-good stories.

Could an entire well-respected profession do the wrong thing for a long time? Well, Jane Jacobs thinks so. In a 2000 [3]interview, she said this about economists:

One place where past economic theory has gone wrong in a subtle way is that it has always been called upon for explanations of breakdowns and trouble. Look how foreign aid, even today, is all about poverty and where things are not working. There is no focus on trying to learn how things are working when they work. And if you are going to get a good theory about how things work, you have to focus on how they work, not on how they break down. You can look forever at a broken down wagon or airplane and not learn what it did when it was working.

Maybe you say Jacobs wasn't a real economist (because she didn't write mainstream academic papers). Well, consider this. In the 1960s, [4]Saul Sternberg changed the face of experimental psychology when he showed what could

be done with reaction-time experiments, which are set up so that the subject almost always gets the right answer. Before Sternberg, memory and perception were usually studied via percent-correct experiments, set up so that subjects were often wrong.

Sternberg's reaction-time research was so much more revealing than the percent-correct research that preceded it that almost everyone switched to using reaction time. The profession of experimental psychologists had done the wrong thing for a long time.

---

Matt McIntosh (2007-04-21 08:02:57)

As far as economists and economic development go, check out anything by Hernando de Soto and Douglass North. Those two are bright lights in a field full of darkness and confusion: they actually study real economies to figure out how they work, rather than playing with toy models on paper.

Stephen M (Ethesis) (2007-04-21 20:25:57)

There is some amazing stuff in economics. Finding out why honey is related to SIDS and lots of other things. In a way, economics is a study of math and how it relates. Neat stuff. I liked your points in this post, btw, and I'm thinking on them.

Evelyn (2007-04-22 10:36:03)

I'm reading *The Ab Revolution* by Dr. Jolie Bookspan, and it's a wonderful example of how a profession can be wrong about something for a long time. The book is all about how proper posture can be more effective in preventing back pain and developing abdominal muscles than crunches, because proper posture provides a workout all the time in a way which enhances everyday functioning. Crunches don't actually strengthen abs, and can hurt your neck and back. Great stuff! Her blog is quite good as well: [http://www.healthline.com/blogs/exercise\\_fitness/index.html](http://www.healthline.com/blogs/exercise_fitness/index.html)

### **Science in Action: Omega-3 (flaxseed oil vs. olive oil) (2007-04-21 20:29)**

As I've described in [1]previous posts, flaxseed oil (high in omega-3) seems to improve my balance. As I increased the daily dose, I found that 4 tablespoons (T)/day had almost the same effect as 3 T/day. To measure the effects of omega-3, I plan to use 3 or 4 T/day flaxseed oil – which presumably produces near-optimal omega-3 levels – as a baseline for measuring the effect of other things.

For my first comparison I chose olive oil: widely believed healthy, but low in omega-3. (And recommended by me in *The Shangri-La Diet*.) I used an ABA design: several days flaxseed oil, several days olive oil, several days flaxseed oil. In all conditions, I took 2 tablespoons of the oil at about 10 am and 2 tablespoons at about 10 pm each day. I measured my balance at about 8 am the next day. Each daily test consisted of 30 trials. Each trial consisted of balancing on one foot on a board atop a metal cylinder ([2]pictures). The score was how long before I lost my balance and put the other

foot down.

Here are the results.

While drinking the olive oil, my balance slowly got worse. When I returned to flaxseed oil, my balance quickly returned to its previous level. Very clear difference between the oils,  $F(2,40) = 18$ , which corresponds to a tiny p value and t about 5.

A possible explanation is that when the concentration of omega-3 in the blood is low, the omega-3 in cell membranes slowly "evaporates" into the blood. When a cell's membranes lose omega-3, it doesn't work as well.

1. <http://www.blog.sethroberts.net/2007/02/24/omega-3-greatest-hits/>

2. <http://www.blog.sethroberts.net/2007/01/26/science-in-action-omega-3-materials/>

August (2007-04-21 21:07:42)

So, how would someone already taking a flavorless oil to lose weight also manage to take flaxseed oil too? Nose clips? Is there a flavorless omega 3 out there?

seth (2007-04-21 23:02:30)

yes, with nose clips. that's what I used (with both the flaxseed oil & the olive oil).

Candy Minx (2007-04-22 00:03:31)

I take flax seed oil everyday in a shot glass, then I don't need nose clips because I swallow it quickly. I am fascinated by this experiment. I don't know if my balance is especially good because I take flax seed oil, but I feel as if my energy level is higher. Taking the flax seed oil affects my sense of hunger. I don't feel very hungry after I shoot back a half ounce. Seth, I love your blog and your great attitude towards experiments.

Sean (2007-04-22 06:23:07)

Why not an ABAB design? It gives us a better look at experimental error.

Dale (2007-04-22 07:12:34)

It would be interesting to compare fish oil to flax seed oil and olive oil.

seth (2007-04-22 08:10:57)

I agree.

Candy Minx (2007-04-22 08:51:48)

I think it would be very interesting to compare the flax oil with the fish oil. Just quickly, two contrasts i can think of is difference in cost between the two oils. Plus, fish oil...I believe, doesn't have Alpha Linolenic Acid. ALA is one of the factors that contribute to the efficiency of motor skills and absorption of all the Omega #s. But I am rather rusty on these differences. A friend of mine started a flax seed oil company...I think they were the very first flax seed oil company...and their website might have some value or interest to you Seth, or your readers. <http://www.omeganutrition.com/> I am going to e-mail my pal and let him know about your experiments here.

Matt McIntosh (2007-04-22 12:05:22)

Just want to say that I've been enjoying the omega-3 posts, and have been thinking about Tim Lundeen's results. This doesn't fit within the self-experimentation paradigm, but it'd be interesting to do a controlled study comparing the scores of omega-3 supplement users vs. non-users on the WAIS. Or perhaps better yet, since the test-retest consistency is about 0.9, just have the same people write the test without supplementation and then a few months later write it again after a week of supplementation. That way we could get a handle on whether it was just processing speed and/or working memory that was given a boost, or g. This could shed some light on the neurobiology of intelligence and ways to boost it as well. I've got plausible models dancing in my head, but more data would help . . .

Andrew Gelman (2007-04-22 16:45:27)

Seth, I suggest you try to do this experiment using a blind design, so you can do your measurements without being influenced by your knowledge about which oil you're taking. See here for more thoughts on this: [http://www.stat.columbia.edu/cook/movab-letype/archives/2007/04/testing\\_omega3.html](http://www.stat.columbia.edu/cook/movab-letype/archives/2007/04/testing_omega3.html)

seth (2007-04-22 20:32:10)

I like Andrew's comments about this at his blog. Here is what I wrote in reply over there:

That's a perfectly good suggestion except that the low-omega-3 oils take perhaps 5 days of exposure to have an easily-noticed effect, as my graph shows. Learning this time course is a very good reason to do the easier unblinded experiment first. Yes, I should do such a blinded experiment, no doubt. But what experiment should I do next?

That's a harder question. This is much like our interest in sample size: Sure, a study with a larger n is always a good idea, in some sense. But which sample size should be used *next*? That's a harder question. And a more practical one. I think it is curious how little has been written to help scientists answer such questions, which all of them who gather data have to answer many times.

gill (2007-05-25 11:51:58)

Hello , I have read your comments with interest. I take 2000 mgs of flaxseed oil -in capsule form - daily. I tend to suffer from nervousness- I can get shaky if I am the centre of attention etc- but since upping my dose from 1500 mgs to 2000 mgs I have noticed a huge lessening of my nervousness. In fact, only this week I had a very high profile event to attend where I would be photographed and introduced to lots of people and I sailed through without any nervousness at all. But the main reason I started to take flaxseed oil is because I read that it can help combat high cholesterol-mine is slightly raised- I don't know if any studies have been done on this. Also I am a vegetarian and so would not take cod liver or other fish oils.

seth (2007-05-25 15:28:33)

Your comments about raising the dose are very interesting. I suspect many people taking flaxseed oil are taking a lower-than-optimal dose.

Gill (2007-06-20 00:04:37)

Hello, I recently had another cholesterol test and my levels are now normal with my HDL being above optimum. I have made no changes whatsoever to my diet and lifestyle apart from increasing my dose of flaxseed oil so I would think that it must have contributed to my lower levels.

seth (2007-06-20 06:37:58)

Thanks for the update.

Gill (2007-07-23 14:36:32)

Hi Seth, are you still getting comments /info about your research re flaxseed oil? I have not read anything since my last comments. Regards, Gill

seth (2007-07-23 15:58:16)

yes, I am still getting comments. You can read all my posts on omega-3 - including the ones since your last comments - by clicking on "omega-3" in the category list.

Marcia (2008-07-31 20:25:36)

Hi Seth, this is a great site, so interesting. I started having ground flaxseed's after I read in a book 'The Gabriel Method' (brilliant!) that to have ground flaxseeds are so much more affective than the oil, (even tho the oil is still great!) The only thing is, you have to grind them (in a coffee grinder) just before you consume them, they go rancid very easily so even buying them pre-ground isnt good enough. I have about 3 tbs ground with a few walnuts every morning with natural, fat-free yoghurt, crushed frozen blueberries and a trickle of honey, I really look forward to it everyday now, I dont feel way different but I dont get sick and I know I am eating healthy, Im sure long term will benefit me even more!! Thanks Seth, I will keep on reading. :)

anonTMI (2008-08-01 09:44:04)

Pardon the TMI, but I have tried using flaxseed oil a couple of times for SLD. I get a negative side effect in that my prostate enlargement gets worse. Has anyone else noticed this? Details: Male (duh), 50 years old, taking 2T Flaxseed oil twice daily according to SLD rules (nose pinched shut, 1 hr before and after flavors).

Angela (2010-08-20 09:18:57)

how do you determine the appropriate dosage of flaxseed oil or other oil in capsule form? I was thinking about taking flaxseed oil in capsule form however, the directions state to take 1 to 3 capsules daily. Considering that the caloric intake from just one capsule is only 15 calories, how does one take enough to get the weight loss effect desired and appropriate for one's weight

without overdosing?

Seth Roberts (2010-08-21 07:56:20)

Angela, I determined how much flaxseed oil to take by figuring out amount made my brain work best. I ignored what bottle labels said. The best dose for me turned out to be about 30 capsules/day. So that's how much I took (in liquid form).

flaxseedguy (2011-03-08 12:38:16)

I read an article today that talked of how flaxseed oil can actually cause prostate cancer. Anybody else read anything on this?

Sam (2011-03-08 14:24:45)

I've read somewhere that you should not combine Omega-3 with alcohol, maybe a combination like this might be the problem?

Jazi yechezkel zilber (2011-06-12 05:13:16)

only extra virgin olive oil is supposed to have health benefits, and it comes from the non oil component or from being negligently handled and not processed. (According to "fats that heal fats that kill" a very deep review on the biochemistry etc. of oils) Here it was extra light olive oil, if I guess correctly. Thus it is compatible with existing evidence. (which is a positive!)

Seth Roberts (2011-06-12 17:15:39)

I think the experts are wrong about this. Flaxseed oil is high in omega-3, olive oil is not.

Ross (2011-12-21 11:35:07)

I've searched your site, and I can't find any reviews of good flaxseed oil brands. Do you have a preference? Or a pointer to a good page of flaxseed oil reviews?

Seth Roberts (2011-12-21 13:43:55)

I tested several flaxseed oil brands (Barleans, Spectrum, Whole Foods) and found no difference between them. In China, however, the flaxseed oil I bought turned out to be defective.

Lares (2012-04-02 07:33:27)

I just took my first two tablespoons of EVOO about a half hour ago (10 am). When should I take the next dose? Seth: Try 1 or more hours after dinner.

## **A New Yorker Misstep (2007-04-23 00:01)**

On the left-hand side of The New Yorker [1] website is a series of sections: Goings-On, In This Issue, Cartoon Caption Contest, and so forth. Pretty standard stuff. Then comes a section called Awards:

### **AWARDS**

Lawrence Wright has won a Pulitzer Prize for his book "The Looming Tower." Read "The Master Plan"; watch an excerpt from "My Trip to Al-Qaeda."

The New Yorker has been nominated for a Webby Award for Best Copy/Writing. Vote for us at [webbyawards.com](http://webbyawards.com).

The New Yorker received nine nominations for the National Magazine Awards. View a list of finalists and read nominated articles.

I wouldn't be so casual about such great accomplishments. Such things – at least for most of us – are more noteworthy and wonderful than what's In This Issue.

Speaking of missteps, I mentioned [2]a few days ago how New York Times columnist Nicholas Kristof put in [3]his blog a letter from a University of North Carolina student that was more interesting and insightful than anything in the NY Times in a long time. If someone wrote a letter like that to me, I would have begged her to allow me to use her full name so that she would get credit for her brilliant comment. I would have responded to it, not just printed it. I would have gotten other people's reactions to it. I would have gone on and on about it.

Maybe I should have titled this post Too Little Emphasis on Success to go with [4]Too Much Emphasis on Failure.

Addendum: Kristof has now posted the student's full name: [5]Loren Berlin.

1. <http://www.newyorker.com/>
2. <http://www.blog.sethroberts.net/2007/04/20/too-much-emphasis-on-failure/>
3. <http://kristof.blogs.nytimes.com/>
4. <http://www.blog.sethroberts.net/2007/04/20/too-much-emphasis-on-failure/>
5. <http://www.lorenberlin.com/>

---

Andrew Gelman (2007-04-23 16:42:36)

For the New Yorker's biggest (recent) misstep, see here: [http://www.stat.columbia.edu/~cook/movabletype/archives/2006/12/i\\_guess\\_rich\\_li.html](http://www.stat.columbia.edu/~cook/movabletype/archives/2006/12/i_guess_rich_li.html)

### **What Loren Berlin, a Student at the University of North Carolina, Wrote Nicholas Kristof (2007-04-23 08:06)**

I have mentioned this letter three times ([1]here, [2]here and [3]here) and [4]Jeremy Cherfas rightfully complains that he can't read it. Here is most of it:

Friday marked the deadline to enter The New York Times columnist Nick Kristof's second annual "Win a Trip with Nick Kristof" contest. Open to students currently enrolled at any American college or university, as well as middle and high school teachers, the contest offers one student and one teacher an all expenses-paid trip through Africa with the Pulitzer Prize-winning journalist to gather stories on the impoverished continent. . . The prize includes the chance - more accurately the expectation - to detail the experience on a blog on NYTimes.com.

Because I am currently a graduate student at the University of North Carolina at Chapel Hill, I qualify to enter this competition, and have many reasons to do so. . . . Yet, I refuse to apply. I think the way Kristof has cast this trip is a disservice to Africa. . . .

Kristof insists on telling the story of a failing Africa when instead he could report on its ability to overcome. On the competition's webpage Kristof has posted a letter to potential applicants that provides this explanation: "Frankly, I'm hoping that you'll be changed when you see a boy dying of malaria because his parents couldn't afford a \$5 mosquito net, or when you talk to a smart girl who is

at the top of her class but is forced to drop out of school because she can't afford a school uniform. . . .

Last year's student witnessed the death of a woman during childbirth despite the fact that both Kristof and his traveling companion donated blood in an attempt to save her. Though the doctor promised to help the young woman, he apparently ducked out the back door as she died. That was Kristof's story of Cameroon, a West African nation with tremendous ecological diversity and a per-capita GDP higher than that of most other African countries. . . .

The story of Africa in turmoil is the African narrative that many Americans - and certainly those who read The New York Times - already know. It is virtually the only type of reporting that Western news outlets broadcast about the continent. Every American student who has to listen to National Public Radio in the car when Dad picks her up from soccer practice, or has had to read The Economist for a school assignment, or has read in a church newsletter about a local youth group's spring break trip to a rural African village knows that people in Africa are hurting. Maybe we haven't smelled an understaffed health clinic that cares for HIV-positive orphans, or walked through rows of coffee trees with a farmer whose young son was beaten into serving in a youth militia in a civil war between tribal groups whose names we can't pronounce and whose agendas we can't keep straight. But we know they are poor, and that Africa will break your American heart if its contaminated water doesn't kill you first. . . .

Americans don't need any more stories of a dying Africa. Instead, we should learn of a living one. Kristof and his winners should investigate how it is that Botswana had the highest per-capita growth of any country in the world for the last 30 years of the twenty-first century. Report on the recent completion of the West Africa Gas Pipeline that delivers cheaper, cleaner energy to parts of sub-Saharan Africa. Tell us about investment opportunities in Nigeria's burgeoning capital markets.

Sadly, it's impossible to report on Africa's successes without relaying its tragedies. Virtually every African victory is somehow also a story of malnourishment and malaria, misogyny and malevolence. That's important because Africa's horrors are massive and crushing, and demand attention. I agree with Pope John Paul II, who said "a society will be judged on the basis of how it treats its weakest members." Clearly Africa will be the [basis of] judgment of our global community.

Kristof knows this, of course, and I am certain he means well when he writes that his original purpose for the contest was because he thought that "a plenty of young people [who] tune out a fuddy-duddy like myself might be more engaged by a fellow-student encountering African poverty for the first time." But they would also be excited to encounter African hope, something equally unknown to most Americans, students or otherwise.

So I'm asking Kristof to refine his summer travel itinerary to include a tour of a thriving organic farm owned and operated by a local Ethiopian cooperative. And the Ugandan health clinics that are reducing the number of AIDS cases despite a continuing guerilla war. And the wonderful "PlayPumps" scattered throughout the continent that provide safe drinking water via a pump system powered by children as they play on a playground. Brilliant idea. And something many people don't know about.

Africa needs a lot of things. It needs money and aid workers, vaccines and functioning governments. Some of those things can be provided by outside donors, and other can't. But universally, Africa needs us to believe in it. And that is something we have to be taught.

dilys (2007-05-14 06:31:05)

I long ago concluded that there is a psychological-emotional split among the population: one group likes challenge and achievement, the other relishes pathos. This is not the place for my theories as to why, or what else it correlates with. But Kristof demonstrates in what is quoted here, that he gets some kind of neurological kick from pathos, as well as from discomforting other people.

Frank (2008-02-26 06:16:43)

If your the Loren Berlin who published the article in today's NY times Health section drop me an e-mail and I'll pass on some information about an MD in NYC doing some alternative stuff and seemingly have some success DPYN3100@Hotmail.com

seth (2008-02-26 08:42:36)

Thanks, Frank. I have emailed Loren about your comment.

Pilar Soler (2008-02-26 10:06:10)

Loren, I've just read your article in today's NY Times. Great. I share all your feelings. I'm an Spanish diabetic girl, so I'll have to live with it. There's no cure, but I hope not to die because of it. Sorry about my English, I can understand your article, but I can't express myself very well. I've enjoyed your article because I think people usually don't know what living with a chronical disease or illness means. It's encouraging for me. I've been a diabetic for seventeen years, but sometimes I feel I'm not still used to it. Anyway, hope is a good idea. Thanks for your article, Pilar

Charles (2008-02-26 10:29:17)

Sorry, Seth, this isn't about the letter to Kristof, but like Frank, about other approaches to autoimmune disease. Please pass this on to Loren. I had an autoimmune disorder nearly three years ago. After getting nothing but an "incurable" label from several practitioners of conventional medicine I saw Richard Panico, MD, at the Mind-Body Institute at Athens (GA) Regional Medical Center. Rich is a remarkable mix: highly trained in Western medicine, an excellent diagnostician, expert in nutrition, herbal and other supplementation therapies, a yoga teacher, and the hub of a diverse group of other healers. My point is not that the Mind-Body Institute is your only hope but that a wide range of options are available which are unlikely to be mentioned (other than to be ridiculed) by most MDs today. I hope you can find some effective help, Loren. Best wishes.

sarah (2008-02-26 10:58:45)

I found this article after reading Loren's "cases" piece in the NYT. a). Is this the Loren who went to Crystallaire as a kid? If so, drop me an email, it has been a long time. b). Regardless of whether or not we actually know each other, this is an incredibly insightful criticism about modern media's portrayal of Africa. I find it frustrating to continually dispel the myths about how much success there is amidst the significant troubles. The country of Ghana, for example, is incredibly safe and stable with a rapidly growing economy and 50 years of democratic rule. I think that the young people of the world need to spend time in Africa to better differentiate between the failings and successes of the continent. Thanks for republishing this article, Seth. Best wishes to Loren.

Emily Cleath (2008-02-26 14:46:49)

Could someone please pass along my contact info to Loren in regards to her piece today in the NYTimes. I'd really like to talk to her as my experience with UC has been identical - emotionally and physically - but I've found a better way to manage the disease: with a combo of less harsh Western meds and over-the-counter products. No, I'm not trying to sell her anything. Emily

Loren Berlin (2008-02-26 18:11:48)

Hi. This is Loren. Anyone who wants to contact me can so at loren230@hotmail.com Thank you for all your kind words about my piece in the NYT, and yes, I went to Crystallaire. I will try to reply to you individually now.

Helene (2008-02-26 18:15:45)

to Loren Berlin. You are going through an awful lot and causing yourself a lot of anguish. Why don't you have a colectomy? With the J pouch technique you can have normal bowel function. See a surgeon in your area that specialized in inflammatory bowel disease. You will be surprised at your options.

GG (2008-02-26 18:36:04)

To Loren, Please consider looking outside the western medicine model and look into a good a chinese herbalist and acupuncturist. They have very effective and gentle approaches to autoimmune conditions. Best

Laura (2008-02-27 07:47:45)

I, too, have a message for Loren. I was diagnosed in 1989 (by a doctor at Duke University) with ulcerative colitis at the age of 35 and had to alternately take sulfur drugs and prednisone to control the symptoms (very similar to those described by Loren in her article). I was NOT told to alter my diet or change my lifestyle in any way. In 1992 I stopped eating meat (and fish) and at my next colonoscopy in 1994 my new doctor did not believe that I had had ulcerative colitis. She insisted on getting my records and the videotape from the Duke doctor which confirmed that I HAD had colitis in 1989, but I did NOT have it in 1994. The only difference was that I had stopped eating meat! I hope that if Loren has not made this change in her diet, that she will do so. I wish her all the best. (Please note, Loren may contact me if she wishes.)

kit (2008-02-27 10:01:45)

Loren, Just wanted to write to thank you for your article in NYTimes today.

Sally Lechich (2008-02-29 11:47:09)

Hi Loren, I just telephoned you from Stockton, Ca. and left a message, wondering if you have heard of Edgar Cayce and his remedies...I mentioned on the phone the Castor Oil Pack as a remedy for colitis...I think it would benefit you to at least try it...it is natural and seems to have worked for many. If you Google "Edgar Cayce Castor Oil Pack" you will have all the info you need. I wish you a speedy recovery. God Bless. Sally in Stockton, Ca. you may reply if you wish.

Sally (2008-02-29 11:50:17)

Hi Loren, I just telephoned you from California and told you about Edgar Cayce and his Castor Oil Pack for Colitis..Read about your HOPE in the NY times... If you google "Edgar Cayce Castor Oil Pack" you will have all the info you need. I and others have used it for many problems and it works. God Bless, Sally in Stockton, Ca.

## **Bleak House Fact of the Day (2007-04-23 19:38)**

The grandfather of Gillian Anderson, who starred in a wonderful Bleak House mini-series,

once bet someone in a bar in Kentucky that he'd marry the next girl who walked into the place; he did

and they went on to have nine children together.

From [1]this interview with Anderson.

### **Which Signs of Aging are Inevitable? (2007-04-23 22:24)**

In a New Yorker [1]article titled "The Way We Age Now," Atul Gawande writes:

With age . . . the gums tend to become inflamed.

As I [2]posted a few weeks ago, my gums have recently become less inflamed – no doubt because of more omega-3 from flaxseed oil. For the first time in memory they are not inflamed at all. (My dentist was surprised. Hardly anybody improves, he said.) Could Gawande's "with age" effect be due to not enough omega-3?

### **If Science Had Been Invented More Than Once (2007-04-24 19:23)**

Last night, at a Vietnamese restaurant, I had an avocado shake for dessert. On the way home I stopped at a Chinese bakery and got garlic pork cookies. Had science, like cooking, been invented more than once, what would other scientific traditions – other ways of doing science – look like? My guess is they would not include:

1. Treating results with  $p = 0.04$  quite differently than results with  $p = 0.06$ . Use of an arbitrary dividing line ( $p = 0.05$ ) makes little sense.

2. Departments of Statistics. Departments of Scientific Tools, yes; but to put all one's resources into figuring out how to analyze data and none into figuring out how to collect it is unwise. The misallocation is even worse because most of the effort in a statistics department goes into figuring out how to test ideas; little goes into figuring out how to generate ideas. In other words, almost all the resources go toward solving one-quarter of the problem.

3. Passive acceptance of a negative bias. The average scientist thinks it is better to be negative ("skeptical") than positive when reacting to other people's work. What is the positive equivalent of skeptical – a word that means appreciative in a "good" way? (Just as skeptical means disbelieving in a "good" way.) There isn't one. However, there's gullible, further showing the bias. Is there a word that means too skeptical, just as gullible means too accepting? Nope. The overall negative bias is (male) human nature, I believe; it's the absence of attempts to [1]overcome the bias that is cultural. I used to subscribe to the newsletter of the Center For Science in the Public Interest (CSPI). I stopped after I read an article about selenium that had been prompted by a new study showing that selenium supplements reduced the rate of some cancer (skin cancer?). In the newsletter article, someone at CSPI pointed out some flaws in the study. Other data supported the idea that selenium reduces cancer (and showed that the supposed flaws didn't matter), but that was never mentioned; the new study was discussed as if it were the only one. Apparently the CSPI expert didn't know about the other data and couldn't be bothered to find out. And the CSPI writer saw nothing wrong with that. Yet that's the essence of figuring out what's good about a study: Figuring out what it adds to previous work.

My [2]earlier post about another bit of scientific culture: the claim that "correlation does not equal causation."

1. <http://www.overcomingbias.com/>

2. <http://www.blog.sethroberts.net/2007/02/10/what-should-correlation-does-not-imply-causation-be-replaced-with/>

---

Therac-25 (2007-04-24 20:31:05)

I'm just randomly coming up with ideas, but the skeptical/gullible divide is possibly due to the fact that "positive acceptance" is the default behavior for humans when encountering a proposition, and that a negative attitude towards rejecting a proposition is the default as well (consider the typical reaction to having an urban legend debunked – more often than not, it's considered rude). That is, that "positive rejection" (skepticism) and "negative acceptance" (gullibility) are attitudes that are explicitly opposite to normal human behavior, which is the reason they have names, and are valued so highly. If that makes any sense.

Er (2007-04-25 01:06:11)

'Science' has been invented more than once, but we on the western hemisphere do only accept our kind of science. Other Science like the energy knowledge of the chinese are just disregarded as not being science at all, because they do not fit in our 'scientific' thinking.

seth (2007-04-25 03:08:59)

Therac, "skepticism" and "gullibility" are themselves opposites –they can't both be "attitudes that are explicitly opposite to normal human behavior." I assume you mean the value system inherent in the words is what's opposite. I think they have

names because people often praise what they call skepticism and criticize what they call gullibility. Their opposite-valenced counterparts – over-skepticism and under-gullibility – don't have names because the underlying values (it's bad to be skeptical, good to be gullible) aren't expressed very often. You might have something there that X is not praised and Y not dispraised because they already exist – I don't know.

Tom Myers (2007-04-25 08:24:57)

I'm, ummm, skeptical about all three of these. (And I'm wondering how strong the evidence is that cooking was actually invented more than once. Sure, it could have been, but how can you be sure?) (1) Dividing lines between those-that-make-it and those-that-don't are usually somewhat arbitrary in the sense that they can be pushed around without changing the framework, yes; that's true whether you're talking about picking the ideas you're going to go on working with ("the difference between significance and insignificance is not significant") or actual evolutionary survival-via-fitness-functions (e.g., when I write a genetic algorithm). Still, we have to choose, unless we choose to keep everything, which is not usually cost-effective. I admit that I'm not sure that the issue is always cost-effectiveness; sometimes, as with the placement of an international date line, you have an actual logical necessity. (I think.) But just on cost-effectiveness grounds, I think any culture trying out ideas is going to come up with ways of measuring that look a lot like p-values, and then is gonna have to choose arbitrary conventions for picking the ones to go on with. (2) Departments of Statistics do less than a quarter of the work, with less than a quarter of the resources; that's good. Keep 'em. (3) Almost all ideas are bad, especially mine. Skepticism is appropriate. (Yes, meta-skepticism applied to claims about the virtue of skepticism is also appropriate, and so recursively to find the least fixpoint thereof, which is "I dunno." And indeed, I dunno. But I think I'll post this just the same, in appreciation of ideas of which I am skeptical.)

Jeffrey Miller (2007-04-26 08:50:12)

"Departments of Scientific Tools, yes; but to put all one's resources into figuring out how to analyze data and none into figuring out how to collect it is unwise." I'm not sure I understand what you mean. As you know, statisticans are very interested in how one should design experiments, and how to iterate between data, theory and experiment. The classic textbook by Box, Hunter, and Hunter, "Statistics for Experimenters" is concerned entirely with this topic.

seth (2007-04-26 12:53:01)

Well, "Statistics for Experimenters" might be the best statistics textbook ever written. It isn't typical. Look at an average statistics text. Statistics professors have done much more work on how to analyze data than on how to collect it.

## **Introductions to Jane Jacobs (2007-04-25 04:31)**

Nice summaries of her ideas [1]here (shorter) and [2]here (longer).

Why is an experimental psychologist (me) so interested in Jacobs' work – which on the face of it has nothing to do with experimental psychology? Four reasons. From big to little:

1. I enjoy her books and articles. They are very well-written, discuss the stuff of everyday life – what I see when I walk through any city – and have lots of ideas that I hadn't previously encountered.
2. Jacobs is essentially an economist. Psychology and economics are very close. Economics is psychology writ large, psychology is economics writ small. I came up with [3]a theory of human evolution based on economics learned from Jacobs.
3. Jacobs wrote about something that fascinates me – how things begin. [4]My longest paper is about how scientific ideas begin.

4. Self-experimentation had led me to conclusions outside experimental psychology – for example, conclusions about weight control and sleep. Jacobs, with no Ph.D. in anything, was even more an outsider.

---

Stephen M (Ethesis) (2008-02-15 20:07:09)

That Jacobs essay made sense out of Paris for me. Paris (France, not Texas) is vibrant on the street and sidewalk level, compared to Dallas which is barren on the sidewalk level (though the underground actually has some life). The places that attempt classic city planning are vacant surprises, kind of fun to discover, but empty and alone. Thanks for this post and the links.

### **Science in Action: Omega-3 (flaxseed oil vs. olive oil, continued) (2007-04-25 19:29)**

I posted [1] a few days ago about the different effects of flaxseed oil (high in omega-3) and olive oil (low in omega-3) on my balance. There was a big difference. If omega-3 affects one measure of brain function (balance), it should affect many other measures of brain function. The whole brain is made of the same stuff (neurons, etc.).

Which brain measures are most sensitive to omega-3? The more processing/time the better, I assumed; so I looked for tasks that, like balance, involve continuous processing for most of the test period. This led me to try a paper-and-pencil version of Saul Sternberg's [2] memory-scanning task. (Sternberg's use of this procedure is described [3] here.) On each trial I memorized a list of three digits (e.g., 2, 3, 7); then as fast as possible marked each of 100 digits (20 digits/row in 5 rows) according to whether they were in the list or not. I made a line under the digit if it was in the list, through the digit if it was not. I did five trials per day.

Here is an example of the test materials and my marks:

temp

targets = 0 2 4

8	1	6	8	5	0	9	5	4	4	6	0	0	7	0	4	2	3	4	2
1	1	1	5	1	5	9	2	2	6	1	3	2	5	3	7	5	8	6	2
4	6	4	0	8	0	2	9	4	0	6	7	2	8	3	0	9	5	0	8
4	3	6	4	2	3	9	9	0	2	2	5	9	7	7	0	0	6	7	0
2	8	4	4	3	7	4	1	2	8	1	5	3	4	9	2	7	8	6	1

targets = 0 1 6

9	5	1	6	7	4	5	3	7	4	9	9	5	3	4	5	5	3	3	3
0	8	6	0	2	6	4	3	2	8	0	0	7	2	6	2	0	1	8	0
4	6	1	8	1	6	9	2	1	6	5	2	5	7	7	1	0	7	7	1
4	8	0	9	0	6	2	8	2	0	6	9	1	4	4	9	6	6	5	1
1	3	8	6	8	6	7	1	0	1	0	9	3	1	9	8	7	1	0	6

targets = 1 8 9

4	2	9	4	0	4	2	0	3	2	5	1	1	6	4	6	9	6	2	1
8	8	1	1	0	7	5	1	3	9	2	0	8	2	9	4	7	1	7	9
0	1	6	0	8	8	8	3	8	9	5	9	8	1	9	5	2	8	0	1
5	6	2	0	3	4	7	9	8	6	3	8	8	6	3	8	3	6	4	7
7	3	1	7	5	9	1	7	9	5	1	9	3	0	2	5	9	4	1	4

Page 1

The other side of the page had two more sets of digits.

Here are the results from the same flaxseed/olive oil experiment I discussed a few days ago:

There was a huge difference between the flaxseed oil and olive oil condition:  $t > 7$ .

Curiously the time course is different from the [4]balance results. In the case of balance, when I switched from flaxseed to olive oil my balance slowly got worse. Nothing like that is apparent here. This might reflect a different mechanism or it might be due to the vast difference in how much practice I had had with each task. When this experiment began, I had had far more practice with the balance task than with the memory-scanning task.

3. <http://www.psych.upenn.edu/~saul/procedure.html>
4. <http://www.blog.sethroberts.net/2007/04/21/science-in-action-omega-3-flaxseed-oil-vs-olive-oil/>

TomM (2007-04-26 15:50:18)

Hi Seth, Very intriguing results! I've been looking at these and other recent plots on your blog, and was especially interested in the discussion about whether a trend (or change in trend) is "obvious" as opposed to requiring a more formal statistical test. One thing that should be mentioned is the effect of serial correlation on both observed visual patterns and statistical tests. A hallmark of time series data is that observations tend to be correlated over time: If I know your score today I can predict with better than chance accuracy your score tomorrow. The result is that observations are not independent, yet standard versions of statistical tests such as t-tests from linear models require this. The model parameter estimates are fine, but their standard errors are underestimated in the presence of autocorrelation, and thus statistical "significance" is overestimated. I digitized this graph and did a quick analysis modeling the autocorrelation along with the experimental condition, and I get a t-value about half of your reported  $t=7$ , depending on the exact model. Still big, so it may seem like I'm being pedantic here, but in other cases autocorrelation effects can be really important. Here are a couple of interesting links, the first to a general discussion of autocorrelation with some examples of visually striking patterns that are nonetheless random, and caused by high autocorrelations: [http://socrates.berkeley.edu/~epsc120/Toolkits/Toolkit\\_11.pdf](http://socrates.berkeley.edu/~epsc120/Toolkits/Toolkit_11.pdf) and this, an empirical study of people's judgements about intervention effects in single-case AB designs: <http://www.pubmedcentral.nih.gov/articlerender.fcgi?artid=1286245> In any case, your blog is really interesting and I'm looking forward to more data!

seth (2007-04-27 06:37:08)

That's a good point. These data do not look like what I expected nor like other self-experimental data I have collected and now that you mention it I realize that auto-correlation would explain it. I imagine it will go away with more practice.

Elaine S. (2007-12-09 17:07:47)

I just had some heart news and need to go on a strict diet when I recover from Pneumonia which I have had for two or more weeks. Any thing you can tell me about which oil and which foods would help me with heart issues, high cholest. etc. is helpful. I have never been ill or had any problems and want to be very pro active with diet and exercise. Thanks, Elaine

### **Does Omega-3 Affect the Brain? (2007-04-26 23:27)**

The last three data sets I've posted – [1]one from Tim Lundeen, two from me ([2]here and [3]here) – provide evidence that omega-3 affects the brain. The evidence has several good features:

1. Two people.
2. Three tasks.
3. Two ways of varying omega-3.
4. Strong effects (that is, large t values).
5. Easy to obtain.

Does omega-3 affect the brain? This is a good place to start a research project because there is a reasonable chance the answer to the question "does omega-3 affect the brain?" is yes.

The placebo/expectations explanation – which, based on the lack of effect of placebos in most studies, is implausible to begin with – has trouble with several facts: 1. The initial discovery was a surprise. 2. Tim's results involved comparison of two plausible doses. 3. Tim had earlier found that dose increases had no effect. 4. Tim's results had a pattern I have never seen (and thus Tim couldn't have expected). 5. My results had two different time courses.

Even more interesting than the idea that how much omega-3 we eat might affect how well our brains work are two more subtle ideas that are also becoming plausible: (a) the average diet (very low in omega-3) is very suboptimal and (b) improvement can be noticed quickly and easily.

In the latest [4]U.S. government nutrition guidelines, there is no omega-3 requirement.

Oren Tirosh (2007-04-27 09:04:39)

I agree that it's pretty unlikely to be a placebo effect - but why not go and do a double blind experiment anyway? It's not very difficult.

seth (2007-04-27 10:58:42)

The experiments I do first are those where I least know what will happen.

Ronald Pottol (2008-04-02 23:10:36)

Have you compared long chain vs short chain? I have heard that you need much higher doses of short chain (such as flax oil) vs long chain (fish oil for instance), and that was my experience. I'm very fond of Trader Joe's, as their's is higher purity than most (smells less awful), more concentrated, and larger, thus I get my 1.5g a day in just three, vs 5 for most fish oil capsules. I've been taking it for a decade for depression, it works much better than ssri anti depressants for me.

### **A Professor Complains Loudly (2007-04-27 20:18)**

Generalization #1: Everyone likes to be listened to. Being a professor is being paid to be listened to. It's like being a restaurant reviewer or a professional athlete - your job is doing what others do for fun. Generalization #2: American colleges are run more for the benefit of professors than for the benefit of students, as I have intimated [1]earlier.

That's why this [2]complaint is noteworthy:

This has been an excruciating term, because for the first time I had students who resented having to think, to work, to meet expectations, who seemed to really believe that showing up was all it took . . . As hard as I've tried, I haven't been able to salvage any time for my own research, so I feel as though - in addition

to wasting my efforts and care and concern on students who wouldn't even grasp that I was doing them some favors (yes, I'll teach extra evening sessions to help you understand the material that was a prerequisite for the course, but, um, yes, you need to do the reading) – I made absolutely no progress toward tenure. . . . This term has taken too much out of me, and right now, the thought of teaching again – ever – makes me want to sob. So here's my secret: I don't want to go back. I never want to see these people again – colleagues or students – and I think I made a terrible mistake.

A comment was "AMEN!"

I'm sure we're genetically wired to teach and learn but that doesn't mean the process can't go badly wrong. We're genetically wired to eat, too, and lots of ways people eat are very unhealthy. I have [3]compared formal education to agriculture. Sure, agriculture is more efficient than hunting and gathering but agriculture caused nutrient deficiencies that [4]reduced human health for a very long time. (My [5]weight-control research and [6]omega-3 research suggest it is still doing so.) We barely know how to eat. This complaint suggests we know even less how to teach.

1. <http://www.blog.sethroberts.net/2007/03/31/for-whom-do-colleges-exist/>

cristina (2007-04-28 11:34:37)

I am very surprised that you see this comment as unusual. I am a PhD student and although I agree that schools are not run for the benefits of students, they are not really run for the benefits of professors either. Especially not when you consider the mass cuts of tenured professors and shifts towards adjuncts, the horrendous job markets, the heavy teaching loads and incredibly high publication requirements to get tenure, etc. Teaching is not just hearing yourself talk; it requires pedagogical skill, a great deal of patience, creativity and personality. I wish I could just talk to my students about things I was interested in and have that count as teaching. Unfortunately, I often have to teach subjects I know little about or am not interested in, to students who are not interested either, and do the best job that I can. It is a JOB, not a privilege.

seth (2007-04-28 12:55:40)

I didn't see the complaint as unusual, I saw it as noteworthy, given how good the job *should* be. To the average non-professor, I think, being a professor looks like a very nice job.

### **More about The Secret (2007-04-28 08:27)**

Wouldn't it be nice if good things just happened to you? And you hardly had to do anything – certainly not labor for years – to make them happen? Yes, that would be nice. I say this because the blog [1]I Hate The New Yorker, which I like a lot, has linked to this blog. A good thing that just happened.

[2]More on The Secret.

1. <http://ihatethenyer.blogspot.com/>

2. <http://www.blog.sethroberts.net/2007/04/02/how-bad-is-the-secret/>

---

losing-it (2007-04-29 15:06:38)

Good news, Dr. R. You deserve good and excellent things happening to you, for you and from you. Like bread on water. When you teach, you learn the most. Whenever you give, you receive the most. Sometimes in unexpected and fascinating ways.

zp (2007-04-30 09:24:18)

Did you actually read my blog before I linked to you? Now that would be a nice thing for me, that just happened.

seth (2007-04-30 10:26:10)

I read your blog long before you linked to me.

### **Guest-Blogger Timothy Beneke on Self-Experimentation (part 1 of 2) (2007-04-28 20:51)**

[Timothy Beneke, an Oakland, California writer, was one of the first to try Shangri-La Diet. – Seth]

First, let me say that just as Seth can list a remarkable number of positive effects – related to sleep, mood, weight, balance, and even gum health – from surprising methods of self experimentation, I can do something similar. Here are the two biggest examples:

Following Seth's advice, by getting sunlight in the morning and going to bed earlier – around midnight instead of 3:30 a.m. – my mood has gotten better; I'd estimate a 2 point improvement on a 10 point scale – which is a lot. It led to an awakened passion for music and dancing, better functioning, and to put it mildly, a lot more joy in my life. That baseline improvement has formed the basis for other improvements of mood as well.

Using Seth's weight loss theory, I've lost about a third of my body weight – from 280 to 190. I've kept 30 pounds for 6 and a half years; 70 for 3 years, and 90 for approaching 2. I went from 280 to 250 eating weaker tasting low glycemic index foods; from 250 to 210 consuming about 350 calories of extra light tasting olive oil a day, and trying to avoid strong tasting high GI foods. Then, applying Seth's theory, I invented a way to get as many calories as I wanted taste free. I liquified lots of fruits and vegetables in a blender, added rice, bean, nut, soy, non-fat milk, flax, oat, and at times other powders to the liquified fruits and vegies, added water, cooked it in a microwave until it's moderately hard – not crusty, but not liquidy either. And then take spoonful of the mush, put it in my mouth, and gulp down water and float it down my throat. Using this method, I went from 210 to 177 going about 70-80 % tasteless for 4 months; in the last 20 months, my weight has oscillated between 177-190, perhaps a little higher – I don't weigh myself often for strategic reasons.

Geoff (2007-04-30 08:07:45)

RE morning sun, here is a possible mechanism: [http://www.ncbi.nlm.nih.gov/entrez/query.fcgi?cmd=Retrieve &db=PubMed &list\\_uids=9539254 &dopt=Abstract](http://www.ncbi.nlm.nih.gov/entrez/query.fcgi?cmd=Retrieve &db=PubMed &list_uids=9539254 &dopt=Abstract) (more references here: <http://www.vitamindcouncil.com/depression.shtml> ) I wonder if experimentation with Vitamin D supplements would yield results as interesting as those for omega 3s? Perhaps there is a circadian component, i.e. morning supplements would be more effective than those later in the day?

### **Injury-Causing Falls: The New Scurvy? (2007-04-29 12:22)**

In an article about aging in this week's New Yorker, Atul Gawande [1]writes:

The single most serious threat she faced was not the lung nodule or the back pain. It was falling. Each year, about three hundred and fifty thousand Americans fall and break a hip. Of those, forty per cent end up in a nursing home, and twenty per cent are never able to walk again. The three primary risk factors for falling are poor balance, taking more than four prescription medications, and muscle weakness. Elderly people without these risk factors have a twelve-per-cent chance of falling in a year. Those with all three risk factors have almost a hundred-per-cent chance.

Could the cause of so much falling be too little omega-3? [2]My omega-3 research suggests that more omega-3 quickly improves balance and that current levels in most places are far below optimal.

### **Blogger Alert: Paperback SLD Available (2007-04-29 16:36)**

If you have a blog, would like a copy of the paperback edition of The Shangri-La Diet – which is substantially better than the hardback, I like to think – and are willing to review the book on your blog, please contact Katherine Wasilewski (X.Y@ us.penguinroup.com where X = katherine and Y = wasilewski). She has 50 copies available. Please put "SLD review copy" in your subject line.

Addendum: The earlier version of this notice failed to say that these copies are for bloggers who will review it. I will soon post how the paperback is different from the hardback. The main difference is it incorporates lessons learned from forum feedback.

---

Andrew Gelman (2007-04-29 17:40:28)  
I'll get one, right???

seth (2007-04-29 20:05:04)  
Yes. If there were numbered copies, you'd get #1.

losing-it (2007-05-01 15:24:51)  
Just the act of being a blogger/having a blog qualifies me to ask for a book from Ms Wasilewski?

seth (2007-05-01 17:23:33)  
Correct. Addendum: Oops, not correct. You should review it in your blog.

Ann Eshana (2007-05-03 14:27:07)  
Hi - I tried to email her but it was returned to me unrecognized. Are you sure you have the address correct? I noticed there is a space in it, so I took it out, but it was still returned. I'd love to review your book. I also started your plan recently. Off topic, it would be great if people could post pictures on this site. Pictures are really powerful. Thank you -

## **Where Do Useful Discoveries Come From? (2007-04-30 05:11)**

From Andrew Gelman's [1]blog:

On page xxi [of Nassim Taleb's new book *The Black Swan*], Taleb says how almost no great discovery came from design and planning.

I said something similar to a graduate student last week: Really useful discoveries are almost never the result of trying to do something useful; they are almost always due to accidents. Penicillin, for example. If you notice something by accident, it must be a big effect otherwise you wouldn't have noticed it. That's a great place to start: A big effect you didn't know about.

I'll have to see what else *The Black Swan* says about this. It makes self-experimentation look really good: (a) It's much easier to do a self-experiment than to do a conventional experiment so there is more chance of accidents; and (b) because we pay close attention to ourselves, it's much easier to notice the unexpected with self-experimentation than with conventional research. Every useful finding in my long [2]self-experimentation paper – breakfast, morning faces, standing, morning light, sugar water – came from an accidental discovery. In four of the five cases, the accident happened during a self-experiment; I varied something to see if X would change and noticed that Y changed. The exception was sugar water, whose appetite-suppressing effects I noticed while traveling. Hmm. Maybe travel is a type of self-experimentation. Or self-experimentation a type of [3]travel. Certainly they are [4]closely related.

## **2.5 May**

### **Guest-Blogger Timothy Beneke on Self-Control (part 2 of 2) (2007-05-01 05:51)**

I continue to struggle – not terribly – but still struggle with compulsive eating. The forces in me that caused me to gain 100 pounds between 1982 and 1996 still exist in my personality. When I am stressed, I want to eat. I probably have gone about 35 % tasteless in the last 2 years. I would like to get skinnier, to push my blood pressure down as much as within reason, and get rid of the fat on my belly; my waist is around 39 inches – I am 6 feet and of moderately large athletic build. I have the tendency, when I want to go mostly tasteless for a day to impulsively give in and overeat. I was misconceiving this as an issue of will.

What I've discovered lately is that I was confusing "willpower" with technique. Low blood sugar can manifest as depressed mood, lightheadedness, vague disquiet, and more obviously food fantasies. It can be subtle. If I attend carefully to my mood when I am trying to go tasteless, attend to my hunger levels and always have the mush and water available, I can manage my blood sugar levels and not have sudden attacks and fantasies of food. If I anticipate times when I may experience such attacks I can preempt them. The conjunction of being around available food and having blood sugar drops leads me to eat compulsively. So now, I keep the mush next to my computer when I work, have it with me wherever I go and if I notice a sudden sign of blood sugar drop that may lead to compulsive eating, I consume a small bit of mush.

I would like to take this experiment as far as it will go but have not yet had the motivation to do the requisite work. I would like to see how thin I can become – within reason – using the method. It's a matter of going predominantly tasteless for 3 months as I did in the summer of 2005, when I went from 210 to 177. I'm at 188 now. Time will tell whether I can pull it off...

[1]Part 1.

1. <http://www.blog.sethroberts.net/2007/04/28/guest-blogger-tim-beneke-on-self-experimentation-part-1-of-2/>

---

Dave (2007-05-01 06:44:23)

Timothy: Rather than losing more weight, being 6 feet and about 190 pounds, why not think about going from "skinny-fat" to "athletic". Do you exercise much? Is it aerobic or weight-lifting or a mix? You seem to have a strong handle on diet, but diet only helps you lose weight, not gain lean body mass.

Brad (2007-05-01 10:24:45)

I'm developing the discipline of drinking 2T flavorless coconut oil when I start fantasizing about cookies. It always kills the craving, yet, perversely, there are times when I want the craving, even though I know the cookies are bad for me.

RandomToad (2007-05-01 10:55:16)

Hi Tim, Enjoying your guest blogging — I am unsure if it is low blood sugar per se that is causing your urges to overeat. Rather, I think, consuming a bit of your concoction that you described in your previous post '*fruits and vegetables in a blender, added rice, bean, nut, soy, non-fat milk, flax, oat, and at times other powders to the liquified fruits and vegies,*' leads to an insulin spike. Your insulin sensitivity is then diminished, leading to cravings for more carbs. My guess is that one could get far in weight loss and general health combining Seth's appetite suppressant techniques with Art de Vany's theories on evolutionary health and diet. (BTW Art's theory, in a nutshell:

Evolutionary Fitness is a blending of the Stone Age with the High Tech. It's based on the following premisesâ€¦  
1) That our genes are from the Stone Age and they encode both behaviors and human physiology for a hunter-gatherer body and mind. 2) That modern research on human performance and health benefit from an evolutionary perspective.

An interview with Art here, excuse the fact that it is on meathead bodybuilding site (apologies to any bodybuilders out there): <http://www.t-nation.com/readTopic.do?id=1373291> Another interview here: <http://www.t-nation.com/readTopic.do?id=709484>

CD (2007-05-01 12:13:34)

I'm an Art fan as well. He and Seth are the only two health/diet blogs I visit on a regular basis. Here is another very good short summary of the basics, from a recent post: [http://www.arthurdevany.com/2007/04/dieters\\_gain\\_we.html](http://www.arthurdevany.com/2007/04/dieters_gain_we.html) For more comprehensive information, I recommend this paper he's written: <http://www.arthurdevany.com/webstuff/WhyWeGetFat.pdf> Good luck!

Timothy Beneke (2007-05-02 22:32:26)

Thanks for all the thoughtful comments. Hi Dave, I walk an average of about 70 minutes a day, briskly – for 3 hours at least on Sunday. I agree with you; for health reasons I want to get rid of more fat from my belly. And I want to get my blood pressure under 115/75; above that is considered pre-hypertensive and begins to be risky, we now know. Hi Brad, There may be a difference between craving for taste and craving for calories; it's not real clear to me. I agree that flavorless calories are the best way to go to get rid of unwanted eating impulses. I wonder if flavorless carbs would do better than flavorless fats – to make it simple, you could just cook quick oatmeal in a couple of minutes and then cool it a bit and float it down your throat with a big gulp of water – you could have it flavorless and that might be more powerful and effective. The more calories you get that are tasteless, the less general hunger you will have... Hi RandomToad (great name!) I don't know about the insulin spike idea; you may be right. My assumption has been that consuming the mush tastelessly by floating it down my throat, means that I only get just enough calories to assuage hunger – and hunger is very weak. There is no incentive to consume more than that because there is no "active" pleasure in the consumption because no taste. So I only eat small amounts of the mush.

Then suddenly I have weakness, or lightheadedness or something and that leads to food fantasies in the course of my day; if I have the mush available, I can intervene before that happens... There is plenty of protein and fat in the mush by the way; soy protein, garbanzo beans, almond meal etc... I must check out Art Devany's blog, thanks for the URLs and thanks CD as well. It's great to participate in Seth's blog; he is a hero of mine – his ideas have helped me enormously... Thanks again. Timothy Beneke

Stephen M (Ethesis) (2007-05-03 09:14:26)

"What I've discovered lately is that I was confusing 'willpower' with technique." That was brilliant. I think it is one of the core problems with most weight loss efforts is that they do not understand the mental breakthrough you describe.

Willy (2007-05-03 16:38:56)

>What I've discovered lately is that I was confusing 'willpower' with technique. I loved that part too, but for some reason my comment didn't show. It is an excellent point from where to start changes and not fall in thoughts like one is a weak person, etc. Does this mean one needs the help of some "expert" or one can "self experiment" with a new pattern. I think in some cases the help of other person is needed (identification, imitation, modelling). Very interesting topic to develop further :-)

### **A Stanford Nutrition Professor's Explanation of SLD (2007-05-02 08:22)**

A Palo Alto resident found SLD so effective (lost 10 pounds in 1.5 months) that he told others about it. "Everyone I speak to about the diet laughs at me or just shakes their head," he wrote. (Which is [1]good.) A tenant of his, a Stanford medical student, asked his nutrition professor how such a crazy diet could possibly work. The professor, [2]Dr. Clyde Wilson, replied:

Fats and sugars reduce hunger when consumed in moderate amounts. Fructose stimulates less of an insulin response than glucose, putting you at less risk of subsequent hunger. Flavored foods result in a greater caloric consumption. Unflavored fructose and olive oil would therefore reduce hunger during a subsequent meal. Any small healthy snack will provide the same result. A small healthy snack would be, for example, a whole grain cracker with some peanut butter and half an apple.

The interesting thing about SLD is not that the oil or sugar water reduces hunger – most food does that – but that it causes easy weight loss. This is what needs explaining. Why does X calories of sugar water cause you to reduce future consumption by more than X calories? This paragraph doesn't explain this.

Since fructose, sucrose, and unflavored oils all have the same effect, it cannot be due to a special property of fructose.

As for the prediction that a small healthy snack will have the same effect, that has not been my experience. I'm pretty sure that weight loss would not be such a big problem if one could lose substantial weight (such as 10 pounds in 1.5 months) by eating as many small healthy snacks as you want.

1. <http://www.blog.sethroberts.net/2007/03/28/the-most-valuable-truths/>

2. <http://www.DrClydeWilson.com/>

---

J. Weighty (2007-05-03 14:37:32)

"eating as many small healthy snacks as you want." Hmm. Is SLD "drinking as many tablespoons of flavorless oil as you want?"

seth (2007-05-03 19:58:41)

More or less, yes – there are no tight restrictions.

### **What If College Were Taught by Basketball Players? (2007-05-03 06:06)**

1. "I don't teach passing, I teach teamwork," says a Professor of Ball Handling at an elite university.
2. The more prestigious the school, the taller its students and professors.
3. The Bell Curve is about the advantages of being tall. Taller people have better life outcomes, the authors discover via analysis of a large data set. Curiously, the authors – both tall – conclude that tall people should be favored even more.
4. The better students say that at college they learned how to learn. They mean they learned how to learn to play a sport.
5. At "research" universities the professors spend more time playing basketball than teaching.
6. A Princeton, New Jersey company develops and sells a fast standardized way to measure basketball ability.
7. Sports Illustrated publishes an essay titled "What Every Educated Person Should Know."
8. By graduation, students know very well how good at basketball they are but know almost nothing about their ability in other areas.

The excellent humorist [1]Henry Alford wrote "What If" articles for Spy magazine and, more recently, for Vanity Fair, such as [2]"What If Paris Hilton Were President of the United States?"

### **SLD in Paperback: What's New (2007-05-04 04:51)**

The paperback edition of The Shangri-La Diet was published last week. The feedback I'd gotten, mainly from the forums, suggested many changes, so I was glad to be able to revise it. The main revisions are:

1. A foreword about events since hardback publication.
2. More emphasis on flavorless oil, less emphasis on unflavored sugar water.
3. New case studies (to match the emphasis on oil).
4. Data from the Tracking Data forum about how fast people lose.
5. New sidebars about omega-3, combining SLD with other diets, and how to drink oil.
6. Nose-clipping as an important new way of doing the diet.

My thanks to all SLD forum contributors and others who provided feedback.

---

### **Encouraging Events (2007-05-04 09:06)**

Which should I find more encouraging?

1. [1]Now (a UK celebrity magazine) ran a 2-page article titled "Goodbye Atkins, Hello Shangri-La". It said celebrities have been sighted with rapeseed oil and normal-sized portions of food.
2. Yesterday the SLD forums got more than 13,000 hits, the most since November.

Probably the latter.

1. <http://www.nowmagazine.co.uk/>

---

Tim Lundeen (2007-05-04 09:33:36)  
Congrats!

### **Science in Action: Omega-3 (more memory results) (2007-05-05 16:22)**

Several weeks ago I compared flaxseed oil (high in omega-3) and olive oil (low in omega-3). I've posted results from a [1]balance task and a [2]memory-scanning task. I also measured what is called digit span – the number of digits you

can remember perfectly after one presentation. It is a widely-used measure of short-term memory. In my test, the digits were shown one by one for 1 second each on my computer screen. A few seconds after the last one, I had to write them down in order. If I was 100 % correct the next trial had one more digit than the last. If any of my answers were wrong, the next trial had one fewer digits than the last. The test continued until there had been six "reversals" – right answers after one or more wrong answers, or wrong answers after one or more right answers. The measure of performance is the mean of the six reversal points. It estimates the list length at which I have a 50 % chance of being correct.

Here are the results:

Performance was better with flaxseed than olive oil ( $t = 2.5$ , one-tailed  $p = 0.01$ ). The difference – the omega-3 effect, you might say – was quite a bit weaker than what I saw with balance and memory scanning. My guess is that the relative insensitivity of this task comes from two features: 1. Binary measures. Each trial is measured right or wrong; whereas with the memory-scanning and balance task, each trial yielded a duration (many-valued). 2. Slow. Each trial takes about 30 seconds; it takes about 10 minutes to get six reversals.

[3]Guide to my omega-3 posts.

2. <http://www.blog.sethroberts.net/2007/04/25/science-in-action-omega-3-flaxseed-oil-vs-olive-oil-continued/>
3. <http://www.blog.sethroberts.net/2007/02/24/omega-3-greatest-hits/>

---

peter (2007-05-06 09:09:57)

do you intend to compare flax seed with DHA (either derived from algae or fish oil or both)?

seth (2007-05-06 11:21:22)

Yes, something like that. Right now I am comparing flaxseed oil to nothing.

Andrew Gelman (2007-05-06 15:40:54)

I'm still worried that, by knowing which treatment you're taking, you can be unconsciously biasing your results. Could you have your neighbor give you the dose of oil each day so you won't know which you're taking?

seth (2007-05-06 19:34:04)

I'll eventually do that. But before I do that experiment I want to do experiments where I'm more uncertain what will happen.

### **Life-Size Faces (2007-05-06 13:12)**

My [1]long self-experimentation paper (Example 2) describes how I discovered that seeing faces in the morning improves my mood the next day. At the time I used TV faces. I tried different-sized TVs and found that the TV that produced the most life-size faces also produced the biggest effect. I also found that distance mattered: A conversational distance produced better results than a larger distance. The faces need to be looking at the camera. Clearly the TV faces were replacements for what our Stone-Age ancestors saw when they chatted with their neighbors soon after getting up. The faces/mood effect, I believe, is produced by a mechanism whose function was to synchronize the sleep and mood of people living together. It is hard to work with someone who is (a) asleep or (b) in a bad mood.

I needed 30-60 minutes of faces to get a big easy-to-notice effect. At first I used a variety of talk shows, then concentrated on two C-SPAN shows, [2]Booknotes and Washington Journal. However, Booknotes is only once/week and Washington Journal is pretty boring. Soon after I wrote to C-SPAN suggesting they re-air old Booknotes, they started doing just that. Encore Booknotes was a regular feature of Book TV. But I still had to watch a lot of Washington Journal and I wasn't as interested in politics as Brian Lamb.

Then I realized I could look at my own face in a mirror. This had the advantage that the face was exactly life-size. I listened to books or interviews or other stuff at the same time. Lately I have been listening to [3]Authors@Google talks.

Today I realized I could also use the vlogs on YouTube, the ones where people speak right at the camera. I've known about them – who doesn't, I suppose – for a long time but there have always been two problem: 1. Boring. 2. Too small. Today I came across a long series done by [4]LucyinLA (a struggling actress named [5]Laura Segura) and discovered that some of them were not boring, such as [6]this one. There was still the problem that her face is a little too small. Then I realized I can increase the size of anything on my screen by increasing the display resolution (go to the Display icon on Control Panel).

[7]Here's an example of the right stimuli:

[EMBED] I still need to find enough non-boring vlogs but that shouldn't be too hard. Whether I will switch to YouTube faces I don't know but you, Dear Reader, can now see for yourself without any special equipment. You should look at the faces soon after you wake up in the morning. Addendum: Nansen's comment about using a cheap mirror shows that I think of a \$5 mirror as "special equipment" and an internet-connected computer as not special. It's true, I do. As for the best time to see faces, all I know is it's quite early. I figured it out for myself by trial and error.

1. <http://www.google.com/url?sa=t&ct=res&cd=1&url=http%3A%2F%2Frepositories.cdlib.org%2Fpostprints%2F117%2F&ei=hZA-RsryMYjWgw0ajtjIAg&usg=AFrqEzdQa3IRUhFtM5qAQiKq778LyBY0Ew&sig2=5DDx8ntYT880EluSgrh5oA>

7. <http://www.youtube.com/watch?v=Cnca5kFZsR4>

---

diarist (2007-05-06 15:20:55)

Changing the display resolution is far too much work. In Internet Express 7, just click on the zoom dropdown (bottom right corner, in the "status bar" along the bottom, which is set to visible on the Tools menu) and set the zoom to 400 %. The entire page (text and all images) zooms by that factor, and a YouTube playback window will nearly fill a 1600 x 1200 screen. Use whatever percentage zoom gives the result you want.

Brad (2007-05-06 17:32:12)

Is it true that you have to go to bed by 8pm to see the improvement in mood?

seth (2007-05-06 19:32:51)

diarist, thanks for the suggestion. However, when I do that the wrong part of the screen (the upper left) is magnified. I need the center of the screen (where the face is) to be magnified. Brad, no. You shouldn't have a lot of face to face conversations late at night to see the improvement in mood.

Nansen (2007-05-06 19:36:07)

When I first tried to use Seth's mirror technique, I was too depressed to get out of bed so early in the morning. Even though I was taking anti-depressants, I could not lift my ear off the pillow. So one afternoon at a drugstore I bought a small mirror that swiveled on a little stand. By standing this small mirror on the mattress top, at arm's length from my head, I could look into it at right angles. I was a horrible sight, yet somehow I got through the hour. After two days I could rotate my head, still on the pillow, upward toward the ceiling. I held the mirror above me at arm's length, and when my arms got tired I alternated back to the first position. After two more days I could sit up, and I propped the mirror on a cardboard box by my knees. Finally, after several more days of these maneuvers, I could get out of bed for the treatment within an hour after sunrise. That was a year ago. This treatment may not be for everyone, it may even indirectly harm some people, but I swear by it for myself.

Janet (2007-05-07 05:28:06)

Have you tried meeting people first thing in the morning? Even if none of your friends are interested in waking up so early or don't have time before work, I'm sure you could find people on Craigslist who would be.

seth (2007-05-07 07:00:10)

Close to trying it, yes; actually trying it, no. It's a density thing: travel time is a problem. A friend of mine told me that her mom came out of a major depression during a period when she had breakfast meetings.

Jeff Winkler (2007-05-07 07:29:17)

Too bad [1]ze frank is off the air... he did the extreme closeup thing (sans blinking!). All the old shows are up.. might be worth watching. My GF/fiancee would think I was crazy if I stared in a mirror for an hour every day...though staring at her might be ok :)

1. <http://www.zefrank.com/theshow/>

diarist (2007-05-07 17:04:29)

"diarist, thanks for the suggestion. However, when I do that the wrong part of the screen (the upper left) is magnified. I need the center of the screen (where the face is) to be magnified." I had tried it on WinXPSP2, IE7, on a 1600x1200 screen; it worked for me. When I look at your sample YouTube video and zoom to 400 %, I get scroll bars in both directions. Using these scroll bars, position the video panel to fill your screen. You can see any part of the magnified page, not just the upper left. (This is a sort of mal-feature in IE7, that when it zooms it magnifies the whole page [text, images, layout] like a telescope, and introduces scroll bars. Normally that's not ideal—you'd usually like the page reflowed without horizontal scroll bars. But for your application of large faces, it works exactly right. AFAIK, Firefox 2 doesn't work this way. Opera does. Don't know about Safari. The recommendation was tried successfully only on IE7 on WinXP.)

seth (2007-05-07 21:26:13)

Thanks, diarist, for the detailed directions. I do get the scroll bars when I magnify the standard YouTube presentation – where the TV screen takes up about 10 % of the screen. I don't get the scroll bars when I increase the magnification after first going to full-screen view. The picture becomes much bigger but I only get the upper left portion of the screen – and no scroll bars to adjust. Magnifying the ordinary YouTube view by 400 % usually isn't enough, unfortunately. For example, this video, even when magnified by 400 %, still has the face much too small: <http://www.youtube.com/watch?v=ZdqOvBflp70>

pdf23ds (2007-05-08 11:46:48)

Seth, do you know if it's required to look directly at the face? I was thinking I could put a large face on my desktop background and read webpages with my browser resized to just fill a small portion on the left of my screen, but then the face would be just outside of my focal point.

seth (2007-05-08 20:23:04)

I think you need to look directly at the face. But you have an interesting idea; maybe the face could fill the screen and the text be superimposed on it.

pdf23ds (2007-05-09 16:31:24)

Search for "alphaxp lite" to find a free program to make windows transparent. I'm going to try using that program with my web browser and a desktop background of a face to see if it helps. Do the faces need to be facing directly at you, or can they be at, say, a 45 degree angle from the camera?

seth (2007-05-09 19:00:34)

Thanks for the alphaxp lite info. The faces need to be looking directly at you.

MorningPerson (2007-05-11 16:08:58)

Iâ€™ve been using the faces method for some time now, with significant (but not perfect) success. Iâ€™ve found that the more directly the face looks at the camera the better results I get and that there is diminished efficacy when the face diverges even just 20 or 30 degrees from directly facing the camera. I also found that a more interesting and compelling speaker gets better results, most likely because it causes me to focus more closely on the speakerâ€™s face. I too have tried Booknotes, which worked, but I eventually ran out of interesting lectures in which the speaker was facing directly at the camera. I also spent some time with You-Tube blogs (I also watched LucyinLA!) but found them unwieldy and impractical. The videos are typically very short and even the bloggers that most often provide a lot of face time vary in the amount of direct face time each particular one of their videos provides. Because of this, I ended up spending a lot of time looking for good videos, bouncing around among different videos and watching videos without a lot of good face time. It was difficult to get a quality 30 or 40 minutes of face time every day. However, if anybody wants, I can post a list of the bloggers that I found most helpful. I am

currently using The Teaching Company lecture series. I've found that in some of the series the lecturers provide a more direct camera gaze for more of the time than in others and it is difficult to gauge before ordering how good a particular series will be. It's also worth mentioning, in case any of you decide to order from them, that their website provides information on how prevalent visual aides (charts, graphs, photos) are in each series. The fewer visual aides the better, as they take away from direct face time. I asked The Teaching Company to post excerpts of their videos on their website (that way I can see which videos are better before ordering). Maybe if enough people request it they will listen! Janet: I was considering posting on Craigslist a while back but I decided that the post would sound pretty weird to most people who have never heard of the faces method and I would just attract a lot of strange characters (I live in NYC) as opposed to people with whom I would actually be able to have productive morning sessions. Finally, I wish there were a group study of people who tried the faces technique, so that we could know the percentages of people that achieved positive results. Seth, any thoughts on the likelihood of a study?

seth (2007-05-12 08:16:32)

The likelihood of such a study in the next few years is low. I for one would be interested in a list of the bloggers you found helpful.

dilys (2007-05-14 06:06:06)

I entered the Eastern Orthodox church a while ago, and the "wallpaper" of large icons, often faces, sometimes whole figures – in most churches distinguishes this tradition. One practice is to gaze at icons while praying. At what point of "reality" (obviously mirrors and videos are effective) in terms of stylization and motion do you think the cut-off might be for this phenomenon to be at work (not of course that I'm making a reductive suggestion that this is *all* there is going on)? As to collective religious wisdom, I seem to remember also that there were studies that Catholic monks who engaged frequently in Gregorian chant were healthier, less depressed, and needed less sleep, than monks where there was less chant. I don't suppose you have undertaken any experiments with sonorous humming... :-)

seth (2007-05-14 08:39:59)

I'll be a little surprised if still photos work, but I haven't tested them. In one experiment I did I compared sound + video of faces with sound alone – the sound alone did nothing. I think hearing voices can reduce feelings of loneliness but that is quite different than the faces effect.

Johnny Ingles (2007-06-05 08:55:52)

What about photographic portraits, would they work? Or does the face have to be moving?

seth (2007-06-05 09:10:04)

I don't know. I've never tried them. They might fail because of what is called "rapid adaptation" in the nervous system – an example of which is the way the second sip of orange juice tastes quite different from the first. I do wonder if I would get better results looking at several faces, not just mine, over the course of an hour. But I haven't yet tested that possibility.

Tim (2008-11-13 14:47:10)

Can you be more specific about your mirror distances? I ask because mirrors have some properties that may not be obvious. You say that your face in the mirror is exactly life-sized. Actually, your own face in the mirror is exactly half life-sized. This means that if you stand three feet away, it would be like having a conversation with someone six feet away (makes sense, as the light is traveling six feet). Another question I have about your post is you theorize this effect is because people used to chat with their neighbors shortly after waking. What if this predates language? I can't imagine 30-60 minutes of non-verbal communication to start your stone age day, but in any case stone age chatting was probably different than our chatting, and perhaps there's something to that. Great blog!

seth (2008-11-13 22:00:22)

The mirror is about 1.0-1.5 feet away – making the face appear to be twice that distant. I don't consciously measure it, I just try to make the face appear the proper distance for a conversation. I don't understand the question "what if this predates language?" Could you make more explicit what the question is?

Jimmy B (2010-06-27 09:22:00)

Seth, or anyone out there .. do you still do this ?? If so, some more reports would be great!

seth (2010-06-27 22:09:41)

I still do this, yes. But when I shift time zones (e.g., go from Beijing to Berkeley) I need to wait about 3 weeks before the effect regains full strength. I will soon post about using 2 faces rather than one.

Jimmy B (2010-06-28 14:54:49)

Thanks for the quick response Seth. I look forward to the updated article . Quick question, you stated that you get a mood boost , do you also feel more calm/ less general anxiety as well?

seth (2010-06-28 15:14:29)

The faces have three obvious effects on my mood/energy: 1. I feel happier. 2. I feel more eager to do things. If I think of doing something, I am more prone to do it, it is easier to do it. The opposite of procrastination. This is not the same as restlessness. 3. I feel more serene, less irritated by this or that bad event. Less prone to react to it. I don't feel general anxiety so I don't know if the faces would lower it. One of my subjects found she had a sharp reduction in mild panic attacks when she started seeing faces.

## Neat Freak (2007-05-06 22:20)

In [1]today's Freakonomics column, Dubner and Levitt write:

we can't think of a single person who, since the invention of the washing machine, practices  
laundry for fun.

Look no further: I do. And not just laundry: For my tenth high school reunion I listed my hobbies as "doing the dishes." Yes, I enjoy doing the dishes. Long ago I hired someone to clean my apartment (including laundry) not because it was dirty but because I was spending too much time cleaning it. More recently, because of the [2]growing success of The Shangri-La Diet (which Dubner and Levitt have everything to do with), I decided I could go back to cleaning a bit more so I hired someone to clean my apartment but not do my laundry.

Before [3]watching faces in the morning I suppose I was as messy as a typical guy. The mood elevation produced by faces suddenly changed me: I discovered I enjoyed cleaning, and I started to spend lots of time (about an hour/day) doing it. It would be harsh to say that messiness is a sign of depression but I think that a very messy room or office – not to be confused with [4]extreme hoarding – is a indication of the sort of problem that when it becomes extreme we call depression.

---

Sam (2007-05-07 01:16:50)

Do I read this right: you do not use a washing machine but instead wash your clothes by hand? At least that is what the quote says for me. Not only is this a lot of work, it also is quite a strain for the clothing to be scrubbed clean.

seth (2007-05-07 06:55:16)

I don't wash my clothes by hand, no. I agree the quote could be read that way. The column also refers to people who cook for fun; I'm sure they use tools such as gas stoves and blenders.

Evelyn (2007-05-08 16:09:19)

Gregory Hines, the late dancer, also mentioned in an interview one time (with the New Yorker? I don't recall), that he enjoyed doing laundry. I like having clean clothes, but prefer not to think too much about the process.

### **New Way to Lose Weight? (2007-05-07 14:42)**

At the Shangri-La Diet [1]forums, several people are trying [2]a new way to lose weight: Drinking a flavored calorie-free drink between and with meals. The first few weeks of experience suggest it works at least short-term. Here's what [3]Jenn does:

I am drinking about 1 1/2 to 2 litres of splenda sweetened kool-aid or iced tea/juice mix in water. You know those little packets that you add to a 2 cup water bottle. I have them with meals and then sip on them all day in-between. Sometimes I actually drink the whole bottle in a 1/2 hour (cause it tastes so good). I also add some olives and an occasional pickle to some of my meals and then if I want a little snack, I have a few of them between meals. This seems to really work too. . . . I never had that kind of AS [appetite suppression] or success with oils or SW.

Jenn has lost 6 pounds in a few weeks.

Why might this work (assuming [4]my theory of weight control is true)? Flavor signals must linger in the brain because it takes several minutes (15 or more?) to get a some idea of how many calories a food contains. To forget the flavor in a few seconds wouldn't work. If you eat a piece of ham and follow it with a sip of raspberry lemonade, the lemonade may reduce (erase) the memory of the ham flavor. This should have two effects: (a) reduce how much the ham flavor raises your set point and (b) reduce how much the ham flavor is associated with calories. You can think of the lemonade soaking up the associative energy that the ham calories produce. If the lemonade is also drunk (a lot) between meals, any lemonade-calorie association will disappear.

The interesting prediction: To get the effect, you must drink the calorie-free flavored drink with meals and between meals.

4. <http://sethroberts.net/about/whatmakesfoodfattening.pdf>

---

peter (2007-05-07 15:19:44)

this may explain why smoking tends to reduce one's weight. the taste of smoking reduces how much the flavor of the meal raises one's set point; the taste of smoking may also reduces how much a meal's flavor is associated with calories. Smokers also indulge throughout the day. The reason people gain weight after quitting may be the reestablishment of the flavor calorie association. Those smokers that want to quit should consider substituting a low calorie or no calorie taste to replace smoking. This may prevent them from gaining weight.

seth (2007-05-07 23:44:29)

You may have something there. Michel Cabanac, however, has done some experiments that imply nicotine lowers the set point.

peter (2007-05-08 08:29:12)

then one can take nicotine patches to augment the effect of sld or as a stand alone strategy.

S Williamson (2007-05-16 10:43:35)

I can't believe this is true, because my experience disproves it. For years, while I got heavier, and with no appetite suppression, I drank diet coke with nearly every meal and in between meals also. I can't believe I would be the only one to do this either. Currently, I have a friend that follows this same pattern, drinking Diet Coke both with and between meals, and his weight has gone up at least 20 pounds just over the last year.

seth (2007-05-16 18:38:33)

The implication is not: if you do this, you will never gain weight. The implication is: if you do this, you will weigh less than if you don't do it.

Brenda (2007-06-18 21:07:18)

In my experience, all sodas MAKE YOU GAIN WEIGHT, even the diet sodas. Because the acid in it makes you more hungry. My weight drastically reduced when I stopped drinking soda. Secondly, I never drink anything acidic. Pure fruit juices, especially organic ones, (sipped with a straw to avoid cavities) once in a while is good. I do drink coffee, latte, chai, or plain tea once in a while, mstly in the morning, (Kava coffee has reduced acid, and there are other brands). But predominantly I drink plain bottled water (usually Fiji water which has silica in it that's good for your skin and hair). I learned that drinking water before I eat helps. I don't drink water during or after the meal. Of course, I'll sip water throughout the day to keep me hydrated and my energy levels up. But I feel that if I sip something while I'm eating, it's flushing the flavor out of my mouth and then I end up wanting to bite more of the food. You want your taste buds to signal to the brain that they've had enough of eating this food now, bite after bite. And if I drink water after I've finished eating, I get hungry again soon after a little while. The water just flushes all that food down, and you're hungry again. So, to feel full, I don't drink during or right after a meal. I also notice not drinking or eating anything past 8pm or not eating anything for 12 hours after dinner until breakfast the next day, helps. Exercising one hour in the morning or one hour before going to bed or even both helps. I usually workout for a half hour in the morning and one hour in the evening. If I don't have time in the morning, i'll workout anywhere between 1 to 2 hours in the evening. However I do it, I make sure i get atleast a half hour of exercise a day, preferably running. I know if you're a meat eater, eating meat helps to sustain hunger. So, I eat deli slices once in a while (preferably low sodium). If you are not a meat eater, then eat something with fiber to sustain your hunger. I noticed that going on a soup diet or eating as much soup as possible, helps to reduce the weight. Another thing, I avoid dairy at all costs. But that's

just me. if it doesn't have sugar or fat, it's got sodium. Even though I eat meat, I drink plenty of water and I make sure that I get most of my fiber in the morning. If I don't eat enough fruits and vegetables or grains/breads, then I will take a fiber supplement in the morning, which actually helps to sustain my hunger. Or I'll put tasteless, clear fiber powder in my bottled water or coffee or any drink. Inulin, which is found in some fiber, keeps blood sugar levels normal and sustains your hunger.

### **IDEO Visits a Hospital (2007-05-08 14:00)**

Science is a form of systematic innovation, right? A particular way of learning more about the world. The design firm [1]IDEO has a systematic way of coming up with new designs, illustrated in this [2]hospital visit. My guess is that IDEO and science don't have much in common in spite of the surface similarity. The product design done by IDEO is a form of engineering. Science and engineering are like two phases in the lives of ants: random search (science) and path following (engineering).

When I co-taught a course about office design, we visited IDEO (in Palo Alto). Most of their work was contract (design a new X for Client Y) but they also had a small group of toy designers who came up with new toys on spec. Their mail room was lush, with magazines, food, and a TV. Its purpose, said the CEO, was to cause people to interact. It was the big shady tree of an African village.

### **The Man Who Walks Backwards (2007-05-09 14:20)**

From the Journal of the Royal Society of Medicine:

In his early 40s the [1]torticollis began to worsen and was accompanied by increasing lumbar spine pain as he twisted his torso to compensate for a deviated field of vision. An occupational therapist suggested he try walking backwards, and this he did with some success. . . . Friends nicknamed him 'The Sidewinder'. . . . He now never walks forwards unless asked.

Case report [2]here.

## My Theory of Human Evolution (American Idol edition) (2007-05-09 20:21)

My theory of human evolution ([1]paper, [2]talk) is that our brains changed in several ways to build healthy economies – in particular, to increase specialization, trade, and technical know-how. For example, collectors and connoisseurs pay more for finely-made things than the rest of us; the extra payment helps skilled craftsmen advance their art. Collectors and connoisseurs come to value small improvements, I believe, through side-by-side comparisons. Obviously side-by-side comparisons help us notice small improvements; it's the predicted hedonic change that's interesting.

After listening to Jordin Sparks sing "Woman in Love" on American Idol last night, I wondered what other singers had done with it. YouTube was happy to help.

Jordin Sparks

[EMBED] Barbra Streisand [EMBED] Liz McClarnon [EMBED] Lili Ivanova [EMBED] Young Divas [EMBED] Leticia [EMBED] Shiela Rodriguez [EMBED] Regine Velasquez [EMBED] After you listen to several of these performances, I predict you will respond more strongly – more fully? – to future performances. The better ones will bring you more pleasure, the worse ones more pain. You will be willing to pay more for the better ones. [3]Saul Sternberg has also been interested in the effect of side-by-side musical comparisons. [4]Christmas edition of my theory.

## Is the Goal of Education Obvious? (2007-05-10 19:03)

A Harvard task force [1]has concluded that Harvard undergraduate education needs improvement. One task force member is Eric Mazur, a professor of physics. He has presumably given the matter a lot of thought. Here is what he does and says:

As a model for innovative teaching, Professor Skocpol [head of the task force] pointed to Professor Mazur, the physicist.

He threw out his lectures in his introductory physics class when he realized his students were not absorbing the underlying principles, relying instead on memory to solve problems. His classes now focus on students working in small groups.

“When I asked them to apply their knowledge in a situation they had not seen before, they failed,” Professor Mazur said. “You have to be able to tackle the new and unfamiliar, not just the familiar, in everything. We have to give the students the skills to solve such problems. That’s the goal of education.”

The other faculty in Professor Mazur’s department are surely terrific at tackling “new and unfamiliar” physics problems, which is the skill Professor Mazur wants to teach his students. Yet these other faculty are obviously not good teachers. (When he lectured, Mazur was simply imitating those around him.) I conclude that the skills needed to (a) do good physics research and (b) teach physics well are quite different. So why is Mazur emphasizing the skills needed to do the former (research) and not the latter (teaching)? And what about all the other jobs in the world – what do “you have to be able to” do in those jobs? The goal of education is not as obvious as Mazur claims.

The electrical charge of a single electron was first determined by Robert Millikan, who made a mistake in his calculations (wrong value for the viscosity of air). It was several years before this mistake was noticed. In the meantime, other physicists calculated the charge on a single electron. They did not make Millikan’s mistake – yet they got [2]nearly the same (wrong) answer! Over time, the answers gradually drifted toward the correct answer.

That is essentially what is happening here. Mazur realizes something is wrong with the current system, but he has twisted his thinking – just as post-Millikan scientists determining the charge of an electron tweaked their equipment and data analyses – until the discrepancy is small enough to live with. The notion that “the goal of education” is being able to solve new and unfamiliar physics problems (or new and unfamiliar problems in general) doesn’t survive even a little scrutiny, but that’s what a Harvard professor who cares about education has come to believe.

## **My Theory of Human Evolution (business book edition) (2007-05-12 00:26)**

[1]My theory of human evolution says there are mechanisms that produce diversity of skills and knowledge. These mechanisms evolved because diversity of goods and services is crucial to a healthy economy. Human diversity generates economic diversity – the person who likes to paint becomes an artist, the person who likes to make things becomes an engineer. These differences are crucial because they allow trade. If everyone made the same things, there could be no trade and no gains from specialization. The more diversity, the better. This is the opposite of the way variation is viewed in statistics. A statistician thinks of variation in measurement as “error” – something to be reduced, perhaps by averaging. Variation is everywhere, of course; you can think of it as something to be encouraged or discouraged.

Human nature encourages diversity. You can build (a) institutions that encourage, benefit from, or at least accept human diversity or (b) institutions that discourage it. The former will work vastly better than the latter because the

latter are always fighting human nature. It is the difference between swimming with the current and swimming against it. This is the heart of my criticism of higher education: It is anti-human-nature. It is anti-human-nature because every student in a class is treated the same. Every student is expected to learn the same things and is measured using the same yardstick. Such classes ignore diversity and try to reduce diversity (every student is supposed to learn the same stuff, thus making their brains more similar). They are ignoring and fighting human nature.

When I told [2]Sarah Kapoor this critique, she recommended [3]First, Break All the Rules: What the World's Greatest Managers Do Differently (1999) by Marcus Buckingham and Curt Coffman. "You'll like it," she said. She was right. At the heart of what distinguishes better managers from worse managers, say the authors, is that the better managers have this "revolutionary insight":

People don't change that much. Don't waste time trying to put in what was left out. [In other words, don't try to make your employees identical.] Try to draw out what was left in.

In other words: 1. Start by accepting diversity. 2. Try to use it to advantage.

Better managers achieve better results, defined all sorts of ways, than worse managers. The author's conclusions are based on a vast amount of research done by the Gallup Organization.

Dave (2007-05-13 12:54:15)

Another book on this subject is "The Difference" by Scott Page, which recently came out. He shows how teams and groups of diverse individuals, or individuals with diverse tools, are better at solving problems and making predictions than those with lots of "ability."

Lizzie Connor (2007-06-08 16:43:05)

Dear Seth I just thought you (and perhaps some of your readers) might like to check out my new blog that traces the scientific story of human evolution from the Big Bang on, and makes the case for diversity as one of the key factors in all evolution. The accompanying book is available free to anyone signing in to my guestbook.

## Where Did Blogs Come From? (2007-05-13 03:18)

The more I blog, the more I think about blogging. (And [1]the more I enjoy blogs.) In an email to [2]Tyler Cowen I wondered if blogs were a new art form. He replied:

I've long been interested in early literary models for bloggers, including Boswell, Pepys, Julio Cortazar, and John Cage (having a co blogger and comments introduces an aleatoric element)...I'm always looking for others...

I replied:

My literary model is [3]Scheherazade. When I think of more standard precursors of blogs, I think of diaries and epistolary novels. Improvisational jazz, too, the way bloggers riff on something they've read. Also the Watts Towers – especially for [4]MR.

I think the way bloggers inject emotion into non-fiction is something new in the world of expression. Robert Caro once said that he tried to inject desperation into every page of his bio of Lyndon Johnson. "Is there desperation on the page?" read a note to himself pinned near his typewriter.

Non-fiction with emotion isn't easy, in other words. Caro's books are fantastic achievements because he manages to convey emotion page after page for thousands of pages. Not just Johnson's desperation – as a friend of mine said, Caro seems to "hate" Johnson. He certainly hated the later [5]Robert Moses.

Blogging with emotion, however, is easy. Almost unavoidable. For post after post. Nobody blogs about stuff they don't care about or feel strongly about. If you want to learn about something, find a blog about it.

Addendum: Speaking of blogs and art, [6]this NY Times Mag article is excellent.

## The New Yorker Crosses a Line (2007-05-14 04:22)

This week's New Yorker contains an [1]article (humor by [2]Larry Doyle) that can be fully appreciated only online – it is full of hyperlinks. A [3]press release calls the online version "an interactive version" of the article. A better term

would be "the real version." It's the difference between a sculpture (the online version) and a picture of a sculpture (the print version).

Before Spy ran into financial trouble, I had had approved an article about someone in the software industry. At the time, the Internet and web pages were just starting. I envisioned my article with lots of pseudo-hyperlinks (underlined bits of text in the main article connected to text boxes). Since there was no online Spy it would have just been a form of footnote or annotation. Alas, the article was canceled. My editor at Spy, Susan Morrison, now edits the section of The New Yorker in which this line-crossing Spyish article has appeared. "We [the editors of Spy] try to find new ways to present information," Susan once told me, as some staffers played a board game that appeared in the next issue. Larry Doyle used to [4]write for Spy. Congrats to both of them.

Could this have been cleverly timed to coincide with publication of Doyle's [5]new book? Probably.

Addendum: Doyle himself [6]comments:

I have a humor piece in the New Yorker today "and it's interactive! The piece is a website devoted to wedding plans of one particularly ambitious bride, crammed with links both real and fabricated: to her blog; to a new movie starring Reese Witherspoon and Jennifer Lopez; to a site on how to treat stab wounds. Once you've bought the magazine and read the story, go to [7]gwynnanddavesharetheirjoy.com and poke around (You need to read the story first, or the website won't make sense.) You can also read the story for free online, but where's the fun in that?

Love that dare not speak its name. Use of the old-fashioned term interactive is a hint that something is amiss. It's not interactive in the print version, Larry.

Tim Lundeen (2007-05-14 12:54:18)

This was a very funny article, thanks for linking to it! And you're right, to fully appreciate it you have to follow the links.

erypelrrina (2009-01-06 14:41:46)

What is bumburbia?

## **Underrated Tourist Activity (2007-05-14 17:12)**

Riding the bus. I dislike riding the bus where I live but in strange cities it turns out to be a great way to see the sights. Getting on a random bus has worked well for me in Shanghai and Seoul. I just ride until I see something interesting. Today I took a long bus ride in New Orleans to get to the local Whole Foods to buy flaxseed oil.

---

Stephen M (Ethesis) (2007-07-22 17:43:13)

Hmm, that might be why I didn't mind the bus from Sra to Venice, but don't like it usually.

## **Life-Size Faces on YouTube (2007-05-14 18:41)**

[1]My recent post about life-size faces; the comments are especially interesting. Here are some usable YouTube faces, thanks to MorningPerson:

<http://www.youtube.com/profile?user=Oneparkave>  
<http://www.youtube.com/profile?user=communitychannel>  
<http://www.youtube.com/profile?user=geriatric1927>  
<http://www.youtube.com/profile?user=LUCYinLA>  
<http://www.youtube.com/profile?user=lanCrossland>  
<http://www.youtube.com/profile?user=crossmack>  
<http://www.youtube.com/profile?user=faintstarlite>  
<http://www.youtube.com/profile?user=Paperlilies>  
<http://www.youtube.com/profile?user=xPLx>  
<http://www.youtube.com/profile?user=loneylgirl15> (the earlier entries are better)

MorningPerson (2007-05-17 14:32:56)

Another webpage with videos of talking heads is Barnes & Noble's Meet the Writers, at <http://www.barnesandnoble.com/writers/browse.asp?> If you click on the author names that are marked with a little filmstrip you will have access to a short online video interview of the author.

seth (2007-05-17 16:30:44)

That's good to know, thanks.

Heatherface (2011-05-01 19:06:58)

I'm not entirely clear on the purpose of this post, but I found it by Googling myself. If you still need to look at big heads in the morning, my new YouTube is [youtube.com/heatherface](http://youtube.com/heatherface) :)

## The Future of SLD (2007-05-15 07:57)

In a Pottery Barn yesterday, I noticed some air "fresheners" with names like Tupelo Honey, Paper White, Pomegranate, and Mandarin. Like an incense stick or scent candle, they add a pleasant smell to the air. The display included testers, similar to perfume testers, that produce a fine spray. I tried a few. They were an easy way to alter the flavor of one's food, I realized. I asked a clerk, "Can these be sprayed on food?" He tried to find the ingredients but couldn't. "Is this the strangest question you've been asked today?" I asked. "No one has ever asked me this," he said.

If you carried in your purse a few small sleek canisters of "food perfumes," you could easily make any food at any meal less recognizable and thus less fattening. Randomly using two or three perfumes per meal might provide enough diversity to last a lifetime. The SLD forum term for this is crazy-spicing. At least one person has lost a great deal of weight (80 pounds?) doing nothing else. You can still eat all your favorite foods; depending on the dose of food perfume, they will still taste good (if not out-of-this-world delicious). In [1]this post, Peter Merel describes his discovery that slightly-altered favorite foods no longer trigger binges.

a little slice of mud cake ... I know if I start I'm going to be inhaling that stuff big time. No question. Serious ditto for me.

Do you think lemon juice can cut that?

Only one way to find out. Into the microwave and then a squeeze of lemon juice on top. I'll admit the lemon juice didn't help a chocolate cake. But it wasn't bad either. I mean I'd have it again like that if this actually worked.

This Actually Worked!

I have also posted [2]many times about the benefits of flaxseed oil, which I believe derives from its high omega-3 content. The benefits are so large, fast, and repeatable I suspect almost everyone is suffering from omega-3 deficiency. The Shangri-La Diet of the future, I believe, will have three main parts:

1. Some sort of oil for weight loss and other benefits, including better sleep, better skin, and omega-3s. If it has flavor, you close your nose while you ingest it.
2. Elegant little spray cannisters of food perfumes to vary the flavor of your food.
3. (For hot weather) Ice-cold fructose water. I think it's a viable product, like ice tea.

1. <http://boards.sethroberts.net/index.php?topic=4619.msg47133#msg47133>

2. <http://www.blog.sethroberts.net/2007/02/24/omega-3-greatest-hits/>

---

Bob (2007-05-15 10:27:42)

Perfumes have petrochemicals, that's crazy to spray them on food. You can use food grade essential oils though.

Brad (2007-05-15 11:03:27)

Seth, actually spraying the perfumes on the food would be unwieldy and people are unlikely to do it while people are watching. Wouldn't it make more sense to carry a set of short-life liquid aromas (food "perfumes," if you will) that you could dab in each nostril before a meal?

William Roberts (2007-05-15 14:16:44)

I think you may not need to spray the food. If you rub the perfume under your nose you will smell it throughout the meal.

seth (2007-05-15 15:26:23)

The notion of dabbing a few perfumes in each nostril before a meal is fascinating. However, you might get sensory adaptation – after a minute or two there would no more effect. While eating the smell is on and off so there is less adaptation.

Sheri M (2007-05-17 22:42:17)

I successfully lost 60 pounds some years ago. One of my techniques when eating out was to divide all the food on my plate in half, then sprinkle salt and/or sugar packets liberally on one of the halves - thereby rendering it inedible.

seth (2007-05-18 00:56:12)

Very interesting! 1. Have you kept off the 60 pounds? 2. If so what were your other techniques?

cellardoor (2007-06-05 10:55:39)

It's fairly well known that by holding one's nose, one can greatly reduce the perception of flavor in food, drink, etc. This effect is not just (total taste perception) - (intake of aroma from food). For instance, if one were to contrive an apparatus that doesn't stuff up one's nose, but instead allows one to breathe only filtered air through the nostrils, the reduction in perceived flavor would be minimal. I'm curious whether people who don't really mind holding their nose (or perhaps, using noseplugs) while consuming food or drink, might thus be able to satisfice on the shangri la diet under non-ideal circumstances (where even sugar water in a teacup is difficult to get)...

seth (2007-06-05 14:30:07)

Many people have applied the theory behind the Shangri-La Diet by holding their nose closed while eating. It's called "nose-clipping".

## **Memorial University Continues to Destroy Its Reputation (2007-05-15 15:45)**

A [1]paper by Saul Sternberg and me questioned a 2001 Nutrition [2]paper by Ranjit Chandra, a nutrition professor at Memorial University of Newfoundland. We were not the first to question Chandra's published work. Many years earlier, a nurse named Marilyn Harvey, who worked for Chandra, complained to Memorial that Chandra could not have done the research he claimed to have done. It is now obvious that Harvey was right. A panel convened by Memorial, however, found that she was wrong – more precisely,

The university said it did conduct an investigation of Chandra's research, but based on what it knew at the time, "properly determined there was insufficient evidence to sustain the complaint against Dr. Chandra."

Harvey claimed that certain data didn't exist. The Memorial panel was unable to figure out if this was right or wrong!

Harvey showed a lot of courage. She put herself at considerable risk by challenging Chandra, who was the best-known professor at Memorial. By doing a travesty of an investigation, Memorial University failed to protect her. And

now Memorial University [3]is defending what they did! Such a defense is a second travesty.

As the person responsible, the President of Memorial, Axel Meisen, continues to demonstrate his cluelessness. When the truth about Chandra became evident, he [4]said, "I don't think one can conclude that everything Dr. Chandra did is under suspicion."

[5]More about Chandra.

### **Will It Last? (part 2) (2007-05-16 06:38)**

I posted [1]earlier about the recent increase in hits to the Shangri-La Diet [2]forums. Here is an updated graph.

My shallow data analysis failed to show me the most interesting thing: An increase in the rate of change. To see rates of change, I plotted ratios: hits today/hits one week before. I used one week because there are strong day-of-week effects: Sunday is different from Monday, etc. Here is a graph of these ratios.

The green line is no change. Points below the green line indicate decreases; above the green line, increases. The red line is from loess. Here is a close-up that shows the red line more clearly.

Since November, the rate of increase has been increasing. 5 %/week would be huge; the rate is now 10 %/week. This thrills me. It is a sign of what the Chinese call "word to word."

1. <http://www.blog.sethroberts.net/2007/04/04/will-it-continue/>
2. <http://boards.sethroberts.net/index.php?action=collapse;c=1;sa=expand#1>

---

Stephen M (Ethesis) (2007-07-22 17:42:41)  
 Hmm, this will be interesting to see next year.

### Why Blogs are Better-Written (2007-05-16 21:02)

... than other stuff the blogger writes: 1. Shorter. 2. More emotional. 3. More personal.

Example 1: Philip Weiss. Love his [1]blog, did not love his [2]book. Alas.

Example 2: Rebecca Aronauer. Love her [3]blog, especially the [4]book reviews. This [5]magazine article was less great. I hope this isn't the best writing I will ever do. [6]More blog theory.

1. <http://www.philipweiss.org/mondoweiss/>
2. <http://www.metacritic.com/books/authors/weissphilip/americanaboo>
3. <http://raronauer.blogspot.com/>
4. <http://raronauer.blogspot.com/2006/12/raronauer-reviews-in-2006.html>
5. [http://www.salesandmarketing.com/msg/content\\_display/publications/e3i778b0e5af917c8c649a51ebf1bd4fe4b](http://www.salesandmarketing.com/msg/content_display/publications/e3i778b0e5af917c8c649a51ebf1bd4fe4b)
6. <http://www.blog.sethroberts.net/2007/05/13/where-did-blogs-come-from/>

---

Candy Minx (2007-05-17 07:11:33)

I think there is an immediate gratification with blogs too. And you are writing knowing "someone" might read it... I don't know if my comment function is working but here is a review I did of your book... [http://gnosticminx.blogspot.com/2007/05/there-is-no-spoon\\_16.html](http://gnosticminx.blogspot.com/2007/05/there-is-no-spoon_16.html)

seth (2007-05-17 07:25:07)

Thanks for the great review, Candy. Maybe I should have called it the Matrix Diet, huh? My favorite part of the book is at the end, too.

Candy Minx (2007-05-18 09:33:31)

I am glad you were able to stop by and visit my review. Yes, The Matrix Diet would have been funny...I love movies so sometimes I see comparisons. I think The Shangri-La Diet is a perfect title though. I am still feeling benefits from the four basic rules. My skin feels amazing. I slept like a rock last night no wakin for 8 hours...that is unusual for me. did you read my link about Jane Jacobs when she passed away? I was impressed when you referenced her in your book. I hope you will add my review to your page with online reviews.

seth (2007-05-18 17:58:36)

I will add your review to the list of reviews, gladly! I didn't see your Jane Jacobs obituary - I'll look for it.

Tina (2007-06-01 01:18:32)

I'm less than a third-way through your book, and so far, I like it, so as far as I'm concerned, you have nothing to worry about. Also, I like Omega-3s and I like Cory Booker. I'm glad everything is going so well for your book- and I take it- you. Thanks to YOU, my diet's going pretty well for the second day into it. Thanks.

### **Andrew Gelman on Blogging (part 1 of 3) (2007-05-18 15:55)**

Long ago, scholars taught. Then they taught and wrote books. Scholarly journals began. Scholars taught and wrote books and articles. Now a few of them teach, write books and articles, and blog. For example, Andrew Gelman, a professor of statistics at Columbia University, whose blog is [1]here. To learn more about this new form of scholarship, I interviewed Andrew.

What led you to start blogging?

I started the blog in 2004 as a way for the students and postdocs in my research group to communicate with each other-the idea was that we would post items on our recent research and half-baked ideas, and it would be an open forum for us to comment on each others' ideas, also with the opportunity for outsiders to add thoughts. It also seemed

like a good way to publicize our work. I decided to post daily, and I figured that on days that I had nothing to say, I could just post one of my old papers. (As it turned out, I actually have a big backlog of blog entries now.)

Have there been any unexpected effects of blogging?

The blog itself developed differently than I expected. My students and postdocs rarely posted on it (except when I went on vacation and explicitly asked them to do an entry per day) so it became much more of my own personal forum. I've somehow developed a fairly equanimous "blog personality" in which I can comment on research by myself and others. Beyond that, I wouldn't say there have been unexpected effects. The most positive effects have been:

Commenters pointing me to software and research of which I'd been unaware;

Having to type up my vague ideas has forced the ideas into a less-vague state; it's also helpful to have to justify my thoughts to skeptical strangers;

Publicity for my work; I think that my ideas may be reaching more people now than before. But I anticipated all these effects. If those three positive effects went away or became small, would you stop blogging? If they all went away, and they weren't replaced by something else positive, then I suppose I'd stop. I do have a feeling of accomplishment from publishing every weekday for over 3 years (for my own sanity, I generally keep a no-weekend-posts rule), but if I wasn't getting anything out of it, I'd probably lose motivation and stop.

1. <http://www.stat.columbia.edu/~gelman/blog/>

---

### **Science in Action: Omega-3 (flaxseed oil vs. nothing 1) (2007-05-19 06:27)**

Do our brains need more omega-3? I have blogged about this [1] many times. My first two self-experiments to answer this question compared flaxseed oil (high in omega-3) with olive oil or sesame oil (low in omega-3). My balance was better with flaxseed oil, suggesting the answer is yes. However, another interpretation is (a) flaxseed oil had no effect and (b) sesame oil and olive oil made my balance worse. To test this possibility, I compared flaxseed oil to nothing (no supplement). If flaxseed oil has no effect, the two conditions should be the same. If flaxseed oil improves my balance, my balance should be better during the flaxseed-oil condition.

During the flaxseed-oil condition, I drank 4 tablespoons/day of flaxseed oil – 2 at 10 am, 2 at 10 pm. The balance test was at 8 am the next day. During both conditions, I did not eat fish.

Here are the results:

There was a large and very clear difference between the conditions. It took about three days of no flaxseed oil before the difference stopped increasing. On the first day of resumption of the flaxseed oil, my balance was much better than the day before. Comparing the two conditions (omitting the first three days of the nothing condition),  $t = 7$ .

These results support the idea that flaxseed oil made my brain work better.

Are injury-causing falls the [2]new scurvy? The large fast improvement in my balance when I resumed flaxseed oil does resemble the large fast improvement when a person with scurvy eats oranges.

I was surprised by the time course of the decrement during the no-flaxseed condition: It looks different than [3]what happened when I drank olive oil. In this experiment, my balance got worse for about 3 days and then stopped getting worse. In the previous experiment, my balance appeared to get worse for at least 9 days. This may be due to the high omega-6 content of olive oil – omega-6 (almost identical to omega-3) may displace omega-3. In the absence of omega-6, omega-3 takes longer to deplete.

1. <http://www.blog.sethroberts.net/2007/02/24/omega-3-greatest-hits/>

2. <http://www.blog.sethroberts.net/2007/04/29/does-too-little-omega-3-cause-falling/>

3. <http://www.blog.sethroberts.net/2007/04/21/science-in-action-omega-3-flaxseed-oil-vs-olive-oil/>

---

Rick (2007-05-19 07:05:33)

Would you get the same results with fish oil?

seth (2007-05-19 08:12:24)

Good question. Comparison of fish oil and flaxseed oil is high on my list of things to do.

peter (2007-05-20 09:02:55)

i note that your scores increased significantly after you "cycled" off flax seed oil. There is theory, mostly applied to exercise, where the results are better if one cycles on and off intense exercise, i.e., a short period of intense exercise followed by rest or low level exercise. see, A Healthy Mix of Rest and Motion <http://www.nytimes.com/2007/05/03/fashion/03Fitness.html> this theory has been applied generally to all activities, e.g., showering alternatively with hot and cold water etc.. I wonder if cycling on an off flax seed oil would improve ones score and ultimately result in a higher level of performance?

seth (2007-05-20 11:37:10)

My balance scores have always increased whenever I do the test – the general term for this is "practice effect". In other words, I don't think the "time off" had anything to do with it. Notice how the results "after" nothing fall on a line that fits the "before" nothing points – they show steady improvement, too. If you look at the other balance data I have posted, you will see there has always been steady improvement. I think it is due to more and more of the brain being devoted to the task. The exercise effect you talk about is surely due to a different mechanism.

### **Andrew Gelman on Blogging (part 2 of 3) (2007-05-19 21:25)**

To me the most interesting effect of [1]your blog is educational – when I read it I feel like I'm getting a painless lesson in advanced statistics. Any idea if it affects many other readers that way?

It's nice to hear this, but it's probably like the difference between watching baseball and playing it. A reader feels he or she is getting an education by reading the blog, but you really learn by doing. On the other hand, you (and many other readers) are active data analysts. So I suspect that you're really learning from your own data analysis. But the blog could be helpful because you go back and forth—something on the blog can inspire you to try something, which then motivates a question which is answered on the blog, etc.

In any case, I certainly help the people for whom I directly answer questions. Years ago I decided it was less effort to answer people's questions than to say No. (This was back when strangers would email me after reading [2]Bayesian Data Analysis with questions about nonconverging Gibbs samplers and the like.) Anyway, if I'm answering a question anyway, I might as well do it on the blog.

One thing I've tried to avoid is the lazy pattern of answering the easy questions and ducking the hard ones. I notice this on some computer bulletin boards (for example, R-help): There are some people who pounce on any easy question that comes up (often to tell people to Read the Manual). But when you ask a hard question, you get responses from a different sort of person. That's who I want to be. If it takes too much effort to be helpful in this way, I'd rather not try at all.

[3]Part 1 of this interview.

1. <http://www.stat.columbia.edu/~gelman/blog/>
2. <http://www.stat.columbia.edu/~gelman/book/>
3. <http://www.blog.sethroberts.net/2007/05/18/andrew-gelman-on-blogging-part-1-of-3/>

### Science in Action: Omega-3 (flaxseed oil vs. nothing 2) (2007-05-21 15:59)

Here are more results from my comparison of flaxseed oil with nothing. I wrote earlier about the [1]balance results.

Each day I measured how quickly I could do each of 100 simple arithmetic problems (e.g.,  $2+7$ ,  $5-2$ ,  $5*6$ ). I learned about this task from [2]Tim Lundeen. Tim did the task with paper and pencil whereas I used [3]R (a statistics-oriented language) on my laptop to do the experiment: For each problem, I typed the answer and then hit return. "FALSE" was printed if I made a mistake. The next problem appeared immediately.

Here are the average solution times:

There was a very clear difference,  $t = 6$ . It took more than one day for the effect to become clear, in contrast to the

balance results, where it took more than two days.

These results confirm what Tim found. Unlike what he did and my balance measurements, no special equipment was used (besides a computer). This may be the easiest way to study the effect.

My balance results have obvious practical value: Old people [4]often seriously hurt themselves due to loss of balance. What about these results? Well, failure to react fast enough causes many car accidents. Flaxseed oil (and probably other sources of omega-3) may make you a better driver.

[5]Directory of my omega-3 posts.

---

Jeff Winkler (2007-05-22 10:00:28)

Fascinating. Could you post/email the R program? I assume it logs the results to a file for analysis..

seth (2007-05-22 10:03:55)

I will post the program.

Jack Christopher (2009-03-19 10:04:02)

Are you vegetarian or vegan? I'm am, but if you're not, fish and krill oil are supposed to be better utilized by the body than flax.

## Five Similar Words of Wisdom (2007-05-21 23:04)

1. I have mentioned [1]several times what [2]Loren Berlin, a student at the University of North Carolina, told Nicholas Kristof, the New York Times columnist: Stop writing about African failures, start writing about African successes.

2. At the recent New Yorker Conference, Cory Booker, the mayor of Newark, NJ, [3]told this story:

I moved into Newark around 1995. . . In my first month there I saw my first shooting ever. . . I had my life threatened . . . That same month I met this woman who changed my life. She's an ornery, tough as nails, just an amazing certifiably insane leader. She was the head of the Brick Tower Tenants Association. . . I meet this woman . . . The first thing I say to her, in my Yale Law School arrogance, I say to her, "Ma'am, I'm Cory Booker, I live across the street, I'm here to help you."

She looks at me and she says, "You want to help me, first tell me what you see around you." . . .

"I see drug dealers." Which I said in a very respectful tone, in case they overheard me. "I see a crack house." I describe the neighborhood.

"Well, you could never ever help me."

"What do you mean?"

"Boy, you need to understand something. The world you see outside of you is a reflection of what you have inside of you. If you only see problems and darkness and despair that's all there's ever going to be. But if you see hope and opportunity and even love, then you can be somebody that makes a change."

3. As I mentioned [4]earlier, in *First, Break All the Rules*, the authors summarize what they learned from thousands of interviews into one lesson for managers:

Don't waste time trying to put in [your employees] what was left out. Try to draw out what was left in.

4. At the end of my [5]long self-experimentation paper, I wrote:

[Jane] Jacobs (2000) argued that caste systems and other forms of discrimination retard economic development because they prevent certain jobs from becoming the seeds of new businesses. . . . Belief that something is bad makes it harder to learn what it is good for – including what it could become.

I was referring to the belief of many psychology professors that self-experimentation is bad.

5. In an [6]interview with someone from Buffalo, NY, Jane Jacobs said how development of Buffalo should proceed:

You need to do something – I hate to keep repeating myself – that's unique to Buffalo, that comes out of Buffalo itself. You don't want to keep acting like a company town.

In other words, don't try to make Buffalo more like other cities. Try to make it less like other cities.

Curious, huh?

Thanks to [7]Tobian, who blogs about Ethiopia, for reminding me of the [8]Loren Berlin letter.

## R Programs Used to Study Omega-3 (2007-05-22 10:17)

I [1]recently posted that flaxseed oil affected how fast I did simple arithmetic problems (a way to measure brain function). Someone asked to see the [2]R programs I used. Here they are.

```
> arithmetic.add
function (trials=100, condition = "test2", procedure = "no mistake correction",note="")
{ # collect new arithmetic data
#
invisible()
start.time=Sys.time()
condition=new.condition()
start.expt()
trls=sample(rep(c("+","-","*"),times=c(34,34,34)),size=trials) #determine trial sequence
t=arithmetic[1,]
for (tr in 1:trials) {
t2=c(current(),condition=condition,procedure=procedure,trial=tr,arithmetic.new.line(func=trls[tr]),note=note)
t=rbind(t,t2)
}
arithmetic«-rbind(arithmetic,t[-1,])
save.ws()
arithmetic.plot()
cat("total time",round(difftime(Sys.time(),start.time, unit="mins")), "minutes\n")
}
```

```
> new.condition
function (conditions.so.far = arithmetic $condition)
{ # get new condition name
#
# conditions.so.far vector of conditions so far
#
cat("most recent condition",last(conditions.so.far),"nth is condition")
condition=scan(nlines=1,what="character",quiet=TRUE, sep="!")
condition
}
```

```
> start.expt
function ()
{ #wait for Enter to start data collection
#
cat("press Enter to start "); scan(quiet=TRUE)
}
```

```
> arithmetic.new.line
function (func="+")
{ # give addition, subtraction, or multiplication problem
#
# func function
#
b=sample(0:9,2)
```

```

if(func=="+") answ=b[1]+b[2]
if(func=="-") {b[1]=b[1]+b[2];answ=b[1]-b[2] }
if(func=="*") answ=b[1]*b[2]
start.time=Sys.time()
cat(b[1],func,b[2],"= ")
a=scan(n=1, what = "integer", quiet = TRUE)
msec=as.integer(1000*difftime(Sys.time(),start.time,unit="sec"))
correct=a==answ
if(!correct) print(correct)
list(type=func,first.num=b[1],second.num=b[2], msec=msec, answer=as.integer(a),correct=correct)
}

```

```

function (vec, n = 1, drop = 0)
{ #return last n elements of vec
#
# vec vector
# n number of elements
# drop elements at end to drop before taking n elements
#
le=length(vec)
okay.le=le-drop
vec=vec[1:okay.le]
le=length(vec)
ind=(1+le-n):le
vec[ind]
}

```

---

Maja (2007-05-23 07:11:31)

Wow, to somebody like me who doesn't know much about statistics, this looks like a very impressive formula. My 16-year old daughter wants to study psychology, but doesn't like maths. I'm not sure whether I should show her it or not.

Matt (2007-06-05 10:38:54)

I can't get this to work. There is a function called last() that is called by new.condition() that I don't have on my build of R. Is this a function you forgot to include?

seth (2007-06-05 14:10:58)

```
oops. here it is: function (vec, n = 1, drop = 0) { #return last n elements of vec # # vec vector # n number of elements #
drop elements at end to drop before taking n elements # le=length(vec) okay.le=le-drop vec=vec[1:okay.le] le=length(vec)
ind=(1+le-n):le vec[ind] }
```

### Andrew Gelman on Blogging (part 3 of 3) (2007-05-23 05:15)

What have you learned about blogging?

I'm surprised that there are no other statistics blogs. Chris Genovese used to do one but he stopped--and his blog was more personal than [1]mine, less about statistics. I've tried to stay on topic (most of the time), since that's what I have to offer. I have political opinions, cute stories about my kids, etc., but why should anyone care about this?

I'm also surprised there are so many blogs about economics. Especially since psychology is more interesting (to me). Is this just path-dependence, or maybe actually there are a lot of other blogs out there that I don't know about. I read some econ blogs partly from clicking my link to Alex's [2]Marginal Revolution blog which links to others. There are also a lot of tech blogs and computer science blogs but this is less surprising given that it's on a computer. I suppose there are also lots of blogs about current TV shows and so forth that I don't really have interest in. As it is, I already read too many blogs. I'm trying to spend more time reading the newspaper. Regarding my own blog, first I was surprised that my students/postdocs/colleagues had so little interest in posting, second I was surprised at how few comments I get on most entries. I don't always know what will get comments, actually. I've had some success using the blog as a sort of out-box where I can park my ideas, but it's not a panacea. For one thing, it means I spend more time on the computer, which is hard on my hands and maybe degrades my general work productivity.

It's fun having 1000 readers a day (whatever that means; as a statistical consumer I'm remarkably uncurious about where the numbers come from. One day my postdoc discovered that we had set a switch wrong on the counter, and it turned out we had 1000 rather than 500 per day) although it's hard for me to think if that's a lot or a little. Many of my favorite statistical ideas have had struggles with acceptance (for example, there are still a lot of statisticians, even Bayesians, who fit models without even trying to see if they produce replications that look like observed data) so the proselytizer in me wants that large audience.

Finally, I've learned that writing can be easier than reading. As is illustrated by the above response that I've spewed out.

## Jane Jacobs on Pay Per Click (2007-05-24 08:54)

Jane Jacobs has [1]said:

You canâ€™t prescribe decently for something you hate. It will always come out wrong. . . . People [who] give prescriptions, who have ideas for improving things, ought to concentrate on the things that they love and that they want to nurture.

Emphasis added. This applies more widely than I might have thought. [2]Here is an example:

Two gourmet chocolate companies. Two pay-per-click ad campaigns. Two very different results.

Charles Chocolates – a small artisanal chocolate manufacturer in Emeryville – spent \$3,000 on pay-per-click ads over a three-month period last year and sold fewer than five boxes of chocolates. Meanwhile, Lake Champlain Chocolates – a rival chocolatier based in Vermont – sells about 30,000 pounds of chocolates each year from pay-per-click ads.

What accounts for that difference?

With 100 employees, Lake Champlain is far larger than 25-person Charles Chocolates. And with an annual pay-per-click budget of \$100,000, it also spends far more on ads than Charles Chocolates did. But that doesn't really explain the difference. When Lake Champlain started experimenting with pay per click in 2002, its budget for all forms of marketing was just \$5,000.

What Lake Champlain did have was an inquisitive employee who threw himself into learning everything about how pay per click works – mastering arcane details and strategies about keyword bidding . . . Middings was fascinated by a medium that seemed the reverse of conventional marketing. . . . Middings taught himself the tricks of the trade. He developed a list of 70,000 – seventy thousand – keywords to bid on.

Jane Jacobs on the [3]food industry and [4]scientific method.

---

Jared Schroder (2007-06-12 16:53:42)

Its all about the keyword tail. Long tailed keywords are the foundation of a successful pay per click campaign. Especially when you are dealing with a relatively small budget. A company like Charles Chocolates could waste their entire monthly budget on a keyword like "chocolate" in a single day on Google alone. By implementing keywords such as "buy chocolates online", "specialty box of chocolates", "hand made chocolate candy", or "online specialty chocolates" and thousands of variations of these you can get the best bang for your PPC buck. This is where a small company can find great ROI for their pay per click efforts. You have to be careful with extensive keyword lists, not to overwhelm yourself. So breaking this list down into common components and by the need for different ad copy is very important. Another option is to locally target your campaign to the geographic areas where your customer base is located. This way you can bid more aggressively on the more competitive keywords and still limit your daily ad spend. All of these tactics can help a smaller company succeed in the pay per click game, but if you don't have the necessary ability to track which keywords are generating your sales then you may be "up a creek". My advice is to get the proper tracking and be very smart about keyword building and organization.

## Science in Action: Omega-3 (flaxseed vs nothing 2 continued) (2007-05-24 21:57)

Flaxseed oil increased how fast I did [1]simple arithmetic problems (e.g.,  $7+5$ ,  $9-4$ ,  $3*7$ ). To better measure the effects of fats on my brain, I wanted to find out which problems were most sensitive to flaxseed oil. Then I could hope to create a more sensitive test.

Before looking at the data, I assumed that problems that required more processing – more time – would be more sensitive. But this was not what I found.

First, I compared problems with different functions – plus, minus, and times. (E.g., 5+4 is a plus problem.) Sensitivities:

function	F	n
plus	15	1400
minus	9	1400
times	16	1400

The F values are for the flaxseed/nothing comparison. Greater F = more sensitive. The n values are the number of trials. These results more or less agreed with my preconceptions: times problems were slower than the others.

Then I compared problems based on their correct answers. I divided the problems into groups with roughly equal number of trials. Sensitivities:

answer	F	n
0-3	12	1000
4-6	15	700
7-9	6	900
10-19	2	900
>19	13	500

This was the surprise: Problems with answers 10-19 contributed almost nothing to the overall sensitivity, while problems with answers on both sides contributed much more. Was typing "1" the problem? No, problems with the single-digit answer "1" were no worse than problems with similar one-digit answers.

I redid the analysis omitting problems with answers 10-19 and found more sensitivity to the effects of flaxseed oil – a slightly larger F (or t) value, even though the number of trials was 20 % less. Here is a graph based on the more sensitive analysis:

No important differences from the earlier, less sensitive analysis:

Based on these results I will get rid of the subtraction problems and the problems with answers from 10-19. I haven't decided whether I will keep the total number of problems the same; I might increase the number (which is now 100 - 100 arithmetic problems per session).

1. <http://www.blog.sethroberts.net/2007/05/21/science-in-action-omega-3-flaxseed-oil-vs-nothing-2/>

---

Jeff Thomas (2007-05-25 08:09:04)

I just wanted to point out that for most of these simple problems you are not doing calculations in your head, but rather you are just remembering a memorized answer. This is particularly true for multiplication (where you have memorized the tables) and addition (where you do it so often that you have essentially memorized the answers as well). Subtraction is something you do a bit less often in real life, and thus for some of the subtraction problems you may actually be doing some quick manipulation in your head. So the lower sensitivity of the subtraction problems to the oil might indicate that the oil affects how fast you can call up something from your memory, rather than how fast you can manipulate numbers in your head.

seth (2007-05-25 10:18:47)

The subtraction problems are very simple, e.g.,  $9 - 6$ . Just as easy as  $5 + 3$ , on the face of it. But it's true that I probably do much more addition than subtraction in everyday life. I can test this idea by seeing if the subtraction problems showed more

improvement/session at the beginning than the addition and multiplication problems. If I do them less in real life, they should show more improvement.

peter (2007-05-25 15:08:08)

is there a way to measure your ability to solve more abstract problems, thereby providing a more meaningful measurement of intelligence and any improvement as the result of consuming omega-3 fatty acids?

seth (2007-05-25 15:35:12)

"Intelligence" – you mean the ability to do well in school (which is how the first IQ tests were constructed)? It is quite hard to measure the ability to do more abstract problems; I don't think experimental psychologists have come up with good ways of doing so. My interest is in brain function; arithmetic problems and balance are just two ways to measure that. Since the whole brain is made of the same materials (neurons and glial cells, etc.), I believe that anything that improves one sort of brain function is likely to improve all sorts of brain function. So far the evidence supports that belief.

### **Memorial University, Meet Zagreb University (2007-05-26 06:39)**

From this week's BMJ:

The saga began in the late 1980s when Dr Chalmers was preparing a systematic review of epidural anaesthesia. He noticed that much of the text and data in a 1974 paper co-authored by Professor Kurjak were identical to those in a paper from a different group of authors published three years previously.

He reported his observations to the editor concerned and to Professor Kurjak's university [Zagreb University]. Both requested that the matter be handled discreetly.

In 2006 Dr Chalmers discovered that Professor Kurjak continued plagiarising. A report in 2002 showed that he had taken material from a Norwegian doctoral thesis and published it under his own name as a chapter in a book on fetal neurology.

Likewise, Dr. [1]Ranjit Chandra continued his misdeeds long after someone complained to his employer, Memorial University of Newfoundland. Memorial University and its President, Axel Meisen, deserve some sort of award for now [2]claiming Memorial did nothing wrong when it allowed Chandra to continue.

More [3]here. An [4]editorial by me about how well universities handle this sort of thing.

1. <http://sethroberts.net/chandra/index.html>

2. <http://www.blog.sethroberts.net/2007/05/15/memorial-university-continues-to-destroy-its-reputation/>

3. <http://www.bmj.com/cgi/content/extract/334/7603/1077-a>

4. [http://sethroberts.net/chandra/2006\\_Dealing\\_with\\_scientific\\_fraud-a\\_proposal.pdf](http://sethroberts.net/chandra/2006_Dealing_with_scientific_fraud-a_proposal.pdf)

---

Andrew Gelman (2007-05-26 08:16:38)

Seth, I'm curious—your article on scientific fraud seems to be labeled by the journal as a "Debate." Were there accompanying articles or discussions by others?

seth (2007-05-26 08:48:50)

Not exactly. It was the first example of a new section ("Debate") and there were no other articles in that section, no replies to what I had written. However, in that issue an editorial from the editor said this: "Public Health Nutrition will be the forum for communication and debate about the nature of what needs to be done and the best way to do it" which means the journal must have a role that is wider than simply receiving and accepting or rejecting original contributions. The journal must engage actively in discussion about the big issues that affect the nutrition-related well-being of society. The journal must be an example of best practice in terms of defining, adopting and following standards of best practice."

### **Science in Action: Sunlight and Sleep (could it be?) (2007-05-26 11:42)**

In an airport a few weeks ago, chatting with a stranger, I told her about my self-experimentation. [1]When I stand a lot, I sleep better, I said. She said that sunlight had the same effect on her: When she sunbathes, she sleeps better. Better how? I asked. More deeply, she said.

I had found that [2]morning sunlight (an hour, say) helps me sleep. Her idea was different: No one sunbathes in the morning. She was saying that the amount of sunlight matters independent of the time of day.

This was fascinating because I remembered two days, prior to studying the effects of standing and morning light, after which I had slept very well (i.e., woken up feeling very well-rested):

1. A day when I went to many artists' studios to look at their work (an event called Open Studios).
2. A camping trip.

Both days I was on my feet a lot. But both days I was also outside a lot, I realized.

Yesterday I gave her idea a test: I spent more time than usual outside – about three hours more, I'd guess. I spend a lot of time sitting in cafes writing; yesterday I sat outside instead of inside.

This morning I woke up feeling unusually well-rested. This bears more investigation.

---

1. <http://repositories.cdlib.org/postprints/117/>

2. <http://repositories.cdlib.org/postprints/117/>

Timothy Beneke (2007-05-26 12:21:47)

You might recall the experiment done at Wake Forest where they had subjects who liked to sunbathe spend time in two areas of artificial sunlight; one of which had the ultraviolet light screened out. They were given mood assessments afterwards and alternated exposures in the different rooms. Mood was much higher after being exposed to the UV light; and when they were given a choice at the end of the experiment to pick one of the two rooms to sunbathe in, 11 of 12 preferred the one with UV light. Here's one summary <http://isteve.blogspot.com/2006/04/tanning-and-mood.html> "Professor Steven Feldman The Wake Forest team analysed 14 people, aged between 16 and 34, who typically used tanning beds two times a week. Each volunteer spent 15 minutes lying on a sunbed which exposed them to UV rays and then on another - again for 15 minutes - which released no rays. The volunteers were not told which beds released UV. The subjects were asked if they would like to return days later and use a sunbed of their own choosing. Twelve returned and 95 % [?] opted for the bed which radiated UV light. They said it made them feel good and helped them relax. The researchers believe that tanning may release endorphins into the bloodstream." And another URL: <http://news.bbc.co.uk/2/hi/health/3917985.stm> So the better sleep could be mediated by better mood during the day. Maybe you should try being outside exposed to UV rays versus being in the shade outside... There's also the question whether sunlight is a conditioned stimulus; we react with positive emotion because we associate it with freedom as children (Rain rain go away), and warmth. I don't think in desert cultures people love sunny days... It may be that being out in "beautiful" sunny days lifts mood, which enhances sleep. So I'd be curious to see if being outside on cloudy days has the same effect. God science is complicated and hard - but the knowledge can change your life. Cheers, Tim

Linda (2007-08-30 03:58:05)

I have noticed that on days I lay out in the sun for a minimum of one hour, I sleep like a baby. Other days, I don't sleep well at all. Unfortunately, I live in an area where we get rough winters. I am going to try, however, to be out in the winter on sunny days to see if that still enhances my sleep. I wish I could bottle whatever it is that helps me sleep.

### **Science in Action: Omega-3 (flaxseed oil vs. nothing 3) (2007-05-27 05:58)**

I blogged earlier about comparing flaxseed oil and nothing: here are the [1]balance and [2]arithmetic results. I also used a paper-and-pencil memory-scanning task that I described [3]earlier. Here are the flaxseed vs. nothing results from that task:

The difference was even clearer -  $t = 8$  - than with the other measures (balance,  $t = 7$ ; arithmetic,  $t = 6$ ). It took about three days of no flaxseed oil before its effect completely wore off, but only one day of resumption to reach full strength again - the pattern seen several times earlier.

The test took 5 minutes/day, twice as long as the arithmetic problems but only half as long as the balance test. The equipment demands are mild: printer, pencil and paper (in addition to computer).

I'll discuss the implications in a later post.

1. <http://www.blog.sethroberts.net/2007/05/19/science-in-action-omega-3-flaxseed-oil-vs-nothing-1/>
2. <http://www.blog.sethroberts.net/2007/05/21/science-in-action-omega-3-flaxseed-oil-vs-nothing-2/>
3. <http://www.blog.sethroberts.net/2007/04/25/science-in-action-omega-3-flaxseed-oil-vs-olive-oil-continued/>

---

Geoff (2007-05-29 15:50:43)

It will be interesting to see what kinds of results you see (if any) when you start blinding the tests. Any good ideas on how to go about doing so?

seth (2007-05-29 16:26:05)

Use capsules. I can put them in identical containers that I label on the bottom and mix up.

Geoff (2007-05-30 11:12:16)

So is there a blinded version of your experiments in the works?

seth (2007-05-30 14:34:01)

By me, no. I prefer to do experiments where I am less sure of the answer. Most placebo-controlled experiments are, in my opinion, poor experiments. They are poor from both a pure-understanding and a practical point of view. From the pure-understanding point of view, they are bad because the manipulation is so crude: the conditions being compared differ in dozens of ways. From a practical point of view, they are bad because the knowledge they provide is almost useless: The interesting practical comparison – the comparison that interests consumers – is not between Treatment A and a placebo, it is between two plausible treatments.

Tina (2007-06-01 00:53:01)

Good point! Have you seen David Burns' critique of clinical trials of psychiatric medication? See chapter 4 of his newest book entitled WHEN PANIC ATTACKS. The chapter is called "Placebo Nation: The Truth about Antidepressants and Anti-Anxiety Medications." Essentially, the two of you are agreeing.

seth (2007-06-01 06:49:42)

Thanks. And thanks for telling me about Burns' book, which I haven't seen.

### **Science in Action: Sunlight and Sleep (could it be? continued) (2007-05-28 06:36)**

Yesterday I deliberately spent almost all day indoors. I didn't change anything else. This morning I woke up feeling less refreshed than usual. Here are the last three days:

Day 1: Try to spend lots of time outdoors (in the shade). Result: Wake up feeling more refreshed than usual.

Day 2: Try to spend lots of time outdoors (in the shade). Result: Wake up feeling more refreshed than usual.

Day 3: Try to spend as little time outdoors as possible. Result: Wake up feeling less refreshed than usual.

My belief is increasing. Via Google I found [1]this:

Person 1: During the warm months of the year, I swim ...a lot! . . . The amount I sleep during swimming season can increase by 1-2 hours.

Person 2: You're probably sleeping longer due to all the extra calories and physical exertion you use by swimming.

Person 1: Nah, it's the same physical exertion year round for me. I exercise year round. But in the warm months, my exercise takes me outside where I am exposed to sunlight instead of artificial indoor light. That's how I know it's the sunlight that helps me sleep better.

I also found this:

We have found that people who are outdoors more have fewer sleep problems.

From an interesting [2]mini-book about the dangers of sleeping pills (apparently the new ones cause cancer). I haven't yet found the study it refers to.

---

Matt (2007-05-28 21:29:17)

I've been informally experimenting with sunlight as a sleep aid for the past year, and I now have the suspicion that it helps me sleep better but unfortunately no hard data to share. [1]Janet Raloff's wonderful two-part article on lighting's environmental and human impacts is what started me thinking about it last year. She cites some interesting research being done in this area. I'm glad you're taking a hard look at it now! I'd be interested in participating in a group study if such a thing comes about.

1. <http://www.sciencenews.org/articles/20060527/bob9.asp>

Trina (2007-05-29 08:28:17)

I am very grateful for the information concerning sleeping pills. This is completely new to me and a frightening revelation. I have used eszopiclone sporadically for a few years, although I tried to be careful and usually took  $\frac{1}{2}$  dose when I did use them. And really, my sleep was never really improved with them. Now they are dumped! You seem to keep saving my life!

seth (2007-05-29 08:32:13)

Thanks, Trina.

Timothy Beneke (2007-05-29 11:58:43)

I sleep better, and feel better generally when I get a lot of fresh air; both when the air I'm sleeping in is fresh and when my apartment during the day has fresh air. When you are outside you are getting both more sunlight and more fresh air; this is a confound that would have to be dealt with. Can you get more sunlight without getting more fresh air and see if you still get the effect?

seth (2007-05-29 16:02:55)

I can sit in front of a big window looking out.

Janet Rosenbaum (2007-06-03 11:57:07)

Doesn't a window filter out one component of UV light?

### **The Secret of My Success (2007-05-29 06:01)**

Jane Jacobs said dozens of things that impressed me, [1]this most of all:

You can't prescribe decently for something you hate. It will always come out wrong. You can't prescribe decently for something you despair in. . . . I think people [who] give prescriptions, who have ideas for improving things, ought to concentrate on the things that they love and that they want to nurture.

She had noticed that people who hate cities or who despair of cities make bad prescriptions for them.

It was a long time before I realized this comment applied to me. I used [2]self-experimentation to improve my sleep and mood and to lose weight. Unlike most health researchers, I wasn't trying to solve other people's problems – I was trying to solve my own. No wonder I persisted in spite of many failures.

[3]Similar advice. Another [4]example.

## Best Google Talks I've Heard So Far (2007-05-30 08:50)

The collection of Google Talks at YouTube is the best collection of stuff I've found to listen to while I [1]look in the mirror every morning. The best (so far) of the best:

Don Tapscott, author of [2]Wikinomics:

[EMBED] Jessica Livingston, author of Founders at Work: [EMBED] Reed Hundt, author of In China's Shadow: [EMBED]

1. <http://www.blog.sethroberts.net/2007/05/06/life-size-faces/>
2. <http://wikinomics.com/>

---

Brad (2007-05-30 16:43:18)

How big is the mirror you use, and how far away? How long do you look at yourself, & around what time in the morning? Sorry for the barrage of questions!

## **Don't Follow the Money (2007-05-30 19:38)**

Dr. Erika Schwartz, a New York internist, rightly [1]chastises the New York Times for a [2]long article about stroke (part of a series on major causes of death) that says nothing about prevention. Schwartz attributes the over-emphasis on treatment to relative cost: Treatment is far more expensive than prevention. Memo to Gina Kolata: Don't follow the money.

This is a genuine problem with self-experimentation: It costs almost nothing. No status-enhancing grant is required to do it. One of many ways that science is at odds with human nature.

1. <http://www.drerika.com/blog?action=viewBlog&blogID=232675754370729215>

2. [http://www.nytimes.com/2007/05/28/health/28stroke.html?\\_r=2&ref=health&oref=slogin&oref=slogin](http://www.nytimes.com/2007/05/28/health/28stroke.html?_r=2&ref=health&oref=slogin&oref=slogin)

---

Tina (2007-06-01 00:44:16)

Tell me about it!

Erika Schwartz, MD (2007-06-06 12:26:07)

Thank you Seth! You are correct and your approach to helping people loose weight with natural, awareness enhancing methods works. I can attest to it and I am a conventional doctor who got fed up with a system that more often harms than helps. DrErika

seth (2007-06-06 12:33:22)

Thanks, Erica. "A system that more often harms than helps" – I think you have put your finger on the problem. The less obvious effects turn out to be more damaging than the more obvious effects are beneficial. I was watching a movie this morning that begins with an old man taking a handful of pills. "Please don't let my old age turn out like that," I thought to myself.

## **The New Yorker Crosses Another Line (2007-05-30 22:41)**

A few days ago the New Yorker [1]website added magazine-quality material to only the website. Stuff just as good as the stuff in the magazine, but not in the magazine. This is a first for The New Yorker and perhaps for any magazine. The never-before-broken rule has been that the website-only stuff is inferior or at least subsidiary to the printed stuff.

The particular item is [2]humor by James Collins, who used to write for Spy. Brilliant writer. I read his pieces over and over. I especially liked one about friendship ("The Nature of Friendship Today"). "My social life was paying off," it began.

The New Yorker website doesn't have a good place for Collins's piece on the home page. It is listed under "Shouts & Murmurs" but there is no indication that, unlike the other Shouts & Murmurs links, which precede and follow it, it is online only. Well, yes, Jackie Robinson was a first baseman, but to describe Jackie Robinson as a first baseman is incomplete.

I suspect my old editor, Susan Morrison, is behind this just like I think she was behind the New Yorker line-crossing a [3]few weeks ago. Incidentally, the printed Shouts & Murmurs (about a [4]creative astronaut) is very good.

3. <http://www.blog.sethroberts.net/2007/05/14/a-line-has-been-crossed/>
4. [http://www.newyorker.com/humor/2007/06/04/070604sh\\_shouts\\_kanin](http://www.newyorker.com/humor/2007/06/04/070604sh_shouts_kanin)

---

Frank Quist (2007-05-31 07:20:37)

I'm not sure it's exclusive to the New Yorker. There are many magazines that publish web exclusives. What defines 'good' is subjective, of course. Just going through some magazines in my head, I can think of the Economist (its Global Agenda section) and the New Republic (they publish some great stuff online sometimes). The Atlantic Monthly, Mother Jones and The American Prospect also might be contenders.

seth (2007-05-31 07:34:33)

All the web-exclusive stuff I have seen on magazine websites has always been stuff that would not appear in the magazine for either or both of two reasons: quality too low or format not appropriate. Web exclusives are often written by interns, for example. That recent reality show about Rolling Stone interns showed many examples.

Dan Liebert (2007-06-05 06:08:58)

This is too short for a Shouts and Murmurs hard copy.

seth (2007-06-05 06:22:28)

Interesting point. Yes, why doesn't The New Yorker have a place for humor of this length? Maybe it could go in Talk of the Town – now that they're signed.

## 2.6 June

### Science in Action: Flavor-Calorie Learning (simple example) (2007-06-01 11:52)

The Shangri-La Diet is partly based on the idea that we learn to associate flavors and calories. A food's flavors become associated with the calories in the food. This association makes the flavor more pleasant.

I would like to learn more about this associative process so I have been studying it. Here is a simple example. At intervals of a day or so between bottles, I drank 4 bottles of a lemongrass-flavored soda. I chose that flavor because it was unfamiliar. Each bottle had 50 calories of cane sugar. I rated how pleasant each bottle tasted on a scale where 40 = slightly unpleasant, 50 = neutral, 60 = slightly pleasant, and 70 = somewhat pleasant. I drank the bottles between meals – far away from other food.

Here are the ratings.

The flavor gradually became more pleasant.

---

Timothy Beneke (2007-06-01 14:55:55)

Next, try swishing it around in your mouth and spitting it out, and keep assessing for taste pleasure; see if it has a deconditioning effect as one would predict. My experience with "enlightened tasting" where I let myself taste but not swallow junk food that I'm attracted to suggests that by the third day, the flavor will be negative again...

peter (2007-06-01 15:39:37)

this reminds me of how drinkers "acquire" a taste for scotch.

seth (2007-06-01 16:02:31)

Thanks for the suggestion, Tim. Peter, you're quite right. Some of my first studies of this used liquor, such as orzo. I've been saving scotch for a later experiment.

Oren (2007-06-02 06:16:56)

What do you expect to happen if you switch to lemongrass soda with a low-calorie sweetener?

seth (2007-06-02 06:29:20)

I expect the rating would go back down to around 50. I've had hundreds of Diet Cokes, almost never with meals. I still don't like the flavor. I like the carbonation, the thirst-quenching, and the sweetness – whereas the flavor: uh, okay.

Thierry (2008-06-28 23:19:24)

I never could enjoy diet cola, but most people I know are saying that they cannot drink the regular stuff anymore. Would you say that this comes from the fact that they have associated the taste with calories from other foods eaten at the same time?

seth (2008-06-29 08:10:53)

yes, you are probably right, Thierry

## **Until Nassim Taleb Starts a Blog (2007-06-01 14:27)**

This [1]collection of his Amazon reviews will do. Memo to Taleb: You might like Exploratory Data Analysis by John Tukey.

1. [http://www.amazon.com/gp/cdp/member-reviews/A3V94HTDKTOY10/ref=cm\\_cr\\_auth/103-3675802-8345458?ie=UTF8&sort%5Fby=MostRecentReview](http://www.amazon.com/gp/cdp/member-reviews/A3V94HTDKTOY10/ref=cm_cr_auth/103-3675802-8345458?ie=UTF8&sort%5Fby=MostRecentReview)

---

Tim Lundeen (2007-06-01 21:58:12)

Wonderful list, thanks!

The dust jacket of the Indonesian edition of The Shangri-La Diet. What does "diet tanpa diet" mean? What's this about diabetes and cholesterol? Uh, take my book – please.

And I mean it. Because I am stunned and happy to have written a book that anyone in Indonesia could possibly care about.

Addendum: By staring at the cover, I have figured out that tanpa means "without."

Psy student (2007-08-24 14:01:34)

The bit on the front of the book that says "Baik untuk Diabetes & Kolesterol" is roughly translated as "Good for those with diabetes and (high) cholesterol". "Tanpa" does indeed mean "without", you're spot on on that (doesn't guessing right make you feel smart? It always does for me). "Tanpa lapar, tanpa pantangan, tanpa olahraga" therefor means 'Without hunger, without restrictions, without sports'. Sadly, if I had seen this Indonesian version of the book in a store, I would've laughed my ass off and passed it off as a fad diet that'll crash and burn within a month. The Indonesian cover seriously sounds that bad... (Luckily, I heard about this diet through different channels. I haven't tried it yet as my book hasn't arrived yet at the store, but once it's there, I'm going for it. Wish me luck!)

## One-Sided Critiques of the Day (2007-06-02 21:22)

Here is an example of the negative evaluation bias I mentioned [1]earlier. Larry Sanger [2]criticizing a comparison of Wikipedia and the Encyclopedia Britannica:

Some might point to Nature's December 2005 investigative report<sup>1</sup> "often billed as a scientific study, though it was not peer-reviewed<sup>2</sup>" that purported to show, of a set of 42 articles, that whereas the Britannica articles averaged around three errors or omissions, Wikipedia averaged around four. Wikipedia did remarkably well. But the article proved very little, as Britannica staff pointed out a few months later. There were many problems: the tiny sample size, the poor way the comparison articles were chosen and constructed, and the failure to quantify the degree of errors or the quality of writing. But the most significant problem, as I see it, was that the comparison articles were all chosen from scientific topics. Wikipedia can be expected to excel in scientific and technical topics, simply because there is relatively little disagreement about the facts in these disciplines. (Also because contributors to wikis tend to be technically-minded, but this probably matters less than that it's hard to get scientific facts wrong when you're simply copying them out of a book.) Other studies have appeared, but they provide nothing remotely resembling statistical confirmation that Wikipedia has anything like Britannica-levels of quality. One has to wonder what the results would have been if Nature had chosen 1,000 Britannica articles randomly, and then matched Wikipedia articles up with those.

"Tiny sample size"? Hmm. How often have you heard "the sample size was too large"?

[3]Here is another example of a one-sided critique: her advisor's reaction to her work ("My advisor started out tearing apart the things I had done").

1. <http://www.blog.sethroberts.net/2007/04/24/if-science-had-been-invented-more-than-once/>

## Science in Action: Omega-3 (conference submission) (2007-06-03 04:59)

A few days ago I submitted a title and abstract for a talk to be given at the November 2007 meeting of the Psychonomic Society, a group of experimental psychologists:

## Rapid Effects Of Omega-3 Fats On Brain Function

I measured the effect of omega-3 fats on my brain by comparing flaxseed oil (high in omega-3) with other plant fats (low in omega-3) and with nothing. Flaxseed oil improved my balance, increased my speed in a memory-scanning task and in simple arithmetic problems, and increased my digit span. The first three effects were very clear,  $t > 6$ . The effects of flaxseed oil wore off in a few days and appeared at full strength within a day of resumption. The best dose was at least 3 tablespoons/day, much more than most flaxseed-oil recommendations. Supporting results come from three other subjects. Because the brain is more than half fat, it is plausible that type of dietary fat affects how well it works. The most interesting feature of these results is the speed and clarity of the improvement. The tools of experimental psychology may be used to determine the optimal mix of fats for the brain with unusual clarity.

If I ever made a time line for my life, this submission would be one of the events.

[1]Directory of my omega-3 posts.

1. <http://www.blog.sethroberts.net/2007/02/24/omega-3-greatest-hits/>

---

Tim Lundeen (2007-06-03 09:18:23)

Congratulations! It is an amazing discovery, and will have far-reaching effects as it becomes better known. It is also interesting to look at this result and try to see why it wasn't found earlier. We've known for some time that omega-3 and omega-6 are out of balance in the modern diet, and that people are healthier when they reduce omega-6 and increase omega-3. We've also seen some possible longer-term brain-health benefits from higher omega-3 intake, in terms of the effect on depression and affect. But no one found the right threshold for seeing the overnight effect on brain functioning; with the right intake levels, omega-3s (presumably DHA) increase overall brain performance (speed, balance, and it seems likely that overall IQ would also increase). So we finally have a relatively low-cost diet intervention that can make a significant, measurable difference to how well the world works. Not too shabby :-)

seth (2007-06-03 10:05:12)

That's an excellent question: why wasn't it found earlier? I will gather my thoughts and post something.

Tom (2007-06-03 10:59:13)

Why wasn't it found earlier? Reminds me of something Don Hewitt, creator of 60 Minutes, once said when he was asked why television was so awful. He said, "No one ever asked me a question about television to which the answer was not 'money.'"

Geoff (2007-06-03 11:06:12)

I think the finding is potentially interesting. However, without blinding your experiments, you open yourself up to really easy criticism. Namely, that the \*expectation\* of better performance (from the consumption of omega-3 fatty acids) leads to significantly better performance. It's pretty well-documented that expectations can significantly influence performance - see, for example <http://www.slate.com/id/2154331/> It would be a shame if your experiments were dismissed out of hand because you didn't blind your tests. I don't buy your argument that you didn't expect any effect when you first tried things, as there's plenty of suggestive material out there that omega 3 fatty acids influence brain function, e.g. that they may help relieve depression, help ADD sufferers focus, etc. And even if there weren't, your measurements are noisy, so an increase in performance that's purely random on day 1 could lead to an expectation of further performance gains on days 2 and forward - all of a sudden, a random effect ends up persisting because of a problematic experimental design.

seth (2007-06-03 14:12:20)

Tom, you may have something there. TV is bad because money plays too big a role. And scientists underperform because status-seeking plays too large a role. Self-experimentation made it easy to discover the effects of omega-3, but self-experimentation, because anyone can do it, is very low status. Geoff, I try to do the most informative experiments. There is already plenty of evidence against the expectations explanation: the dose effects that Tim Lundeen and I have found. The surprising effect I discovered was on my balance, not on depression – they are very different. (No one has ever speculated that Prozac improves balance, for example.) I don't know of the results you mention about "helping ADD sufferers focus", but I will look for them.

Timothy Beneke (2007-06-03 17:34:43)

I've been doing 2-4 tablespoons a day now of flax seed oil for a couple of weeks; i think it improves my sleep and seems to be kind of soothing. But I'm not sure exactly. I'm also engage in other experiments that are having effects... One question for Seth: If exhaustive controlled double blind studies were performed and determined that flax seed oil did not have the effects you were experiencing in balance, mental acuity etc., would you stop taking it? Would you conclude that other factors like expectation etc. were causing the effects? I ask because I take Juvenon, which may promote brain cell and metabolic efficiency – or may not, the science has not been done. But I respect Bruce Ames enough to give it a shot; if the science eventually says it does not work, I'll stop spending my money... I can't subjectively judge, though I am generally doing well intellectually...

seth (2007-06-03 18:57:09)

I've measured the effects – they don't disappear just because their explanation might change. I drive a scooter. It works. I won't stop driving just because someone else concludes either (a) scooters don't work or (b) they don't work the way I thought they did.

Geoff (2007-06-04 08:35:47)

Do a google search for "omega 3 cognition" and you'll see tons of material - over a million pages in my search - the meme is quite pervasive. Even if you somehow missed all of that, your "surprise" argument has a simple alternative explanation in the persistent random effect thing I described. I can imagine that expectation levels might have a dose-response effect, too: if thinking that you'll do well improves your performance, why shouldn't thinking that you'll do \*really\* well improve your performance even more? Maybe I'm misinterpreting you, but your suggestion that a blinded experiment would not be "informative" comes across to me as sounding like you have accepted your hypothesis as fact and are not interested in potential falsification. Given that you are already doing non-standard things with self-experimentation, why hand skeptics further reasons to doubt you? I think there's good reason to believe that some portion of your observed effect may be due to expectations. It might be 100 %, it might be 0 %, or it might be somewhere in between. A measure of the size of the expectation effect sounds like information to me, and interesting and valuable information to boot.

seth (2007-06-04 09:09:57)

"there's good reason to believe that some portion of your observed effect may be due to expectations." What is that good reason? Most studies that look for an effect of expectations come up empty. A blinded experiment would less information than other experiments (because the idea it would test is unlikely). I'm not saying it would be zero informative. My idea that varying the dose is a good way to control for all sorts of things (including expectations) is a well-accepted one within experimental psychology. I learned about it my first year of graduate school.

Geoff (2007-06-04 09:51:25)

RE expectations and performance, check out the literature on stereotype threat. There has been some fascinating recent work on expectations and test performance by Robert Rosenthal @ UCLA and Shelley Correll at Cornell - both were referenced in the Slate article I pointed you to above. (It's conceivable that the effect is a function of negative expectations)

Timothy Beneke (2007-06-04 12:08:57)

First, let me say that, given your track record, Seth, I would bet you are on to something very important. I think you have some rare capacity that I cannot describe to make objective judgments of subjective effects. On the other hand, wouldn't

virtually all scientists agree that a double blind study or series of studies with a thousand subjects, none of whom know what they are getting, or even what the study is about, being tested by experimenters who do not know who has gotten what, would tell us far more than one person engaged in self experimentation, no matter how skilled at objective self observation? Another point: the stereotype threat literature is interesting. Also the work of John Bargh and others who show that just by activating a schema in the mind, consciously or unconsciously, and without generating "expectations", behavior is altered. People exposed to words related to the elderly in word unscrambling tests walk more slowly leaving the experiment. People exposed to fast images that they associate with anger on a computer screen that they cannot consciously perceive act angrier in a situation where anger might be appropriate. The general strongly founded observation: When schemas are activated in our minds, consciously or unconsciously, we act in ways that are "consistent" with those schemas in situations where the schemas apply. The last 10 years of research are very strong on this... So could you have olive oil versus flax seed oil schemas in your mind influencing your behavior? It's only a hypothesis. I know that it's something some cognitive psych researchers would immediately ask upon encountering your findings...

seth (2007-06-04 13:25:21)

Thanks for the reference.

Geoff (2007-06-04 14:02:19)

An additional reason for blinding you might want to consider: You are trying to establish self-experimentation as a useful process for coming up with good ideas. I think there are some special considerations for experiments on one's self that are less of an issue when the experimenter and the subject are separate: Consider the rationale for double-blinding experiments: (1) if the subject knows the nature of the treatment and intended outcome, there may be placebo effects or the like, and (2) if the experimenter has a strong stake in a particular outcome, s/he may unconsciously (or consciously) bias measurements in a particular direction. With self-experimentation and no blinding, you get the worst of both worlds: Measurements are performed by and reports come from an interested party who knows the desired outcome. Now, you may be a reliable observer in spite of all these potentials for bias, or you may not be - I have no way of knowing. Conceivably, you may not even know if there is an unconscious bias. Without blinding, you're asking people to take on faith your reliability in the face of an interest in a particular outcome. Any other special considerations in evaluating self-experiments?

seth (2007-06-04 14:19:35)

Geoff, no experiment is perfect. To point out imperfections - possible imperfections - is no help at all in most cases because the alternatives are also imperfect. So long as one deals in hypotheticals. If there was evidence that effects such as the ones I describe (e.g., balance improvement) have been produced by expectations, I would be more interested in doing the experiments you describe. There isn't any evidence that dose-size effects can be produced by expectations in any domain, as far as I know. The Slate article doesn't reference any such evidence. It does mention work by Robert Rosenthal. A much better description of that work is here: <http://sciencethatmatters.com/archives/19> which describes how it has been over-used. Tim, if you look at the experimental psychology literature, you will find few if any placebo-controlled studies. I can't think of a single one. Is this because experimental psychologists are naive? All of them? No, it's because they understand there are better ways to control for expectations.

Paradigm (2007-06-05 03:19:50)

Sounds interesting but, placebo aside, doesn't four tablespoons a day make you gain weight?

seth (2007-06-05 06:07:17)

No I am not gaining weight. At [boards.shangriladiet.com](http://boards.shangriladiet.com) you will find many people who drink flavorless oil to lose weight. In my book *The Shangri-La Diet* you will find an explanation of why this works (and it certainly does, at least some of the time).

Tim V. (2007-06-05 11:05:25)

Interesting finding, but what is the mechanism that produces this change? From my limited knowledge of biology, I am surprised that resumption would have an effect within one day. Sure, the brain is full of fats, but I imagine most of them didn't

migrate there overnight. I share some of Geoff's concerns. Self-experimentation may be special with respect to placebo effects. I also share your infatuation with self-experimentation as a source of ideas and a way to convince yourself to pursue a finding. What is the major issue with recruiting even a small sample of naive participants and administering these supplements and tests to them? Is it IRB? In visual psychophysics we frequently have small sets of subjects, and usually a few of them are simply labmates who don't know precisely what we're up to, but are not entirely naive. Can you get a few of your friends/colleagues to do this sort of thing? I wouldn't bother going to elaborate lengths to "blind" the participants, but confirmation from people who don't share your motivations and expectations would go a long way towards convincing a lot of people like myself.

seth (2007-06-05 14:07:10)

There's been confirmatory data – as my abstract says – from three other people. As you suggest, I will try to find others who will also try it. About mechanism: I can't even guess, except that it involves replacement of omega-6 fats with omega-3 fats. Fats are loosely bound in cell membranes; the speed is plausible because of that fact.

Tim V. (2007-06-05 20:17:00)

Wow, somehow I completely missed the line "Supporting results come from three other subjects." even after reading through it twice. Sorry! For effects this dramatic (assuming it's reasonably strong in the other subjects you tested), the only problem you'll run into is people who don't understand how hard you'd have to work to sort of accidentally fake this data in performance tasks (which is what "placebo effect" implies to me). Unfortunately that includes almost every social scientist on the planet. You've got a friend in the visual psychophysicist, believe me. You only have to check out some of the articles at [journalofvision.com](http://journalofvision.com) to realize that. There was recently an article they published with N=1 for perhaps 1/2 of the reported experiments. The journal is peer-reviewed, respected, and has a higher impact factor than JEP: Human Perception and Performance, which is reasonably high-profile. Nice work! I look forward to your talk.

## **Vows = The Hunt? (2007-06-03 15:25)**

I told Joyce Cohen that I liked her column "[1]The Hunt" far more than the rest of the New York Times because it was about everyday life. They should have other columns like yours, I said – about finding a job or a mate, for example. She said that the [2]Vows section was sort of like that.

That's true. But how much?

Maybe I should give each Vows article a 0-100 Hunt score according to how well it approximates a Hunt column. I started reading the [3]most recent one. Then I came to this:

She is the host of "Winning Advice," on ABC Radio, and the author of "The Millionaire Zone: Seven Winning Steps to a Seven-Figure Fortune" (Hyperion). . . . But when the lopsided conversation turned to business, Ms. Openshaw perked up.

And decided I would not pursue my ranking system.

1. [http://realestate.nytimes.com/a9/search.asp?query=joyce+cohen&date\\_select=full](http://realestate.nytimes.com/a9/search.asp?query=joyce+cohen&date_select=full)

2. [http://query.nytimes.com/search/query?d=nytdsection%2b&o=e%2b&v=Style%2b&c=a%2b&query=vows&date\\_select=full](http://query.nytimes.com/search/query?d=nytdsection%2b&o=e%2b&v=Style%2b&c=a%2b&query=vows&date_select=full)

### New Yorker Hint (2007-06-03 22:44)

To decide whether to read a piece of fiction in The New Yorker, read the [1]press release.

1. [http://www.newyorker.com/services/presscenter/2007/06/11/070611pr\\_press\\_releases](http://www.newyorker.com/services/presscenter/2007/06/11/070611pr_press_releases)

---

Andrew Gelman (2007-06-04 13:57:19)

But I hate spoilers! Especially for magazine fiction, there's that wonderful feeling of disorientation when you start reading and don't know anything about what's coming next. Unrelated P.S. You have google ads on your site. Is the \$ they bring in really worth the irrelevance they bring to the page?

seth (2007-06-04 14:02:37)

The press releases I've seen did not contain spoilers. I've skipped too many New Yorker stories I probably would have liked because I couldn't figure out in the first half-page or so what they were about. William Trevor's stories, for example. The Google ads are my toe-in-the-water of small business, which fascinates me. The best way to learn is to do.

peter (2007-06-04 18:50:21)

if you're counting, i don't mind the ad and it's ok with me if you make \$ \$ \$ to offset the cost of maintaining and contributing to the site. (as long as they're not pop up ads.

seth (2007-06-04 20:04:40)

Thanks, Peter. It's more \$ than \$ \$ \$.

### Science in Action: Sunlight and Sleep (background) (2007-06-04 22:22)

[1]Daniel Kripke, a professor of psychiatry at UC San Diego, has done lots of research on the effect of exposure to varying amounts of natural light. His subjects often wear meters that record the illumination level. His [2]latest paper (2004) on the connection between outside light and sleep reports several weak correlations between amount of light exposure and sleep quality:

mesor  $\log_{10}[\text{lux}]$  [a measure of light exposure] was . . . positively correlated with sleep quality ( $r_p = 0.17$ ,  $p < 0.005$ ), and negatively correlated with reported trouble falling asleep ( $r_p = -0.17$ ,  $p < 0.005$ ), waking up several times a night ( $r_p = -0.18$ ,  $p < 0.001$ ), waking up earlier than planned ( $r_p = -0.09$ ,  $p < 0.10$ ), and trouble getting back to sleep ( $r_p = -0.11$ ,  $p < 0.025$ ).

The introduction states:

Bright light has been recommended for treatment of various sleep disorders [13], but very few experimental trials have been reported.

"Very few" seems to mean none, given the absence of citations.

The paper ends:

In conclusion, low illumination has a small relationship to . . . sleep disturbances.

### **Librarians vs. Soft Censorship (2007-06-05 06:35)**

The Shangri-La Diet was published because a [1]paper I wrote was amplified by blogs. [2]Here (from 2002) is something similar: one person's opinion amplified by a listserv. A librarian persuaded HarperCollins to publish a book by Michael Moore (Stupid White Men) that they had decided not to publish.

"They [HarperCollins] said it would be 'intellectually dishonest' not to admit that Bush has done a good job, and that the other things in the book wouldn't be believable if I didn't at least give Bush that much," says Moore. The author was certain that HarperCollins would cancel and destroy the book if he didn't accede to its demands.

### **Science in Action: Sunlight and Sleep (update) (2007-06-05 21:33)**

Today I had lunch with a friend and said, "I'd like to sit outside." I answered my phone indoors and went outside. I answered my email sitting outside.

I'm now convinced that more outdoor light exposure makes me sleep better – better in the sense that I wake up

feeling like I have slept more deeply. Whatever sleep does, it has done more of it. I'm convinced because I have gotten this well-slept feeling after six or seven days during which I spent several hours more than usual outdoor and did not get this feeling after two days when I spent an average or less-than-average amount of time outdoors.

I am going to start to measure my sleep quality with a rating and keep track of how long I spend outdoors.

The two questions that arise for me are: (1) As I posted before, controlling for fresh air effects. The best sleep I remember getting is when I slept in the corner of a room where there were 2 windows within 4 feet of my head on either side. I kept them open and woke up in a near euphoric state. So sleep is definitely better in fresh as compared with stuffy air. Might there be an effect that carries over from getting more fresh air during the day? (2) Is there a time of day effect? Do you get better sleep if you are outside earlier in the day? Does this increase wave amplitude, so that you are more "awake" when you are awake and more asleep when you are asleep? When I changed my circadian rhythms so that I went to sleep around midnight instead of 3:30 a.m., (following Seth's advice) I did it through getting a lot of sunlight early in the day and avoiding it later in the day. I noticed that later in the day when it was time to sleep, my body felt gripped by a very relaxed animal pleasure. I would really enjoy bedtime, something I did not experience when I went to bed at 3:30 a.m. All of this had a powerful effect on my mood generally. If your findings on increased sunlight and flax seed oil are even half true, they are mind-blowing. I'm going to experiment with both... Cheers!

Thanks, Tim. Re clean air: Someone else told me something similar: she slept better with the windows open. I tried it and indeed seemed to sleep somewhat better. But the effect wasn't large and not so clear after a while. So I stopped. Whereas the effect I see now shows no signs of going away and is so large there can be no doubt. But your comment shows a simple way to test the clean air explanation: open the windows in my bedroom. Maybe I will try again. I am inclined to discount this possibility because of the thousands of studies showing an effect of light on circadian rhythms. This gets to your "amplitude" idea. That is how I thought sunlight affected my sleep. In my recent observations, however, the additional sunlight happens late in the day (say, 4 pm) so I am surprised that it would affect amplitude of an oscillator. As you say if it is an oscillator effect time of day should make a difference – earlier in the day should be better. Whereas if it is a sleeping-pill-like effect later in the day should be better.

i think the best way to have a good sleep is that you are so busy and get tired . so when you have time and bed and of course fresh air , you can have a quite good sleep. in china, there is a traditional medicine , i remember some part of it , it says : cook the red beans and together with the special rice for a long time , and each day you insist on eating it , this will help a lot for your sleep. ä?æ~~ä.€ä°é,¶æ~ŸÜ-Džbè°ä¿†ã€,

So... MY question is: How well would you sleep if you were to STAND OUTDOORS for 9-10 hours?? ;D (Wearing SPF, of course)

yes, during camping trips I sleep very well.

dotslady (2008-06-22 13:09:33)

Hi - I know this is late in coming, but thought I'd add something not discussed. I'm new to your site having googled for 'raising HDL blog' btw - I have a malabsorption disease, celiac sprue, due to eating glutenous grains - which our society is full of and so was I. I have to work harder than most people to get where I am (thinking of Kathy Griffin on that one), and in doing so tried extra hard to get my fiber cause of \*eh hem\* constipation (per doctors instructions for low-fat, high fiber diet). Twenty years later Kashi breakfasts helped me into full blown celiac. Sooo, when you're celiac you're low on nutrients because of malabsorption. My symptoms included, but are not limited to, INSOMNIA, fibromyalgia, fatigue, depression, restless leg syndrome, worsening eyesight, eczema, dry skin, headaches, hypothyroidism (I thought so many symptoms were because of hypothyroidism, but they got better on a gluten-free diet and not on thyroid meds), hair loss (iron & other deficiencies), ADD (starving brain - no fat or nutrients). As a child my symptoms were aching muscles ("growing pain" likely iron deficiency), cavities, lowered immune system and tendency to have annual bouts of bronchitis and laryngitis. Well, I'm 47 now and the gf diet is high glycemic - I'm obese and looking to raise my HDL. So far I've lowered my LDL, but not raised much my HDL (cod liver oil and just starting low-carb, Nourishing Traditions-type diet). Okay, now my point: My first year of remission, as-it-were, was spent lolling in the pool and taking Rx for Vitamin D(2 - which I know now wasn't necessary, I could have taken D3 oil capsules, but hey, it worked, and I have insurance - referring to Dr. Davis' blogs, of which I'm an avid reader/believer). My vitamin D level prior to the pills was 21, after that it was 60. You want to be over 50 (for heart health too). And here's the kicker I didn't expect: I slept better. More story: I got tired of timing my thyroid pills with calcium/vit D/iron supplements and stopped taking them. Without realizing the connection, I was awakening earlier in the day. ALSO - I'd not been in the pool the next summer because of weather (OK - if you don't like the weather, wait a minute!) ... my vitamin D by the time I got it tested again, was down to 15-yikes! Alert Alert! And I felt it. I really like Dr. Holick and his stance on Vitamin D. Google for more info. Thanks for YOUR info - I'm sending it to my prediabetic insomniac melanoma-recovering never in the sunshine mother. She needs to be off gluten too - but she's kinda stuck feeling crappy and can't seem to muster the energy. It's sad. And I'm gonna look into your book now ...

Varangy (2008-06-23 07:31:14)

@dotslady You may want to try a hyperlipid diet and avoid fiber. <http://high-fat-nutrition.blogspot.com/> PS Yes, you read correctly, avoiding fiber probably would probably help you with your constipation problem.

dotslady (2008-06-28 17:29:16)

Thanks for the link - I'll check it out. Oh, and constipation was resolved about month 4-6 on gf diet. Everything is swimmingly fine because villous atrophy resolved, I surmise. I really believe that there is a high fiber hoax going on ... I seem to do better with less grain fiber, and more vegetables/fruit fibers ... actually less fruit nowadays as I'm working on getting rid of insulin resistance. It's always something with me! lol (high maintenance babe). Thank goodness for the internet - saved my life! Thanks again.

Ollie (2009-06-10 15:11:45)

Well written post. Over time I recovered from depression but it took medication, counseling and also a lot of personal development. Are there any good forums you would recommend?

## Say No to Genetic Determinism (2007-06-06 08:38)

James Watson, co-discoverer of the double helix, gave the Alumni Convocation address at the University of Chicago last weekend. His genome had been sequenced, he said, but he didn't want to know if he had "the Alzheimer's gene". This is misleading. It implies too much certainty, like a measurement with too many digits. It is entirely possible that this "Alzheimer's gene" determines one's vulnerability to low levels of omega-3s and that with sufficient omega-3 it makes no difference. My flaxseed-oil research suggests that almost everyone is omega-3 deficient (because the optimum amount of flaxseed oil was so high). A [1]study of persons 65 or older found that more fish consumption was associated with less cognitive decline.

Am I saying there is gene-environment interaction? Well, is there a "scurvy gene"? Surely there are genes that affect one's sensitivity to low levels of Vitamin C. But no one cares about them – because most people get enough Vitamin C to avoid scurvy.

Addendum: [2]More and [3]more about Watson and celebrity genomes.

### **My Theory of Human Evolution (scrapbook edition) (2007-06-07 05:23)**

At the scrapbook store the clerk smiled as I paid. (I have a Shangri-La Diet scrapbook.)

"You're amused because I'm a professor?" I asked.

"Because you're a man. Never see men in here," she said. "My husband hasn't been here."

"I think scrapbooking is very important," I said. "Everyone's an artist."

"There's no right or wrong," she said.

Exactly. There's no right or wrong in art but there is better and worse. Unlike technology where there is "right and wrong": the tool works or it doesn't work.

Suppose you are trying to guess a number between 1 and 10000. Contrast two kinds of feedback:

yes/no

and

too low/correct/too high

The first is discouraging, the second encouraging. With the second you can find the number; with the first you will give up.

Suppose you are trying to learn how to make steel. To make useful steel requires doing several things almost exactly right. There really is right or wrong. Trying to guess what to do is hopeless because the feedback is of the yes/no variety. And, in the beginning, all of it is no.

In contrast, suppose you are using steel-like materials in art. There is better and worse in art; as a result, you will slowly learn better control of your materials. You will be slowly guided toward the knowledge you need to make steel. The evolutionary reason for art, I believe, is that paying artists paid for research in material science, which

eventually led to better tools. Just as ramps and curb cuts help people on wheels, art helped ancient man. It replaced step functions of utility vs. knowledge with ramp functions.

For fascinating recent comments on sex differences see [1]Rebecca A. and [2]Tyler Cowen. Just as scrapbooking releases the inner artist, blogging releases the inner story-teller.

### Atul Gawande on Unofficial Research (2007-06-07 21:28)

Regardless of what one ultimately does in medicine—“or outside medicine, for that matter”—one should be a scientist in this world. In the simplest terms, this means one should count something. . . . The only requirement is that what you count should be interesting to you.

When I was a resident I began counting how often our surgical patients ended up with an instrument or sponge forgotten inside them. It didn't happen often: about one in fifteen thousand operations, I discovered. But when it did, serious injury could result. One patient had a thirteen-inch retractor left in him that tore into his bowel and bladder. Another had a small sponge left in his brain that caused an abscess and a permanent seizure disorder. . . . I found that the mishaps predominantly occurred in patients undergoing emergency operations or procedures that revealed the unexpected—such as a cancer when the surgeon had anticipated only appendicitis.

The numbers began to make sense. If nurses have to track fifty sponges and a couple of hundred instruments during an operation—“already a tricky thing to do”—it is understandably much harder under urgent circumstances or when unexpected changes require bringing in lots more equipment. Our usual approach of punishing people for failures wasn't going to eliminate the problem, I realized. Only a technological solution would—and I soon found myself working with some colleagues to come up with a device that could automate the tracking of sponges and instruments.

From [1]Better: A Surgeon's Notes on Performance. Part of Gawande's answer to the question: How to matter?

Thanks to Sean Curley.

## The Twilight of Expertise (part 1) (2007-06-09 11:47)

In a [1]TED talk, Stewart Brand pointed out that all over the world, poor villages – the same villages that Jeffrey Sachs seems to [2]want to preserve – are vanishing. The people who lived in them have moved to squatter cities, where, according to Brand, there is zero unemployment and a much better life. Because Jeffrey Sachs' interest in poor African villages seems to be recent, I am [3]not surprised that he may end up on the wrong side of the helped/didn't help ledger.

This is the general pattern with experts today: Sometimes they help, but often they make things worse. In a comment on an [4]earlier post, [5]Dr. Erika Schwartz called modern medicine "a system that more often harms than helps."

We are living in the twilight of expertise because we now have alternatives to experts – better alternatives. Squatter cities are a new thing. They solve a very difficult problem (poverty) because they combine three things: (a) People care about themselves and their children (far more than any expert will ever care). (b) The technological knowledge behind the many small businesses (e.g., hair dresser, copy center, pirated videos, cell phones) that allow squatter cities to exist. And (c) something that brings the first two things – caring and know-how – together, namely the cities themselves. Of course, squatter cities owe nothing to Sachs-type experts.

The [6]self-help self-experimentation I have done is another new thing. I solved the difficult problems of how to control my weight, my mood, my sleep, and a few other things related to omega-3, such as [7]my gums. None of which I am expert in – I am not a weight-control expert, a sleep expert, etc. I attribute my success to the combination of the same three elements that come together in squatter cities: (a) [8]I cared. I care about myself far more than experts care about most of the people they try to help. (b) Scientific knowledge – both statistical methods (e.g., exploratory data analysis tools) and basic behavioral science (e.g., the rat experiments of Israel Ramirez). (c) The ability to combine (a) and (b). Self-experimentation was a big part of this, but not the whole thing. My job as a professor and the research library system allowed me the time and opportunity to learn the scientific stuff. The flexibility of my job helped a lot. For example, I almost never had to use an alarm clock to wake up, which allowed sleep self-experimentation. The solutions I discovered are quite different from conventional solutions, but no more different than squatter cities are from what Jeffrey Sachs has prescribed.

Addendum: More info about squatter cities [9]here. A [10]blog about them. [11]More about foreign-aid experts doing more harm than good.

James Aach (2007-06-12 09:52:32)

I would note that self-experimentation is a bit more difficult when trying to make infrastructure changes on a broad level - transforming the energy economy is one example I know that Stewart Brand has also been addressing. But then there's another problem when dealing with these sorts of things: what is an "expert" ? Is it a researcher who has never tried to implement solutions on a broad scale? An engineer who has - but is likely serving as an official spokesman for his/her particular business concern? A longtime activist who has done some research? Just some food for thought.

### **How Blogging Made Philip Weiss a Better Writer (2007-06-09 18:54)**

Did the invention of the piano make the first piano players - the ones who started on harpsichords - better musicians? Probably. Long before blogs, I thought Philip Weiss was the best columnist in America. His weekly or biweekly pieces in the New York Observer were usually original, well-observed, and deeply-felt. He [1]now tells how blogging made him a even better writer.

I had smart readers, whose comments were often better than my posts, and I felt more accountability to them than I had to my print readers. The flippancies and profanities I used to go in for began to vanish. The Internet is not the Wild West, it is more like a great ballroom. Yes, it permits disguise and anonymity, but it is, in the end, a social space in which one's words have consequences. I felt a sense of responsibility when I finished an item and had my finger poised over the enter key. I stopped posting pictures of my dogs.

Why blogs are better written [2]in general.

1. [http://www.amconmag.com/2007/2007\\_06\\_04/feature.html](http://www.amconmag.com/2007/2007_06_04/feature.html)

### **Outside a Chinese Test Site (2007-06-10 06:14)**

In China, a two-day annual test, which ended Friday, determines what college high school graduates will attend. Outside a test site, an AP reporter heard [1]this:

Wang said she has been cooking foods for her son that are considered particularly good for worn-out students, with plenty of vegetables and less grease.

"Oily foods, it's bad for the brain, it makes the brain slow down," she said.

Astute observation. Regular readers of this blog know that certain oily foods (those high in omega-3 fats) have the [2]opposite effect. But I suspect Ms. Wang is right, that most oily foods (high in omega-6) do slow the brain down, perhaps because they replace omega-3 with omega-6.

1. <http://financial.washingtonpost.com/custom/wpost/html-story.asp?dispnav=business&mwpage=story&symb=&guid=B120AA72-6ECE-46E0-9519-986564478F92&tid=informbox>

### **Academic Horror Story (Tulane University) (2007-06-10 10:32)**

A few weeks ago, the manager of a New Orleans art gallery told me a story that I wish had surprised me.

When he was a senior at Tulane University, he took a Political Science class about the British Political System. For his term paper he wrote about the functions of the British Cabinet. The night before the final he got a phone call. It was from the Tulane honor board: He was charged with plagiarism. He was devastated, and did badly on the final.

The next semester a hearing took place. At the hearing, he listened to a tape of his professor's testimony. The professor recommended that he be expelled: Not only had he plagiarized, the professor said, he had flunked the final. The supposed plagiarism was that he had listed ten functions of the British Cabinet without giving a source. He had believed that this was common knowledge, such as saying the sky is blue, and thus did not need a source. He had not copied word for word – he had paraphrased his source. The honor board gave him an WF for the course – withdrawal with an F.

The charge of plagiarism is absurd. It isn't even obvious that the student did anything wrong – he is correct that you don't need to reference "the sky is blue." The telling part of this story is not that an individual professor was cruel and stupid – it is that a committee of professors backed him up.

[1]Another case – this time at Memorial University of Newfoundland – where a committee of professors did exactly the wrong thing with awful consequences for an innocent person. The current Memorial administration now [2]defends this!

A [3]website about how IRBs (institutional review boards) abuse their power. IRBs are university-wide committees that oversee research. They consist mostly of professors.

So you can see why I wasn't really surprised.

1. <http://www.blog.sethroberts.net/2007/05/15/memorial-university-continues-to-destroy-its-reputation/>
2. <http://www.cbc.ca/canada/newfoundland-labrador/story/2007/05/15/chandra-mun.html>
3. <http://www.irbwatch.org/>

---

Interested Reader (2010-02-23 15:32:42)

Hey, I know someone with a similar case. He received a 2 year suspension for using material from a website on a 4 page paper in his last semester before graduation. I am interested to know if you know what happened to the person you wrote about (if he was able to finish college, get a job, etc). Thanks and have a good one!

## **The Twilight of Expertise (part 2) (2007-06-10 23:44)**

The first experts were shamans, an occupational category that eventually divided into doctors and priests. As the Catholic Church became more and more powerful, abuses of priestly power became more and more apparent and upsetting, leading to the Protestant Reformation.

Now – half a millennium later – doctors are under much greater scrutiny. The results of that scrutiny are unfavorable – perhaps highly unfavorable. A [1]RAND study suggested that the overall benefit of a substantial amount of health care was small, except in certain special cases such as eyeglass prescription. A large fraction of surgeries are unnecessary, says [2]one critic—and by large he means large:

Stanford University urologist Thomas A. Stamey, M.D., generally regarded as the father of PSA testing, says that 90 percent of all the prostatectomies performed at the Stanford hospital over the past 5 years have been unnecessary.

[3]Earlier post on this topic.

Addendum: According to [4]Biotech Blog,

Thereâ€™s been a shift in the past 50 years away from the doctor-centric model of healthcare to one in which patients expect, and demand, better information and control over their treatments.

---

A [5]70-293 is a much better choice than [6]70-296 for someone who plans to do [7]70-291 later. If the future plans revolve around [8]70-526, it is alright otherwise.

Andrew Gelman (2007-06-11 07:07:09)

Seth, Given the above sentiments, I think you'd enjoy the Shaw play, *The Doctor's Dilemma*, which considered health care 100 years ago. Seriously, though, I think you're too pessimistic. I've had some serious broken bones and was pretty impressed with the medical treatment. Also I got the chicken pox shot which was pretty cool.

seth (2007-06-11 08:16:45)

Thanks for the Shaw recommendation. If I'm too pessimistic, tell me the serious flaws of the RAND study that I link to – it found little benefit of additional medical treatment. Vaccination works, sure – it is public health, not medicine. Better nutrition works, clean water works – all that is public health. Not smoking works. Broken bones fix themselves, so your "serious broken bones" example isn't impressive. There may have been a minor advantage to what the doctors did. And fixing broken bones is a special area of medicine – one where it is easy to see the benefits. Heart disease, cancer, diabetes, stroke – I think it is easy to see that most of the time, doctors can do little about these things. As one doctor told me: "The truth is that for most problems we see, we can't do much." When it comes to everyday illnesses our immune systems do the work. So where is the great benefit?

Timothy Beneke (2007-06-11 11:22:23)

I wonder if anyone is seriously attempting to determine the morbidity and mortality benefits of "medicine" as opposed to just "public health". It would require huge meta analyses of particular areas of medicine, and then aggregating them in some way, I would guess. My own medical treatment is based on extremely crude correlational science. I've had my blood pressure and cholesterol lowered by drugs (prior to my weight loss); it's clear that high cholesterol and blood pressure correlate with greater mortality, but I'm not sure we know that lowering them with drugs helps that much. My doctor tells me that no one needs to die now from colon cancer. If everyone got colonoscopies at the right age, then all colon cancer would be detected early and when detected early can be "cured". My impression is that cancers like leukemia and others are far more treatable. Or take AIDs – surely medical treatment is extending the lives of AID's patients enormously. But I may be an innocent victim of hype; I don't think about these things rigorously. It's confusing to me. There are apparently serious scientists now claiming that in the next century or longevity will be radically expanded. I am extremely skeptical when I hear this. My question to Seth is: Do we really have the scientific knowledge to justify his claim? Is there any intuition/ideology etc., in his claim? The Rand study would have to be very fine-grained about the specific treatments that the 7000 people got and then sort out the effects – which it did not do. It would have to show which medications were given to whom at what stage of development in pathologies, differences in diagnostic testing, etc. I don't take it very seriously – but I defer to others in evaluating studies. It's probably true that a lot of medical treatment does little good, but we may not know which is useless until it's tried out for a while...

seth (2007-06-11 12:05:34)

The RAND study did look at different treatments; it found that eyeglasses were clearly effective but that most treatments were not. Surely the RAND study has its problems – but is there a better study? My own experience with doctors has been good. I had hernia surgery, which was obviously both necessary and helpful. When I had a kidney stone (very painful), a shot of morphine really worked. Sure, there are cases when medicine helps. But attempts to look at the big picture, counting costs along with benefits, have not been favorable, as far as I know. If there is evidence I am leaving out, please let me know.

Timothy Beneke (2007-06-11 12:26:49)

All the evidence that is left out would presumably not be meta-evidence, since I assume the requisite meta evidence has not been done. There is a lot of research on particular treatments showing some are not that good and some are very good. My point would be that to speak as a scientist the best thing to say is that we don't really know how much medical treatment helps, and may never know a lot. The Rand study may be interesting but way too limited in value. We can't ethically take say 10,000 people at birth, and randomly provide half with stellar medical treatment and half with zero treatment for 100 years, while each receives the same "public health" benefits (however the distinction is drawn) – which would tell us a lot. Short of that, we can look at particular treatments that have been scientifically shown to help and see how much they add up to increased

longevity, lower morbidity, etc... and weigh them against things like the Rand study...

Geoff (2007-06-11 12:32:59)

Read the May 16 comment by Toby on the article you point to. The study does \*not\* say that health care is useless. Rather, it suggests that more health care \*at the margin\* is may not be very helpful. There is an \*enormous\* difference between these two statements. If you want to measure the benefits of health care, the proper control group is people who have \*NO\* access to health care, not people who have health care but have to pay for it. The RAND study measured the benefits of \*free\* health care as compared to care that people pay for or have covered by insurance. Look at the gains in lifespan in the 20th century alone that have come from the development of antibiotics. Diabetics have health care to thank for synthetic insulin. People with heart disease have statins and angioplasties and coronary bypasses and heart transplants. People with cancer have chemotherapy and radiation and surgery - cancer mortality rates have been falling substantially over recent years. I understand that you don't agree with everything in the world of modern medicine, but arguing that health care provides no benefit is, to put it charitably, silly. Without health care, it's quite possible that you'd be dead or seriously disabled from that kidney stone.

seth (2007-06-11 14:27:22)

I don't "argue that health care provides no benefit." No benefit is much too strong. Perhaps I should have made that clearer - that is, in addition to my eyeglasses example and the 10 % of prostatectomies that the Stanford doctor believed are helpful. What I am trying to say is that the increased scrutiny given doctors has not turned out well for them. The RAND study, of course, is limited - but is there a better attempt to figure out the overall value of medicine? I don't know of one. if you can point me to a study that shows the more-than-minor value of modern medicine I'd love to look at it. Lifespan gains in the 20th century are often attributed to public health measures, such as clean drinking water and vaccinations. They do not make a strong case for the value of medicine. Why do you attribute the decline in cancer mortality to medicine rather than lifestyle changes (e.g., less smoking, better nutrition)? Perhaps the improvement is due to 90 % lifestyle change, 10 % medicine. I don't know what the correct percentage is, but you seem to. Diabetics have been helped by synthetic insulin, indeed. But they administer it themselves. It's a special case, between medicine and prevention. And in spite of this help, diabetes is a major cause of death and disability. No doubt because of obesity, which doctors have done nothing to help with. My kidney stone passed in a day or so without help from doctors. The morphine reduced the pain it caused.

Andrew Gelman (2007-06-11 17:00:52)

Seth, I don't know about the Rand study, but my first thought is that the marginal benefits from additional health care will be less than the benefits from good existing care. So, even if more is not much better, that doesn't mean that the overall benefits of existing care are "minor." Regarding various particular issues: My wrist was broken in a zillion places, and my other hand (a completely different injury) was broken internally. I'm pretty sure I'd have quite a bit less use from my hand had I let the bones heal as is. Also, I'd count the chicken pox as medicine, not public health, because (a) I got it at the doctor's office, and (b) it wasn't part of a general vaccination, it was something special that I asked for. It's also my understanding that treatments for Aids and many cancers have been effective. I expect (hope) things will improve-and you can also talk cost-benefit-but the effects of medicine here seem greater than zero.

Geoff (2007-06-11 17:40:35)

Here you go: [http://www.economics.harvard.edu/faculty/dcutler/papers/cutler\\_meara\\_boulders\\_2001\\_final.pdf](http://www.economics.harvard.edu/faculty/dcutler/papers/cutler_meara_boulders_2001_final.pdf) While public health measures and improved nutrition dominated in the early part of the 20th century, antibiotics contributed to a big decline in mortality in the middle of the 20th century. Medical treatment is playing an increasingly important role in reducing mortality, particularly in dealing with cardiovascular disease.

seth (2007-06-11 22:04:22)

Andrew, my point is that when the overall effectiveness of medicine has come under scrutiny, it has not fared well - and the RAND study is a good example. Whatever its flaws or various interpretations, I don't think it can be dismissed. I don't believe that medicine is completely ineffective - far from it. But how effective is it compared to the existing big effects on health - such as clean water? And adequate nutrition? As far as I can tell, not very - which is why I didn't bother to put qualifications

around the straightforward conclusion from the RAND study. (I might have said, "According to a RAND study. . . " or "If you believe this study . . . ") The sheer difficulty of making a convincing case for the great overall efficacy of medicine is a sign of that, I think. The mother of a friend was near death – and then she recovered when all of her medicines were stopped. Her prescribed drugs were killing her. Geoff, thanks for pointing me to the Cutler paper. I am very interested in the evidence for the other side. My take on that paper was that the argument for the importance of medicine in reducing heart disease was completely unconvincing. Sure, there may be a small effect. But the graph of heart disease mortality shows a steady decline starting around 1960. Did something happen around 1960 to make heart disease research all of a sudden effective? Not that I know of. Yet the shape of the graph – a long steady decline – suggests a single cause that became more and more effective. Around 1960, Americans became more interested in physical fitness. JFK dramatized this with his 50-Mile Hikes. This interest in fitness has slowly grown ever since.

Andrew Gelman (2007-06-12 05:02:36)

Seth, See comments here: [http://www.stat.columbia.edu/cook/movabletype/archives/2007/06/total\\_vs\\_margin.html](http://www.stat.columbia.edu/cook/movabletype/archives/2007/06/total_vs_margin.html)

Eliezer Yudkowsky (2007-06-12 10:12:06)

A small NET statistical effect does not necessarily indicate small GROSS causal effects. A large benefit of medicine may be counterbalanced by medical errors, deaths under general anesthesia or from unnecessary surgery, diseases caught in the hospital, unknown side effects of drug combinations... many are talking as if the bold hypothesis under consideration is that medicine is a null-op. This is not the bold hypothesis. The bold hypothesis is actually a spectrum of hypotheses under which the marginal benefits of medicine, and its marginal harms, range in unison from low to high - any point in this spectrum accounts for the RAND data. For every bright anecdote that pops up in your mind about how modern medicine cured your uncle's skin cancer (which I'm quite willing to accept it did) consider the anecdote someone else posted to Overcoming Bias about an uncle who went under general anesthesia for knee surgery and never woke up.

Geoff (2007-06-12 10:55:44)

I think there is probably an even simpler explanation for the RAND study: it's comparing health care that people would pay for on their own to free health care. Free or not, most people will obtain treatments that have obvious benefits: having a broken leg set, antibiotics for an acute infection, visits to an obstetrician while giving birth, and so on. It's things that are less obviously beneficial that people might choose to forgo - maybe things like brand name drugs instead of generics, frequent checkups, extra tests, etc. So perhaps the RAND study just shows that treatments that do not have benefits that are obvious to patients do not pay off in reduced mortality. That doesn't seem very surprising, nor does it discredit medical professionals to my way of thinking.

anon (2007-06-12 19:07:57)

"Heart disease, cancer, diabetes, stroke" I think it is easy to see that most of the time, doctors can do little about these things. As one doctor told me: "The truth is that for most problems we see, we can't do much." When it comes to everyday illnesses our immune systems do the work. So where is the great benefit? "There may not be a cure for diabetes, but certainly treatments such as insulin therapy are effective in regulating blood sugar levels which reduces complications due to diabetes. Hemoglobin A1c is a measure of blood sugar levels over the past 3 months. High A1c is strongly associated with many of the complications of diabetes such as retinopathy, heart disease, and limb amputations, and death just to name a few. You are either IGNORANT or an IDIOT if you can't see the great benefits of medicine for treating diabetes. In regards to cancer, in some cases, early detection is the key to successful treatment. Reductions in heart disease have been shown to be associated with various medicines. Your doctor's quote should perhaps be restated as follows: by the time that patients seek help, there is sometimes not much that the doctor can do to treat the disease, or in the case of diabetes cure it (no cure yet). However, that is not to say that some of the symptoms cannot be treated with meds. In the case of type II diabetics, many of them have spent years over-eating and not exercising and a doctor cannot fix the strain you have put on your body by not taking care of yourself. At the onset of type II diabetes, all the doc can do is attempt to regulate your blood sugar levels with meds or insulin therapy, but both are far from a cure. Your statement "Heart disease, cancer, diabetes, stroke" I think it is easy to see that most of the time, doctors can do little about these things." is very IGNORANT, especially when it comes to diabetes. Medicines have made a huge impact on the treatment of diabetes... without insulin, type I diabetics DIE.

RobbL (2007-06-12 19:38:10)

Seth, After visiting Bangladesh, I would have to disagree with you. There are plenty of people walking around with what seemed to be treatable problems. They probably would value any doctoring...even if it doesn't hold up to your standards. I would also argue with your definitions. All of vaccines and most public health stuff is most strongly driven by doctors. They should get credit for that. Lastly, everyone's prize evidence; an anecdote. (hey wait doesn't this stinking comments section have a spell checker?) My wife had a mysterious infection that destroyed her vestibular nerves. She lost much of her sense of balance. There was nothing that could be done. But after much much testing and expense, they did figure out what had happened. The neurologist had no cure, but his explanation of what had happened and his discussion about the sort of accommodations and changes she needed to make in her life style allowed her to get on with her life. Up until then she was floundering and unable to work or even to function very much. So the point is, what would a study of effectiveness make of this. In one way we spent a lot of money on doctors and in the end they could do nothing. On the other hand, the information about what had happened and how to go forward kind of saved her life.

seth (2007-06-12 20:27:11)

I'm not saying doctors have no effect. I'm not saying they're not comforting - "palliative" is the technical term. I'm saying that the effects of American medicine, in America, that when scrutinized seem overall - not in every case - to be minor compared to the big effects in health - for example, the effects of high-Vitamin-C foods on scurvy, the effects of clean water on infectious diseases, the effects of morphine on pain. As I mentioned earlier, insulin is a special case, halfway between prevention and treatment.

anon (2007-06-12 21:10:19)

You seem to have a very narrowly defined definition of medicine, which actually does not seem very clear. If a doctor diagnoses me with diabetes and tells me to take insulin, is he not in some way responsible for improving my condition? I believe doctors play a very critical role in the diagnosis of disease, to which they at least earn some credit in a less narrowly defined view of medicine. "Diabetics have been helped by synthetic insulin, indeed. But they administer it themselves. It's a special case, between medicine and prevention. And in spite of this help, diabetes is a major cause of death and disability. No doubt because of obesity, which doctors have done nothing to help with." You are right. Doctors do not yet have a magical cure for diabetes that enables patients to not have to take care of themselves. But whose fault is that really? The doctor's fault, or the patient's fault? If a doctor tells me to take an antibiotic, and then I self-administer it, does this also fall in between medicine and treatment?

seth (2007-06-12 21:25:14)

Doctors improve many conditions, absolutely. And one of them is diabetes. But compared to the treatment of scurvy with Vitamin C, is the improvement major or minor? In practice? "Whose fault is that?" I'm trying to describe the situation. Since you ask I don't blame either the doctor or the patient. I blame human nature. You're right, to say the special thing about insulin is that patients "administer it themselves" is confusing. As you say most drugs are self-administered. I should have said that insulin is special in two ways: it replaces something missing from the body; and the administration (to be effective) has to be remarkably careful and intricate. It is true that in the right hands, insulin is a major medical success story. Those "right hands" however are few. Perhaps they will become more common in the future. Self-experimentation played a very big role in showing how insulin could be used most effectively. Something else that sets insulin apart from other treatments.

seth (2007-06-13 09:00:12)

Geoff, The RAND study was surprising to many people, including me. All health care is supposed to help; the study found that a lot of it did not clearly help. I think there is something to be learned from that.

current grad student (2007-06-13 16:00:37)

Seth, see my comments at Gelman's website about interpreting the results from the Rand study and why I am not surprised to not see much of a difference. [http://www.stat.columbia.edu/cook/movabletype/archives/2007/06/total\\_vs\\_margin.html](http://www.stat.columbia.edu/cook/movabletype/archives/2007/06/total_vs_margin.html)

seth (2007-06-13 18:03:16)

Thanks for the link. I have commented over there.

current grad student (2007-06-14 14:22:38)

Seth, Why is every medicine supposed to have a big impact? Won't some have a larger effect? For the meds that are truly important, don't you think that most groups received those, and the less important, those that don't have as large of an impact, were probably what were used more in the free group. Though there may not have been noticeable overall health benefits from going to see the doctor more, as was done in the treatment group, who is to say that they didn't recover from illness faster? For most common ailments, our immune system can fight them off slowly and your health overall won't be affected much by not going to the doctor. However, how much of a benefit is there to taking a drug that speeds up the recovery process, though it may not be a benefit to your overall health. Factors such as this don't show up in the Rand study results. Also, let's say I'm in the free group, is there a benefit to going to the doctor at some of the first signs of getting sick? Even if I find out that if I have a virus that can't be treated by antibiotics, should I not have gone? Should I have used less free health services because my immune system would have most likely been able to handle the ailment? Going to the doctor more often does not necessarily mean that they received more meds... a lot of the times were probably because they were being cautious and because they could for free. When you have to pay, people aren't usually willing to seek care until they get really sick and know that they need to be seen. However, even at this point if they do have something treatable, their overall health is not going to be affected by having waited to see if their immune system could handle it.

current grad student (2007-06-14 14:24:19)

Seth, smaller studies are fine for if you want to concentrate on a population of people who are sick and you are going to randomly give half the cure as in your scurvy example. The point about the most necessary medicines is that those are where the biggest benefits are seen. Not every drug or every treatment will make a big impact in your overall health. For any treatments that do make a large impact on your health, I assure you that even people who had to pay received the necessary treatments. Big effects in healthcare can be seen for those who are sick... it is much harder to see effects of medicine when you take a sample from the general population, thus you should need an even bigger sample if you want to see a benefit. Unfortunately, as medicines become better and better, it becomes harder and harder to improve upon the standard of care. This is one of the reasons why clinical trials require so many patients to see the positive benefits of a new drug. In addition, even when the population in your study is sick, it can still be difficult to see the benefits when looking at events with low incidence rates.... and this is even when your population is sick. Can you imagine how woefully underpowered you must be when looking at a group of healthy people. By the way, for those of you who are interested, the study looked at 2750 families, the mean age was ONLY 33, the youngest person was 14, and the maximum age at time of enrollment was 61.

anon (2007-06-26 12:24:14)

"All of vaccines and most public health stuff is most strongly driven by doctors. They should get credit for that." Actually, it started in the U.S. with public health nurses and insurance companies. Doctors actually went out and got that stopped. That they are behind it now, due to the fact that they collect payment for administering it when nurses used to go door to door and provide the service for free, doesn't tell me anything that makes me want to give them credit.

## **Fat and Anesthesia (2007-06-11 13:37)**

A [1]new theory of nerve conduction takes as its empirical starting point the hundred-year-old observation of [2]a strong correlation between the solubility of a chemical in olive oil and its anesthetic potency. The more soluble, the more potent. Olive oil was used to mimic the cell membranes of nerve cells. Such observations – a certain type of fat is a useful model of the whole nervous system – make it even more plausible that dietary fat affects brain function, as [3]my omega-3 observations suggest.

The authors of the new theory believe that when anesthetics enter a nerve cell, they tend to solidify the fats in

the cell. This makes the cell less responsive.

1. [http://www.wired.com/science/discoveries/news/2007/06/nerve\\_communication](http://www.wired.com/science/discoveries/news/2007/06/nerve_communication)
2. [http://books.google.com/books?id=AA4sICmESWQC&pg=PA204&lpg=PA204&dq=hans+meyer+charles+overton+anesthetic+olive+oil&source=web&ots=AldAA4W8qa&sig=qm5uFr\\_rutSHNcQaRbQHAbqSdek#PPA204,M1](http://books.google.com/books?id=AA4sICmESWQC&pg=PA204&lpg=PA204&dq=hans+meyer+charles+overton+anesthetic+olive+oil&source=web&ots=AldAA4W8qa&sig=qm5uFr_rutSHNcQaRbQHAbqSdek#PPA204,M1)
3. <http://www.blog.sethroberts.net/2007/02/24/omega-3-greatest-hits/>

---

peter (2007-06-11 13:52:29)

are you suggesting that olive oil, which is touted as a heart healthy oil, makes the cells in general and brain cells in particular, less responsive? are you saying that taking olive oil will reduce one's ability to maintain balance and compute mathematical problem (with the inference that such a reduced ability reduces one's mental ability)?

seth (2007-06-11 13:58:22)

No. Olive oil was used to model the brain. It was not a treatment – the anesthetics were the treatments in those experiments. The effect of olive oil on anything was not measured. When I compared olive oil and flaxseed oil, my balance was better with flaxseed oil.

### **The Clouded Crystal Ball (2007-06-12 03:50)**

"Does eating influence brain function?" begins a 1974 Scientific American article titled "Nutrition and the Brain" by 2 MIT professors. It is mainly about how changes in carbohydrate affect the brain – especially what happens after a carbohydrate-rich meal. A few studies of protein variation are discussed. Nothing about the effects of varying fat intake, although the brain is mostly fat.

---

Andrew Sidwell (2007-06-13 17:19:32)

Out of interest, what does happen?

seth (2007-06-18 12:32:22)

A carbohydrate-rich meal increases serotonin synthesis, the authors (John Fernstrom and Richard Wurtman) found. The rats ended up with more serotonin an hour or two after a high-carbohydrate meal. No behavioral effects were measured.

### **The OJ Group (2007-06-12 23:20)**

At the CBC in Toronto, Sarah Kapoor, who did a [1]story about the Shangri-La Diet, started what she called "the OJ group" – OJ meaning Ordinary Journalism. Journalism about ordinary life, like [2]The Hunt.

Were formation of the OJ Group a chess move, I would give it two exclamation points. 1. It points out a major

problem with standard journalism: Too much of it is about famous and powerful people doing boring things. 2. It gathers support. It is a way of persuading others and learning from them. 3. It criticizes by creating – as Michelangelo [3] advised. My self-experimentation – about everyday concerns such as sleep, mood, and weight – might be called Ordinary Science. It is science about ordinary life using methods of ordinary life.

In [4] The Theory of the Leisure Class, Thorstein Veblen argued that we care enormously about status display. The upper (leisure) classes display their status by conspicuously avoiding useful work (e.g., long fingernails) and by conspicuous waste (e.g., hood ornaments). Academics display status by avoiding work on useful questions. Such work is dismissed as "applied", in contrast to "pure" research. The status of scientific work also depends on dimensions that Veblen doesn't mention: 1. It is higher status to have someone else do something than to do it yourself. 2. Expensive research is higher status than cheap research. Thus my self-experimentation had three strikes against it: low-status topics, low-status participants (I'm not ordering anyone around), and low-status cost (cheap).

In journalism, like everywhere else, there is status by association. Writing about high-status people is higher status than writing about low-status people.

4. [http://en.wikipedia.org/wiki/The\\_Theory\\_of\\_the\\_Leisure\\_Class](http://en.wikipedia.org/wiki/The_Theory_of_the_Leisure_Class)

---

Andrew Gelman (2007-06-13 04:46:45)

Seth, I agree with you about the journalism, but maybe not about academic work. Applied work is important but, ultimately, theory has the potential to be longer lasting—a theorem is forever.

seth (2007-06-13 05:52:58)

Veblen had other academic examples. He said that academics used big words and long sentences for the same reason: To impress others with their status. This was a very amusing claim in a book full of big words and long sentences.

Timothy Beneke (2007-06-13 11:33:07)

Fascinating. I'd love to see someone write a book about status in academia, the economic motivations behind the existence of academic fields, and the requisite epistemologies and mastery of knowledge that flows out of that. – Linguist Robin Lakoff says the complexity of academic writing grows from undergrad to grad school and reaches a peak in the Ph.D. dissertation and then gets gradually simpler as people become assistant profs and get tenure – I know that much is made of "bringing money into the department" in psychology at Berkeley – it's a tenure consideration. – It's fascinating (and depressing) that distinguished psychologists would dismiss self experimentation because it "can't be trusted" when it takes most people a few hours to confirm that light-tasting olive oil (or sugar water) dramatically reduces hunger. There are many effects that cannot be so confirmed, but that one can be. It's almost comic that very smart people would be so wrapped up in their scientific ideology that they cannot see or do this. There is an implicit belief that hypotheses and intuitions are in and of themselves trivial since everyone has lots of them and they may well be wrong; and all that matters is hard scientific data and explanatory theories based on the data. But what if a hypothesis about weight loss that can improve the health of millions of people can be confirmed in the period between breakfast and lunch? – I'm exasperated by the intellectual narrowness of academics. I was in a social theory group years ago with Berkeley sociology

grad students, many of whom now teach social theory. They could discourse grandly in big historical terms about society drawing from Marx, Max Weber, Durkheim, Foucault and other thinkers, but none of them knew basic social psychology, and findings about group behavior, findings about what might influence their concrete behavior in the group. All sociological explanation comes down to psychological processes and they knew very little empirical psychology. – A famous literary scholar, Elaine Scarry, who holds an endowed chair at Harvard, delivered some prestigious Gifford lectures on beauty that she turned into a small book. They are full of psychological theorizing and speculation that she treats as sacred truth; she claims to reason her way into psychological truth. There is much in empirical psychology that is relevant to her claims, but she is utterly ignorant of it. She could sit in on an intro psych course and find a lot that applies. The book is, from my perspective, embarrassing. It's as if a Ph.D. in literature is a license to ignore whole fields that are relevant to one's claims.

seth (2007-06-13 12:05:01)

Thanks, Tim. You can read more about academic status displays in Chapter 14 of *The Theory of the Leisure Class*, which is available full-text on the web. Does Robin Lakoff agree with Veblen about why academic writing is complicated?

Timothy Beneke (2007-06-13 12:40:32)

She thinks needlessly complex academic writing is driven by status insecurity, at least in American academia; once you are secure, you don't need to put on airs as much and seek to intimidate. It's interesting though; Bob Blauner, who taught in the Berkeley sociology dept for many years and is now retired, said that when he was a grad student, everyone felt in the same boat and spoke freely to other grad students about ideas without much fear. When he became an assistant professor, he said there was a lot of fear in interacting with other assistant professors, as if they were afraid their ideas would be stolen, or afraid the other guy was smarter than they were. Once he got tenure, all that changed a bit. I'm sure there are sub-cultural variations in the departments and fields...

seth (2007-06-13 13:41:00)

Thanks for the additional details.

### **Thorstein Veblen on the Importance of Spell Check (2007-06-13 17:51)**

From [1]*The Theory of the Leisure Class*:

As felicitous an instance of futile classicism as can well be found . . . is the conventional spelling of the English language. A breach of the proprieties in spelling is extremely annoying and will discredit any writer in the eyes of all persons who are possessed of a developed sense of the true and beautiful. English orthography satisfies all the requirements of the canons of reputability under the law of conspicuous waste. It is archaic, cumbrous, and ineffective; its acquisition consumes much time and effort; failure to acquire it is easy of detection. Therefore it is the first and readiest test of reputability in learning, and conformity to its ritual is indispensable to a blameless scholastic life.

Much of my first year in college I spent reading Veblen. It seemed fresh and smart then; it seems fresh and smart now.

## Secrets of a Successful Blog (part 4) (2007-06-13 21:23)

From [1]the penguin blog:

- 1) It should be personal - but not mundane.
- 2) The author should write about their work as well as their interests.
- 3) They should be entertaining company.
- 4) Posts should be regular and frequent.

Unsurprisingly, few author blogs manage all four.

Hmm. "Unsurprisingly"?

[2]Part 1. [3]Part 2. [4]Part 3.

1. <http://thepenguinblog.typepad.com/>
2. <http://www.blog.sethroberts.net/2006/12/01/on-scientific-method/>
3. <http://www.blog.sethroberts.net/2006/12/20/secrets-of-a-successful-blog-part-2/>
4. <http://www.blog.sethroberts.net/2007/01/28/secrets-of-a-successful-blog-part-3/>

---

Nahinu (2007-06-14 14:30:33)

It's hard to manage all four facets of a successful blog. I can do the first three, where I am personal, write about my interest, and entertaining. Being regular and frequent doesn't work out for me. I have to find a good article and the passion to write about it. I need to have that spark of fire that drives me to write and I don't have that everyday. I have blogs inside me waiting to come out but I just don't have the fire to write them aggressively. I am going to try to write more frequently. That should be my goal.

seth (2007-06-14 15:09:52)

Thanks for explaining that. It once seemed daunting to write 5 posts a week, much less 7. Now I write more than 7. One of my students did a project on remembering her dreams. It got easier and easier, she found.

## The Twilight of Expertise (part 3) (2007-06-14 15:07)

Do you need to be an expert on Topic X to write a serious (i.e., non-celebrity) well-paid well-publicized book about it? Less and less. As I said [1]earlier, I am not a weight-control expert. Mickey DeLorenzo, a Philadelphia "multi-media developer" (website designer?) is even less of a weight-control expert. However, he used his Wii to lose 9 pounds in six weeks ([2]story and data) and is working with an agent from a well-respected agency to write a book about it. The publicity started with digg.

You already knew you no longer have to be an expert on Topic X to write a well-read [3]encyclopedia article about it.

[4]Part 1. [5]Part 2.

Thanks to Elaine Smith.

### **The Twilight of Expertise (part 4) (2007-06-15 22:53)**

I was interviewed today by a writer for [1]Wired Online. She said the [2]Shangri-La Diet forums resembled open-source software. It's a good point; at the SLD forums, a large number of people from all over the place are slowly but surely improving the diet (which is essentially an engineering problem). Because of their improvements, the paperback is about 10 % different from the hardback. I'm not a weight-control expert; the people who contribute to the SLD forums are even less so.

The SLD forums can also be compared to a clinical trial of the diet. A large chunk of SLD forum posts are about how well the diet is working, which is what clinical trials are about. A clinical trial of the Shangri-La Diet (or almost anything) requires experts. Only weight-control experts could raise the money (hundreds of thousands of dollars) and have access to the necessary facilities. Anyone can start a forum.

Which is better? In two ways, a clinical trial is better than forums evaluation: 1. (major) You keep track of everyone who starts the trial. 2. (minor) Better measures. More accurate scales, blood tests, standardized food tracking. In six ways, forums evaluation is better than a clinical trial. 1. (major) More realistic. For example: the diet is more flexible, each dieter uses his or her own brain power to figure out what to do. 2. (major) Better reporting of side effects (both positive and negative). With forums, more brainpower goes into their detection. 3. (major). More transparent. Anyone can read the forums to find out what happened. Raw data from clinical trials is almost never available. 4. (major) Speed. Forums are much faster. 5. (major) Cost. Forums are much cheaper. 6. (major) Openness. Anyone can report his/her results on the SLD forums. Clinical trials, on the other hand, are closed to almost everyone.

I use both Firefox (open source) and Internet Explorer (not open source). But I use Firefox far more.

---

Timothy Beneke (2007-06-16 10:26:52)

"Weight loss experts"? Does it even make sense to use the phrase non-ironically or without scare quotes or the phrase "so-called" in front of it? Doesn't expertise that relates to some demonstrable end imply success and knowledge about how to gain that end? In a field that has a 96+ % failure rate is there such a thing as genuine expertise? Before the Wright brothers, were there "flight experts"? Don't we now look back upon the writings and claims of so-called experts in field prior to their achievement of success with amusement and view them as rather child-like? Someone who knows more history than I do can generate analogies...

seth (2007-06-16 10:40:28)

"Before the Wright brothers, were there 'flight experts'?" Very interesting question. I would guess not, but surely there were transportation experts who said human flight was impossible. Like the president of IBM who said there was a world market for "three, maybe four" computers.

Observer (2007-06-16 13:14:11)

"Like the president of IBM who said there was a world market for "three, maybe four" computers." Or maybe not: [http://en.wikipedia.org/wiki/Thomas\\_J.\\_Watson](http://en.wikipedia.org/wiki/Thomas_J._Watson) #Famous\_misquote *Although Watson is well known for his alleged 1943 statement: "I think there is a world market for maybe five computers," there is no evidence he ever made it. /.../*

Tim Lundeen (2007-06-16 13:19:04)

I see as a major benefit of the forums that they are adaptive/evolutionary, looking for better strategies, while a trial answers well-defined questions about fixed strategies. The forums allow individuals to try different strategies and share the results, which then allows others to try things that are working, and generates ideas about still new things to try.

seth (2007-06-16 15:30:34)

Thanks for the correction, Observer.

## Best Use of a Vocabulary Word (2007-06-16 16:26)

"The whole idea that Rumsfeld projectsâ€”Weâ€™re here to protect the nation from terrorismâ€”is an oxymoron," Taguba said. "He and his aides have abused their offices and have no idea of the values and high standards that are expected of them. And theyâ€™ve dragged a lot of officers with them."

From Seymour Hersh's latest [1] article.

1. [http://www.newyorker.com/reporting/2007/06/25/070625fa\\_fact\\_hersh](http://www.newyorker.com/reporting/2007/06/25/070625fa_fact_hersh)

## My Jaw Dropped When I Read This (2007-06-16 21:51)

From a [1]review in tomorrow's New York Times Book Review:

His ardent defense of statesâ€™ rights would have required him to uphold Virginiaâ€™s anti-miscegenation law, not to mention segregated education, yet he lives with a white wife in Virginia. He is said to dislike light-skinned blacks, yet he is the legal guardian of a biracial child, the son of one of his numerous poor relatives.

"He" is Clarence Thomas. "Yet", huh? There should be a rhetorical term for this: self-destructive.

1. <http://www.nytimes.com/2007/06/17/books/review/Patterson-t.html?ref=books>

---

August (2007-06-16 23:23:19)

You do know this is a hatchet job, right? From the very first sentence, this review is loaded down with trigger words meant to paint Justice Thomas in a very bad light. No doubt the book does too, but really, the very part you quote would suggest the improbable nature of the author's point of view. It's his family! Obviously he loves his family! Plus, the right to free association, to name just one off the top of my head, would mean anti-miscegenation laws would be unconstitutional to anyone with his political views. Seriously, this is a BAD hatchet job! Can you really imagine somebody being as conflicted as the review suggests and being able to function at all, let alone sitting on the Supreme Court?

seth (2007-06-17 04:55:48)

"Hatchet job"? Well, the writer is anti-Clarence-Thomas, sure. But the reputation being damaged is the reputation of the person who wrote the review. As you say.

## Shopping Notes (2007-06-16 22:20)

1. At a Vietnamese take-out place near Berkeley I got a can of sugar-cane juice. Some flavor, but very close to sugar water. From Taiwan. Which makes sense: In a Hong Kong store I saw cans of pure sugar water.

2. At Trader Joe's I bought a package of trail mix called "Omega Trek Mix with Omega Fortified Cranberries." (A new use of omega, by the way.) It contained "500 mg Omega-3 Fatty Acids Per Serving." Sold only by Trader Joe's. Not saying which omega-3 fats is a problem; so is lack of refrigeration. I could do a bio-assay, I realized: using the tests I have blogged about, such as balance and arithmetic, I could determine how much of the mix I had to eat to have the same effect as 1 tablespoon of flaxseed oil.

3. At Trader Joe's I asked the checkout clerk what parts of her job she liked the best. "If we card a secret shopper, we get \$15 for lunch," she said. Lunch here? I asked. Lunch anywhere, she said. Whereas [1]Dell employees detest secret shoppers. A tiny glimpse of a better future.

### **Science in Action: Sunlight and Sleep (progress report) (2007-06-17 22:12)**

I've collected even more observations supporting the idea that outdoor light improves my sleep, as discussed [1]earlier. Now I'd like to get some idea of the dose-response function. To sleep really well do I need two hours of outside light? Four hours? Eight hours?

I've started to rate my sleep on a scale where 50 = average sleep (average for the months before I started spending more time outside) and 100 = best sleep imaginable (which I got after standing about 10 hours). And I've started to use a stopwatch to measure how long I spend outdoors. I've also been using a light meter to measure the strength of light in various places. When I'm outdoors it's almost always in the shade. Today I discovered that sitting indoors next to a cafe window the incident light was just as bright as when I sit outside. Great to know because indoors I can plug in my laptop.

A 1994 book chapter from [2]Daniel Kripke's lab reported a correlation (0.24) between low light exposure and "abnormal sleep." So the connection I am now studying has been plausible for many years. The measurements I am now making are easy, but no one made them. Perhaps too many people believe that anything other than a double-blind trial with control and experimental groups is, as Peter Norvig, Google's Director of Research, [3]believes, a "mistake."

1. <http://www.blog.sethroberts.net/2007/06/05/science-in-action-sunlight-and-sleep-update/>

### **SLD Musings (2007-06-18 19:59)**

On her [1]MySpace page, Janice writes:

I have been on [the Shangri-La Diet] for a month and I have lost 12 pounds! It is the easiest way to lose weight.

During this month she started riding a recumbent bike. I am struck by how often this happens: After people start SLD they start improving their lives in other ways. (Didn't happen to me, by the way.) Does cessation of struggle with food (which took "energy") leave more "energy" for other forms of self-improvement? I wasn't struggling with food when I started SLD so I would fit that theory.

This wouldn't explain why SLD causes non-caloric cravings (such as for coffee and cigarettes) to go away. Maybe they go away because they are triggered by hunger. Speaking of cigarettes, Gary Skaleski, who invented SLD nose-clipping, suggests that maybe you can quit smoking if you clip your nose while you smoke. You get the nicotine needed to remove the craving but the lack of smell removes the possibility of addiction. No one becomes addicted to plain sugar water, which has no smell. Fascinating idea.

1. <http://blog.myspace.com/64480598>

---

James (2007-06-19 04:38:48)

I don't think it's a matter of energy, but rather one of control, time, and physics. Control is the big one – it's very hard to convince yourself that you can improve if you've tried and failed to control something as simple as your eating. My experience with SLD is that it turns off the part of my brain that (a) maximizes calorie consumption and (b) has veto power over the rest of the brain. Before SLD, I didn't even realize that there was this disconnect between what I consciously decided to eat and what I ended up cooking or ordering. Once I started SLD, the conscious decision-making both decreased my intake but, much more importantly in my book, greatly improved the quality of my intake. (If you told me last year that I would willingly eat only 1-2 red-meat meals a week....) With control over my eating (and more stable blood-sugar levels, I'm guessing), doing things like exercising more, getting up earlier, and quitting a massive diet-soda habit seemed both easy and worthwhile. The sleep and eating-less benefits of SLD also increased the time I had available for self-improvement – not by a lot, but every bit helps. Finally, losing weight makes most exercise easier. I actually avoided adding exercise during my first few months on SLD because I wanted to prove to myself that the plan would work without it, and I didn't want to fall into the (for me common) trap of eating more to "make up" for calories used up exercising. I'm glad I waited; when I did start ramping up the exercise, the motivational benefits of feeling light/fast were excellent.

seth (2007-06-19 05:41:42)

Thanks for the analysis.

Janet (2007-06-19 06:12:22)

A couple of months ago, the AHRQ bulletin (which summarizes medical journal articles) included a randomized experiment that showed that making multiple life changes resulted in more positive outcomes than making single life changes. It's an active area of research — I know Bonnie Spring at Northwestern has been looking into it for awhile. The converse is that if someone falls off the diet wagon (or perceives themselves as having fallen off), they may also stop exercising as well.

Pearl (2007-06-19 06:15:31)

I was thinking about this the other day too, as I also have been long trying to improve my life before SLD, not suddenly after. Maybe for a lot of people, they see weight loss like trying to push a giant boulder by themselves, but SLD is like getting a machine that pushes the boulder for you. But the machine only does so much and suddenly one feels that any energy they put into moving the boulder with the machine will actually help the boulder along. People feel like a burden has been lifted and pushing the boulder is possible, so they want to help it move as fast as possible.

Janet (2007-06-19 06:25:32)

I just ran across the article: <http://www.medpagetoday.com/Cardiology/AcuteCoronarySyndrome/tb1/5903>

seth (2007-06-19 06:44:54)

That would be an interesting study: ask people about their various goals (e.g., get more exercise) and how far they have gotten on them month after month; and then see if starting SLD actually causes them to do more on their other goals. Does it affect

1. food-related goals (e.g., drink less diet sodas).
2. weight-related goals (e.g., get more exercise).
3. health-related goals (e.g., eat less salty food).
4. wellness-related goals (e.g., get massage).
5. non-wellness related goals (e.g., blog more).

Brad (2007-06-19 07:51:49)

I would think you'd find a lot of reinforcing effects. With me the oil both tends to reduce cravings and tends to give me a feeling of control, which increases hope, which increases motivation, which increases efforts in other areas, which results in positive effects...which increases feelings of control and motivation. It's a wonderful feedback loop.

david (2007-06-19 07:56:01)

I did SLD over a year ago: was 167 lbs, did some sugar water for 3-4 weeks between breakfast and lunch; got down to 147 lbs; the weight never came back. I didn't start exercising any more though I might be slightly more active. I did however stop eating meat. I didn't so much become a vegetarian as realize I was one. I would go several days and realized I hadn't had any meat. I've since learned that vegetarianism is the new Prius, which is nice, because I can't afford a Prius: <http://www.commondreams.org/views07/0120-20.htm>

Sarah Lewis (2007-06-20 07:20:45)

David, I love that article you linked to. I'm a "[1]flexitarian" mostly due to my picky tastes (I really don't like much meat) but it's encouraging to realize that simply eating more healthfully could help with other, larger problems.

1. <http://en.wikipedia.org/wiki/Flexitarianism>

### **Can Dish It Out But Can't Take It (2007-06-19 23:06)**

The presidents of dozens of liberal arts colleges have decided to stop participating in the annual college rankings by U.S. News and World Report.

From the [1]NY Times. I commented [2]earlier on the contradiction between how college presidents think students should be judged – they believe it is fine to judge all students according to one standard that usually has little to do with their strengths and goals – and how they wish to be their colleges to be judged.

“Frankly, it had bubbled up to the point of, why should we do this work for them?” said Judith P. Shapiro, the president of Barnard College.

Yes, exactly: Why help prospective students? Lest there be any doubt [3]for whom colleges exist.

1. <http://www.nytimes.com/2007/06/20/education/20colleges.html?hp>
2. <http://www.blog.sethroberts.net/2007/04/07/golden-rule-and-reed-college/>
3. <http://www.blog.sethroberts.net/2007/03/31/for-whom-do-colleges-exist/>

---

Andrew Gelman (2007-06-22 05:34:49)

Seth, I'm sure I'm biased because Barnard is an affiliate of Columbia (where I work), but I don't think you're being fair. When referring to "them," Shapiro was talking about U.S. News, not prospective students. Speaking to your larger point, I agree that just about all organizations (including universities, businesses, governments, and, for that matter, magazines such as U.S. News) work for their own interest as well as the groups that they serve. With that in mind, and following the Backseat Driver principle, I suspect that it would be useful for college presidents to listen to your advice.

seth (2007-06-22 06:24:55)

Yes, by "them" Shapiro meant the magazine. But the magazine was helping prospective students. Mayor Bloomberg give a talk at Google in which he referred to the bureaucracy of the New York City public school system as serving itself, not students. As you say, other organizations act the same way. I suspect organizations we have to deal with – such as governments and schools – are worse in this regard.

Andrew Gelman (2007-06-22 06:50:12)

Barnard is a private school so I imagine it's more responsive than governments and public schools. Regarding your first point, maybe U.S. News is helping prospective students, maybe not. Presumably the people buying the magazine think it helps them, but then again the people paying to go to Barnard presumably thinks Barnard helps them. Just as you're skeptical about Barnard providing what it claims (and what people pay for), maybe you should apply similar skepticism to U.S. News rankings, which have come under a lot of criticism in recent years.

seth (2007-06-22 07:19:34)

The problems with how college students are taught relate to my ideas about human evolution; that is one reason I discuss them. My evolutionary ideas suggest why things have gone wrong and how to fix them. The other reason is that I am familiar with colleges – at least, compared to magazines. As I once blogged, I think it is better to offer advice about stuff you are familiar with. No one is forced to buy U.S. News and World Report. But students are pretty much forced to go to college to get jobs above a certain level of prestige.

jc (2007-06-23 09:48:43)

Interesting discussion - My read of this is that schools are not saying they don't want to be graded; they are saying they don't want to be graded by US News & World Report. One, because no one thinks they have expertise in such evaluation. Two, because unlike student grades that are based on real assessment of course work related to a published syllabus, these college rankings are based on poorly executed surveys of self-interested parties and "objective" measures (like size of research budget) which have not been proven to be associated with quality of education. What is wrong-headed about the school's response is that they want to replace the US News ranking with a self-reported ranking. Instead, they should find a third party, preferably a non-profit research organization that has expertise in statistical methods, to execute an open ranking, with rules agreed upon by all schools.

seth (2007-10-25 20:29:25)

Yes, that's a good idea.

## **The Twilight of Expertise (part 5: psychotherapy) (2007-06-20 06:48)**

In [1]The Starfish and the Spider (2006), a book about decentralized organizations, one of the examples is Alcoholics Anonymous, started in 1935, in which local chapters are almost entirely autonomous from headquarters. Of course

AA led to many similar programs: Narcotics Anonymous, Overeaters Anonymous, and so on. All of these twelve-step programs offer therapy without therapists – for free. A little like the [2]Protestant Reformation, which I mentioned [3]earlier.

At a recent party I met a woman who runs an outpatient program for persons with mental disorders, including major depression. She asked me what I would suggest. Based on [4]my faces research, I suggested early morning face-to-face meetings, especially for persons with depression. Very interesting, she said, AA folk wisdom is that morning meetings have the best success rates.

If you want to attend an early morning meeting (non-twelve-step), and you live in San Francisco, you may have a communal breakfast ( \$5 plus tax, served 8:30-9:30 am) at [5]OneTaste (1074 Folsom at 7th St.), an "Urban Retreat Center". If you can do this, I'm jealous. OneTaste is a group of 50 people who live and work together. They appear to support themselves by teaching yoga and giving other classes. They have been at their SF location for two years; before that they were at many different locations. The receptionist told me it was a "sensual community." What's that? I asked. "We try to activate our sensuality" etc., she said. I didn't know what she meant. Is this on the website? I asked. Yes, she said, so I didn't bother to take careful notes. I wish I had. The website puts it more bluntly: "Our purpose at OneTaste is to return to connection by researching our relationship to orgasm." A recruitment [6]video, to prepare for breakfast.

---

Willy (2007-06-20 14:19:16)

I repost, it seems I have some problems. Very nice post. Now I think I have a reason why so many people like to have breakfast at a cafe (a habit I hate). It can't be they are too lazy to make a cup of coffee.

seth (2007-06-20 14:27:07)

I think you're right. Unfortunately if you go to a cafe for breakfast you are unlikely to have long conversations with the other patrons. Which is why I like the OneTaste breakfast. The mother of a friend of mine suffered from severe depression; she couldn't get out of bed. She got better when she started a business breakfast for women. Maybe other sorts of breakfast groups are possible.

seth (2007-06-20 14:49:50)

if your comment does not appear after you post it it probably means the system treated it as spam.

seth (2007-06-20 19:49:13)

Someone had trouble posting this: Bill Wilson, the founder of AA, is an excellent example of someone who made a great discovery through self-experimentation. The AA program was adapted from an earlier program based on Wilson's observations about what worked and what didn't work for alcoholics. The entire program continued to be shaped by this type of experimentation and by group collaboration. AA is far from perfect, but evidence-based medicine has so far failed to come up with a treatment option that rivals the 12 step approach.

seth (2007-06-20 19:49:31)  
That's a good point.

### **A New and Useful Word (2007-06-20 12:26)**

The word is black-and-white-ism. For [1]instance:

Berman's chief problem as a thinker is black-and-white-ism, and this is a good example of his failure to make subtle distinctions.

Scientists are guilty of black-and-white-ism all the time: this statistic is wrong, that way of doing things is a mistake, and so on. John Tukey wrote about this tendency in a paper called "Analyzing data: Sanctification or detective work?" If you believe data analysis is sanctification, there are indeed right ways and wrong ways, as with any ritual. But if science is not a set of rituals, talking about right and wrong confuses graduate students – who begin to think science is a set of rituals – and restricts what you can do. After you say something is wrong, it is harder to do it.

1. [http://www.philipweiss.org/mondoweiss/2007/06/paul\\_berman\\_is\\_.html](http://www.philipweiss.org/mondoweiss/2007/06/paul_berman_is_.html)

---

pete (2007-06-20 20:31:32)  
manicheanism?

pete (2007-06-20 20:33:22)  
well, i take it back, not exactly the same thing – less of a moral edge to "black-and-white-ism"

seth (2007-06-20 20:59:35)  
perhaps "black-and-white-ism" is the poor man's "manicheanism".

### **Strengths and Weaknesses of Epidemiology: A Semi-Insider's View (2007-06-21 23:38)**

On BART I met a graduate student in epidemiology. "What are the strengths and weaknesses of epidemiology?" I asked. Strengths:

1. It asks important questions. What causes cancer? for example.
2. The results are useful. They can guide public policy. If you learn that smoking causes cancer, you can start an anti-smoking campaign. Epidemiological results can also lead to informative experiments: Epidemiology suggests that X causes cancer, you do an experiment to test that conclusion.

Weaknesses:

1. Health is complicated, controlled by many things. Presumably this is why studies often have conflicting conclusions.
2. There is enough flexibility in data analysis that your original hypothesis may influence the way that you analyze your data.

I use epidemiology all the time – [1]here, for example. It often makes an interesting idea more plausible. My ideas about depression, derived from studying the effects of seeing faces, became more plausible to me because of the epidemiology of depression.

### **The Dog-Food Diet (part 1) (2007-06-23 09:38)**

From [1]craigslist:

I have 2 dogs & I was buying a large bag of Pal at Big W and standing inline at the check out.

A woman behind me asked if I had a dog.

On impulse, I told her that no, I was starting The Pal Diet again . . . I told her that it was essentially a perfect diet and that the way that it works is to load your pants pockets with Pal nuggets and simply eat one or two every time you feel hungry & that the food is nutritionally complete.

Not absurd. [2]Sclafani and Springer (1976) compared two groups of rats: (a) rats given rat chow (which resembles Pal nuggets) and (b) rats given rat chow plus human food (e.g., salami, cheese). Both groups could eat as much as they wanted. The second group gained a lot more weight than the first. I suspect rat chow is less fattening than human food because it is more bland and digested more slowly. This is one of the experiments that led me to the [3]theory behind the Shangri-La Diet.

1. <http://seattle.craigslist.org/about/best/wdc/323692159.html>

2. [http://www.sciencedirect.com/science?\\_ob=ArticleURL&\\_udi=B6T0P-484NWYY-N4&\\_user=4420&\\_coverDate=09%2F30%2F1976&\\_alid=592270496&\\_rdoc=6&\\_fmt=summary&\\_orig=search&\\_cdi=4868&\\_sort=d&\\_docanchor=&view=c&\\_ct=6&\\_acct=C000059607&\\_version=1&\\_urlVersion=0&\\_userid=4420&md5=4ff975bdef39f32be7636d02c1d9092d](http://www.sciencedirect.com/science?_ob=ArticleURL&_udi=B6T0P-484NWYY-N4&_user=4420&_coverDate=09%2F30%2F1976&_alid=592270496&_rdoc=6&_fmt=summary&_orig=search&_cdi=4868&_sort=d&_docanchor=&view=c&_ct=6&_acct=C000059607&_version=1&_urlVersion=0&_userid=4420&md5=4ff975bdef39f32be7636d02c1d9092d)

---

J. Weighty (2007-06-23 15:25:36)

And of course, there's the Monkey Chow Diet: <http://www.angryman.ca/monkey.html>

seth (2007-06-23 15:53:27)

Thanks for the link. The big difference is that dog food is a lot more available than monkey chow.

Dale (2007-06-27 12:57:40)

Let's not forget, if you do go on a animal chow diet – don't add water!! [see Seth's Shangri-La Diet appendix page pp153-154]

seth (2007-06-27 14:10:48)

That is correct: don't add water.

## **Learning to Write Better (2007-06-24 07:19)**

[1]From the SLD forums:

I just had a great victory. My daughter is having her friends over so we are making friendship cookies. . .  
. I was feeling miserable for the first time since starting SLD [Shangri-La Diet] like I wanted to eat a whole bunch of them and totally binge out. I ate a few crumbs that fell off and couldn't get them out of my mind (I haven't had this problem in 6 wks.). I went ahead and decided to eat just one of the yummy delights.  
. . . After one I was so very full I actually didn't want anymore! DO YOU REALIZE WHAT THIS MEANS? I mean, wow! I can actually have just one cookie. I never ever ever have been able to do that before.

I like to think the Internet is improving my writing by showing me many examples of how to do it. This quote is half of a well-written few paragraphs. The other half would be the general rule that Michel Cabanac discovered: If your set point is lower than usual you will feel full sooner than usual, as this quote illustrates. (The Shangri-La Diet had lowered her set point.) Interesting idea + emotion-charged example = good writing. Blogs are another example. As I've said [2]before, they are full of good writing. You don't blog about stuff you don't care about.

Books – part of the great wide non-Internet – suffer by comparison. I recently started reading a book about [3]Alice Waters and Chez Panisse. I was favorably disposed: Chez Panisse is a great achievement, I am very interested in food and changes in food, it took place near my house, I had attended a nice reading given by the author. In spite of all this, I stopped after a few chapters. The book is very well written in a nuts-and-bolts way. However, it lacks emotion – the author didn't care passionately about his subject and it shows. The book had come about because Alice Waters's assistant had approached him and asked him if he was interested in doing such a book. He took a long time, he did a careful and thorough job, but no amount of time or care or editing could fix the problem that he didn't feel strongly enough.

2. <http://www.blog.sethroberts.net/2007/05/16/why-blogs-are-better-written/>

3. <http://sfgate.com/cgi-bin/article.cgi?file=/c/a/2007/04/06/DDG3FP2P621.DTL&type=printable>

## Good Thinking (2007-06-24 15:23)

I heard about [the Shangri-La] diet from someone on a discussion group I'm part of and it sounded like total bunk. . . . This person pushes my buttons, so I decided I would test the diet. If it worked, I'd lose some unhealthy weight (three pregnancies combined with the stress of recent years left me 40 pounds overweight for my height), and if it didn't work, I'd have the satisfaction of proving her wrong. It was a win/win.

I chuckle every time I read this. [1]It continues:

I eliminated my two daily Cokes . . . from my diet and replaced them with the equivalent amount of liquid and calories from sugar water. I've been less hungry and losing weight ever since. Damn her!

[2]Speaking of SLD and blogs and good writing. [3]This has nothing to do with SLD.

1. <http://mamampj.blogspot.com/2007/06/8-things-about-me.html>
2. <http://www.blog.sethroberts.net/2007/06/24/learning-to-write-better/>

---

Mary (MPJ) (2007-06-24 19:41:55)

Wow, thanks for the compliment on my writing. And thanks above all, for my new healthier and svelter self. I can't believe how easy it has been to eat reasonable portion sizes and cut down on junky snacks. I'm so happy with my new relationship with food, and as an added bonus, I find that sipping a cup of sugar water is a great way to relax. I tell any and all who will listen about the good times I'm having in Shangri-La!

Dave (2007-06-27 00:05:23)

Seth, found your site after doing some online research. Your diet info on the site obviously relates to the book which I'll go check out. It looks like its common sense based but like everyone else I lose my common sense around a bag of cookies. The wife and kids have learned to hide them from me.

## The Twilight of Expertise (part 6: psychotherapy, continued) (2007-06-25 04:02)

Among the community of psychotherapists, according to Dr. Marion Arom, a psychotherapist friend of mine, "it is common knowledge that in many traditional therapies, if the therapy fails – if the desired change doesn't occur – it's due to client resistance or lack of motivation to change or unconscious motivation. The role or skill of the therapist is not examined, ever."

[1]Dark Age Ahead by Jane Jacobs has a chapter about the failure of highly-respected professions to police themselves.

---

Nansen (2007-06-25 17:23:38)

And, if the desired change DOES occur, it just can't be due mainly to something unheard of, such as Seth's discovery about seeing faces early in the morning. Rather: the change must be due to the therapy, or chance, or remission, et cetera.

Psychotherapy (2008-06-03 08:22:55)

Yes, so very true. As a practicing therapist and director of an organization dedicated to promoting healthy psychotherapy and counseling, I can tell you that the inability of some therapists to self-examine is a big issue. As a general rule of thumb I believe that if the therapy is not going well, then there is a part in the way. The part may be an aspect of the client, but it is just as likely to be an aspect of the therapist. A good therapist makes an effort to know themselves and to be conscious of how parts of themselves may be interfering with the clients work or reacting to the client in subtle and significant ways. It's an excellent subject to talk about and one that we at goodtherapy.org are trying to bring more awareness to. Thanks for the blog post... I look forward to reading more and exploring your blog. Noah

## The Twilight of Expertise (part 7: education experts) (2007-06-26 13:56)

The education improvement program – merit pay for teachers as part of a larger package – promoted by the Milken Family Foundation received a big public boost last week with [1]this NY Times article about a similar program in Minnesota.

A consensus is building across the political spectrum that rewarding teachers with bonuses or raises for improving student achievement, working in lower income schools or teaching subjects that are hard to staff can energize veteran teachers and attract bright rookies to the profession. . . . Minnesota’s experience shows . . . that an incentive plan created with union input can draw teacher support.

The plan that is gaining support was devised by Lowell Milken, according to Jana Rausch, who works for the Milken Family Foundation on [2]this initiative. Before he started the foundation, Lowell Milken was a lawyer. As far as education goes, he is self-taught. Yet the program he devised seems to be working better than other programs. Of course many people have proposed merit pay for teachers; but it is the Milken Family Foundation that has managed to make it work. We need engineers to build a better plane. But we do not need education experts, apparently, to build better schools.

### **My Theory of Human Evolution (music video edition) (2007-06-27 10:33)**

[1]This clever and attractive music video creates images out of repetition of dice numbers – pictures of dice showing 1, 2, etc. It illustrates the general point that we like to see identical or nearly-identical things side by side. A vast amount of decoration (wallpaper, rugs, packages, posters, architectural details) takes advantage of this.

It's a curious propensity because we don't see this pattern in nature: we don't see identical things side by side, neatly lined up. So the propensity did not evolve so that people will prefer Place X to Place Y. It's a propensity that causes us to place similar things side by side – if we have a doll collection, for example, to put our dolls side by side rather than far apart.

When we put things [2]side by side it is far easier to notice small differences. Noticing small differences is the first step toward caring about small differences, deriving pleasure and displeasure from them – becoming a connoisseur, in other words. Connoisseurs pay more for "fine" stuff than the rest of us – wine connoisseurs pay more for wine, for example. In human prehistory, I theorize, connoisseurs supported [3]artists and artisans, who were the first material scientists.

The pleasure we take from identical things side by side evolved because it increased connoisseurship. Supermarkets should do more side-by-side sampling of different products in the same category – different balsamic vinegars, for example.

Shane (2010-03-06 08:22:40)

I read the "Diversity in Learning" article and loved the practical parts of it, though phrasing it in ev-psych terms is too vague for my tastes, esp. when all of these accounts - language development, to take just one - have been treated extensively, thoroughly, and critically. (One example you may enjoy is Arbib's 2005 article in BBS on language evolution via the mirror-neuron system. Even though MNS has attracted a huge range of loonies, Arbib is about as mainstream neuroscience as it gets; so him sticking his neck out in this way was an event of some note.) Anyway, I'm putting together a curriculum for teaching various aspects of the linear model, from linear algebra to multiple regression to the derivation of the multivariate Gaussian distribution (yes, this makes sense in context.) I would love to use your idea "Do 60 hours of work on something having to do with psychology, but it has to be off-campus" but I don't think that particular phrasing would work in a mathematical class of this sort, or at least, the kinds of applications I can imagine would severely constrain the material, and the material does need to be learned - the student doesn't have the luxury of learning the stuff that she likes when she'll need these tools for the rest of her graduate career. In other words, if she doesn't leave being able to derive and hand-code a multivariate regression, connect this to geometry, and from there to fitting complex surfaces using OLS, then I lose. Any thoughts? How does one use the powerful ideas in your paper for more ... constricted domains?

seth (2010-06-21 07:04:59)

Sorry to not reply sooner. I didn't see this. I suppose my first attempt would be to say to the students: do something you want to do with these ideas. And see what happens. It could involve about 60 hours of work.

Raenell (2011-02-24 19:52:31)

As what the saying goes, "The Only Permanent Thing in this World is Change." Human evolution is happening every now and then and it's up to us humans how we will adopt and adjust into it. But the only thing I could say is that everything that is happening in our time today, it has a purpose. Only God knows that purpose.

Tian Liang (2011-09-12 10:51:04)

Greetings Seth, I read your paper on How Economics Shaped Human Nature and I am impressed by the fresh approach you took as opposed to traditional explanations of human origins and uniqueness. I'd like to offer a different approach that also involves some economics and game theory to explaining human origins. The book "Death from a Distance and the Birth of a Humane Universe" (Paul M. Bingham and Joanne Souza, 2009; [www.deathfromadistance.com](http://www.deathfromadistance.com)) in my opinion provides a fresh angle at explaining human origins much like yours and also predicts the human future. Let me call your attention to the fact that Bingham and Souza's theory accounts explicitly for why humans first evolved the capacity for "trade" and, thus, provides new insights into the relationship between human evolution and contemporary economic behavior. Let me know what you think! [I can probably arrange for the authors to send you a free copy of their book if you are interested in reviewing it. See their website at [www.deathfromadistance.com](http://www.deathfromadistance.com) .]

### **The Twilight of Expertise (part 8: spiritual experts) (2007-06-28 19:18)**

"Religion is extremely important to the Tibetans," says [1]Wikipedia, but what does that mean? The [2]Tibetan Buddhism entry is no help. Last night at dinner, however, I did learn what it means, at least in part. Tibetans spend a vast amount of time on religious observances – what the observer (Bryan Ng, a Berkeley engineer) called a "religion tax." One example was a well-observed month-long annual religious festival. Another was a sensationally slow method of travel: Take a step or two, bow down, lie down on the ground, get up, take another step, bow down, and so on. This method is used to cover long distances, such as 20 miles or more. The extremely devout do this along highways.

The Chinese government wants to reduce the influence of religion, he said. Goods imported into Tibet from China via the new railway should increase commerce, for example. The power of the Chinese government makes it likely they will succeed.

1. <http://en.wikipedia.org/wiki/Tibet>

2. [http://en.wikipedia.org/wiki/Tibetan\\_Buddhism](http://en.wikipedia.org/wiki/Tibetan_Buddhism)

---

Janet (2007-06-28 20:07:52)

If this Tibetan practice is widely followed, wouldn't it qualify as a folk practice rather than expert-driven practice? An example of twilight of expertise in religion is the rise of clergy-less places of worship. I'm most familiar with Jewish case: the chavurah (a type of clergyless prayer group) movement is a few decades old, and recently the most dynamic parts of Judaism are arising from non-denominational independent traditional prayer groups which have sprung up starting with Hadar in Manhattan, and subsequently in most urban centers. Of course, many of these groups were started by skilled lay leaders who attended a couple of Ivy League colleges, so maybe it is just a different type of expertise. Someone who has a finger on the pulse of Christian movements can comment on that. My sense is that the rise of non-denominational evangelical Christianity has brought greater opportunities for substantial lay leadership. The few street ministries that I know of were started by people who don't have any particular credential except experience in witnessing, and they perpetuate it by training lay people.

seth (2007-06-28 20:32:25)

Those are good examples, thanks. The Tibetan practices I mentioned were prescribed and sustained by the spiritual experts: the leaders of Tibetan Buddhism.

## Michael Moore and Jane Jacobs (2007-06-29 06:13)

Sicko is a great movie, one of the most emotion-evoking films I have ever seen. In this interview

[EMBED] Moore says something that is at the heart of Sicko:

They [HMOs] are required by law . . . to maximize profits for their shareholders. That's what the law requires them to do. The way they can maximize profits is to deny care, is to not pay out claims. The more claims they pay, the less profit they make. You should never have the idea of profit enter into a health decision. We wouldn't allow it for the fire department or the police department. We wouldn't say, well, you know, we've got to be sure the fire department posts a profit. We wouldn't turn it over to a private company, have investors invest in it, say, well, some people are going to get fire protection and other people aren't. We wouldn't allow that, would we? It would be immoral.

This is what [1]Systems of Survival by Jane Jacobs is all about. Jacobs argued that there are two sets of "moral" rules – one appropriate for "guardians" (such as firemen, police and doctors), the other appropriate for "traders" (business people) – and that the two should not be mixed. When guardians follow commercial rules or when traders follow guardian rules, bad things happen. Sicko is about the bad things that happen when doctors follow commercial rules and how these bad things are avoided when (in other countries) doctors follow guardian rules.

1. [http://en.wikipedia.org/wiki/Systems\\_of\\_Survival](http://en.wikipedia.org/wiki/Systems_of_Survival)

---

Varangy (2007-06-29 08:56:42)

Seth, While you are clearly intelligent, your take on Sicko and socialized medicine is naive at best. Explain to me how socialized medicine, in the absence of visible prices, would ration healthcare. In Canada, healthcare is often rationed via someone's ability to wait for an operation. In the UK and other places, after a certain age, people do not get operated on b/c it is considered a waste of public monies.

Scoop (2007-06-29 09:05:34)

Of course we take money into account when deciding who we'll save from crime and fire. We decide, in advance, how much we will spend on police and firefighters, even though we know we could save more people if we spent more. Moreover, the amount spent on your protection from crime and fire does vary directly with your income because rich towns chose to buy better services than poor ones. Actual policemen and firemen may not follow "trader" rules but society follows trader rules in apportioning money for those services. What's the difference where we take money into account?

seth (2007-06-29 09:09:32)

Varangy, that's a very good question, outside my area of expertise. Varangy, you don't clearly explain why my take on Sicko is naive. It is propaganda, not a think piece. There is a place for films and books that engage emotions. Sicko is a Common Sense for our times.

Sandeep Prakash (2007-06-29 09:33:36)

Seth, Paine's Common Sense was a political pamphlet that was written with the unambiguous intention of convincing people to get rid of their present government (Britain). Michael Moore's film seeks to persuade people to look for a grand, centrally-planned health-care solution. No, Sicko is no the Common Sense of our times. Sicko asks us to return to a barbaric state of affairs where the politically connected and powerful are the most likely to have access to health care, and be well-off. Hence, it is more appropriate to say that Sicko is the [1]Occasional Discourse on the Negro Question of our times.

1. <http://cepa.newschool.edu/het/texts/carlyle/carlodnq.htm>

seth (2007-06-29 09:35:54)

Scoop, we don't require that the fire department or the police department post a profit, just as Moore says. It's true that there is consideration of money but it is of a different sort.

lasser11 (2007-06-29 09:57:40)

I don't know seth. Your criticism of our for-profit health care system seems to center on our top-down model. Decisions are made according to Wall Street's standards instead of those actually administering care, like doctors. Yet, a single payer system, like Canada, is even more top down structured than the US. A centralized agency chooses everything. There's less flexibility. In the US doctors are more empowered because insurance companies are not unified.

Carter (2007-06-29 10:40:57)

Seth, A few things. First, it seems to me that you carefully examine ideas before accepting them, and so I'm surprised to see you endorse a movie or an issue without carefully examining the counterarguments. "Common Sense" tells me that the Shangri-La diet wouldn't work, and yet I wouldn't accept that as truth without giving it a fair shake. I have to say that I'm shocked that someone who promotes a "heterodox" way of doing things in his own field would favor such a top-down, one-size-fits-all system when it comes to health care. The beauty of the free market (not that medicine is a free market now) is that experimentation flourishes and the best and most cost-effective methods for treatment and care rise to the top. Such a process is impossible when the government controls health care. When health care is "free" (paid for by massive tax increases), then the quantity demanded will be unlimited. Without prices to ration care, there will have to be some other rationing mechanism. It might be waiting lists, and more than a few people die every year in Canada waiting for treatment that takes only a few days in the U.S. (since you enjoy propaganda films, you should watch one from the other side of the fence: <http://www.onthefencefilms.com/video/twowomen.html>). A doctor motivated by money is far more trustworthy than a government bureaucrat. When the government provides services, the customer is a nuisance.

seth (2007-06-29 11:16:11)

My take on Moore's movie is that above all it is meant to evoke outrage or disgust or sadness that will lead to action – that is, to change. To spell out what the new system should be is left for a different piece of communication. This is perfectly appropriate. Moore is not a thinker and he doesn't claim to be one. His movie does so well what we always ask of art – that it evoke emotion. We don't look to novels for solutions, at least we shouldn't. Perhaps I should have called it *The Jungle* for our times. I don't favor any particular new system – that is beyond my expertise, as I have said. But I do favor some new system. The emotion evoked by Moore's movie is reasonable and helpful, I believe. In a free market, you say, "the best and most cost-effective methods" rise to the top, and that such a process "is impossible when the government controls health care." That's an interesting point. I'm not so sure it's impossible. If individuals and individual doctors can be empowered relative to a Washington bureaucracy, you may be wrong. After all people care about their health and getting the best possible treatment. The internet empowers them and maybe they can be empowered further. The voucher system is not incompatible with government control of education.

CD (2007-06-29 11:18:38)

The difference between police/fire and healthcare is that there is very little incentive to consume unlimited amounts of police/fire services, just because they are free.

seth (2007-06-29 11:25:06)

Good point, CD. If doctors were as effective as firemen, we would not argue about whether or not they are effective (see my earlier post about the *Twilight of Expertise* part 2, about doctors). People consume large amounts of health care, I believe, when their basic problems are not solved. E.g., they remain obese, diabetic, depressed, etc. This is what a doctor I know meant when she said "most of the people we see we can't really help". She worked in a community hospital.

Varangy (2007-06-29 15:31:25)

*t is propaganda, not a think piece. There is a place for films and books that engage emotions. Sicko is a Common Sense for our*

times. It is clearly propaganda. Anti-american propaganda. I should point out that Anti-americanism while very chic as well as a cashbox for people of MM's ilk is nothing less than a vicious prejudice. And you're right, it does engage emotions, cruel ones that do not wish the US well. *My take on Moore's movie is that above all it is meant to evoke outrage or disgust or sadness that will lead to action - that is, to change. To spell out what the new system should be is left for a different piece of communication. This is perfectly appropriate. Moore is not a thinker and he doesn't claim to be one.* At least we almost agree here, MM IS NOT a thinker. But he does claim to be one. *His movie does so well what we always ask of art - that it evoke emotion. We don't look to novels for solutions, at least we shouldn't. Perhaps I should have called it a The Jungle for our times.* His denigration of the world's best healthcare system (yes, I say that fully knowing its myriad, serious flaws and warts etc etc) is simply not art. *I don't favor any particular new system - that is beyond my expertise, as I have said. But I do favor some new system.* That is rather weak, no? :) YOU are a thinker - you must have an idea of what an ideal system would look like? Keep in mind, utopia does not count. *The emotion evoked by Moore's movie is reasonable and helpful, I believe.* From having read your blog, I don't think that you believe that prejudice of any sort is reasonable and helpful. And that is what this movie is about.

seth (2007-06-29 17:11:50)

I hope we can also agree that it is not the world's best healthcare system for those without health insurance. I don't think Moore's movie is about prejudice. It is full of facts and examples. I don't think it is "anti-American" to make a movie criticizing American health care. Lots of Americans agree with Moore - especially the uninsured.

lasser11 (2007-06-29 18:20:09)

I agree with Seth that our health care system has serious issues (especially for the uninsured) and if Moore's film provokes serious discussion on the issue without offering the Canadian or English system as a template, then that's great. But I'm concerned that that most viewers of sickco will believe that those two flawed health care systems are the end all of exceptional health care. I believe France offers us a better model to look at. French health care offers breadth of coverage while remaining more decentralized than our health care system. Yet, Moore raves about Canadian and even Cuban health care due to their geographic proximity.

Jason (2007-07-02 16:59:39)

I agree that healthcare has a conflict of interest which is inappropriate - profit vs quality care. Not sure that socializing healthcare is not just a tradeoff of other negative aspects though. As far as police - I hate to say I think there is frequently a conflict of interest as well since they are responsible for issuing tickets for all sorts of things and almost always those dollars go into their budget as well. For example - police have a motivation to have dangerous controlled intersections with red light cameras as these generate revenues. While it is always good to stop people from running red lights, from a police perspective there is motivation to write tickets as opposed to re-engineer the intersection to reduce that behavior. Jason

seth (2007-07-02 17:23:09)

One of Jacobs's examples of commercial values being used inappropriately by guardians is about police - being given a quota of tickets to issue, I think. I don't think Jacobs says it explicitly but an underlying idea of her book is that these two sets of values represent accumulated wisdom. That is, they are based on experience and perhaps competition between different ways of doing things.

Patri Friedman (2007-07-07 00:13:31)

Seth - I am surprised to hear you speak so favorably of emotional, poorly researched propaganda. If someone inaccurately portrays the problem, or what the solution is, in an emotional manner which moves people, that does not help the debate. It adds noise. It gets people stirred up, without really understanding the subject. I think that's a bad thing, not a good thing. I mean, undirected emotional manipulation is a good way to be popular, to get lots of viewers and sell lots of tickets. But why is it good? There is a reason "demagogue" has negative connotations. As an example, would you call Bush's speeches about the War on Terror a good thing, because they get people stirred up about terrorism? I would call them a bad thing b/c they blindly evoke emotionally moving subjects while having little to do with reality. I'd describe Moore's work (that which I've seen

- I haven't seen Sicko) the same way, just from the other side of the fence.

Brad (2007-07-07 01:59:33)

A lot of these posts are fishy. I just don't believe there are that many people out there still flogging the "socialized medicine" canard. I just don't believe there are that many people out there happy with the way things are. There is some kind of orchestrated campaign to post on blogs going on.

seth (2007-07-07 03:33:38)

When Bush talked about us versus them, I was appalled and believed it was a step in the wrong direction. One big difference is that after 9/11, I thought the danger was overreaction. People were already stirred up. Bush rode the wave. I don't think Moore has inaccurately portrayed the problem, nor would I say Sicko says what the solution is, except that it is different than what we have now in the direction of more universal coverage. It is going too far to say that a vague proposal is "inaccurate" or at least I don't understand why you say that. Why is it good to get people "stirred up" in this instance? So that something will happen. In Demosclerosis by Jonathan Rausch he wrote about why so little changes in our federal government. One big reason, Rausch said, is that with any proposed change the people who have something to lose fight much harder than the people who have something to gain. In this case, to get anywhere – to improve health care – you need to energize the people who have something to gain. Namely, the public. Emotion = activation energy.

Todd (2007-07-08 08:45:58)

The above comments tend to fall into an either-or stance: favoring either the current U.S. healthcare system or some sort of universal single-payer system. Actually, I think that both are seriously flawed for the same reason: they remove true market forces by severing the connection between the individual patient and the provider of health care solutions. In the U.S. we don't have anything even closely approaching a true free market. Rather, we have a cartel of "approved" (and very expensive) solutions and we ban or place barriers on more effective, less expensive solutions. The real scandal is the high cost of health care - everywhere. If we removed subsidies (provided through both government and institutional insurance) and let folks spend their money on what really works, we'd quickly drive the market to more cost effective solutions. And in fact, many of today's health care problems could be greatly diminished, if not reversed, by focusing on nutritional and dietary approaches – yes, including the Shangri-la Diet, the using of omega-3 oils, B vitamins, etc. Removing the subsidy to "Big Medicine" would drive people to more carefully look at how nutritional deficiencies, poor health habits, sedentary lifestyles, etc. underlie a good deal of the health crisis in this country. Research should shift to epidemiology, self-experimentation, nutritional science, and better methods for understanding biochemical individuality. We also need to radically change our liability laws which remove individual responsibility and prevent or discourage cheaper "non-orthodox" solutions. We rely on a methodology of mega-funded establishment medicine driven more by legal and political considerations than by true benefit to the medical consumer. The result of pulling the plug on "subsidized health care" would be a far more affordable, individualized, and effective approach to health care than what we have in EITHER the U.S. or in "socialized" Europe and Canada.

seth (2007-07-08 10:31:48)

Those are good points. By allowing a certain kind of research – focussed on cure rather than prevention – to get most of the research money, you end up with a very expensive system that doesn't work very well. We have "doctors" who mainly try to cure people – what is the comparable prevention-focussed job? There isn't one.

## **The Twilight of Expertise (part 9: clinical trials again) (2007-06-29 22:08)**

An [1]article in this week's BMJ about problems with clinical trials makes some of the points I made in a [2]recent post. The article is based on a London conference held last week. In my post, I said the evaluation of the Shangri-La Diet going on at the [3]SLD forums was in many ways better than a clinical trial.

At the conference, a speaker complained that

key groups of participants were often excluded from clinical studies

I pointed out that anyone could post at the SLD forums.

Doug Altman, professor of statistics in medicine at Oxford University, said that the presentation of statistical results of clinical trials "lacked transparency and precluded any further analysis."

I said that the forums are more transparent.

Paul Glasziou, director of the Centre for Evidence Based Medicine at Oxford University, warned that many clinical trials described treatments that were difficult to replicate in normal clinical settings.

I said that the forums were more realistic – meaning that the treatments being tested were closer to what actually could happen.

2. <http://www.blog.sethroberts.net/2007/06/15/the-twilight-of-expertise-part-4/>
3. <http://boards.sethroberts.net/index.php?action=collapse;c=1;sa=expand#1>

---

Dale (2007-06-30 00:00:04)

The funny thing about a double-blind clinical trial for the Shangri-La Diet: half the participants would be randomly assigned to drink sugar water, and the other half would be assigned to drink a sugar water placebo – so everyone would be on the Shangri-La Diet!!

BestHelen (2009-06-05 17:02:00)

I have found what i was looking for !!! thx )

### **Science in Action: Omega-3 (a surprise!) (2007-06-30 11:16)**

I have always stopped self-experimenting when I travel because so much changes. Surely I will sleep differently, etc., far from home. However, it is not so obvious my arithmetic speed (how fast I do arithmetic problems such as  $6 + 3$ )

will change. I am measuring arithmetic speed as part of my study of omega-3 ([1]directory).

I recently spent a week in Los Angeles. For the first time I continued self-experimentation while traveling. When I arrived I bought a bottle of flaxseed oil. I continued to take 4 T/day and did the same mental-function tests I do at home: arithmetic, memory-scanning, and balance. I have described these tests in other posts.

My balance was much worse in Los Angeles, apparently because what I see during the test changed (because the floor and other surroundings are different). I hadn't realized how much that mattered. My arithmetic and memory-scanning results were roughly the same as the results at home – that is, until the last day. This graph shows arithmetic speeds:

The sudden improvement on the last day – also clear in the balance test – was a big surprise. It was too large to be due to practice, nor could it be due to being in LA – the previous 5 measurements were also in LA. It did, however, have a ready explanation: The previous night I had gotten back late and had forgotten to take the oil. So instead of taking 4 T at 11 pm I took it at 7 am. I did the tests at about noon. Instead of 8 or 9 hours between oil ingestion and test, in this case the difference was 5 hours.

If this explanation is correct, there is a short-lived effect of flaxseed oil on brain function – present 5 hours after ingestion but absent or weaker 8 hours later. Which, as a scientist, makes me say "Wow!" If this effect exists, it's a new tool, the most precious and powerful thing in science. I can use it to compare amounts of flaxseed oil, oils (e.g., fish oil), and foods (e.g., salmon).

My current way of measuring omega-3 effects requires one/day tests repeated for weeks. When I reduced the amount of flaxseed oil I was taking from 4 T/day to nothing, it took more than a day with the lower dose before performance even went down, and many more days before performance stabilized. This meant that experiments had to last several weeks. If the new effect exists, it will allow much faster experiments.

1. <http://www.blog.sethroberts.net/category/nutrition/omega-3/omega-3-directory/>

Willy (2007-06-30 12:25:55)

4 tablespoons / day is a high dose. Do you take extra antioxidants?. From which dose do you start to notice balance improvement?. I need to have a reference to give flax oil to an old person with balance problems. I will post results if I can convince this person to take it. Thanks.

seth (2007-06-30 13:35:16)

I noticed balance improvement with a much lower dose. I suggest starting with 1 Tablespoon/day. I take a multi-vitamin pill that contains, among other things, vitamin A and vitamin C.

lasser11 (2007-06-30 14:57:36)

I recently read in an article that drinking flaxseed oil increases one's risk of prostate cancer. The article states that the risk can be avoided by eating actual flaxseeds. Does the risk of prostate cancer have a strong scientific basis? and are there any disadvantages of eating flaxseeds as opposed to drinking flaxseed oil?

Willy (2007-06-30 18:31:59)

Thanks. I think you could increase your intake of antioxidants like vitamin E, selenium, etc. I read (Pelton's book) that high Omega 3 intake requires adequate antioxidants. On the subject of fatty acids and creativity, have you read this article (I don't remember where I found it mentioned that caused me to download it, maybe here?): Psychoses and creativity: is the missing link a biological mechanism related to phospholipids turnover? Bradley S.Folley\*, Mikisha .Doo, Sohee Park Department of Psychology, Vanderbilt University, 301 Wilson Hall, 111 21st Ave. South, Nashville, TN 37240, USA Horrobin has suggested [3] that evolutionary brain changes occurring 2 million years ago coincided with the appearance of both psychoses and creativity, and that creativity and psychoses-proneness have made us truly human. Elements of both psychotic thoughts and creative thinking occur in all humans at some time; indeed there is a continuum attributable to both of these states suggesting that all humans are capable of psychotic thinking and creative problem-solving. If these elements can be \*\*\*related to changes in dietary fat intake\*\*\*, then it is also possible to assume that alterations in catecholamine neurotransmitter function mechanisms may have evolved as well.

seth (2007-06-30 19:11:13)

I don't know if flaxseed oil increases the risk of prostate cancer. An excellent just-published article (that I will describe in an upcoming post) implies that omega-3 fats decrease the risk of colorectal cancer – and therefore presumably all cancers. I take selenium in addition to the other antioxidants I listed.

peter (2007-06-30 19:21:00)

you can take flax seed oil with lignans, which, i understand eliminates the cancer risk.

lasser11 (2007-06-30 21:09:21)

yeah, the author of the article noted that the potential increase risk stemmed from most flaxseed oil's lack of lignans. eating actual seeds sounds like its more difficult to deal with than oil. and I bet that oil enters one's system more effectively than eating seeds.

peter (2007-07-02 01:13:38)

i'm afraid i wasn't clear. you can buy flax seed oil that contains high lignan in the oil, so you don't have to eat the flax seeds separately. You have to check the label for "high lignans" (if you do decide to eat flax seeds separately they must be ground up to release, among other things, lignans. If you eat flax seeds whole -without grinding- it will likely just pass thru your system. you can use a coffee grinder to grind the seeds. i purchase a Krup, which is effective and wasn't too much \$ \$ \$)

?????? (2011-11-23 04:34:17)

Thank you for the excellent post I did not understand what the speed of scanning?

## 2.7 July

### Science in Action: Omega-3 (data from my mom) (2007-07-01 10:52)

My mother tried drinking flaxseed oil. She measured her balance by standing on one leg; the measure was how long she could do that. She did ten of these measurements per day.

Here is what happened:

When she started taking the flaxseed oil, her balance suddenly started to improve.

Are injury-causing falls "the new scurvy," I [1] wondered – that is, caused by an easily-preventable nutrient deficiency? These results support that idea. However, I can't explain the decline in balance during the pre-flaxseed baseline period. Perhaps she had eaten food high in omega-3 and the effects were wearing off.

[2]Here are precautions about flaxseed oil. If you are 70 years old or older and would like to find out if flaxseed oil improves your balance, please contact me.

[3]Directory of my omega-3 research.

---

Willy (2007-07-01 14:48:56)

Thanks for posting this, especially the precautions. Most old people take lots of drugs. I hope I can try this. There are exercises to improve balance but I think Omega3 would help.

lasser11 (2007-07-01 17:02:57)

Seth, or anybody else who has a helpful link or information, it would be great if you posted a flaxseed oil buying guide. I had a frustrating experience trying to buy flaxseed oil today. Target, Kroger, and Meijer didn't have it. then I went to walmart (probably not a good idea). the pharmacist advised me against buying flaxseed oil not stored in a refrigerator. Next I went to GNC, which also didn't refrigerate their flaxseed oil. tired, I gave in and bought it. It taste awful. i thought it would milder and nuttier. I'm concerned it's spoiled. although maybe i'm just not used to it.

seth (2007-07-01 18:09:59)

You should be able to find flaxseed oil at upscale supermarkets such as Whole Foods. They store it in a refrigerated case. I started with flaxseed oil capsules from Long's Drugs (house brand) that were not refrigerated. They produced the effect. However, I agree with your pharmacist, although I hope to study the question experimentally. I now use flaxseed oil in liquid form because I use much larger doses. I think flaxseed oil goes bad quickly but until it comes into contact with oxygen it can't go bad. So be sure to store it in the refrigerator.

lasser11 (2007-07-01 20:36:37)

thanks for the help. its probably a good idea to cut my losses and head for Whole Foods. Keeping flaxseed oil refrigerated must lessen the chance of it spoiling.

Willy (2007-07-02 05:27:48)

Flax oil tastes bad for me too. I don't think it can be used in salads as some advertisements claim. Do not think bad taste means the oil is in bad condition. If it is rancid you will notice. I see bottles are not kept in the refrigerator in shops, but I think this is important after opening. Bottles should be dark to protect from light.

Janet (2007-07-02 18:10:45)

I think it's neat to look at an older population, and wonder if it would work, but what it looks like to me is like your mom's balance improved with practice as her ankle muscles strengthened since the improvement didn't go away when she stopped the flaxseed oil.

seth (2007-07-02 18:13:22)

A practice explanation doesn't explain why the improvement started exactly when she started the flaxseed oil. It should have started after the very first trial. The persistence of improvement with zero flaxseed oil occurred with me too - it takes a week or two for the improvement to go away when the flaxseed oil is stopped.

## Creepy Assertions (2007-07-01 19:01)

The ability of patients to try experimental drugs outside of clinical trials has a lot in common with self-experimentation. The former empowers the patient; the latter empowers the amateur scientist. Another form of health-related empowerment is to allow people to buy and sell organs. Of course, some people are against this:

Nancy Scheper-Hughes, a Berkeley anthropologist – now in residence at Harvard's Radcliffe Institute – has documented how wealthy organ brokers exploit the impoverished in places like Moldova and South Africa. She cites a moral parable . . . A starving man adrift with others on a raft does not have the right to eat his fellow passengers. [Huh?] Scheper-Hughes suggests there is something of the same "predatory" aspect to organ sales – a creepy assertion "that I have the right to the body of another person, to live."

From the [1]Boston Globe. To me, the creepy assertion is "I, Professor Scheper-Hughes, know better than other people what they should do with their own bodies." Alas, this sort of professorial arrogance is common. I encountered it with the UC Berkeley Committee for the Protection of Human Subjects: I must have a certain control group in my experiment, they said. As if they knew how to do my research better than I did. I once heard [2]an NPR commentator, describing her IRB participation, boast about this: "Sometimes a control was missing, or we felt the study was misguided." A [3]website about IRB abuses has many similar stories.

1. [http://www.boston.com/news/globe/ideas/articles/2007/07/01/why\\_cant\\_you\\_buy\\_a\\_kidney\\_to\\_save\\_your\\_life/?page=full](http://www.boston.com/news/globe/ideas/articles/2007/07/01/why_cant_you_buy_a_kidney_to_save_your_life/?page=full)
2. <http://www.npr.org/templates/story/story.php?storyId=5358288>
3. <http://www.irbwatch.org/>

---

Andrew Gelman (2007-07-02 14:46:51)

I wouldn't frame this as Scheper-Hughes vs. people's own bodies. It's pretty much the standard view that buying and selling organs should be illegal. Maybe the standard view is wrong, but I wouldn't label it "creepy" or "professorial arrogance" that she agrees with what is probably the vast majority opinion. The IRB thing is a separate issue—I basically agree with you here, but I think the concern is with power and implicit coercion. It does seem like it's out of bounds of your IRB to tell you to run a control group, since that doesn't seem like an ethical issue.

seth (2007-07-02 15:25:20)

Thanks for the comment. I agree, what Scheper-Hughes said is taken as reasonable and appropriate by many people, including the writer of the article. However, it's the standard view among IRBs that they are entitled to force researchers to run whatever control groups they (the IRB) thinks are appropriate. I don't think the fact that something is the standard view or well-accepted should shield it from criticism. I also agree, by itself Scheper-Hughes' belief isn't arrogant. Maybe I should have made that clearer. It isn't arrogant to think organs shouldn't be sold. It is the context and certitude that bother me. For me, the problem arises when someone goes further than a simple statement of belief – is so sure of herself – that she forces or advocates forcing others who disagree with her and know much more about their situation to go along with her beliefs. It is especially distasteful when the advocate is powerful and the people she is telling what to do are powerless. And when you defend your view by saying that buying an organ is like asserting a "right" to eat somebody (to me there is a big difference between trading

and taking and between cannibalism and organ commerce) and that a statement of disagreement with your point of view is a "creepy assertion" and when the speaker is powerful and considered a serious thinker . . . that strikes me as creepy.

### **Omega-3 and Cancer (2007-07-02 17:47)**

A just-published [1]article in the American Journal of Epidemiology reports a very clear negative correlation between colorectal cancer and omega-3 consumption. It describes the results of a case-control study done in Scotland from 1999 to 2006. The investigators hoped to recruit all cases of colorectal cancer coming for surgery in Scotland; they managed to recruit about half of them and ended up with about 1500 "cases." Each case was paired with a healthy control matched for age, sex, and residence. Then they compared the diets of the two groups. This is the approach that first linked smoking and lung cancer. Lung-cancer patients were more likely to smoke than other types of patients.

In the Scotland study, there was no correlation between cancer and overall fat consumption, but there was a very clear correlation with omega-3 fat consumption: more omega-3, less cancer. There was no correlation with omega-6 fat consumption. The conclusions remained the same after they combined their results with four previous similar studies.

---

Yvan F (2007-12-03 16:25:23)

Hi, Congratulations for your excellent blog. He is a link for a substitute of flaxseed. It suppose too have 2,400 mg of omega-3 per 2 tablespoons. Is it a appropriate substitute for flaxseed. <http://www.sourcesalba.com/index1.php>

mike (2009-05-12 14:11:35)

the other topic everyone should know about is vitamin D, The Canadian Cancer Society have recommended for over 18 months that everyone take vitamin D to prevent cancer. Take a look at [www.vitaminD3UK.com](http://www.vitaminD3UK.com) for some good information. It may be very good for you health

### **Science in Action: Omega-3 (what the results mean) (2007-07-03 21:48)**

How do I interpret the results so far of my omega-3 self-experimentation? I'm going to skip the obvious implications (I should do more experiments, I should take omega-3, . . . ) and jump to the less obvious ones:

1. Omega-6 may make things worse. The difference between flaxseed oil and olive oil was larger than the difference between flaxseed oil and nothing, implying that olive oil is worse than nothing. Perhaps this is because olive oil is relatively high in omega-6, which displaces omega-3. The [1]Israeli Paradox points in the same anti-omega-6 direction as do lab experiments that suggest omega-6 fats are pro-inflammatory.

2. I should study other fats. My experiments don't just imply that omega-3 fats have a big effect on brain function, they imply that fats in general have big effects – and that these effects can be easily measured (which is the interesting part).

3. Health providers should pay far more attention to brain function – to "brain health." Improvements in balance led me to treatments that improved my performance on memory tests. Not surprising, since the whole brain is made of the same stuff (neurons, glial cells, etc.), but it implies that with easy to administer tests you could catch a wide range of brain problems long before they cause serious difficulties, such as dementia, Alzheimer's, and injury-causing falls. Note that no doctor ever orders tests similar to those I have used. Yet my tests eventually revealed that I was suffering from what might be called omega-3 deficiency. One well-accepted test of mental function is the Mini-Mental State Exam. It consists of such questions as "What month of the year is this?". By the standards of experimental psychology, it is incredibly crude. Experimental psychologists have a lot to teach the health community about how to measure brain function.

1. <http://www.blog.sethroberts.net/2007/02/02/the-israeli-paradox/>

---

accuracy-police (2007-07-04 06:47:48)

> "olive oil is high in omega-6" Wait a minute–flaxseed oil has about 20 % Omega-6, but olive oil contains LESS, only about 12 % Omega-6. Flaxseed oil does have a much higher percentage of Omega-3, but olive oil is predominantly Omega-9. Neither is a great source of Omega-6. Changing from flaxseed to olive could change your ratio of Omega-3/Omega-6 (depending on other dietary intake), but it should LOWER the amount of Omega-6 you ingest, ceteris paribus.

jeff (2007-07-04 07:59:31)

seth - re: olive vs. flaxseed oil Is your comparison only referring to the brain benefits between the two oils? Aren't there a number of studies that demonstrate olive oil's cardiovascular benefits? I'm unsure if research shows the same for flaxseed oil. On a more personal note, I am currently taking 2 TBS of flaxseed oil before bed and 1 TBS of fish oil & 1 TBS of olive oil in the AM. Does your research suggest that even 1 TBS of olive oil would counteract the effect of the high dose of omega 3s in the fish and flaxseed oil?

seth (2007-07-04 08:00:28)

Accuracy Police, thanks for the correction. I should have said "relatively high in omega-6". And I should be more open to the possibility that it is the omega-9 in olive oil that caused it to be worse than nothing. Jeff, When I compared olive oil and flaxseed oil, I only measured my balance – a measure of brain function. I don't know of any studies that show olive oil is better for the cardiovascular system than flaxseed oil. I don't think they have been compared. The whole interest in omega-3 fats started because Eskimos had very low rates of heart disease; the eventual explanation was that they were eating lots of high omega-3 foods. If it turned out that olive oil is better for the cardiovascular system than flaxseed oil (comparing equal amounts of each), I would be very surprised. If "counteract" means "reduce the effect of", yes, my results suggest – just barely – that olive oil counteracts the effects of flaxseed and fish oils on balance and other measures of brain function. This is something I would like to test.

Tim Lundeen (2007-08-25 21:16:31)

My understanding is that the polyphenols in olive oil help reduce inflammation, so are a primary reason that olive oil improves heart health. See [http://search.lef.org/cgi-src-bin/MsmGo.exe?grab\\_id=0 &page\\_id=1451 &query=olive%20oil%20polyphenols &hiword=OLIVA%20OLIVER%20OLIVES%20OLIVI%20OLIVO%20POLYPHENOL%20POLYPHENOLE%20POLYPHENOLIC%20oil%20olive%20polyphenols%20](http://search.lef.org/cgi-src-bin/MsmGo.exe?grab_id=0 &page_id=1451 &query=olive%20oil%20polyphenols &hiword=OLIVA%20OLIVER%20OLIVES%20OLIVI%20OLIVO%20POLYPHENOL%20POLYPHENOLE%20POLYPHENOLIC%20oil%20olive%20polyphenols%20) Also, the body needs both omega-3 and omega-6 fatty acids, you don't want to get all your polyunsaturated fats from omega-3's. A 1:1 to 1:2 ratio of omega-3 to omega-6 is recommended by Enig at the Weston A

Price site. So my guess is that both this ratio and the absolute amount of omega-3 is what controls the effects of omega-3 on brain function.

### **The Shangri-La Diet: What Went Wrong? (2007-07-05 06:11)**

[1]Andrew Gelman astutely noted that the three researchers (Michel Cabanac, Anthony Sclafani, and Israel Ramirez) whose work I used the most to come up with the Shangri-La Diet were not at Harvard or Yale or Rockefeller University. Isn't that where breakthrough research is supposed to come from? This wasn't the only way that development of the Shangri-La Diet was not quite "right":

1. The research of Cabanac et al. got little recognition. The set point idea arose in the 1950s, or even earlier. In the 1970s, Cabanac saw very clearly that your set point depends on what you eat. With Rabe, he did an excellent experiment supporting this view. Not one weight-control researcher took note. No other lab built on this work.
2. I was not a weight-control researcher. In graduate school, I studied animal learning. Weight control is not just a different field of psychology; it is usually studied in a different department (nutrition or physiology).
3. The research I did was not funded. Given my lack of credentials and previous experience, it is not obvious it could ever be funded.

The hard-core defender of the system would say: SLD is rubbish. Just another fad diet. The open-minded defender would say: What do you want? You were a tenured professor at Berkeley. You published your work in Behavioral and Brain Sciences. It is well-recognized that really new ideas often take a while to be appreciated. The open-minded critic would say: All three points are correct. In addition, why isn't Israel Ramirez still a scientist? After all that brilliant research. What a loss. The hard-core critic would say: SLD reached the public as a self-help book. Why give the system any credit? Lots of non-scientists have published influential self-help books.

The hard-core views ignore reality. The [2]SLD forums make it clear SLD is not rubbish. The notion that the system should get no credit at all ignores the fact that I made a living as a scientist at a well-respected place and published my work in a well-respected journal. The open-minded views, however, are both reasonable.

1. <http://www.stat.columbia.edu/~gelman/>

2. <http://boards.sethroberts.net/index.php?action=collapse;c=1;sa=expand#1>

---

Andrew Gelman (2007-07-05 08:05:21)

Seth, Your research benefited in (at least) four ways from your being a tenured professor at Berkeley. (1) You were given lots of free time to do your research (since the job of a tenured prof is approx 50 % teaching, 50 % research). (2) You were given the opportunity to teach bright students. Some of your ideas arose because you wanted to teach things that the students were interested in, rather than the usual textbook material. Also, you wrote an earlier version of some of your self-experimentation stuff in the form of a book that was inspired by one of your classes. (And your Berkeley job gave you the time to write that book.) (3) You saw me give a talk on graphical display of data. Presumably, you were more likely to see this sort of talk at a top university such as Berkeley which has an excellent statistics department. Graphing helped your research and certainly made your Behavioral and Brain Sciences article distinctive. (4) Personal connections with me led to the idea of sending your article to Chance (which maybe motivated the Behavioral and Brain Sciences article) and got you linked to a blog, which was

forwarded by another blog, which was forwarded by another blog, leading to the New York Times article which led to your book getting a contract. Once again, being at a top university such as Berkeley probably increased the probability of that original contact. All of the above could've happened at a lesser university (or even at a non-university job where you did extra work at night), you could've learned graphics by reading Ed Tufte's book, etc.-but Berkeley helped.

seth (2007-07-05 09:42:54)

Yes, I agree. That's part of what I meant when I said the open-minded defender of the system made reasonable points.

Josh M (2007-07-06 16:46:53)

As a student it was interesting that most of the professors at Stanford didn't come from top research institutions. (Math and physics seemed to be exceptions.) At first I thought maybe being at the top 10 made you soft, but eventually I decided that education quality at the top 400 schools is very similar. Research universities are more like awards or exploiting a promising line of research than where ideas originate. The guy who figured out ulcers are from bacteria could get a good position with a Nobel in his pocket, but since it isn't a whole new area of research that people could start working on he probably wasn't immediately that interesting. One part of your problem is follow up. How do others build on your work or reference it in their own papers? In a summer research job (pretend grad school) the professor I worked with said something like "these folks have some interesting results, try it out and see what happens when we do it this way." And a more independent grad student needs to think this is an interesting approach, I can add my approach to SLD and the grants will flow freely. Self experimenting might be too easy. Grad students have these tools they want to use and it seems like anyone could start record keeping and drawing inferences. Instinctively they are (I was) drawn to work that can only be done after mastering the complex information from all the classes and books and studying. It is also too hard. Key points in the process involved insight and some serendipity. "Come up with an insight" is a very hard mission for people and they would prefer less risky work. For the acceptance problem it's hard to distinguish exactly what it is that separates your findings from the enormous number of cures in the health food store (which I've been encountering as I search for flax oil). Every one of the 2000 ingredients seems to cure many things for everyone. I credit what you say because of the old Victorian science idea of a "reliable observer." You are careful, aware of placebo and confirmation bias effects and tend to find things which are "surprising" to you and discard much else. But that's a little elitist of me. (Health store guy: Oh for sleeping and mental function, try this saw palmetto too, it totally opened my mind. Me: I'll just do this for now.) These seems to be where larger studies should come in, but as you point out we've way over engineered double blind studies. Back to the system: it is great at funding big promising projects like human genome, a fab for new kinds of chips, or the effects of global warming. And for having lots of play in the system for personally interesting work. Not very good at recognizing true ideas quickly or nimbly trying out the avenues with large possible impact but small staffs. Silicon valley is very good with the last two. At various startups we've just "tried out stuff on people" all the time, I wonder if a human research committee would have approved facebook or youtube. "Hmm intense, sometimes hurtful social interaction. Privacy invasions. And what is the control?" Ebay and paypal both depended on existing where the law was just ambiguous enough to not apply to them. It would be nice if scientific standing or true finding points could be converted to money to pay off VC's and angel investors. They might then invest in the young Israel Ramirez in a way that the current system apparently didn't. Even so, modern professional research universities (the system since 1950) have produced remarkable work and such different work than what the rest of society produces that it's frightening to think about messing it up. That giant step in difficulty when you want to validate an idea. Ideally it would look as close as possible to a smooth slop. Right now it's get idea, test idea, ask friend colleagues, ask colleagues, [small leap] some publication,[big leap] get \$2 million for giant double blind study for a binary result which might be wrong, major publication, and finally acceptance. How about a giant ongoing longitudinal study where researchers could ask the participants to try things out? So instead of needing to start from scratch with each study you do the equivalent of posting to the SLD forums. Some giant study is intensively monitoring everything they can about 30,000 people. Yearly physicals, monthly phone interviews, diaries, automated sensor monitoring. Someone says they are trying SLD or the Atkins diet and that's noted and the data can be tracked. There are currently longitudinal studies but they don't try interventions and they don't investigate lives very deeply - they have interviews every 5 years or so. You don't worry about representative, you pick people that live close to the research institution and who are convenient, because you want to see what happens when they do something different. People will try the very most mainstream things and the craziest on the edge ear candle things imaginable and you track it all. Anyone

can post ideas to the forum, but researchers can support each other by commenting "I think this might work." Then ideas like Atkins, SLD, or weight watchers can be evaluated as they come up. You can say our participants who started Atkins, lost weight and raised cholesterol and 5 years later they were right back where they started. There is an opportunity for surprise and multivariate causality, maybe spinach + peanuts is a miracle food. Some people can get as intense as you Seth about recording everything, some people can get intense with automated monitoring (sensors on the cellphone, or gps, or logging heart rate monitors), and some people can just wait for the monthly interview. Participants could share the data with whoever they liked. So I could show Seth my whole record or just the part he's interested in. This is a massive very expensive step, but it might enable lots of gentler slops for lots of other research. And a place for grad students to frolic merrily in meadows of data.

seth (2007-07-06 19:18:38)

If I were reading me, I would believe my conclusions about flaxseed oil because I had experimental data that anyone could see. The effects were big and repeated, the designs were good. And there was plenty of supporting evidence. I heard a talk in which the speaker said engineers were good at going from research to device usable by tech person and from device usable by tech person to device usable by expert but poor at the final stage: going from device usable by expert to device usable by ordinary person. Science funding has the opposite problem: it is poor at the first stage, funding research that will generate ideas.

### **Advances in Retailing: Penny-Free Store (2007-07-05 15:27)**

[1]Alko Office Supply, a small Berkeley store, is penny free: If you pay cash, prices are rounded down to the nearest nickel. I have never seen this anywhere else nor had the store clerk I asked. They thought of it themselves, she said. Farmer's market prices are always rounded down to the nickel or dime, in my experience. Here and there I have made small credit card purchases (< \$20) with no signature required.

Addendum: Wikipedia [2]entry on penny elimination. A [3]penny protester.

1. <http://www.alkos.com/>

2. [http://en.wikipedia.org/wiki/Efforts\\_to\\_eliminate\\_the\\_penny\\_in\\_the\\_United\\_States](http://en.wikipedia.org/wiki/Efforts_to_eliminate_the_penny_in_the_United_States)

3. <http://www.feyaccompli.com/?p=719>

---

Sam (2007-07-08 21:36:12)

I've seen this more than 10 years ago in Norway, prices would be rounded to avoid the very small change. But as far as I remember there it had been a government thing to get rid of the small coins since they had been virtually worthless and quite expensive to produce.

### **Omega-3 and Dental Health: Surgery Commuted (2007-07-06 04:23)**

I started writing a follow-up to this Marginal Revolution [1]post by Tyler Cowen before I knew of its existence:

January [2007] endodontist [= gum specialist]: "You'll need surgery either right now, or within a few months. We cut open the gum, clean out the inflammation, and sew your mouth right back up. Only sometimes do we have to eliminate the tooth."

July 5 [2007] entodontic surgeon, 10:31 a.m.: "We can cancel this morning's surgery, it seems OK for now, just keep an eye on it."

In June, Tyler [2] posted about the benefits he derived from flaxseed oil (2 Tablespoons/day): "Very good for my heart, my brain, and my gums." I asked him what was better. "Much better gums, for sure," he replied. "The rest is harder to measure." On July 4 I got around to asking for details. Tyler said that he had had bad gums for most of his life and that he noticed they were much better within a week or two of starting the flaxseed oil. He added

I have crooked wisdom teeth, never wore braces, and my mouth naturally produces lots of plaque. Put all together that means a significant problem with gum disease. I get cleanings every three months or so but still my gums have been much worse than average.

I too have crooked teeth and more plaque than average and I too found that flaxseed oil improved [3] my gums; my dentist was the first to notice.

A recent [4] experiment about omega-3 and dental health. A 1997 [5] experiment. An amazing [6] bowling video.

---

Pearl (2007-07-06 07:56:11)

Was that bowling video really necessary? Or was that done with flaxseed oil? ^ \_ ^

peter (2007-07-06 08:27:44)

my guess is that is a form of oil pulling, i.e., swishing oil in your mouth for 20 minutes or so. Taking flax seed oil, or any other oil seems to eliminate plaque. When i went to the dentist to clean my teeth the plaque was reduced at the front of my mouth, but not the back. I believe this occurred because taking several tablespoons of oil "hits" the front of the mouth and not so much in the back of the mouth. Now that i'm oil pulling, i believe the plaque will be eliminated at the back of mouth as well. i'll let you know when i go to the dentist. The point is, if my sense is correct, the reduction of plaque and improvement of gums works by applying oil to the surface of the teeth/mouth rather than consuming it. I tend to think that any oil would have the same effect.

seth (2007-07-06 09:14:05)

The bowling video shows the follow-up ball launched before the first ball. "I tend to think that any oil would have the same effect." I took olive oil (ELOO) for three years. My gums did not improve. Only when I switched to flaxseed oil did they improve. The improvement was not a reduction in plaque: it was a reduction in inflammation.

Craig (2007-07-06 10:47:18)

What is the difference between long chain and short chain omega 3?

seth (2007-07-06 10:59:26)

Long-chain have a few more carbon atoms than short-chain.

peter (2007-07-06 11:03:28)

it may be that reduction of plaque and improvement in gums are caused by discrete pathways. I always thought that they were related, i.e., the more plaque the more inflammation of the gums because of the irritation caused by plaque and the bacteria from which plaque is formed .

Timothy Beneke (2007-07-06 15:29:34)

I have a long history of gum disease, plus a long history of depression. Also, I've always hated fish and virtually never eaten it. In recent years I've taken omega 3s, and in recent months, flax seed oil. I'll see what the dentist says next time. It ought to be easy to look for correlational evidence linking fish consumption and gum health. There seems to be significant correlation between fish consumption and lack of depression. Also, depression, as I dimly understand it, is implicated with heart disease, as is gum disease. All of this warrants a lot more research...

Dave (2007-07-06 20:11:57)

I'm wondering about the above comment in regard to swishing the flaxseed oil. Seth where you swishing the oil or just taking it and you noticed the improvement in your gums.

seth (2007-07-06 20:36:03)

Just taking it. Not swishing it.

seth (2007-07-06 20:41:05)

Tim, when the experiment is that easy, it seems pointless to do surveys. The dose from fish may be too low, anyway. Tyler took 2 Tablespoons/day; I take 3-4 Tablespoons/day.

peter (2007-07-07 09:24:31)

just to clarify, i'm not swishing flax seed oil in my mouth for two reasons: (i) would result in tasting/smelling the oil which would defeat the underlying purpose of the SLD; (ii) from what i understanding swishing, first thing in the AM removes the bacteria/viruses from your teeth/mouth and you don't want to swallow that, you spit it out. I use other oils for oil pulling. there are several internet sites that discuss this and the type of oil that is used (most recommend sesame and sunflower). I suggest that anyone seeking to do this examine the web-sites. My sense is that oil pulling prevents plaque from forming on one's teeth. That's separate and apart from consuming flax seed oil as part of the SLD; and, apparently, for the anti-inflammatory effect of flax seed oil, that, among other things, improves one's gums.

Dr. Jeff Leighton (2007-07-26 11:19:59)

Inflammatory gum disease appears to respond very well to high dose OmegaMaine omega 3 oil. We formulate this high potency oil in Maine and locally our clients have reported excellent results in terms of reducing gum inflammation. Inflammation and bone resorption go hand in hand . When inflammation is reduced , progression of peridontal disease slows or stops.

Santosh Anagol (2007-09-20 12:19:18)

I've been taking two pills of flaxseed oil per day for the past few weeks and have noticed that my gums no longer bleed when I floss.

seth (2007-09-20 13:01:12)

That would be a good study to do: measuring bleeding caused by flossing or something similar.

Ann (2007-10-21 12:46:00)

I had to chime in on the Oil Pulling. I've been doing this for 2 years now. There are two theories out there about the "OP". First, there are some bacteria in the mouth that cannot be removed by conventional means. They seem however to be oil soluble. They are the nasties that build the yellow cities on your teeth, releasing harmful acids. And acidic mouth is an unhealthy mouth. There is something in the oil, perhaps their acids, that seem to vanquish these buggers. Secondly, what do you think about sublingual absorption of EFA's as opposed to ingesting? They use Oleic Acid in pharmaceuticals for sublingual medication as an enhancer. What is the difference between sublingual and ingesting medication? What role do the stomach acids play in ingestion? Would you get more benefit from one, as opposed to the other? Could it be that swishing oil around your mouth might be a more efficient way to get the EFA's? How long does it take for sublingual medication to hit the bloodstream? From what I read, Flax Seed Oil while wonderful for you, is too lopsided. Flax is very rich in Omega-3 and low in Omega-6 (n-3: n-6 ratio is usually between 3.5: 1 and 4: 1). Exclusive use of flax oil can lead to Omega-6 deficiency within 2-8 months. Using CLA (conjugated linoleic acid, a trans- fatty acid which is produced by shifting a double bond and twisting the molecule of the n-6 EFA, LA) in addition to flax oil can lead to Omega-6 deficiency symptoms even sooner than flax oil used alone. Omega-6 deficiency symptoms from too much flax oil can be reversed either by lowering Omega-3 intake or by increasing Omega-6 intake. All in all, my dental health has never been this good since swishing oil around my mouth for 20 minutes each day. I use a good balanced 3-6-9 oil. My skin, my hair, my teeth....it's not my imagination. No one has scientifically studied this except a Dr. Karach, a Russian Doctor who claimed it cured his chronic blood disease. His writings are in Russian and unavailable. Thanks for listening. Ann

joe ott (2008-05-10 18:40:38)

I HAD TO GO TO THE DENTIST IN THE PAST , 3 TIMES A YEAR BECAUSE OF GINGIVITIS. THE BLEEDING IS NOW AT A MINIMUM. FOR THE PAST YEAR I HAVE BEEN PUTTING 1 TEASPOON OF FLAXSEED OIL ON MY OATMEAL EVERY DAY. RECENTLY, I WENT FOR A 6- MONTH CLEANING AND MY HYGIENIST SAID MY GUMS LOOK REMARKABLY IMPROVED!

Lillie (2009-05-14 20:14:51)

I have a sublingual formulation of Omega 6 & 3 that is a 1:1 ratio, just perfect for humans whose blood levels are supposed to contain both Omegas but in a 1:1 ratio. You hold it in your mouth for 45 seconds and it hits the brain in 60 seconds. If you swallow liquid or take capsules you lose up to 60 % in the digestion process and it takes hours to get into your bloodstream. From the sublingual formulation you can get as much as 85 % absorption.

John (2009-12-20 23:12:24)

People! If you live in any Western industrialized country (including Israel), you are in NO danger of an Omega 6 deficiency—ever, unless you really work HARD to eliminate these fats from your diet. And you don't need any supplemental fats with Omega 6, the one exception may be Gamma Linoleic Acid and you should only take it if you are taking a lot (a lot!) of Omega 3 fatty acids. The predominant diet in the US and Europe has Omega 6 fatty acids in abundance/excess and the reason people are adding Omega 3s to their diet is because they have been removed from the diet due to processing (they go rancid amazingly quickly). For example, I was taking Coromega in the evening before bed and thought that it would just slide down my throat. I would wake up in the morning with the flavor of rancid almonds in my mouth and with dark mucus (YUCK!)-it was the Coromega having gone rancid in my throat overnight with much exposure to oxygen (I'm a mouth breather). So try to get 1:1 Omega 6:Omega 3 by reducing your Omega 6 intake while increasing your Omega 3s!

Daniela (2010-01-03 13:48:16)

I think we can all decide for ourselves what we feel we are deficient of. Not everyone eats the same food and therefore makes an educated decision. I, for one, had eliminated all fats from my diet (all I ate was fruit and veg with the odd bit of chicken breast) for a long time and whilst this eliminated some things, it compounded others. I became very thin, felt weak, had sore gums, thin hair, had equilibrium problems, etc., just to mention a few. Does anyone else have similar experiences?

Joel (2010-01-08 19:32:39)

I would LOVE to get people's opinions about this article: <http://www.sciencedaily.com/releases/2009/04/090404093331.htm> and check out this: <http://www.fasebj.org/cgi/content/full/20/2/401> When and how can human beings receding gums get our

hands on this?

Tom in TX (2010-01-09 13:59:11)

Joel - Are you sure that you need to get resolvins to solve your receding gum problem? The resolvins are derived from EPA and DHA, which are in fish oil. Why not take fish oil and see if that helps?

### **Why is Sicko So Good? (2007-07-06 20:31)**

In [1]What is Art? Tolstoy argued that the goal of art is to evoke emotion. According to a [2]Blue Cross vice president, "You would have to be dead to be unaffected by [Sicko]."

Why is Sicko so good?

I have a theory: the Internet. At his website, Moore asked for health-insurance horror stories. He got 25 thousand submissions, I have read. With that much to work with, you can select some extremely moving stories. Not only that. In an article I wrote for Spy, my editor crossed out some comment I had made. "Sometimes the material is so good it speaks for itself," she said. Moore's material was so good it spoke for itself. Because Moore said less the diversity of voices was increased, a big artistic plus.

There is a connection with self-experimentation. I was surprised how effective my self-experimentation turned out to be - effective scientifically. Far more than my other research (just as Sicko is far better than Moore's other movies). I came to believe that there was a large plodding element in effective science - to find new cause-effect relationships, you needed to be able to try lots of things. Self-experimentation worked so well because it made it easy to plod, to try lots of things. Sicko is so good because his website made it easy for Moore to gather lots of good stories.

[3]Moore and Jane Jacobs.

1. [http://en.wikipedia.org/wiki/What\\_Is\\_Art%3F](http://en.wikipedia.org/wiki/What_Is_Art%3F)
2. <http://www.michaelmoore.com/sicko/news/article.php?id=9996>

---

lasser11 (2007-07-07 13:03:43)

Your ideas remind me of John Dewey. Although Dewey did not specifically call for "self-experimentation", he did champion the democratization of experimentation. Which is interesting because historically, he played a major role in professionalizing the sciences which, in my opinion, hurt the idea of democratic experimentation (like a previous post you commented on). there seems to be a parallel between Michael Moore and John Dewey. Both seek a more democratic environment, which is good. But I'm concerned about the idea that such an environment can be mandated from above rather than created in a more organic manner. Moore is so obsessed about criticizing the insurance industry, he doesn't even ponder making a critique against the

AMA (havn't seen the movie, I'm just going to make a guess here he didn't). The AMA artificially creates higher salaries for doctors by restricting their supply. Additionally, the AMA is hesitant to incorporate cost reductive medical methods. its not just insurance companies which are the problem.

seth (2007-07-07 15:33:33)

That's an interesting point about "mandated from above." For some strange reason, it does not seem to be possible that the solution not be "mandated from above." Lots of things start small and grow but alternative health care systems do not seem to be among them. Richard Harris, a writer for The New Yorker, wrote an excellent book about the AMA and its lobbyists called A Sacred Trust, which you have made me want to re-read. My choice of who to blame for the health care crisis is researchers. A big reason people suffer from poor health care is that people are in poor health – obesity, diabetes, other chronic conditions. I think research on these topics could be hundreds of times more helpful than it actually is. Atul Gawande told freakonomics.com that we can now cure 70 % of cancers. This is an example of what I'm talking about: We should be trying to prevent cancer, not cure it.

lasser11 (2007-07-07 16:57:04)

I'll have to read that book "For some strange reason, it does not seem to be possible that the solution not be "mandated from above." Lots of things start small and grow but alternative health care systems do not seem to be among them." yeah, that's a good point. Health care has to be mandated from above in some form. but I guess what I would prefer is less federal regulations and more state or city regulations. Or maybe in areas with a sufficient amount of competition, less regulations all together. this idea by tyler coven sounds exciting: <http://www.marginalrevolution.com/marginalrevolution/2007/07/medical-free-tr.html> But as a hospital administrator living in the Detroit area, I'd prefer the zone to be here rather than memphis.

Varangy (2007-07-08 21:46:50)

*A big reason people suffer from poor health care is that people are in poor health " obesity, diabetes, other chronic conditions. I think research on these topics could be hundreds of times more helpful than it actually is.* Perhaps. But so what? I think we know a lot of what is needed — IMHO a lot of obesity, diabetes, other chronic conditions are brought quasi-intentionally. That is, one has to know that eating Cheesy Poofs and watching TV all day can't be good for you.

seth (2007-07-08 21:57:09)

"I think we know a lot of what is needed." You are in good company. This is what many experts said and still say about obesity: Hey, just eat more, exercise less. Marian Nestle says this, for example. But I disagree. Let's take depression: Is it obvious what it takes to not be depressed? I don't think so. Is it obvious what it takes to sleep better? Well, it wasn't obvious to me. Is it obvious how to prevent injury-causing falls? No.

### **Science in Action: Sunlight and Sleep (more background) (2007-07-07 16:51)**

An early section of [1]Wide Awake (2006), Alan Berliner's documentary about his life-long insomnia – he can't fall asleep until 3 or 4 am – lists common folk remedies:

BERLINER Over the years I've tried to cry myself to sleep, to drink myself to sleep, aroma therapy, changing mattresses, changing pillows, lavender beads, massage therapy, white noise, meditation, counting sheep, melatonin, Valerian root, acupuncture, acupressure, chamomile tea, warm milk, hypnosis even, yoga, homeopathic medicines, marijuana, lots of sex, hot baths, herbal teas, biofeedback.

SISTER Okay, nothing worked.

Conspicuously absent: sunlight. At the end of the movie, however:

DOCTOR We have to reset your [internal] clock. Since you're such a night owl, I'd like to move your sleep cycle earlier by having you get light exposure in the morning. When you wake up, throw on some clothes and go outdoors for an hour. I really want light to get into your eyes 'cause that's what going to move your rhythm so you can fall asleep earlier.

ANOTHER DOCTOR Light is one of the most powerful cues for your internal clock to know what time it is. You see light and it tells you: be active during the day, sleep at night.

But the treatment they settle on is sleep deprivation: "I'd like you to spend just 6.5 hours in bed," says a doctor. "Give you less time in bed than you want. . . . 2:30 to 9:00 am would be a reasonable way to go." "You are going to be dysfunctional," Berliner is warned. The film ends: "Now that I know what I have to do, the question is: Can I do it?"

This is a good summary of what people believe about how to cure insomnia. Sunshine is absent from the folk remedies you are likely hear. When doctors mention it, they emphasize early-morning sunlight.

Until recently, I too thought that sunlight exposure was important in the morning, but not during the rest of the day. Every morning I exercised on a treadmill with sunlight-spectrum light shining on me for an hour; I thought that was enough. Now I am adding to that sunlight later in the day – in the afternoon, for instance – and finding that it helps.

1. [http://www.alanberliner.com/flm\\_06.html](http://www.alanberliner.com/flm_06.html)

---

Timothy Beneke (2007-07-08 23:39:32)

Seth told me in 1997 that my biggest problem was going to bed at 3:30 in the morning. I didn't really change that until December 2003, when I resolved to change my circadian rhythms. I followed some advice from Dement, the Stanford sleep specialist. He suggested, as did Seth, getting sunlight earlier in the day. He also suggested taking a small amount of melatonin, just when it started getting dark, and avoiding sunlight later in the day. I found that the melatonin had the biggest effect; I took about a milligram or less. It tended to make me feel yucky in the morning, but it did make it easier to get up earlier. By Christmas day I was getting up around 8:30 rather than noon. And something extraordinary occurred. I always went for years on Christmas with my girlfriend to her best friend's house 40 miles away, where her family would be present. We'd spend the day together and go to a Chinese restaurant in the evening. For years, on Christmas day, I always got depressed and felt bad by the end of the day, even though I was around people I liked and cared about. But this time, there was no bad mood; I felt fine. It was amazing, as if I had some protection against all those boring negative feelings. Changing my sleep/wake cycle began a turning point towards enjoying life more.... I began to take pleasure in sleep itself, in the way my body would be gripped by a delicious tiredness that pulled me into bed and how I began to wake up with energy and fun on my mind...

seth (2007-07-09 04:31:45)

Dement was one of the experts that Berliner consulted.

Kerry (2008-03-20 21:37:04)

I've been reading about sleep problems. I've always been a night owl. It was always hard to get to sleep and hard to wake. TM helped the falling asleep part but I still woke up not rested. I do wake up better with sunlight. My doc thinks I have restless leg syndrome. It seems to fit but Mirapex and Requip didn't work. At first I thought it was a way to sell another drug. The diagnosis does fit though. Has any of your research shed any light (no pun intended) on this syndrome?

seth (2008-03-21 06:42:10)

My research suggests that our bodies are designed to spend each day standing far more than most people do. A good amount is 8 hours/day, my research suggests. You might try doing that. It's hard the day or so but then it gets easy.

### **An SLD Marketing Puzzle (2007-07-08 04:19)**

I have done 40-odd radio interviews about The Shangri-La Diet. A few of them noticeably increased the number of visitors to the [1]SLD forums. The forums software measures number of visitors with a statistic called most online: the maximum number of simultaneous visitors to the forums, computing the maximum over one day. Until recently, the interview with the most impact was with [2]Dennis Prager (May 2006). For the five days before the interview, most online = 54 40 43 53 48. On the day of the interview, most online = 231. For the five following days, most online = 72 82 44 52 74. This was the general pattern: An increase caused by an interview lasted one day or a little more.

On June 28, I was a guest on [3]The David Lawrence Show. This one was different. For the 10 days before the show, most online =

52 38 35 44 47 44 48 40 42 44

On the day of the show (live), most online = 148. On the following days,

137 119 164 281 88 95 207 89 130 128 164 96

A much longer increase than usual. And the maximum value so far (281) happened days after the show. To make it clear how unusual this is, here is a graph of most online for the whole history of the forums.

Why was the David Lawrence interview so different? I can think of four possibilities: 1. The SLD forums have become more persuasive. Because they are more persuasive, new visitors come more than once. 2. David Lawrence listeners were more likely to be persuaded by the forums. 3. The David Lawrence Show gets lots of listeners via the website, where the interview can be downloaded. These downloads happened over many days, so the effect of the interview was spread out. 4. Something was different about the interview itself.

Another measure of forums activity is provided by the hosting service: unique visitors per day. This is more interesting, of course, but harder for me to record. Only recently did I start recording it. Here is a graph of visitors per day:

These data support the idea that the David Lawrence interview had a long-lasting effect, yes – but why the decrease in variability?

1. <http://boards.sethroberts.net/index.php?action=collapse;c=1;sa=expand#1>
2. <http://sethroberts.net/reviews/dennispragermay3interview.mp3>
3. [http://www.thedavidlawrenceshow.com/googlefying\\_murray\\_gold\\_and\\_the\\_shangrila\\_diet\\_007186.html](http://www.thedavidlawrenceshow.com/googlefying_murray_gold_and_the_shangrila_diet_007186.html)

---

Rich (2007-07-08 10:36:44)

It looks like you have this plotted on some sort of log scale. If you take it off that scale, my guess is there isn't much decrease in variability.

seth (2007-07-08 10:49:21)

Yes, it is plotted on a log scale. When counts are plotted on square root or log scales, the variability is usually constant with changes in level – one of the big reasons for the transformation. This data violates that expectation. If it were plotted on a "raw" (untransformed) scale, the reduction in variability would still be obvious because the pre-interview values cover such a wide range.

## **More Self-Congratulation (probably erroneous) (2007-07-09 04:27)**

July 2, 2007. Online issue of The New Yorker appears. [1]Editorial by Hertzberg is based on a [2]series of articles in the Washington Post, but does not link to them.

July 2, 2007. I write to the New Yorker webmaster: If an article refers to something Web-available, why not link to it?

July 9, 2007. New [3]Financial Page appears. Number of links: 7. Number of links in previous three Financial Pages: 0.

[4]Earlier self-congratulation.

## **A Student Advisor's Unlovely View of UC Berkeley (2007-07-09 06:20)**

I started talking with Catherine Pauling, who has worked at UC Berkeley more than 20 years, because I confused her with someone else. While she was head student advisor in the Math Department, she increased the number of majors from 170 to 600 in 5 years. "Some math professors were afraid this was too many – it could only occur because we were bringing in inadequate students, they believed," she said. "But the percentage of students having trouble and excelling remained the same."

When advising math majors, she told me, "sometimes I felt there should have been a Red Cross on my door." She learned to preach compassion – compassion for the professors. She said over and over to the students,

You have to realize it's not you. The professors will say terrible things like 'You know nothing.' But that's because in the process of becoming the best in what they do, they've neglected certain social and communication skills. So we have to appreciate and learn from their gifts and have compassion for their lack of development in these other areas.

Over the years, she was repeatedly shocked by how undergraduates were treated. "If someone has achieved so much, I would have thought it would be easy to be generous. Instead of an interest in mentoring the next generation, I often found impatience and dismissal," she said. "One student explained to me the difference between Stanford and Berkeley. At Stanford, if a student has a problem, they [faculty and administrators] assume that they're approaching it wrong and they try a new approach; at Berkeley, if a student has a problem, the assumption is that we made a mistake in admitting the student."

One recent Dean of the College of Letters and Science (also a professor) began his tenure as dean, she told me, by giving a talk in which he emphasized his belief that students were "gaming the system." He acted on this belief by rigidly

enforcing the rules, with few exceptions. (Many Berkeley students suffer serious hardships, including homelessness and major mental disorders.) When he stopped being dean several years later, it was to take a better position at another university. The next dean was less strict.

[1]For whom do colleges exist?

1. <http://www.blog.sethroberts.net/2007/03/31/for-whom-do-colleges-exist/>

---

Dennis Mangan (2007-07-09 08:02:00)

A member of my family attended Berkeley about 15 years ago, and she lasted under a semester after transferring with an "A" average from elsewhere. The impression I got was that the school was totally heartless. The core classes had 300 students in them, and no one to turn to for help. Dormitory rules went completely unenforced. She hated it and left quickly.

Catherine Pauling (2007-07-09 10:59:14)

While accurately quoted above, I want to encourage anyone at or interested in attending U C Berkeley to find advisors like myself to help you achieve your academic goals. We can teach you how to join or create smaller communities within a large campus, form mentoring relationships with faculty, master the bureaucracy, and enrich your classroom opportunities with research and work internships. I am a Cal alum and have worked here for 20 years because I know what we have to offer. Learning how to learn, even in a challenging environment, can be an important life lesson.

seth (2007-07-09 16:05:15)

I think advisors at UC Berkeley are like band-aids – they can do little about a deep-seated problem. I have never understood the "learning how to learn" argument. Everyone learns all the time – babies, animals, young children, apprentices. That's what the brain is mostly about: learning. Surely we used our brains effectively before colleges came along.

lasser11 (2007-07-09 19:43:09)

this contradicts my (and probably many others) stereotypes of UC Berkeley (Professors at Stanford tend to be less elitist than Berkeley???!). there are no excuses, but I wonder if part of it is a product of undergraduate student size. As Dennis commented above, when professors can't develop personal relationships with students, its easier to be rude. also, with large class sizes, Berkeley might attract professors who don't want to develop positive relationships with students. At my small liberal arts school, with less research opportunities, I could tell that the professors loved interacting with students. Is it possible that professors who are often educated at smaller, elite private institutions showcase snobbery towards a larger, public student body? I have trouble comprehending this because UC Berkeley is such an elite institution. but maybe.

Allen Ethridge (2007-07-24 16:36:32)

There was a nearly four-fold increase in students majoring in math in a five year period? What there an equivalent increase in the math faculty? Was the real objection by the math professors that the students couldn't be adequately taught in that environment? People often become dismissive towards their subordinates and coworkers when they are overworked. I love the stereotype about math professors having poor social and communication skills. Playing on such inaccurate stereotypes doesn't make for a strong argument. It says more about that particular advisor than anyone else. The problem with lower lever math classes is that they are the classes most math professors like to teach the least and they are full of students who have little real interest in and less respect for mathematics. When I was an undergraduate engineering major, once upon a time, I had the experience of listening to an engineering professor mock the mathematics professors in an engineering class lecture. That kind of attitude doesn't lead to comfortable conversations between engineering students and math professors. (Of course, I also had the experience of listening to an engineering professor mock liberal arts students for being outside and

enjoying a warm spring afternoon. That's the point where I realized engineering wasn't the major I wanted.) In my experience math professors become a whole lot more friendly to students they see in upper level classes taking mathematics seriously. Of course, even that is going to be difficult in a math department where faculty growth hasn't kept up with student growth. I've wandered a bit, but you really don't provide enough for anyone to do more than wander and wonder what you're talking about. Over on the Huffington Post, and here on your own blog apparently, you've done a good job of presenting anecdotes about various problems in various different situations but you consistently provide insufficient details or analysis to determine what you're really getting at, if anything. You seem unsatisfied with college education but you don't seem to know why.

seth (2007-07-24 16:52:57)

Oh, I know why. The core problem is that professors have too much power, students too little. And their desires are quite different. In my post For Whom Do Colleges Exist? I was pretty explicit about this. Or so I thought. "Playing on such inaccurate stereotypes [that of the socially-inept math professor] doesn't make for a strong argument." There might be room for improvement, I agree. But let me ask you two questions: 1. Why are you sure the stereotype is inaccurate in this case (Berkeley math professors)? 2. What would be a better approach for a student advisor to take, to replace the one you don't like?

## **Blogs and Street Food (2007-07-09 19:38)**

In The New Yorker, Orhan Pamuk writes:

The best thing about Istanbul street food now is not that each purveyor is different from all the others, offering his own specialties; it is that these different street vendors sell only the things that they themselves know and love.

This is [1]what I was saying about blogs: They are so well-written, so easy to read, because bloggers only write about what they care about.

1. <http://www.blog.sethroberts.net/2007/05/16/why-blogs-are-better-written/>

---

Andrew Gelman (2007-07-10 09:48:22)

Seth, Does this contradict your statement, several years ago, that you really enjoyed reading Entertainment Weekly because it was so well-written?

seth (2007-07-10 12:27:32)

Now that i read more blogs you're right, my standards for what is good writing have gone up: I am harder to please. (Sort of like a sweet tooth.) So EW would move down a notch in relative terms. But I still read it and enjoy it. Tyler Cowen – speaking of blogs – is also an EW fan.

## My Theory of Human Evolution (diet soda edition) (2007-07-10 05:45)

I have been drinking diet cherry sodas for many years. Last week, for the first time, I decided to compare two different brands. I bought a four-pack of [1]Jones sugar-free Black Cherry Soda and a six-pack of [2]Hansen's sugar-free Black Cherry Soda.

I'm never so thirsty that I want to drink two cans of soda at one time so I resisted making a direct comparison (opening both brands at once). I happily drank three bottles of the Jones soda and four bottles of the Hansen's soda at widely-spaced intervals (several hours at least). Both brands tasted fine.

X

When I had only three bottles left (one Jones, two Hansen's) I finally drank a Jones and a Hansen's side by side: sip of one, sip of the other. It was immediately clear that the Jones was much better. It had a strong clear flavor while the Hansen's had something fuzzy and metallic about it. A difference I hadn't noticed. I will never buy another Hansen's – it was that bad.

The Jones soda cost more. I had never bought it because I saw nothing wrong with the cheap stuff. Now I do. The changes were not just negative: After I noticed the difference, I got more pleasure from the Jones. Now that I am aware of this difference it will be fun to buy other cherry sodas to see how they stack up. The side-by-side comparison greatly increased my hedonic reaction to cherry sodas. Not only will I get more pleasure from the better-made, I'll get less pleasure from the worse-made.

Thus side-by-side comparisons (which we [3]enjoy) make connoisseurs of us. Connoisseurs, of course, pay more for and create a market for finely-made things, helping artists and artisans make a living. In human prehistory, artists

and artisans were material scientists. Their trial-and-error research about how to control materials eventually led to better tools.

[4]More about side-by-side comparisons. [5]The evolutionary function of art.

---

Aaron Brown (2007-07-10 22:43:57)

I think Diet Hansen's Kiwi Strawberry Soda is the nectar of the gods. (I drink other flavors of Hansen's, but not with the same pleasure.)

seth (2007-07-11 05:36:05)

My guess is that you didn't like it so much the first time you tasted it. When I hear "nectar of the gods" I think "strong flavor-calorie association".

Aaron Brown (2007-07-11 07:09:58)

> My guess is that you didn't like it so much the first time > you tasted it. When I hear "nectar of the gods" I think > "strong flavor-calorie association". Actually, I went crazy about it on my first can. (I've gotten a bit less enthusiastic as the newness has worn off.) I remember a similar flavor button being pushed by raspberry (or maybe strawberry) gum of a particular brand when I was a teenager, but again that happened on my first taste. I am, by the way, a successful SLD user. (Thanks for it!) An idea I've played with but never gotten around to trying is drinking ELOO with a food that I don't like so that I can develop a taste for that food.

seth (2007-07-11 08:49:38)

Hmm, well I better try Strawberry Kiwi. Your ELOO idea is definitely worth trying. And if you do try it please let me know what happens.

Ben (2007-07-11 10:17:53)

I like Aaron's suggestion of using ELOO to re-engineer the palatability of certain foods. I'm thinking about kids being picky eaters. We're familiar with the generalization that French kids have a more varied palate than, say, American kids: "French kids like to eat vegetables. American kids hate to eat vegetables." Could this be explained by flavor-calorie association? If a vegetable is characteristically cooked with a significant amount of butter (I am generalizing about French cooking that no French cook would serve a plain steamed or blanched vegetable like I do), then the particular taste of that vegetable should quickly become pleasing due to the calorie association. (Curiously, the flavor of butter itself is pleasing WITH foods, though nobody eats it by the spoonful. Maybe butter flavor just signals 'this is calorie-laden food'.) After gaining a certain amount of experience eating super-high-calorie broccoli, won't the specific flavor of plain broccoli become pleasing in a way that no amount of plain-broccoli-eating would ever produce on its own? This question affects me personally: I've been trying to take daily doses of flaxseed oil for the omega-3 benefit. From the start, I have found the taste of pure flaxseed oil to be nauseatingly vile. Theoretically, though, if I persist, the caloric punch of the oil will eventually force me to like its taste. As an intermediary step, I have taken to drinking it mixed with a very flavorful liquid like lemonade or blueberry juice, sometimes holding my nose, sometimes not. Recently I have actually noticed the thought, "This juice has a pleasant, warm, nutty taste to it." I think this is

the first stirring of liking a flavor that was initially revolting. Another question: Can flavor-calorie association explain why salt makes food more toothsome?

seth (2007-07-11 11:02:51)

Salt makes food taste better for reasons that have nothing to do with flavor-calorie associations. It is an immediate unlearned effect. I think you're right about slowly learning a flavor-calorie association with your juice – in fact that might be a good way to study that learning. yeah, we probably like the flavor of butter partly because it is paired with calories. There is also an unlearned preference for the texture of fat; and fat also intensifies other flavors because it dissolves fat-soluble flavor molecules, making them more mobile and detectable.

Ted (2007-07-11 16:47:27)

It always surprises me how artificial-tasting the "natural" Hansen's diet sodas are. But I should point out that Jones diet black cherry contains sodium benzoate, as do virtually all mainstream soda brands. Hansen's is one of the few that don't. If you believe the recent claim that this chemical could result in DNA damage, that might be an issue. It may be that you'd have to drink 80 gallons of soda a day to cause any real harm, but I figure why take the chance?

Pearl (2007-07-12 08:59:21)

In Japan there are few picky eaters and kids are taught from elementary school to eat everything without picking favorites or avoiding certain foods, big posters and motivational words and everything. I think that it's pretty normal for kids not to like certain foods, but perhaps it is because American parents are allowing the kids to be picky eaters. I think it takes everyone a certain number of times to eat a food they hate before they recognize it as palatable. My mom was almost too militant about making me eat everything, and the number of parents I've met who say "Tommy won't eat this and this" really strikes me as odd. Sometimes I get the impression US kids are being placated with food, and that it is taught to be a reward and a recreation, rather than fuel for them to grow with.

J. Weighty (2007-07-13 19:56:47)

Did the actual containers match the photos? In other words, was the Hansen's in a can, and the Jones in a bottle? That alone may account for the superior taste of the Jones. I drink very little soda, but I know bottled beer tastes better than canned.

seth (2007-07-13 20:11:37)

yes, the containers matched the photos.

glucoholic (2009-03-18 19:21:57)

I totally agree! I've done the same test myself. I think Hansen's is fine, but Jones is better. If you like it, I recommend you give the [1]Root Beer and [2]Green Apple flavors a try as well.

1. <http://www.glucoholic.com/2008/04/19/jones-sugar-free-root-beer>

2. <http://www.glucoholic.com/2009/01/15/jones-sugar-free-green-apple-soda>

## **Irritability and Coca-Cola (2007-07-11 06:44)**

The following is from a friend of mine. He is in the middle of a self-experiment to measure the effect of various forms of Coca-Cola (regular, diet, diet w/o caffeine) on his mood.

### **TODAY'S EVENT**

Today 20 oz of coca cola (w/ caffeine and w/ sugar) dramatically eliminated (in about a minute) a very real, strong feeling of irritability.

## BACKGROUND

I am on day 17/30 of the experiment and I am still blinded to the results of the first 16 days. I do know that none of my previous mood experiences in the past 16 days were like the one today.

I had a significant bout of irritability (6/10) today. This irritability has been brewing last 48 hours but was palpable all morning after I woke up this AM. This irritability was the REAL DEAL that I have been seeking the past few weeks - my family was well aware of my irritability yesterday and this AM. Since this irritability was so palpable, I decided to break my experimental protocol and drink a known real coke. Quite remarkably, within a minute or so of consuming the whole coke ( 20 oz - large) my irritability was gone (really gone). [He drank the coke in 2 or 3 minutes. The effect lasted about an hour.] Be clear, this was not some psychological maybe I feel this maybe I don't, this was real psychiatric, can't miss it, need some drugs, psychotropic bad/irritable feeling.

The past 16 days of this experiment has made me very familiar with hunger, bad moods, hunger irritability, assessing my feelings around hunger, assessing feelings around soda pop, assessing feelings around a good meal. Therefore, today I was well prepared to focus on the minute to minute dynamics around drinking this coke - the coke abruptly ended hours of feeling irritable (no better word to describe the mood than irritable).

## RESULTS

-1) Now that I am half way through the experiment, I think I can break the blind by identifying the three different types of coke. I can taste the clean sweetness of real coke immediately, I can feel caffeine in my body from the diet coke in about 5 minutes.

0) I am currently blinded to the results of the experiment I am doing. However, I do have some anecdotal impressions that presumed diet w/o caffeine causes no mood affect, diet w/ caf does affect mood, coke w/ caffeine and w/ sugar does affect mood. My anecdotal impression is that these effects are mild to modest.

1) Today was the first time I felt psychiatric grade irritability confounded by hunger irritability. Today unblinded Coke abruptly eliminated the bad feelings associated with this irritability.

2) I have been rating my mood with full meals 20-40 minutes after my soda pop drink and my impression is that real satiation does have some positive mood effects.

## DISCUSSION

The big target is understanding how 20 oz of sugar and caffeine totally eliminates the strong and persistent feeling of psychiatric grade irritability confounded by hunger irritability. Designing an experiment to go for this issue is challenged by the infrequentness of this psychiatric grade irritability.

Coke eliminating irritability appears to produce happiness by eliminating the presence of bad irritability feelings. In this setting, Coke did not produce any positive feelings, Coke simply eliminated some strong bad feelings. Coke is not producing a good mood, it removed a bad one. (There may have been some "psychological" grade good mood, but this was so tentative and hard to assess that I am happy saying Coke produced no positive affect. The removal of the psychiatric irritable mood was clear and absolute).

In contrast to the absence of irritability caused by coke (and no good mood effects), I think the satiation I have experienced these past 16 days from the big healthy meals following my soda pop does have some positive feelings associated with it. Satiation presumably feels good not just because of elimination of hunger, there seems to be some warm glow from eating a large, well-balanced, fatty, carbo, vegetable, sweet meal.

There appear to be different kinds of irritability. More than six hours without food brings on a form of irritability, but this hunger irritability appears to be different from "mood" irritability. Mood irritability lasts for days while hunger irritability lasts for hours. Hunger irritability produced in the setting of no mood irritability is not that profound. Hunger irritability on top of mood irritability appears to be the REAL DEAL of irritability. It is this REAL DEAL of irritability which today (and typically) creates the setting such that a large caffeine/sugar soft drink eliminates the persistent palpable bad feelings associated with REAL DEAL irritability.

I understand why it would be nice if the subject is blinded. However, I am not sure the subject needs to be blinded. I think one still gets meaningful results even if placebo/nocebo effects are folded into the results.

## CONCLUSION

A couple of days of irritability compounded by hunger produces a strong form of irritability which was dramatically relieved by a large glass of caffeine/sugar coke today (unblinded N = 1 in experiment). Strategies for further behavioral characterization of this phenomenon are needed. A physiological hypothesis is needed. A future design for FMRI measurements of this quick irritability response to caffeine/sugar will be fun to design.

In the final analysis, I guess it is worth finishing the current experiment - even though I think I can determine the identity of each drink. Good data from an inadequate experimental design will be helpful in creating a better experimental design.

About the author: John Keltner has a Ph.D. in Physics from UC Berkeley and an M.D. from Harvard. He is a research fellow at the University of Oxford. Given these results, I asked John if he was addicted to caffeine. He told me no, going without caffeine did not make him more irritable.

---

Pearl (2007-07-11 07:16:54)

I'm confused as to why he doesn't think he is addicted to caffeine. Clearly he is irritable until he has had it. Does this mean he was just as irritable on a regular basis before he started drinking coke regularly?

seth (2007-07-11 07:28:17)

Right. About once/month he is irritable - whether or not he has been drinking coke.

Sam (2007-07-11 09:09:12)

Not easy to confirm this effect: he needs to be in a real bad mood to check this fact. And even though he might not be addicted this effect might be behavioural. Maybe he just connects such a good feeling with drinking coke / sugar with caffeine? Interesting start, needs more data ;)

Omar Wasow (2007-07-11 09:14:14)

I concur with Pearl that this low-grade "irritability" sounds a lot like the symptoms of withdrawal. I'd find this whole experiment more plausible if the subject consumed a no-caffeine, low-sugar diet for a month and then attempted to gauge his responses to various types of coke (and other caffeinated and/or sugary beverages).

Janet (2007-07-11 10:39:30)

He seems to imply that the change in irritability is from the composition of the cola. That might be true, but it could also be from a learned association between cola and a positive mental state or even a feeling of liberation due to carrying out an unplanned act. No way to really test the latter, but the former could be tested by trying an unfamiliar beverage with similar composition like Mountain Dew or a caffeinated root beer.

seth (2007-07-11 10:56:32)

I agree, a great deal of light on the mechanism will be shown by learning what else does and doesn't have this effect. If John's irritability were due to withdrawal from caffeine, there should be a strong positive correlation between two things: 1. time since last caffeine 2. irritability There isn't. If I understand John correctly, there is almost no correlation. The one-hour relief from irritability that a Coke provides is a small change relative to the whole pattern.

John Keltner (2007-07-11 12:53:08)

Hello all, Great to see interest regarding food and mood. Here is a bit of clarification of the background of my current experiment. My brother and I (and some friends we have met over the years) have noticed that periodically (once a month or so) we both get really grumpy (irritable is best description) for a few days. There may be low grade irritability the other 27 days of the year, but these three days of irritability are unmistakable. His family and mine both know when we get irritable. Both my brother and myself (and some of our friends) have noticed that being hungry is the worst exacerbant (spel?) of the really irritable 3 day state. This bad irritability (made a lot worse by hunger) is remarkably fixed by eating a good meal. To a significant degree this irritability can be significantly helped by any caffeine/sugar soda pop drink. My present experiment attempts to tease apart the affects of caffeine vs sugar upon this hyperirritable state (irritability plus hunger). To eliminate expectation bias I have blinded myself to coke, diet coke, and diet coke w/o caffeine. I did not use real coca-cola. Instead, I used a cheap co-op version of coke since I felt the caff/sugear and caff/diet and diet w/o caffeine all tasted more similar than the equivalent real coca-cola versions. Based upon a set of 30 random numbers (1, 2, or 3), my wife pours me two pint glasses of the soft drink of the day. Half way through the experiment, I have concluded that I am not totally blind to which drink is which. I think I can taste sugar and I think I can feel caffeine. Eventhough I am not completely blind, I believe some amount of being blinded has some benefit compared to not being blinded at all. Furthermore, even if I knew exactly what I was drinking, I think it would be fine to have placebo/nocebo effects as part of the measured effect. Also, my 17 days of experiment to date indicate that a healthy full meal has a lot more alleviation of hyperirritability than 2 pints of caffeinated/sugar drink. In the long run, I want to continue to pursue understanding food effects upon mood. Better understanding of these dynamics may shed light on the mechanisms of food and mood. I also believe that food affecting mood has important implications for obesity in depressed populations. I look forward to your additional insights. John Keltner

Pearl (2007-07-11 20:02:15)

It looks like there's only one way to fix this.... noseclipping :) They can help you out on that at the SLD forum.

Laura (2010-05-17 20:05:25)

I get agitated sometimes, too. After 3 years of finding out what might or might not work, I see that eating something is the only thing that gets rid of the anxiety.

## **SLD on Los Angeles TV Tonight (2007-07-11 10:47)**

[1]KABC-TV in Los Angeles will air tonight on their 11:00 pm news a 3-5 minute segment on the Shangri-La Diet. When I was in Los Angeles recently they interviewed me and yesterday interviewed someone in the area who has been doing the diet. They found that person via the SLD forums.

### **My Theory of Human Evolution (omiyage edition) (2007-07-12 07:12)**

The Japanese have a tradition of omiyage, little gifts that you bring back from vacation and give to your friends, family, neighbors, and co-workers. A large number of people. According to [1]Wikipedia, "Japanese are often very close-lipped about their travel plans, hoping to minimize their omiyage responsibilities." That is one solution, [2]here is another:

Choosing omiyage is so difficult and takes time out of sightseeing! It makes the luggage so heavy, when it was already heavy to begin with! You are so tired and beaten down when you return home! Just leisurely choose omiyage from this catalog, go on your trip, and weâ€™ll deliver it to your door when you return home to Japan!

And wrapping [3]matters:

When presenting omiyage remember that the wrapping is VERY IMPORTANT. Put your omiyage in the suitcase or bag that will be sent directly to Morioka from Narita Airport and you can wrap your gifts here to avoid the "well traveled" look.

Like [4]Christmas presents, omiyage (especially the wrapping) is something neither the giver nor the recipient would otherwise buy. Gift traditions increase the market for high-end finely-made things. The genes that pushed us toward these traditions evolved because they helped artists and artisans – the first material scientists – make a living.

### **My Theory of Human Evolution (blogs and fan clubs edition); or Why We Blog (2007-07-13 06:55)**

Marc Andreessen, in a fascinating post about [1]lessons learned from blogging, started me thinking about fan clubs. After reading his post, I wondered what had I learned from blogging. Well, nothing very interesting: 1. Easier than expected. 2. More fun than expected. 3. Pleasantly surprised to see audience grow for the esoteric topics I blog

about, such as scientific method and human evolution. These are quite different than Marc's lessons.

But maybe not. I think Marc gets to the heart of the matter with this:

one of the best things about blogs is how they enable a conversation among people with shared interests.

Which is exactly what fan clubs and fan conventions do.

Every blog I read revolves around someone's specialized knowledge. [2]HuntGrunt, for example, is based on Joyce Cohen's journalism: In her blog, she writes what few others could. Bloggers enjoy writing them, I enjoy reading them. I think blogs have done grown so quickly and become so powerful because they tap into something very fundamental and important inside of all of us: We enjoy talking about our area of specialization, of expertise; and we enjoy listening to others with similar interests. Fan clubs and interest groups were old expressions of this; blogs are a new expression.

Why are people like this? My theory of human evolution says that the human brain changed in all sorts of ways to promote occupation specialization, the big way we differ from our closest ancestors. The fan-club tendency evolved because it caused specialists to share their knowledge. This pushed forward technology just as scientific journals and conferences do. People who made shoes talked to others who made shoes and shared what they had learned. The result was not only better shoes but also better use of research effort: No one had to reinvent the wheel.

Blog posts are easy and pleasant to write because they allow me to do something I enjoy doing: talk about my area of expertise. Their esoteric subject matter is crucial: I wouldn't enjoy talking about other stuff. Maybe this tendency has other uses. People with specialized interests who [3]chat every morning via webcam – now there's an idea...

1. <http://blog.pmarca.com/2007/07/eleven-lessons-.html>
2. <http://huntgrunt.blogspot.com/>
3. <http://www.blog.sethroberts.net/2007/05/06/life-size-faces/>

---

Nansen (2007-07-15 17:58:12)

People with specialized interests who chat every morning via webcam: Here's something interesting from the Wikipedia article on videoconferencing: "It is known that eye contact plays a large role in conversational turn-taking. While traditional telephone conversations give no eye contact cues, videoconferencing systems are arguably worse in that they provide an incorrect impression that the remote interlocutor is avoiding eye contact. This issue is being addressed through research that generates a synthetic image with eye contact using stereo reconstruction."

losing-it (2007-07-25 20:45:22)

I love this cartoon on the devolution of blogging. Reminds me of my own current blog (mine is rather more like blah-blah-blah-ging). Thought you might enjoy the funny, too, Dr. R.: [http://sethlevine.typepad.com/vc\\_adventure/images/blog\\_1.jpg](http://sethlevine.typepad.com/vc_adventure/images/blog_1.jpg)

Brett J (2009-08-19 11:28:41)

The "everyone wins" fact you highlight when it comes to sharing knowledge is strongly resonant of Robert Wright's main points in his book *Non-Zero* - working our way toward more and more "non-zero sum" games, as history proceeds...blogs are a sort of non-zero space where ideas can be discussed/shared in a safe environment. Good book- also great post. Thanks

### **Why Tapas and Dim Sum? (2007-07-13 11:49)**

[1]Elizabeth Rode, Paul Rozin, and Paula Durlach measured the remembered pleasure for meals. It didn't matter how long the meal lasted. They called this "duration neglect."

The existence of duration neglect implies that, with respect to memories of a meal, small portions of a highly favored dish will have roughly the same memorial effect as large portions.

### **Omega-3: I Can See For Myself (2007-07-14 07:08)**

[1]"The flax seed oil scam" by a herbalist named Henriette says bad things about flaxseed oil. One is about (lack of) conversion of ALA (the short-chain omega-3 in flaxseed oil) to EPA and DHA (the long-chain omega-3s found in fish oil and presumably active in the brain):

The scam is in flax seed oil folks trying to maintain that we can convert ALA into EPA and DHA in anything like relevant amounts.

We can't. We convert at most 10 %, but usually less than half that.

Which is "fairly common knowledge among nutritionists," says Henriette. She quotes the abstracts of two scientific papers to support this point. The other criticism is that flaxseed oil goes bad quickly:

I dislike flax seed oil for another reason as well: it oxidizes (goes rancid) pretty much the minute it's pressed, and unless it's been refrigerated ALL the way from press to consumer, it's ALWAYS rancid.

After I read this, I realized I was in an unusual position. When it comes to flaxseed oil, I don't have to take anyone's word for it. I have been able to measure the benefits [2]by myself on myself. Apparently the conversion ratio, whatever it is, is high enough; and the suppliers of my flaxseed oil (I have used Spectrum Organic, Barlean's, and the Whole Foods house brand) have solved the oxidation problem.

With almost every other nutrient, my knowledge is far less certain. Sure, I need some Vitamin C, but how much is best? Too much [3] may cause cancer. I'll probably never know the best amount for the average person, much less the best amount for myself.

1. <http://www.henriettesherbal.com/blog/?p=403>
2. <http://www.blog.sethroberts.net/2007/02/24/omega-3-greatest-hits/>
3. [http://www.timesonline.co.uk/tol/life\\_and\\_style/health/healthy\\_eating/article1449813.ece](http://www.timesonline.co.uk/tol/life_and_style/health/healthy_eating/article1449813.ece)

---

Melissa (2007-07-14 08:06:22)

I read Susan Allport's *The Queen of Fats* and was a little disturbed that she failed to address this. More studies need to be done. I think flax seed oil might be sub-optimal, but I think there is evidence it's a lot better than nothing. I was under the impression that if plants are your main source, you need to eat more of the source than if you relied on fish, and also be careful not to drown it out with omega-6, so you not only have to up omega-3, but cut omega-6. Also, with all the pollution causing bioaccumulation of toxins in fatty fish and the depletion of fisheries, I think it's really important to research plant sources of omega-3s. If flax is not the best delivery of omega-3, then we should find ways to improve it. I buy mine fresh pressed and refrigerated from farm to fork. I have had good results, but admittedly I also eat wild salmon once a week. That blog post is rather old? Has there been more research done recently.

Melissa (2007-07-14 10:15:50)

Aha, here is where the aforementioned book backs up the claim that it's not the fish we don't eat, but the omega-6 we do eat that matters. <http://www.epress.com/w3jbio/vol2/holman/holman.html> shows high omega-3 in a population that eats little fish, but a lot of greens (most omega-6 is from grains)

leea (2007-07-14 14:21:18)

According to Stoll, "Taking more than three tablespoons a day of raw flaxseed or ground flaxseed can inhibit the uptake of iodine in the thyroid, which can produce a goiter or enlargement of the thyroid gland." I just read this here <http://www.cnn.com/2007/HEALTH/diet.fitness/07/06/hm.omega.3/index.html> What do u think about this remark?

seth (2007-07-14 14:40:06)

leea, it's news to me. I will try to find out more about it. Melissa, there has been lots of omega-3 research done recently. One good source is [www.fattyacidtrip.com](http://www.fattyacidtrip.com). That's a very important study you link to, thanks for the link. I had heard about the main results, but not the details.

peter (2007-07-14 21:47:28)

are you ever going to test flax seed oil against/ (i) DHA and (ii) EPA/DHA?

seth (2007-07-14 23:14:20)

yes, I'll test fish oil eventually. But the effects of omega-6 are more mysterious than the flaxseed oil vs fish oil question.

Nansen (2007-07-16 13:27:09)

leea, here is the more complete statement from Dr. Stoll's book, *The Omega-3 Connection*, page 219: If you are using flaxseeds or flaxmeal, it is important not to consume more than 2 to 3 tablespoons per day because the seed husks contain naturally occurring cyanogenic nitrates and linamarin, which can be toxic in higher doses. The cyanogenic nitrates interfere with the thyroid gland's ability to take up iodine and may lead to goiter or other thyroid problems. Immature seeds contain

higher amounts of cyanogenic nitrates and glucosides and are more dangerous. Flaxseeds also contain lignans, which have mild estrogenic, antiestrogenic, and steroidlike activity. These problems are not present with flaxseed oil.

seth (2007-07-16 13:48:17)

That's very helpful to know, thanks.

estomagus (2007-11-03 11:42:46)

I have tried flaxseed oil for the first day in my life. I have a strong stomach, used to all kind of strange and not so healthy food but the oil tasted so incredible unbearable I almost vomit. After reading all the stuff here, I suppose it must be rancid and probably is not healthy drinking any more. But it was out of the fridge in the shop (probably for a long time) so it is possible it was in bad state just in the moment I bought it there? I thought you have to put it on the fridge just when you open it, not before, but I was wrong, wasn't I? I think I would jump into the pills.

seth (2007-11-03 12:43:12)

Oxygen is what causes rancidity. Presumably flaxseed oil is bottled with little or no oxygen exposure until you open it. All the bottles of flaxseed oil I've seen have expiration dates; you might want to check that next time. I buy Spectrum Organic and have never had a problem. It is kept refrigerated at the store. However I first discovered the effect of flaxseed oil using capsules that had not been refrigerated at the store. You just have to take so many of them to get the full benefit.

estomagus (2007-11-04 02:23:35)

Thanks for the answer, Seth. I know the bottle I bought is not out of time. Maybe it was not rancid, just is a taste I feel specially unfamiliar. I will give it a second chance, otherwise pills should be the answer.

## **Cure Versus Prevention (flies edition) (2007-07-15 08:17)**

How to reduce flies? [1]Here's one way:

A Chinese city suburb has set a bounty on dead flies in a bid to promote public hygiene . . . Xigong, a district of Luoyang in the central province of Henan, paid out more than 1,000 yuan ( \$125) for about 2,000 dead flies on July 1, the day it launched the scheme with the aim of encouraging cleanliness in residential areas. . . An Internet user said that although the office had good intentions, the action itself had made the district a laughing stock.

"The key point is the government should encourage residents to clean up the environment so that no flies can live there, instead of spending money on dead flies," the Internet user wrote.

Yes. This [2]gets back to Erika Schwartz's [3]criticism of Gina Kolata and the NY Times for not mentioning prevention in an [4]article about strokes. Kolata's article accurately reflected the situation: far more interest in (i.e., money spent on) cure than prevention. It makes as much sense in America as it does in China.

Norman Temple and I [5]wrote about a related problem: more support for high-tech than low-tech research, even though low-tech research has been more helpful. The low-tech research is more prevention-related.

[6]More health-care absurdity.

1. ---

michael vassar (2007-07-16 10:47:16)

I think that one reason for the emphasis on cure rather than prevention is that the beneficiaries of a cure get to see the benefit while the beneficiaries of prevention generally don't have access to high credibility information confirming the effects of not taking the preventative action. Too much low quality information or interested propaganda, for instance the sort of "health" education that takes place in public schools, goes under the guise of prevention. It isn't easy or convenient for individuals to state outright disbelief, due to authoritarian pressure, but it is easy for them to base their behavioral decisions on the imitation of others rather than on an attempt to infer the behaviors implied by official dogma. This is, sadly, terribly costly, as it prevents them from benefiting from legitimate prevention.

seth (2007-07-16 11:50:10)

I agree. Not only the beneficiaries. I spoke to a doctor who works in a hospital. We can't really help most of the people we see, she told me. So why do you do it? I asked. Why not do something that helps, such as prevention? Because I like to be thanked, she said.

### **Absurdity and Pathos in Elementary-School Education (2007-07-15 21:47)**

At the [1]San Francisco Chocolate Salon, which I attended because of my interest in [2]connoisseurship and [3]gifts, I learned some sad truths about elementary-school education. A San Francisco public school teacher told me:

1. The curriculum is mandated. Tests are mandated. And they disagree. For example, you are forced to teach what a certain word means. You spend two weeks teaching that word and then the tests use a different word for the same idea.
2. There is no allowance for differing rates of learning. Some kids learn faster than others. Teachers are not allowed to adjust.
3. There are rules about what teachers must put on classroom walls. If a federal inspector comes around and you don't have the proper material on your classroom walls, a note goes in your permanent file.
4. The Reading First program requires that reading be taught before everything else. Some kids are relatively slow to learn to read but they are able to learn in other ways. The effect of the mandate is that these other kids sit in the classroom baffled and unhappy and lose self-confidence.
5. The rigidity of the curriculum – which must be exactly the same for all students – squashes encouragement. For example, suppose a student is interested in bugs. You could encourage reading by giving the student books about bugs. This is a natural, effective, and easy way to teach reading. This way of teaching is not just discouraged but prohibited.

6. A friend of mine says that bookstores should be divided into "real books" and "other books." Children's textbooks, which are [4]worse than anything in a bookstore, deserve their own category. A fifth-grade teacher got around the awfulness of the textbooks by putting real books in the center of the classroom tables and having children sit with their textbooks open around them. This allowed the students to read the real books but if the principal came by the teacher would not get in trouble because the assigned textbooks were open in front of the students.

Excellent posts about elementary-school education by [5]Tyler Cowen and [6]Alex Tabbarok.

---

Rob (2007-07-15 22:42:22)

Seth, I'm a former teacher and current ed school student. When I read this blog, I always think of how exciting it would be to incorporate kind of self-experimentation into the secondary science or health classroom--and maybe some kind of group self experimentation. At the very least, you could have kids track what they eat and their moods afterward and try to determine the relationship. You'd somehow have to avoid encouraging kids to experiment with dangerous things, though. Any thoughts on this?

Pearl (2007-07-16 05:36:53)

That's so sad. When I was in elementary school I was really good at reading so the teacher assigned me a report on rainbows to show for the class. I worked really hard on it and it gave me a lot of confidence to learn English. I was also in something called "expanded learning program" (ELP) throughout middle school that encouraged this kind of learning, but I always thought it should have been how they taught everyone. Instead it was criticized for being selective.

seth (2007-07-16 06:09:42)

Rob, it sounds too one-size-fits-all for me. I tried assigning self-experimentation to my intro psych students. I stopped after I decided too many of them were making up the data. I wasn't delusional; a University of Pennsylvania student told me that no thesis gets written at Penn without at least some fraud. I think you can talk about self-experimentation and you can allow it. I'd never force anyone to do it.

Laura (2007-07-16 13:36:52)

Depressing indeed, but I don't doubt it. When I was in elementary school, I read the whole "Reader" in one day and spent the weekend doing the homework in the associated booklet so I would never have to look at it again. I got in trouble for not following instructions and the teacher took away my booklet and gave me a new one so I would have to do it with the other students. I also have memories of frequently getting in trouble for reading "real books" during lessons- and yes, I began hiding them in the text book as well.

Reyes-Chow (2007-07-16 16:17:12)

Let me just post one positive thought about SF Public schools. I have two kids right now in the SF Public school - and one more to come - and I do think every school and every teacher is different. While I do not doubt some of the realities that you bring up, we have NOT had this experience nor have any of our many friends in public school here in the city. I also don't think this kind of rigidity is only present in the Public school. As we went through our "middle class progressive angst" when choosing a school for our kids, we looked at MANY private schools. Some were great, creative, etc while others were far more rigid and elitist than ANY public school could or should ever be. When it got right down to it, we chose public because we felt our kids' worldview would have the greatest chance at expanding in this setting. Not for every family OR teacher, but has been great for us and our kids.

Robin Hanson (2007-07-16 19:52:00)

This is terrible if true. And this is important enough to be worth checking - can others verify these claims? If true, they should be relatively easy to verify.

seth (2007-07-16 20:10:45)

Reyes-Chow, this teacher taught at a low-income school, where she said these problems were greater than at high-income schools where the students tended to have fewer problems learning to read. Robin, the teacher offered to send me some links backing up what she said. I will find out if the offer is still good.

s. (2007-07-17 00:13:13)

Well here are few links to get you started. Reading First <http://www.ed.gov/programs/readingfirst/index.html>  
Star Test <http://star.cde.ca.gov/> CA standards (notice how kindergarteners need to know how to read...)  
<http://www.cde.ca.gov/be/st/ss/index.asp> The \*only\* two approved reading curriculums in CA are... Houghton Mifflin  
[http://www.eduplace.com/index.jsp?state=ca&audience=\\_t&submit.x=49&submit.y=12&submit=About+submit+buttons](http://www.eduplace.com/index.jsp?state=ca&audience=_t&submit.x=49&submit.y=12&submit=About+submit+buttons)  
Open Court [http://en.wikipedia.org/wiki/Open\\_Court\\_Reading](http://en.wikipedia.org/wiki/Open_Court_Reading) I am a total proponent of public school, I just believe that No child left behind (which is being abandoned in Houston where all these "reforms" began) has purposely been destroying public school curriculum. <http://www.fairtest.org/nclb%20flaw%20fact%20sheet%201-7-04.html> This is a great article but the real problem is... "NCLB's obsessive focus on raising test scores will mean an increasing emphasis on test preparation, undermining the higher order thinking skills all students need to succeed in work and life? The reason your public school is probably so nice is that it is not a star or reading first school that trades funding for curriculum constriction. Schools that have the majority or more of kids receiving free or reduced lunch (don't start me on the crap they serve the kids daily) are eligible for these programs that cramp teachers, especially good teachers' style. I adore the teachings of Dr. Mel Levine <http://www.allkindsofminds.org/>

knackeredhack (2007-07-17 07:59:00)

For a UK perspective check out my post relating the achievement of West Dunbartonshire in Scotland, which is about to eradicate childhood illiteracy after a 10-year project adopting a whole community approach, according to a report in the Guardian last week. There is also a link to a very comprehensive study of research into dyslexia and reading difficulties and its implications for the teaching of reading to both adults and children.

## **Science in Action: Sunlight and Sleep (more progress) (2007-07-17 06:51)**

Surely we need sunlight to sleep properly. But how much? Rats can be synchronized to a 24-hour activity rhythm with a relatively small amount of light (such as one hour) every 24 hours. This is one reason for the emphasis on morning light by sleep doctors mentioned in a [1]previous post.

I have agreed with them. For the last 10 years I have gotten one hour of sunlight-like light every morning from a bank of fluorescent lights on the handles of my treadmill. The lights shined up at me while I exercised and

watched TV. This, I thought, allowed me to get a good dose of light with low variance in when and how much and to combine light-getting with exercise. I never questioned this routine.

Then came [2]the event that led to this Sunlight and Sleep series: In the airport during a trip to New Orleans, a student told me when she sunbathes, she sleeps better. When I got home from my trip I tested her idea. Me, too: When I was outdoors a lot (in the shade), I slept better.

I took another trip (to Los Angeles). When I got back from that trip, I decided that I would adjust the timing of the treadmill light so that it interfered less with my day. I shifted it from 9:00 am to 10:00 am (original timing) to 8:00 am to 9:00 am (new timing).

To my surprise I started waking up too early, so often it could not be a coincidence. The only change I had made was timing of the light. So the treadmill light was making things worse! I stopped it entirely. My sleep improved – no more early awakening. Huh.

Here are details:

Period 1 (treadmill light 9-10 am, little sunlight): woke up early 29 days out of 99 (29 %)

Period 2 (treadmill light 9-10 am, lots of sunlight): woke up early 1 day out of 25 (4 %)

Period 3 (treadmill light 8-9 am, lots of sunlight): woke up early 4 days out 8 (50 %)

Period 4 (no treadmill light, lots of sunlight): woke up early 0 days out of 8 (0 %).

Lots of sunlight means 6-8 hours exposure to light of roughly 1000-2000 lux. Sitting in the shade or inside next to a big window is always enough. At the low end (1000 lux) my laptop screen is easy to read; at the high end (2000 lux), which I try to avoid, it becomes slightly hard to read.

### **Inside College Classrooms (2007-07-18 07:01)**

[1]Tom Perrotta, author of the novel *Little Children*, was an undergraduate at Yale, a graduate student at Syracuse, and a teacher at Harvard and Yale. I assume this passage from *Little Children* is based on that experience:

What did her in [as a graduate student] was the teaching. Some people loved it, of course, loved the sound of their own voices, the chance to display their cleverness to a captive audience. And then there were the instructors like herself, who simply couldn't communicate in a classroom setting. They made one point over and over with mind-numbing insistence, or else they circled around a dozen half-articulated ideas without landing on a single one. They read woodenly from prepared notes, or got lost in their muddled syntax while attempting to speak off the cuff. God help them if they attempted a joke.

Curious. To "love teaching" is to love hearing your own voice and showing off. This passage seems to imply that Perrotta's teachers either "loved teaching" in this unpleasant sense or were muddled and awkward failures. I would have thought that in a non-occupational-skills class (such as sociology, history, or literature), what a good teacher does is tell lots of stories. Apparently this didn't happen much in Perrotta's experience.

1. <http://www.tomperrotta.net/>

---

s. (2007-07-19 08:55:39)

That's funny, I believe the best teachers are facilitators. She sounds like she was trained poorly. I think that they assume teaching assistants have been in school so long that they can pull from their own experiences as to how to teach. Also, I find when I teach, and I am secretly a learner. Also, it is a way of showing mastery of a topic. If she is getting an advanced degree in a topic, she should be able to communicate that topic at a basic level to many kinds of people. Teaching is good for ya.

seth (2007-07-19 09:45:31)

Little Children is fiction; the woman referred to in that passage doesn't exist. But I think you're right, the training about how to teach given graduate students has plenty of room for improvement.

## **Why I Blog (2007-07-19 05:56)**

[1]Robin Hanson has doubts about the long-term value of blogging – especially his own:

My main doubt is whether this will accumulate . . . We get over a thousand readers a day here, and those readers must be influenced somehow. But do those influences add up to a long term net effect?

Consider that before the farming revolution humanity's knowledge accumulated very slowly. Each person learned a great deal over the course of his lifetime, both by discovering new insights for himself and by listening to others. Nevertheless, the distribution of knowledge in the population hardly changed; each new generation had to rediscover and relearn the same insights all over again.

Before farming, I believe new insights were passed down in three ways. 1. Stories. Stories are to teaching as good food is to nourishment. Whenever I tell a story, my students pay close attention. 2. Apprenticeships. 3. Specialists talking to each other – a manifestation of the [2]Fan Club Instinct. Blogging is a new version of Method 3. When old specialists talked to young specialists, knowledge was passed down. Robin is young, but his posts are influencing even younger persons.

I think blogging is a good use of my time for several reasons. 1. Advertising. I hope blogging will draw attention to my papers and book and future work. [3]Brian Wansink nicely made this point (scientists should advertise). 2. [4]Quasi-reinforcement. Blogging divides a big task (writing a book or paper) into much smaller tasks (writing posts).

3. Data collection. Because of my omega-3 posts, two other people gathered data useful (very) to me. [5]Tim Lundeen's data led me to study new tasks. Tyler Cowen's [6]experience with flaxseed oil is enormously important to my omega-3 research.

But I have to agree with Robin that blogging sometimes seems too seductive – that I should write fewer posts like this one and more that fit into the book and papers I want to write. I keep thinking of something Philip Weiss said in [7]his blog: For men, the most enjoyable form of expression is the Op-Ed piece.

1. <http://www.overcomingbias.com/2007/07/blogging-doubts.html>
2. <http://www.blog.sethroberts.net/2007/07/13/my-theory-of-human-evolution-blogs-and-fan-clubs-edition-or-why-we-blog/>

---

Andrew Gelman (2007-07-19 16:11:20)

Robin's not so young. The median age of humans is something like 18. Even the median age of Americans is only 36 or so.

seth (2007-07-19 20:49:25)

Well, few 18-year-olds wonder how to have a lasting intellectual effect. I think Robin is young compared to people who have such effects.

Tim Lundeen (2007-07-20 10:20:34)

I hope both you and Robin will continue to blog – I would miss both of these!

Willy (2007-07-21 13:52:23)

Seth, have you used blogging as a test for the effects of Omega 3 in writing?. It could be another reason to blog :) Have you noticed if taking Omega 3 oils affect writing? e.g. fluency, typing speed, spelling mistakes, calmness?. All these could be measured. Thanks

### **Science in Action: Omega-3 (follow-up of surprise) (2007-07-20 09:53)**

During a trip to Los Angeles a few weeks ago, I [1]noticed that my scores on several mental tests were better all of a sudden. The apparent cause was that I had taken flaxseed oil at an unusual time. Normally I took it about 10 hours before the tests; in this case I had taken it about 4 hours before.

Does flaxseed oil have a short-lived effect on brain function? When I got home I tried to find out. Rather than doing a set of four tests once per day I switched to one test many times per day (e.g., 10 times). This would allow detection of short-lived ups and downs in my mental function.

The test I used required nothing but my laptop. I usually have my laptop with me so such a test is much easier to do throughout the day than a task that requires other equipment. The test consisted of four blocks of 50 trials each.

For each block I memorized a new set of three digits (e.g., 0 1 7). On each trial I saw 1, 3, or 5 digits and pressed a keyboard key as quickly as possible to indicate if any of the memorized digits is in the displayed set. For example, if the memory set was 0 1 7 and the display set was 3 2 8 the correct answer was "no" (which I indicated by pressing "4").

The trials were packed together as closely as possible: As soon as I answered, the next set appeared. It took about 3 minutes to do 200 trials.

I did frequent measurements for four or five days. They appeared to confirm what the Los Angeles measurements suggested: Flaxseed oil did have a short-term effect. But two things muddled the water:

1. Baseline measurements were not always as steady as I would like. There were ups and downs that seemed too large to be random variation. The curious and exciting thing was that these ups and downs usually had a possible explanation – something had changed. For example, the measurements would be X1, X2, X3, Y. X1, X2, and X3 are close; Y is quite different. Between X3 and Y I had eaten a meal.

2. The task was difficult. I was about 88 % correct and it was hard to do better. With any reaction-time task there is a speed-accuracy tradeoff: If you are slower, you can be more accurate. In this particular case this is a problem because it is an added source of variation and may reduce reaction-time differences: Rather than becoming slower, I become less accurate (or rather than becoming faster I become more accurate).

Problem #1 is easy (if slightly unpleasant) to solve: Keep the situation more constant. Eat less during the measurement period, etc.

To reduce Problem #2 I am learning a new task. I will go into detail tomorrow.

1. <http://www.blog.sethroberts.net/2007/06/30/science-in-action-omega-3-a-surprise/>

---

Tom (2007-07-20 13:19:26)

Seth, I'm not sure why you seem to think that the flax oil is changing the brain's composition. Such an effect would surely take months to manifest. What's clearly happening is the brain is burning flax oil (probably as ketones) for fuel. Then the meal effect is not curious; it's the expected result of the brain changing fuel sources from omega-3 derived ketones to carb-derived glucose.

seth (2007-07-20 13:42:03)

The first question I want to answer is whether it really is cause and effect. Later I'll try to answer questions about mechanism – if flax oil causes a certain change, why? I'm much less sure than you what's going on. I found that olive and flaxseed oil appeared to have effects on balance in opposite directions. These effects appeared within a day or so – much less than months. Can you explain this? About the meal effect: according to your explanation, did the meal increase or decrease reaction time?

Tom (2007-07-20 15:36:26)

Well, I apologize for the word "clearly" – it's just my hunch about a possible explanation. That the effects of flax and olive oil would show within a day would also seem to support the idea that these oils are being used by the brain for energy, rather than incorporated into the structure of brain cells. And an explanation for the different effects of these oils might be found in their fatty acid profiles. Olive oil is largely n-9 oleic acid, right? Flax contains a lot of n-3 ALA...it seems possible that the brain

might perform differently on different oils, and differently yet again on blood sugar from a (presumably) carb-heavy meal. (I think how your brain would perform after a meal might depend on what the meal was. You might have better balance after a filet of wild salmon than you do after chicken fried in trans fats with a side of french fries, for example.) It would certainly be interesting to construct a matrix of various oils and frequent tests and see which oils and carbohydrates made you smarter!

SusanJ (2007-07-20 20:01:07)

Are you familiar with the card game known as Set? You can enjoy this as solitaire as well as playing against other persons. Set is a neat and fun abstract matching test that might be useful for your experiments. <http://www.setgame.com/> I can sometimes do the online Daily Puzzle in under a minute but a minute and a half is more typical. I would expect a newbie to take several minutes.

Dale (2007-07-21 01:52:45)

Tom, I'm sure Seth will probably chime in. But he has tested other oils – with olive oil performing poorly! You should read his other posts on the subject – this one is mainly a follow up. He's explained more of his methodologies and theories in other posts. Unfortunately Seth is a one-man laboratory, I wish he had an army of subjects or at least an army of highly trainable rats! Maybe a MacArthur genius grant will come his way.

seth (2007-07-21 06:13:03)

The effects of flaxseed oil can be summed up like this: 1. going from low level to high level: fast (overnight) improvement. 2. going from high level to low level: slow (a few weeks) decline. This is the pattern seen with vitamins: 1. going from low level (e.g., scurvy) to high (sufficient) level: fast improvement 2. going from high level to low level: slow decline. With the difference that with vitamins the time course is slower: Scurvy takes a few weeks to fully recover from and takes months to develop. The fuel/structure dichotomy doesn't exhaust the possibilities. Think of oil: Adding oil to an under-oiled engine produces very fast improvement and it takes a long time without enough oil before performance gets a lot worse.

Wade (2007-07-21 07:03:41)

I can't claim to be an expert of any kind, so I'll simply point to what I've read for what it's worth. You might find at least some possible explanations in "The Ultimate Omega-3 Diet" ([http://www.amazon.com/Ultimate-Omega-3-Diet-Evelyn-Tribole/dp/0071469869/ref=pd\\_bbs\\_sr\\_1/002-3939287-9868043?ie=UTF8&s=books&qid=1185024664&sr=8-1](http://www.amazon.com/Ultimate-Omega-3-Diet-Evelyn-Tribole/dp/0071469869/ref=pd_bbs_sr_1/002-3939287-9868043?ie=UTF8&s=books&qid=1185024664&sr=8-1)). This topic is covered in Chapter 7 "Omega-3s, the Brain and Mood". According to the author, with what appears to be an awful lot of evidence to back her up, Omega-3s affect the brain in two ways. The first is in reducing inflammation, which she claims is one of the major causes of disease in all areas of the body, including the brain. More specific to the brain, Omega 3s appear to have a strong effect on the fluidity of the brain's cell membranes. Both of these seem to be more long-term benefits than what you are seeing, but it may help you piece the puzzle together a little bit. The major message of that book is that our diet includes way too much Omega-6, and not nearly enough Omega-3. All Omega-3 processes depend on certain enzymes, and Omega-3 competes with Omega-6 for these enzymes. With too much Omega-6, and not enough Omega-3, the Omega-3 can not be as effective as it should be. If this is correct, then the amount of Omega-6 in your meal could have a substantial effect on the bioavailability of the Omega-3s from your Flax Oil. She also asserts that you need an additional source of Omega-3 beyond what you get with Flax Oil. With Flax Oil you only get one of the three essential fatty acids: ALA. You also need two others, EPA and DLA every day, which can be obtained from fish sources, fish concentrates (e.g. Fish Oil), and supplements made from Algae. Your body can create EPA and DLA from ALA, but at a very low efficiency rate. The ALA seems to be more important than EPA and DLA, which would explain why you get good results with Flax Oil only. If this is all correct, you should get even better results by mixing in either some EPA/DLA supplements. I've been doing this by simply taking Fish Oil tablets with my Flax Oil or ELOO, to increase my uptake of EPA/DLA, but I haven't been doing it systematically as you are. Olive oil was entirely Omega-3 neutral, meaning that it doesn't change the Omega-3/Omega-6 ratio at all, partly because it's mostly Omega-9, and the remaining essential fatty acids are properly balanced. I also think that Tom's point about blood sugar and insulin spikes seems like something that could have a big effect on your results. It's relatively easy to prove that a carbohydrate heavy meal has an effect on brain function. Just eat one, and try to stay awake an hour later. It would be interesting if you could post a link to your mental test that you're using, so others could repeat the experiment.

imsovain (2010-07-10 15:55:49)

If I read the scientificese correctly in this abstract, it says that ALA (such as in flax) converts into ketones: <http://www.ncbi.nlm.nih.gov/pubmed/14769482> If so, Tom's hypothesis of a ketone explanation seems more plausible. Also, it suggests that coconut and MCT oil might have similar effects.

## **My Theory of Human Evolution (red stained glass edition) (2007-07-21 10:42)**

As regular readers of this blog know, I propose that art exists because in our evolutionary past payment to artists promoted material science – learning how to create new materials with useful properties. For example, [1]red stained glass.

Medieval artisans unknowingly became nanotechnologists when they made red stained glass by mixing gold chloride into molten glass. That created tiny gold spheres, which absorbed and reflected sunlight in a way that produces a rich ruby color.

The gold spheres have to be about 25 nanometers in diameter to get this effect.

Thanks to Joshua Schrier.

1. <http://www.nytimes.com/2005/02/22/science/22nano.html?ex=1184904000&en=cd11e918d259f715&ei=5070>

---

Karin (2007-07-21 13:48:14)

Art exists because humans have a drive to create... relevant art exists because some humans are in touch with universal trends, or what Carl Jung termed the 'collective unconscious.' Technological, and other scientific advances, can be driven by artists (because of their heightened receptivity to the aforementioned zeitgeist and their need to create media for its expression). However, I would disagree that art exists solely because artists were inspired by material gain (i.e. payment). Certainly, notable artworks (e.g., Lascaux cave paintings) were created during the human hunter-gatherer period and predate any form of trade economics. It would make more sense to say that science exists because of art (when art is defined as the product of the human drive to create). It should be noted that non-secular art, such as stained glass dating from the 7th century and later, had motivations not strictly limited to patronage and profit. Moreover, there is a critical difference between a craftsman and an artist.

Steve (2009-06-24 18:23:05)

This is a fascinating discussion! In my humble opinion, I must agree a little with both of you. There are instances where art exists because of science....and other areas where science exists because of art. Without science, where would art be?

David Gomm (2010-01-22 12:18:51)

I knew that trace amounts of precious metal are used to form some of the hot colors, it's just nice to hear a little more about the process. I met a guy who made pink opalescent seedy glass by broadcasting arsenic into the glass, so it's pretty special,

only the owner can make it because it's not safe enough for employees to do it.

### **Science in Action: Omega-3 (a new test) (2007-07-22 09:15)**

[1]Two days ago I explained why the test I was using to measure my mental function many times/day had room for improvement. I wanted a new test much like the old test but with which my accuracy was higher.

I was more accurate with the simple arithmetic test (e.g.,  $3 + 6$ ) than with the memory test I described two days ago. The crucial difference might have been the number of possible answers. The arithmetic test had 40-odd possible answers; the memory test had 2 (yes and no). Saul Sternberg did a reaction-time experiment in which the number of possible answers was varied from 2 to 8. I don't know what the accuracy data were but the [2]variance of the reaction times was lower with 8 possible answers even though reaction times were longer. A plausible explanation is that there was much more anticipation with 2 possible answers than with 8. Anticipation can cause errors.

The new test I am trying consists of typing how many letters from the set {A, B, C, D } are among a set of four letters chosen from a much larger set (most of the alphabet). The possible answers are "1", "2", "3", and "4," each equally likely. For example, I might see T B X A. The correct answer is "2". I am using R (the programming language) to run this test so I type "2" with one hand and hit Enter with the other as fast as possible.

Here are the results so far from the new test – the training phase.

## Memory Test: How Fast

These values are taken from fit of a linear model; they are similar to means. As I gain experience with the test I am getting faster. The new test is slower than the old test (which is good – more mental processing).

Consistent with what Sternberg found, variation in reaction times is less with the new test than with the old test even though average reaction times are greater:

This graph shows the standard deviation of residuals from the fitted model. The units are reciprocal seconds (x 10) because I did a reciprocal transformation before fitting the model. The reciprocal transformation made the reaction times close to normally distributed.

Here is accuracy:

The new test feels easier than the old test, but so far there is little difference.

Overall it seems to be a step in the right direction. Reduction in variation of reaction times means more sensitive measurements.

The experiments I am planning are very simple: Test myself regularly (say, every half-hour), eat something. If the measurements are steady, it is very easy to see an effect. As far as I know, such experiments have never been done. One reason, I think, is that they require self-experimentation: It is no trouble for me to do the test (which takes 4 minutes) 100 times in a week and thereby reach a steady state. But to have someone else do the test 100 times as preparation – especially if the test were done in a lab – would be very difficult.

## A Student's Unlovely View of UC Berkeley (2007-07-23 10:02)

I recently met an undergraduate named Samantha who is majoring in Economics at UC Berkeley. She is almost done. I asked her a few questions about her education:

SR: Did UC Berkeley help you figure out what you were good at?

Samantha: No. In UC Berkeley classes you don't get to do any individual searching. You just have to do what they tell you. Because it's all theoretical, none of it is very practical. You don't do any practical projects. The classes don't give you any idea of what you want to do career-wise.

SR: Did UC Berkeley help you figure out what you enjoy doing?

Samantha: No.

SR: Why not?

Samantha: I'm here just for the name. It scares you away from trying new things. Intimidating class sizes, professors that don't seem invested in the students.

[1]A student advisor's view.

1. <http://www.blog.sethroberts.net/2007/07/09/a-student-advisors-unlovely-view-of-uc-berkeley/>

---

Avinash (2007-07-23 10:34:04)

Hardly surprising. I've been at Cal for 3 years and can't say the university helped me at all. The only thing they emphasize at orientation is take requirements, buy your textbooks on time, go to office hours, study aimlessly for hours. Not that any of these things are bad, but it's all about learning to conform and it blows. No one tells you who to go to when you make mistakes, so you're pretty much left to fend for yourself when things go downhill. It's hard to feel connected to this place when you feel like you're being treated like disposables. The only great benefit is that I've been able to connect with all sorts of people I'd never get the chance to in another place. That's the real tangible benefit I'll get from graduating from here. Plus all this disgust at the system has slowly led me down another path that might make me happier in the long-run. But there is no love lost between Cal undergrads and their school. Adapt or die.

seth (2007-07-23 11:14:19)

Yeah, there are two kinds of education: education that tries to make everyone the same – assembly-line education – and education that doesn't. Practically all discussion of education improvement among Berkeley professors is about how to do a better job of making everyone the same. How to raise lecture attendance, how to raise test performance, how to reduce plagiarism and cheating, etc. I have never heard this goal questioned.

Dale (2007-07-23 21:10:09)

Economics at Berkeley?? "You knew I was a snake when you picked me up" said the snake to the frog.

## My Theory of Human Evolution (fancy chocolate edition) (2007-07-24 09:50)

The chocolates of [1]Poco Dolce (which means "not too sweet") have been named "top ten" in America by Saveur. One of Poco Dolce's products is a [2]bittersweet chocolate square with double-roasted almonds.

"Why double-roasted?" I asked Kathy Wiley, who makes the chocolates, at the [3]San Francisco Chocolate Salon. Double roasting – roast, cool, roast again – produces a better flavor, she said. "Why not just roast them longer?" I asked. Because you are more likely to over-cook them. There are special ovens for roasting nuts but she doesn't have one.

This is basic material science. Wiley wants to maximize the concentration of certain molecules (that produce a roasted almond flavor) while minimizing the concentration of other molecules (that produce a burnt flavor). By trial and error she has figured out how. She was able to do the trial and error – i.e., research – because her business is successful. Her business is successful in large part because of connoisseurship and gift rituals. People give her products as gifts.

I believe we have genetic tendencies toward connoisseurship and gift-giving [4]holidays and [5]rituals because, long ago, these tendencies supported research in material science. Pleasure from finely-made things and desire for gifts supported artists and artisans, who by trial and error learned better control of their materials. Poco Dolce is a latter-day example.

---

Dale (2007-07-24 16:17:51)

Seth, you seem to be treading on common ground with Virginia Postrel's *The Substance of Style*. Have you read it? <http://www.vpostrel.com/tsos/>

seth (2007-07-24 16:54:27)

Only a little of it. Thanks for the recommendation.

jschrier (2007-08-04 00:31:03)

Double roasting almonds is not science! It is quite literally the *opsopoiia* ("fancy cooking" such as making delicate pastries or other cookery, i.e., aimed at flattering the senses and directed by *empeiria* ("experience", or a kind of knack)), rather than *technē* ("art" or "craft", the root of technology, i.e., a rational enterprise aimed at some end enacted by a skilled practitioner), that was skewered (as "collateral damage", so to speak) by Plato's Socrates in the [1]Gorgias dialogue. At least as written (who knows? maybe Poco Dolce has a GC/MS in the back room), it appears that there is no underlying theory of mechanism, no Popperian falsifiable hypotheses, etc. characteristic of science. Instead, it is just a somewhat blind "fiddling around" until some arbitrary aesthetic criteria is reached. (Actually, the same thing originally bugged me about the post on the gold nanoparticles—stained glass, but I couldn't put my finger on it precisely). While these kinds of efforts certainly increase man's material comforts, and perhaps serve as a "raw material" for scientific discovery, the end is not to answer/raise any question. For example, one could not use these results to hypothesize the conditions for roasting hazelnuts instead of almonds, other than "try the same thing, and maybe it will still work (or be close)". At best this is the kind of low level "engineering" practised

before the development of classical mechanics, where you build bridges, cathedrals, aquaducts similar to known examples that didn't fall down (and hope that yours doesn't fall down either).

1. <http://en.wikisource.org/wiki/Gorgias>

seth (2007-08-04 11:55:25)

That's true, it's engineering at best, not science. In the phrase "material science" there is a bit of the usage of "science" that occurs in the phrase "computer science" – which is not science at all, either. Professors in Computer Science departments don't wonder how computers work; it's just that "computer science" sounds better than "computer engineering".

## **Human Experimental Psychology: Science With One Hand Behind Your Back (2007-07-25 15:36)**

Human experimental psychologists are in a most curious position. Their subject – the human brain – is obviously the most complicated thing studied by any science. Its components (neurons) are not only very numerous and densely-connected they are also very inaccessible. Moreover brains soak up their environments in a way that other objects of study do not. It isn't impossible to do experiments, but it isn't easy. You can't keep a supply of humans in your lab, for example. The difficulty of human experimental psychology is the main reason I decided to study animal experimental psychology. But the complexity of the brain is not only a difficulty but also an advantage: It means there is the most to be learned.

It is also easy to argue that human experimental psychologists study the most important subject of any science. Advances in understanding the human brain go "straight to the bottom line" – namely, human welfare and happiness – in a way that is true for few other sciences. Mood disorders and learning problems – not to mention obesity and poor sleep – cause a huge amount of suffering. Brain dysfunction is behind all of them. Norman Temple and I have [1]argued that the sort of low-tech vary-the-environment type of research done by experimental psychologists is the most likely to produce useful results.

Given such a task, human experimental psychologists are lucky to be able to use an unusual tool: self-experimentation. Self-experimentation makes it remarkably easy to study topics with practical value (as I [2]have). Because our world is already built around requirements of the human brain, self-experimentation requires no special equipment, no laboratory, and can be done at almost no cost. No other science, except human nutrition, has anything like this.

But human experimental psychologists don't do self-experimentation! (There are a few exceptions, such as psychophysics.) The standard arguments for the avoidance don't withstand scrutiny. Standard argument #1: Experimenter bias. The experimenter's expectations may influence the results. Rebuttal: The human experimental psychologists who say this don't practice what they preach: They don't run their experiments blinded. Very few psychology experiments are run blinded. Standards argument #2: Lack of generalizability. You don't know how general the results will be. Rebuttal: Yes you do. Typical psychology experiments have on the order of 8 subjects. They can be so small and still get reliable results because all the subjects change in the same direction. This means that if you know how one subject has changed you can predict how the others will change. In other words, the whole history of human experimental psychology – tens of thousands of experiments, a vast amount of data – shows that yes, you can safely generalize from one subject.

Because the stated reasons for not doing self-experimentation are so easy to rebut, the actual reasons may have more to do with human nature. My guess is that they are some combination of: (a) Fear of being different – different from other psychologists (the who-goes-first problem) and, especially, different from scientists in other areas, few of whom can self-experiment. (b) Desire for prestige. A large grant, a large lab, and activities in which others follow your orders are inherently more prestige-enhancing than doing something all by yourself.

This is why human experimental psychology, as currently practiced, really is science with one hand behind your back. Too bad it matters so much.

Thanks to Saul Sternberg for a thought-provoking discussion.

1. [http://sethroberts.net/about/2002\\_medical\\_research--a\\_bettor's\\_guide.pdf](http://sethroberts.net/about/2002_medical_research--a_bettor's_guide.pdf)
2. <http://repositories.cdlib.org/postprints/117/>

---

Timothy Beneke (2007-07-26 20:42:37)

Regarding: "Very few psychology experiments are run blinded." I may well be missing something, but my impression is that in most psychology experiments, those who measure the dependent variable are usually "blinded"; i.e., they don't know whether they are observing the control group or those who have been influenced by the independent variable. I thought that was just standard practice. I am most familiar with social psychology experiments. Wouldn't most intro psych texts argue for blinding in measuring effects as basic to psychology? I'm a bit confused. Certainly in medicine in measuring the effects of agents or activities on illness, double blinding is considered the gold standard.

seth (2007-07-26 21:22:58)

I should have made clearer that I was talking about human experimental psychology. Self-experimentation is not available for most other areas of psychology – e.g., developmental, clinical, social. At least in human experimental psychology – sometimes called cognitive psychology – you will have to look long and hard to find any experiments in which the subjects or the experimenter were prevented from knowing the condition.

Timothy Beneke (2007-07-27 09:34:18)

Thanks for the clarification. What's clear to me is that if you had a team of 100 self experimenters actively generating and testing hypotheses about major human problems, like say, mood disorders or sleep, they should be able to make major progress fast. I would like to see such a program funded by the powers that be some day. It's clear in the history of psychology that major advances often start from self observation. Festinger noticed how the more his car, I think a Nash Rambler, broke down, the more attached he got to it and defended its value – that and other observations led to cognitive dissonance research that totally contradicted and refuted Skinnerian ideas about operant conditioning. The step from self observation as generating hypothesis to self experimentation – in those domains where it is viable – is not that big. I suppose getting the powers that be to see that one person's self experimentation has made huge strides in solving the obesity problem is the first step.

seth (2007-07-27 10:06:13)

I didn't know that about Festinger and cognitive dissonance. A revealing story. Self-experimentation seems to me such a powerful tool that I find it hard to imagine it will lie unused forever. And with research funding becoming harder to get, the fact that it costs nothing looks better and better.

## Science in Action: Omega-3 (better measures) (2007-07-26 16:31)

I am collecting more self-experimental data than ever before. Partly because I am excited by the prospect of doing food-brain experiments that take just a few days (measuring effects of flaxseed oil and other foods that last a few hours) and partly because I learned how to get R to respond to single keystrokes. (Via the command `getGraphicsEvent`. Thanks to Greg Snow at Intermountain Healthcare.) This allows for much better reaction-time experiments; no longer do I need to respond and then hit Enter. Because the new method uses graphic windows, I have much better stimulus control.

I converted my letter-counting test (how many ABCD's in GDKM? for example) to use the new command. Because the new command is so wonderful, I also used it to make a new test involving naming: The task is to type "1" when I see a 1, "2" when I see a 2, and so on. With eight possible stimuli (1, 2, 3, 4, 7, 8, 9, 0) and eight possible answers, there should be few anticipation errors. Accuracy should be high. The task takes advantage of the fact that I have already learned to type "1" when I see a 1, which means there should be less problem with slow learning curves – learning (getting faster) continuing for a long time. The experiments I want to do need a steady baseline.

After running into [1]Greg Niemeyer a few days ago, I realized it would help if I made these tests more game-like – then they would be more fun. I'm not sure how to do this so I hope to talk to Greg about it.

1. <http://art.berkeley.edu/niemeyer/bio.html>

---

Dale (2007-07-27 17:55:39)

Seth, you are not just a self-experimenter, you are our self-experiMENTOR. When you've confidently documented Omega-3s affects, we desperately need some clarity in the Omega 3/6/9 ratio theory. You need to find out if you can indeed block Omega 3s by eating too much Omega 6s at the same time. This is one of the more pressing issues facing us SLD oil guzzlers. Did you know the 2005 Nobel Prize in Medicine was given to a self-experimenter! "Dr Marshall finally swallowed the bacterium himself to prove his point." <http://news.bbc.co.uk/2/hi/asia-pacific/4307826.stm>

seth (2007-07-27 18:23:02)

Thanks, Dale, that's a nice way of putting it. I agree, I want to measure the effects of omega-6 and omega-9, not just omega-3. Too bad Marshall doesn't have a blog.

## My Theory of Human Evolution (computer chip edition) (2007-07-27 22:16)

Computer chip designers have a tradition of putting very tiny pictures on their chips. Often pictures of animals.

A cheetah:

A hummingbird:

A [1]gallery.

The better they control their materials, the better the picture. More evidence that art = material science.

1. <http://micro.magnet.fsu.edu/creatures/index.html>

## Science in Action: Omega-3 (a delay) (2007-07-28 23:56)

All excited about my two new reaction-time tests – one involving letter counting (if I see GADZ I type "2"), the other involving naming (if I see 8 I type "8") – I did both of them in close succession this morning. Each has 4 blocks of 50 trials each. After the second test my left wrist hurt. Too much typing. Now I must reduce typing to a minimum for a few days.

---

Sam (2007-07-29 11:21:38)

Ha, I already know tomorrows news hotline: Omega-3 causes wrist pain! :)

Darius Bacon (2007-07-30 10:18:01)

Do you use a keypad, or the top number row of the keyboard? I'm thinking of trying this out, and don't want to make it gratuitously different, though I guess it's no big deal.

seth (2007-07-30 12:02:08)

I use the top row of the keyboard.

## Misleading Info in The Joy of Cooking (2007-07-29 22:49)

From the nutrition chapter of latest (2006) edition of The Joy of Cooking (p. 5):

We get essential polyunsaturated fats from corn oil, soybean oil, seeds, nuts, whole grains, and fatty fish, such as salmon and tuna. The omega-3 fats are a particularly important type of polyunsaturated fat. They help with everything from normal brain and nerve development to healthy functioning of the immune system, heart, and blood vessels.

This is misleading because the first sentence lumps together foods high in omega-6 (such as corn oil and nuts) and foods high in omega-3 (fatty fish), even though omega-6 and omega-3 probably have opposite effects when consumed in the amounts we consume them. (We consume too much omega-6, too little omega-3.) [1]The Israeli Paradox is reason to think that high amounts of omega-6 are harmful. I don't know if omega-6 fats make one's brain work worse but I'm sure they don't make it work better, as omega-3 fats do.

The nutrition section of The Joy of Cooking was reviewed by Walter Willett, the Harvard epidemiologist. This blanket statement about the goodness of polyunsaturated fats is similar to what he wrote in Eat, Drink, and Be Healthy.

My [2]earlier post on the Israeli Paradox.

1. [http://www.ncbi.nlm.nih.gov/sites/entrez?db=pubmed&cmd=Retrieve&list\\_uids=8960090](http://www.ncbi.nlm.nih.gov/sites/entrez?db=pubmed&cmd=Retrieve&list_uids=8960090)

2. <http://www.blog.sethroberts.net/2007/02/02/the-israeli-paradox/>

---

George Christodoulou (2007-07-30 23:54:41)

Hello, This is a mistake that I also see pretty often. People love their deep fried things so the more you can boost up poly fats, the better. Is it true that if you fry fish, it loses its nutrients? Does that also mean you don't get the benefits from the omega 3 with fried fish? Just wondering since this came up in a recent discussion about the fillet-o-fish at mcdonalds :-). Thanks, George Christodoulou

seth (2007-07-31 02:46:31)

I too wonder about the effect of cooking on omega-3. I hope to find out with my new reaction-time tests – compare raw salmon with cooked salmon, for example.

### **Annals of Self-Experimentation: Elmer Gates (2007-07-30 13:04)**

[1]Elmer Gates (1859-1923) was an inventor who did a lot of self-experimentation or self-observation. He wanted to figure out how to make his mind work better:

He kept voluminous records on his own physiology, taking urine samples several times a day and blood samples. He would take his temperature. He was doing this to find out what his physiological state was when he was most productive.

Gates was ahead of his time. Studies of body temperature and simple mental problems (e.g., arithmetic) suggest your brain works best [2]when your body temperature is highest – around 5 or 6 pm for most people. When you are most likely to be stuck in traffic.

A [3]Washington Post article about Gates.

Thanks to Robin Hanson.

1. <http://www.elmergates.com/>

2. <http://www.ncbi.nlm.nih.gov/sites/entrez?Db=pubmed&Cmd=ShowDetailView&TermToSearch=12388468>

3. <http://www.washingtonpost.com/wp-dyn/content/article/2007/07/29/AR2007072901267.html>

---

willy (2007-07-30 19:23:00)

How interesting. So math is better to take at Pm and not early in the morning as traditional pedagogy used to do.

Dale (2007-07-31 05:19:35)

OK, Seth since oils can raise basal body temperatures, you need to perform your omega-3 tests in and out of a walk-in refrigerator. ;) :)

jschrier (2007-08-03 15:21:30)

...and he was even interested in combinatorial chemistry (another of Seth's pet topics): "[Elmer Gate's] metallurgical room is for investigations in alloys. He proposes to make a complete series of 10,000 (or so) varying percentages of alloys of certain two metals, and test the properties of the alloys." letter by Herman T. Lukens, The American Journal of Psychology, Vol.10, No. 1 (Oct. 1898), pp. 163-164. (from <http://www.elmergates.com/visits/lukens.pdf> )

seth (2007-08-03 21:15:59)

way ahead of his time...although self-experimentation was common back then, combinatorial chemistry was not.

## SLD Phenomenology (2007-07-30 17:51)

From the [1]SLD forums:

I stumbled on SLD when I, after a sinus-infection, lost my ability to smell and therefor also taste the flavor of the food I was eating. I could only tell if the food was sweet, sour or salty. I was devastated especially after reading that it could very well be permanent. During those days I noticed how much the flavor of the food means to me but also how my appetite was affected. I just didn't want to eat. After 3-4 days my ability to smell started to return slowly and to my great joy so did my appetite.

Of course, you can simulate loss of smell by closing your nose with swimmer's nose clips ( \$4) when eating. By what factor is that easier, cheaper, faster, and safer than bariatric surgery? One million?

1. <http://boards.sethroberts.net/index.php?topic=5327.msg55866#msg55866>

---

Dale (2007-07-31 00:16:03)

It was interesting to note the author of the post could distinguish three flavors without a sense of smell: sweet, sour and salty. You've already shown that pure sugar water doesn't count in calorie association. My challenge to you is, can you find a pure "sour" water with calories that can be tested for SLD affects.

Natron (2007-10-29 05:30:35)

It has come across my mind that smokers are generally slimmer than non-smokers, and they (generally) gain weight after quitting. Those that I know say that food tastes better after they stopped smoking, most of them have gained weight after stopping, there must be a link there. I am experimenting with adding a small amount of sea salt to my SW solution, first to use mineral replacment therapy, and second, to reduce the sweet flavor, even if it doesn't seem to matter. The flavor is less subtle than plain fructose in water, so far ( a few days) the As is the same. Natron

## More SLD Phenomenology (2007-07-31 10:02)

A [1]fascinating thread in the SLD forums about unexpected reactions to your weight loss:

As I've lost a significant amount of weight and really started looking different, I've started noticing more . . . unsupportive behavior. One of them has started offering little biting comments about my size. . . . The other has started getting very upset with me as I approach her weight. . . . When one of their husbands commented on how nice I looked I thought I might be murdered in my sleep.

I had a friend once tell me I was a "traitor" when I lost a lot of weight.

The dragon used to have an issue with my weight, now I've lost a lot, she still has an issue.

Addendum. The discussion wandered slightly:

I used to have hair down almost to my bottom & was used to getting lots & lots of attention.....i just thought men liked me...then I cut my hair quite short...whallah....where did all the men go? Very interesting & sobering experience.

---

Stephen M (Ethesis) (2007-08-01 17:27:41)

In many ways, in many situations, weight contributes to social placing. By merely changing your weight you change your social status and place, with the resulting distortions and push back from those trying to "keep you in your place."

peter (2007-08-02 18:28:14)

the idea of "keeping you in your place" is a variation of the social norm, which accounts for fat friends contributing to being fat. it strikes me as being loosely analogous to one's set point. however it is characterized, it is clear that one's weight is more complicated than calorie in and calorie out.

## More About Faces and Mood (2007-07-31 20:29)

Today I spoke to someone who has been looking at his face in a mirror every morning to raise his mood. "It's a big effect," he said. It raises his mood "about 30 points" on a 0-100 scale where 0 = misery, 50 = neutral, and 100 = ecstasy. He starts around 6 am and does it for about an hour. This is close to [1]what I observed with TV faces: one hour of faces at the best time produced about a 30-point improvement.

Thirty points, however wonderful, is not enough to change his life, he said; he would need 60 points for that. He has been in and out of mental hospitals several times and of course mental illness of that severity destroys all sorts

of things we need, such as a decent job and friendships. As he looked at the diagram (two causes of depression) on p. 237 of my [2]self-experimentation paper, his situation sunk in on him. It wasn't just lack of morning faces that was making him depressed; it was also on-going life events.

My guess is that most Americans, asked to rate their mood, would say they are around 50 – neutral. Sure, they procrastinate, and bad traffic bothers them, but on the whole life is okay. But when something awful happens – they lose a job or a spouse, for example – their mood goes way down and takes a very long time to come back up. It is like AIDS. Our mood regulatory system, which requires morning faces to work properly, functions like our immune system to fight off damage and push us back to normal. In most people, unfortunately, that system is broken, just as AIDS sufferers lack a working immune system. So many people have far too much trouble getting rid of crippling bad moods. I suspect that most addictions, including the food addictions behind serious obesity, Internet addiction and video-game addiction, are self-medication to get rid of bad mood. It is the fact that the addictive act pushes a mood of 20 or 30 up to 50 that makes it so attractive. One of my students investigated the connection between depression and drug addiction; in her small sample, the depression always came first.

[3]Earlier post about faces and mood.

Addendum: A February 2007 [4]article in the American Journal of Psychiatry about bariatric-surgery candidates (average BMI = 52) reported this:

The discrepancy between lifetime and current substance use disorders was striking (32.6 % versus 1.7 %).

In other words, they used to take drugs but they don't any more – possibly because food has replaced drugs.

---

Timothy Beneke (2007-08-01 11:57:17)

FYI: There is huge happiness research which suggests that Americans are somewhat happy, according to Dacher Keltner. So the figure is probably closer to 60-70 rather than 50. Amsterdam has the highest ratings for happiness. More economically egalitarian countries are happier. The research finds no gender differences in happiness. I don't know if there is any research on whether Americans suffer bigger mood dips with trauma and failure than other cultures. I suspect Americans' notorious unrealistic optimism, and intolerance of contradiction get them into trouble. A bad thing happening may turn out to be good in the long run. I'm sure that mood often drives "addictions"; though a friend I worked with on heroin addiction issues said that often he thought people were not trying to "kill the pain". And of course it's easier to get "addicted" to very strong tasting ditto foods – junk foods – which I have no doubt have grown far more strong tasting in recent years with the flavor chemists doing their work. But in my case, I got clinically severely depressed in 1982, stayed depressed in varying degrees, and overate a lot, and by 1996 had gained more than 100 pounds – from 182 to 286. Though I actually got a bit higher. It's very important to note that I lost most of the weight while remaining fairly depressed. When I began to turn the depression around in 2003, I was 50 pounds lighter. In depression people tend to eat less or eat more. I ate more (and slept more.) So it's important for depressed, overweight people to see that you can be depressed and override hunger and lose weight – which itself gives hope

and empowerment.

seth (2007-08-01 14:24:37)

Yeah, I know about those ratings that Keltner mentions. I'm inclined to think that people answer a question about happiness differently than a question about mood. I think happiness is somewhat equated with absence of wants (as in "are you happy now?"). Whereas by mood I mean something completely visceral. When I look around – at people on the street for example – it is very rare to see someone who looks or acts happy. Practically everyone seems to be neither happy nor sad. We take this as a fact of life but I don't think everywhere is like this. A friend of mine went to a poor country in Africa and came back surprised how happy the people were. Happier than Americans.

Timothy Beneke (2007-08-01 14:44:27)

If you trust Mihaly Csikszentmihalyi's work on mood, flow and happiness, where he had people respond to random beepers and write down what they were experiencing/doing/feeling at the moment, people are happiest (best mood??) in a state of flow – states of absorption where their energies/abilities are challenged but not overwhelmed, where there is feedback as to how they are doing – states of meaningful engagement. I doubt they are smiling at such times. So I wonder how much facial expressions are an index of mood. I assume Ekman/Keltner/Levenson etc. have ideas about this...

seth (2007-08-01 14:52:54)

I think when people are happy they tend to smile. Or least smile readily.

Janet (2007-08-02 09:58:04)

Europeans smile much less than Americans, and the perpetual complaint among Europeans is that Americans smile TOO much.

Chris (2007-08-02 18:13:42)

It might be interesting to look for any correlations between the use of subways/trains, employment and depression. People who need to see lots of faces on their way to their morning jobs should theoretically have better moods than those who are stuck in their cars or looking at the back of another seat. If you use employment as a way of controlling for socioeconomic gaps, it might be a good indicator. Subways would be better than commuter trains, and far better than solo car commuters, etc. And theoretically, a longer subway commute would correlate to a better mood than a shorter one (!). Another possibility would be to study the differences between bartenders and morning baristas. Both see lots of faces but bartenders late at night and baristas early in the morning. The baristas should be much happier if your theory holds. Personally, I somewhat doubt the effects of faces. I moved from the US where I was a get in the car, listen to NPR and drive to work single guy to Japan where I'm now a walk to the train station, stand in the train and walk the rest of the way to work kind of guy and despite a much higher daily dose of morning faces, I don't think my mood is better. And my mood on weekends when I don't need to commute seems even better although I'm sure a lack of work helps there.

seth (2007-08-02 19:35:54)

I have tried to get a helpful dose of faces on the subway or a crowded bus but I couldn't – you can't look at strangers that way. You need to see what you would see when you are having a conversation with someone. In my experience, that never happens on public transportation unless you are actually having a conversation. And that is very rare. I know of two people who felt much better when their job required them to have face to face contact in the early morning than when the same job required them to have the same contact at other times. One was a waitress; the other a doctor.

thehova (2007-08-02 20:53:46)

"Europeans smile much less than Americans, and the perpetual complaint among Europeans is that Americans smile TOO much." Yes, I hate to make generalizations like this, but its true: American's tend to be much more friendly with strangers and in public than Europeans. I'm not sure if this means that Americans are in better moods than Europeans. But without a doubt, the irrational friendliness of Americans puts me in a good mood. its an asset.

## 2.8 August

### Ideology of the Meritocracy (2007-08-01 10:31)

[1]Philip Weiss makes a shrewd (and I think correct) point about Jews marrying non-Jews:

A lot of meritocratic Jews like me were hoist on the petard of superiority. If you bought into the ideology of intellectual excellence—the ideology of the meritocracy, which we Jews helped to build so we could get into the good schools (and which the WASPs then helped us to festoon with prestige, to disguise the fact that none of us would have to actually serve in Iraq)—then you would inevitably look around for smart people to socialize with, and most of them turned out to be gentiles. See, it's my family's fault [that I married a non-Jew].

Weiss went to Harvard. "Ideology of the meritocracy" is a good phrase. Richard Herrnstein, the late Harvard professor of psychology and Bell Curve co-author, was indeed meritocratic – in a narrow way. (Which is the trouble with ideologies.) When I was a graduate student, he gave a talk at my school (Brown) and several graduate students, including me, had lunch with him. He was on the Harvard admissions board. During lunch, he said that some kid was the perfect candidate: "800's on his SATs, plays football, plays the flute." He was serious. Surely the best candidates should be less easily described, I thought.

1. <http://www.philipweiss.org/mondoweiss/2007/08/are-intermarrie.html>

---

Andrew Gelman (2007-08-01 16:42:32)

I think Weiss may be overcomplicating things. Whether or not you go to a selective college (or, as he puts it, "good schools"), most Jews in the U.S. will encounter lots of non-Jews. Once you remove or reduce the constraints from intermarriage, it'll happen.

seth (2007-08-01 16:57:47)

I think Weiss was pointing out that anti-semitism had two effects: (a) excluded Jews; (b) kept Jews together.

Pearl (2007-08-02 09:14:35)

I've never actually met a man who played football and the flute.....interesting dynamic. I had no inkling of that which is Jewish culture until I majored in music at Michigan and suddenly BAM!, it was like the coolest club ever. I once heard a would-be conductor friend quip, "well, I'm not Jewish or gay; I've been thinking I ought to work on changing one of the two to help my career along.....no, really."

Anonymous Modern Orthodox Jew (2007-08-02 10:26:58)

The ethos at Maimon (Noah's school) is very different from the secular Jewish meritocracy that Weiss describes. Maimon was founded by the symbol and leader of American Modern Orthodoxy Rabbi Joseph Soloveitchik, who immigrated to the US before the war. Soloveitchik's ideology is that it's possible to be a Harvard PhD and a committed religious Jew learning Talmud regularly: success in the New World while maintaining Old World standards. The school pushes its students to advance the ideology: cynically, they want to prove to the Ultra-Orthodox that education isn't religiously dangerous and to other Jews that

religion isn't educationally detrimental. That the top Talmud student from the exemplar yeshiva high school could intermarry is hardly new — there are examples of similar even in the Talmud itself — but he is an example of why the Ultra-Orthodox are suspicious of secular education and becoming more so.

### **Jane Jacobs and Japan (2007-08-02 03:17)**

At the end of The Shangri-La Diet, I mention Jane Jacobs's view of complaints about overpopulation. The problem is not too many people, she said, the problem is the undone work. Much of that undone work is recycling, of course.

As The Onion recently [1]reported ("Earthquake sets Japan back to 2147"), Japan is closer to the future. How the Japanese recycle:

[2]More. [3]Jane Jacobs and the food industry.

1. [http://www.theonion.com/content/news/earthquake\\_sets\\_japan\\_back\\_to\\_2147](http://www.theonion.com/content/news/earthquake_sets_japan_back_to_2147)

---

KenF (2007-08-02 09:32:09)

We stayed with some friends in Tokyo this year. They had an extraordinarily thick book of recycling regulations. If they didn't sort and prepare the trash perfectly, the trash man would refuse to take it. Milk cartons needed to be washed thoroughly, flattened correctly, and put out on the correct day. We were afraid to buy anything and bring it home, because it was such a burden on them to create extra trash that needed to be cleaned, prepared for disposal, and sorted.

Pearl (2007-08-02 20:54:26)

It is a pain, but surprisingly easy to get used to. It's like learning any other habit; eventually you stop realizing you're even doing it.

Noumenon (2007-08-09 13:17:51)

Maybe for you, Pearl, but some of us never get used to things like showering or taking out the trash and chafe every time we have to do it.

### **SLD Phenomenology (part 3) (2007-08-02 13:41)**

Kris from South Carolina writes:

I have an interesting side effect of the SLD diet: I have not peeled from sunburn. I have been using the extra light olive oil. I have light skin and usually peel even after a minor sunburn. It has not happened since I have been taking the oil. I tested it last week at the beach. Several hours on the beach with no sunscreen. I got a little red but after a week—no peeling. I've also lost 25 lbs in a couple of months.

[1]Part 1. [2]Part 2.

### **My Theory of Human Evolution (amazon.com edition) (2007-08-04 06:16)**

For a birthday present, I bought [1]Planet Earth, a beautiful and eloquent 5-DVD documentary, from amazon.com. I had it gift-wrapped. It looked like this:

I was amused. This is not how gifts should look. It looked machine-wrapped; gifts should look hand-wrapped. They should look like lots of care went into the wrapping. I thought everyone knew this, but the gift-wrap designers at amazon.com appear to be unclear on the concept. At least use intricate wrapping paper, would have been my advice. Here is my gift among the other gifts:

Why do we want gifts to be intricately wrapped? It is part of a whole gift-giving ethos. Sure, gifts must be (slightly) difficult otherwise they are meaningless. But that's not the whole story. The [2]signaling explanation of gifts (gifts show we care) is not the whole explanation because there are many ways to be difficult, only some of which advance material science. Do we like gifts to be old – to be aged, to have sat in our closet for 5 years? That would be difficult, but it wouldn't advance material science. Do we like gifts to be very new ("fresh") – made that morning? That too would be difficult but wouldn't advance material science. Do we like gifts to be made by very old or very young people? That too would be difficult but wouldn't advance material science. Whereas the actual desire for intricacy does advance material science. To produce more intricate designs, you need better control of your materials. The most intricate objects are made by specialists – artists and artisans. Our desire for intricacy supports them (we can buy a nicer gift than we can make) and pushes them to improve their skills.

When Bill McKibben, an excellent writer, calls for [3]homemade Christmas presents, I believe he is missing this point. In Berkeley, at least, local artisans, such as ceramicists, must make most of their money in Christmas season. (I should ask some of them about this.)

[4]The evolutionary basis of Christmas.

c (2007-12-08 06:26:48)

The Japanese presented gifts wrapped in such costly wrappers of woven and embroidered cloth, sometimes with real gold thread decoration, that the recipient was expected to return the wrapper to the giver.

Kit (2011-05-03 10:55:00)

I completely disagree. I adore gorgeous, neatly wrapped packaging such as your amazon package, it doesn't say 'machine wrapped' to me, it says careful perfection, and it's how all our square presents are like. I hate the way people get so sentimental over hand-made things, I've always been big on good presentation. It's all down to taste, and it's not exactly putting a big middle finger up to the concept of love now is it. It's simple and elegant!

Anonymous (2011-07-16 20:55:49)

No, the reason gifts should look hand-wrapped is because they should be hand-wrapped- by the giver. Since you're not wrapping them anyway, which is what the recipient would care about, it doesn't matter if it's done by a machine or a human being.

### **How to Be a Grown-up About Evolution (2007-08-04 22:56)**

Spy magazine had a wonderful column by [1]Ellis Weiner called "How to Be a Grown-up". (In one column, Weiner pointed out that homeless, applied to beggars, should be houseless.) Gordy Slack, a Bay Area science writer, has written the first book that might be called How to be a Grown-up About Evolution. It is an account of the Dover, PA trial in which parents sued the school board for requiring that intelligent design be mentioned in biology class. The actual title is [2]The Battle Over the Meaning of Everything. (I've known Gordy for years and he wrote about me for [3]The Scientist.)

Not surprisingly, Gordy sympathizes with the parents (the anti-creationists). But he tries to understand the other side rather than demonize it, which is what is grown-up about his book. One reason for this attitude is that his father is on the other side. His father, at one point a professor of psychology at Harvard, became at age 51 a born-again Christian and a creationist. In 1998, his father took Gordy to meet Philip Johnson, the Berkeley law professor who is the father of intelligent design (ID), a big-tent version of creationism. "Give us five or ten years, and you'll see scientific breakthroughs biologists hadn't dreamed of before ID," Johnson told Gordy.

While writing the book, Gordy happened to interview Joan Roughgarden, a Stanford biology professor whose specialty is evolution.

I thought our interview was going well. But when I told her that I was writing a book about ID in order to understand what drove its proponents, her attitude and demeanor swung around 180 degrees. . . . "They want to define me [Roughgarden is a transsexual] as inhuman," she said.

How dare anyone try to understand the other side! (Roughgarden's [4]reaction to a psychology talk she didn't like.) The notion that the solution to intolerance is more intolerance is remarkably popular, which is why The Battle Over the Meaning of Everything really stands out.

[5]Gordy's blog.

lasser11 (2007-08-05 12:27:50)

I wish more people would read Darwin, himself. He's such a humble and respectable thinker. A lot of the emphasis Darwin placed on variation and contingency is lost in debates on evolution today. Such an emphasis by Darwin made him much more open to ideas than most of his scientific followers.

seth (2007-08-05 12:35:08)

Yeah, I think the we're-sure-we-know attitude of the pro-evolution side is not conducive to progress. Political or scientific. How much of evolution is neutral drift (driven by variation) and how much is driven by selection? I've never heard a good answer to that.

Sam Penrose (2007-08-06 11:07:43)

Practice what you preach: try to understand where Roughgarden is coming from. Her exact words (as quoted here) are: "They want to define me as inhuman" From the context I would guess that she is implying that these are fighting words. Given that the legal status of transsexuals \*has\* left them subject to malign neglect, coercion, and simple violence, she has a prima facie case that these people are a threat to her wellbeing in very concrete ways. They are attacking HER. You, by contrast, are engaged in an intellectual contest from a position of personal safety. They are attacking views you hold. It's a lot easier to consider sympathy as a tactic in the sort of struggle you're engaged in than in the one she's engaged in.

seth (2007-08-06 11:47:07)

I agree, it is easier for me to consider what you call "sympathy" and what I call "an attempt to understand". Perhaps that's why I am making such an argument. Still, I don't think it means I am wrong.

## **Something is Better Than Nothing (2007-08-05 20:49)**

I have been asked to write six columns about common scientific mistakes for the journal Nutrition. This is a draft of the first. I am very interested in feedback, especially about what you don't like.

Lesson 1. Doing something is better than doing nothing.

"You should go to the studio everyday," a University of Michigan art professor named Richard Sears told his students. "There's no guarantee that you'll make something good – but if you don't go, you're guaranteed to make nothing." The same is true of science. Every research plan has flaws, often big ones – but if you don't do anything, you won't learn anything.

I have been asked to write six columns about common scientific mistakes. The mistakes I see are mostly mistakes of omission.

A few years ago I visited a pediatrician in Stockholm. She was interested in the connection between sunlight and illness (children are much healthier in the summer) and had been considering doing a simple correlational study.

When she told her colleagues about it, they said: Your study doesn't control for X. You should a more difficult study. It was awful advice. In the end, she did nothing.

Science is all about learning from experience. It is a kind of fancy trial and error. But this modest description is not enough for some scientists, who create rules about proper behavior. Rule 1. You must do X (e.g., double-blind placebo-controlled experiments). Rule 2. You must not do Y (e.g., "uncontrolled" experiments). Such ritualistic thinking is common in scientific discussions, hurting not only the discussants – it makes them dismissive – but also those they might help. Sure, some experimental designs are better than others. It's the overstatement, the notion that experiments in a certain group are not worth doing, that is the problem. It is likely that the forbidden experiments, whatever their flaws, are better than nothing. A group that has suffered from this way of thinking is people with bipolar disorder. Over the last thirty years, few new treatments for this problem have been developed. According to Post and Luckenbaugh (2003, p. 71), "many of us in the academic community have inadvertently participated in the limitation of a generation of research on bipolar illness . . . by demands for methodological purity or study comprehensiveness that can rarely be achieved."

Rituals have right and wrong. Science is more practical. The statistician John Tukey wrote about ritualistic thinking among psychologists in an article called "Analyzing data: Sanctification or detective work?" (Tukey, 1969). One of his examples involved measurement typology. The philosopher of science N. R. Campbell had come up with the notion, popularized by Stevens (1946), that scales of measurement could be divided into four types: ratio, interval, ordinal, and nominal. Weight and age are ratio scales, for example; rating how hungry you are is an ordinal measure. The problem, said Tukey, were the accompanying prohibitions. Campbell said you can add two measurements (e.g., two heights) only if the scale is ratio or interval; if you are dealing with ordinal or nominal measures, you cannot. The effect of such prohibitions, said Tukey, is to make it less likely that you will learn something you could have learned. (See Velleman and Wilkinson, 1993, for more about what's wrong with this typology.)

I fell victim to right-and-wrong thinking as a graduate student. I had started to use a new way to study timing and had collected data from ten rats. I plotted the data from each rat separately and looked at the ten graphs. I did not plot the average of the rats because I had read an article about how, with data like mine, averages can be misleading – they can show something not in any of the data being averaged. For example, if you average bimodal distributions you may get a unimodal distribution and vice-versa. After several months, however, I averaged my data anyway; I can't remember why. Looking at the average, I immediately noticed a feature of the data (symmetry) that I hadn't noticed when looking at each rat separately. The symmetry was important (Roberts, 1981).

A corollary is this: If someone (else) did something, they probably learned something. And you can probably learn something from what they did. For a few years, I attended a meeting called Animal Behavior Lunch where we discussed new animal behavior articles. All of the meetings consisted of graduate students talking at great length about the flaws of that week's paper. The professors in attendance knew better but somehow we did not manage to teach this. The students seemed to have a very strong bias to criticize. Perhaps they had been told that "critical thinking" is good. They may have never been told that appreciation should come first. I suspect failure to teach graduate students to see clearly the virtues of flawed research is the beginning of the problem I discuss here: Mature researchers who don't do this or that because they have been told not to do it (it is "flawed") and as a result do nothing.

Peter (2007-08-06 11:28:02)

"only if the scale is ratio or interval; if you are dealing with interval measures, you cannot." Did you mean "only if the scale is ratio or ordinal" here?

Sam Penrose (2007-08-06 11:28:05)

I'm sympathetic to your argument; I'd like it more if it addressed the most popular and/or best-in-your-opinion counter arguments. Given that you are encouraging scientists to generate results more aggressively, you might start with "how can false results do harm?"

seth (2007-08-06 11:36:31)

That's a good point, thanks. It isn't easy to argue how more evidence can be worse. It's not "results" that are false (unless fabricated); it's the conclusions drawn from them.

Timothy Beneke (2007-08-06 11:44:10)

Generally, I'd like to see clarification that distinguishes processes that lead to knowledge or hypotheses, but cannot be used to completely confirm hypotheses or establish knowledge, from processes or methods that can. Or perhaps activities that lead to greater observation or awareness of phenomena, or to further hypotheses. Part of what you're identifying is disjunctive thinking and an unwillingness in scientists to acknowledge a huge grey area. There is a huge continuum between partial confirmation of a hypotheses and totally unquestionable science. What determines what falls where on that continuum? Of course a controlled 5 year study with thousands of subjects might be ideal in confirming the Shangri-la Diet, but as more people have success with it over longer periods of time, it becomes more and more trivial. A glaring error related to people who read about your diet: there seem to be doctors and experts who dismiss it as "placebo" when they could confirm that extra light olive oil, and associated methods, reduce hunger in the time between breakfast and lunch. Can you articulate the mind-set that leads to such intellectual incompetence? An enthusiastic teenager might be more likely to confirm what's going on with the olive oil than many educated or mis-educated people. Much of the problem seems to be letting the perfect be the enemy of the good. There is a belief that because I know the hypothesis that I am trying to confirm, I cannot experiment on myself. But it would be pretty bizarre if my beliefs could alone take away hunger. Part of the problem is that you are threatening some peoples' sense of their own authority and power. To try out your method and see that it reduces hunger would be ego threatening. It's true that one person cannot completely confirm something through self experimentation, because there may be something unusual about them resulting in the effect. But even 5 or 10 people all getting the same effect in self experimentation gives me, at least, a lot of confidence that something interesting is going on, though we always have to be careful about self fulfilling prophecies.

Kayvan Sylvan (2007-08-06 14:53:37)

I like the article very much but I also agree with Sam's criticism above. Best regards, —Kayvan

Janet R. (2007-08-27 07:51:47)

I agree that there's too much emphasis on the negative, but I would say that grad students are encouraged to be negative: I actually failed one of my qualification exams and had to take the entire thing the next year for including the following in the evaluation of a study: "The lack of a real control group, subject self-selection, and other threats to internal validity mentioned above make it impossible to distinguish regression to the mean from a treatment effect... However, this study takes place in the real world in which the prospects for good multi-year studies are severely limited by funding, compliance with protocols, and cooperative participants. Policy decisions need to be made even on programs whose effectiveness have not been evaluated at all. Assessing the study from a pragmatic policy-making perspective, interventions such as these have great promise... so some generosity should be shown in interpreting the results...[The program] is relatively low cost compared with alternatives ... and unlike these programs, it has been studied. We can't prove that the intervention had any effect ... , but it may very well be the best option among the set of alternatives."

seth (2007-08-27 08:35:33)

Janet R., you failed your qualifying exam because you included praise – pointing out virtues – in one of your answers? Astonishing. Can you explain why? I've never heard of such a thing.

Ben Popken (2007-09-19 05:31:12)

On the internet we call them trolls.

## **Interview with HuntGrunt (part 1) (2007-08-06 19:55)**

Joyce Cohen, the New York Times real-estate columnist behind [1]The Hunt, blogs at [2]HuntGrunt, one of my favorite blogs. I interviewed her about blogging.

SR: Do you like blogging?

JC: No.

SR: Why not?

JC: There's easy blogging and hard blogging. Easy blogging is like a diary – you want to write about your bad dates or complain about your mother or your boss . . . the kind of thing that otherwise you would do in longhand. Hard blogging feels more obligatory. It's time-consuming and labor-intensive and the payoff isn't clear. The technology is still not up to snuff. There are space issues: You can't quite figure out the spacing to make the picture go in the right place. It's easy to make a typo and not notice it until later. You can endlessly tinker to make it look good. Sometimes, updates are necessary. In some ways, it never ends.

SR: Why do you blog if you don't like doing it?

JC: I don't know. I started. It has a momentum of its own. The more gratifying stuff is the stuff that gets linked to by someone else and commented upon. If [3]Curbed or [4]Gothamist or [5]Gawker links to the blog or one of my stories, that's interesting. Especially because of the feedback. And occasionally there is something that I want to say.

SR: Many bloggers stop.

JC: I think a lot of people try it and find that there are many reasons not to continue. Maybe it's not as great as they initially thought. Maybe they started it not really knowing. I'm not sure a lot of people start intending to stop.

SR: Yeah, that would be a small number of people.

JC: Unless you blog because of a particular project. Like if you're blogging during your kitchen renovation or during your Shangri-La diet or for some very specific purpose like that. I don't know that people start a blog and say, I'm doing this in order to stop doing it. I think people embark on it not knowing what it's like.

### **Art and Commerce (2007-08-07 10:36)**

A fascinating [1]discussion about the art and business of pottery, such as:

I used to make bowls of many colors, then one day I realized that my stock of colors of bowls on the shelves was increasing, but I had no blue bowls. It dawned on me that I was selling off everything blue, and bringing home all the other colors. So I now make only blue stuff. And mostly bowls. Why? 95 % of my customers are ladies, and every lady needs a good bowl. And it shows in my sales. Now, I confess to playing a bit now and then and making the occasional ornamental bean pot, or platter, or bread baker. But those are not my mainstay. That is bowls. Bowls and pots with a commercial attitude .... I stay away from art and craft shows - too expensive for what they do. I try and sell in a fifty mile radius of where I live and that seems to work. And I try to simply make good pots.

Veblen's [2]Instinct of Workmanship.

### **David Tufte (2007-08-07 12:52:35)**

That sounds like the story they tell in statistics about how they chose to armor planes in England during WWII by looking where the bullet holes were in the planes that made it back. After a while, it dawned on them that the places where they didn't see bullet holes indicated that the plane hadn't survived.

seth (2007-08-07 13:50:49)  
yes, I agree.

Ian Bicking (2007-08-07 19:03:58)

"Blue pots" are sometimes used a shorthand among the potters I know to talk about pots that are ugly (to them) but commercially successful. Perhaps "crafty". Some feel that it's because browns and oranges are the colors good potters are most drawn too, and that a less educated eye goes for something like a blue. My personal opinion is that blue is just generally popular, and that making blue pots you can be a successful potter even if you aren't very good at it, and a lot of the business you do is based on the initial impression (where blue does well), not necessarily the richness of the lifetime of experience a person might have with their purchase. As a result of all this, I've seen potters start to associate poor craftsmanship with the color blue, perhaps unfairly hating blue as a result – the color is more of a crutch than a flaw in itself. Though there are other things too – thick, opaque glazes tend to obscure the form, for instance, so it helps the poor potter and obscures the work of the good potter. Anyway, touches on some interesting details of the craft I suppose.

seth (2007-08-07 21:19:21)

When I was about 8 years old I decided my favorite color was blue. As a high school student I wore lots of blue shirts. But as I got older, this seemed a less and less interesting choice.

Brad (2007-08-08 06:56:47)

Seems silly to hate blue. Might as well hate pots.

## **Something is Better Than Nothing (part 2) (2007-08-08 06:50)**

In a [1]recent post I said that scientists are often much too dismissive. They are "evidence snobs," Alex Tabarrok [2]might say. A [3]letter in the current issue of the American Journal of Clinical Nutrition criticizes a important example of just such dismissiveness:

In conclusion, whereas we agree that policy decisions should be evidence-based and not hasty, we do not agree that the evidence base [used to make those decisions] should be constrained to one type of study [long-term randomized controlled trials]—in particular, not to a study design that is inherently limited. Do we really want to wait perhaps decades for results of long-term RCTs, which almost certainly will not provide definitive evidence, while ignoring other relevant evidence involving shorter-term endpoints? An example is provided in the panel's own summary statement (2). In lauding RCTs as the "gold standard for evidence-based decision making," the panel proudly points to the fact that, even though folate was well known to decrease the risk of neural tube defects in animal studies, policy recommendations for folate supplementation to prevent neural tube defects were delayed while authorities waited some years for confirmation from RCTs. One can only wonder how many infants were born with neural tube defects while authorities waited.

"Proudly," huh? Inclusion of that word shows how pissed the authors of the letter are – and rightly so. One author is Bruce Ames, a neighbor of mine, for whom I have great respect; another is Walter Willett, the Harvard epidemiologist. In 1998, Willett wrote a smart [4]article challenging the popular belief that a low-fat diet is a good way to lose weight.

Here is part of the [5]reply from the authors of the report that Ames et al. criticized:

It is important to note that our panel was not charged with asking whether vitamins and minerals play a role in human disease – a topic that occupies much of the letter by Ames et al, and for which observational

evidence is indeed central – but, as a State-of-the Science Panel, was charged to reflect on the state of the available evidence for a treatment recommendation on the use of vitamins and minerals in the general population. For treatment decisions, the RCT is the established standard. No better proof of this principle can be found than in the RCTs reviewed in our report, which showed serious harm from vitamin ingestion in certain circumstances.

A less-than-reassuring answer. A commentator on my earlier post thought I should address the strongest arguments on the other side. I had trouble thinking of any. It's hard to argue that less evidence is better. You can see that those who wrote this paragraph – some of the most prominent nutrition scientists in the country – were equally baffled.

I will revise my "common mistakes" article to mention the Ames et al. letter.

Chris Kaiser (2007-08-09 02:05:55)

This is a hot debate regarding lung cancer screening. Researchers at Cornell led by Dr. Claudia Henschke have for years published data from their observational studies that found low-dose CT screening in high risk subjects saves lives. Henschke et al screen all subjects with CT and then randomize them to either treatment or not treatment. On the other side, are investigators for the National Lung Screening Trial, an 8-year, \$200 million NIH RCT study whose results won't be available until 2010. In this trial, subjects are randomized to either CT or chest x-ray. The observational studies have looked at thousands of cases, amassed impressive data not only regarding the efficacy of screening but also protocols for reducing false positives and downstream invasive procedures, and protocols for observing differences in lesion makeup and minute lesion growth. A model they [1]constructed claims to reduce lung cancer mortality by 80 % when caught early in stage I, which is what screening does. The folks at NLST always point out that Henschke et al have not proven that screening actually saves lives. The observational researchers claim to have an effective "cure" rate, which they extrapolate to a reduction in mortality. But the NLST investigators claim that many of the cancers found by Henschke et al are indolent and not biologically dangerous. Subjects would have died by other causes with those lesions present. NLST advocates claim that Henschke et al muddy the waters talking about cure rates rather than a [2]reduction in deaths. They claim that only the RCT study will prove whether CT screening reduces mortality or not. In the meantime, their best advice is to quit smoking. And so it goes. At medical conferences, these two opposing camps sometimes snipe and spar with each other, obfuscating any real news that might be presented. In the meantime, a [3]British panel has deemed lung cancer screening safe and effective based on the Cornell research. David Yankelevitz at Cornell wrote a good [4]article dissecting the two approaches.

### **Annals of Self-Experimentation: Magnetic Implants (2007-08-08 23:38)**

Quinn Norton, a San Francisco journalist, had a tiny magnet [1]implanted in her finger, which enabled her to detect electrical fields.

Bits of my laptop became familiar as tingles and buzzes. Every so often I would pass near something and get an unexpected vibration. Live phone pairs on the sides of houses sometimes startled me.

You might think of self-experimentation as a modern version of "know thyself" but this is "know the rest of the world".

1. <http://www.wired.com/gadgets/mods/news/2006/06/71087>

---

dirty\_corner (2007-08-10 14:19:29)

That's the freakiest thing I ever heard of... not really, but pretty weird, and quite cool. Is it something that you would consider? What are the benefits, apart from being able to sense stuff.... given that some animals (pigeons, sharks) navigate using the earth's electromagnetic field, would there ever be a time when enough magnets could be inserted into the human body to enable this?

seth (2007-08-10 18:39:04)

Would I consider it? Not until the benefits are clearer. Also, my current self-experimentation makes heavy use of my fingers (reaction-time experiments). I wouldn't want to mess with them.

## **A Great Day For Free Speech (2007-08-09 08:32)**

Two days ago, Dubner and Levitt, the Freakonomics authors, moved their [1]blog to the Opinion section of the NY Times website. There was a big announcement on the Times home page. Dubner posted a short and modest [2]note about the move ("we are excited and flattered"). It got over 100 comments, mostly about the lack of full RSS feed ("I thought this move would be good news but the truncated RSS feed pisses me off") along with a few formulaic congratulations.

So I'll say it: This is a fantastic accomplishment. Two days ago was a great day for freedom of speech. For the first time ever, someone – actually two people – can say whatever they want as often as they want however they want (long, short, funny, serious, video, text) in the most coveted spot in the entire media world. Levitt took the new freedom out for a spin by posting a what might be considered [3]a big help to terrorists. Nothing like that has ever appeared in the Times or any other major newspaper in the whole history of newspapers, I'm quite sure. Nor anywhere else with a big audience.

David Brooks earned his Op-Ed column, yes, but he was also given it. His influence went way up when he started that job. Were he to lose his column, his influence would clearly diminish. He can be fired, in other words, and being fired would hurt him. Dubner and Levitt, on the other hand, can upset the people who control the Times as often and as deeply as they wish. They can be removed from the Times but it will make little difference to them – it might even help them. No matter what they say, no matter how many powerful people they offend, they will always be able to find a hosting service for their blog and will always have a big respectful audience. If anyone should be worried about offending anyone else, the people who run the Times should be worried about offending Dubner and Levitt. That's

taking freedom of speech to a whole new level.

To the right of David Brooks' column – which appears twice a week and has a fairly constant length, format, and tone – on the Times website is a blank area. David Brooks controls none of it. Whereas to the right of the Freakonomics blog is the largest set of links ever to appear on the Times website, completely under the authors' control. One section (5 links) is titled Organ Transplants. Dubner and Levitt believe that the regulations about organ transplants are too restrictive. Given its visibility and prestige placement, that little section is not just a constant reminder of their position but a powerful force for change. It is a new kind of activism. The rest of the Times's dozen-odd blogs have tiny blogrolls if any, always narrow-focus and never activist.

Quite apart from the tangible power, there is also the symbolism of it: A blog is being given the utmost respect. Blogs are inherently about diversity of voices and the notion that everyone has something to say. Editorials are not (of course). Newspaper columns are not (they are almost always by journalists). Now that the Times has shown a blog such respect, other important places will do the same. The esteem of blogs will rise in the world and, inextricably, so will the beliefs they embody.

1. <http://freakonomics.blogs.nytimes.com/>

2. <http://freakonomics.blogs.nytimes.com/2007/08/07/moving-day/>

3. <http://freakonomics.blogs.nytimes.com/2007/08/08/if-you-were-a-terrorist-how-would-you-attack/>

---

lasser11 (2007-08-09 17:10:17)

I do admire Levitt's boldness in his terrorist post. but with the timing, I bet a good part of the motivation behind the post was to publicize the blog's move.

seth (2007-08-09 20:15:27)

My guess is that he had wanted to write it for a while and saved it for this occasion because he wanted the large audience.

lasser11 (2007-08-09 22:10:08)

yes, very true. my comment was probably too cynical.

## **Ideology of the Meritocracy (part 2) (2007-08-10 05:47)**

From [1]The American:

Rich Karlgaard, the technology entrepreneur who is publisher of Forbes, tells the story of a trip he took with Microsoft's Bill Gates in the early 1990s. On the flight, he asked Gates, "Who is your chief competitor?"

"Goldman Sachs" was Gates's surprising reply.

Gates went on to explain that he was in the "IQ business." Microsoft needed the best brains available to make top-shelf software. His primary rivals for the smartest kids in America were elite investment

banks such as Goldman or Morgan Stanley.

“Microsoft must win the IQ war,” Gates said, “or we won’t have a future.”

Contrast this with open-source-leader Eric Raymond’s beliefs (expressed in [2]this talk) about software development. He repeats the idea that “with enough eyeballs all bugs are shallow” – implicitly meaning enough diverse eyeballs. That I am writing this with Firefox gives some sense of who (Gates or Raymond) was more realistic.

[3]Part 1. [4]Charles Murray vs Charles Murray. [5]How important is IQ?

1. <http://www.american.com/archive/2007/july-august-magazine-contents/revenge-of-the-frosh-seeking-robots>
2. [http://www.catb.org/~esr/writings/cathedral-bazaar/linux1\\_d50\\_96kbs.mp3](http://www.catb.org/~esr/writings/cathedral-bazaar/linux1_d50_96kbs.mp3)
3. <http://www.blog.sethroberts.net/2007/08/01/ideology-of-the-meritocracy/>
4. <http://www.blog.sethroberts.net/2007/01/17/charles-murray-vs-charles-murray/>
5. [http://www.huffingtonpost.com/seth-roberts/how-important-is-iq\\_b\\_39554.html](http://www.huffingtonpost.com/seth-roberts/how-important-is-iq_b_39554.html)

---

pdf23ds (2007-08-10 06:25:36)

Keep in mind that Firefox is based on the old Mozilla code, which was an open-sourced version of Netscape Navigator, which was developed by one of Microsoft’s fiercest competitors in the early browser wars. Maybe not the best example. The open source method has produced a small number of very good pieces of software, and a large number of very bad ones. There just aren’t enough eyeballs to go around.

seth (2007-08-10 06:34:42)

Interesting. I also use R all the time – also open-source.

Nansen (2007-08-10 15:26:35)

pdf23ds, if Linux and Apache are examples of very good pieces of OSS, then what are examples of very bad ones? Thanks in advance.

SusanJ (2007-08-10 20:33:08)

Just because software is Open Source doesn’t mean that lots of people have worked on it. (And just because lots of people have worked on a piece of software doesn’t mean it is any good.) There are more than 150,000 Open Source projects on SourceForge alone. If you pick one at random, you are much more likely to find a bad one than a good one.

KenF (2007-08-11 21:37:42)

Talk to anyone in the software business. They will tell you that one good programmer is better than 5, or even 10, mediocre ones. Look at Google, and how successful they are. They’ve taken the Gates approach. They’ve hired the smartest of the smartest, paid them much more than their competitors, treated them like kings. And look at the results. Open source software isn’t a product of the masses working together, it isn’t some emergent phenomenon. And fixing bugs is a very different thing from planning and constructing a piece of first-class software. In some fields of endeavor, IQ matters a lot. Writing computer software is one of these.

seth (2007-08-11 22:53:21)

Hmm. Lots of companies try to hire smart people. Those with more money hire more of them. Rich companies like Google hire lots of smart people, yes. But I imagine Google looks for other qualities, too, such as imagination and perseverance. I suspect that to produce really good software requires several or even many different talents and that only a few of them fall under the term "high IQ". In my experience, the quality of Microsoft products is remarkably low given the resources at their disposal; a narrow emphasis on IQ may one reason why – but that's just a guess since I am so far away.

KenF (2007-08-12 11:26:51)

Google doesn't hire smart people because they are rich, they are rich because they hired the smartest people. Perseverance may be a separate quality from IQ, but imagination, at least in the realm of software development, is not. You need the IQ to be imaginative in that realm. Really in any realm. Just compare the imaginative life of a high IQ child from an average child. It's worlds apart. I actually think being in Washington keeps Microsoft from attracting the smartest people. However, Microsoft's goal has never been to make the best products on earth, it has been to make the most money. And they've succeeded at that.

michael vassar (2007-08-16 09:09:52)

Programming ability is fairly easy to measure directly, so companies will generally do the obvious and correct thing and measure it directly rather than through the proxy of IQ. There doesn't seem to be much data on how well IQ predicts programming ability, but who needs to predict something trivially measured?

## **My Theory of Human Evolution (Planet Earth edition) (2007-08-10 21:53)**

The many-hour BBC documentary Planet Earth, mentioned [1]earlier, takes viewers way off the beaten track – deep into giant caves, for example. But humans – and human evolution – creep in.

Non-human primates are shown a dozen-odd times during the series. Only once do we see them walk erect: When baboons waded into a flooded area of Africa. This adds credence to the Aquatic Ape theory of human evolution, which assumes our ancestors came to walk upright because it helped them walk in water. David Attenborough, Planet Earth's narrator, made an excellent [2]radio show about the Aquatic Ape theory.

The Aquatic Ape theory explains all sorts of physical differences between man and our closest primate ancestors – why we walk upright and they don't, for example. My ideas about human evolution are about what happened next. I try to explain ways we differ mentally from other primates – we speak, for example. The core idea of my theory is that the human brain has changed in many ways to promote occupational specialization. For example, language – single words – began because it facilitated trade; it was the first advertising. (I think of a Guatemalan market where someone shouted "toothpaste" over and over. He was selling toothpaste.)

The magic of occupational specialization also comes up in Planet Earth. The "Planet Earth Diaries" (Making-of) section of "Seasonal Forests" describes filming baobab trees using a unique hot-air balloon designed for photography by Dany Cleyet-Marrel and piloted by him. Twice he flies into trees by mistake. "Many of Planet Earth's finest images would have been impossible without devoted and passionate specialists like Dany," says Attenborough.

seth (2007-08-12 06:34:31)

Thanks. I picked it up in a bookstore but I should look at it again. Certainly the flexible hand preceded the big brain.

DDeden (2007-09-02 16:29:55)

Interesting read. I missed the show (no TV) but saw the baboon wading video and macaque swimming video at Laelaps blog. I agree with much of the AAT, but see it as part of life in a generalised coastal tropical habitat. Your mention of occupational specialization in later humans fits with my interpretation of butted hand axes as both butchering tools and woodcrafting tools used to construct the first dugout boats from hollow bent trees at waterside. These dugouts were the 'first cargo pickup trucks on the aquatic superhighway' that allowed trade and settlements upstream inland in areas formerly dominated by the big cat predators, and allowed relatively safe easy transport of people including babies, with slingstone pebbles as ballast in the bottom for stability, and push-pole thrusting spears propelling and spare throwing spears bunched aside like arrows in a quiver. Further development of boats included thinner lighter dugouts and later portageable ribbed skin kayaks, birchbark canoes and plank sailboats on the sea of galilee 20,000 years ago. The words Tectonic, Technical, Technology has the root Tek, which is Greek for carpenter or craftsman. I think it derived from the sound of stone "tick-ticking" against stone to make a hand axe and other simple tools. Other languages around the world have similar sounding words for crafting tools, which suggest great antiquity. (Chip or chop are other variations of it.) The hand in primates (and even more in anthropoids) was selected for plucking loosely hanging fruits in angiosperm trees, which had previously been the long held domain of fruit bats and frugivorous birds. Plucking allowed the changes in the jaws and dental structure, which allowed the brain to enlarge later. This combined with greater vertical climbing and posture produced a more stable bipedal locomotion, as seen in the gibbon and spider monkey. Bipedal wading doesn't cause dry land bipedalism (see wetland apes which wade on 2 legs but walk on 4, while gibbons are bipedal on the ground but never wade), but it does reinforce an already bipedal habit. Most likely the combination of fruit tree climbing, wading for molluscs in mangroves, shore cliff climbing for seabird eggs, coconut palm climbing, beachcombing for turtle eggs, vertical floating (with inflated laryngeal air sac) while plucking aquatic vegetation all combined to further the upright stance in hominoids and resulted in the complete loss of the tail. Later, the ancestors of the Great apes expanded inland along gallery forests staying arboreal and becoming more quadrupedal when on the ground, while ancient Homo erectus improved swimming and changed from vertical floating to horizontal backfloating (losing the lar. throat air sac but gaining a layer of skin fat) resulting in greater hydrodynamic linearity, thermoinsulation and oxygen breath holding abilities and becoming a more adept diver for shellfish and crustaceans. I envision them diving as male-female pairs alternating dives, while the younger males acted as area patrol guards/gangs and younger females as babysitters at the shore. Later the use of hollow logs and driftwood as floats in waters with crocs or sharks began the emergence of the most primitive vehicular industry, shells pebbles and stone tools used to make simple dugouts.

seth (2007-09-02 20:26:46)

Very interesting comment, thanks. And you have a most thought-provoking website, too.

DDeden (2007-09-02 20:51:19)

thanks, yep.

## **Interview with HuntGrunt (part 2) (2007-08-11 06:13)**

Joyce Cohen, the New York Times real-estate columnist – her column is [1]The Hunt – blogs at [2]HuntGrunt, one of my favorite blogs. [3]Part 1 of this interview.

SR: Why did you start?

JC: Because HuntGrunt was too good a name not to use. Also, I started at the time we had [4]The Walk-through. [A Times real-estate blog.] The Walk-through was on Wordpress and Wordpress sucks. It's all buggy and glitchy. I had to teach myself HTML to even do it. It was while I was doing that that I came up with HuntGrunt.

SR: Did you think of HuntGrunt?

JC: My very first entry tells you that. You can't make a diminutive from my name. You can't make a diminutive from "The Hunt" either.

SR: You'd be JCo. Like JLo.

JC: No one's ever called me that. HuntGrunt came from [5]Property Grunt. Property Grunt would write to me – to me and about me. He's a Corcoran broker. Property Grunt was his name and all of a sudden HuntGrunt came to me.

SR: You're the pure artist who has an idea and has to use it. Your blog is a way of drawing attention to the phrase HuntGrunt.

JC: Without the name HuntGrunt, I'm not sure it would exist. I'm not sure there would be much resonance.

## **Annals of Self-Experimentation: Highway Signs (2007-08-11 10:08)**

Meeker initially assumed that the solution to the nation's highway sign problem lay in the clean utilitarian typefaces of Europe. One afternoon in the late fall of 1992, Meeker was sitting in his Larchmont office with a small team of designers and engineers. He suggested that the group get away from the computer screens and out of the office to see what actually worked in the open air at long distances. They grabbed all the road signs Meeker had printed – nearly 40 metal panels set in a dozen different fonts of varying weights – and headed across the street to the Larchmont train station, where they rested the signs along a railing. They then hiked to the top of a nearby hill. When they stopped and turned, they were standing a couple hundred feet from the lineup below. There was the original Highway Gothic; British Transport, the road typeface used in the United Kingdom; Univers, found in the Paris Metro and on Apple computer keyboards; DIN 1451, used on road and train signage in Germany; and also Helvetica, the classic sans-serif seen in modified versions on roadways in a number of European countries. There

was something wrong with each one," Meeker remembers. "Nothing gave us the legibility we were looking for." The team immediately realized that it would have to draw something from scratch.

A little bit of self-experimentation went a long way. From a [1]wonderful story in the NY Times Sunday Magazine about highway signage. Like all good stories, there is struggle.

Over several years Meeker and Pietrucha went to meetings at the Federal Highway Administration; they would end each one by setting up a row of sample highway signs in the long hallways of the agency's headquarters. The government's own engineers were impressed with Clearview, but any immediate progress was slowed by the inevitable forces of inertia and bureaucracy in Washington. "We'd go in each time excited," Meeker says of their presentations to federal officials. "And we'd leave each time thinking, 'Why did we even bother?'"

But it ends happily.

### Science in Action: Omega-3 (letter-counting test) (2007-08-11 23:13)

At a reading, the novelist Dennis McFarland said that the hardest part of writing [1]The Music Room had been after breaks in writing it. Before he could resume, he had to reread what he'd written so far. This became so painful that he forced himself to never stop.

Because of a break due to [2]wrist problems, I'm going to backtrack a little. When my wrist started to hurt, I had been learning a new way to measure brain function. It's a reaction-time task that I can do almost anywhere. On each trial I see four letters. For example:

C A B D

The task is to respond as fast as possible how many of the letters are from the set {A, B, C, D}. In this case the answer is 4, so I would type "4".

Here is another possible display:

X D B C

The correct answer is 3. The possible answers are 1, 2, 3, and 4; I just leave my fingers resting on those four keyboard keys.

As soon as I respond to one display, the next appears. Each test has 4 blocks of 50 displays (= 200 trials) and takes about 4 minutes.

I slowly got better – faster and more accurate. This graph shows how my reaction times decreased:

When I started the task, I had to hit Enter after typing the answer (e.g., type "3" then hit "Enter"). After 50 tests, I learned about an [3]R function that got rid of the need to hit Enter after typing the answer. I could just type the answer (e.g., just type "3").

This shows how my accuracy improved:

The points become more widely spaced around July 24 because at that point I started learning another reaction-time task. After I hurt my wrist I decided I was trying to do too much.

1. <http://books.google.com/books?id=V6QNbPoazacC&dq=%22dennis+mcfarland%22&printsec=frontcover&source=web&ots=CwJDy4bpNV&sig=c4G0GnR6RsS1ccY0TIyyIGTcBD4#PPP1,M1>

3. <http://www.blog.sethroberts.net/2007/07/26/science-in-action-omega-3-better-measures/>

---

pdf23ds (2007-08-12 18:15:21)

Does that accuracy graph indicate that your accuracy improved after the change to just pressing the number keys? Could the improvement have been caused by that change? That would be kind of weird.

seth (2007-08-12 20:08:21)

My accuracy improved sharply before the change to just pressing the number keys. I should have used more easily distinguished colors.

How to Make Your Brain Work Better in Three Hours | We Need Health (2007-09-05 15:42:34)

[...] At about 7 am I took 4 tablespoons of flaxseed oil (Spectrum Organic). I measured my mental function with a letter-counting test. Here is what happened. [...]

### **An Endangered Language (2007-08-12 21:41)**

This is the most moving YouTube video I have ever seen.

[EMBED] Background [1]here. Several years ago I visited Alaska with a friend. We stayed in Juno. One day I visited a nearby glacier. A visitor's center had a slide show about the glacier, with taped narration from a park ranger. The glacier came out in the winter, he said, and retreated during the summer. He spoke about plants and animals nearby. It was all very factual and flat but you could tell the speaker cared a lot about the glacier. How rare, I thought. Not the emotion - people care about lots of things - but its expression.

### Science in Action: Omega-3 (time course) (2007-08-13 12:13)

During a recent trip to Los Angeles, I continued my self-experimental activities – three mental tests, which I did once/day. On the last day of the trip, my scores were [1]much better than usual. There was an obvious explanation: I had taken my daily flaxseed oil (4 T) closer to the time of the test – 4 hours before rather than 12 hours before. This suggested that flaxseed oil has an effect that happens fast and diminishes quickly. [2]Earlier observations had implied that the effect at least a few days to wear off completely.

Back home, I wanted to measure this effect. I started testing more often. With a two-answer (yes-no) test, I saw the short-lived effect a few times. But accuracy was relatively low (about 90 % correct) due to anticipation errors. I switched to a [3]new test that measures how fast I count letters.

After doing the new test about 70 times, my performance was fairly constant. I resumed trying to measure the short-lived effect. At 3 pm six days ago I drank 4 tablespoons of flaxseed oil. Here are the results:

The blue line shows when I took the flaxseed oil. Within a few hours, reaction time sharply decreased. The improvement slowly went away.

Two big conclusions: (1) Here is a new way to see the effect of flaxseed oil. My earlier experiments took a few weeks; this took a few days. (2) Low between-test variability. The cluster of points around the time of the first meal is an example. The one point below the cluster is a counter-example – I have no idea why it was low all of a sudden. But that is rare. Almost always erratic points suggest explanations. During the second meal I drank a sugar-sweetened drink, forgetting previous observations that these drinks lower reaction time for a few hours (no doubt because they increase blood glucose levels).

This experiment has one big flaw, which is that after I took the flaxseed oil I started making more frequent measurements. A year ago, I made the same mistake with my balance experiments. There is a kind of Heisenberg Uncertainty Principle here: The measurement itself – the test – causes learning. Learning lowers the baseline.

I'll fix this mistake and a few others and do the experiment again.

### **Can Professors Say the Truth? (part 1) (2007-08-13 15:34)**

Kaiping Peng, a friend of mine who is a professor at Berkeley, recently said to me that professors have an unusual place in our society: They are expected to tell the truth. Hardly anyone else is, he said. But what happens when they do?

The most impressive professorial truth-telling in my lifetime has been [1]The Man Who Would Be Queen (2003) by Michael Bailey, a professor of psychology at Northwestern. It's mainly about male homosexuals but it also discusses male-to-female transsexuals, not all of whom are homosexual. The "controversy" – actually a defamation campaign – after its publication is described in an excellent new [2]article by Alice Dreger, another Northwestern faculty member.

The serious truth-telling in the book is in the chapters about transsexuals, in which Bailey brought into public view the ideas of Ray Blanchard, a Toronto researcher. Blanchard had proposed that there are two types of transsexuals: homosexual and autogynephilic – in other words, that all or almost all transsexuals fall into one of these two categories. I'm going to call them Type 1 (homosexual) and Type 2 (autogynephilic). Both are men who become women or who want to become women; but they are otherwise quite different. There are many surface differences – so many that it is no surprise that, as Bailey says, the two types almost never mix socially. Type 1 appear far more like other women than Type 2, who sometimes resemble men wearing dresses. As children, Type 1 acted feminine; Type 2 did not. Type 1 often work in occupations full of women, such as beautician and hairstylist; Type 2 usually work in male-dominated professions, such as policeman, truck driver, scientist, engineer, and computer programmer. Type 1 usually start living as a female before age 25; Type 2 usually start much later, after age 40. Type 2 have usually been married (to a woman); Type 1 have not.

Blanchard proposed that these surface differences derive from a difference in motivation. Type 1 transsexuals are

sexually attracted to men; changing their sex will help them attract men. (They prefer straight men to homosexual men.) Type 2 transsexuals are sexually aroused by thinking of themselves as a woman; this is why they seek sex-change surgery.

Blanchard's typology, well-known to sex researchers, had not reached the public when Bailey's book was published. "When I have tried to educate journalists who have called me as an expert on transsexualism, they have reacted uncomfortably," wrote Bailey. "One said: "We can't put that in a family newspaper."

1. [http://books.nap.edu/catalog.php?record\\_id=10530](http://books.nap.edu/catalog.php?record_id=10530)

2. [http://www.bioethics.northwestern.edu/faculty/work/dreger/controversy\\_tmwwbq.pdf](http://www.bioethics.northwestern.edu/faculty/work/dreger/controversy_tmwwbq.pdf)

---

Robin Hanson (2007-08-15 17:19:56)

An interesting thesis, and reasonable, but how is this an impressive example of truth-telling?

seth (2007-08-16 03:30:33)

Because of what followed the book's publication: an attack against Bailey worse than any I have seen against any other professor. This is described in Dreger's paper. I don't mean that Bailey anticipated the size of what would happen – it's hard to anticipate something that's never happened before. I mean that he knew that what he was writing would upset many people, including powerful people, and he did so without having other powerful people on his side.

Karen S (2007-08-16 07:31:52)

Academic, or for that matter, semi- or non-academic furor, is no indicator of the truth of any thesis. Nor is it a refutation. In fairness to Raymond Blanchard, his theories should be discussed as being possible. As should others. I don't see any more scientific refutation anywhere than "If you don't believe my theory, you are deluded...or unethical...or just need to be spanked!!!" To erase the voices of people who have lived through a transgender/transsexual experience simply by saying, "Well, they are just wrong, either lying or deluded" cuts off scientific inquiry then and there. That is a fair charge. I say that for both sides, and I do mean Profs. McCloskey, Conway, as well as Andrea James (who is not a professor\*), not to say Michael Bailey, Anne Lawrence, Alice Dreger, or any other of his supporters as well. I am unimpressed with any shrillness on anyone's part. Keep it calm, and academically detached. Keep it tabula rasa, too. There are many who argue transsexualism is not a mental disorder, but a state of being. Transsexuals want to choose how they deal with it, and if surgery is part of that, they should have enough control over their own lives and destinies to opt for that. That is not examined in the BBL typologies. It's already assumed to be false. It's true that no science is impartial; as long as humans conduct it, there will be biases. Part of the process of giving research out is to examine those biases (from the standpoint of our own biases, observes a skeptic) Blanchard's theories need to be examined without the escape clause. There may well be autogynephiliac transsexuals and homosexual transsexuals in the world. There may well be others typologies, however, has anyone examined what the causations of autogynephilia might be...or if it is a manifestation of something else? Does autogynephilia show up in people who are not transsexual? How about following through on the lives of transsexuals who do transition, versus those who may be convinced to live as gay men, if there are such people? Do the autogynephiles and homosexual transsexuals who transition lead happy lives..., or can they lead happy lives, especially if the public someday is conditioned to accept them as any other citizen. A huge question. I would ask a great many transsexuals some very detailed questions about that, and replicate the studies, before answering. All this said, I applaud Alice Dreger for pointing out that "attack academics" are deplorable. I would add "regardless of the theory involved." Questioning is par for the course. Ethical questioning, btw, is also, but it involves a process that does not start out with a conclusion. Alice Dreger is right in pointing that out. \*nor am I, for that matter.

Mak (2007-08-16 08:40:01)

Too bad you don't understand it from a trans perspective. You should really do a little more research before you blast those that are most affected by his "scientific" (snicker snicker) inquiry.

michael vassar (2007-08-16 09:00:17)

err... and Larry Summers?

seth (2007-08-17 05:32:39)

Larry Summers – yes, maybe worse. Those he upset weren't as upset but there were more of them.

## **Instead of Reading a Book (2007-08-13 21:30)**

I watched some of this [1]Flash art. I especially liked Scene3.

1. <http://eight8.jp/inspiration/>

---

Pearl (2007-08-13 22:28:59)

Waaah! If only I lived in Tokyo, I could have seen the exhibition yesterday!! Scene 3 is so cute and reminds me so much of Tokyo; no translation necessary to appreciate it I think, but anyway Man at work: "I gotta do it! work hard!" Woman cooking: "gotta hurry!" Man eating: "ahh, happiness! the flavor of love! delicious!" Woman sitting after he leaves: "What a pain that was!"

seth (2007-08-13 22:36:21)

Thanks for the translation. The Tokyo exhibition was in an art gallery? Or a museum? I had thought that Flash art exists only on the Web so I am curious.

Pearl (2007-08-13 23:38:01)

Whoopsy, actually I was confused. The text on the right side of the page in your link indicates there was a public exhibit of the work (Night Jam 2006 8/14 in English) exactly one year ago today. It is currently 8/14 in Japan, but it is a Tuesday; I read "monday 8/14" somewhere on the page and thought it occurred yesterday. Weird. You can see photos from the event here: <http://inspiration.67.org/nj/>

## **Can Professors Say the Truth? (part 2) (2007-08-14 05:22)**

I learned about [1]Blanchard's typology of transsexuals from a draft of part of [2]Bailey's book that Bailey had posted on the Web. If correct, it is surely central to understanding male-to-female transsexuals.

I read Bailey's draft a few months after reading Crossing (1999), a memoir by Deirdre McCloskey, a professor of economics at the University of Illinois at Chicago. Crossing tells the story of McCloskey's change from man to woman. It is an emotionally powerful book, full of longing. According to Crossing and Bailey's draft, McCloskey had at least three features in common with Type 2 transsexuals (worked in male-dominated profession (economist), married, changed sex after age 40). Crossing also describes being sexually aroused by cross-dressing. This appeared consistent with Blanchard's typology – which Crossing didn't mention. Why not? I felt deceived. I wrote to McCloskey to complain:

Shouldn't you have mentioned Blanchard's ideas? Her reply: Do you believe everything you read on the internet?

No, but I believed Blanchard was a serious scientist. I did not know Bailey but he wrote extremely well. The draft I had read was brilliant science journalism. I liked Bailey's own research, too, which was about how gay and straight men differ. Blanchard could be wrong but to discuss transsexualism at book length without mentioning him seemed like writing a book about France without mentioning Paris.

[3]Part 1. Alice Dreger's [4]paper about the Bailey "controversy".

1. <http://www.blog.sethroberts.net/2007/08/13/can-professors-say-the-truth-part-1/>

### Can Professors Say the Truth? (part 3) (2007-08-14 21:51)

After [1]The Man Who Would Be Queen: The Science of Gender-Bending and Transsexualism by Michael Bailey was published, several transsexuals started an extraordinary defamation campaign against Bailey. The story of this campaign, including interviews, is told in the [2]new paper by Alice Dreger that I mentioned in earlier posts on this topic ([3]Part 1, [4]Part 2).

The defamation campaign was led by professors. They claimed Blanchard's typology of transsexuals was false, of course, but never clearly explained why. Bailey's crime wasn't that his book spread falsehoods; it was that it spread a truth they didn't want spread.

One of those professors was Deidre McCloskey, the author of Crossing. She wrote an [5]amazing review of Bailey's book. From her review:

Almost everyone in the scientific study of sex and gender has checked and balanced and resisted the Clarke Institute's [Blanchard worked at the Clarke Institute] theory. It has proven to be wrong and has been laid aside by the mainstream of gender researchers.

Who are these "almost everyone"? McCloskey never says. And it's a long review.

Lynn Conway, a professor of electrical engineering at the University of Michigan and a member of the National Academy of Engineering, constructed a [6]website called "An investigation into the publication of J. Michael Bailey's book on transsexualism by the National Academies". This big website has little to say about Blanchard's typology other than [7]this, written by Conway:

It is unfalsifiable (note: any trans woman who reports that she doesn't fit the classifications is explained by the "theory" as being a "liar"). Furthermore, the scheme has no predictive capabilities. Thus it is thus

untestable.

Well, which is it? "Proven wrong" by "almost everyone" (McCloskey) or "unfalsifiable" and without "predictive capabilities" and "untestable" (Conway)? McCloskey and Conway must have talked many times. This discrepancy in how they attacked Blanchard's theory shows how little they cared about its truth – or that they knew it was true.

For people engaged in what they called a noble cause (defending transsexuals), McCloskey and Conway showed a remarkable disinclination to tell Dreger what they had done. Dreger tried hard to interview both of them.

McCloskey gave Dreger some brief email answers and then

refused to tell me anything more substantial unless I first proved to her, by showing her what I was writing, that I agreed with her position.

As for Conway, Dreger was unable to reach her at the University of Michigan. Finally she called Conway at home:

We had a phone call that lasted about a minute (August 16, 2006). She surprised me by being extremely hostile at the outset. She also would not answer a question about whether she was willing to speak to me on the record. This confused me – why would she not just tell me whether or not she wanted to speak on the record. I said as much. She responded that it was very strange that I would call her at home. I told her how many other ways I had tried to reach her with no response before finally calling her home. She then said that I was stalking her and added that she would circulate this fact widely.

---

A. Reader (2007-08-15 07:39:39)

Thanks for blogging on this book and the responses to it. Now I will want to read it. Having been married to a cross-gendered person (Type 2 cross-dresser, by the indications you cite) for nearly 40 years, I'm interested in what researchers may find and/or speculate about transexualality, especially concerning cross-gender and cross-dressing. My comments will stray from the main points of your blog. Discovery Health aired a fascinating televised documentary, "I Am My Own Twin," about Natural Chimerism, in which one has two genetically distinct types of cells. In such an instance, a person may also be, essentially, his or her own twin. I immediately wondered if there have been any medical studies to research if chimierism might be a possible root of transexuality, especially cross-gendered behavior, in which, a man feels like he is a woman trapped in a man's body, or visa versa for a cross-gendered woman? After knowing and intimately experiencing shared-life with a male cross-dresser for so many years, and realizing that there are an enormous variety of genetic anomalies, some rare, some more common than we may know, I would have difficulty believing transexualism is a completely learned, adopted or adaptive (i.e., mainly

psychological) behavior. From Wikipedia: "Human chimeras were first discovered with the advent of blood typing when it was found that some people had more than one blood type. Most of them proved to be "blood chimeras" – non-identical twins who shared a blood supply in the uterus. Those who were not twins are thought to have blood cells from a twin that died early in gestation. Twin embryos often share a blood supply in the placenta, allowing blood stem cells to pass from one and settle in the bone marrow of the other. About 8 % of non-identical twin pairs are chimeras." [http://en.wikipedia.org/wiki/Chimera\\_\(animal\)](http://en.wikipedia.org/wiki/Chimera_(animal)) #Natural \_chimerism An excerpt from the blog, "Inspired Moms.Com": During pregnancy, the majority of mothers and children will exchange cellular information in a process called microchimerism. This is actually beneficial to the Mother and Child at this point because it encourages the mother to not treat her child as a foreign body and spontaneous abort or miscarry her child. However, the cells and information received from the child remain. In fact, in some studies it has been shown to remain decades after childbirth in a mother's system. When a mom has other children, it is highly likely that the DNA information from the other child is passed onto the younger sibling in the womb creating Chimeras, or individuals who have been affected by Chimerism. <http://www.inspiredmoms.com/subpage/FeatureArticles/OctoberNovember2005/healthWendyStewartHamiltonChimera%20OctNov2005.htm> Also: <http://www.medterms.com/script/main/art.asp?articlekey=8905>

Rachel Owens (2007-08-16 17:31:12)

The reason we transsexuals have so much problem with the two type is there are so many of us who violate one or more rules about one of those 'types'. Those come across us as stereotypes, which is why there have been so many attacks on Bailey for his research. Sure there are many who fall under 1 or 2, but there are many that confuse or blend between the two at the same time. Saying there are two types of transsexuals is like saying there are two types of gay men. Feminine gay men, and leather daddies, it's absurd to think everyone fits into two categories. Bailey refuses to admit that bisexual men exist, he believes in the 'gay, straight or lying' idea. I myself am a transsexual. I transitioned at age 23 (type 1). I have a Master's degree in business (type 2). I was feminine as a child (Type 1). I pass fairly well, ie: not a man in a dress (Type 1). I crossdressed when young (Type 2). I date men and women (Neither Type). I didn't marry a female (Type 1). I don't obsess over being 'girly' insofar as I don't even own a single dress or pair of high heels. Bailey seems obsessed over the fetishization of female clothing when there are plenty of us who just wear jeans and t-shirts. I don't know what 'type' that qualifies me as. Bailey seems to refuse to admit people like me exist. Just like he refuses to admit that bisexual men exist. Source on his bisexual men study. <http://www.cbsnews.com/stories/2005/08/30/health/webmd/main805081.shtml>

seth (2007-08-17 06:08:37)

"So many attacks on Bailey for his research" – well, his research is mostly about male homosexuals. The typology you mention is Blanchard's research, not Bailey's. So it is clear that Bailey was not attacked because of his research. He was attacked because he wrote a book that included Blanchard's research. The types that Blanchard hypothesizes refer to motivations for sex change. The two hypothesized motivations correlate, but not perfectly, with more visible characteristics, such as married/unmarried. There aren't "rules" about the two types, just correlations.

Rachel Owens (2007-08-17 12:41:28)

I beg to differ. Bailey himself uses the same dichotomy as gay, straight or lying. You are type 1, type 2 or lying. In particular Type 2's are always lying to make themselves come across as type 1's. Quotes follow to support this. "The most important reason that most people do not realize that there are two types of transsexuals is that members of one type sometime misrepresent themselves as members of the other. ... they are often silent about their true motivation and instead tell stories about themselves that are misleading and, in important respects, false." p146 "Once you've learned about autogynephilic and homosexual transsexuals and seen several of each, distinguishing them is easy." p192 "The current popular literature about transsexualism is noteworthy for its ignorance of the distinction between autogynephilic and homosexual transsexuals." p216 He then also proceeds to defame Type 1's by calling them uneducated and stupid in various ways, as well as sex crazy. "Homosexual transsexuals tend to have a short time horizon, with certain pleasure in the present worth great risks for the future." "Prostitution is the single most common occupation that homosexual transsexuals in our study admitted to." p184 "Nearly all the homosexual transsexuals I know work as escorts after they have their surgery." p184 "As for shoplifting, homosexual transsexuals are not especially well suited as much as especially motivated. For many, their taste in clothing is much more expensive than their income allows." p185 So, in his book, he says all Type 2's are lying. All Type 1's are sex crazed

whores. Why wouldn't we be angry? Shouldn't it be obvious? Have you ever read *The Man Who Would be Queen*? All of this is right there. According to him and Blanchard I am either a sociopathic liar, or a sex crazed kleptomaniac obsessed with clothing that's suited for nothing but prostitution. Now, I won't condone what Conway and others have done. I don't see any reason to make up false accusations of Bailey's personal behavior when all that's needed is to well...actually read the book and understand how much it degrades. As for Conway being unable to cite any refuting research, I can tell you from my personal interactions that therapists and psychologists aren't buying it in the slightest. I've been to roughly ten or so since this book has been released and they all disagree with the book almost as vehemently as any transsexual. This is of course only my personal experience and no real survey of any sort, it's also confined to the state of Virginia, but I still found it interesting.

Very Anonimoose (2007-09-06 07:26:57)

Seth, your criticisms of Dr Bailey's detractors seem fine on the surface, except for one small thing - we don't fit into those neat boxes. Many of us have attributes of both types, as Rachel so eloquently pointed out, and I agree with her that your response to her post did not adequately address her concerns. To say there are two types and then say they don't correlate "perfectly" is not only an understatement but it leaves the majority of transsexuals who don't fit neatly into those types in limbo. If many of us don't fit the categories, then there are simply not enough categories. Or the wrong ones. My own background is as confusing as Rachel's: I transitioned at age 36 (type 2). I have spent most of my working life in clerical, admin and assistant roles generally held by females (type 1). I refused to see myself as feminine as a child but due to family pressures I had started "shaping myself" male at a very early age, yet schoolmates saw though my act and I was bullied (for being gay and too girly) to the point where I had to leave without any qualifications (Type ?) I pass as a woman in all walks of life and straight men often flirt with me - and I with them (Type 1). I crossdressed when young (Type 2). I am fairly intellectual (Type 2). I date men exclusively and have zero sexual interest in women (Type 1). I married a female earlier on i life (Type 2). Like Rachel, I'm not obsessive about being "girly" and wear jeans, shorts or slacks most of the time. I agree with Rachel that Dr Bailey oversexualises us. Did he wonder for a moment what could make a male sexually aroused by feminisation? I would have thought that was crucial. It doesn't take a genius to know that autog, being an unnatural impulse (ie. it is not partner-based), is caused by a form of childhood or teen trauma. What causes that particular kind of trauma? A devastating sense of emasculation as a child. Does a male child have to be feminine in fact to feel emasculated? No, it's all relative, and some may be androgynous when young but grow to be masculine, but they still retain the self-image. That's why some with an autog background are feminine (which is plain old human diversity) and others are not (slow to mature). This is hardly brain surgery, yet a supposedly serious researcher could not even come close, nor even try coming up with some hypotheses. He did, however, get to spend time in gay bars chatting with - was it 9? - transwomen. Is this the sort of research a "truth teller" does? That's just one reason why his peers rejected his book. So where does all that that leave me? I was a Type 1 who fought against my softness through family attitudes, and the resistance and subsequent insecurity and harassment gave me a Type 2 fetish (ie. damaged sexuality). If you accept it, then you're no going to be as traumatised. My confusion and denial lead to me a misguided Type 2 marriage that I thought would fix me up (and caused unfair problems for an innocent woman). I know now that, as a male, I was always bi with a strong gay preference, yet I feel I was not a "proper" gay because I never felt happy with my "equipment" at the time and pretending to be masculine made me feel disturbed. I have a fairly androgynous gay friend who knows my past and in talking we noticed how similar aspects of our youth were. One time we sat down and compared notes; we found only a few differences. I always looked more naturally feminine than he ever did. I never liked having a male organ (I used to try to wish cancer on it) and he always did. I never had that rampant male libido that he has. He has always enjoyed casual liaisons whereas they make me feel miserable and as though I've wasted my time. He knows more about tupperware, fabrics, homeware and furnishings than I do. He also knows a lot more about cars (which isn't hard). He's a bright boy. Joking aside, when I had the surgery I told myself I was doing it for practical reasons like being able to have face-to-face intimacy, not feel paranoid in change rooms, wearing tight jeans, changing my birth certificate, not worry about going to hospital if in a car accident, etc. Yet I was really surprised to find the surgery had another effect - I started being happy and I became functional. Promotions at work soon followed - for the first time in my life - because I could finally concentrate. I now earn over double what I did 13 years ago in my male life. I found that unexpected effect of the surgery weird because I never believed in the woman-in-a-male-body line; I always thought of TSism as just being a long way towards the end of the the feminine end of the male scale, to the point where living as a woman was more comfortable and allowed you to be more natural. The fact that I had that reaction suggests to me that there may well be something to the idea of gender identity, despite the naysaying of cynics. Perhaps it's an interaction of body,

mind and emotions? I had to work hard to shake off the damage to my sexuality caused by autog and I will never be 100 % fixed. It seems that, in fantasy, I can replace autog fantasies during those times when I can be bothered pleasuring myself with rape fantasies with good effect. I think that says a lot about the dynamics. In terms of my REAL orientation, I am now left with a low-intensity heterosexual preference (as in a woman who falls in love with men). One problem in removing the cancer of autog from my sexuality is that my surgery was badly done and I often experience pain during sex, even a decade post-op and despite two follow-up surgeries to remove neuromas. So I can only be with men who are modestly endowed and even then it sometimes hurts. Transwomen face a lot of problems and the last thing we need is a psychologist publishing his rough guesses and presenting them as The Truth. We have enough problems without that kind of "truth telling". A bit of real truth telling (without inverted commas) would be nice. Hopefully you will find this bit of REAL truth-telling of use in your practice.

seth (2007-09-06 15:23:45)

A theory that there are two underlying reasons for TS doesn't mean that the two clusters must be perfectly distinct. You seem to be much closer to Type 1 than Type 2. You don't mention your job; "intellectual" isn't type 2, it is computer programming, scientist, engineer, and other male-dominated jobs that are type 2. How were you "damaged" by autog? It's unclear what you mean.

Very Anonimoose (2007-09-08 23:55:20)

Thanks for your reply, Seth. I don't think there are two underlying reasons. Dr Bailey has focused on two underlying reasons but it's so much more complex. The whole idea that being a "gay boy" is the only possible manifestation of high level male femininity is terribly simplistic. It entirely disregards our ability to shape ourselves and our being, as though suppression and repression don't exist. It also disregards the varying flexibility of people. Some of us are capable of shaping ourselves to fit others' conceptions of us very convincingly and others cannot. How can a person whose specialty is studying the human mind disregard the way we shape ourselves to suit our environment? Any classification system that ignores asseveration and denial in an area where they play such a crucial role due to the intensity of stigma is can only be wrong or, at best, incomplete. Some people are more motivated than others to do alter themselves to fit the expected mold. If a budding T-woman has highly phobic parents as a child it can cut either way; sometimes we give up ever gaining their affection and camp it up to the max as a form of rebellion. If we feel parental approval is not a lost cause we might try to shape ourselves in a way that makes sure we win their approval. There is also a matter of pride, confidence and character/personality strength. Some of us think "I am who I am and I see no reason to change myself to suit anyone else" while others have more of a "Gee, I'd better be careful of I'll lose their love" attitude. The problem with Dr Bailey's approach is that it doesn't seem to be presented as "two underlying reasons" but just two types of T-woman. That's the way it's presented - is that if you are a transwoman you are either a girly gay guy who like straight men or you are a straight guy who likes wearing dresses or fantasises about having female equipment. No argument. If you say otherwise you are lying. I have worked in HR for most of my working life. Women abound, gay men are common and potential partners are thin on the ground :( Autog is highly damaging to a person's relationships as is any sexual impulse that is not relationship-based and I talked about this quite a bit in my earlier post. People are supposed to form relationships, not to fantasise about weird self-oriented things. I can be turned on by a gorgeous man or one with whom I share a special connection, but my strongest sexual impulse is towards humiliation and hurt - to myself. How horrible is that?? I am bitter about what I lost through all this and it annoys me when psychologists or psychiatrists create a very rough taxonomy on us that only serves to further damage our standing in the community. It's like kicking a kitten. As I mentioned in the previous post, the trauma/denial that creates autog can occur in both masculine and feminine kids - in the former due to slow growth, exaggerated cultural masculinity or misconceptions about self, and the latter due to denial of your pronounced feminine or androgynous features. If you accept and embrace your feminine aspects in youth then you won't be an autog, but more likely to suffer other neurotic reactions from the victimization you will inevitably suffer (that autogs change themselves to avoid). This can lead supposedly 'homosexual' transwomen to have an insatiable hunger for masculine love and acceptance to counter the lack they experienced when they were young. Then they have to put up with being tagged "sex mad" or "boy crazy". We can't win. In my opinion, TSism in its pure form is about diversity. Males vary from the hyper-masculine to the highly feminine, with most sitting somewhere in between. If you are at the feminine end of the scale then it can make for a more comfortable life to live female because you fulfill more societal/familial expectations naturally without acting or trying to muscle up or whatever. You can be yourself and actually win approval for it. I see it as a mix of the physical, mental and emotional and if you are androgynous in all areas then male life is an endless struggle. By the way, I think Dr Bailey's preferred

classifications will break down even further due to the internet because more young autogs will change over since they will be more aware of their options and feel more accepted through cyber communities.

Vera Nonimousse (2007-09-27 20:30:18)

Seth, I am disappointed. I thought you would show interest in discussing the issues but you seem uninterested. If you are unable to work past the points I make then you don't have a right to publicly spread views on the subject, unless they are modified greatly to take our views into account. If Dr Bailey wasn't so unreachable then I'd put these issues to him, so it has to be you. Those who like Dr Bailey's views have complained a lot about the lack of civility of those with contra views, yet when confronted with reasoned debate it seems they shy away. It doesn't stop them spreading a hypothesis masquerading as a theory that undermines the lives of transwomen, though.

seth (2007-09-27 23:01:38)

The "issue" for me is freedom of speech. Not whether Bailey was right, which is what you are talking about. To call what Conway and McCloskey did "lack of civility" is understating it.

Vera Nonimousse (2007-09-30 15:06:41)

Seth, you called this topic is called "Can professors speak the truth?". If Dr Bailey is right or not - speaking the truth - is exactly the "issue". The topic would more accurately be called "Can professors present half baked hypotheses seemingly shaped by their own salacious attitudes as scientific fact with impunity?". The answer is no. If Dr Bailey hurts vulnerable people by misleadingly presenting pseudo-science as science, why should he maintain a good scientific reputation and high status? Why should he not suffer sanctions and criticism? It's nothing compared with having your civil rights damaged; lawmakers are now referring to Dr Bailey's "work". It's so frustrating. I found your blog through a news article where you were interviewed. You defended Dr Bailey AND championed the whole flawed homo-auto model (further sullyng the reputation of transwomen in the process). How can you now say that the accuracy or not of the material is not the "issue" for you? You might think about admitting you were wrong and apologising. I disagree with personal attacks on Dr Bailey but the harm done by them is minuscule compared with the hurt he has caused - by NOT speaking the truth.

seth (2007-09-30 15:26:51)

"I found your blog through a news article where you were interviewed. You defended Dr Bailey AND championed the whole flawed homo-auto model (further sullyng the reputation of transwomen in the process)." What news article was that?

Vera Nonimousse (2007-10-03 01:31:25)

I can't remember now. It was about a month ago. I found it via Google news and I immediately looked you up to see where you were coming from, found this page and thought I might try to clarify a few things.

seth (2007-10-03 03:28:40)

I have never done in an interview what you say I did.

Googla (2007-10-07 03:18:14)

All I know is that you were quoted extensively in this article found on Google News. I had never heard of you until then. I am very honest and have no agenda. No, I am not part of the anti-autog ring. I just found you quoted heavily via Google news, that's all. I tried to find it again but I can't. This is odd because I can't imagine you being unaware of articles you appear in unless the journalist quoted you from a website (this website?).

## **Hope and Surprise (2007-08-15 05:31)**

From the [1]SLD forums:

I hoped it [the Shangri-La Diet] will work but still surprised it really does! . . . I had a piece of chocolate in the afternoon but not as much as normal.

Nicely put. I feel the same way – hopeful but still a little surprised. Hope and surprise go together. If you were sure something was going to happen, you wouldn't hope for it, you'd expect it.

Curiously, hoping for something is more pleasant than expecting it. Compare "I hope to get a sweater for my birthday" and "I expect to get a sweater for my birthday."

1. <http://boards.sethroberts.net/index.php?topic=5442.msg57229#msg57229>

---

KimBooSan (2007-08-15 06:32:04)

And, I think, the fact is that most of us who have dieted over and over and over again for years are well trained to "hope but not expect." We hope WW will work; we hope Atkins will work; we hope the weight will stay off. As I wrote in my own SLD blog about Pavlovian responses, just waking up one day to find that you are not physically hungry at all doesn't quite change how you think about it. Suddenly finding an AS that works does not translate into that we expect it will work. Personally, I'm being very cagey about the possibility that I might lose weight because I cannot bring myself to expect it. But hope? Oh yes, I hope. I dream, I hope, and I wait... :)

Timothy Beneke (2007-08-15 09:59:51)

I think "hope is more pleasureable than expectation" is tied to a kind of reverse "ordinization", which has to do with how emotionally charged events become familiar over time lose their emotional charge. Timothy Wilson and others write about how after something good or bad happens to us, the consequences are smaller than we expect, because they become familiar to the mind and lose their charge. Life goes on. In looking to the future, the familiar – the expected – also has less emotional charge. Interesting: Do we dread the expected? Yes, but there is always in the dread an awareness that it might be terrible and not just bad. What is the opposite of dreading the expected? There are researchers claiming that negative emotions have more charge than positive for humans. The worst that can happen to us may be death or being tortured – but is there anything positive that has a charge as strong as negative as those do?

### **Crazy-Spiced Smoothies Revisited (2007-08-15 19:43)**

The [1]theory behind the Shangri-La Diet says that food with unfamiliar flavor will be just as unfattening as food with no flavor (such as flavorless oil and sugar water). The Shangri-La Diet mentions using random spice combinations to get unfamiliar flavors.

I do this with smoothies. With smoothies there is no sense of loss – you're not "ruining" something by randomly flavoring it. In my practice, "adding random spices" (also called crazy-spicing) means adding spices from three or four randomly-chosen spice mixes. It works great. Today I made a smoothie from crushed ice, plain yogurt, an egg, protein powder, powdered fiber, sugar, Splenda, Tabasco Sauce, vinegar, and, as I said, lots of four randomly-chosen spice mixes (Russian Sausage, Poultry Seasoning, etc.). Were I not in the middle of a flaxseed-oil experiment, I would have added flaxseed oil or some other oil. It tasted great.

As [2]Michel Cabanac might say, pleasure is additive. This drink provides pleasure from these properties: creamy, protein, cool, liquid (satisfying thirst), sweet, salty (from the spice mixes), hot (Tabasco Sauce), spicy, sour. Nine sources, more than most food. They add up to a lot. It doesn't matter that it tastes like nothing and that on a menu, no one would order it.

An hour later I thought: That tasted so good! But I was too full to want more.

I will be blogging more about that egg.

green smoothies (2010-06-29 17:08:29)

While we're talking about Seth's blog » Blog Archive » Crazy-Spiced Smoothies Revisited, Filtered water and organic fruit and greens are best - but again, do the best you can with what you have.

### **Can Professors Say the Truth? (part 4) (2007-08-16 03:08)**

Deidre McCloskey and Lynn Conway – the subjects of my [1]previous post on this topic – are both powerful persons. McCloskey is Distinguished Professor of Economics, History, English, and Communication, a title created just for her. In October 2007, she will receive an honorary degree from Goteborg University. Conway is a member of the National Academy of Engineering. McCloskey and Conway abused their power when they attacked Bailey.

As awful as their actions were, even worse is what Northwestern University administrators (led by Provost Lawrence Dumas) did: Let themselves be used as tools in the attack. McCloskey and Conway master-minded the filing of an absurd human-subjects complaint against Bailey – and Northwestern took it seriously! As Bailey [2]says, it was "obvious to Northwestern officials" what McCloskey and Conway were trying to do (ruin Bailey) and why. It was like the teacher in a playground taking the side of the bully. Except worse, because Bailey could have been fired.

Kudos to Alice Dreger for shining light on a very unsavory episode in American academic history.

[3]Dreger's paper. [4]Part 1. [5]Part 2. [6]Part 3.

---

April (2007-08-16 08:32:42)

I've always found myself surprised by those who didn't expect the kind of vitriol that Bailey received. You take an already oppressed group of people (transsexuals) and combine that with a scientific theory that is sure to pick up press and portray transsexuals negatively. Regardless of the truth of the matter, \*of course\* there would be negative feedback. The problem with Blanchard/Bailey's theory is makes grand, overarching statements about a group of people without the incredibly strong statistical evidence needed to justify it. Take myself for instance: I'm a post-op transsexual who is married to a woman (type 2), transitioned before 25 (which would make me type 1), in a male-oriented line of work (type 2), but never got aroused by thinking of myself as a woman or by cross-dressing (type 1.) One of my oldest transsexual friends is interested in men (type 1), transitioned after 40 (type 2), in a male-oriented line of work (type 2), but never got aroused by cross-dressing (type 1.) To anybody who is personally familiar with a large number of transwomen, the thought that such a theory could pass any kind of statistical muster seems almost comical. \*That\* is why there is such a backlash to it. It's a complicated world out there, and the sciences (especially psychology) that proclaim all people are either Type A or Type B of anything has been historically been fraught with inadequacies. It is lamentable that Bailey himself was targeted and not his theories, but this sort of thing has happened before when somebody writes a popular-science book and becomes the spokesperson of a scientific theory (such as with "The Bell Curve".)

Mak (2007-08-16 10:48:58)

As I said (before my comment on your other pages was erased, you really should do more research into what OTHER trans women (besides Conway and McCloskey) think of Bailey and Drager before you take the position you do. You really don't add anything of substance to the concept of truth when you defend Bailey.

seth (2007-08-17 05:50:10)

April, I don't understand what you mean when you say Blanchard's theory needs "incredibly strong statistical evidence". For you to believe it? For me to believe it? "A scientific theory that is sure to pick up press" – Bailey found the opposite, newspaper reporters didn't want to hear it when he said it. Blanchard was familiar with a large number of transwomen, and he did not find his theory comical. Nor did Bailey, also familiar with a large number of transwomen. Re "The Bell Curve": Murray was not attacked with the vitriol that Bailey was attacked with. Mak, I've read a lot about the Bailey "controversy", including what other transwomen think. I posted about this stuff because it interests me and I hope readers of this blog will be interested as well. Some of what I have written is new – for example, pointing out the contradictory ways that McCloskey and Conway criticize Blanchard's theory.

April (2007-08-17 07:34:22)

It needs "incredibly strong statistical evidence" if it is to be The Truth - that is what you're driving at, correct? People are free to believe whatever they want, whether it's regarding to the flatness of the Earth or the origin of our species, intelligence of races, or whatever. For it to be The Truth, it should have some kind of statistical validity, and be easily falsifiable, and agree with additional research. Of the forty or so transwomen that I know, only one or two agree that they easily fit into one of his two categories. If the rest of the trans population is feeling that their existences are being invalidated by these claims, then it really shouldn't be surprising that they have defended themselves (and some, as you pointed out, have done so to excesses that have damaged their credibility.) If I were to write a pop-science book that claimed that Cal professors were actually considerably less intelligent than Stanford professors, wouldn't you agree that such an extraordinary claim required extraordinary proof? If I didn't have some sort of evidence (as Bailey doesn't), in the form of WAIS scores, SAT scores, maybe some kind of publishing history, etc., then I would I even deserve to be defended from any public outlash?

Andrew Gelman (2007-08-17 12:51:13)

I think April makes a good point that, just because a person is attacked in an unfair way, it doesn't make his theory true. The fact that Blanchard "was familiar with a large number of transwomen, and he did not find his theory comical" is not really

additional evidence, since he was the one who came up with the theory in the first place, right? It would seem fairer to describe the case as an open question, perhaps with so much politics on both sides that it will never be possible for outsiders such as myself to be convinced of the truth one way or another. (Just as, for example, no amount of Middle East archeology is going to be able to convince non-experts of the amount of truth in various passages from the bible—there are too many people on both sides of the issue who are pre-convinced of the truth of their side of the story.)

Rachel Owens (2007-08-17 13:30:07)

Okay, I was trying to think of something more scientific and actually try to cite examples of refutation of the two-type theory when I just realized the following. I don't really need to do that, because Bailey himself states he wants us to be happy. So, I'll take it from that angle. Unlike many transsexuals I have actually read the entire book. It makes me feel attacked, damaged and dirty. The book made me feel \_worse \_ about myself, it made me feel like some sort of sexual pervert, it made me feel even more isolated and discriminated against than I already am. I know Bailey claims to be focused on the happiness of transsexuals, but just reading his book has made me extremely unhappy and disgusted with myself because I am either a liar or an ideal prostitute. The book makes me, on a personal level, feel worse off than before I read the book. That's all that matters to me personally.

Boo (2007-08-17 14:46:45)

"Blanchard was familiar with a large number of transwomen, and he did not find his theory comical." Yes, but you see, among the many many flaws Blanchard overlooked was that he was in a position to get those transwomen to tell him whatever he wanted through his control over whether or not they got medical treatment. If Blanchard were to declare tomorrow that all transsexuals like to wear giant pink bunny suits, pretty soon all the transsexuals who are trying to get government subsidized medical treatment in Ontario, which is only available through his clinic and can be denied to anyone for any reason, would start showing up at his clinic in giant pink bunny suits, and he could write another "scientific" paper about bunny fetishism in transsexuals. But you're right, really. It's just so unsavory when the damn ni- oops, transsexuals don't know their place.

seth (2007-08-17 16:15:18)

"If I were to write a pop-science book that claimed that Cal professors were actually considerably less intelligent than Stanford professors, wouldn't you agree that such an extraordinary claim required extraordinary proof? If I didn't have some sort of evidence (as Bailey doesn't), in the form of WAIS scores, SAT scores, maybe some kind of publishing history, etc., then I would I even deserve to be defended from any public outlash?" Answer to Question 1: No you would not need "extraordinary proof" to say such a thing. You might need such proof to convince other people. Bailey was not proposing Blanchard's theory, he was reporting it. Blanchard's theory had stood the test of time in his and Bailey's community of researchers. Answer to Question 2: Bailey was not reporting his own ideas; he was reporting Blanchard's – who did have evidence. Bailey was appropriately not going over much of the evidence because it was a book for a general audience, not a scholarly paper. Yes, Bailey deserved to be defended. For the same reason the Bill of Rights defends freedom of speech. Boo, if you want to list the "many many flaws" in Blanchard's work I would be happy to post it and send it to Blanchard to see if he wishes to comment. Andrew, you write: "Fairer to describe the case as an open question." It's not quite clear what you mean. Bailey did not say that Blanchard's theory couldn't possibly be wrong. Bailey did say – by giving the theory so much space – that it was a reasonable theory, the best so far, and seemed credible to him based not only on Blanchard's evidence but also Bailey's own experience. To call this an "open case" – if I understand that term correctly – seems to be ignoring a lot of evidence, including the evidence in Blanchard's papers, the reactions of other sex researchers to the theory, and Bailey's reasons for believing the theory.

Andrew Gelman (2007-08-17 18:24:13)

Seth, You've clearly read more than I have in this area, so I defer to your knowledge about this case. But in an area such as sexual preference, where the data probably aren't so clean, and the phenomenon itself is changing rapidly, I'd expect scientific research to be pretty preliminary and inherently not so solid. Hence, maybe it's a bit strong to refer to Blanchard's findings as "truth." Remember how, when we taught our course on left-handedness, there were many published papers but still many open questions? And some of the published papers seemed to contradict each other? And there were always worries about data quality? I'd expect to see much more of these problems in studies of transsexuals. Not to knock Blanchard, just to say that there might be legitimate differences of opinion—even if he and Bailey found the theory to be reasonable, others might

have good grounds to differ. Of course, that's no excuse for intimidation, suppression, etc.

seth (2007-08-17 20:44:32)

The truth that Bailey wrote was that a serious scientist had come up with a reasonable theory that deserved the world's attention – a theory that Bailey himself found credible. Bailey's book is science journalism. Like journalism it tries to reach a broad audience. Bailey's book is especially journalism when he wrote about someone else's (Blanchard's) research. It's like a quote: No one criticizes a journalist if the words inside a quote make a false statement. (Peter said, "The world is flat.") The question of accuracy is whether or not the person quoted actually said them. That's what I meant when I said Bailey spoke the truth: He told the world about Blanchard's ideas. "Others might have good grounds to differ." They might, but I am still waiting to hear them. If anyone will send me a list of such grounds, I would be happy to post it and send it to Blanchard for comment.

Robert Owen (2007-08-18 01:55:55)

You continue to seem to state that Blanchard's theory is more or less 'settled theory or science' etc. However I have googled constantly for over an hour just now and the only study I can find discussing this, aside from Bailey's pop-science book, is Blanchard's 1989 study. If it is so studied, why can I only find one study, the original, on all the internet? I would assume if this was such a solid theory it would have been tested several times, but I see no evidence of that anywhere. Quotes I have found more recently from Blanchard seem to indicate he isn't even studying transsexuals anymore, he has no interest in continuing the work. How can something be refuted or supported with so few studies? I'm not a scientist and especially not a psychologist, but I thought the point of a new theory was to test it over and over again. I'm not the best internet searcher but I would have thought I would have found at least one more study in support/against, I can't find ANYTHING, pro or con his findings. What other studies have you seen that bring you to agree with his findings? Are all these studies in journals then? I can't even find citations for them though, nothing at all.

Boo (2007-08-18 04:35:13)

"Boo, if you want to list the 'many many flaws' in Blanchard's work I would be happy to post it and send it to Blanchard to see if he wishes to comment." I already put three of them into comments on your Huffingtonpost blog, so you can start there. I doubt he'd be willing to acknowledge that his clients lie to fit into his typology tho, for some reason the "conservative" clinicians never seem to want to admit that their clients are just as capable of manipulating them as they are capable of manipulating their clients. And if you brought up the fact that not one of his studies ever involved comparing transwomen to cissexual women, he'd probably look at you like you were from Mars. After all, these are "transsexual men," so what on earth could women have to do with anything? (If you pay enough attention, you may notice that when Blanchard and Bailey talk about femininity in transwomen, they are most definitely not talking about the degree to which we're like cissexual women. They're talking about the degree to which we're like effeminate gay men, which is rather a different thing.) Plus: Blanchard raised the possibility that AG might actually be a reaction to some cases of transsexualism in an early paper, then just ignored it. The idea that it's more of a side effect that can occur in some transwomen who repress their TSism is actually more consistent with the evidence of transwomen who acknowledge eroticism connected with their TSism, since they consistently say their TS feelings developed well before any eroticism occurred, and faded away once they began transition. It also doesn't make sense from a physiological point of view that AG could motivate transition, since the mtf transition process involves lowering testosterone levels, which is known to diminish paraphilic drives, which should take the desire to transition away with them if they were the cause of it. This is actually what happens when middle aged transvestites try to transition. A few months on hormones, and they're like oh, this isn't the kick I thought it would be. Blanchard also notes that male-attracted transwomen tend to transition earlier in life than other transwomen, but overlooks that this is something we should expect regardless of whether or not his typology is accurate. Transwomen who exist in the gay community before transition are in an environment where cross-gendered behavior is much more visible and tolerated than it is for transwomen who aren't in the gay community, and hence they would tend to come to see transition as a realistic option sooner. It's also worth noting that there doesn't appear to be a single transwomen alive who completely agrees with them. Willow Arune has denied having a history of crossgendered eroticism, and in her shortlived "autogynephiliasupport" group (which Yahoo shut down after she started another group devoted to cyberstalking Andrea James- a common oddity of Bailey sycophants is their weird fixation on Andrea) of the dozen or so actual "autogynephilia supporters" who made themselves known, most denied that AG was

a paraphilia. Even his number one cheerleader Anne Lawrence makes claims about herself that are inconsistent with the theory, such as claiming to have been effeminate in childhood. (Although to be fair, I suppose it is possible she's just trying to demonstrate his contention that transwomen such as herself are prone to lie about their pasts.) The transkids site disputes the notion that transwomen of the "type" they choose to identify as are well suited to prostitution. Ironically, there are actually several "hallmarks of autogynephilia" on the transkids site if you look hard enough. Hmm... more fun Blanchard questions: "Can you construct a rationalization for why Maxine Petersen went before the Canadian Legislature to testify against adding transsexuals to Canada's human rights legislation that doesn't involve the fear that it might undermine your control of your clients?" "Did it ever once occur to you that forcing people who have serious body image issues, often involving their genitalia, to let you strap machines to their genitals and make them watch a bunch of weird fetish porn is not exactly the most ethical thing to do?" "Has it ever occurred to you that forcing transwomen to act out stereotypes of femininity such as only wearing skirts or dresses will harm your ability to make unbiased assessments of their behavior?" "Are you aware that women do in fact wear pants?" "Is there any rational purpose to demanding control of what your clients can change their names to?" "Would a transwomen named Terry be the end of civilization as we know it?" "Does the strain of pretending that the multitude of gay and bisexual transmen out there don't exist ever wear on you?" "The truth that Bailey wrote was that a serious scientist had come up with a reasonable theory that deserved the world's attention" a theory that Bailey himself found credible." The truth is that Bailey lied repeatedly in the book and in his subsequent responses to his critics. When he grudgingly acknowledges that Blanchard's ideas are not accepted by the majority of his colleagues, he claims this must be because they just aren't well read enough. The truth happens to be that Blanchard's colleagues are well aware of his ideas, but find them silly and not particularly applicable to many of the clients they see. The truth is the claim that Bailey's critics all subscribe to a "feminine essence narrative" or claim to be or have been "women trapped in men's bodies" is false. The truth is that McCloskey's book makes no such claim despite Bailey's claim in his book that it does. The truth is that the only place on her website where Andrea even uses that phrase is to mock it. The truth is that Bailey lied when he claimed Lynn Conway and Andrea James did not want people to read his book, as both had prominently displayed links on their websites to where the whole book could at the time be read online for free. The truth is that Bailey exposed his complete and utter contempt for transwomen when he called his own words "dirty captions" and "obscene" when applied to nontranssexuals. The truth is that however much he might like to believe otherwise, our lives are not delineated by the degree to which we make "single, heterosexual men" like Bailey pitch a tent. And here's a question for you- applying Baileylogic where objecting to something means it must be true, and considering that denial of autogynephilia is alleged to be a symptom of autogynephilia, let me ask you something: Are you autogynephilic? And if your answer is no, why should we believe your denial any more than Blanchard and Bailey believe the denials of transwomen?

seth (2007-08-18 05:06:55)

Robert, yes, the papers are in journals. Here are some citations: Blanchard R. Early history of the concept of autogynephilia. Arch Sex Behav. 2005 Aug;34(4):439-46. Blanchard R. The concept of autogynephilia and the typology of male gender dysphoria. J Nerv Ment Dis. 1989 Oct;177(10):616-23. Blanchard R. Typology of male-to-female transsexualism. Arch Sex Behav. 1985 Jun;14(3):247-61.

April (2007-08-18 07:58:16)

I think the spirit of Robert was driving at is that, aside from Blanchard's studies and Anne Lawrence's and Bailey's commentary on Blanchard's studies, there's really aren't any studies that offer confirmatory evidence for autogynephilia. Or at least, I couldn't find any in PubMed or PsycINFO. I think when the head of HBIDGA (who sets the rules for psychologists and psychiatrists) and the Program in Human Sexuality at the University of Minnesota (one of the foremost sexuality research institutions in the world, as well as a place that sees more transgender patients than anywhere in the world), as well as Editor of the International Journal on Transgenderism, declares that Blanchard's/Bailey's research is "bad science", then perhaps that should be a sign that it might actually somewhat maaaaaybe actually \*be\* bad science, and not just some global conspiracy by thousands of autogynephiliac transsexuals to disgrace Blanchard/Bailey. <http://www.tsroadmap.com/info/eli-coleman.html>

Robert Owen (2007-08-18 08:02:20)

So...only he studied it? No one else confirmed his findings? Color me highly confused suddenly. Why hasn't another

psychologist done the same study? Whatever happened to the concept of 'peer-review?' I thought the entire point of scientific journals was to help spread the information so peer-review could take place. It's been almost 20 years and no one else has attempted to duplicate this observation?

seth (2007-08-18 20:55:18)

Robert: "Only he studied it"? I didn't say that. I don't know who else has studied it. April, when I was an undergraduate I gave a talk called "The Scientific \_ \_ \_ \_" My claim was that when you read that such-and-such is "scientific" or something else is "unscientific", that's a good sign that you should stop reading. Because the term "scientific" is nearly meaningless. I still think that. To say that someone's research is "bad science" is about as interesting and helpful and clear as saying someone's research is "bad". It says more about the person who said it than anyone else.

Boo (2007-08-19 04:42:23)

"April, when I was an undergraduate I gave a talk called "The Scientific \_ \_ \_ \_". My claim was that when you read that such-and-such is "scientific" or something else is "unscientific", that's a good sign that you should stop reading. Because the term "scientific" is nearly meaningless. I still think that. To say that someone's research is "bad science" is about as interesting and helpful and clear as saying someone's research is "bad". It says more about the person who said it than anyone else." Seth, have you considered seeking employment at The Discovery Institute? It looks like you'd fit right in. They love to pretend scientific is meaningless too. Legitimate scientists of course realize that good science would be that which strictly follows the rules of scientific investigation and analysis, and bad science would be that which does not. Like, say, purporting to investigate the sexuality of a whole population by trolling hooker bars at 3am. Or insisting that any evidence you see against a theory must automatically be reinterpreted as evidence for the theory. Which is why when anthropologists found evidence that Homo Habilis was co-existent with Homo Erectus, they immediately accused the Habilis fossils of "not being honest with themselves," instead of adjusting their views of human evolutionary ancestry to compensate.

Robert Owen (2007-08-19 16:12:59)

[http://www.genderpsychology.org/autogynephilia/ray\\_blanchard/](http://www.genderpsychology.org/autogynephilia/ray_blanchard/) I managed to find this site, it's a much more...calm discussion and study of Blanchard's work. She admits to being transsexual herself, but she doesn't throw around wild personal accusations of the man's theory. Apparently the only studies that have ever been done were by Blanchard and he only did one study, all the other papers are merely commentary and further extrapolation of his own data. Furthermore his study was done on the population he himself helped select, there was no blinding or double blinding or control grouping. At the center he did his work at he apparently rejected 90 %+ of the patients that came to him for help.

seth (2007-08-20 21:41:54)

The site you link to is relatively calm but also very biased. For example:

Blanchard's model is not supported by the empirical data. Blanchard's model assumes the very things it seeks to prove by assigning transsexuals to types and by a peculiar definition of gender dysphoria.

This makes little sense. The data Blanchard describes supports his theory. Models do not "seek to prove" anything.

Boo (2007-08-21 04:59:51)

"This makes little sense. The data Blanchard describes supports his theory. Models do not "seek to prove" anything." Actually, it doesn't support the theory. Blanchard's theory of transsexual typology is "All male-to-female transsexuals who are not attracted to men are attracted to the thought or image of themselves as women." Not some, not correlations, all are one or the other, no exceptions. Even if you take the data at face value (and as I've noted, there are several good reasons not to), it doesn't support the theory. Exclusively male-attracted transwomen should experience NO cross-gendered eroticism, yet this and Blanchard's other studies consistently find that some of them do. Bailey and pals try to weasel out of this by claiming, without evidence, that those who do must not really be male-attracted, which amounts to claiming the data as support of the theory and then turning around and goosing the very same data because it doesn't support the theory. (And that's where the unfalsifiable part comes in.) But as I've noted, since his measurement instrument doesn't

actually measure cross-gendered eroticism, there's no way to draw any meaningful conclusions from this study. Also, as you have ducked the question of your own autogynephilia, applying the logic and Bailey and cohorts means you must therefore be autogynphilic but too ashamed to admit it. Admittedly, this is ridiculous logic to apply to you, but applied to us, it's "science."

### **A Curious View of Obesity (2007-08-16 12:27)**

From a recent issue of JAMA:

Several lines of evidence from the study of patients with brain diseases converge on the prefrontal cortex (PFC), especially in the right hemisphere, as a critical area involved in the cognitive control of food intake. The PFC is the part of the brain that has undergone the biggest expansion during evolution, accounting for approximately one third of the surface of the human brain (Figure). Many complex aspects of behavior that distinguish humans from other species originate here, through the confluence of sensory, limbic, and autonomic information. Current theories on the PFC posit a crucial role for this region in the top-down control of behavior, especially under conflicting situations, when inappropriate responses need to be inhibited.

Diverse findings suggest a crucial role of the PFC in obesity. In the mid-1900s, overeating and weight gain were a common side effect in patients who underwent frontal leukotomy, a psychosurgical procedure that disconnects the frontal lobe from the rest of the brain. Damage to the right frontal lobe can cause a passion for eating and a specific preference for fine food, the so-called gourmand syndrome. In patients with degenerative dementia, the presence of hyperphagia correlates positively with right frontal atrophy and negatively with left frontal atrophy. . . . Hyperactivity of the right PFC can lead to anorexia-like symptoms, for example, in patients with right prefrontal focal epilepsy, in which the eating disorder can cease after initiation of anticonvulsant therapy.

Additional data support a link between the right PFC and spontaneous physical activity. . . . The right PFC is preferentially involved in guiding decision making according to social conduct and comprehension of bodily information at a higher level. . . . A dysfunction of the right PFC may represent a central event in the etiology of human obesity. . . . Increasing the activity of the right PFC might decrease appetite and reestablish inhibitory mechanisms controlling eating, as well as improve long-term adherence to interventions such as diet or exercise therapy, which is a major barrier that limits the success of any attempt to treat obesity.

No data to support this prediction are given. I think exercise and diet therapies usually fail because they are based on too-simple ideas about weight control. What does the gourmand syndrome reveal, I wonder.

## Omega-3 and Dental Health (still more) (2007-08-16 17:07)

The gum improvements produced by omega-3 fats can be easy to see:

1. About six months ago, [1]my dentist noticed that my gums were in excellent shape (a healthy pink, not red), for the first time in memory. I had started taking 3-4 Tablespoons/day flaxseed oil a few months earlier. I hadn't made other dietary changes nor had I started brushing or flossing my teeth more. I have slacked off the usual dental care (I floss less often) but my gums have remained in excellent shape, according to my dentist.
2. When Tyler Cowen (author of [2]Discover Your Inner Economist) starting taking 2 Tablespoons/day flaxseed oil, his gums got much better within weeks. They improved so much [3]surgery was canceled.
3. Catherine Shaffer, a Michigan writer, had the [4]same experience with fish oil:

I bought a bottle of Carlson Laboratories [fish oil] and began taking the recommended dosage [1 tea-spoon/day] . . . My gums have been chronically inflamed for as long as I can remember. They were reddish in color, had a tendency to bleed when poked, and have earned me many lectures on flossing from my dental hygienist. I have had to brush three times a day and floss twice to keep the inflammation down. However, as soon as I started taking the fish oil, my gums turned a pale pink, and I even though I have been very lazy about flossing, they have not been bleeding.

Maybe I should have called gingivitis (inflamed gums) the [5]new scurvy. (Vitamin C cures scurvy in a few weeks.) Such fast big lasting improvements imply the flaxseed or fish oil supplied something important that was missing. Too much inflammation is a body-wide problem – many conditions end in -itis (e.g., arthritis) – so it is likely that the flaxseed or fish oil is having other benefits. Consistent with this idea, gum disease is correlated with several other health problems, including stroke, heart disease, and [6]low-weight babies.

According to an [7]online health-info source, echoing [8]conventional wisdom:

Gingivitis is the most common and mildest form of oral/dental disease. According to the Food and Drug Administration, approximately 15 percent of adults between 21 and 50 years old, and 30 percent of adults over 50, have gum disease . . . The main cause of gingivitis is plaque . . . The best defense against gingivitis is brushing and flossing after meals, as well as professional cleaning by a dental hygienist every three to four months.

How fragile the conventional wisdom ("The main cause of gingivitis is plaque . . . The best defense . . . is brushing and flossing") turns out to be. Eighty years ago, [9]Weston Price, a Cleveland dentist, had the same doubts I do. In travels around the world, he saw many people with excellent teeth who never brushed them. They ate ancient diets, with far more omega-3 than modern food.

peter (2007-08-17 11:11:25)

did you have your teeth clean? if so, did you have plaque; if so, was it in the back teeth or was it equally distributed among the teeth, as it usually is, with a concentration in the back of lower front teeth.

Cosmetic Dentist Vancouver (2009-08-19 12:53:09)

While flax and fish oil definitely helps improve the condition of your gums, one mustn't assume that this is ALL they need to do to keep their teeth healthy! A good diet should never be a substitute for good dental habits –just think of it as an additional layer of defense against plaque, gingivitis and such. Other than that, you speak the truth :)

### **Even in Sweden (2007-08-17 04:24)**

From the [1]SLD forums, someone who recently started SLD:

On vacation at my friend's place in Dalarna Sweden. Used to live here some years ago and IÅ´m now hanging out with all my old buddies, an jeeees... everything's about food. BBQÅ´s, breakfast, snacks and lunch....? WhatÅ´s this? Has food been so important before? HavenÅ´t noticed that before, all food talk and all snacking. For fun I counted how often the word FOOD was used-25 times- during the day!!!

### **Why Does Gum Disease Correlate With Heart Disease? (2007-08-17 06:38)**

People who have heart disease are more likely to have gum problems. Why? According to an [1]online health magazine from the University of Texas,

Medical researchers have two main theories to explain the link between gum disease and heart disease . . . One theory is that the bacteria from periodontal disease enter the blood stream and stick to the blood vessels, creating a thickening of the walls, which may end up clogging these vessels. The second theory is that the chemical by-products from gum disease cause the same clogging effect. The chemicals may come from the by-products of the bacteria or from the chemicals produced by the body's own immune system.

A third possibility, not mentioned in the article, is that both gum disease and heart disease are caused by too much [2]inflammation.

The three cases I described [3]yesterday, in which high-omega-3 oils rapidly eliminated gum disease, convince me that the third possibility is correct. When you take 2 tablespoons/day flaxseed oil or 1 teaspoon/day fish oil, you are not killing the bacteria in your mouth. The bacteria remain as plentiful as ever. The difference is that your body is no longer overreacting to them. [4]Plenty of evidence suggests that heart disease is caused by too much inflammation. This correlation is more evidence.

Why omega-3s reduce inflammation is known. The body requires omega-3 to build an anti-inflammatory signaling molecule. Not enough omega-3, not enough of this molecule, too much inflammation.

3. <http://www.blog.sethroberts.net/2007/08/16/omega-3-and-dental-health-still-more/>
4. <http://www.abc.net.au/health/minutes/stories/s1290235.htm>

---

Jen (2007-08-18 18:01:18)

Gum disease and heart disease may be associated because each is associated with diabetes/metabolic syndrome. Inflammation plays a role in MetS, as well, but whether it's as cause or effect is unknown. Poor diet in general, not only the lack of omega-3 fats, is implicated. Omega-3 fats correct some but not all of the lipid abnormalities of MetS.

Ruth Heasman (2007-08-19 12:02:26)

My own take on this is somewhat different. I have rheumatoid arthritis and chronically elevated CRP (C-Reactive Protein) levels, indicating high levels of inflammation in my body. I also have healthy pink gums. This may be as a result of drinking the oil - certainly in part I'm sure. But despite the health of my mouth, I continue to have high inflammation levels elsewhere in my body. One thing I have noticed (as I do not take the oil religiously, but rather sloppily, and thankfully still have weightloss, albeit slow), is that the 'fur' on my tongue is considerably less whenever I drink the oil. I use hempseed oil, and this is known to have mild antibacterial and anti-fungal properties. There is virtually no tongue 'fur' when I use the oil, and there can be quite a lot when I don't, especially if I eat a lot of sugar. I use oral steroids, such as prednisone, to combat my arthritis and these meds and others make me prone to being a bit yeasty. I think this may be what the 'fur' on my tongue is, or else it's bacterial. Either way, I wonder whether the flaxseed oil you use Seth is antibacterial/antifungal as well? And whether keeping the mouth bacteria down is what's keeping your gums (and hopefully heart) healthy. I agree that CRP is a major marker for heart disease, much more so than cholesterol or good/bad fats, but as my CRP is always very high - always more than 20 and often more than 60 - and my gums are pink and tongue free of fur, it makes me wonder if the oil is controlling bacteria, more than inflammation?

## **Ortho-Ergonomics (2007-08-17 20:21)**

In honor of this week's BMJ [1]cover story.

My current test to study omega-3s ([2]letter counting) involves lots of typing. To avoid carpal tunnel syndrome, which I started to approach a [3]few weeks ago, I use one hand to raise the other one, as these pictures show.

Since I started doing this, I haven't had any problems. No discomfort. I usually put an hour or more between tests. (Each test involves 200 keystrokes – 50/finger – in a few minutes.)

### **What Goes Around Comes Around (2007-08-18 08:23)**

One of my favorite stories in [1]Discover Your Inner Economist by Tyler Cowen:

During one riot in Michigan, one woman sold stones to rioters. . . . Small stones went for \$1, larger stones brought in \$5 a piece. Most of the rocks were thrown at police. . . . The woman claimed that she collected about \$70 from her efforts, but she stopped when she was hit by a rock herself.

A perfect illustration of the title of this post.

What makes a good story? Perhaps 1. Hero. 2. Villain. 3. Struggle. 4. Details. 5. Humor. 6. Message. 7. Goodness is rewarded or sin is punished. 8. Truth (it actually happened). The rock story has six of these.

1. <http://www.amazon.com/exec/obidos/ASIN/0525950257/sethrobertand-20>

---

Brad (2007-08-19 18:28:51)

Two others (which this story includes) are: 7. Surprise 8. An ending that reveals a fundamental truth, ideally one that isn't obvious from the outset. "What goes around comes around."

seth (2007-08-20 21:32:35)

Yes, I agree about your #7. Your #8 is my #6.

### **Nutritional Psychology: A Gaping Hole Where a Field Should Be (2007-08-18 21:53)**

Yesterday I attended the annual convention of the American Psychological Association (APA) in San Francisco. I was also measuring (again) the [1]time course of omega-3 effects. The exhibits hall was full of books. I picked up three introductory psychology texts to see what they said about nutrition. None of their indexes listed nutrition; apparently they said nothing about it. None of the hundreds of books I saw was about nutrition – that is, about how to nourish the brain. Yet the APA is mainly about mental health.

It's not just APA. At Berkeley, I've attended dozens of talks in the Nutrition Department. I have never seen another psych professor or grad student at any of them. Nor have I seen a nutrition professor at any Psychology Department talk. Both disciplines have [2]Annual Review series. In last seven years, there hasn't been a single article in the Nutrition series about behavior or cognition (aside from eating) nor a single article in the Psychology series about nutrition (aside from an article about weight control).

Sometimes interdisciplinary is hard. Cognitive science has tried to unite computer scientists with linguists and philosophers and psychologists. That's hard because computer scientists are engineers, not scientists, and philosophers are neither. But nutrition and psychology are both experimental sciences. Nutrition is an independent variable (food), psychology a dependent variable (behavior). They naturally go together, especially if you are concerned with mental health.

Now and then someone will study how Disorder X responds to Nutritional Treatment Y – how depression responds to omega-3, for example. [3]Better than nothing, absolutely, but not the best approach. By the time something is broken it is likely to be (a) a mess and therefore hard to measure and (b) hard to put back together. If you want to learn how a car works, should you study a car that works or a car that doesn't work? The answer isn't obvious, at least to cognitive psychologists, because for half a century they mainly studied how memory, perception, etc., failed. In the 1960s, Saul Sternberg taught the rest of the profession a better approach – namely, study a car that works. Sternberg made popular the kinds of experiments usually done today: reaction time experiments with easy problems that subjects almost always get right. [4]My omega-3 research has illustrated the truth of Sternberg's general point. I found much clearer effects of flaxseed oil on easy tasks (easy arithmetic, an easy memory task) than on a difficult task (digit span). A better way to learn how food affects our brains will be to study the effect of food on healthy brains. Such experiments will be much much easier than studying people who are depressed, children with ADD, schizophrenics, autistic children, drug addicts, and so on. I'm sure that the conclusions from healthy brains will generalize to malfunctioning brains, just as all cars – working or broken – work the same way.

### **Jane Jacobs and Traffic Tickets (2007-08-19 07:10)**

Rexford Township, Michigan, has started to pay police officers [1]according to the number of tickets they write. In [2]Systems of Survival, a book about moral systems, Jane Jacobs criticized something similar: ticket quotas for police. Treating guardians (such as police) as if they were in commerce doesn't work well, she wrote. There are two ways of making a living (taking and trading). Both have value, but they need to follow different rules of conduct (which we may grandly call morals) to work well.

1. <http://www.clickondetroit.com/news/13919921/detail.html>

## Science in Action: Omega-3 (time course 2, with eggs) (2007-08-20 21:21)

Last week, I tried to measure again the [1]time course of flaxseed oil's effect on how well my brain works. As before, I used a [2]letter-counting test. The test consists of trials where I see a four-letter display such as ECQZ and type as quickly as possible how many letters from ABCD are among them (in this case, 1). 200 trials per test, about one test per hour.

On Tuesday, about 3 pm, I drank 4 tablespoons of flaxseed oil. Here's what happened:

2. <http://www.blog.sethroberts.net/2007/08/11/science-in-action-omega-3-letter-counting-test/>
3. [http://www.ncbi.nlm.nih.gov/sites/entrez?Db=pubmed&Cmd=ShowDetailView&TermToSearch=1734678&ordinalpos=4&itool=EntrezSystem2.PEntrez.Pubmed.Pubmed\\_ResultsPanel.Pubmed\\_RVDocSum](http://www.ncbi.nlm.nih.gov/sites/entrez?Db=pubmed&Cmd=ShowDetailView&TermToSearch=1734678&ordinalpos=4&itool=EntrezSystem2.PEntrez.Pubmed.Pubmed_ResultsPanel.Pubmed_RVDocSum)

## **Does Walking By McDonald's Make You Fat? (2007-08-21 21:33)**

Few people have used [1]the theory behind the Shangri-La Diet more successfully than Tim Beneke, an Oakland journalist. I put before and after photos of him – before and after he lost about 100 pounds – on the front page of the proposal for The Shangri-La Diet. He writes:

It's very clear to me this summer that it's much easier for me to go tasteless and only consume the mush if I don't go to Berkeley, and just stay home in my apartment (except going for my neighborhood walk). And it's not merely a matter of behavior. When I go to Berkeley and walk near places where I am accustomed to eating (and tasting) – mostly restaurants, sandwich shops and coffee houses – I actually experience more hunger and must consume more mush to satisfy hunger than if I stay home.

I'm not surprised that auditory and visual signals for food cause hunger. There are lots of conditioned cravings like that. Tim goes on to wonder if these learned signals for food raise the body-fat setpoint, as the [2]theory behind the Shangri-La Diet says that food-associated flavors do. If you walk by your favorite bakery every day, will you weigh more than if you don't?

I always lose weight when I travel in foreign countries. I've attributed this to unfamiliar food. But could unfamiliar places also play a role?

In 1973, Edward Zamble, a professor of psychology at Queen's University, Kingston, Ontario, published an experiment very relevant to this question. He divided rats into two groups. Both group got their daily meal at random times. For one group, the meal was preceded by 30 minutes of light; the light went off before the food was available. The other group was exposed to the same amount of light but the light bore no relation to when they were fed. The rats with signaled food ate more and weighed more than the rats with unsignaled food.

I knew of this experiment – and often mentioned it – before I came up with the theory behind the Shangri-La Diet, but I never connected them. Thanks, Tim.

2. <http://www.freakonomics.com/pdf/whatmakesfoodfattening.pdf>

KimBooSan (2007-08-23 10:53:29)

Actually this brings up a point on SLD that has me a bit concerned. As a woman, I love to lather myself with lotions and unguents and balms, and I know it doesn't seem like that has anything to do with SLD or set point levels. But have you looked at the high-end lotions and lip balms these days? "Vanilla-Fig" and "Raspberry-Peach" and "Mint Julep" and "Mango Melon" and on and on. I've started using blah unscented lotions and lip balms because I'm concerned about the smell/flavor/calorie connection, although I felt silly about it. Reading this, I think I'm not so off the mark. I often use lotions first thing after a shower, and just a few minutes before I down my flavorless calorie dose. I suppose I should be wary of VCO as well, as it has a strong coconut smell to it. I could also move my dosage to later in the morning. Hmmm. Time to experiment. :::KBS

Timothy Beneke (2007-08-23 12:08:58)

Actually there is a fair amount of research showing fragrances can lead to weight loss in people, probably be interfering with the process by which the brain learns taste/calorie associations. One study found that people wearing a vanilla scented band, I think, on their wrist lost weight compared to a control group who did not. That was a few years ago; I know a lot more has been done.

KimBooSan (2007-08-23 13:45:59)

That actually makes sense if they are wearing the scents at times when they are \*not\* eating. I'll have to look around for the studies you refer to, should be interesting reading to find out. In my case, I am referring to the combination of "flavorless" calories (a la SLD) combined with a food-associated scent, which when combined essentially makes a meal. lol! :::KBS

Timothy Beneke (2007-08-23 14:09:54)

You might try to put on lotions during times when you are not eating; that would weaken any association for the times when you are...

KimBoo's Shangrila Diet Experience (2007-08-24 10:25:10)

Day Fifteen: Lessons to be Learned... Interesting development, which I've decided to write about based on Seth's post about the flavor/smell relation. He discussed a study done with (what else?) rats about the relation of a stimulus associated with eating and feeding/weight gain, which...

Lee (2007-08-27 19:21:44)

Wouldn't this theory predict that city residents would be fatter, or at least hungrier, than suburbanites? For instance, New Yorkers walk past a great number of restaurants daily, whereas suburbanites are exposed less often, because there are fewer restaurants in the suburbs, and residents are more likely to quickly drive past them rather than walk past, thus experiencing them for less time. Maybe all of the city dwellers' walking makes up for their increased exposure to food signals.

Lee (2007-08-27 19:25:09)

Maybe the visual stimulus of product packaging has a similar effect. Seeing the packages of favorite foods in your fridge or on the shelf may trigger hunger. I wonder what would happen if you repackaged your food in generic containers, or in the containers of non-edible products such as shampoo and soap?

## Science in Action: Omega-3 (VSE) (2007-08-22 06:43)

VSE = Very Short Experiment. After [1]VSL (Very Short List). I did this experiment yesterday. It took the whole day but the results were clear by noon.

At about 7 am I took 4 tablespoons of flaxseed oil (Spectrum Organic). I measured my mental function with a [2]letter-counting test. Here is what happened.

My reaction times decreased 2-3 hours after drinking the flaxseed oil. Over the next 6-8 hours they returned to baseline.

For cognoscenti, here are the accuracy data:

Accuracy was fairly constant.

These results resemble earlier time-course measurements ([3]here and [4]here). What pleases me so much is not the confirmation – after the earlier two results I had found the dip a third time and had found that olive oil does not cause a dip – but how fast and clear the main result (the dip) was. I could have done a mere four tests (7, 8, 10, 11 am) and found interesting results – I knew that the 8 am test was too early to see a difference so it would have been two tests "before" and two "after". Six hours of testing can say something interesting about what we should eat and how to make our brains work best.

If you've been reading this blog you won't be surprised that flaxseed oil helps; what's new is how easily I can test a big wide world of foods. Salmon, trout, herring, fish oil, olive oil, canola oil, walnut oil, soybean oil, and so on. All sources of fat. Not to mention [5]eggs.

I take 4 tablespoons of flaxseed oil most days; I am not suffering from too little omega-3, as most people are. This improvement is on top of the improvement produced by getting enough omega-3 most days. If I stopped taking flaxseed oil, my mental function would slowly get worse, as an earlier experiment ([6]here and [7]here) showed.

Willy (2007-08-22 07:01:17)

Hello. Seth, is the software/script you use to display the letters to count and measure time available?. Thanks.

seth (2007-08-22 07:02:34)

yes that software is available. It uses R (which is free).

Willy (2007-08-22 07:14:15)

I forgot to ask if it is your creation and if it is free/paid/cost. Sorry.

seth (2007-08-22 09:16:34)

yes, it is free.

TC (2007-08-22 11:44:59)

There are 4 data non flax seed data points, and 10 flax seed data points, shouldn't you be doing some kind of re-sample with replacement [either groups of 4 from the flaxseed 10 or groups of 10 from the nonflax 4] and compare a couple of 1000 of the re-sampled groups before assuming the pictures tell the whole story

Brad (2007-08-22 11:58:53)

You're on to something amazing here, Seth. The rapid testing of various foods for short-term brain effects is going to open up whole new areas of science (and probably pharmaceuticals, eventually.)

seth (2007-08-22 13:02:50)

Thanks, Brad. As far as I know, the existence of such effects was never suspected – including by me.

Brad (2007-08-22 15:25:21)

Not to mention all the cycling coaches who will be beating your doors down. Well, maybe chess coaches. :- ) (I have a vision of hordes of law school grads chugging cod liver oil before their bar exams while muttering, "Curse you, Seth Roberts!")

Brad (2007-08-22 15:37:15)

It'd be a great way for a grad student to make a hell of a name for himself – do your protocol on every spice in the spice aisle, every oil in the oil aisle, every grain in the bread aisle. Headlines would be generated like clockwork: Dough Makes You Dokey. Fish Before Physics. Memory Gone? Tarragon!

Brad (2007-08-22 15:38:31)

I smell another best-seller, too.

Andrew Gelman (2007-08-22 15:42:44)

Seth, Not to be a wet blanket or anything, but aren't you worried that your findings might be due to expectation effects: you knew which oil you were taking when doing the tests, right?

peter (2007-08-22 17:31:27)

could you put Purslane on your list of foods to test? It is rich a source of omega-3, although i've never been able to find it anywhere. (if you could tell me where to buy it that would be great, although it may be asking a lot)

seth (2007-08-22 21:43:07)

Andrew, no, I'm not worried that the results are due to expectations. If the results always conformed to my expectations, I'd be worried, but they haven't – see my post about eggs. Moreover, this particular result confirms a result that was a surprise. In other words, I've gotten the same result when I was expecting it and when I wasn't expecting it. Peter, thanks for the suggestion. I'm going to start by testing common foods, such as salmon, and easy-to-get foods, such as my 8 remaining grass-fed eggs.

Timothy Beneke (2007-08-23 10:26:31)

My non-rigorous observation after doing 3-4 tablespoons a day of flax seed oil is that yes, it does enhance mental functioning. I've been reading and writing poetry furiously all summer, and have reached degrees of comprehension in reading and interesting associations in writing that I never got to before. One caveat: I also have done a lot of reading poetry out loud; reading aloud according to a Japanese neuroscientist oxygenates the brain more than any other activity tested. That is a confound. But I'm staying with the flax seed oil until I am given a reason not to...

Michael Parente (2007-08-23 14:19:59)

Seth, when you are clearly an advocate of the benefits of flaxseed oil, what makes you trust the results of your experiment?

seth (2007-08-24 04:37:05)

Michael, what makes me trust my results is repetition. This is my fifth observation of the dip. The first observation was a surprise. Before this series of observations, I believed that flaxseed oil had long-lasting benefits. Long-lasting, meaning weeks or months. This is a short-lasting benefit – not an effect that I thought flaxseed oil had.

Janet R (2007-08-24 09:16:36)

What do the plots look like when you don't take anything? Mental acuity may vary substantially through the day.

seth (2007-08-24 22:03:54)

During an uneventful day they are flat within the limits of measurement, except at the beginning and end of the day I am slower.

### **Can Professors Say the Truth? (radio show) (2007-08-22 21:07)**

Part of today's KQED Forum program with Michael Krasny was devoted to the attacks on Michael Bailey and his book. [1]Here is the webpage. Joan Roughgarden, a professor of biology at Stanford, was one of the guests. After Bailey gave a talk at Stanford in 2003, Roughgarden wrote an [2]op-ed in the student newspaper that contained the following sentence:

To many observers, Bailey appears to be a rather dumb, stubborn, dense and possibly deceptive regular guy with some experience in locker-room humor.

This sort of comment would go over poorly on KQED, so what would she say? It turns out that she calls Bailey's book a "fraud." It is fraudulent because it is not "science" – by which she means a scientific article – in spite of having the word science in the title. Apparently Roughgarden thinks that if you write a book about science it is fraud to use the word science in the title. She also complains that Bailey uses stories based on transsexuals he had met to illustrate

Blanchard's theory. She calls those stories Bailey's evidence for the theory, ignoring the evidence in Blanchard's papers. This is not quite the incisive criticism we might expect from a Stanford professor.

### **A Novelist on the Aquatic Ape Theory of Evolution (2007-08-22 22:45)**

Plausibility of the [1]Aquatic Ape Theory of Human Evolution is one reason I started studying the effects of omega-3s. Novelist Elizabeth Bear [2]doesn't like it:

[Doris] Lessing appears to have drawn her background from Elaine Morgan's notorious pseudoscientific tome, *The Descent of Woman* (1972), which argues that human evolution was shaped by a seal-like return to the sea. Crackpot theories can make for great fiction but in this case . . .

That I found beneficial effects of omega-3s many times supports the "crackpot" theory.

Falasha (2008-02-27 15:02:50)  
Please see my views on aquatic ape.

### **The Twilight of Expertise (part 10: book reviewers) (2007-08-23 16:16)**

According to [1]Publisher's Weekly, a new program at amazon.com called

Amazon Vine rewards the site's elite reviewers by giving them access to advance copies. According to a representative at Amazon, invitations have gone out to the site's "top reviewers," deemed so by their review rankings, to become Vine Voices.

I once read about a Los Angeles catering business that wasn't doing so well until they doubled their prices. This is the opposite of that.

From [2]Seth Godin:

When the Times switched from 10 books on the Hardcover [Best Sellers] list, they created a list of 15 Hardcover [Best Sellers] and a list of 5 Advice, How To and Miscellaneous [Best Sellers]. I wrote in and asked the editor why they only had 5 titles on this list and 15 on the others. She wrote back and said,

"Because we don't want people to read those books."

Pride goeth before a fall.

### **Nassim Taleb on Research Strategy (2007-08-23 22:52)**

In [1]Forbes, Nassim Taleb, author of The Black Swan, made some comments I like:

Things, it turns out, are all too often discovered by accident. . . . Academics are starting to realize that a considerable component of medical discovery comes from the fringes, where people find what they are not exactly looking for. It is not just that hypertension drugs led to Viagra or that angiogenesis drugs led to the treatment of macular degeneration, but that even discoveries we claim come from research are themselves highly accidental. They are the result of undirected tinkering narrated after the fact, when it is dressed up as controlled research. The high rate of failure in scientific research should be sufficient to convince us of the lack of effectiveness in its design. If the success rate of directed research is very low, though, it is true that the more we search, the more likely we are to find things "by accident," outside the original plan.

If the success rate per test is low, a good research strategy is to start with low-cost tests. Ants do this: They search with low-cost tests (single ants), exploit with high-cost tests (many ants). I don't think the need to use different tools at different stages in the scientific process is well understood. John Tukey used the terms exploratory data analysis and confirmatory data analysis to make this point about data analysis but distinguishing exploratory and confirmatory experimental design is much less common.

I think my self-experimentation has been productive partly because it is a low-cost way of testing. All my interesting discoveries were accidents. My [2]latest omega-3 research started with an [3]accidental observation.

### Criticize by Creating (2007-08-24 16:26)

The Whole Foods - Wild Oats merger can finally take place, I was pleased to learn. A court [1]denied the Federal Trade Commission's request for a stay. The world needs more CEO's like Whole Foods CEO John Mackey. In a talk he gave at Berkeley last year, he quoted Michaelangelo: "Criticize by creating," a wise and memorable saying that I hadn't heard before. That's exactly what Mackey has done.

1. [http://www.wholefoods.com/investor/pr07\\_08-23.html](http://www.wholefoods.com/investor/pr07_08-23.html)

---

Matt (2007-08-24 18:27:07)

I thought it was interesting that [1]for years John Mackey participated anonymously in Yahoo financial bulletin board discussions about Whole Foods and Wild Oats. When his avatar was outed, [2]he temporarily discontinued posting to his blog while the matter was investigated. I wonder if he'll resume posting now, anonymously or otherwise. What do you think about it?

1. <http://www.iht.com/articles/2007/07/12/business/pseudo.php>
2. <http://www.wholefoodsmarket.com/blogs/jm/>

seth (2007-08-24 22:01:52)

I believe too much was made of his anonymous postings. I believe they were harmless.

peter (2007-08-25 10:27:01)

i don't agree that Mackey's false and misleading posts made under the guise of being just another investor were harmless. They were probably illegal and he should be pursued (and probably will be civilly) I also don't agree that the merger is a good thing. stores will be closed and competition will be reduced. how is that good thing?

seth (2007-08-25 22:34:28)

What harm did Mackey's anonymous posts do? Given hundreds or thousands of people posting, I would think it is awfully hard to know that one of them had a big effect. And even harder to know the direction of that effect. The merger is a good thing because Whole Foods is much better run than Wild Oats. The better WF policies, etc., will replace the worse WO policies, etc. Whole Foods' main competition, Mackey has said, is Trader Joe's. Trader Joe's is not going away.

## Saul Sternberg on Research Strategy (2007-08-24 21:50)

In a [1]recent post I guessed that it would be better to begin to study the effects of omega-3 and other fats on the brain with healthy subjects than with "unhealthy" ones – that is, persons with obvious brain dysfunction. So far, almost all behavioral studies of omega-3 have used unhealthy subjects – adults with bipolar disorder or depression, children with coordination problems, autism, or ADHD. My guess was based on three things: 1. A thought experiment. Imagine trying to learn how cars work. You'd rather experiment with working cars than broken cars. 2. Healthy subjects are far more available and easier to study. 3. The work of Saul Sternberg, who pioneered the study of memory using tests on which subjects are very accurate (e.g., 95 % correct). The main measure of performance on these tasks was speed (called reaction time) rather than accuracy. After his work, reaction-time experiments became far more popular. In my study of the effects of flaxseed oil, I had directly compared high- and low-accuracy tasks. I had measured the effects of flaxseed oil using two high-accuracy tasks (arithmetic and memory-scanning) and a low-accuracy task (digit span). The effects were much clearer (smaller p values) with the high-accuracy tasks.

I asked Sternberg what he thought of my guess. He wrote, "I certainly agree that it is worth studying the effects of X on "normal" brains, where X can be many things" and later added:

I suspect my decision to measure [reaction] time under conditions of high accuracy was multiply determined, and that the determinants included some speculative notions. E. g. I may have thought that the variety of strategies is greater when the system is overloaded and errors are occurring than when it is functioning smoothly, so one was more likely to get clear answers about an underlying mechanism. Also, there was something of a tradition of measuring RT in experiments on "information processing" that weren't normally described as memory experiments, but could be. Another reason was probably that I felt that RT - a continuous measure - probably contained more "information" than errors, with a few discrete possibilities, did.

It is possible that the emphasis in memory experiments on studying accuracy when the relevant brain system is failing was influenced by the study of sensory processes, where the experimental and analytic techniques (e.g., for measuring discriminability and detectability) were well worked out, and where it is believed that the enterprise has been highly successful. Also, sensory detectability and discriminability may be more intrinsically interesting and more closely related to actual situations of practical concern than accurate performance.

Nansen (2007-08-25 19:12:12)

In the case of Andrew Stoll's research on omega-3s and bipolar disorder, he did not begin with the question "What is the effect of omega-3s on mood?" He began this way: "Several years ago, we were searching for alternatives to mood stabilizers, such as lithium and Depakote, used to treat bipolar. We began investigating what we knew about the chemical mechanisms of lithium and valproate (Depakote) on the brain and discovered that these drugs are not working on the receptors, or re-uptake sites, that Prozac and similar drugs do. They work inside the cell in a process called signal transduction. "In our search, we began looking for compounds that had a similar mechanism in the brain but had never been tested before. Omega-3s, along with other compounds, came up in our search. But omega-3s had a whole list of mechanisms that certainly appeared to have mood effects in people. This discovery was very surprising, because no one had ever looked at using omega-3s in adult psychiatric disorders. Later in our research, we discovered that we are all depleted of these essential

fattyacids. "When individuals consume a diet rich in omega3s, their brain cell membranes become more fluid, allowing for smoother flow of chemical messengers, such as serotonin, in the brain." (Source: UMI, THE SATURDAY EVENING POST, 09/2001)

seth (2007-08-27 07:17:53)

Thanks, that's good to know.

### **Can Professors Say the Truth? (letter from Deirdre McCloskey) (2007-08-25 10:32)**

Yesterday, to my surprise, I received an email from [1]Deirdre McCloskey, whom I had [2]criticized. Here it is:

Dear Professor Roberts:

I imagine you are not longer open to persuasion on the Bailey/Dreger issue, having written yourself on it in no uncertain terms after reading Dr. Dreger's article and especially Mr. Carey's piece in the Times. People are like that, I know. They swallow a line hastily acquired—in this case the Bailey = Galileo, "transsexual activists" (e.g. Barres, Roughgarden, McCloskey, Conway, and other distinguished scientists) = The Inquisition—and then won't listen any more. It's one of the main supports for the culture of yelling we seem to have developed in the United States over the past couple of decades.

But in case you are more careful and thoughtful than your blog suggests, I attach a couple of attempts to persuade you that you've got the story wrong. Dreger is wrong, and what's more important in the long run a theory based on ignoring most of the scientific evidence, and appealing instead to the sort of prejudices about queers you praise in your piece, is wrong.

Sincerely,

Deirdre McCloskey

Attached to the email were copies of her Reason [3]review of Bailey's book, a [4]commentary by her on Dreger's article, and her [5]vita.

I replied:

Dear Professor McCloskey:

Thank you for writing. I am happy to have complaints about my writing but it would help if you were more specific. What in my blog wasn't "careful and thoughtful"? When you say I wasn't careful you seem to be saying there are factual mistakes in what I wrote. If so, please tell me; I would like to correct them.

In your letter, you seem to say I have "swallow[ed] a line hastily acquired." This is puzzling, since in my blog I mention writing to you about Bailey's book draft many years ago. Surely thinking about something for many years isn't hasty. One of your attachments is the review you wrote for Reason. Another puzzle

because I quote from this review in my blog.

In your article about Dreger's paper, you "deny that [you] worked 'to ruin Bailey professional and personally" but this denial is incomplete and unconvincing. It's incomplete because you don't defend the letter you wrote to the State of Illinois complaining that Bailey had practiced medicine without a license. That is exactly trying to ruin someone.

And you don't convince me that causing to be filed an absurd human-subjects complaint against Bailey constitutes some sort of virtuous act. "Complaining through channels about mistreatment of his victims"! Please. It is another example of trying to ruin someone.

In your email to me, you write:

what's more important in the long run a theory based on ignoring most of the scientific evidence, and appealing instead to the sort of prejudices about queers you praise in your piece, is wrong.

This may be the big issue to you; it isn't the big issue to me. The big issue for me is free speech. Two professors (you and Conway) with great power tried to silence someone who said something they didn't like. I titled my blog posts on the topic "Can Professors Say the Truth?" The "truth" was not Blanchard's theory; it was that Blanchard had proposed a theory, a theory that Bailey accurately described. Blanchard said something; Bailey accurately reported what he said. The accurate reporting was the "truth". Somehow it was not enough for you and Conway that Blanchard's theory, if false, would eventually be discarded. Somehow it was not enough to attack the theory; you had to attack Bailey too, and in an awful way – by filing absurd complaints with credulous and powerful bureaucracies.

Sincerely,

Seth Roberts

Today she [6]replied to my reply.

## Something is Better than Nothing: Wedding Costs (2007-08-25 21:36)

The Numbers Guy Wall Street Journal columnist [1]wrote recently about reporting the average cost of weddings. He said the averages are means, not medians, they don't include certain groups, and so on. It was one of the better numerical discussions I've seen in a newspaper.

However, it was about 25 % of an ideal discussion. When I was a freshman in college, I went to a talk about life on other planets. The speaker wrote a bunch of numbers on the board, multiplied them together, and came up with something that was supposed to estimate the number of other planets with life. After the talk, I asked, "What's the error in that number?" The speaker had no idea.

If the Numbers Guy gave his column as a talk, during the question period I would say: "You've told us what's wrong with those numbers. Thanks. I'd also like to know what's good about them." His column and [2]blog contain nothing about this.

Here's my answer:

1. Sure, the median is more interesting than the mean. Because the distribution is obviously skewed positive (like the distribution of incomes), the mean provides an upper bound on the median. If the mean is \$30,000, for example, the median must be less. That's helpful to know.
2. Assuming the distribution of wedding costs resembles the distribution of incomes, I'd guess that the median is somewhere between half and two-thirds of the mean. So the mean is providing even more useful information.
3. The false precision of some estimates (e.g., "\$27,852") indicates the numerical savvy of their source. That too is helpful to know. I will take the rest of what they say less seriously. In a talk I attended, Richard Herrnstein, the Harvard psychologist, said a certain  $t$  value was so large that he had to use a special table to find the associated  $p$  value. This was an accurate foreshadowing of the quality of The Bell Curve, which Herrnstein co-authored.

That brings us to about half of a good discussion. The other half would come from eliminating the long discussion of sampling bias. Yes, the wedding industry loves sampling methods that overestimate the average cost. I knew that before I read the column. What I don't know is a method that will tend to underestimate the average cost and thus provide a lower bound. That's what I'd like to read about.

[3]Something is better than nothing. [4]Micronutrient requirements.

James (2007-08-26 11:04:58)

To me, the real unanswered question is the net cost of weddings after gifts are accounted for. I have heard of a few weddings in the New York area (home of the nice, efficient cash gift) that have turned a profit, so the distribution may not skew positive to the degree expected. This also means that couples have an interest in keeping the perceived cost of weddings high, to encourage more-generous gifting.

### **Can Professors Say the Truth? (another letter from Deirdre McCloskey) (2007-08-26 18:23)**

In response to [1]my reply to her letter, Deirdre McCloskey wrote again:

Dear Professor Roberts,

You are not listening, which I rather expected you would not. You are satisfied with debating points rather than trying to get to the scientific truth. Is this your *modus operandi*, or are you for some reason wedded off-stage to Bailey behaviorism, say, or transphobia? I really would like to know where your indignant certitude about things you know practically nothing about is coming from.

"The big issue" for you is free speech. In what way have I or anyone else in this debate abridged anyone's free speech? We aren't the government. It's just confused to identify published complaints by private citizens about someone—justified in this case, but let's for the moment set the issue of the merits aside—with censorship or some other governmental act in violation of "free speech." People complain about other people all the time. For example, I complain about Paris Hilton.

Your confusion fits smoothly with your strange assertion, swallowed from Dr. Dreger's self-dramatizing piece published at bizarre length in a distinguished journal run by the chief Baileyite, that we have "great power." That's how the Bailey-as-brave-victim line, adopted by Mr. Carey of the NY Times from an uncritical reading of Dr. Dreger's assault on me and others, got going.

Hmm. In what does our great power lie? Professor Bailey, like us, is a senior, tenured professor. We objected to his work and to his behavior, through our writings and through channels. What exactly is the exercise of "great power" there? Isn't this power called "the power of the pen," and isn't that exactly the "free speech" you believe you are so courageously defending? The National Academy of Science, which published Bailey's unscientific book, and which has been taken over it would appear by a clique of Gay Gene theorists (I suppose it is an indirect effect of Bush's administration, but I don't know), is powerful. That's the hand of a governmental advisory body, great power indeed, right? We are a couple of professors not in sexology who objected to the mistreatment of some of our poor and ignorant friends, and objected to Bailey's theories and especially to his lack of interest in investigating the bulk of the actual scientific evidence on the matter, namely, any serious sample of the lives of gender crossers. Where's the power?

And how about our right of free speech? We complained to the licensing board about Bailey practicing psychology without a license and you regard that action as requiring defense. (One reason the board did not act, by the way, is that the physician-created statute of limitation on malpractice had run out. It has a notably short fuse.) We complained about his abuse of scientific subjects (it's his claim, not ours, that they were scientific subjects), to the proper authorities. The proper authorities took what you call an "absurd" complaint most seriously, and Bailey resigned from the chairmanship of his department.

You regard our actions not as the "free speech" you believe you are defending but as attempts to destroy Bailey.

May I suggest that you are not making sense? Criticizing people in open forums and through channels is precisely what Dr. Dreger, and now the reporter for the Times, and now you, have done. That's fine. I do not call Dreger's hysterical letters through channels against Andrea James, or her Bailey-group subsidized piece which you have so completely swallowed, an attempt to "destroy" James or me. I call her action self-dramatizing and illiberal, and I call her writings unscientific and nonsensical, politically slanted pseudo-history. I do not call your blog retailing Carey's article an attempt to destroy me or to suppress free speech. I call it a silly remark about a subject you have no experience of.

What sort of double standard are you applying to my speech but not to your own? My criticism and complaint is "an attempt to destroy." Dreger's, the reporter Carey's secondary, and now your tertiary criticism and complaint are then. . . what? I say both are free speech, the duty of serious citizens in a democracy. Go to it. Aux barricades for a free press. But stop making these unsupported claims about censorship and destroying Professor Bailey's life.

Speaking of "destroyed lives," by the way, what about our lives and the lives of the gender crossers we sought to protect? My children have not spoken to me since I transitioned, in 1995. I have two grandchildren I have not been allowed to meet. One important reason is the sex, sex, sex theory, known in the field to be of little scientific merit, which Bailey defends with shallow evidence but which is attractive to ignorant outsiders hostile to gender crossers. More widely, the sex, sex, sex theory is one potent reason for transphobia and for the numerous violent deaths of gender crossers. You may consult GenderPak on the issue, if you can rouse some scientific curiosity about the actual facts of the matter. Or you can read the hate mail I have received since Carey's piece.

Let me ask you what you would do in a similar case. I don't know what your scientific work has been, but let's be symmetrical. Suppose an economist had written a book with a exiguous selection of evidence saying that psychologists were liars and sexual perverts, and refused to risk his theory in a serious scientific test by interviewing a wide range of psychologists. Suppose he found, by searching in places where prostitutes gather, some psychologists working as prostitutes, and concluded that psychologists tended to be prostitutes. Suppose the psychologists he interviewed were very eager to get The Letter that would, they believed in their innocence, give them, say, very valuable rights to trade on the New York Stock Exchange, and suppose the economist said he would write the letter if they would talk to him. Suppose he then in addition slept with one of the psychologists, and then used the "evidence" thus acquired to support his unscientific theories in a long book published with the government's imprimatur filled with anti-psychologist lore. First, kill all the psychologists.

What would you do about the economist's unscientific claims, let us say, on your blog? And would you also complain to the legitimate authorities about the economist's unprofessional and fraudulent behavior? When someone mugs you or a friend on the street, do you report it to the police? And would your just complaints against such a character be an attempt to ruin him? Or would it be fair comment in a free society and the exercise of the rights and duties of a citizen?

You may quote anything I write, in whole or in part. My pieces are posted on my webpage, [2]deirdremccloskey.org. I expect, however, to be answered again with silly debating points. You have closed your mind on the issue, and are not open to evidence or to reason. It is a most unscientific stance. Shame on you. (That's called fair comment in a free society, dear, not an attempt to destroy you.)

Sincerely,

Deirdre McCloskey

### **Can Professors Say the Truth? (my reply to Deirdre McCloskey's 2nd letter) (2007-08-26 19:36)**

In reply to Deirdre McCloskey's [1]second letter, I wrote:

Dear Professor McCloskey,

I'm glad to hear more of your side of the story. To answer your questions:

"In what way have I or anyone else in this debate abridged anyone's free speech?" By attacking someone – Bailey – who said something you didn't like. Fearful of future attacks from you or Conway or Andrea James, others will keep their mouths shut. The term is chilling effect. Here is [2]Wikipedia's definition: "A chilling effect is a situation where speech or conduct is suppressed or limited by fear of penalization at the hands of an individual or group." Wikipedia's example is fear of a lawsuit – which you have threatened ("[3]I'm going to sue Bailey for defamation if . . . "). Minutes after I posted my second blog entry about the attacks on Bailey, the first post that mentioned you, I got an email from a wise friend. "There has been a big McCloskey/Bailey feud, I believe involving also lawsuits or the threat thereof," he wrote. It was a warning. He was worried.

"In what does our great power lie?" In four things: 1. Job security. Not only tenure – you and Conway are near the top of your professions. 2. Money. 3. Respect. Your upcoming honorary degree, for example. A recent memoir by an esteemed economist praised you for your "courage." Conway's membership in the National Academy of Engineering. 4. Knowing how the system works – in particular how to get powerful bureaucracies (such as Northwestern's) to do what you want. "We are a couple of professors not in sexology." Please. You and Conway are not average professors. What fraction of professors get honorary degrees? What fraction of engineering professors are in the National Academy of Engineering?

"What about our right to free speech?" You think calling your absurd complaints to credulous and powerful authorities "free speech" somehow defends them? I don't.

"What about our lives? . . . My children have not spoken to me since I transitioned, in 1995. I have two grandchildren I have not been allowed to meet." Yes, that is horrible. No one should be treated like

that. But the fact that you have been treated badly doesn't justify doing something awful (your absurd complaints) to someone else.

How would I react if your scenario about psychologists came to pass? I would do nothing. I'm supposed to get upset that Person X asked Person Y for a letter and before Person Y wrote that letter he asked Person X to speak to him – perhaps about the contents of the letter? On what planet is that wrong? I should react because someone "had sex with a psychologist"? I should be upset that the person "used the "evidence" thus acquired to support his unscientific theories in a long book"? We are at a curious place in intellectual history when a Distinguished Professor of this and that, soon to receive an honorary degree from a major university, thinks that a sane person might be upset that someone had sex with a psychologist.

Your complaints to powerful and credulous authorities, you say, were not absurd because they were taken seriously. ("They took what you call an "absurd" complaint most seriously.") Okay, here is why your complaints were absurd. 1. You and Conway complained to the State of Illinois that Bailey was practicing psychology without a license because he wrote letters on behalf of several persons who had come to him for help. He helped them! They came to him for help! To complain about this is absurd. To say your complaint "protects" anyone is absurd. To say what Bailey did resembles "mugging" is absurd. No one seeks out a mugger and asks to be mugged. 2. You and Conway orchestrated the filing of human-subjects complaints against Bailey. These complaints assumed that persons mentioned in stories in Bailey's book were "research subjects" – simply because they were in the book. Never before in the history of science had the subject of a story told to illustrate a point been thereby considered a research subject. Bailey's book is not a scientific monograph. It is not a piece of science. It is a trade book about science. When I or anyone else gives a lecture about a scientific subject, and tell a story from everyday life to make the conclusions come alive, do we need informed consent from everyone mentioned in the story? Of course not. No one has ever been required to do this. No one has ever done this. No one has ever even conceived of such a thing. The whole idea is absurd. Northwestern administrators may be credulous; I'm not.

Twice in your letter you combine two very different activities as if they are similar. "My criticism and complaint" is one example; "criticizing people in open forums and through channels" is the other. These two activities of yours were very different. Open-forum criticism, if factually correct, is fine with me. Absurd complaints to credulous authorities with the power to destroy someone's career are much much less than fine with me. When Dreger says you tried to "ruin" Bailey, she is referring to the absurd complaints. Not to the review in Reason.

Sincerely,

Seth Roberts

2. [http://en.wikipedia.org/wiki/Chilling\\_effect](http://en.wikipedia.org/wiki/Chilling_effect)
3. <http://www.deirdremccloskey.org/pubs/gender/bailey.php#letter>

p-ter (2007-08-26 22:22:09)

do you honestly think you're going to convince her of anything? why bother? that's not a facetious question; I'm actually kind of curious.

KimBooSan (2007-08-27 05:57:21)

I am not familiar with the whole story here – the theory in question, the actions of one researcher or the other – but I am following these exchanges with interest. To be perfectly honest, it seems you two are talking past each other. She doesn't believe you have anything to say, and you can't get her to answer the points you raise. She believes you are attacking her right to object to a theory and challenge the theorist; you are disagreeing with her methods of doing so. DÃ©tente. Personally, I certainly believe in her right to challenge the credibility of a theory, but it does seem she is taking it personally. I come from the queer community and I've known trans of all kinds; they have good reason to be defensive, to be honest. Still, I would expect more from a professional, tenured professor than condescension....hmmm, or maybe not.

seth (2007-08-27 07:15:10)

p-ter, no, I don't expect to convince her of anything. Why bother? She did two awful things – those two complaints – and I wonder how she defends them. It is also therapeutic to write about this. I was sickened by what McCloskey and Conway did to Bailey. KimBooSan, I don't mind her challenging the credibility of a theory. I mind her trying to ruin Bailey's life.

Pearl (2007-08-27 07:36:40)

I'm particularly fascinated by the fact that she continues to resort to grouping anyone who might disagree with her actions to agreeing with Bailey, as if this were the main issue at hand. The main issue is freedom of speech. And, I believe, is particularly important when in consequence to the exchanging of ideas, knowledge, and culture. If she truly believes what she is backing, there would be no need to flee from what she has done. There would be no need to make excuses or hide behind rhetorical speech to mask heinous behavior. The effort thus far exerted to silence Bailey is deplorable.

KimBooSan (2007-08-27 08:43:40)

The act of her trying to ruin Bailey's life just shows how personally she takes this whole matter. To her, defending her position is a self-evident argument and she thinks less of you for questioning it. That's why she won't debate the issue of her methods. The more she is hammered about her methods, the more she will defend her reasons. It's just silly reactionism, and Bailey is on the stick end, unfortunately. See? THIS is why I decided not to pursue a career in academia, oh so long ago!

Rachel Owens (2007-08-27 15:18:14)

I tried for days to find other studies about this particular theory by Blanchard, but apparently he's the only one that ever studied it. I think it is a wrong theory, I see evidence contrary to it every day of my life by looking in the mirror. Of course this means I am a compulsive liar. That's where the rub is, you read the book, right? The language Bailey uses to describe both type 1 and type 2 is very...offensive to say the least. I think Conway and company feel they were made fun of, mocked and insulted by Bailey's words in the book, and they think of it as returning the favor. I don't find anything in particular about the theories horribly offensive, but I do find Bailey's way of describing various women as incredibly offensive in the book. We feel insulted, degraded and spat on by this man's book, so the reactions are needless to say going to come from the gut rather than thoughtful counter-arguments from the mind.

seth (2007-08-27 18:23:09)

Would you give an example of something from Bailey's book that made you feel "spat on"?

Rachel Owens (2007-08-27 20:09:43)

Quote that seems to indicate we're stupid: "Homosexual transsexuals tend to have a short time horizon, with certain pleasure in the present worth great risks for the future." p184 Quotes that seem to indicate the only thing I'm good for is being a whore: "Prostitution is the single most common occupation that homosexual transsexuals in our study admitted to." "Nearly all the homosexual transsexuals I know work as escorts after they have their surgery." p210 Quote that indicates that I'm likely to be

a shop-lifter, and obsessed with clothing: "As for shoplifting, homosexual transsexuals are not especially well suited as much as especially motivated. For many, their taste in clothing is much more expensive than their income allows." p185 That I'm not marriage material, for the record. I\*AM\* happily married, and yes to a man, but I have a career, I did not become some stepford wife. "Do they get married? ... homosexual transsexuals are not very successful at finding desirable men willing to commit to them." p209 "They wanted to get their surgery (if they had not had it yet) and meet a nice, attractive, and financially stable heterosexual man who would marry them and take care of them ... When I was conducting my study of homosexual transsexuals, I routinely asked them if they knew anyone who had realized this dream. No one did." p186 Quotes that we're sex crazed men with vaginas that don't care about our partner of the time. "Gay transsexuals are boy crazy." p178 "ability to enjoy emotionally meaningless sex appears male-typical. In this sense, homosexual transsexuals might be especially well-suited to prostitution." p185 From an analytical point of view, I think I can see why he found what he did find. As far as I can tell, his source for 'homosexual transsexuals' was hitting up inner city gay bars. You're going to get a VERY skewed sample if your only source of people is from one sort of environment. Not all of us live in the inner city and work the streets.

seth (2007-08-27 21:35:48)

Rachel, thanks for providing those examples. These quotes describe traits that some people consider negative, yes, but not in an unfriendly or insulting way. You seem to be saying you are a homosexual transsexual. The whole book is enormously sympathetic to homosexuals, part of why it was nominated for a Lambda Award. How you have failed to see that I don't know.

Rachel Owens (2007-08-27 22:45:13)

Lambda re-examined the book more closely and revoked its status as a nominee and deemed it "Not appropriate". <http://www.planetout.com/news/article.html?2004/03/16/3> In particular this quote. "The specific issue was whether the book was transphobic," Marks told the Gay.com/PlanetOut.com Network. "The judges looked at the book more closely and decided it was." I don't find it sympathetic towards me at all, I feel dirty because of the way he talks about us. I find it degrading and insulting. I am NOT a homosexual, I dislike the terminology itself. I'm only using it when talking to you because you seem to have swallowed the theory hook line and sinker.

Geoff Davis (2007-08-28 06:35:37)

This sounds a lot like the Larry Summers fiasco: legitimate (albeit possibly misguided) discussion of sensitive issues (in both cases gender-related) leads to personal attacks with ultimately severe professional consequences. Nobody won that one.

Rachel Owens (2007-08-29 04:14:28)

[http://members.aol.com/katrinacrose/new/Dreger-Bailey\\_Bush-Libby.pdf](http://members.aol.com/katrinacrose/new/Dreger-Bailey_Bush-Libby.pdf) <http://www.intersexualite.org/Eugenics.html> Two, I guess I would say professional, commentaries on Dreger's article. One by a transwoman, another by another intersexed individual. It should be noted that Dreger herself seems to be a somewhat controversial person in her own circle of intersex organizations and individuals. Also, Exodus International and NARTH wholeheartedly support the book for study to understand how homosexuality can and should be 'cured'. I dealt with NARTH myself when I was a teenager and I was forced to undergo shock and noise aversion therapy in an attempt to make me 'more masculine' and to undo the attraction towards men that I have. These people have ENDORSED Bailey's book. They more or less tortured me as a teenager, and they support the book. How on earth can I side with people that destroyed my childhood and left me mentally scarred?

## **The Twilight of Expertise (part 11: journalists) (2007-08-27 23:08)**

Philip Weiss has written an excellent (as usual) [1]article about Matt Drudge.

“Matt Drudge is just about the most powerful journalist in America,” said Pat Buchanan.

And he's self-employed. He started way down:

This is an incredibly lonely kid, [said a friend]. He doesn't have a sister, his mother is in and out of hospitals [diagnosed with schizophrenia], the father was beside himself. In high school they treated him like shit. He was starting to lose his hair in high school; think what that does to a kid.

1. <http://nymag.com/news/media/36617/>

---

Sam (2007-08-28 06:56:42)

The other way round, think what has to be done to a kid so he loses his hair!

peter (2007-08-28 08:25:56)

it's in the genes; some people lose their hair early; the teasing etc., is incidental and, to my knowledge, doesn't cause hair loss.

### **Vitamins, minerals, and mood (2007-08-28 05:43)**

... is the title of a just-published article in Psychological Bulletin. From the abstract:

Since the 1920s, there have been many studies on individual vitamins (especially B vitamins and Vitamins C, D, and E), minerals (calcium, chromium, iron, magnesium, zinc, and selenium), and vitamin-like compounds (choline). Recent investigations with multi-ingredient formulas are especially promising. However, without a reasonable conceptual framework for understanding mechanisms by which micronutrients might influence mood, the published literature is too readily dismissed. Consequently, 4 explanatory models are presented, suggesting that mood symptoms may be expressions of inborn errors of metabolism, manifestations of deficient methylation reactions, alterations of gene expression by nutrient deficiency, and/or long-latency deficiency diseases.

I am eager to see the data. The whole brain is the same stuff. If something affects mood, it should also affect reaction time, which is much easier to measure.

Reference: Psychological Bulletin. 2007 Sep Vol 133(5) 747-760

---

Dennis Mangan (2007-08-28 21:01:49)

The way that influences on mood are characterized make it sound as the default mood is "good", while the various deficiencies, errors, alterations, etc. decrease "good" mood. But some things surely improve mood, e.g. sleep deprivation is known to

improve mood, even in those who aren't depressed. BTW, it seems that sleep deprivation and mood effects would be a perfect subject for self-experimentation.

Vitamin Nut (2008-06-24 17:11:17)

Well, I know that vitamins give me a lot of energy. If I didn't take my vitamins every morning, I would be out of gas by noon.

### **Annals of Self-Experimentation: J. S. Haldane (2007-08-28 22:40)**

[1]J. S. Haldane (1860-1936) was an English physiologist. (The better-known J. B. S. Haldane, a geneticist, is his son.)

He believed that there was no better experimental subject than the scientist himself. . . . Routinely, the accounts of his experiments involve vomiting, convulsions, trembling, confusion and sometimes memory loss. At one point, experimenting with extremes of low barometric pressure, and after writing "very wobbly" as a self-assessment on a piece of paper, he stared into a hand-mirror to check himself for the blue lips "cyanosis" that would indicate anoxaemia. He did this for a long time. Turned out he was looking at the back rather than the front of the mirror. . . .

When the Germans started experimenting with gas warfare "chlorine at first, and later mustard gas" Haldane led the race to provide effective protection for the troops. (As ever, this involved gassing himself half to death.) . . . Having heard about the gas attacks, Churchill declared blithely: "Oh, what you want is what we have in the navy. Smoke helmets or smoke pads, and you make them out of cotton wool or something. You'd better get the Daily Mail to organize the making of a million of them."

Haldane pointed out that while a pad of cotton wool clamped to the mouth might help a little with smoke inhalation, it wouldn't offer the slightest protection against chlorine gas. Yet not long afterwards Haldane returned from France to discover the Times reporting that the War Office had appealed for donations of home-made gas-masks from cotton wool or "double stockinette". Haldane, furious, was reassured that this was merely a propaganda exercise, and that the useless masks wouldn't be dispatched to the Front. Yet, again, not long afterwards 90,000 of them found their way to France "and proved just as much help as Haldane predicted.

Meanwhile, Haldane and his team worked like mad at designing effective respirators, tearing up stockings and shawls and even the young Aldous Huxley's scarf to make face-masks. The one they came up with went into mass production "but not before Haldane had to point out that the reason the women in the factory were getting their fingers burnt and their rubber gloves dissolved was that they were using caustic soda rather than, as prescribed, carbonate of soda.

From a [2]review of a new [3]biography of Haldane. Another [4]review by Lynn Truss. [5]Biographer's blog. A [6]third review.

## **Can Professors Say the Truth? (Deirdre McCloskey's 3rd letter) (2007-08-29 06:18)**

Deirdre McCloskey wrote again.

Dear Professor Roberts:

Criticizing someone is "abridging free speech"? Good Lord, how do you think the Constitutional Convention went? Have you listened to a political campaign? Have you participated in any scientific dispute? I guess not.

If Bailey is chilled, perhaps he should get out of the cold room. If one doesn't like the heat of real scientific disagreement, get out of the kitchen. Free speech is how science advances. It ain't beanbag.

You want to think of yourself as defending the weak. It's a silly thought, which you have adopted completely uncritically from Mr. Carey's journalism. You've in fact allied yourself to the most powerful and queer-hating forces in the society. Congratulations.

The "great power" is on the other foot. Relative to the Hispanic women he abused, Bailey had the power. Relative to Lynn and me (you never mention the other distinguished scientists involved, incidentally) in sexology, Ken Zucker has the power (which he has duly exercised, and which again you do not mention: perhaps it has not registered that he allocated 52 pages of his journal on sexual behavior to what the author described as history of science. Would you be the slightest bit suspicious if an editor in your field used his journal, unrefereed, in this way to defend his own views? Relative to Sex Scientists like Bailey and Zucker, and the reactionary and queer-hating people that Bailey, and now you, have inspired (look at the blogs, dear), Lynn and I, as notable queers, do not have the power. Relative to the authority of The New York Times and its "Science" worshipping and queer-hating editors (though Carey himself, I think, is gay, which of course doesn't mean he's not queer hating!), the "power" of our articles is merely, as I said, a feeble one. The feeble power of truth against prejudice and ignorance and cowardice.

You simply won't listen to the claims of the other side. You won't read. You won't consider. Nothing you say can be mistaken. Dreger got her facts exactly right. I have to conclude that you are immovable and uncritical. Bad qualities in a scientist, though in truth not all that rare in science and scholarship as they actually are.

I recommend that you get out more. Listen to a philosopher and anthropologist, Amelie Oksenberg Rorty, who wrote a long time ago that what matters in science and scholarship is

our ability to engage in continuous conversation, testing one another, discovering our hidden presuppositions [in your case: sex, sex, sex is a true theory of queers; no Hispanic queer tells the truth; ordinary scientific disagreement abridges free speech], changing our minds because we have listened to the voices of our fellows. Lunatics also change their minds, but their minds change with the tides of the moon and no beause they have listened, really listened, to their friends' [and enemies'] questions and objections

Rorty, "Experiments in Philsophical Genre," *Critical Inquiry* 9 (March, 1983); 545-565, p. 562.

Words to live by. You've given no evidence that you have listened, really listened, to anyone except the tiny group of sex, sex, sex folk, believing uncritically their recently constructed image of Bailey as Galileo. You've not done the homework, and apparently have no shame that you haven't.

Have I got you pegged right: Get a theory, any old theory, of gender crossing or of the Bailey Controversy, and stick with it, regardless of the evidence or logic, eh? Don't open your mind. Don't read. Don't listen, really listen. I know a lot of economists like this, intellectually closed; my sister tells me they are pretty common in psychology, too.

Jean-Sartre wrote in 1944 (*Anti-Semite and Jew*: it's the only book of his I have fully understood, and one the few of his writings I agree with) about a personality type:

there are people who are attracted by the durability of a stone. They wish to be massive and impenetrable; they wish not to change. Where, indeed,would change take them? . . . What frightens them is not the content of truth, of which they have no conception, but the form itself of truth, that thing of indefinite approximation(Sartre 1944, p. 18).

Until you've read, really read, my autobiography, say, or done other serious homework, listening, really listening, you're not going to find the truth. You're going to be stuck with your first impressions and your apparently very deep prejudices. I say again (I expect it will have no more effect than it has had before): shame on you for the socially bad and scientifically indefensible thing you have done.

Sincerely,

Deirdre McCloskey

Before I replied, McCloskey wrote again. I will post that letter tomorrow.

Her [1]first letter and my reply. Her [2]second letter and [3]my reply

1. <http://www.blog.sethroberts.net/2007/08/25/can-professors-say-the-truth-letter-from-mccloskey/>

2. <http://www.blog.sethroberts.net/2007/08/26/can-professors-say-the-truth-another-letter-from-deirdre-mccloskey/>

3. <http://www.blog.sethroberts.net/2007/08/26/can-professors-say-the-truth-my-reply-to-deirdre-mccloskeys-2nd-letter/>

EC (2007-08-29 10:09:11)

This argument is going nowhere. Her argument boils down to "You are close-minded, therefore you are wrong". Anyone who has to resort to calling someone close-minded probably doesn't have the facts on his or her side.

---

Rachel Owens (2007-08-29 12:14:15)

That's somewhat frightening, but I can't say as I'm surprised as heavily as SSRI's are prescribed. I think they are necessary, but they are necessary in far fewer people than actually are on the things. I've tried to live without an SSRI (I take lexapro myself). However my anxiety issues are so strong I will faint/pass out during an attack. Seeing as you have to be conscious to mentally fight a panic attack, this makes anything besides medication quite difficult.

### **How To Name a Book (2007-08-29 11:37)**

What a nice title, I thought, when I read in [1]Marginal Revolution about a collection of essays called Do Economists Make Markets?. A few glances later I realized I had misread it. The title was not Do Economists Make Mistakes?

[2]Do psychologists make mistakes?

1. <http://www.marginalrevolution.com/marginalrevolution/2007/08/what-ive-been-1.html>

2. <http://www.blog.sethroberts.net/2007/06/25/the-twilight-of-expertise-part-6-psychotherapy-continued/>

## Can Professors Say the Truth? (Deirdre McCloskey's 4th letter) (2007-08-29 21:45)

Before I could reply to her [1]third letter, Deirdre McCloskey wrote again:

Dear Professor Roberts:

Having looked into it a bit I am very intrigued by your diet, and will buy the book and try it out.

You have a lot of nerve, however, to quote Bohr— "The common aim of all science" is "the gradual removal of prejudices"—and then without self-experimentation, without consulting people like me who have self-experimented, without examining any of the literature except the sort you like, to relay to the world your prejudices about gender crossers. A lot of nerve.

Sincerely,

Deirdre McCloskey

I replied:

Dear Professor McCloskey,

I'm intrigued. What self-experimentation should I have done? [Later I realized she meant dress as a woman.]

Thank you for reading my book. Yes, Bohr's quote is relevant. Science does remove prejudices. Including the science in Bailey's book, I believe. I think Bailey's book will be a powerful force for tolerance, you think the opposite. Let history decide.

I am not anti-gender-crosser. Nor is Bailey – but I wasn't appalled by what you and Conway did to him because I liked his book. I have [2]defended Holocaust deniers and [3]praised a book with a generous view of creationism. I don't deny the Holocaust and I'm not religious. I believe everyone deserves to speak, to be heard. Everyone. Without harassment or punishment.

Sincerely,

Seth Roberts

2. <http://www.blog.sethroberts.net/2007/04/03/my-holocaust/>

3. <http://www.blog.sethroberts.net/2007/08/04/how-to-be-a-grown-up-about-evolution/>

Pearl (2007-08-30 01:38:27)

I think SLD is the answer to world peace.

Ben Barres (2007-08-30 10:54:57)

This is not simply a harmless academic debate. The welfare of a whole group of people is at stake. It is one thing to defend responsible free speech, but it is quite another to defend overt bigotry. Are transgendered people low socioeconomic liars and shop lifters especially suited for work in the sex trades? Such claims, published by Bailey under the guise of high quality science, engender and maintain the oppression, ostracization, and violence that transgendered people face. The real question is why the entire psychology community failed to question Bailey about the nature of his writings and behavior, leaving a disadvantaged population holding the bag. I applaud the heroic efforts of Lynn Conway, Deirdre McCloskey, Andrea James, and others to bring these issues to light. Although Andrea James has long ago sincerely apologized for her one act of poor judgement, Bailey has yet to utter a single word of apology and continues to strenuously defend even his claim that transgendered people are especially well suited to be prostitutes (this can be found on the audio recording of last weeks Kqed Forum show). It is a dirty business fighting bigots who often claim to care about the people they are targeting and to be proving their bigotted opinions using science. Throughout history, silence from the advantaged non-targeted groups is invariably the rule. Remarkably, Seth Roberts is not only silent and completely insensitive to the bigotry in Bailey's book, but is actively defending Bailey. The transgender community will no longer sit by silently while "professionals" claiming to care about us, write books filled with transphobic hate speech, practice clinical psychology without a license, sleep with their subjects, do research without informed consent, and do junk science that is then used to support public policy and opinion against us. Roberts is concerned about the chilling effects of trans activism on free speech, but he forgets that the only free speech under concern is overt bigotry. Why is he so passionate in his defense of bigotry? Why isn't he concerned about the chilling effects this bigotry has on a whole oppressed group of people? Ben Barres

KimBooSan (2007-08-30 11:15:15)

Great reply, Seth. To the heart of the matter, sincerely, and well said. Not much you can add to that, at all. And Pearl: Preach on, sister!

seth (2007-08-31 07:18:53)

Ben Barres: "Why is he [= Seth Roberts] so passionate in his defense of bigotry?" Ignoring the "when did you stop beating your wife?" aspect - Bailey's book is not, in my opinion, bigoted, quite the opposite - that's a good question. What you call bigotry I call speech. Claiming that certain people do not deserve to be heard has often been an early step down a well-trodden path toward being violent toward them - including murdering them. That's the short answer to your question. Thanks, KimBooSan! Although I felt my reply was slightly pompous I feel better about it now.

Seth's blog » Blog Archive » Can Professors Say the Truth? (more from Deirdre McCloskey — and the email she doesn't want you to see) (2007-09-02 04:43:10)

[...] Can Professors Say the Truth? (Deirdre McCloskey's 4th letter) [...]

Ben Barres (2007-09-02 20:03:04)

And while we are talking about violence and murder, why aren't you equally concerned about the violence that transgendered folks face or the nearly 50 % AIDS/HIV infection rate in gay and transgendered folks who have been forced into prostitution to survive because of employment discrimination or because they have been thrown out of their house by their parents as still frequently occurs with young teenage gay boys.

## Science in Action: Omega-3 (more eggs) (2007-08-30 16:15)

[1]Recently I described how, while testing flaxseed oil, I noticed that some eggs I had eaten seemed to have had a flaxseed-oil-like effect. The eggs came from grass-fed chickens; such eggs are believed to be high in omega-3. So the

inference was plausible. But was it true?

To find out, I deliberately tested eggs. I used 2.5 large eggs (2 large, 1 small) to make scrambled eggs, which I ate. Here's what happened:

The blue line shows when I ate the eggs. The red line is the average of the pre-egg reaction times. The main result is that, as suggested by the earlier data, there was a flaxseed-oil-like effect. I'm not sure what to make of the lowest point. I had eaten half of a cheese-and-mushroom crepe before that measurement. If the crepe was digested quickly, that would have reduced reaction time. (Sugar drinks clearly do this.)

Here are the accuracy values.

Mostly there was little change in accuracy. However, one value (90 %) was very low, the lowest value in a long time. It happened before the biggest changes in reaction times. It might be due to the eggs.

My main conclusion is that yes, the eggs acted like flaxseed oil – presumably because of their omega-3. In addition, the results increase my belief that this method can measure the brain effects of ordinary food and can generate ideas worth testing.

1. <http://www.blog.sethroberts.net/2007/08/20/science-in-action-omega-3-time-course-2-with-eggs/>

CD (2007-08-31 08:01:00)

Seth, Very interesting results. This might be a good opportunity to test the effect of high and low omega-3 eggs without knowing which ones you are consuming in advance (assuming the eggs taste the same).

SusanJ (2007-08-31 10:41:38)

Eggs are the only food I'm allergic to. It actually took me years to figure out that egg consumption the cause of the problem which manifested itself as a severe lack of energy. For example, I could walk very slowly but not quickly and not run even a few steps. (And this could go on for hours.) My understanding is that this could have been an immune response provoked by egg protein getting into my circulatory system somehow. I mention this because allergy to eggs is very common and could be a confounding factor.

Floyd (2008-07-24 14:49:16)

What method did you use to test the Omega-3 levels in the eggs? Did you test your blood or did you test the egg yolks themselves? Do you know of a machine or piece of equipment on the market that can test for Omega-3 levels in egg yolks?

seth (2008-07-24 16:05:28)

I didn't test the eggs myself. The packaging indicated the omega-3 value. Omega-3 levels can only be measured with very expensive machines.

### **Fish and Pregnancy Danger (2007-08-30 17:32)**

An [1]article in the latest issue of the American Journal of Epidemiology reports a correlation between fish consumption and worse pregnancy outcomes. It was done in Denmark. Mothers who had eaten fish four or more times per month during their pregnancy had babies that were less healthy on several measures of fetal growth than mothers who had not eaten fish.

The differences were small; they required a sample of about 40,000 women to detect. However, they are convincing partly because this effect was found for only fatty-fish consumption. For lean fish, the results were quite different. Organic pollutants accumulate in fat; mercury accumulates in protein, so these results are more likely due to organic pollutants than to mercury.

A reason to get one's omega-3 from flaxseed oil rather than lots of fish or fish oil.

Earlier [2]post about a study that found beneficial effects of pregnant women eating fish.

Reference: Is High Consumption of Fatty Fish during Pregnancy a Risk Factor for Fetal Growth Retardation? A Study of 44,824 Danish Pregnant Women. Th. I. Halldorsson, HM Meltzer, I Thorsdottir, V Knudsen, and SF Olsen. Am. J. Epidemiol. 2007 166: 687-696.

1. <http://aje.oxfordjournals.org/cgi/content/abstract/166/6/687?etoc>

2. <http://www.blog.sethroberts.net/2007/02/23/pregnancy-and-omega-3/>

---

Willy (2007-08-30 17:43:55)

Thanks for posting this, it is very important. I remember I read fish oil capsules are safer than fish in relation to contaminants. I don't have any link at hand, sorry.

michael vassar (2007-08-31 01:52:09)

Barely statistically significant as a measure of size, and a study of IQ showed the opposite effect recently.  
<http://www.newscientist.com/article/dn11193-breaking-fish-advice-during-pregnancy-might-benefit-babies.html>

seth (2007-08-31 06:34:18)

Thanks for the link. I should have mentioned my earlier post about that study. What does "as a measure of size" mean?

michael vassar (2007-08-31 08:19:25)

I mean that this study was simply measuring size while the other study measured IQ.

Pregnancy (2009-05-21 05:19:02)

Thank you for your information : But what can I do if I am a big fans of Shushi :p

### **My Theory of Human Evolution (guitar edition) (2007-08-31 05:26)**

In this [1]podcast, New Yorker writer Burkhard Bilger talks about the guitars of Ken Parker. A lot of research goes into them. I propose that we enjoy music because enjoyment of music creates demand for musical instruments, which leads to material-science research. My previous [2]earlier posts about human evolution have said something like this – art generates research – several times. Previous examples were visual.

Josh McDermott, a psychologist at MIT, has compared human and animal responses to music. From an in-press [3]paper:

When presented with a choice between slow tempo musical stimuli, including lullabies, and silence, tamarins and marmosets preferred silence whereas humans, when similarly tested, preferred music. . . .There appear to be motivational ties to music that are uniquely human.

1. [http://downloads.newyorker.com/mp3/070514\\_theperfectwave.mp3](http://downloads.newyorker.com/mp3/070514_theperfectwave.mp3)

2. <http://www.blog.sethroberts.net/2007/06/27/my-theory-of-human-evolution-directory/>

3. [http://web.mit.edu/jhm/www/mcdermott\\_tempo.pdf](http://web.mit.edu/jhm/www/mcdermott_tempo.pdf)

---

losing-it (2007-08-31 08:42:29)

My husband and I have thought on the subject of animal non-response (for the most part, visibly) to music. We believe it may be the complex patterns of math in music which we subconsciously intuit and respond to emotionally, whereas non-human animals (such as our cats and late dog) may not be able to recognize, appreciate or respond to in the same way we do. Our cats don't seem to respond to music recordings, except to startle at unexpected volume or impactive sound; my husband is in the audio business, and we play many types of music in the house. However, interestingly, they respond to sing-song voice when I sing to them; especially a male cat who has a medical condition which can cause seizuring. Singing soft lullabye and hymn songs calms him. If I add cat sounds and his name to the songs, he seems to take notice. I think it is because the song notes sound much like the calling and comfort vocalization tones that mother cats use with their kittens.

### Can Professors Say the Truth? (Roughgarden replies) (2007-08-31 07:27)

Joan Roughgarden has [1]responded to my [2]comment about her recent KQED [3]radio appearance. Her response includes this:

Today, in 2007 only a few, like Roberts, still take Bailey's work seriously.

In 2006, Bailey's work was featured on 60 Minutes in a [4]piece titled "The Science of Sexual Orientation." After the piece aired, a blogger criticized Bailey. Shari Finkelstein, the producer, [5]responded:

His work is highly regarded by all of the researchers in the field who we spoke with.

What a difference a year makes, if Roughgarden is correct.

1. [http://www.scientificblogging.com/joanroughgarden/the\\_bailey\\_affair\\_again](http://www.scientificblogging.com/joanroughgarden/the_bailey_affair_again)

---

Rachel Owens (2007-08-31 14:59:31)

I like how you just sort of glazed over everything she did when talking about how small Blanchard's study was, and the fact that no tests of significance have ever been done on the results. How can you avoid that? How as a scientist can you say that not having a test of significance isn't a lacking part of the studies? I've yet to find a psychologist who agrees with Bailey/Blanchard and I've been going to various doctors for my entire life, I've now seen several in my new area (Seattle). None so far has agreed with his work, and most actually LAUGH at his name, especially because of his gay straight or lying study, because he continues to use a penile plesmograph which is fairly disliked as a study tool Has anyone supported you Seth? You haven't posted anyone saying anything positive about your stance on Bailey, none at all. Shouldn't that tell you anything?

seth (2007-08-31 16:02:13)

My concern is not whether Blanchard is right or wrong; it was what happened to Bailey after his book was published. If Roughgarden justifies trying to ruin Bailey's life because Blanchard didn't do statistical tests, that needs no answer. She continues to act as if a trade book is a research monograph – really, no comment is needed. Yes, several people have supported me. For example, "Great reply, Seth. To the heart of the matter, sincerely, and well said" (via comments). And: "I think you're seeing this situation precisely as it truly is. It has been a horrible example of injustice and attack on scientists for simply telling

the truth, and I'm glad you're speaking out (and that people are listening to you)" (via email). Even McCloskey seems to think that not all I have written is nonsense, as I hope to show in an upcoming post.

Rachel Owens (2007-08-31 17:02:28)

Bailey ruined my life, albeit indirectly. I feel no remorse if his is ruined too, maybe I'm just cruel, but I have my reasons. My parents disowned and kicked me out of the house after they read his book, calling me a sexual deviant and a pervert. I have no family due in part because of the man's writing. I was homeless for a month as a result until I found a new family to replace them.

### **Avoiding Overeating (2007-08-31 11:53)**

On the Shangri-La Diet forums, Timothy Beneke has [1]posted about a creative method of avoiding compulsive eating.

Tim has been an excellent weight-loss engineer. His discovery, after losing 80 pounds, that he could lose even more by eating taste-free nutritionally-balanced mush is one reason I believe the [2]theory behind the Shangri-La Diet. The theory predicts this will work, yet the mush is quite different nutritionally than flavorless oil or sugar water.

---

Bradley Cooke (2007-08-31 13:17:17)

Seth, Do you recall your podcast interview with Glenn Reynolds of Instapundit? I heard it and have since become interested in your ideas about appetite and weight. One of the things Glenn mentioned was that he'd heard commercials from the Sugar Growers of America that stated something to the effect of "a spoonful of sugar a day lowers the appetostat". You said that was consistent with your theory... I was wondering if you'd followed up on that, to determine whether they were promoting the same thing you are today. thanks, Brad. P.S. I appreciate your defense of Michael Bailey. He's a colleague and a great guy.

seth (2007-09-01 16:56:20)

Nice to hear from you, Brad. No, I haven't followed it up. Animal experiments with sugar water added to the cage generally show that the sugar water causes weight gain; this may be because the sugar water increases water intake (which causes weight gain in lab rats), or it may be because the sugar water is drunk at the same time as regular food. But you might be right; maybe I should follow it up.

## **2.9 September**

### **Annals of Self-Experimentation: Video Games (2007-09-01 05:57)**

From an [1]article about drugs and video games:

In late 2006, as rumors of performance-enhancing drug use among pro gamers crackled, FragArcade staff writer Rance Costa used himself as the guinea pig in a Netherlands experiment. He ingested four drugs

typically reputed to heighten perception, taking a different one each morning over a four-day period. It was the nutritional supplement Focus XT on the first day, Red Bull on the second, Jack Daniels on the third, and lastly marijuana. A simple computer program tested his reaction times after he consumed each substance, and each time he was sluggish

Not so different from my omega-3 research. Will gamers start taking flaxseed oil? They [2]should. Maybe some pro gamers have done extensive self-experimentation that they don't tell anyone about. Like classified military research. Good topic for TV show: Top Secret Self-Experimentation.

1. <http://www.n4g.com/News-58077.aspx>

### **Can Professors Say the Truth? (more from Deirdre McCloskey - and the email she doesn't want you to see) (2007-09-01 23:07)**

Continuing our voluminous correspondence ([1]here, [2]here, [3]here, [4]here, and [5]here), Deirdre McCloskey wrote again:

Dear Professor Roberts:

Yup. [In answer to my question "In your last letter, by 'self-experimentation' did you mean dress as a woman?"] That should be obvious to you. That it's not, and that you sneer at the idea, is indicative. No one who has not actually tried to pass in the other gender has any idea what it is like not to pass, how dangerous and embarrassing it is. No one who has not tried the experiment can have any idea how important it is to have nose jobs and the like. It's exactly out of such non-self-experimentation, and the lack of real empathy it implies, that the God-wants-you-to-be-thus, Clarke Institute torturing comes.

I don't remember our discussion about Crossing.

You think Bailey's book will be a powerful force for toleration? I suppose you've actually looked at the evidence, right? You've consulting the blogs, and you've read the hate mail? And your conclusion is. . . what? That a wave of transphobic filth stimulated by your blog and Carey's article will lead, somehow, to the promised land? You have here a questionable social theory, but let's hope you're right.

Disagreement, as you should well know from your own self-experimentation, is not the same as "harassment." Nor is holding people to ethical standards in their scientific behavior. We didn't "do" anything to Bailey. We exercised our rights as free citizens and as ethical scientists. That you were "appalled" shows that you got fired up by Carey's article (just as he wished) and didn't bother inquire—as you easily could have done (you keep making a point of our previous e-mail relationship) but most assuredly did not before shooting off your ill-considered blog—with the principals. You wanted the story to be Bailey = Galileo, and were not going to let such silly things as evidence stand in the way. You've stoutly defended it ever since, with no heed to the evidence.

I'm not impressed that you praise Holocaust deniers, or that you give standing to naive creationism. It just shows what is evident in your defense of Bailey, that you are willing to encourage the worst in our society in aid of a simpleton's version of "fairness." You would have been "fair" to Goebbels and the Inquisition, the Ku Klux Klan and the first Chinese emperor. Your position of "Let them have uncriticized speech to advocate idiotic and harmful proposals" depends on people like Lynn and me exercising our free speech to criticize such people. You would be the first person the Nazis you defend would come for. No, actually, on second thought, you would be the second, after me.

Sincerely,

Deirdre

I replied:

Dear Professor McCloskey:

I don't "sneer" at the self-experimentation you propose. It has a long and admirable history.

I did not get "fired up by Carey's article." My blog posts on this topic appeared before his article.

I mentioned our correspondence about Crossing in my blog posts about this.

I didn't "praise Holocaust deniers" – I just think they shouldn't be harassed or silenced.

I don't mind criticism of Bailey – of course not. I mind attempts to ruin him – which is what your and Conway's absurd complaints to authorities were.

Sincerely,

Seth Roberts

She wrote again:

Dear Professor Roberts:

Let's make this a convergent series, by undertaking to answer in half the space as the last one. Your only-only-argument against our complaints about Bailey's behavior is to assert repeatedly, unadorned by evidence, that they were "absurd." Northwestern University did not think them absurd. They fired Bailey from the chairmanship; they investigated him for a year. The lawyer we consulted did not think them absurd; nor did the state licensing bureau. Alas, the statute of limitation had run out.

We did nothing to "silence" anyone. Get this: we are not the government. We argued with Bailey. We complained about his behavior. None of that constitutes "silencing," unless indeed poor, dear Bailey is too feeble for this world.

Regards,

Deirdre

I replied:

Dear Professor McCloskey:

Please see my earlier letter for a detailed explanation, including evidence, of why your complaints were absurd. No one has ever gone to a mugger and asked to be mugged. That's my evidence for your State of Illinois complaint. And no one has ever been considered a research subject because they were in a story in a trade book. That's my evidence for your Northwestern complaint.

When you say that Bailey left the chairmanship because of your complaints, you are wrong.

"We did nothing to 'silence' anyone." If you don't understand the term chilling effect, we are again at a curious point in intellectual history.

Sincerely,

Seth Roberts

She wrote again:

Dear Professor Roberts:

Anyone who is chilled by being challenged intellectually, I suppose you agree, doesn't belong in intellectual life.

Anyone who is chilled by being investigated for wrongdoing when he's done wrong is just a moral coward, as I reckon Bailey to be. You don't understand The Letter if you don't think the women were mugged. You've not walked in those shoes, or bothered to find out. You haven't read Bailey's book if you think the women were not "research subjects." He called them that, and bragged about it. After the book came out he said, oh, it was "only a trade book. Not science."

Regards,

Deirdre

I replied:

Dear Professor McCloskey,

If you believe that Bailey should be punished for helping those who came to him for help, you have a most unusual and unfortunate view of how people should treat each other.

If you can't tell the difference between a trade book and a research monograph, we are again at a curious place in intellectual history.

Sincerely,

Seth Roberts

On her website, McCloskey includes almost all [6]our correspondence. The omissions are trivial, with one exception: She doesn't include this email from me, in spite of including her reply to it. Curious!

I wrote to her about the omission:

Dear Deirdre:

Thanks for posting our correspondence on your website. I too am glad we had it. A tiny flaw: You omit my email below ("If you believe...").

Seth

No answer. One of the few letters from me she didn't answer. She continued writing to me. I believe she omitted that email from her website because it makes things too clear.

Pearl (2007-09-02 06:57:38)

"That a wave of transphobic filth stimulated by your blog and Carey's article will lead, somehow, to the promised land? " ????? How interesting that she would suggest that transphobia would be stimulated by your blog rather than by HER OWN ACTIONS. Prior to witnessing this exchange, I had within my own limited knowledge deep respect for two transgendered women within my own field. I continue to hold this respect, however now irreparably paralleled with revulsion for a handful of transgendered women who have chosen to act with immature, vile contempt towards those to refuse to "walk in their shoes." One of the transgendered women for whom I continue my utmost esteem is Wendy Carlos, a woman who burgeoned her career unfettered by her sex change, and who I deeply respect for her contribution to classical music as a PERSON. To be

honest, McCloskey's reasoning in the last paragraph starting with "I'm not impressed that you praise Holocaust deniers..." truly frightens me. Could chilling effect be any more transparent?

Rachel Owens (2007-09-02 13:45:38)

There is an inherent inability to communicate our point, and this isn't necessarily your fault, or anyone's really. We say that Bailey's book offends and degrades us. That is our opinion, you say it does not and that he is 'friendly' to us, that is similarly your opinion. We do not share that opinion. You are not transsexual, you cannot know how his book makes us feel. The book makes me feel depressed, it ruined my life, it made me homeless, it made my family turn against me. Have you ever had a book that did this to you? If not, then you can't expect to understand how it makes us feel. This book RUINED my life. I don't know how I can make that any clearer, there aren't any other words that I can use, except to say the same ones over and over again. Bailey's book forced me on the street and I had to live out of my car for three or four weeks, I don't even remember. I had to drop out of school, I had to beg for spare change until I could buy enough gas to get to a friend's house states away. I don't even really know how long I was homeless anymore, see the days blur by when you don't have a bed anymore. My mother is now in the hospital because of ovarian cancer and I cannot visit her, because they won't let me near her because I'm a filthy disgusting hedonist, all of which they got from Bailey's book. The only book that covered transsexuals they read, I was of course kicked out before I could offer something more uplifting and less degrading.

Pearl (2007-09-02 15:24:00)

Knowledge and ideas don't ruin peoples' lives. People ruin peoples' lives.

Tom (2007-09-02 19:25:47)

It is amazing the damage that people will do to avoid confronting the truth in front of their faces. Rachel's parents are blameless, Rachel is blameless, and there was never anything but love, trust and mother's milk in the Owens' home...but the book is Shiva, Destroyer of Worlds. So Bailey must be ruined, because he...wrote a book.

seth (2007-09-02 20:18:34)

Let me add two cents to this discussion: 1. One of my students, a lesbian, was kicked out of her house because she was a lesbian. No book was involved. 2. Someone in McCloskey's family - I think her sister - wanted to have McCloskey committed to a mental institution. No book was involved. This was long before Bailey's book.

Rachel Owens (2007-09-02 23:57:47)

I am certainly not blameless Tom, I could have been more tactful about my life's decisions. My father was certainly not blameless, he wanted to kick me out at 16 over the matter, the only thing holding it back was mom. My mother believed me when I told her I should have been born a girl, especially when I was diagnosed with Klinefelter's, but only until she read that book. Bailey's book completely changed my mother's opinion of me, it was black and white for her, she rapidly grew more distant. So as soon as I was 18 and some change, I was kicked out, written out of the wills and I think they even tried to get restraining orders, but I have no intent of ever going back anyway after what they said. Am I bitter? Yes, but I'm not going to weep tears when Bailey's tenured professorship is rocked a little bit when I never even got the chance to defend myself, he at least has had that luxury. I am declared scum, I was molested, abused and beaten and the cops didn't give a damn because of who I am. Nothing he said was in the slightest 'friendly' to bettering my life to the uneducated masses. Maybe to college-educated folks, they can read the book like Professor Roberts does, but the unwashed masses that read it just looked at me with scorn and only remembered the comments that "some people might consider negative" as Seth put it. As angry as I sound, it's not so much WHAT Bailey says but HOW he says it that has many of us so angry.

KimBooSan (2007-09-04 08:38:04)

I'm queer. I've known transgendered people. I've known people whose lives were ruined by the circumstances of their orientation. I worked for a GLBT newspaper, and I know from the battles our editor raged the power of words to heal or hurt. I understand what you are saying, Rachel, about Bailey: how something is said can create great gulfs in understanding what is said. I was once told by my own editor that bisexuals are not really queer; that we sit on the fence and make a bad reputation

for everyone else in the community, that we "just don't count." But those are just WORDS, Rachel. I chose to call him a bigot and call him out, but I never once tried to shut down his right to that opinion. Instead I set out to prove him wrong and a year later the newspaper was not publishing articles about the "gay community" but the "GLBT community." I could have quit, but we agreed to disagree and eventually he realized he was wrong. We changed the language and thereby changed perception, but to be honest, his perception had to change first, and I did not accomplish that by setting out to destroy him. You simply can NOT say that Bailey ruined your life. That's absurd. If your mother chose to read that book and that book ONLY and then believe that the worst of it which he presented was the truth about her own child's life, then for god's sake I have to say: You mother ruined your life. I think your efforts would be better spent showing how powerful a person you are by standing up for your rights and creating a future of hope for the other "T"s of the world as a proud role model, rather than hurling your anger at tearing down Bailey. His work will rise or fall of it's own accord, so let go of that. If he's really, really wrong, then your job is to prove that, and you will not do so by waging a campaign to silence him. ::::KBS, been there, done that.

lauraline (2007-09-06 16:18:59)

Nothing he [Bailey] said was in the slightest "friendly" to bettering my life to the uneducated masses. Maybe to college-educated folks, they can read the book like Professor Roberts does, but the unwashed masses that read it just looked at me with scorn and only remembered the comments that "some people might consider negative" as Seth put it.

I guess that, fortunately, unwashed masses aren't much for reading books... especially books written by college professors. In any case, the unwashed masses have a tendency to dislike science and discovery in general. The unwashed masses tend to get angry when scientists write about evolution, but biologists are not about to buy into creationism and abandon the study of species evolution because it makes the unwashed masses angry. Gender science and research is no different. As for Bailey's research not making your life better, who said Bailey's job was to make your life better? Researchers are interested in investigating, generating hypotheses and attempting to test hypotheses. Ideas and discoveries that come about along the way can be put to good use or bad use and often to no use at all. Researchers don't subject the exploration process to some litmus test requiring that their investigations have some tangible benefit to some person who thinks they are entitled to such benefit. As for your mother's reaction to Queen, if in reading Bailey's book she found some reason to throw you out of the house, I'd say that your mother must be both stupid and cruel. According to your report, you would more likely fit Blanchard's transgendered homosexual type. If this is so, Bailey would speculate that it is probably due to biological (inborn) factors (this doesn't mean Klinefelter's isn't a factor) and possibly to subsequent experience of adversity including early adversity and psychopathology in the family. Why would your mother think Klinefelter's makes it okay for you to be transgendered, but somehow Bailey's (Blanchard's) typology would change everything? The only thing added to the mix is the suggestion that, perhaps, your parents might have been lousy, disturbed parents. In that case maybe your mother should have thrown your father out of the house rather than you. Better yet, both parents should have started treating you with kindness, love and respect. NOTHING Bailey has written would suggest that you should have been thrown out of your parents' house. Frankly, your parents sound awful, but science is not going to adjust exploration down to a level digestible for your awful, worthless, stupid unwashed parents. The rest of us have rights in this life and those rights are not going to be defined by your ignoramous family. It is terribly sad that you have had such a difficult life through no fault of your own. You shouldn't blame yourself for how you expressed yourself. When we are kids facing adversity, it is the job of our parents to appreciate the difficult challenges we face. This isn't something the unwashed masses seem to be very good at doing. Perhaps you would have expressed yourself better if your parents hadn't been such asses. Again, that isn't because of Bailey. It is terrible that you've suffered what you've suffered but professor Bailey is not to blame. Your low-life parents decided to sever their relationship with their child because they are bigoted, narrow-minded and probably mentally disturbed people.

## Science in Action: A Puzzle (2007-09-03 03:22)

To learn how omega-3 affects brain function, I've been doing a [1]letter-counting test several times per day. I've posted [2]some results. Several times after exercise (treadmill and street walking) my reaction times were faster than expected – meaning my brain was working better than expected.

Does exercise improve brain function? In a [3]chapter on self-experimentation that he and I wrote, Allen Neuringer described several experiments in which other measures of brain function improved after exercise. I wanted to learn more about this for two reasons: 1. Reduce "noise". If I know how much exercise is needed to get the effect, I can be careful to stay below level that while doing omega-3 experiments. 2. Practical value. You might call it nature's caffeine.

So I did a little experiment. I walked on a flat treadmill for 30 minutes and did the letter-counting test several times. Here are the results:

The line shows the middle of the exercise; the exercise ended a few minutes before the first post-exercise test. To my surprise, the first post-exercise test showed no effect. I was wrong, I thought. But to my further and greater surprise later tests showed an effect in the predicted direction.

Between the first post-exercise test and the second, I took a shower. I will need to see if showers have an effect.

If not, then apparently exercise has a delayed effect. No one has ever proposed this, I'm pretty sure.

Most of my self-experimentation has studied elements of ancient life. Omega-3, for example – I believe our ancestors ate lots of seafood (the [4]Aquatic Ape Theory). They surely walked a lot.

---

Willy (2007-09-03 06:32:44)

Hi. I would try running. I think it is aerobic exercise like running which improves mood and cognition (with time). Maybe walking is not strong enough.

Tom (2007-09-03 07:08:56)

A couple of anecdotal suggestions: With me, I definitely feel sharper after exercise, but also not immediately after. I may feel duller for a couple of hours, but much more alert and "on top of it" about six hours later. This happens both on days where I do my 'sprint' training (absolute max. effort for 30 seconds alternated with 3 minutes fast walking, repeated several times) or my resistance exercise (very heavy weights, slow cadence, one set to failure.) Second, I agree with Willy that walking will give you little effect...it's not really exercise. Finally, the NY Times recently ran an article on recent research that exercise increases the formation of new brain cells, even in the elderly: <http://www.nytimes.com/2007/08/19/sports/playmagazine/0819play-brain.html>

Tom (2007-09-03 07:11:54)

another interesting study: <http://www.jneurosci.org/cgi/content/full/25/38/8680>

knackeredhack (2007-09-03 07:17:23)

Seth, as I think I mentioned before, you might want at some point to try "intervals" of cold shower bursts. Athletes use contrast bathing to speed recovery, and I'm confident it has an effect on cognitive function. Three intervals of 30 seconds each of warm vs cold was the recommendation of the physios at Bath University Sports Training Village, who look after some of our leading international competitors, including the England Rugby team, some of whom reportedly go in for more extreme exposure to cold. I've been doing this consistently and almost daily since June/July and am satisfied of the benefits. I believe mood, cognition and dealing with stress have all been better as a result. There was one week when I could not cold shower and did not always feel so fresh. Some research has been done on the effects of cold on mental function and is mentioned here:- <http://news.bbc.co.uk/1/hi/england/humber/4172097.stm> Of course, Seneca got there before us all on this one.

Timothy Beneke (2007-09-03 08:04:21)

I was a runner when I was younger and am now a big brisk walker; I've never gotten the same "high" from walking that I once got from running. A comment on showers: it is clear to me that taking hot showers, probably by increasing blood flow to the brain, causes more mental activity – I will have flurry of thought, association, memory in my consciousness when I take showers. Descartes liked to think with his head near stove; he claimed it activated brain activity. Anyway, showers may be a confound worth considering. My guess is that people tend to sing in the shower because the brain is activated there.

peter (2007-09-03 08:47:12)

art de vany would probably say that your brain would work better after a short intense burst of activity, i.e., sprinting.

On Walking « Two Newtons (2007-09-03 10:28:48)

[...] On Walking September 3rd, 2007 I love to walk and I won't be surprised if someday soon walking is crowned as king of exercise. Not running. Not cycling. Not StairMaster. Walking. It's easy on the body and appears to be good for the brain. [...]

Willy (2007-09-03 21:31:48)

How interesting knackeredhack, too bad I hate cold showers. Maybe hot increase circulation and cold increases norepinephrine and stimulates you.

Seth's blog » Blog Archive » Science in Action: Exercise (confirmation) (2007-09-08 10:42:27)

[...] Science in Action: A Puzzle [...]

## **My Theory of Human Evolution (quasi-reinforcement edition) (2007-09-03 21:32)**

[1]My theory of human evolution assumes that art evolved because it acted like a ramp. It helped bridge the technical gap between one useful tool and the next. Tools have the property that almost all the necessary knowledge is no help. If you have 90 % of the technical knowledge you need to build a gun, you can't build a gun that works 90 % as well as an actual gun; in fact, you won't be able to build a useful gun at all. The point is even clearer with computers: Until you have a vast amount of technical knowledge, you can't build even the crudest possible computer. When you finally get enough knowledge to build a very crude but working version, then increases in technical knowledge will help you improve it. But eventually you will reach a ceiling where more technical knowledge has little payoff. This state of affairs is shown by the "without art" function of this graph:

## The Function of Art

Art is different. Because we value novelty in art, and improvements in technology have obvious effects (e.g., new colors, brighter colors, sharper lines), each little improvement in technology – in the “state of the art” – is rewarded, long before that increase in knowledge helps build something more conventionally useful. Artists were the first material scientists.

Support for my assumption that evolution can build such ramps comes from a little-known psychological effect called [2]quasi-reinforcement discovered by Allen Neuringer and Shin-Ho Chung. Suppose you require a pigeon to peck a key 300 times to get food. It will peck, but slowly. Now you change the situation so that every 20 pecks a light comes on for a few seconds. Although the pigeon will not peck a key simply to turn on a light, this change will roughly double the peck rate – a huge increase given that food per peck hasn’t changed. It’s like doubling the amount of work you get from an employee without a salary increase. I use this effect daily. Given any large task, I break it into much smaller tasks and mark the completion of each one. A friend of mine found it helped to make a mark on a piece of paper each time she read a textbook page. The quasi-reinforcement effect is essentially a ramp that helps us do long tasks that would otherwise pay off only when completed.

To me, blogging is a kind of ramp: It breaks a big task (e.g., writing about my omega-3 research) into much smaller parts with reward after each one.

2. <http://www.pubmedcentral.nih.gov/picrender.fcgi?artid=1338316&blobtype=pdf>

---

peter (2007-09-04 12:51:38)

years ago i did bio-feed back training. The object was to maintain a state of mind in a particular range of brain waves (i forget the precise type of brain wave). When i maintained the desired state i got the equivalent of brownie points which were reflected on a screen and after i reached a sufficient number of points a grand finale occurred, such as a compute depiction of a volcano erupting or fireworks. this reminds me of what you call "quasi-reinforcement." you also see it on message boards, where posters appear to compete for recognition and "recommendations" of their messages. a broader inquiry would be the evolutionary purposes of what you call quasi-reinforcement and its derivatives, since it appears to manifest itself widely.

Harry Forsdick (2007-09-07 06:42:28)

Although your argument is appealing, I think you are ignoring the same nature of incremental development that happens in all of technology. For example, the Internet has been one of the most impressive technical tools to recently happen. To think that all of the parts of the Internet had to be in place and working for it to have value is wrong. There was a constant pattern of developing useful small changes in the 25 years prior to the world "discovering" the Internet – each a small refinement of previous results. That pattern of small improvements is repeated over and over in the tool making world.

Novalis (2007-09-07 12:18:54)

Seth, you may enjoy [1]The Artful Mind, which collects some recent work on what might be called "scientific aesthetics" (e.g., Zeki).

1. ## **Science in Action: Methodology surprise and improvement (2007-09-04 21:28)**

I've been using a letter-counting test to keep hour-by-hour track of how well my brain is working. The test consists of 200 trials that ask how many of four displayed letters (e.g., YCAW) are from the set {ABCD }. for YCAW, the answer is 2. Faster answers = better brain function.

For the first several hundred tests, I kept the location of the four letters constant: the center of the window. As soon as I answered, the next display appeared in the same position as the last one. The display never repeated immediately; for example UXRA was never followed by UXRA. But UXRA could be followed by UXAR. This was too easy because it looked like the A and R had switched places. This was a big difference from the usual appearance and it signalled that the answer had not changed. Overlap between one display and the next was probably important but was hard to measure.

To make the test more uniform across trials, I had the display move up and down, which eliminated overlap between one display and the next. Successive displays appeared above center, below center, above center, below center, etc.

To my great surprise, this made the task a lot easier. Here are accuracy scores before and after the change:

Before the change, mean accuracy was 94.9 % (standard error 0.2); after the change, 97.4 (standard error 0.3). The error rate was cut in half, in other words. I had no idea this would happen.

Reaction times were slightly more after the change. A treatment that changes reaction time and accuracy in conceptually opposite directions – makes the task harder in terms of reaction times (= longer reaction times) but easier in terms of accuracy (= great accuracy) – is very unusual. I don't know of any other examples.

The displays have always been big black letters on a white background – very easy to read. But this change made them seem more visible somehow. At some high level of my visual system, it was as if the contrast had been improved. It's a funny feeling because I thought I was seeing them perfectly clearly with the old procedure.

Because accuracy is better it is now closer to constant, which is what you want in a reaction-time experiment. You want as much variation in reaction time as possible and as little variation in accuracy as possible.

---

Steve (2007-09-05 05:33:54)

Is your letter-counting test software publically available?

seth (2007-09-05 09:30:37)

if you know how to use R I am willing to send it to you and help you use it.

Steve (2007-09-08 13:03:19)

I'm not familiar with R - and that's a devilishly hard thing to Google. Can you tell me the vendor or some other hind, so I can learn more about it? Thanks!

seth (2007-09-09 08:07:22)

Google "R language"

Steve (2007-09-10 08:36:27)

Thanks, that did it: <http://www.r-project.org/> But I'm still confused. It looks like R is mostly a package for analyzing and displaying statistics. Did you actually create the application that flashes letters on your screen and lets you key in an answer in R? Or do you just use R to analyze the results? If the latter, then what I'm really interested in is the actual "letter-counting test" application.

seth (2007-09-11 07:33:26)

You're right, R is not designed for data collection. But I actually created the application in R that flashes letters, etc.

## **Can Professors Say the Truth? (Michael Bailey and Alice Dreger respond to Joan Roughgarden)** (2007-09-05 05:46)

[1]Michael Bailey and [2]Alice Dreger have responded to Joan Roughgarden's [3]KQED appearance and her [4]blog post. The NY Times [5]article. Dreger's [6]paper. Bailey's [7]book.

In her KQED appearance, Roughgarden said that Bailey's book was "fraudulent" because it used the word science in its title. Here's how she said it:

The bottom headline to the cover of Bailey's book says "The Science of Gender-Bending and Transsexualism." But in point of fact, there is no science in the book, as they're apparently now agreeing. And on the whole, the book, as a work of science, is fraudulent.

Dreger notes "by this logic, the publishers of Science Times of the New York Times, the magazine Science News, and thousands of popularizations of science are also guilty of fraud."

In Pale Fire, the narrator quotes Erich Fromm's claim that in Little Red Riding Hood, the red hat is a symbol of menstruation. Does Fromm actually believe this? the narrator wonders. Dreger raises a similar question: Does Roughgarden, a professor of biology at Stanford, believe that Science News and the Science Times section are "fraudulent"?

Bailey links to a [8]page with the abstracts of twenty articles by Blanchard related to his typology of transsexuals, which I found very interesting.

Rachel Owens (2007-09-05 13:02:55)

I still am puzzled given the fact that no one has bothered to try to duplicate Blanchard's findings. Every single study there is his own, absolutely no peer reviews and most of the studies seem to have been done at the same clinic except for a few exceptions. If I were to conduct a study at an inner city clinic versus a suburban I think just about anything would show rather different results due to underlying population variance, yet he only has ONE clinic in his studies, and there is no control group. There is also a near complete lack of study by him of FTM's. At all three colleges I attended, they outnumbered the MTF's by 4-5times the number and there was far more than 1/56 of them that preferred men sexually. So it doesn't seem to match my casual observation, hey if Bailey can do it so can I!

Jason Malloy (2007-09-06 00:41:13)

*I still am puzzled given the fact that no one has bothered to try to duplicate Blanchard's findings.* This is incorrect. From the Netherlands (University Medical Center Utrecht and Gender Clinic at the VU University Medical Center in Amsterdam): [1]Transsexual subtypes: Clinical and theoretical significance

"Within a large transsexual sample (n = 187), homosexual and nonhomosexual subjects were compared on a number of characteristics before the start of treatment... **A distinction between subtypes of transsexuals on the basis of sexual orientation seems theoretically and clinically meaningful.** The results support the notion that in the two groups different factors influence the decision to apply for sex reassignment."

2. [http://akikos-planet.cocolog-nifty.com/blog/files/psychiatry\\_research\\_\\_transsexual\\_subtypes\\_clinical\\_and\\_theoretical\\_significance.pdf](http://akikos-planet.cocolog-nifty.com/blog/files/psychiatry_research__transsexual_subtypes_clinical_and_theoretical_significance.pdf)

turkey (2007-09-06 04:40:57)

I'm sure duplication studies of Blanchard will be forthcoming any day now, given how safe the research is for one's career and how congenial the environment.

seth (2007-09-06 05:23:15)

turkey, yes, that is my reaction: What a surprise that Blanchard himself no longer does research in this area.

## Marion Nestle on Omega-3s (2007-09-05 23:27)

In a January 2007 New York Times [1]article about adding omega-3s to food, Marion Nestle, the NYU nutrition professor, said this:

My experience in nutrition is that single nutrients rarely produce miracles. But it's also been my experience that companies will put anything in their food if they think the extra marketing hype will help them sell more of it.

I was [2]critical. The single nutrients called vitamins produce miraculous improvements in vitamin-deficiency diseases. In the current issue of Scientific American, Nestle is [3]more accurate:

In the early 1970s Danish investigators observed surprisingly low frequencies of heart disease among indigenous populations in Greenland that typically ate fatty fish, seals and whales. The researchers attributed the protective effect to the foods' content of omega-3 fatty acids. Some subsequent studies "but by no means all" confirm this idea.

Because large, fatty fish are likely to have accumulated methylmercury and other toxins through predation, however, eating them raises questions about the balance between benefits and risks. Understandably, the fish industry is eager to prove that the health benefits of omega-3s outweigh any risks from eating fish. [A mysterious sentence. Perhaps something was lost in the editing.]

Even independent studies on omega-3 fats can be interpreted differently. In 2004 the National Oceanic and Atmospheric Administration "for fish, the agency equivalent to the USDA" asked the Institute of Medicine (IOM) to review studies of the benefits and risks of consuming seafood. The ensuing review of the research on heart disease risk illustrates the challenge such work poses for interpretation.

The IOM's October 2006 report concluded that eating seafood reduces the risk of heart disease but judged the studies too inconsistent to decide if omega-3 fats were responsible. In contrast, investigators from the Harvard School of Public Health published a much more positive report in the Journal of the American Medical Association that same month. Even modest consumption of fish omega-3s, they stated, would cut coronary deaths by 36 percent and total mortality by 17 percent, meaning that not eating fish would constitute a health risk.

Differences in interpretation explain how distinguished scientists could arrive at such different conclusions after considering the same studies. The two groups, for example, had conflicting views of earlier work published in March 2006 in the British Medical Journal. That study found no overall effect of omega-3s on heart disease risk or mortality, although a subset of the original studies displayed a 14 percent reduction in total mortality that did not reach statistical significance. The IOM team interpreted the "nonsignificant" result as evidence for the need for caution, whereas the Harvard group saw the data as consistent with studies reporting the benefits of omega-3s.

I would have described benefits of omega-3 for which the evidence is clearer, as is done in the [4]cover story about omega-3 in the [5]current issue of Ode. Nabokov called Salvador Dali "Norman Rockwell's twin brother, kidnapped by gypsies in babyhood." I think of Ode, which put a Dali lookalike on its [6]July/August 2005 cover, and [7]Spy as linked like that.

Igor Carron (2007-09-05 23:58:06)

Seth, It is interesting to see that we do not understand why this is happening and that there seems to be even more potentially compelling examples i.e.: [http://scienceblogs.com/developingintelligence/2007/08/short\\_bowel\\_syndrome\\_and\\_the\\_p.php](http://scienceblogs.com/developingintelligence/2007/08/short_bowel_syndrome_and_the_p.php) Igor.

Timothy Beneke (2007-09-06 15:11:18)

"The single nutrients called vitamins produce miraculous improvements in vitamin-deficiency diseases." My very casual impression is that the research findings that have been showing up in the press in the last year or two suggest that there is little evidence that taking vitamins helps people; and may in fact be harmful. Yes, Vitamin C was a major success with scurvy, but most of the other empirical evidence appears to be very disappointing for vitamins... That's just my impression...

seth (2007-09-06 15:16:10)

Igor, that's a very interesting example, thanks for bringing it to my attention. Timothy, vitamins may not help when you are not deficient – e.g., don't have scurvy. There is no doubt that vitamins produce miraculous recoveries from certain diseases (or to be more precise, certain symptom clusters).

peter (2007-09-07 17:36:40)

i just got my blood test back and it shows that my HDL (good cholestrol) went from 48-50 to 58 since i've started taking flax seed oil on a daily basis. there were two subtypes of HDL measured, HDL-2 and HDL-3. Both were above the reference range. HDL-2 is better than HDL-3. (my hdl3 was way above ref. and my hdl2 was only slightly above the ref. ) The point of all this is that one measurement of the benefit of omega-3 is the effect on HDL. If Seth were to conduct a study, the measurements might include HDL2 and HDL3. It might be interesting to see if consuming DHA would increase the HDL3 more than flax seed oil.

seth (2007-09-08 08:28:49)

Thanks for the info, Peter.

asoff eracchi (2007-09-19 20:41:05)

Seth: Great stuff on your blog, I see that you have an interest in Omega oils, I was wondering whether you plan to cover Omega 5 oil. This is oil that is extracted from the seeds of pomegranates, usually by cold press methods. It has superb medicinal properties for men and women. Two California companies sell great Omega 5 oil products to include gel caps. I have been using the products of one of them for quite some time and simply adore the innovation. see: [www.pomega5.com](http://www.pomega5.com) Please review and I am awaiting to hear your thoughts on this item. asoff

## **Ditto Food: Microwave Popcorn (2007-09-06 05:03)**

In The Shangri-La Diet I argue that the obesity epidemic is due to what I call ditto food: Food that tastes exactly the same each time. Just as you will make a very deep hole with a gun if you hit exactly the same spot each time you fire it, you will produce a very strong flavor-calorie association if you eat a food that tastes exactly the same each time.

The [1]experience of a Colorado man supports this idea. He went to a doctor because of shortness of breath. He didn't smoke. His test results resembled those of workers in microwave popcorn factories, who often have lung damage because of exposure to a flavoring chemical. The doctor asked the man if he was around a lot of popcorn. "How could you possibly know that about me?" the man said. "I am Mr. Popcorn." He had eaten microwave popcorn twice a day or more for at least 10 years. When he stopped, he lost 50 pounds in six months. Apparently he made no other changes.

1. <http://www.nytimes.com/2007/09/05/us/05popcorn.html?em&ex=1189224000&en=e88ac8c3e56e25d9&ei=5087%0A>

---

fascinated (2007-09-06 12:48:01)

I find your experiments and theories quite intriguing, albeit I remain skeptical. However, the research discussed in this article seems to provide support for a generalization of your theory involving the sense of sight! [http://www.guardian.co.uk/uk\\_news/story/0,,2157226,00.html](http://www.guardian.co.uk/uk_news/story/0,,2157226,00.html)

Kevin Mullaney.com » Blog Archive » Shangri-La Diet and Science (2008-03-23 03:59:39)

[...] It doesn't seem like much of a leap that eating the same foods over and over might contribute to weight gain, provided those foods had a strong, consistent flavor and dense calories. Junk food, fast food, sugary beverages and heavily processed foods all seem to fit into this theory nicely. Seth Roberts, the author of the Shangri-la Diet, calls these foods ditto foods. I think most people would accept the idea that foods which are dense in calories are fattening. What might be surprising is how important strong, consistent flavors are. [...]

## **Loneliness and National Security (2007-09-07 14:47)**

This [1]story – about an NSA employee named Gene Carson – by Igor Vamos is so strange and affecting I would have thought it made up (like Truman Capote's [2]snakes story) except that almost every detail rings true.

I remember when you used to tell me that fruit from the supermarket is tasteless. I agree with you. If small markets work, why do we need the super markets? I miss you.

This is one of Carson's diary entries. "You" is Imogene Campbell, whom Carson wiretapped daily but never met.

Given how little I can learn about Gene Carson and Imogene Campbell via Google, maybe it is fiction. If so, Igor Vamos is a genius.

Addendum: I guess it's fiction.

1. <http://www.e-felix.org/issue5/vamos.html>
2. [http://ronrosenbaum.pajamasmedia.com/2006/08/31/truman\\_capote\\_fake\\_snakes\\_in\\_a.php](http://ronrosenbaum.pajamasmedia.com/2006/08/31/truman_capote_fake_snakes_in_a.php)

---

CP (2007-09-07 16:05:45)

Forgot the link, maybe? :o) <http://www.e-felix.org/issue5/vamos.html> By the way, I love your blog, and SLD is the best since sliced bread. Works like a charm.

Ben (2007-09-07 17:02:14)

Igor Vamos went to Reed College, like you, I think. He and I were there at the same time. One night in 1991, Igor and his crew changed all the street signs on a major street – I think it was SE Grand – to read "Malcolm X Boulevard". (The city was talking about taking the name away from some other street). The fake signs were beautifully made; the artists even manufactured fake offramp signage. That stunt alone pretty much qualifies as genius.

seth (2007-09-07 17:47:05)

Thanks, CP. Strange because I remember adding it.

## **How Things Begin (Oakland Art Murmur) (2007-09-07 23:17)**

The [1]Oakland Art Murmur is an art-galleries-open-late event that happens the first Friday of every month. It is about a year old. It started when two galleries in a cheap-rent district of Oakland got together. Soon other galleries joined them. There was a meeting at which "nothing happened" (according to a gallery manager) but they got together on paying for advertising and printing. How much did it cost each gallery? I asked. "Not much."

Each month it has grown larger. More galleries and more people. Recently the City of Oakland began a shuttle bus to take people around and a few galleries now participate that are not close to the original ones. The event has a new name, too: First Fridays Art Night. This is not as weird as it sounds; I learned that there are many First Fridays events at cities all over the country, including [2]Richmond, Virginia, and Washington, DC, but Oakland's is unusually large – around 40 galleries, whereas in Washington DC there are about 30.

In honor of Freakonomics I visited the [3]Rock Paper Scissors Collective, which turned out to be the most crowded art gallery I have ever seen. People were practically lining up on the street to get in. (Inside was a show of cartoon art and a few racks of clothes.) It felt like every artist in Oakland was there. Across the street was the opening of an exhibit of work by [4]Timothy Brown, which consisted of food or food-related things (such as spoons) in blocks of transparent plastic. I really liked some of it. Upstairs at another gallery a dozen people were finishing a meal. Each person had been given \$100 (play money?) which they used to bid for the various dishes.

I learned about the Murmur because a week earlier I had met one of the three founders of [5]The Moon, a nearby art store that opened that night. I was surprised that a senior in college (Mills) is starting a small business, much less an unusual one. At the Murmur I met a woman who had just started a [6]preschool. It was two days old. Craig's List was

involved. She had three partners. "I'm very impressed," I said. "Most people never start anything." "You're starting to walk across the street," she said.

It was way fun not only because most of the art was quite different than what I see in big-city higher-rent galleries (New Orleans, San Francisco, New York) but also because the people I met were friendly and easy to talk to. Not every conversation went well, however. I saw a guy who sells at the Farmers' Market. "Are you an artist?" I asked. Yes, he said, but that might be misleading because he was a lot of things. "What else are you?" I asked. He was too tired to answer my question, he said, "but thanks for saying hello."

Totto-Chan « Entertaining Research (2007-09-08 10:17:07)

[...] I understand Totto-Chan is a favourite book of Seth; it is one of my all time favourites too. I first read it in Tamil; I loved it but I was not too happy with the translation. Recently, I managed to get an English translation from the library and read it. In case you haven't read the book, hunt it down—it is well worth the effort. Some diligent Googling might also get you the book online (though the legality of the online versions might be questionable). [...]

Tetsuko-san Cosplay Expo « Pearl is Culturally Confused (2007-09-09 08:04:00)

[...] September 9th, 2007 Recently Seth Roberts blogged about “Totto-chan—The Little Girl at the Window”, a famous book by Kuroyanagi Tetsuko, after I sent him a picture of one of the trophies from Sports Day which occurred at my junior high school yesterday. Sports Day was mentioned in his book “The Shangri-La Diet.” [...]

## **Science in Action: Exercise (confirmation) (2007-09-08 10:42)**

During my omega-3 tests, I noticed that exercise seemed to be reducing reaction time (= better brain function). When I tested this, the [1]results surprised me: Reaction time wasn't lower immediately after exercise but became lower later. Did exercise have a delayed effect or was the shower I took soon after exercise responsible?

To find out, I did a little experiment. The earlier exercise was 30 minutes on a flat treadmill at about 2.8 miles/hour; this time I walked 30 minutes on a steep treadmill at higher speed (about 3.7 miles per hour). Here are the results:

Vertical lines show when the exercise started and stopped. This time there was improvement immediately after the exercise (unsurprising, given that it was much more intense) but even more improvement a half-hour later. I took a shower several hours later; it had no clear effect. The improvement lasted several hours before starting to diminish.

The data are very clear. They imply the earlier results can be believed: Exercise does improve brain function in an unanticipated way. Losing weight with exercise is hard; improving brain function with exercise appears easy. I want to study this effect in detail. Not only should it teach me how to improve brain function, it should also suggest the best dose of exercise for the rest of my body.

1. <http://www.blog.sethroberts.net/2007/09/03/science-in-action-a-puzzle/>

---

Willy (2007-09-08 13:56:42)

it would be interesting to compare aerobic vs anaerobic exercise e.g. running in the treadmill vs pushups.

Mark (2007-09-09 09:01:08)

See several related articles (in addition to these) that show strong correlation between aerobic exercise and increased neuronal growth factors available in the brain, specifically helping the hippocampus, and increased oxygen flow to the brain:

<http://www.nytimes.com/2007/08/19/sports/playmagazine/0819play-brain.html?ex=1345176000&en=50ec7d1aef2de5e6&ei=5090> [http://www.ncbi.nlm.nih.gov/sites/entrez?cmd=Retrieve&db=PubMed&list\\_uids=11222653&dopt=AbstractPlus](http://www.ncbi.nlm.nih.gov/sites/entrez?cmd=Retrieve&db=PubMed&list_uids=11222653&dopt=AbstractPlus)

Kevin C (2007-09-09 14:18:41)

I'm curious if exercise and Omega 3 have an additive effect for brain function. Also, is the test you use available to download somewhere so we can conduct our own brain function tests?

Seth's blog » Blog Archive » Science in Action: Exercise (more confirmation) (2007-09-10 07:38:08)

### Modern Veblen: Theory Testing (2007-09-09 12:50)

In 2000, Hal Pashler and I published a [1]paper called "How persuasive is a good fit? A comment on theory testing." For more than 50 years, psychologists had supported mathematical theories by showing that the equations of the theory could fit data. We pointed out that this was a mistake because no account was taken of the flexibility of the theory. A too-flexible theory can fit anything. However obvious this may sound to outsiders, the practice we criticized was common (and continues).

Recently I asked Hal: Is the problem we pointed out an example of something more general? Neither Hal nor I had a good answer to this. Both of us thought the practice we had criticized was what Feynman called [2]cargo-cult science – looks like science but isn't – but that was more of a derogatory description than anything else.

Now I think I have a helpful answer: What we pointed out was an example of the general point Thorstein Veblen made in [3]The Theory of the Leisure Class: The growth of worse-than-useless practices among the well-off. Foot-binding. Hood ornaments. Long words and bad writing in scholarly articles. Conspicuous waste. The [4]last chapter of Veblen's book is about academia.

## A Student's Unlovely View of UC Berkeley (part 2) (2007-09-09 21:50)

At the Huffington Post, some [1]commentators on my post "A Student's Unlovely View of UC Berkeley" denounced what they called "coddling":

That's Berkeley. No coddling.

Berkeley still is a sink or swim place, with no coddling or significant support system. So what? Grow up.

Coddling? Having your nails done, sleeping on a super-soft bed, being served a fancy dessert – that's coddling. No one needs coddling, true. But what about basic nutrition? Is being served food with enough Vitamin C coddling? I don't think so.

The student who spoke to me said that UC Berkeley did nothing to help her find out (a) what she was good at and (b) what she enjoyed. That speaks volumes about UC Berkeley, of course. Students need to learn these things about themselves – everyone does. To go through life without learning these things is a tragedy. It is not asking to be coddled to want these things.

To serve up an education that fails to provide these crucial ingredients is just as unfortunate as a parent or an orphanage serving food that fails to provide essential nutrients. The effect in both cases is the same: Development is stunted. If students weren't forced to go to schools like Berkeley in order to get a good job ("I'm here for the name" the student told me) it would be less unfortunate. But they are.

Some commentators said Berkeley was somehow better for resembling "the real world" where no one holds your hand. Huh? College students are still growing. Growing things need special environments to grow properly.

One commentator said there are ways to learn on your own: "Go to a library, surf the net, watch TV." True, there are. But UC Berkeley makes it hard for students to do this because classwork is so time-consuming. Not only does the school serve its students bad food, it makes it hard for them to find good food.

[2]The original post.

JZ (2007-09-10 19:31:46)

"The student who spoke to me said that UC Berkeley did nothing to help her find out (a) what she was good at and (b) what she enjoyed." I agree that these are important things for college students to find out, but does any college help students do this, and if so, how? Any advice that college students receive is complicated by the fact that they're trying to be fiercely independent, and it's hard to tell them very much that they'll listen to.

seth (2007-09-11 07:29:40)

Does any college help students do this? Yes. Columbia University schedules no classes on Friday so that students can more easily do internships. Many schools have classes that encourage students to do internships and volunteer work. They are often called "fieldwork" classes. I taught a class at Berkeley called "Psychology and the Real World" which did that. At Berkeley such courses are unusual; they are more common at less prestigious schools.

### Science in Action: Exercise (more confirmation) (2007-09-10 07:18)

How little exercise will produce the reaction-time-lowering effect I've found ([1]here and [2]here)? I decided to measure the effect of a 10-minute walk from a BART stop to a cafe. (Nicely integrating work and work.) But I got off BART at the wrong stop and my 10-minute walk took 40 minutes.

Here is what happened:

Just as with a 30-minute treadmill walk, the effect was delayed.

This is more support for the idea that exercise temporarily improves brain function. The novelty in this particular experiment is that the exercise was "real" rather than on an indoor treadmill.

For comparison, here are earlier results from much more strenuous exercise (30 minutes walking uphill on a treadmill):

The effect of more strenuous exercise was larger and lasted longer. With the easier exercise (the stroll) there was a downward spike in reaction time; with the more difficult exercise (the climb) there was a more crater-like effect. The spike shape suggests the effect was sub-maximal; the crater shape suggests that the maximum effect was reached. Which makes sense because the climb was close to maximum effort, whereas the stroll was far below it.

A kind reader pointed to a [3]NY Times article on the brain effects of exercise. "Exercise can, in fact, create a stronger, faster brain," says the article. "Create" refers to neurogenesis. The effects I've observed are more temporary – more like adding better fuel to a car.

"The human brain is extremely difficult to study, especially when a person is still alive," says the article. Not entirely true.

3. <http://www.nytimes.com/2007/08/19/sports/playmagazine/0819play-brain.html?ex=1345176000&en=50ec7d1aef2de5e6&ei=5090>

---

Timothy Beneke (2007-09-10 08:03:00)

For what it's worth, a general finding about performance and the presence of others, which is believed to be an effect of arousal. We perform well-learned easy tasks, like simple arithmetic or tying our shoes better, faster, when in the presence of other people. The presence of others is arousing physiologically and that makes it easier. We perform more novel, difficult tasks worse in the presence of other people; it is believed because we are more aroused. It was suspected that this was because we feared being judged by others, but it holds even if the others present cannot see us. Robert Zajonc is the one who theorized all of this, that is, made sense of the disparate findings about performing better or worse around other people. I wonder if the arousal effects of exercise might differentiate in terms of easy versus difficult tasks.

Willy (2007-09-10 15:10:44)

Am I reading the results right?. The peak effect of exercise is after 1-2 hours?. I think this is important to schedule exercise the right time before you need to be sharper. Thanks.

Tom (2007-09-10 17:52:48)

It looks like anyone who isn't hitting the gym right before taking the SAT or Bar exams is making a big mistake!

seth (2007-09-11 07:31:43)

That's right – the peak effect of exercise is afterwards.

## **How Could We Be This Wrong about Medicine? (2007-09-11 07:24)**

Robin Hanson's excellent [1]essay in Cato Unbound is a proposal to cut medical spending in half. The evidence suggests that this would do little harm and it would help us focus on more helpful activities. I like the way this article summarizes the RAND experiment, searches for the right metaphor, and answers objections.

One question Robin answers is "How could we be this wrong about medicine?" My answer is different than Robin's. I point to the way many scholarly and scientific disciplines start off useful and [2]become useless. In the case of medicine, the lack of benefit is easier to measure. Try measuring the value of a class in 18th Century English Literature.

1. <http://www.cato-unbound.org/2007/09/10/robin-hanson/cut-medicine-in-half/>

2. <http://www.blog.sethroberts.net/2007/09/09/modern-veblen-theory-testing/>

---

Robin Hanson (2007-09-11 11:12:26)

That is also a valid reason why we could be so wrong. I can also think of other reasons, such as the analogy to investment advisors who seem to on average provide little value.

## Science in Action: Exercise (15-minute walk) (2007-09-11 10:37)

Exercise reduces reaction time, I've [1]found. What's the threshold? I wondered – how little exercise do you need to get the effect? I wanted to know so that in my omega-3 experiments, I could be active – e.g., walk to a cafe – without distorting the results. Also, for practical reasons, I wanted to produce the effect as easily as possible.

To learn more about the threshold, I walked on my treadmill for 15 minutes at a comfortable speed (2.8 miles/hour). Here's what happened:

If anything, the short walk increased reaction time. [2]Thirty minutes of walking produced a clear (and [3]repeatable) decrease, so the the effect appears to require between 15 and 30 minutes of walking.

I did this experiment three days ago. Self-experimentation is many times easier than conventional science; blogging is many times easier than conventional publishing. A powerful combination, I hope.

1. <http://www.blog.sethroberts.net/2007/09/10/science-in-action-exercise-more-confirmation/>

2. <http://www.blog.sethroberts.net/2007/09/03/science-in-action-a-puzzle/>

3. <http://www.blog.sethroberts.net/2007/09/10/science-in-action-exercise-more-confirmation/>

---

Bob (2007-09-11 10:56:06)

In this set your pre-walk reaction times are lower than in any other experiment. I'm not surprised that you don't see an effect in this set because you're already responding faster than you do in other sets (even post-exercise). Any speculation on why you did better across the board on Saturday? This is my first comment to your blog so I also want to take a moment and thank you for the consistently intriguing posts.

seth (2007-09-11 11:07:49)

Thanks, Bob. Why I did better across the board? My reaction times have been steadily going down for a long time. I'm just learning the task better and better; how long the learning has continued (hundreds of tests) surprised me when I did the analysis that showed it. This experiment was followed by another experiment in which I did see an RT decrease due to exercise.

### **Modern Veblen: Flight From Data (2007-09-11 21:12)**

I read [1]The Theory of the Leisure Class by Thorstein Veblen during college and was very impressed. One of the book's main points is that wealthy people advertise their avoidance of "dirty" work. Long fingernails on women. Obscure and elaborate phrases in academic articles. "The advantage of the accredited locutions lies in their reputability; they are reputable because they are cumbersome and out of date, and therefore argue waste of time and exemption from the use and the need of direct and forcible speech," wrote Veblen.

A friend of mine does research for an oil company. Several years ago, the oil company he worked for (Company X) was bought by another oil company (Company Y), which merged their research departments. Company X's research group moved to the research campus of Company Y. Following the move, each Company X researcher was asked to give a talk about his recent work. My friend wrote an abstract for his talk. The seminar coordinator – from Company Y – came into my friend's office with his abstract and said to him, "Could you deemphasize the parts involving real data? We don't deal with real data here."

This was true. The Company Y researchers included many theorists, heavily into abstruse mathematical models. Others were coding new algorithms and relied on model "data" for testing, but not actual data. In contrast, many of Company X's researchers, including my friend, "got their hands dirty." After my friend's talk, several people told him how nice it was to hear about real data.

You can see this tendency everywhere at UC Berkeley, from English to Statistics to Engineering to Psychology. Disciplines that began closely connected with reality and everyday concerns moved farther and farther away. A few days ago someone complained to me about a class where students graded each other's papers. That's academia, I said.

Nansen (2007-09-13 17:46:49)

John Maynard Keynes wrote: "Too large a proportion of recent 'mathematical' economics are mere concoctions, as imprecise as the initial assumptions they rest on, which allow the author to lose sight of the complexities and interdependencies of the real world in a maze of pretentious and unhelpful symbols." – The General Theory of Employment, Interest, and Money (1936)

### **Laboratory Confidential (2007-09-12 13:54)**

A friend of mine has started to wonder how to find scientists he will feel comfortable working with. For the past year, he has been working in a lab in a very prestigious institution. He wrote me about it:

The director of my lab is a very successful scientist. She is also director of the research facility. Our personalities blended well initially, but then we grew apart. She is very nice, very busy, and impressively ambitious. Despite her genuine desire to be nice, honest, and good teacher, her ambition is supreme – above honesty and integrity from my point of view.

My biggest issue has been her caring more about her own advancement than about the discovery of truth. She does not blatantly lie about her research results, but she profoundly modulates her research efforts based upon what she believes will give her the success she seeks. I realize that on the face of it there is not anything unethical about ambition directing the evolution of research. However, I am not comfortable with the degree to which the research in this group is shaped by its leader's ambition.

What has had the biggest effect on me is realizing that it isn't just her. The rest of my group has allowed her to pursue her strategies. I have realized that I don't want to pursue research in a culture where ambition is above all, particularly the pursuit of truth.

What's an example? I asked. He replied:

We had an interesting result in a study we did. Accompanying this result was an unusual artifact. It is my impression that my director did not want to publish our good result because she was hesitant to admit that we observed this unusual artifact. I believe that the unusual artifact could negatively impact the use of fMRI to investigate pharmacological drugs that affect the brain – a big research market. It is not a lie to not publish a result. However, I don't like not being able to speak frankly about the implications of a result.

This is an advantage of self-experimentation I hadn't thought of.

Addendum: "It is not a lie to not publish a result." In The Shangri-La Diet I use Vladimir Nabokov's term doughnut truth – the whole truth, nothing but the truth, with a hole in the truth.

For those who like to ponder about research ethics « Entertaining Research (2007-09-12 20:54:46)

[...] For those who like to ponder about research ethics Here is a quote from one of Seth's post: We had an interesting result in a study we did. Accompanying this result was an unusual artifact. It is my impression that my director did not want to publish our good result because she was hesitant to admit that we observed this unusual artifact. I believe that the unusual artifact could negatively impact the use of fMRI to investigate pharmacological drugs that affect the brain â€” a big research market. It is not a lie to not publish a result. However, I don't like not being able to speak frankly about the implications of a result. [...]

michael vassar (2007-09-13 07:05:01)

I think that modern tenure track is simply too competitive for anyone who isn't destructively competitive to have a chance unless they start with a huge advantage, like say having a half dozen + papers as an undergrad.

michael vassar (2007-09-13 07:05:29)

or a Nobel Laureate thesis adviser who actually cares, you know.

Tom (2007-09-14 01:33:56)

A lie of omission is a lie.

seth (2007-09-14 21:11:21)

Tom, the lab director would say you can't publish everything. To which I would say: Is it misleading to not publish the unusual artifact? Yes.

### **Joyce Hatto and Ranjit Chandra: Separated at Birth? (2007-09-13 06:42)**

In the current New Yorker, Mark Singer, one of my favorite writers, [1]describes the "incredible career" of the late Joyce Hatto, a British pianist. According to her husband, she had a stillborn twin brother. Could that brother have in fact lived, and become Ranjit Chandra, a Canadian immunologist?

Consider the similarities:

1. Accolades. Toward the end of her life, Hatto released dozens of recordings that elicited great praise. "One of the greatest pianists I have ever heard," said one critic. Chandra was awarded the Order of Canada, the country's highest honor.
2. Man of mystery. Hatto recorded several concertos with Rene Kohler and the National Philharmonic-Symphony Orchestra but "there was no mention of him or the orchestra in any reference book," according to Singer. Saul Sternberg and I could not locate Amrit L. Jain, author of a study with the same results as one of Chandra's studies. Nor could we locate his institution ("Medical Clinic and Nursing Home").
3. One strange fact after another. Many of Hatto's performances were identical or almost identical to performances by others. As Saul Sternberg, Ken Carpenter, and I examined Chandra's papers, we discovered many unlikely or impossible details. Our letters to editors about this are [2]here and [3]here.

[4]

More about Chandra, who has sued the CBC (Canadian Broadcasting Corporation) over its documentary about him. [5]Part 1 of that documentary, for which Chris O'Neill-Yates won a journalism award.

5. [http://www.cbc.ca/clips/ram-newsworld/chandra\\_1.ram](http://www.cbc.ca/clips/ram-newsworld/chandra_1.ram)

---

j n kalhan (2007-11-24 10:07:38)

It is not true. I have personal knowledge. Dr. Chandra has no twin brother.

### **Modern Veblen: The Less-Than-Obvious Value of Evolutionary Explanations (2007-09-13 19:28)**

An interesting Economist [1]article about sex differences in a visual task calls an evolutionary explanation a "just-so story." I don't know if the late [2]Stephen Jay Gould, evolutionary theorist, Harvard professor, and "one of the most influential and widely-read writers of popular science of his generation" ([3]Wikipedia), invented this form of dismissal, but certainly he was fond of it. [4]Here, for example:

Evolutionary biology has been severely hampered by a speculative style of argument that . . . tries to construct historical or adaptive explanations for why this bone looked like that or why this creature lived here. These speculations have been charitably called "scenarios"; they are often more contemptuously, and rightly, labeled "stories" (or "just-so stories" if they rely on the fallacious assumption that everything exists for a purpose). Scientists know that these tales are stories; unfortunately, they are presented in the professional literature where they are taken too seriously and literally.

Well, this is seriously wrong. My work contains several just-so stories – evolutionary explanations of the [5]morning-faces effect and of [6]the mechanism behind the Shangri-La Diet, for example. My [7]theory of human evolution might be called a just-so saga.

These explanations made me (at least) believe more strongly in the result or theory they explained – which turned out to be a good thing. My morning-faces result was at first exceedingly implausible. The evolutionary explanation encouraged me to study it more. After repeating it hundreds of times I no longer need the evolutionary explanation to believe it but the explanation may help convince others to take it seriously. The evolutionary explanation connected with the Shangri-La Diet had the same effect. My evolutionary explanation of the [8]effect of breakfast on sleep led me to do the experiment that discovered the morning-faces effect. My theory of human evolution led me to try [9]new ways of teaching, with good results.

Why did Gould make this mistake? Thorstein Veblen wrote about our fondness for "invidious comparisons." We like to say our X is better than someone else's X. Sure, evolutionary explanations may be hard to test. That doesn't mean they're worthless. Like many scientists, Gould failed to grasp that [10]something is better than nothing.

Addendum: Perhaps the Economist writer had read a recent [11]Bad Science column that began:

I want you to know that I love evolutionary psychologists, because the ideas, like "girls prefer pink because they need to be better at hunting berries" are so much fun. Sure there are problems, like,

we don't know a lot about life in the pleistocene period through which humans evolved; their claims sound a bit like "just so" stories, relying on their own internal, circular logic; the existing evidence for genetic influence on behaviour, emotion, and cognition, is coarse; they only pick the behaviours which they think they can explain while leaving the rest; and they get themselves in massive trouble as soon as they go beyond examining broad categories of human behaviors across societies and cultures, becoming crassly ethnocentric.

"They only pick the behaviours which they think they can explain" – how dare they!

Tom Myers (2007-09-14 07:13:43)

I'm not sure you are disagreeing with Gould's actual point: just-so stories, those which assume that "everything exists for a purpose", are taken "too seriously" in the actual literature. That doesn't mean that they shouldn't exist, or that evolutionary biologists should stop constructing them (especially in dinner conversations, or just with a glass of wine); it certainly doesn't conflict with your observation that something is better than nothing. I haven't found evolutionary biologists (my brothers and uncle) to be reluctant to come up with just-so stories; they just don't take the stories very seriously until they turn into testable ideas. My ornithologist/environmentalist brother did, long ago, have an American Bird column on [1]"Facts, Inferences and Shameless Speculations" ; it's unfortunately the case that not all scientists are good at keeping track of the differences between these categories. I'm sure your orientation really is different from Gould's; it's likely that you would view an explicit list of shameless speculations as having higher value than he, and I might agree—I sometimes thought he was looking for [2]spandrel-stories where others might look for purpose-stories. Still, as the list got longer and longer, I think you would want to put down the wine-glass and start looking down that list for something testable, i.e. something definite enough so that it might be found to be wrong. I predict that you would find that some evolutionary psychology people would be with you, indeed might be ahead of you... and that others, in particular the ones Gould is fussing about, wouldn't. (But my predictions are mostly wrong.)

1. <http://www.google.com/search?q=%22Facts%2C+Inferences+and+Shameless+Speculations%22>

Timothy Beneke (2007-09-14 07:53:10)

Interesting blog. It's a tricky business. "Just so" stories make good servants but bad masters. If the just so story gives us a hypothesis we can confirm or disconfirm then it can lead to breakthroughs, as in Seth's work on weight control or faces in the morning; if the story can't be falsified, then it's an appeal to intuitive plausibility and may or may not be true. But sometimes all we can do is generate hypotheses and hope that future evidence will emerge and confirm or disconfirm them. And sometimes we can theorize in a way that our theories will never be confirmed. The problem is treating hypotheses as truths – or treating hypotheses about reality as accurate representations of reality without being honest about it, which is I suspect what Gould is complaining about. It is a form of intellectual corruption that's common. It's often noted that Freud is full of these just so

stories that can't be confirmed; yet a charismatic therapist can foist them on patients and convince them they are true. One problem in therapy is knowing what's a valid insight; people can have what feels like insights that aren't, like insights that they were sexually abused as children and that explains their difficulties; or at the fringes, insights about past lives. It's also useful to distinguish theorizing not based on any methodically derived evidence from insight that is. Most scientific psychology tries to theorize based on scientific evidence. But in a lot of social theory and sociology, people will state that the world is like X, without showing it, and then theorize about why. I know because I've done it, and it passed peer reviewers in sociology easily...

### **The View From MIT (2007-09-14 11:50)**

I have blogged many times about the problems with UC Berkeley's undergraduate education ([1]here, [2]here, and [3]here, for example). For all the conventional talk about "the value of diversity", I never see recognition of diversity of interests and diversity of skills. Everyone in a class is taught the same material (and expected to be interested in the same stuff as the professor); and everyone is graded the same way (and expected to imitate the professor). Of course, UC Berkeley is hardly unique. Practically all higher education works this way, more or less. Berkeley is just the example I know. It is a particularly egregious example given the diversity of vocational interests among its students (much more diverse than Caltech, say), its status as a public institution (with a charter to serve the public rather than its professors), and the exceptionally high research focus of its professors (making them even less interested in [4]what students want).

At a school like Caltech or MIT, the talents of the students are closer to the talents of the professors, but I heard David Brin, the novelist, complain that after he finished Caltech with a low GPA he felt like a worthless human being. Caltech and MIT, like Berkeley, also fail to teach their students about the outside world. From an [5]MIT professor:

Most of the sweeping generalizations one hears about MIT undergraduates are too outrageous to be taken seriously. The claim that MIT students are naive, however, has struck me as being true, at least in a statistical sense. [Could the MIT faculty have anything to do with this?] Last year, for example, one of our mathematics majors, who had accepted a lucrative offer of employment from a Wall Street firm, telephoned to complain that the politics in his office was "like a soap opera." More than a few MIT graduates are shocked by their first contact with the professional world after graduation. There is a wide gap between the realities of business, medicine, law, or applied engineering, for example, and the universe of scientific objectivity and theoretical constructs that is MIT.

It's Veblen again: MIT professors would rather teach "scientific objectivity and theoretical constructs" than "the [dirty] realities" of the world in which their students will spend the rest of their lives. Law schools, especially elite ones, are notoriously like this: To teach how to practice law is beneath the dignity of their professors.

August (2007-09-14 12:33:03)

Another view from M.I.T. [http://video.google.com/videoplay?docid=-7603731854830368188 &q=fab+labs &total=79 &start=0 &num=10 &so=0 &type=search &plindex=0](http://video.google.com/videoplay?docid=-7603731854830368188&q=fab+labs&total=79&start=0&num=10&so=0&type=search&plindex=0) Hopefully the link works. Its a Ted Talk from Neil Gershenfeld. He's started something called Fab Labs (fabrication). Anyway, it's fascinating, and it proves demand driven education works. I can't go into a full description here, but I think this is a great model for how things could work. He has a book out there by the same name too.

Bob V (2007-09-15 06:45:35)

I wouldn't be so concerned with an undergraduate commenting that his office is "like a soap opera." Such rhetoric is the stuff of small talk. When I was a consultant, I would often talk to past associates about the zoo that my current project is or relate the dramas going on in my old project. Now that I am back in academia, I talk to my old friends about the "soap opera" that is my current department. Maybe MIT can do a better job of preparing its graduates. However, I don't take such comments as an indication that they are not doing a good job of it now.

## How to Answer Your Critics (2007-09-14 21:01)

From [1]Vanity Fair:

As for the thousand or so members of the online "Rachael Ray Sucks Community" "a pack who delight in obnoxious nicknames (Retchel, Raytard), mock her smile, hate her vocabulary ("yum-o" especially), criticize her over-reliance on canned chicken stock, and think she dresses like Greg on The Brady Bunch . . . Ray answers such critics by agreeing with them. "Most of what they say is absolutely true. I don't know how to bake. I didn't make my own pierogis in episode whatever. You can't be all things to all people."

Not bad.

## How Accurate is Epidemiology? (part 1) (2007-09-14 21:56)

Adding to [1]earlier discussion of that question, [2]here is an excellent article in the LA Times.

Addendum: A long [3]article in the NY Times on exactly this question appeared minutes after I posted the above.

1. <http://www.blog.sethroberts.net/2007/06/21/strengths-and-weaknesses-of-epidemiology-a-semi-insiders-view/>
2. <http://www.latimes.com/features/health/la-he-epidemiology17sep17,0,4034843.story?page=1&coll=la-home-mid-right>
3. <http://www.nytimes.com/2007/09/16/magazine/16epidemiology-t.html?pagewanted=all>

---

Tom (2007-09-15 06:46:50)

Seth, the author of the NYT article is Gary Taubes, a brilliant science writer who writes a lot about how the conventional wisdom is often wrong. (He has a book coming out that lines up nicely with your Shangri-La work.)

seth (2007-09-15 12:00:48)

Yes, that's important. Taubes's previous article in the NY Times Magazine was "What if it's all been a big fat lie?" – meaning the idea that low-fat diets are a good way to lose weight. This one article, in 2002, caused a big national boom in low-carb diets, including Atkins and South Beach. I have been waiting for the book ever since.

### **Modern Veblen: Determinants of Conspicuous Consumption (2007-09-15 11:47)**

At Marginal Revolution, Alex Tabarrok has an [1]interesting post about black/white differences in what Thorstein Veblen called conspicuous consumption. It begins:

Several years ago Bill Cosby chided poor blacks for spending their limited incomes on high-priced shoes and other items of conspicuous consumption instead of investing in education.

The comments are fascinating, including this:

Merely being white is a way of signaling wealth. If you don't believe it, visit Peru.

1. <http://www.marginalrevolution.com/marginalrevolution/2007/09/politically-i-1.html>

---

Willy (2007-09-15 15:35:58)

Excellent, I always noticed that if you are white you can enter a shop with not too good clothes and nobody cares.

seth (2007-09-16 09:52:37)

But if you were black and wore not-too-good clothes that was a problem? That's interesting. Where did you notice this?

Tom (2007-09-16 13:18:18)

Seriously, Seth? You've never seen this, anywhere?

seth (2007-09-16 21:11:20)

That's right – I've never seen it. The only shopping I do much of is food shopping in an upscale neighborhood. Persons, black or white, wearing not-too-good clothes are never seen. I'm curious where exactly he is talking about.

### **Why I Blog (2007-09-15 22:53)**

Could this have something to do with it?

The sign says: Will listen to your story for free. Outside a Tokyo train station.

From [1]Pearl is Culturally Confused.

[2]More about blogging and listening.

### How to Raise HDL (2007-09-15 23:13)

This piece of a [1]discussion at the Google Group sci.med.cardiology fascinated me:

[My] HDL was always around 32, until I dropped the low fat nonsense about 7 years ago. Adding healthy fats and dropping carbs brings my HDL to about 70 while boosting my LDL almost none. And after the HDL shot up, the low-carbing continued to produce weight loss without difficulty. I've never felt better in my life and I am 63 now.

I would like to raise my HDL. The advice I've read (do a long list of things) hasn't helped. For example, one bit of advice was to lose weight. I did lose weight and my HDL briefly got much better. I kept the weight off but my HDL did not stay high. Whereas whatever this guy did had lasting effects. I tried to find out more about what he did but, alas, he didn't answer my email.

1. [http://groups.google.com/group/sci.med.cardiology/browse\\_thread/thread/398f4b7cfb9b325e/661ffbcblad735cf?lnk=raot&hl=en#661ffbcblad735cf](http://groups.google.com/group/sci.med.cardiology/browse_thread/thread/398f4b7cfb9b325e/661ffbcblad735cf?lnk=raot&hl=en#661ffbcblad735cf)

---

James (2007-09-16 15:33:25)

It's been established that low HDL is associated with metabolic syndrome and there's some evidence that low-carb diets improve metabolic syndrome ([http://www.nlm.nih.gov/medlineplus/news/fullstory\\_52485.html](http://www.nlm.nih.gov/medlineplus/news/fullstory_52485.html)), so the author's experience does not appear to be unique. In your case, Professor Roberts, it appears that isolated low HDL (i.e., low HDL with normal-to-optimal triglycerides and LDL, which I'm wildly assuming is what you have) is associated with, among other things, active

weight loss, a low-fat diet, and starvation...all of which I've certainly experienced on the SLD. (Down 74 pounds. Thanks!) From some Googling, it's not clear whether these causes of low HDL carry the same cardiovascular risks as the more common metabolic-syndrome-type causes.

Stephen M (Ethesis) (2007-09-16 19:34:29)

Sounds like he was on an Atkins/South Beach sort of diet. That will raise fat and is the low carb weight loss program most people try.

Jen (2007-09-16 20:28:01)

The trio of low HDL, high triglycerides, and small, dense LDL particles, commonly found together as components of metabolic syndrome, all respond nicely to carbohydrate restriction. Reducing the glycemic load of the diet by substituting fat and protein for carbohydrate will almost always lower triglycerides substantially. Most people will see a significant rise in HDL. In addition, carbohydrate restriction shifts LDL to the less dense, less atherogenic form. Other ways to raise HDL include exercise, niacin, and moderate consumption of alcohol.

Dave Lull (2007-11-04 19:42:38)

A cardiologist suggests supplemental vitamin D: <http://heartscanblog.blogspot.com/2007/02/hdl-and-vitamin-d.html> <http://heartscanblog.blogspot.com/2007/04/more-vitamin-d-and-hdl.html> But, he says, be sure it's "an oil-based capsule, a gel-cap, not a tablet": <http://heartscanblog.blogspot.com/2007/03/vitamin-d-must-be-oil-based.html> And D3 not D2: <http://heartscanblog.blogspot.com/2007/08/vitamin-d2-belongs-in-garbage.html>

Dave Lull (2007-11-05 09:07:49)

Commenting on a posting about diabetes and vitamin D, at another blog, this same cardiologist said: ". . . a [vitamin D] gelcap is essential, though an internist recently flew in to see me from Kansas City to show me the phenomenal effects he's experienced on his spinal disease taking a tablet form along with a tablespoon of olive oil. (He's tougher than me!)" <http://diabetesupdate.blogspot.com/2007/10/vitamin-d-lowers-insulin-resistance.html> #c7508352879127444206

Tamara (2007-12-11 09:23:53)

I just found out yesterday that my HDL is a whopping 90 (!!!). This is a big change from 2 years ago when my TOTAL cholesterol was 87, and my MD warned that it was too low. I was on an organic vegetarian diet at the time. He encouraged me to eat more eggs and animal products. At that time I began to eat extremely natural foods, most from my local Amish farmer (grassfed meats and eggs, and raw milk products). I also added a heavy dose of cod liver oil daily, a bunch of superfoods like bee pollen, chlorella, spirulina, brewers yeast, & blue green algae. I make & eat bone broths, naturally fermented foods like freshly-made sauerkraut and kombucha and kefir. Homemade ice cream made with raw light cream (no milk or fillers! amazing!!!). I also have an intense weakness for 87 % organic dark chocolate. The veggies, fruits, and grains that I eat are mostly organic; I try to soak the grains as much as possible before eating. But most of the time I'm eating sprouted grain bread (Ezekiel) with raw butter (lots). As far as oils, I have very little vegetable oil in the house...only organic olive oil, which I never cook with; only on salads in the summer or sometimes poured on already-cooked veggies. I cook with organic ghee or coconut oil. My MIL watches what I eat and practically gags...she has totally bought into the whole low fat, low cholesterol thing. Yet her cholesterol is 350! (she eats vegetarian with no butter, eggs, or cholesterol meats...only olive oil & canola oil for cooking, and for meats mostly fish. She doesn't even eat very much bread, and usually whole wheat when she does. A lot of fruits is what ended up being a factor of her high cholesterol, but I can't help but wonder what would happen to the rest of it if she adopted my diet.) I read what's out there about how to manipulate your cholesterol, and according to them I'm doing a lot of stuff wrong. Yet I have a very healthy cholesterol profile (total cholesterol at 216...you can say that's technically high but we'll just laugh at you, since the HDL takes up 90 points, leaving only 126 for the LDL and triglycerides). Anyone interested in exploring this further with me can email me at [tamaraz@optonline.net](mailto:tamaraz@optonline.net)

Robert Neil (2007-12-19 08:24:36)

I have found that Spirulina and Chlorella really help. Regards, Robert [1]Spirulina

1. <http://www.allseasonshealth.co.uk/acatalog/SPIRULINA.html>

Jason Sole (2008-12-06 17:22:25)

I am very interested in raising my HDL, I do not want to continue on drugs.

## How Accurate is Epidemiology? (part 2) (2007-09-16 09:44)

Because Gary Taubes is probably the country's best health journalist, his [1]article in today's NY Times Magazine ("Do We Really Know What Makes Us Healthy?") about the perils of epidemiology especially interested me. It's the best article on the subject I've read. He does a good job explaining what's called the healthy-user bias – people who take Medicine X tend to make other healthy choices as well. Does wine reduce heart attacks? Well, probably – but people who drink more wine also [2]eat more fruits and vegetables.

The article falls short in two big ways. Taubes does a terrible job presenting the case for epidemiology. He mentions the discovery that smoking causes lung cancer but then disparages it by quoting someone calling it "turkey shoot" epidemiology. Actually, that discovery did more for public health than any clinical trial or laboratory experiment I can think of. Taubes fails to mention the discovery that too-little folate in a pregnant woman's diet causes neural-tube and other birth defects. As the dean of a school of public health put it in a talk, that one discovery justified all the money ever spent on schools of public health (where epidemiology is taught). Taubes also fails to mention that some sorts of epidemiology are much less error-prone than the studies he talks about. For example, a county-by-county [3]study of cancer rates in the United States showed a big change across a geological fault line. People on one side of the line were eating more selenium than people on the other side. Experiments have left no doubt that too-little selenium in your diet causes cancer.

Even worse, Taubes shows no understanding of the big picture. Above all, epidemiology is a way to generate new ideas. Clinical trials are a way to test new ideas. To complain that epidemiology has led to many ideas that turned out to be wrong – or to write a long article about it – is like complaining that you can't take a bike on the highway. That's not what bikes are for. If only 10 % of the ideas generated by epidemiology turn out to be correct, well, [4]10 % is more than zero. Taubes should have asked everyone he interviewed "Is there a better way to generate new ideas?" Judging from his article, he asked no one.

Now excuse me to take a selenium pill . . .

---

Tom (2007-09-16 11:53:19)

If only 10 % of the ideas generated by epidemiology turn out to be correct, well, 10 % is more than zero. \_\_\_\_\_ Taubes' points, and I think they're good ones, are that the hypotheses yielded by epidemiology are confused with facts, and that these questionable hypotheses are immediately implemented as social policy due to a critical storm of: 1. researchers trying to build names and careers 2. climbing reporters, bloggers and a sensationalist press trying to make noise, money and

fill space. (USA Today will not be running any articles headlined "Slight correlation of questionable causality found in tiny subset." 3. opportunistic big Pharma & other entrepreneurs large and small who see trends to milk, and 4. politicians eager to prove their "protecting" Americans from the latest evil. 5. an uneducated population which thinks correlation is causality.

seth (2007-09-16 21:37:29)

The facts (observations) collected by epidemiologists suggest hypotheses; and sometimes those hypotheses are wrong. You may think it is awful that those hypotheses are told to the public; I don't. Let's say that an epidemiological study finds a correlation between Behavior X and better health. USA Today publishes this. As a result, many people start doing Behavior X. I don't see the problem. Sure, they could be wasting their time. But maybe not. Everything has risks, is uncertain. The epidemiological evidence does raise – or should raise – one's belief that Behavior X causes better health. A little knowledge – a little push in the direction of certainty – is better than nothing. I'm more worried about poorly-educated science journalists who are overly critical and poorly-educated scientists who are dismissive (e.g., they fail to grasp that correlation raises the plausibility of causation—I have blogged about this) than "an uneducated population." It's the journalists and scientists who have the power. I think you're right that scientists sometimes overstate their case. But I don't see a lot of that. I see much more unwise dismissiveness.

Tom (2007-09-16 23:20:30)

Well, much of Taubes' article is about the kind of problems associated with overstating those cases...the erroneous conclusion that HRT helps, when it actually kills women...the downside of folate supplementation...the panicked switch to trans fats after CSPI's alarms over palm oil in popcorn...and what Taubes explores in his new book, the real result of the bad science that is still believed to support the explosion in carb consumption of the last thirty years. I wouldn't argue for censorship, no, but I would support intelligent use of the data, which ain't happening. For me, it's hard to argue with the idea that the double-blind trials that are necessary aren't being done. The conversion of hypothesis into fact means the "trials" are done on the public at large.

Igor Carron (2007-09-17 15:09:32)

Seth, I liked what you wrote but pay attention to that pill: <http://diabetes.webmd.com/news/20070709/selenium-supplements-diabetes-risk> Igor.

seth (2007-09-17 20:31:12)

Thanks, Igor.

Seth's blog » Blog Archive » How Accurate is Epidemiology? (part 3) (2007-09-18 09:29:25)

[...] How Accurate is Epidemiology? (part 2) [...]

Zagreus Ammon (2007-09-19 14:49:51)

Epidemiology is accurate enough. The interpretation of data leaves much to be desired. From a clinician, teacher and manager's perspectives, I wish everyone would please please please realize that every piece of information has its limitations and conclusions drawn by inference cannot be logically assumed to represent complete and unalterable truth. Ya, take a pill and learn to live with uncertainty.

## **Regent Blum, Meet Provost Dumas (2007-09-16 10:29)**

Richard Blum, chairman of the UC Board of Regents, rescinded a speaking invitation to Larry Summers after some UC Davis faculty [1]complained:

After a group of UC Davis women faculty began circulating a petition, UC regents rescinded an invitation to Larry Summers, the controversial former president of Harvard University, to speak at a board dinner Wednesday night in Sacramento. The dinner comes during the regents' meeting at UCD next week. Summers gained notoriety for saying that innate differences between men and women could be a reason for under-representation of women in science, math and engineering. . . Professor Maureen Stanton, one of the petition organizers, was delighted by news of the change this morning, saying it's "a move in the right direction."

Northwestern University Provost Lawrence Dumas is responsible for allowing Lynn Conway and Deirdre McCloskey to use his university's considerable power [2]to try to silence Michael Bailey. At [3]Marginal Revolution, Alex Tabarrok calls the UC Regents' action "shameful." I agree.

Thanks to Matthew Pearson.

### **Abstracts from The New Yorker (2007-09-16 23:01)**

The New Yorker now has online abstracts, just like scientific journals. From the [1]abstract of an article by Patricia Marx:

The writer spies from her living-room window a multitude of colorful puffy parkas from Pucci (24 East 64th Street). The writer then calls Dr. Andrej Romanovsky to ask how the body detects cold. New York is the city of coats. Real coats, not car coats, for in this town, we walk. . . . Still worried about the coming cold? There is always one thing left to do: Miami (U.S. Airways; flights as low as \$59 one-way).

Surely this is better than the article itself. Just as brandy is better than the wine it is distilled from.

1. [http://www.newyorker.com/reporting/2007/09/24/070924fa\\_fact\\_marx](http://www.newyorker.com/reporting/2007/09/24/070924fa_fact_marx)

sysrick.com » links for 2007-09-18 (2007-09-17 18:29:00)  
[...] Abstracts from The New Yorker [...]

Emily Gordon (2007-09-18 14:28:38)

This isn't new, though! They've been writing these forever. If you look through the Complete New Yorker hard drive/DVD you can read a bunch.

seth (2007-09-18 16:18:43)

"They've been writing these forever." Like cave paintings (discovered by a 4-year-old): If only I'd raised my eyes...

TC (2007-09-28 22:13:48)

\_\_ \_Seth Wrote \_\_ \_ > Surely this is better than the article itself. > Just as brandy is better than the wine it is distilled from. If this tragic taste-bud dysfunction is a result of ingesting flax oil, I'm gonn'a have to rethink this whole Shangri-la thing

## **Why Are Medical Costs So High? (2007-09-16 23:22)**

At Cato Unbound, David Cutler, a Harvard public policy professor whose research I used in The Shangri-La Diet, [1]writes:

The most important reason why medical costs increase over time is because we develop new ways of treating patients and provide that care to ever more people.

At least in his essay, Cutler fails to consider an alternative explanation: Medical costs have increased a lot because we have become a lot more sick – more in need of help. Over the last 50 years, obesity has greatly increased. Diabetes has greatly increased. Depression has greatly increased. Depression, including subclinical depression, is now common and has so many bad effects or correlates – less activity, less socializing, less sunlight, poor sleep, less compliance with everything – that its impact on health must be great.

1. <http://www.cato-unbound.org/2007/09/12/david-m-cutler/use-a-scalpel-not-a-meat-cleaver/>

---

lasser11 (2007-09-17 20:04:32)

"less activity, less socializing, less sunlight, poor sleep, less compliance with everything" that its impact on health must be great" In college I had a temp job sorting medical files. It felt like 10 percent of the doctor's patients gave him 90 % of his service. Nothing worked for them. they all were depressed with various aches and pains. We all would be better off if Doctors could work up the courage to limit care. The patients would be forced to self remedy (eat healthier, be more active, etc.). but doctors have no incentive to say no. I think Seth mentioned how Jane Jacobs argued that no one would want a privatized, profit seeking police department. Likewise, we shouldn't have a profit seekers distribute health care like the insurance companies due. But Doctors are much more powerful than insurance companies. They make the decisions. we need to de-profitize the way Doctors make decisions.

seth (2007-09-18 16:14:56)

I don't think that would work very well. Huge amounts of social pressure have not caused everyone to be thin. It's not that fat people don't want to be thin; it is that no one has told them how (correctly – there is an endless amount of bad advice available). Absent good advice, it is incredibly difficult. Same with depression. You place too much faith in "self remedy".

lasser11 (2007-09-18 19:03:28)

"It's not that fat people don't want to be thin; it is that no one has told them how (correctly – there is an endless amount of bad advice available)." I see what your saying. but do family doctors really have ground breaking advice on how to lose weight? They tell their patients to burn more calories than intake. basically eat healthier and exercise more. Nutritionist have better advice. I guess its the Hayek in me which believes that if we forced ourselves to ignore our current medical system (which is not very effective for the amount of money put into it), some sort of better medical system will spontaneously construct itself.

matt (2007-10-21 08:07:59)

Yeah there are a lot of hypochondriacs. My mother is one of them. She eats poorly and does not exercise enough if at all. Thus she is overweight, which contributes to knee problems, type 2 diabetes and depression. But at the same time it is surprising to find out that the US government spends more per person on health care than Canada or France, but most americans still have to buy insurance and pay out of pocket expenses.

## A Bayesian Tries SLD (2007-09-17 13:55)

Bayesian data analysis, which Andrew Gelman has [1]pioneered, is about taking one's beliefs into account when doing data analysis. When I wrote The Shangri-La Diet, I was being a kind of Bayesian: I realized that the facts I had gathered so far did not establish the diet as any sort of panacea. Based on the facts in the book, it was hard to say how widely helpful the diet would turn out to be. I wrote the book anyway because the facts I had gathered so far were so surprising, so inconsistent with what almost everyone said about how to lose weight. From a Bayesian point of view – taking prior beliefs into account – they were impressive. If conventional views were right, no one should lose weight following SLD. But several people had. Some of them, such as Tim Beneke, had lost a lot of weight. To complain that there was no clinical trial, no certainty, was to miss the point that the book includes data that should have been impossible.

Whoever blogs at [2]4d2.org says something similar:

My first reaction to [SLD] was, of course, that it was one of the stupidest things I'd ever seen. Then I started reading the forums on the creator's (Seth Roberts) site, and then I did some Googling. And would you believe that, in the absence of anything that I would call scientific evidence, this thing seems to work for most people that try it. . . . Five days ago I honestly believed the Shangri-La Diet to be hooey – interesting hooey, maybe, but still hooey. . . I decided I'd try it for myself and report on the results. I want to make it really clear that I approached this diet with a very healthy dose of skepticism. You should also understand that I'm a staunch advocate of the "eat right and exercise, stupid" philosophy of weight loss. I have never followed a prepackaged diet strategy. Having said all that: it works. I do not know why or how it works, but it works.

1. <http://books.google.com/books?id=TNyhnkXQSjAC&dq=&pg=PP1&ots=5F8K8HwyL7&sig=o0CT110IkfIG4zs2fDy09KFnBAk&prev=http://www.google.com/search%3Fq%3D%2522bayesian%2Bdata%2Banalysis%2522%26ie%3Dutf-8%26oe%3Dutf-8%26aq%3Dt%26rls%3Dorg.mozilla:en-US:official%26client%3Dfirefox-a&sa=X&oi=print&ct=title>
2. <http://4d2.org/archives/63>

---

Blaise Pascal (2007-09-17 20:37:18)

I wonder how much of the success of SLD is reporting bias? I think people are more likely to say "I tried it, and it worked" than to say "I tried it, and it didn't work". Since the evidence for and against SLD's efficacy seems to be self-reported, a bias against saying it didn't work would artificially inflate its seeming success. (For the record, I have not previously reported that I weighted 275lb at the beginning of July when I started SLD, and 285 at the end of July when I stopped SLD. My experience is that SLD didn't work for me.)

### **How Accurate is Epidemiology? (part 3) (2007-09-18 09:29)**

To my [1]previous post about Gary Taubes's NY Times [2]article, [3]Andrew Gelman adds that it is good to see public discussion of these issues. I agree. I also like seeing them raised in a dramatic context: Who's right? Powerful people making serious mistakes. How will we know? Health at risk! That sort of thing.

Speaking of drama and epidemiology . . . For many years the introductory epidemiology class for graduate students in the UC Berkeley School of Public Health was taught by Leonard Syme. I learned about this class at party. I spoke to someone who had taken it and, as a result, had switched from public policy to epidemiology. Very impressive. I knew Syme slightly. I went to his office to learn more about how he had managed to influence someone so much. "Lots of students have said that," he told me as I entered his office. Lots of students, after taking his class, had decided to become epidemiologists. The list included Michael Marmot, one of the most important epidemiologists in the world, who studies the [4]social gradient in health – the tendency for the people at the top to be healthier than the people at the bottom, even after controlling for all sorts of things.

The class met once/week. Every week there was a new topic. For every topic Syme would assign a paper laying out the conventional wisdom – that high cholesterol causes heart disease, for example – plus three or four papers that cast doubt on that conclusion. I think he even had American Heart Association internal emails. Several students would present the material and then there would be debate – what's to be believed? The debates were intense. If ever the students seemed to be reaching agreement, he would say something to derail it. "You know, there was a study that found . . ."

Practically all classes make you think you know more at the end of them than you knew when they began. Practically all professors believe this is proper and good and cannot imagine anything else. With Syme's class, the opposite

happened: Your beliefs were undermined. You walked out knowing less than when you walked in. You had been sure that X causes Y; now you were unsure. At first, Syme said, many students found it hard to take. A three-hour debate with no resolution. They did not like the uncertainty that it produced. But eventually they got used to it.

The overall effect of Syme's class was to make students think that epidemiology was important and difficult – even exciting. It was important because we really didn't know the answers to big questions, like how to reduce heart disease; and it was difficult and exciting because the answers were not nearly as obvious as we had been told. This is why many students switched careers.

[5]Marmot on Syme: "I have never come across anyone in the academic world who had quite the powerful influence on students that Syme did." Nor have I. That meeting with Syme, about five years ago, was one of two conversations in my life that really taught me something about how to teach. I was the only person at Berkeley to ever ask him about his teaching, Syme said. What a pity.

[6]Syme on how his research began.

[...] I don't think conventional research in nutrition, clinical psychology, or psychiatry is worthless — far from it. I think it is very valuable. (For one thing, it helped me see that my self-experimental conclusions, as unorthodox as they were, had plenty of empirical support.) What is hard for outsiders to grasp is how what they see — what they read in magazines and newspapers and even books — is heavily filtered to conform to a party line. Plenty of research supports the Shangri-La Diet, for example (such as research about the set point theory of weight control), but you are unlikely to read about it in, say, The New Yorker because it doesn't fit conventional ideas. Plenty of conventional research supports my ideas about mood, but you are unlikely to read about that research because it doesn't support the party line of "dopamine imbalance" causing depression or whatever. This is what Leonard Syme taught his public-health students — that the party line was a lot more questionable than an outsider would ever guess. They hadn't heard that before. (And it was unpleasant: Uncertainty is unpleasant.) This is a third sort of filtering: What data reaches outsiders. [...]

Wow, it was even dedicated to you and you didn't know about it....

### **Fear-Mongering? (2007-09-18 11:48)**

[1]This post by Dr. Erika Schwartz, complaining about a [2]breast cancer story in the NY Times, makes important points. When politicians – such as Joe McCarthy or Jean-Marie Le Pen – try to scare us, most of us appreciate the psychology involved: The more fearful we become, the more we will look to them to protect us, thus increasing their power. Our fear = their power. Schwartz is saying that respected doctors and journalists do the same thing. How prophetic was [3]The Coming Plague (1994) by Laurie Garrett?

Schwartz's post has too little detail to convince me that this particular story is guilty. Nor do I agree with her that statistics are "totally meaningless when applied to the individual." Her contribution is to ask: how can we discuss these issues without fear-mongering?

Andrew Gelman (2007-09-19 04:19:24)

Seth, I agree with your general point but I think your analysis is oversimplified. My guess is that journalists want to sell books more than they want power. Joe McCarthy wanted power; he also wanted to get reelected (not exactly the same as wanting power; he wanted to keep his job), also it is said that he enjoyed seeing his name in the paper. In other settings, organizations are set up to have a particular bias. For example, if the EPA raises a ruckus about some environmental hazard, it might be that people in the organization want power, but it might just be that it's essentially their job to do this.

Doctors and Statistics « Two Newtons (2007-09-19 09:32:16)

[...] Doctors and Statistics Seth comments on Dr. Schwartz's contention that statistics are "totally meaningless when applied to the individual." [1]

## The Academic Stockholm Syndrome (2007-09-18 16:47)

Today I went to a talk about terrorism. After the talk, I asked a question: What's the evidence for the recommendations you made at the end? The speaker, a professor at Harvard, began her answer by apologizing: I can only tell you case-by-case anecdotes, she said. She repeated this apology a little later. Well, of course no one has done a controlled experiment (or any experiment) on how to deal with terrorism. Of course all we have is a story here, a story there. The speaker, whose talk was good, had heard the pervasive dismissiveness I criticize [1] here so many times that not only did she expect it, she accepted it. The academic Stockholm Syndrome.

1. <http://www.blog.sethroberts.net/2007/08/05/something-is-better-than-nothing/>

---

Andrew Gelman (2007-09-18 17:59:27)

"Of course all we have is a story here, a story there." You're setting the bar a bit low there, Seth. Political scientists can indeed do quantitative studies, even if not experimental, by gathering what data are at hand. There's a lot of room between pure anecdote at one extreme, and a randomized controlled study at the other.

seth (2007-09-18 18:31:34)

No doubt the evidence can be improved, yes. But that is usually true.

## Spider Science (2007-09-19 12:06)

The success of my self-experimentation has puzzled me. The individual discoveries (a new way to lose weight, a new way to improve mood, sleep-related stuff, the fast effects of omega-3) seem normal; someone would have found them. It's their combination that's strange. Scientists who study weight control do not discover anything about mood, for example. But I did.

An [1] ancient (2001) essay by Paul Graham is about how the future lies with web-based applications. No more Microsoft Word. One of Graham's stories sheds light on my puzzle:

I studied click trails of people taking the test drive [of Graham's web-based application] and found that at a certain step they would get confused and click on the browser's Back button. . . . So I added a message at that point, telling users that they were nearly finished, and reminding them not to click on the Back button. . . . The number of people completing the test drive rose immediately from 60 % to 90 %. . . . Our revenue growth increased by 50 %, just from that change.

I studied click trails. He examined a rich data set, looking for hypotheses to test. I practiced what I'll call spider science: I waited for something to happen. When it did, I started to study it, just as a spider moves to the part of the web with

the fly. Here are examples:

1. A change in what I ate for breakfast caused me to wake up early much more often. I did many little experiments to find out why.
2. Watching TV early one morning seemed to have improved my mood the next day. This led to a lot of research to figure out why and how to control the effect.
3. After I started to stand more, my sleep improved. I made many measurements to see if this was cause and effect and if so what the function looked like (the function relating hours of standing to sleep improvement).
4. In Paris I lost my appetite. This started the research that led to the Shangri-La Diet.
5. The morning after I took some omega-3 capsules, my balance improved. This led to experiments to see if it was cause and effect and if so what the function (balance vs. amount of omega-3) looked like.
6. One day I took flaxseed oil at an unusual time. My mental scores [2] suddenly improved. I started to study these short-term effects.
7. While studying these short-term effects, I noticed improvements shortly after exercise. I started to study the effect of exercise.

Graham studied click trails partly because he could so easily act on anything he learned, partly because it was his company and he was so committed to its success. The seven examples I have given all came about partly because I could easily act on what I noticed and partly because I would directly benefit from learning more.

Conventional scientists do not practice spider science. They do not continuously monitor or search out large rich data sets hoping to find something they can act on. They can't afford to, it's unconventional, it's too risky, it won't pay off soon enough, they probably couldn't act on what they found, etc. Later in Graham's essay he marvels that big companies develop any software at all. Microsoft is like "a mountain that can walk." Likewise, I'm impressed that scientists operating under the usual constraints manage to discover anything. You might think tenure allows them to relax, wait, take chances, and do things they weren't trained to do, but it doesn't work out that way.

---

Igor Carron (2007-09-19 13:13:44)

Seth, You mentioned a drink in Paris that got your taste twisted, do you recall if it was Orangina ? ( <http://en.wikipedia.org/wiki/Orangina> ). The Coke tastes different as well. I need to write something longer on this, but there is some type of wisdom that says the french are thinner or at the very least they seem to be less weighty on average. While one can definitely see lifestyle differences in particular with regards to the use of cars as opposed to a more pedestrian approach to moving (hence letting french people to be standing longer over a whole day), I was wondering if another aspect of the french lifestyle could also be part of that equation: food. The large choice in the number of sauces and other cooking techniques could be one of the ways to diversify the taste of different mixtures to the point where the taste association, which you refer to, is altered. Igor.

Andrew Gelman (2007-09-19 15:06:46)

Seth, I might argue that, although individual scientists do not usually follow what you call "spider science," this is in fact the path followed by scientific \_fields\_. For example, for the past few years lots of political scientists have been looking at polarization. Any given political scientist (including myself) usually is studying some specific hypotheses, but the field as a whole could be said to "continuously monitor or search out large rich data." Consider also the large communally-funded studies such as the National Election Study and General Social Survey. On an unrelated point, relating to your final sentence: the vast majority of scientists don't have tenure.

seth (2007-09-19 15:18:58)

I sort of agree that whole "fields" practice something like waiting. But what happens when something is found? Does that shift the research of the person who found it? I don't know enough about political science to know the answer. True, most scientists don't have tenure, making it even harder for them to wait. The Paris drink wasn't Orangina. Orangina is available in Berkeley. The Paris drinks I tried I had never seen before. I agree that the diversity of French cooking helps them be thin.

NE1 (2007-09-19 17:03:27)

You're wrong. Scientists are willing to admit strange data. It's unlikely they will do so without at least an attempted explanation, but you can't afford to pass up new ideas when a completely independent experiment takes years and hundreds of thousands of dollars to set up. You build it, you make a bunch of measurements along the way to make sure you're really studying what you think you are, and you finally get the ones you wanted to publish. Or you have to work another 6 months refining your device. Maybe the real difference is that you're dealing with systems which are innately complex, and hard to isolate. You can't recreate a Mr. Seth every morning in exactly the same state to repeat the experiment. I use perfect crystals. This is also what makes me so skeptical about any significance in your results. If you find the tiniest thing prompts a new approach, how can you be sure it isn't something else confounding your results? I guess you can only hope Omega-3 is a helluva powerful effect.

## **A Clinical Trial of Fish Oil (2007-09-20 04:32)**

A big study of the effects of fish oil is taking place at Ohio State University. From [1]its website:

The beneficial effects of fish oil (or eating fish more frequently) include reductions in triglycerides, blood pressure, and heart rate, as well as increases in HDL cholesterol, the "good" type of cholesterol. In

addition, certain aspects of immune function also appear to show favorable responses to fish oil supplementation, and some studies suggest that fish oil helps to improve mood and decrease depression. This study is designed to examine how supplementation with omega-3 polyunsaturated fatty acids (key fish oil components) affects aspects of your immune response, and your mood; because some research suggests that people who eat more fish may do better during stressful times, the study will also examine how fish oil affects your immune response to stress, certain stress hormone responses, and your psychological response to stress.

I was especially curious how they are measuring brain function. Here's how:

At Visit 1 and Visit 5 [16 weeks after Visit 1] only, you will be asked to perform various tasks for about 20 minutes; these will include making a short speech and computing arithmetic problems without pencil or paper in the presence of other research team members. You will be audiotaped while you complete these tasks. . . At Visit 1 and Visit 5 only, the researchers will administer short tests that measure aspects of memory and concentration to see if the fish oil supplements have positive effects on learning and memory. For example, you might be asked to memorize several words, and then you would be asked which of the words you remember several minutes later.

Each subject participates for 24 weeks. The study, which started in 2006, is supposed to [2]end in 2010, with 138 subjects in two groups (69 per group).

Tyler Cowen's [3]experience with flaxseed oil implies that omega-3 supplementation can dramatically reduce inflammation within a few weeks. [4]My research shows that omega-3 supplementation can improve brain function within a few hours. This study appears to be much larger than necessary.

fascinated (2007-09-21 22:50:39)

Given your interest in fish oil and omega-3, you will probably find this article in the NYT interesting (as I did): <http://www.nytimes.com/2007/09/19/business/smallbusiness/19hunt.html>

### **Janet Malcolm on Email (2007-09-20 06:20)**

Janet Malcolm is the most divisive (within me) writer I have encountered. I loved *The Journalist* and *the Murderer*. A journalistic masterpiece (except for the opening sentence about all journalists being con artists). I wrote her a fan letter about it. I hated *In the Freud Archives*, her hit piece about Jeffrey Masson. [1]This review of a book about how to write email is not very good, alas. Too obvious. How far the gifted have fallen.

Jeffrey Masson used to live in Berkeley. I visited him while writing an article for Spy about his lawsuit against Malcolm (it never ran). While I was there, he got a phone call from Joe McGinness, the "journalist" of The Journalist and the Murderer.

1. <http://www.nybooks.com/articles/20571>

---

## How Accurate is Epidemiology? (part 4) (2007-09-20 12:37)

In Sunday's NY Times Magazine, [1]Gary Taubes argued that epidemiology does not provide a good basis for health decisions – it is often wrong, he claimed. By "wrong" he meant experiments were more pessimistic. Things that seemed to help based on surveys turned out not to help, or help much less, when experiments were done. A 2001 [2]BMJ editorial disagrees:

Randomized controlled trials and observational studies are often seen as mutually exclusive, if not opposing, methods of clinical research. Two recent reports, however, identified clinical questions (19 in one report, five in the other) where both randomized trials and observational methods had been used to evaluate the same question, and performed a head to head comparison of them. In contrast to the belief that randomized controlled trials are more reliable estimators of how much a treatment works, both reports found that observational studies did not overestimate the size of the treatment effect compared with their randomized counterparts. . . . The combined results from the two reports indeed show a striking concordance between the estimates obtained with the two research designs. . . . The correlation coefficient between the odds ratio of randomized trials and the odds ratio of observational designs is 0.84 ( $P < 0.001$ ). This represents excellent concordance.

Here is the data:

The correlation coefficient is the wrong statistic. They should have reported the slope of a line through the points constrained to have intercept = 0. The graph above shows that the slope of such a line would be close to 1. Unlike the correlation, that is relevant to their main question – whether surveys tend to find larger risk ratios than experiments.

[3]Part 1. [4]Part 2. [5]Part 3.

Addendum: A [6]later (2005) paper by John Ioannidis, one of the authors of the 2001 paper, claims to explain, in the words of its title, "why most published research findings are false." The above data suggest that most published research findings in Ioannidis's area are accurate. [7]Alex Tabarrok on the 2005 paper.

## Leonard Syme on Teaching (2007-09-21 04:13)

In a [1]recent post I described an amazingly influential class on epidemiology taught by Leonard Syme, a professor in the UC Berkeley School of Public Health. [2]Andrew Gelman ("inspiring") and [3]Matthew Henty ("THIS is how to learn") were impressed. To find out more about the class, I asked Syme a few questions:

1. What gave you the idea of teaching the course this way?

I was struck by the fact that we can't do classic experiments in epidemiology. We can't assign one randomly selected group of babies to be smokers for the rest of their lives and another random group to refrain. Instead, we have to study people as we find them (in religious groups, in jobs, in various locations, marital statuses, etc) and then try to statistically adjust for the things we think might be confounders. In general, we end with evidence that is not very good and the burden on us is to assess the data very, very carefully. I have defined epidemiology as the the activity of evaluating lousy data as best we can. The class merely illustrated this issue. The theme of the class was how can so many bright and caring people come to such different conclusions looking at basically the same data. The lesson was that we really needed to be clear about our biases and expectations and that we needed to think about the data as carefully as possible. I thought the class should have been called "The Sociology of Knowledge".

2. What were a few of the accepted ideas that you covered?

a. Everyone knew that high fat diets were related to serum lipids and coronary heart disease. The data then (and now) do not support that belief.

b. Everyone knew that the surgical treatment of breast cancer required radical surgery. There was a rumor that lumpectomy would do as good a job but few people believed that. The evidence showed that a more limited procedure was just as good.

c. Some people had been calling for research on the relationship between race and IQ. Majority scholars argued that no good could come from such research and they were refusing to fund such work. How do we decide what is worth studying? Because there might be harm?

d. A major national clinical trial on the treatment of diabetes showed no results but it turned out the randomization procedures were seriously flawed. People in the treated group consistently had higher risk factors to begin with and this doomed the trial. How do we take account of the fact that randomization is a method and not a result? Unbalanced randomization results will occur with a predictable regularity. This study led to the idea of stratification in sampling.

e. Everyone knew that multiphasic screening was good to do. It detected disease early. The evidence did not

support this. The evidence showed that early detection means you live longer with the disease but you still die on Thursday morning at 10 AM. You just knew about it longer.

There were 10 sessions like this. Three hours each! Students ( $n = 15-20$ ) had to read hundreds of pages each week and had to present their case with great frequency - probably 3 or 4 times during the semester. The only rule for presentations was that people could not summarize the papers. Everyone had already read everything and they had to get on with the argument.

3. How long did you teach the course? Did the course change over the years? If so, how?

I taught the course for 12 years. It changed each year only because I updated the literature on particular issues and because I found a new issue that I thought might be more interesting than one of the older topics. But the way in which the course was organized did not change.

4. Apart from lots of epidemiology, what did you learn from teaching the course? For example, did you learn anything about teaching?

I'm not sure. As a teacher, my emphasis has always been on challenging people to think hard about issues. My favorite definition of a good book is one that forces you to do your own thinking. When I lecture, I get very nervous when I see people taking notes. What are they writing? What I'm saying? Not good. Unless they are writing things down so that they can refute my points later on.

Wow, wonderful! Wish I could have taken this :-)

### **Can Professors Say the Truth? (letter from Willow Arune) (2007-09-21 08:23)**

Willow Arune, a retired lawyer who has been one of Michael Bailey's supporters, sent me this email:

Hi Seth,

I have found your exchanges with Deirdre McCloskey rather amusing.

I am one of those transsexual women who supported Bailey. I did so publicly and as a result was subjected to the lies, half-truths and innuendo of Andrea James and Lynn Conway. Even now, the slander is still on both of their web pages. Along the way, I noted that Dr. McCloskey had announced that she

would sue Bailey if he dared to suggest that she was "one of those" so I did it for him. Frankly, her autobiography does that to her as well, although she does not use the term

I invited Dr. McCloskey to sue me. I even wrote her lawyer providing an address for service. For one week, I wrote her daily asking her to please, please sue me. Years later, she has still not done so. A shame really as I had lined up a wonderful cast of potential witnesses to provide expert testimony. Truth is always a defence to such silly actions.

Dr. McCloskey has hidden behind the more overt actions of Andrea James and Lynn Conway. Yet she was one with them, an equal participant in the vile and ugly attacks made not only on Bailey but also on other transsexual women who dared to support him. As Dr. Dreger points out, many would not allow their names to be used for fear of attracting attacks from McCloskey's crew. I also received many letters of support from transsexual women who agreed with Bailey or, at the least, thought the actions of Conway, James and McCloskey were repugnant. None would dare have their comments public for fear of being subjected to the same attacks that had been made against other transsexual women and myself.

Let me give you one example of those actions that McCloskey supported, those actions she says do not cause her shame.

Firstly, I am a rape survivor. Andrea James was well aware of this as we had continued a "back channel" correspondence well after Bailey's book was published. During 2003, on a public newsgroup, an anonymous writer posted a vile accusation that I was a "registered sex offender". Not true then or now. Then, on December 24th of that year, I received a post from Andrea James asking me to "confirm or deny" that I was a registered sex offender. In the same post, she threatened to send out "investigators" to look into my past. She justified this action by the broad premise that her end justified any means and that those of us who supported Bailey must have ugly reasons to do so in our past. She would discover those and expose us.

Her web page on me followed, as did another screed from Lynn Conway. Lies, half-truths and innuendo.

This tactic "the no-name post to an e-group or newsgroup" was repeated in the case of the Transkids. It started with a further anonymous post, this one to an e-group on Calpernia Addams' web site. I first heard of it on an e-group for UK transsexuals and complained to the moderator. In time, thanks to confirmation from other transgendered people, Christine Burns issued a formal apology for spreading the lies, the day after she was awarded an MBE. She had, she stated, relied upon a "usually reliable source" (Andrea James).

The tactic is straight from the McCarthy days. Spread an unfounded accusation and repeat it often so that some will believe it is true. As the writer Patricia Cornwell has recently shown, even one with many financial resources cannot control a slander on the Web.

Ms. James attacked several transsexual women who dared to either support Bailey or Blanchard, or even those who simply wanted to turn down the heat. Each was (and remains) subjected to a web page on Andrea's site. No wonder few were willing to step out of the trenches. Most transsexual women simply wish to get on with life. They do not wish to be vilified "and outed" on a web page available to anyone with a computer.

If Dr. McCloskey is not ashamed of this type of tactic, as she states, she should be. Instead, she

continues to attack you and anyone who dares to express even the slightest question about Blanchard's theory or the means used by Conway and James to attack Bailey and anyone else who crosses their sights.

It is part of this nasty group to ignore the theory and go personal. In the years since Bailey's book has been published, I have had few conversations or exchanges about "the theory". The hate mail that arrives in my mailbox always quotes some of the accusations made by James or Conway about me as a person. James's screed is copied and posted to some newsgroups on a regular basis by her supporters. Nor, after all this time, have I met any transsexual who has directly suffered as a result of Bailey's book "and I have asked repeatedly for one to come forward.

The book was published several years ago; I have certainly moved on. I stood up for Dr. Bailey's right to publish and against the vile and arrogant tactics of Conway, James and McCloskey. I am glad that Dr. Dreger had the courage to expose the facts concerning this matter. As both James and Conway see fit to retain their personal attacks on me on their respective web pages, I can now point to Dr. Dreger's article as some vindication, certainly as an explanation. In these days when potential employers even check e-groups and such regarding potential employees, slander of the type employed by Conway, James and McCloskey against other transsexual women can have dramatic effect. A dispute over a theory is not a reason to slander a person in the manner employed by these zealots.

Willow Arune

Richard Whitaker (2007-09-21 16:52:00)

Hi, sorry to be off topic, but the blog format change has put the text to the far left (hard too read) and made the charts too large for the screen. I've looked running various versions of IE under a couple of OS's. Haven't had a chance yet to look with Firefox or anything else. Thought you'd want to know. Now back to lurking --richard--

seth (2007-09-21 19:39:57)

what blog format change? I haven't changed anything.

Pearl (2007-09-21 20:51:40)

I experienced that as well, sometimes the chart in the recent epidemiology post appears really huge and runs off the screen. It has always been viewed in the same browser and appears to change randomly from normal-sized to huge.

Richard Whitaker (2007-09-22 04:29:37)

It looks fine this morning, but Pearl describes my experience exactly. I'll drop you a line if it recurs. --richard--

seth (2007-09-22 09:06:49)

Pearl's comment clarified the problem. I used a too-large jpg file for the data. I changed it to a smaller file.

Boo (2007-09-22 19:25:57)

Wow. You got one of Bailey's supporters to freely admit that she acts like a two year old. That's pretty kewl.

Jennifer Usher (2007-09-25 11:25:12)

Before anyone jumps to any conclusions about Arune's remarks concerning Andrea James, I would strongly urge that they actually check out what Ms. James has to say. The web sites in question are actually quite well documented, including details of Arune's harassment of Andrea James. and others. As to the repeated requests that Deidre McCloskey sue Arune, well it would be foolhardy for Ms. McCloskey to bother pursuing such an endeavor. It is well known that Arune is supported by disability payments in Canada and is, in effect, judgment proof. Jennifer Usher

seth (2007-09-30 15:25:32)

Willow Arune has asked me to post this: "As mentioned in my post, those who oppose Bailey rarely talk about the theory of transsexuality set out in his book. Instead, they use personal attacks. As confirmation of this statement, we have the comments of BOO and Jennifer Usher above, both of which attack me and leave the theory untouched. Need I say more?"

Stephen M (Ethesis) (2007-10-06 08:19:33)

This is fascinating to read as a study in a conflict where I have no emotional attachments – for me it is like pure research. (You can note my general interest in such things at <http://adrr.com/> and <http://srmarsh.com/> ). I've no other conclusions to draw at the moment, I almost feel that it is unfair to use this as a case study because I'm not a stakeholder in the conflict and it is so raw.

## **My Theory of Human Evolution (the pleasure of crafts) (2007-09-22 04:06)**

On the [1]Meet the Pros episode of This American Life, [2]David Rakoff said

I make stuff: boxes, lamps, mirrors, small folding screens, painted jackets for kids, that sort of thing. It's what I do in my spare time. Some people exercise; my salvation lies in time spent alone with an Xacto knife and commercial-grade adhesive. During the act of making something, I experience a kind of blissful absence of self and a loss of time. I almost cannot get this feeling any other way. . . . I once spent 16 hours making 150 wedding invitations by hand and was not for one instant of that day tempted to check the time.

He gives the stuff he makes as gifts to his friends. A Martha Stewart Living staffer tells Rakoff it is harder to do this sort of thing for a living than as a hobby.

[3]

My theory of human evolution, which explains how we became the only species whose members make their living in many diverse ways, says the sequence was: 1. Hobbies. 2. Part-time jobs. 3. Full-time jobs. The first hobbies obviously involved making things and were the beginnings of craftsmanship. That many of us, such as Rakoff, enjoy crafts indicates that those early genes are still there.

Before trading evolved, you gave the products of your specialized skill to your friends, which generated a vague obligation. This was the precursor of trading. In contrast to trading, of course, in this case the recipients may have only a little use for what they receive.

### **What Is Intelligence? by James Flynn (2007-09-23 04:26)**

James Flynn's conclusion that IQ scores all over the world had gone up by one standard deviation over 50 years or so (the Flynn effect) was one of the great psychological discoveries of the 20th century. It showed more clearly than anything else that everyday life can have a big effect on IQ, contrary to what many claimed.

In a new book called *What Is Intelligence? Beyond the Flynn Effect* Flynn takes this discovery as a starting point. After reading it, I could see there are three broad classes of explanation:

1. Events fed on themselves to promote certain abilities. To illustrate the dynamics, Flynn gives the example of basketball. As basketball became more popular, more people watched basketball, more people played basketball, and the rewards possible from basketball went up. All this increased the average level of play.
2. The trend of the last 50 years is a continuation of very long-term trends affecting those of high and low IQ roughly equally.
3. During the last 50 years, some environmental features were "fixed" – not everyone was reaching full potential. Better nutrition is the obvious example – nutritional deficiencies were corrected. This explanation is discussed briefly.

These three classes of explanation correspond to different expectations about how the distribution of IQ scores has changed. The first suggests that the high end (e.g., 75th %ile) increased more than the low end (e.g., 25th %ile). This is surely the case with basketball ability. The second means that that whole distribution has shifted. The third suggests that there will have been more improvement at the low end of the distribution than at the high end. Flynn does not make clear what the data show.

To the question, "were our (lower-IQ) ancestors sort of stupid?" Flynn answers yes. He quotes interviews with Russian peasants. Asked what dogs and chickens have in common, the answer was nothing. Asked what fish and crows have in common, again the answer was nothing. "Sort of stupid" is a harsh way to put it – and obviously they had many skills we have lost – but with the New York Times archives online, you can judge for yourself. Here is the opening of a 1937 [1]review of Eleanor Roosevelt's autobiography:

You pick up this book in the acute–and of course inevitable–consciousness that it is the autobiography of the wife of the President of the United States.

That sounds to me like a Spy parody.

I am less interested than Flynn in the question of the title. Intelligence is an everyday word with a meaning most of us know well; and it has also been used by psychologists to label what IQ tests measure (which is reasonable; it's just an abbreviation). I find it hard to get interested in questions about definitions. Asking how to define this or that word is like asking how much cumin or cinnamon or whatever to put into a dish. It matters, but not very much. Definitions, like recipes, are man-made tools. Questions about cause and effect – such as what caused the Flynn effect – interest me more.

The dust jacket calls Flynn "a psychologist" but he's a philosopher by training. "I am too much in love with philosophy to collect data or do field studies," he writes. As a non-nutritionist who has written about nutrition ([2]Chandra, the Shangri-La Diet, omega-3), his out-of-field success pleases me.

p-ter (2007-09-23 08:03:55)

partially genetic explanations would also probably shift the low end more than the high  
<http://www.gnpx.com/blog/2007/09/heterosis-and-flynn-effect.php>

michael vassar (2007-09-23 08:23:38)

3 seems to be correct. I have seen other and more thorough research to this effect, but here are the links I can find with a few minutes of googling [http://en.wikipedia.org/wiki/Flynn\\_effect#\\_note-Colom2005](http://en.wikipedia.org/wiki/Flynn_effect#_note-Colom2005) [http://www.gifteddevelopment.com/Whats\\_New/flynn.htm](http://www.gifteddevelopment.com/Whats_New/flynn.htm)

seth (2007-09-23 11:24:18)

Flynn favored Explanation 1, but it wasn't clear to me what data supported this.

Seth's blog » Blog Archive » How Things Begin: The Flynn Effect (2007-10-28 16:44:15)

[...] Flynn said that only now (in his new book What is Intelligence?) can he give a coherent explanation of the gains. [...]

sigh (2007-10-29 12:44:42)

I am always amazed that "intelligent" people believe that human intelligence can be measured. It's like saying the queen bee is smarter than a worker. They do completely different things. You have to look at whole system to get a picture of intelligence.

NE1 (2007-11-02 09:44:55)

What is Science Fiction? You have a point. What is Intelligence? from the point of view with which you write about the book is more of a "What contributes to Intelligence, and what influences it?" I would be surprised if you found this uninteresting. That "lack of lead in paint" is intelligence seems very important, to me.

## **The Anti-Veblen (2007-09-23 06:32)**

It is curious that both Thorstein Veblen and Tyler Cowen were/are economists. Judged by their interests, they might have been psychologists, sociologists, or anthropologists, especially the last. The Theory of the Leisure Class was pure

anthropology. Tyler's new book [1]Discover Your Inner Economist is a blend of psychology and anthropology. Veblen wrote a whole book arguing what Tyler (rightly) takes as needing little support. "Cookbooks by famous chefs . . . seek to impress rather than respect our limits," writes Tyler. Straight out of Theory of the Leisure Class except better written.

In book after book, Veblen criticized mainstream economics. The mainstream economists of his time liked to assume that everyone "maximized utility"; the point of Theory of the Leisure Class was how wrong this was – all that conspicuous waste and consumption and impracticality done to signal one's wealth. Whereas Tyler's theme is essentially the opposite: mainstream economic ideas, which now include Veblen's, explain a lot about everyday life, such as which countries have the best restaurants. U. N. troops were "very good for the people who sell lobster," a Haitian taxi driver told him.

Whereas Veblen expressed his dissatisfaction in the usual academic way – he wrote a book saying this is bad, that is bad (very creatively and thematically) – Tyler did something far less predictable and probably far more powerful: With Alex Tabarrok, he started a blog. The main theme of [2]Marginal Revolution, as far as I can tell, is to praise stuff (usually academic economic stuff) that Tyler believes is or is likely to be under-appreciated. Greg Clark's [3]new book is an example. Stories teach values, and MR is a long-running serial with "recurring characters" (to quote Tyler). To criticize by creating is as old as Michaelangelo but requires a willingness to start small and deal with small things (such as a [4]tiny restaurant) that doesn't come easily to academics in prestigious positions.

veblengood (2007-10-13 12:13:13)

And I say Veblen is a genius :) It's more sexy to be negative. It's the new black, didn't you know?

### **Anastasia Goodstein on Blogging (2007-09-24 03:33)**

[1]Anastasia Goodstein, a San Francisco writer, blogs at [2]Ypulse – Y as in youth, meaning teenagers. She came to blogging from the "other side" – from journalism rather than subject-matter expertise – and blogging is one way she makes a living. She has written a book called [3]Totally Wired: What Teens and Tweens are Really Doing Online.

What did you slowly learn about blogging from doing it?

I learned when you are running a professional blog that has to be updated every day (or five days a week), you just can't be brilliant every day. You have days where you have no clue what to blog about or when you're just not inspired, but still you have to post. I also learned that posts I think might be amazing may get no response while other posts that I didn't think were that great generate lots of comments. I have found ways to produce content that don't rely on me having to write full blown posts all the time. I do a lot of Q &As (like this), repost some of the more interesting comments and have easy features like Ypulse Quote (where I find a relevant and interesting quote) or From The Ypulse WTF files (a short post about something that just makes you scratch your head).

I think blogging is a great way to work your writing muscles and develop/strengthen your writing voice – it takes focus and discipline and it's public so you get feedback on what you do. I love blogs where you find great info and get to know the blogger – For example, USA Today's [4]Pop Candy, written by Whitney Matheson is one of my favorites.

What do non-bloggers fail to realize about blogging?

I think non-bloggers don't realize how much work it is (see number one) – to build a decent readership, you have to update your blog pretty regularly. They may not realize that blogging can be financially lucrative – there are many writers now being hired as professional bloggers, individual bloggers like myself who have build media brands from their blogs and consultants and agencies who have used their blogs to generate lots of business.

You write: "Since May 2004 Ypulse has been updated five days a week . . . [in] September 2006 . . . I decided to try to make Ypulse my full-time gig." Was it a hard decision? What was behind it, besides the obvious advantages of working for oneself?

The decision to leave Current TV was agonizing – I love the mission of the network and very much enjoyed the people I worked with. I left partly to be able to promote my book, *Totally Wired*, which came out in March of 2007, and because Ypulse was becoming more than just a side project. The scariest part of leaving a job is leaving the security of a regular paycheck and benefits. I also wasn't sure where I wanted to focus. I was going to try consulting, maybe launch a paid subscription product – I wasn't sure. It has been a year since I left my job, and it was the best decision I've made. I now have a business partner helping me grow, a successful conference business and am still promoting my book on the road, which I never could have done working full time.

Blogging as flexing the writing muscles! « Entertaining Research (2007-09-24 05:07:22)  
[...] From Seth's blog. [...]

### **Science in Action: Exercise (15-minute walk twice more) (2007-09-25 04:21)**

As part of my digression into the effects of exercise, I tested the effect of a 15-minute walk (= on a treadmill at about 2.8 miles/hour) twice more. Here are the results:

### Effect of 15-Minute Walk (2nd Test)

Here is the result (posted earlier) of the first test:

Here is a test of a 40-minute walk:

What do I learn from all this? For my omega-3 experiments, which might cover 6 hours, I should keep the walking involved under 15 minutes. If I want to get some sort of mental benefit from walking, I should spend 40 minutes or more. Less obvious is this: I take these results to indicate the existence of a mechanism that "turns up" our brain when we are doing stuff and turns it "down" when we are inactive. This suggests what Stone-Age activity consisted of: more than 15 minutes of walking. This also suggests that whatever the benefits of exercise, they require more than 15 minutes of walking to obtain.

The practical question these results raise is how to use this effect to help me with what I do all day – most of which, such as writing, seems to be incompatible with walking. Walking breaks every few hours? What about running 10 minutes every few hours?

Gary Taubes' [1] new book on food and weight comes out today. Taubes [2] agrees with what I say in The Shangri-La Diet: Exercise is a poor way to lose weight. The results above provide a different reason to exercise, of course. But the details should change. My impression is that most people focus on burning calories; whereas these results suggest choosing exercise that best produces this reaction-time-lowering effect.

2. <http://nymag.com/news/sports/38001/>

---

Nootropos (2007-09-25 06:50:33)

Hello, this is a very interesting and important finding. I think I would choose running 10 minutes on the spot (better on a rubber mat). The problem is sweat. Not good for when you are at the office. Instead of coffee machines there should be places to walk and exercise at work. No wonder a school of philosophy is called "peripatetic". The greek walked to think. Maybe for a different reason, it seems that when you put your body to work or in movement your mind is more free of tensions. But it could also be due to what you describe here.

seth (2007-09-25 10:59:56)

That's a good point about the peripatetic philosophers. I have found that interviews go much better if we walk rather than sit.

lasser11 (2007-09-25 16:22:29)

Gary Taubes' diet recommendations sound similar to SLD and especially Dr. Atkins diet. Did anyone really disprove Dr. Atkins? I know there was a giant backlash against him with people distastefully making fun of how fat he was when he died. Didn't Atkins start all of this? or at least popularized the idea that Seth and Gary Taubes seem to agree with: the type of food one eats, NOT THE AMOUNT OF CALORIES, matters.

Shopping for Builders (2007-09-26 05:36:41)

Wow! really interesting and amazing research, i just got surprised by looking at this. Instead of coffee machines there should be places to walk and exercise at work.

Matthew (2007-12-30 19:21:13)

Matthew... ..Basically put, how long does the support for your new treadmill last?.....

seth (2007-12-31 17:41:36)

Matthew, I don't understand your question.

jim boggs (2008-08-01 11:19:16)

what great research...great information

## **Thank You, Abu Ayyub Ibrahim (2007-09-25 08:35)**

Abu Ayyub Ibrahim is behind [1]Behind the Approval Matrix – that is, New York magazine's [2]Approval Matrix, which is the first thing I read – if that's the right word – in every issue. For example:

Ibrahim's blog or whatever you call it explains the items in the Approval Matrix.

I wonder why Ibrahim and I like it so much. Perhaps 1. We enjoy praise and dispraise. 2. Cute little pictures. 3. Use of pictures as dots. 4. Draws our attention to stuff we may enjoy but otherwise wouldn't know about (e.g., YouTube clips). 5. Unpompous. 6. Artistic in the Nabokovian sense (i.e., implies a better world – see Afterword to Lolita). 7. Mixes high and low. (My students laughed when I wrote "pimple" on the board.) 8. Sometimes witty.

1. <http://www.behindtheapprovalmatrix.com/>

2. <http://nymag.com/arts/all/approvalmatrix/37962/>

---

Ibrahim (2007-09-25 19:53:00)

Thanks for the post! I see that you're an educator too. Maybe that's the reason we love the Approval Matrix, but I bet it's really the "cute little pictures." Thanks again, Ibrahim [www.BehindtheApprovalMatrix.com](http://www.BehindtheApprovalMatrix.com)

### Progress in Higher Education (2007-09-25 10:56)

The present system of working for examinations by students is one which is doing a great deal of harm in every way.

From a 1883 letter by J. S. Haldane to his mother.

---

Ben A (2007-09-26 04:08:42)

Did you see the article on HE in Britain in yesterday's Guardian? Quoting from it: *Students, he says, work hardest when there is a high volume of formative-only assessment and oral feedback - typically writing essays that don't count towards their degree result, but for which they have to cover a range of material. This is the Oxford and Cambridge model, and used to be the case at most universities 30 years ago. They do less work when there is a high volume of summative assessment, that is, coursework or exams that count towards the degree mark, the pattern in new universities. They do least of all when there is relatively little assessment of either kind, which is what tends to happen in Russell group universities other than Oxbridge, and which may explain the low hours of study in some of them, he says.*

losing-it (2007-09-27 00:22:55)

Sorry Dr. R. - I pasted in a wrong URL for the Sir Ken Robinson video, from another open window. The correct URL to "The Conflict between Education and Creativity by Sir Ken Robinson" follows: <http://pathwaytohappiness.com/happiness/2007/05/20/the-conflict-between-education-and-creativity-by-sir-ken-robinson/>

### The SLD Way (2007-09-25 22:35)

From [1]Tayster, below a poll that asks "do you sing in the car?":

It's been a week since I started the Shangri La Diet and I have lost eight pounds. More importantly, I have lost the cravings that I used to have. I don't feel like eating as much food as I did before. And when I do eat food, I feel like I need to make it something besides a bag of chips and a chocolate cherry Coke. Since I eat less meals, I prefer to make the meals count.

I still can't explain it, but it works.

One comment: "CHOCOLATE CHERRY COKE?!!! How did I not know about this assuredly sublime creation?!"

1. <http://tayster.blogspot.com/>

---

david (2007-09-26 07:37:35)

I did the SLD for 3 weeks two years ago using sugar water. Lost 20 lbs that never came back. I also made it a point to eat better food since I was eating fewer calories. I ended up becoming a vegetarian (one year ago). The "eat less, but eat better" part is interesting to me. I wonder how common the reaction is among SLDers. If it happens often, is it instinct or just people following their common sense? Perhaps it's related to the effect you've mentioned elsewhere that after being successful with the SLD people report that they make other lifestyle improvements (exercise, stopping smoking, whatever). In addition to dropping meat, I also quit caffeine.

### **What Do Meatloaf, Acupuncture, Psychotherapy, and Clinical Trials Have in Common? (2007-09-26 04:29)**

Jane Jacobs tells a story about a handed-down meatloaf recipe: After the loaf is made, the end is cut off. "Why?" she asked. "We've always done it that way," she was told. The original recipe was for a smaller oven, it turned out; the end was cut off to make the loaf fit in the oven.

I thought of this story when I read a [1]recent study in the Annals of Internal Medicine that compared three treatments for back pain: acupuncture, "sham acupuncture," and "conventional therapy." Sham acupuncture was like acupuncture except that the needles were put in "wrong" places, inserted less deeply, and not rotated after insertion. Conventional therapy was drugs, physical therapy, and exercise. The study found that acupuncture and sham acupuncture were equally effective. Both were much better than conventional therapy. The results imply that acupuncture works, but the surrounding theory (meridians, etc.) is wrong. Which I find reassuring.

Psychotherapy is essentially the same. Lots of studies show that psychotherapy helps – but many studies also imply that the surrounding theory is wrong. Untrained therapists are as effective as trained therapists. [2]Keeping a journal has similar effects. The active ingredient may be telling your problems, just as the active ingredient of acupuncture is apparently needle insertion.

Ritual – doing something just because – can be found in meatloaf recipes, acupuncture, psychotherapy, and clinical trials. In the discussion section of the acupuncture paper, the authors wrote:

Potential limitations of this study [include] inability to blind acupuncturists to the form of acupuncture.

Just as the meatloaf cooks did not understand their recipe, the acupuncture researchers did not understand their research design. The original reason for blinding was to equate expectations. That the two forms of acupuncture came out equal in spite of unequal expectations among the therapists is better evidence that expectations were not important. The authors failed to grasp that lack of blinding worked in their favor.

Thanks to Hal Pashler.

## **My Theory of Human Evolution (language) (2007-09-27 04:27)**

After reading [1]Christine Kenneally's [2]The First Word: The Search for the Origins of Language (2007) I could see that most theorists agree with me that language must have started small: With single words. None of the theorists seem to use my other guiding principle: Lightning doesn't strike twice in one place for different reasons. If two rare events – such as (a) a sound in the night that sounds like a burglar and (b) in the morning your wallet is gone – might be due to the same thing, they probably are. Use of this principle means that how language evolved should fit into a larger explanation.

Humans differ from our closest primate relatives – not to mention all other species – in many ways, of course. One big difference is language; but there are many others. Application of the lightning-strikes-twice principle means that language probably began for the same reason as the other differences.

The overwhelming difference between humans and other species is that humans specialize in terms of jobs. Two randomly-selected people almost surely make their living doing quite different things all day. No other species does this. Two randomly-selected members of any other species almost surely make their living doing the same thing all day. The story I am trying to tell in my human evolution posts is how humans came to specialize like this. (I believe the aquatic ape theory is right, but it's about an earlier stage of human evolution, before job specialization.)

For me, the question of how language evolved becomes the question: How did single-word language promote job specialization? This has an obvious answer: It promoted trade, which job specialization obviously requires. The first words were nouns – in particular, the names of objects (chair, knife, bag, etc.). These words promoted trade because:

1. They served as advertising. It became much easier to tell others that you or someone else had something to trade. It's weird that there is no word for the other side of the picture: Wanting something. Single words also made it much easier to broadcast that there was something you wanted.
2. They emphasized function. The words chair, knife, and bag describe the function of the objects they name. Objects have many other qualities, of course: color, location, ownership, age, materials, etc. Common words tend to hide those qualities and emphasize function. Trades based on function became easier to arrange than trades based on desires for other qualities. The first words helped people trade for stuff they could use, in other words.

Single words work perfectly as advertising. They are still used this way. In a Guatemalan market, I heard a man shout the Spanish word for "toothpaste" over and over. Lots of businesses use single words on their signs to indicate what they sell. Early names, moreover, reflected what a person would have to give in trade: Smith, for example.

People who criticize evolutionary explanations sometimes say it is impossible to have evidence. Not so. In the case of language, you can examine how single words are used today. Sure, new ways of using language have grown up; but they are unlikely to have made old uses impossible. There are dozens of things you can't do with single words. But you certainly can advertise and request ("fork?").

---

Pearl (2007-09-27 06:11:46)

I agree, however I wanted to add that in Japanese, and maybe other languages, you can actually have a regular conversation in single words. They don't use pronouns or modifications of the "to be" verb (ex. 'are you going?' is simply 'go?'), and often verbs are not conjugated into a particular tense. A lot of the language is made cogent by context and voice inflection. You can have a pretty lengthy, albeit shallow, conversation in single word statements. It's sort of amazing how much you can do with one word actually, sometimes I find it unfortunate English is so unwieldy :)

### **How Much Water Should You Drink? (2007-09-27 05:21)**

According to this persuasive non-embeddable [1]video – from a BBC series called The Truth About Food – the answer is don't worry about it.

They compare two twins. One drinks 2 liters water/day, the other doesn't drink any water. Not self-experimentation, but close.

I did [2]an experiment in which I drank 5 liters of water/day. I lost a few pounds, not nearly worth the trouble. There was one surprise: Flavors intensified. Every strawberry was the best-tasting strawberry I'd ever had.

1. <http://www.youtube.com/watch?v=fK2b6UtVW70>
2. <http://repositories.cdlib.org/postprints/117/>

---

James (2007-09-27 06:56:53)

...plus the few pounds you lost were water, which removed some of the buffer between your normal hydration level and being dehydrated. As someone who recently stopped taking a diuretic, I must say that having a few extra pounds on the scale is far superior to being on the edge of dehydration when exercising. That being said, I drink a lot of water – I'm up to liter 6 today and it's before 10AM – after experimenting with more normal consumption levels. Two advantages I've found for losing weight: 1) The well-known "you may be thirsty when you think you're hungry" angle. I'm not sure that this is true, since hunger is often a passing thing anyway, but, even so, this is a nice simple habit to get into to let it pass. 2) Being well hydrated seems to make higher ambient temperatures much more tolerable, perhaps because sweating is more effective. Between the additional calories needed for thermoregulation and the reduced energy use/cost from air conditioning, this aspect has been a total win/win for me. Of course, I work alone (so my slightly increased sweatiness doesn't affect anyone else) at home (so I can keep the temperature high); not sure how broadly applicable this aspect is.

whahuunhuuuh? (2007-09-27 12:14:32)

6 liters before 10 a.m.? Forget dehydration, I'd call that drowning.

lasser11 (2007-09-27 14:41:43)

"There was one surprise: Flavors intensified. Every strawberry was the best-tasting strawberry Iâ€™d ever had." That's not a good thing for the SLD diet. But that's interesting.

James (2007-09-28 06:26:11)

Before "whahuunhuuuh?" has me committed for water-poisoning myself, I'll point out that I weigh 290 pounds and had walked 5 miles in 100 % humidity when I posted yesterday. Because of the conditions, I weighed myself after the walk, so I knew I had lost 2 pounds of water since waking up; this was after drinking 4 liters before and during the walk, so I knew I needed at least one more. Considering that waking up is my low point for hydration, the extra liter over replacement seemed prudent. Side rant: Really big people sweat a \*lot\*, even on a gentle stroll, and the resultant discomfort and dehydration keeps big people from continuing to exercise. If I were an insurance company (or the US government, for that matter, to avoid future Medicare/Medicaid costs), I would send free sweat-wicking clothes and a Camelbak to every obese customer who asked for it.

seth (2007-09-28 08:46:42)

"Not a good thing for the SLD diet." I think that drinking all that water only affected my taste buds, whereas SLD is about smell.

### **Columbia University President Lee Bollinger's Surprising View of Freedom of Speech (2007-09-27 22:14)**

On issues I care about, college presidents have a terrible record. After [1]Margot O'Toole accused Imanishi-Kari of scientific misconduct, David Baltimore – later president of Rockefeller University and Caltech – stood by as O'Toole's career was ruined. Both O'Toole and Imanishi-Kari were in Baltimore's lab. I'm sure O'Toole was right; ink and digit analyses made it clear that Imanishi-Kari's data was fake. The current Chancellor of UC Berkeley, Robert Birgeneau, when he was head of the University of Toronto, stood by as [2]a job offer to the psychiatrist David Healy was withdrawn because Healy had criticized drug companies. President of Reed College Colin Diver [3]failed to grasp that what he strongly objected being done to him was what Reed professors did to their students every day. Axel Meisen, President of Memorial University, has allowed his university's lawyers to defend the indefensible: Memorial failed to protect the nurse who tried to stop [4]Ranjit Chandra. Henry Bienen, President of Northwestern University, allowed Lynn Conway and Deidre McCloskey to use the power of his university [5]to punish Michael Bailey for saying something that Conway and McCloskey didn't like.

I might have given Columbia University President Lee Bollinger credit for supporting free speech when the President of Iran spoke there a few days ago. But I won't, because [6]here is how Bollinger introduced him:

[long self-congratulation] . . . Let me now turn to Mr. Ahmadinejad. . . [long no-stone-unturned condemnation] . . . Mr. President, you exhibit all the signs of a petty and cruel dictator. . . . Why are you so afraid of Iranian citizens expressing their opinions for change? . . . You held a two-day conference of Holocaust deniers. For the illiterate and ignorant, this is dangerous propaganda. . . . When you have come to a place like this, this makes you, quite simply, ridiculous. You are either brazenly provocative or astonishingly uneducated. . . . Because of this, and for many other reasons, your absurd comments . . . I close with this comment frankly and in all candor, Mr. President. I doubt that you will have the intellectual courage to answer these questions. . . . your preposterous and belligerent statements . . . so embarrassed sensible Iranian citizens . . . I am only a professor, who is also a university president.

Ugh. Ahmadinejad objected:

In Iran, tradition requires that when we demand a person . . . to be a speaker, we actually respect [the audience] by allowing them to make their own judgment, and we don't think it's necessary before the speech is even given . . . to provide vaccination.

Bollinger did not understand that freedom of speech means nothing unless you listen to those allowed to speak.

Addendum: Bollinger, a former Law School professor, teaches a class on freedom of speech. At the next meeting of this class, shortly after the remarks I quote above, "the students erupted in cheers."

Contrast Bollinger's welcome to dictator General Musharraf: <http://distantocean.com/2007/09/lee-bollinger-f.html>

qarni (2007-09-28 22:41:49)

An Open Letter to Lee Bollinger, President of Columbia University A Barbarous and Ignorant Speech By CLIFTON ROSS To Mr. Lee Bollinger, I'm writing you to express my outrage over your vulgar treatment of President Ahmadinejad yesterday when you invited him to speak at your university. Simple human etiquette of the most primitive and elemental sort, was required in the situation, but you failed to deliver even that. You were obnoxious, insulting and displayed an appalling ignorance of President Ahmadinejad, Iran and politics, not to mention the rules that govern "civilized" human conduct (arguably "primitive" conduct is even more governed by politeness and elevated rules of conduct). Moreover, in a context that calls for objectivity, investigation, open mindedness and a willingness to learn and exchange ideas, you displayed a remarkable absence of any of those qualities. Instead, you showed yourself to be one with the bullying, abusive, ignorant and arrogant people who unfortunately govern our country at the moment and who are attempting to induce a phobic and neurotic xenophobia comparable only to what Hitler and Mussolini and Stalin inculcated in their countries during those moments of greatest darkness in human history. The irony of the situation is that you displayed all those qualities of which you accused President Ahmadinejad. Where was that display of that "great tradition of openness" in your callous, close minded speech? Your speech shows you to "exhibit all the signs of a petty and cruel dictator" and worse: a bully, a man who invites a guest into his house, then abuses him before a cheering crowd. You accuse President Ahmadinejad of "a brutal crackdown on scholars, journalists and human rights advocates" but you fail to mention the scores of scholars, journalists and human rights advocates, imprisoned, tortured and murdered by U.S. forces in Iraq. Is that cowardice or a double standard or merely "oversight" on your part? And when you accuse President Ahmadinejad of denying the Holocaust and calling for the destruction of the state of Israel, that is, when you pander to your Zionist supporters, you merely display an ignorance of the actual words of Ahmadinejad (words that were twisted in the translation to English, predictably; see this piece by Virginia Tilley,), which he corrected yesterday in his comments and clarifications. However, when you say "your [Iran's] government is now undermining American troops in Iraq by funding, arming, and providing safe transit to insurgent leaders like Muqtada al-Sadr and his forces" you show yourself to be as biased,

and blinded by nationalism and an imperial arrogance as the architects of the genocide we're currently seeing in Iraq. You don't ask what "American troops in Iraq" are doing there as invaders, occupiers, who are, de facto, now made war criminals by being the willing instruments of the "war of aggression," considered the supreme international crime, one committed by Mr. George Bush through fabrications of evidence, lies, and manipulation; you don't ask what role those resistance fighters like Muqtada Al Sadr are playing, but those less blinded by nationalism than you would compare him to our own patriotic forefathers who fought the British for our own nationhood; and now you don't bother to ask what your ignorant, uninformed criticisms of President Ahmadinejad will do to help the same war criminals who destroyed Iraq to now go on and destroy Iran. If you knew anything of history, the history of your own lifetime, you might understand the situation that currently confronts Iran. You probably know that the U.S. overthrew Iran's democracy in 1953 and set up a brutal, decadent Shah who was our man in the Middle East for the following two and a half decades. You may even know that the CIA helped organize the imprisonment, torture and killings of dissidents under that Shah, which is why the students took over the U.S. embassy when they finally got rid of the filth the U.S. had imposed upon them for all those dark years. We don't need to agree with the elected President of Iran, Ahmadinejad, to show him the simple respect due an elected head of state. But you seem incapable of that simple act required of someone in your position. To call an elected president a "dictator," however, is not only insulting but inaccurate. Such epithets are reserved for those who impose themselves by force and by fraud, such as Mr. Bush, who has stolen two elections. But I'm sure you wouldn't use terms to describe your own head of state so, now would you? The Chinese have a saying, roughly translated, that goes, "the one pointing his finger at another, has three fingers pointing at himself." But you are so blind to who you are, up there in your position of power as President of the prestigious Columbia University of New York in the great empire of the United States of America, that you don't see the man being accused by his three fingers. So, to close, I invite you to take a look at yourself, and our people, as another sees us. Her name is Layla Anwar and she writes a blog called Arab Woman Blues which you can find [here](#). I warn you. A man of your highly sensitive sensibilities may find some of her language harsh, painful, distasteful. But I assure you, she has far more justification for saying what she does than you did in your pronouncements against the President of Iran yesterday. And it is long, but I plead for you to have patience because you are a man in need of an education, and sometimes education is a very painful process. She writes: Is there anything in Iraq that the Americans have not destroyed? Anything at all? ... The past - you have looted and destroyed. Trying to erase our collective historical memory ... Our roots, where we came from, what our ancestors did, their achievements, their trials, their statues, their writings ... You do not know history, you are rejects of history. You have no history. You have no past, you have nothing ... you are nothing. You are nothing but ogres of consumerism. Not just material stuff, but anything you can swallow whole you will. You even swallow other people's history whole. You are a greedy, covetous, gluttonous, voracious, jealous, envious people ... Since you are nothing, your nihilism contaminates everything else ... You destroy and self destruct ... No Future - You have no future, because inside of yourselves, your future is limited to your own little egos. Little egos have no future. Little egos are amoebas, parasites, feeding off others ... You think you have a vision but your vision is only about your stomach, your pockets and what you have in between your legs ... That is it. This is where it stops. Surely this does not make you seers ... What have you contributed to the world? Anything of real substance? Nothing. Apart from brutal might and power ... and your sickening culture that is as hollow and as empty as you are. And just as you have no real future, you robbed us of our own. You are collectively a bunch of criminals, thieves, thugs and perverts of the worst kind. Since your f—ing 9/11, you have totally destroyed two countries. Afghanistan and Iraq. And you have not stopped. Not one day, not one hour ... You wanted regime change in Iraq - you got it. You also changed us, me, beyond anything I can recognize ... I never hated you before. Today I do. I really hate you. You collectively disgust me. Even our ancient Mesopotamian deities and spirits are disgusted with you. Every single letter of the Alphabet is disgusted with you. The earth, the rivers, the sky, the mountains, the trees, the birds of Iraq are disgusted with you ... The cosmos is disgusted with you ... Everytime I spot one of you anywhere in close proximity and hear that ugly accent of yours I run away ... I avoid you like the plague. I can't bear to hear you or see you. You represent nothing but Death and Destruction to me. Your ugliness is all pervading ... Everytime I switch on the TV or the Radio and see or hear one of you, I zap. I wish I can zap you out of my life once and for all ... I know, I keep repeating myself, but then you keep repeating the same acts. Iraq is going down, with its past and its future ... I can only promise you one thing, however long it may take, we are going to take you down with us." As a North American I can add nothing more except to apologize to Iraq for what my government has done and continues to do to them and to Iran for what you, and your government have done, and are preparing to do, to them. And to President Ahmadinejad, I apologize for Mr. Bollinger's barbarous and inexcusable words. Not all U.S. citizens are as ignorant and lacking in basic manners as the presidents of our universities. Clifton Ross Clifton Ross is the co-editor of *Voice of Fire: Communiques and Interviews of the Zapatista National Liberation Army* (1994,

New Earth Publications). His book, *Fables for an Open Field* (1994, Trombone Press, New Earth Publications), has just been released in Spanish by La Casa Tomada of Venezuela. His forthcoming book of poems in translation, *Traducir el Silencio*, will be published later this year by Venezuela's Ministry of Culture editorial, Perro y Rana. Ross teaches English at Berkeley City College, Berkeley, California. He can be reached at: [cliffross@gmail.com](mailto:cliffross@gmail.com)

Justin (2008-04-16 12:37:36)

Well, I will first say that I don't agree with the way Lee addressed the President of Iran. I found it to be more of a mud slinging contest than an actual debate. None the less, he was honest when he said he "felt all the weight of the modern civilized world yearning to express the revoltion at which you stand for". So, who did he really please? The mass of stupid, that's who. Which seem to highly out number the intelligent ones. However, I do not agree with Layla Anwar and her equally belligerent comments. I realize she is not broadcasting as mainstream as Lee is and therefore, she must play catch-up and speak bolder, louder and more aggressive to win her opinion over on her readers. She did quite well and I almost agreed with her. Unfortunately, someone who possesses so much hate and animosity for a country they willingly live in sure isn't going to be someone who I would put much stock in. As we can already see, using hateful and unprofessional comments in your opinions only makes you just as bad as the person you're accusing. So, I guess you were right, Qarni. There are three fingers pointing back at you. That's the way it works, didn't you know? Same goes for you, Layla. "I can only promise you one thing, however long it may take, we are going to take you down with us." This is a clear indication that you have some anger issues that you need to address, Layla. You're protesting against the violence in one country and then you turn around and promote the violence of another. Revenge is a stinky cologne. However, I can't say I haven't felt revenge at some point in my life. I don't blame you for feeling that way. I'm a secular humanist so understanding is in my nature. I just strongly disagree with your out look on the whole thing. You're spreading hate and doing exactly the opposite of what is best for you and your readers. Therefore, you're no different then Lee when he makes an ass out of himself in front of the "modern civilized world". You're no better than Mahmoud Ahmadinejad when he makes his outrageous comments and preposterous claims to the denial of the holocaust and his ever so convenient miscommunication of his intentions on dealing with Israel. Just so we're clear, humans don't get a long because of many barriers between us. Like no other species we desire to control the world around us. Temptation for murder and genocide is higher than you may think. Our primitive side isn't that far gone, let's be honest here. Living in America, I'm sure you have to force yourself not to throw someone who cuts you off in traffic the middle finger. That anger gets the best of us and it's just a hop, skip and a jump away from our true primitive feelings. Understanding is our only way to unite the world. You're just being a hypocrite, Layla. Shame on you for not seeing that in her, Qarni. My conclusion: All four of you [Lee, Ahmadinejad, Qarni, Layla] are wrong because your version of the truth is distorted by your emotions - which have no place in a professional debate. Sorry for the bad grammar, spelling, etc. I never claimed to be perfect. -Justin

Sam (2008-09-05 14:52:04)

After reading all this I must say that I agree with Justin. Layla is just full of hate and animosity and she's also wrong about the Americans having no history. She's just an angry little hermit who probably lives in her mothers basement and writes hate columns in her blog trying to justify her reaction to the world in hopes that she can suck other innocent people into her web of hate. Ahmadinejad is a liar, a terrorist and an instigator and is obviously refusing to comply with The United Nations which is why sanctions were placed down in the first place. Let's not forget who's provoking who.

### **Aaron Swartz on What's Wrong with Wikipedia (2007-09-28 06:47)**

I recently asked [1]Aaron Swartz, who has [2]written about Wikipedia and [3]run for its board of directors, what he thought was wrong with it. Three big things, he said:

1. Failure to value new contributors. A small number of insiders are dismissive of and treat poorly newcomers who contribute. For example, their contributions are deleted without explanation. The insiders see the newcomers as a source of trouble rather than strength.

2. Disorganized and underfunded. It took someone Aaron knows two years to make a deal with Wikipedia. The finances are in bad shape.

3. Lack of vision. Wikipedia could be improved in many ways but actual improvements are rare.

He used to see Wikipedia as just a wonderful thing, he said; now he sees it as a wonderful thing that is falling way short of what it could be.

You seem to be saying someone could come along and start a better open-source encyclopedia, I said. That's unlikely, he said, Wikipedia is so big.

Who does it better? A similar but vastly [4]better-run website is craigslist, he said. A chart of [5]page view rank and number of employees shows Yahoo at #1 with 10,000 employees, TimeWarner at #2 with 90,000, Google at #3 with 10,000, and so on. Craigslist is #7 with 23 employees.

Addendum: Wikipedia, with very few employees, would of course also rank very high on such a chart; this is the magic of both Wikipedia and craigslist and why it makes sense to compare them. The craigslist link I gave, to a Wall Street Journal article, suggests that craigslist values contributors much more than Wikipedia. [6]Here is what happened at a Wikipedia board of directors meeting that Aaron attended a few years ago:

One presentation was by a usability expert who told us about a study done on how hard people found it to add a photo to a Wikipedia page. The discussion after the presentation turned into a debate over whether Wikipedia should be easy to use. Some suggested that confused users should just add their contributions in the wrong way and a more experienced users would come along to clean their contributions up. Others questioned whether confused users should be allowed to edit the site at all – were their contributions even valuable?

Sage (User:Ragesoss) (2007-09-28 19:00:05)

I think that chart is misleading when you're trying to compare Wikipedia to Craigslist. That chart is limited to English language rankings, and is probably out of date. The overall rankings (not page view rankings) from Alexa currently have Wikipedia at #9 and Craigslist at #10 for the U.S. Globally, Craigslist is something around #40, while Wikipedia is #8 and serves almost 3 times the page views of Craigslist. Wikipedia also has a much broader constituency; Craigslist has a much higher number of page views per user, but much lower "reach". Incidentally, the Wikimedia Foundation has a paid staff of 12. I love Craigslist, but I think this is apples and oranges. Aaron is certainly right that Wikipedia and the Wikimedia Foundation has some problems (and I respect Aaron's viewpoint; I voted for him for the board), but I think he's out of touch with the way things have been going since he disconnected with the community when it comes to points 2 and 3. Organization has been improving rapidly, and funding has more or less kept pace with the organization's ability to spend it in an organized and effective manner. Yes, many people (myself included) have thrown out big ideas for what we could do if we had the money for it, but the priority has

been to create stability first, including a stable funding base. This is much more of a challenge for Wikimedia (a non-profit) than Craigslist (which makes its money from job and housing ads). As for lack of vision, I think Aaron is deeply mistaken here, but I guess it comes down to a judgment call.

seth (2007-09-28 23:24:26)

Yes, obviously Wikipedia gets a staggering number of page views with a small staff and lots of user-contributed content, just like craigslist. That's why they're worth comparing. But if you don't like that comparison – which is fine – tell me a better one. If you think Aaron is wrong about lack of vision, it would be helpful to know why.

## **Support for the Theory Behind SLD (2007-09-28 22:39)**

On the SLD forums, a member named Del [1] posted this:

Roughly a month ago, I got tired of the oil. I was fighting to take it and something about one of them was causing an allergic reaction (dermatitis), so I switched to noseclipped oatmeal with brown rice protein. I haven't noticed any change in my appetite suppression (read, still ridiculously good) and my weight loss has maintained at the usual rate of 3lbs or so per week. I'm really enjoying it and I have that nice full feeling as well.

So in the interest of sharing, that's:

1/2 c. quick cook oatmeal

2T. brown rice or egg white protein

1 c of water

Cook in microwave for 2 minutes, let sit for one minute. Consume noseclipped morning and night.

In conventional nutritional terms, oil and the oatmeal mixture are very different. One is all fat, the other has almost no fat. Yet they have had the same effect on her weight. The theory behind the Shangri-La Diet predicts this but few if any other theories do. For example, if you believe in low-carb diets, you would predict that the oil (no carbs) would cause weight loss more easily than the oatmeal mixture (which has plenty of carbs).

1. <http://boards.sethroberts.net/index.php?topic=5684.msg59502#msg59502>

Lori (2007-09-29 06:44:55)

But why would oatmeal or any other (nose-clipped) flavourless carb be any different than sugar water, the original flavourless carb in the SLD saga? SLD'rs are nose-clipping all kinds of foods.

seth (2007-09-29 08:33:00)

Lori, are you saying this result was obvious? I'm afraid I don't understand your question or point.

### **Deeper Voice = More Children? (2007-09-29 05:46)**

At Language Log, [1]Mark Liberman has an excellent discussion of a new paper that reports a correlation between voice pitch and number of children for men in a hunter-gatherer population. Men with deeper voices had more children. This portion of Liberman's post surprised me:

This particular form of sexual dimorphism is apparently not shared with our relatives the chimps and gorillas, so it must have evolved during the same period that human speech and language did. Therefore, starting at some point during the last five million years or so, there must have been a selective advantage for male hominins with lower voices. And according to the featured study (C.L. Apicella, D.R. Feinberg, F.W. Marlowe, "Voice pitch predicts reproductive success in male hunter-gatherers", *Biology Letters*, published online 9/25/2007), evidence of this selective advantage can still be found today.

I agree with all of this. The puzzle is that the effect remains. Five million years is a long time; shouldn't the dimorphism have gotten larger and larger until an equilibrium was reached, and then stayed at that equilibrium? Once equilibrium is reached it will be the average voice pitch that is most successful.

I can think of several possible answers.

1. The correlation is due to random variation. Because lots of surveys have shown that women prefer men with deeper voices, this is less plausible.
2. Evolution is still happening on this dimension. That is, equilibrium hasn't yet been reached.
3. This particular tribe was pushed away from equilibrium for an extended time – that is, for a long time higher-pitched men's voices were more advantageous than usual. Whatever caused that has disappeared so this group is moving back toward equilibrium.
4. It's about signalling. The voice-pitch variation observed in populations is mostly due not to genetic variation but to early environment (say, testosterone in the womb) and is correlated with something less visible that makes a difference in the reproductive success of one's children.

I imagine the authors of the paper favor #4. When the full text is available for free, I'll find out and post again.

---

Tom Myers (2007-09-29 10:11:18)

I have two thoughts about this selective advantage...first, it could still be that the relationship is non-causal, in the sense that gene G being selected for causes phenotypical effects P1 and P2, where P1 is being selected for and P2 is lower masculine voice. I don't see that this possibility has been eliminated by the discussion I see so far. Second, I would point to a [1]zoologist's [2]book about communication with dogs:

Dogs and humans share an interpretation of high and low sounds (as do many other mammals)...Simply saying a signal in a lower voice than before can make the difference between your dog's ignoring you or obeying...I know I'm not the only woman whose voice tends to rise just when I most need it to carry authority: Some men, on the other hand, need to practice using a higher voice to praise or encourage their dogs. Almost every training class has at least one guy's guy who shouts out "Good dog" in a voice that stops all the dogs and usually half the humans...high sounds are associated with excitement, immaturity, or fear, while lower sounds are associated with authority, threat, or aggression...practice saying "No!" or "Stay" in a low voice rather than a loud one and letting your voice rise when you call "Come"...[pp 62-3]

It seems likely to me that the selective advantage was already present among our shared ancestors with chimps and gorillas, but became more important simply because human signaling became more verbal. (But it's still a Just-So story; I don't have further testing in mind at the moment.)

Tom (2007-09-29 15:17:14)

How about #5) Chicks dig deep voices. Or was that included in #2>

Mark Liberman (2007-09-29 15:19:24)

Apicella et al. don't discuss the question, but I expect that they would favor the view that this sexual dimorphism is roughly in equilibrium, and has been for a long time. Why don't male voices go on getting deeper and deeper? Perhaps females somewhat prefer baritones to basses; perhaps larger larynx size carries increasing selective disadvantages of other kinds, having to do with the mechanics of breathing and swallowing. Both ideas are plausible. Meanwhile, I'll send you a .pdf of the article.

Mark Liberman (2007-09-29 15:27:55)

I should have said, \_some \_ females somewhat prefer baritones. The shape of individual preference functions and the distribution of such preferences in the female population are both largely unknown. There might also be other maladaptive effects of whatever combination of higher testosterone levels and greater sensitivity to testosterone during adolescent growth is responsible for larger larynx size and lower pitch.

seth (2007-09-29 17:35:58)

"Chicks dig deep voices" is a different category of explanation. Such explanations are called "proximate" while evolutionary explanations are called "ultimate". Weird terminology, but you get the point.

## The Wikipedia Wars (2007-09-29 09:32)

[1]Speaking of Wikipedia, the LA Times has an [2]interesting article today about what happened when Jimmy Wales – the founder – posted a one-sentence article about a butcher shop on the outskirts of Cape Town. It was deleted quickly – not important enough – but then a big debate ensued. The Times piece turned to the bigger issue:

Perhaps the granddaddy of all the Wikipedia debates is the question of which information deserves to be

included, and which doesn't. So-called Inclusionists believe that because Wikipedia is not bound by the same physical limits as a paper encyclopedia, it shouldn't have the same conceptual limits either. If there's room for an article on unreleased Kylie Minogue singles – and a group of people who might find it useful – why not include it? Deletionists, meanwhile, believe that because not all articles are created equal, judicious pruning increases the overall quality of Wikipedia's information and strengthens its reputation. An encyclopedia, they say, is not just a dumping ground for facts.

While the people who run craigslist try hard to figure out what users want and how to give it to them – starting with the assumption that they themselves do not know – the people who run Wikipedia play God, at least by comparison. In this debate, both sides are playing God. As [3]Aaron Swartz said, it isn't wise. Jane Jacobs tells a story about a Pennsylvania Girl Scout troop. They were snobs; they made it hard for new members to join (the Wikipedian attitude that Aaron criticized). The girls who couldn't get in formed their own troop. Several years later the new troop was thriving; the old troop was dying.

---

david (2007-09-29 12:02:25)

Reminds me of this post of yours <http://www.blog.sethroberts.net/2007/04/16/birth-of-a-website/> about the genesis of <http://www.scientificblogging.com/> I still have scientificblogging in my feed reader and regularly find interesting things there. Any news on how the other site that rejected everybody is doing?

seth (2007-09-29 18:43:47)

I think the site that rejected everyone is doing fine but I'm not sure. Maybe the founder of scientificblogging could answer that one.

### **Interesting Idea about Addiction (2007-09-29 19:52)**

From [1]addiction and self-experimentation:

I am coming to believe that [my] addiction may be caused by a specific kind of autism-related syndrome. I don't crave order in everything that I do but I do crave order and structure in order for me to relate to others. I need to figure out some ways to get that structured social interaction that my brain requires. . . A 12-step meeting could be [seen] as just a highly structured social event.

A friend of mine became an Orthodox Jew in college; his parents were not very religious. Now and then I went to his house for Shabbat. As I got to know him better – outside the religious rituals – I was astonished at the difficulty he had carrying on a conversation. The many structures (rituals) of Orthodox Judaism made it much easier for him to spend time with other people.

---

Mary (MPJ) (2007-09-29 21:09:29)

This is absolutely fascinating. Thanks so much for posting! I will have to check the blog you referenced. I have a husband who is an addict and a son with autism, and I have noticed that there are many, many other families in which both addiction and autism are found together. Both addiction and autism have obsessive/compulsive components, and as the writer pointed out, a need for order and structure and difficulty relating to others.

Stephen M (Ethesis) (2007-09-30 21:22:55)

This post has me thinking as well. Thank you.

Arnoud (2007-10-05 10:58:41)

how to handle addiction if one has Asperger or PDD?

### **How Lucky I Feel (2007-09-30 02:41)**

From an [1]email to science-fiction author [2]Bruce Sterling:

The main thing [most book] authors experience is THE VOID. We never get any feedback or at least never enough. I have a friend called Ruth who is 80 years old and reads voraciously: novels, biographies, poetry. She writes to the authors she likes and gets back extraordinary responses: four pages hand written, invitations to dinner. She says, 'I would have thought they were too important to read my letters' and I say 'Ruth, you are the only one who writes'.

It's the same with teaching. We get to know so little of what effects we have on our students. But the internet offers a small measure of salvation. Sometimes a former student writes, 'You don't know me but I sat in your class in 1991 and...' It makes all the difference to get just one of those every few years, but it doesn't add up to an objectification of the audience for our work.

I've had thousands of students and written one book. (In Chinese you are a "writer" if you've written one book and an "author" if you've written more than one – so I am a writer.) I don't hear from my students very often but every day I get feedback from the SLD forums. To say I get "enough" feedback would be to understate the effect of comments like [3]this:

I started a new job this past August . . . It's so strange to be in a new place with people who've never known me as Fat Del. . . . That insidious "I wonder if there's something wrong with her" has never

crossed their minds. I'm just the normal girl in the next office. Men flirt with me and seem to think it's cute when I'm not sure how to flirt back. . . . No one ever thinks I used to be fat and no one ever judges me in that light. Hell, my boss calls me by my full name and says it's because Del is too short and casual for a pretty girl.

It's so odd to be normal. I never thought I'd know what that was like.

Thanks for letting me know, Del.

1. <http://blog.wired.com/sterling/2007/09/author-20-feeli.html>
2. [http://en.wikipedia.org/wiki/Bruce\\_Sterling](http://en.wikipedia.org/wiki/Bruce_Sterling)

---

michael vassar (2007-09-30 02:56:56)

Funny to hear that from Sterling while his peer Neal Stephenson vociferously objects to criticism he receives for never responding to mail or to journalists except when a new book must be promoted.

Tom (2007-09-30 10:27:36)

Wow. Seth, what a great post, and how wonderful to have created something that gives that gift to people.

### **A Story About Data (2007-09-30 10:38)**

While [1]introducing Justin Wolfers as guest blogger at Marginal Revolution – which I am greatly looking forward to, since Wolfers is an excellent data analyst – Alex Tabbarok wrote:

An open secret and an open sin in economics is that many empirical studies are difficult to replicate, even when journals supposedly require authors to make their data publicly available.

Which reminds me. Several months ago, I read an article in a psychology journal about a topic I care a lot about. The conclusions of the article were the opposite of what I think is the case. Was I wrong? Possibly – but the data analysis done in the article was unquestionably "wrong" in the sense that (a) it assumed something that was unlikely to be true and (b) it was possible to do a data analysis that didn't make that unlikely assumption. I don't think my opinion here is controversial; I think a blunt but fair summing up of the situation is that the authors made a big mistake.

I was in New Orleans a few weeks after the article appeared. Someone in an art gallery told me the conclusion of the paper! Which is only to say it is a really interesting conclusion. Anyway, I wrote to the first author of the paper (a graduate student) to explain my concern about their conclusions and to ask for the data, so I could do a better analysis. Two weeks went by, no answer. I sent a reminder email, and got this answer:

We typically do not give out our original data, but when I get a chance, I will run the analyses in HLM and get the results back to you. Thanks for your interest in the study,

Wow! It is the policy of the journal in which the paper was published that the data be made available. A month passed. When do you expect to run these analyses? I wrote. A month passed with no answer. I wrote to the faculty member who was a co-author on the paper. Finally I got an answer from the student:

I have been meaning to respond to your email & I apologize for not getting back to you sooner. I am a graduate student and am traveling for the summer. I understand the difficulty with the [blank] situation and am assuming that HLM would be a good way to work through that. However, I am not familiar with the procedure, so it will not be until late August/ early September when I can get a statistician here at [blank] to teach me the procedure. If you have specific suggestions about the analyses, please let me know and I will keep that in mind when I get a chance to work with it. We should have some follow-up data coming in as well so it will be good to learn the procedures for future research. Thanks for your interest in the study.

The story so far is uncomfortably close to what happened when Saul Sternberg and I questioned [2]Ranjit Chandra's data. Similarity 1: He never provided the data. Similarity 2: It took a remarkably long time and several emails to get any response. Similarity 3: The response, when it finally came, was only vaguely reassuring. However, in this case, I predict the better analysis will actually be done. Which is good – I would rather someone else do them.

1. <http://www.marginalrevolution.com/marginalrevolution/2007/09/justin-wolfers-.html>

2. <http://www.sethroberts.net/chandra/index.html>

---

Stephen M (Ethesis) (2007-10-06 08:17:05)

That was well worth reading.

### **Marc Andreessen's Career Advice (2007-09-30 19:20)**

[1]Marc Andreessen is starting a series of posts of what I am sure will be excellent career advice. This is from the [2]first:

I believe a huge part of what people would like to refer to as "career planning" is being continuously alert to opportunities that present themselves to you spontaneously, when you happen to be in the right place at the right time. . . . [for example:]

Your former manager has jumped ship to a hot growth company and calls you three months later and says, come join me.

I am continually amazed at the number of people who are presented with an opportunity like one of the above, and pass. There's your basic dividing line between the people who shoot up in their careers like a rocket ship, and those who don't – right there.

A friend of mine worked at UC Berkeley with Bill Joy, one of the founders of Sun Microsystems. One day he got a call from Joy: Want to join me at Sun? My friend would have been employee #5 – something like that. He said no. It was a huge mistake, just as Andreessen says.

1. <http://blog.pmarca.com/>

2. <http://blog.pmarca.com/2007/09/the-pmarca-gu-1.html>

---

Blaise Pascal (2007-09-30 21:55:04)

Conversely, I've a friend who, in a similar situation, jumped from a well-paying university tech-support position to move half-way across the country to join a dot-com. Over the past few years he's seen several of the businesses he's worked for sell out and close down. He's happy where he is, but his income isn't much higher than it was when he started working for the start ups. If he'd passed on the opportunity, he'd have tons of seniority at the university, fewer periods of unemployment, and more security than he's experienced. Would he do it again? Probably. But it's reasonable to make the same risk-assessment and to decide not to leap.

KenF (2007-10-01 09:45:27)

So many people devote their heart and souls to start-ups that go nowhere. They work nights, weekends, etc. for mediocre salaries and end up with little or nothing to show for it. Some people get rich that way, of course, but most end up chasing failed dreams. I've known several people who stayed at their "boring" jobs, while others went and chased riches, and actually they ended up making the most as their "boring" companies ended up being sold or they rose high up in the company.

OneStepAheadCV (2008-07-10 03:49:09)

For every start-up that succeeds, more fail - however like gambling, the big risks pay the most! I worked for an SME startup, it had the best working environment, a great training scheme...but it only lasted six months! I guess you can't win them all, but at least you can try!

## **Walk and Write at the Same Time (2007-09-30 21:14)**

My [1]exercise research suggests our brains work better when we walk. Here's one way to combine walking and writing:

While working on a paper, which was most of the time, [Niels] Bohr would select an assistant from among the young physicists in Copenhagen. The assistant, affectionately dubbed the victim, was supposed to sit in place while Bohr paced around the room, constantly puffing away at his pip, working and reworking his ideas, talking aloud as the idea took shape, trying and retrying to dictate his sentences to the victim.

From [2]Faust in Copenhagen: A Struggle for the Soul of Physics by Gino Segre.

The modern version may be use of word recognition software with the computer screen on a wall or large TV. You walk back and forth in front of it. I have spent a lot of time writing while walking on a treadmill but it was noisy and

tiring. Moreover, it was hard to start and stop and it was monotonous.

1. <http://www.blog.sethroberts.net/2007/09/25/science-in-action-exercise-15-minute-walk-twice-more/>

2. [http://www.edge.org/3rd\\_culture/segre07/segre07\\_index.html](http://www.edge.org/3rd_culture/segre07/segre07_index.html)

---

Igor Carron (2007-10-01 12:00:02)

I find a lot of truth in the walking while having ideas. I think most people do. I have gone through several PDAs and always come back to the little paper notebook. There is another place where my brain works real fast and efficiently: Planes. Being stuck in a plane for 10 hours has consistently provided me a pretty good brainstorming session. I don't know if it is the surrounding, the air/atmospheric pressure, no internet, constant cooling or something else (like having to watch the seat in front of me something akin to your face studies). I have also noticed that ideas generated during those "sessions" generally are of different quality (more far reaching) than the ones I would have had on the ground. I wonder if I am the only one. Igor.

Ben Popken (2007-10-01 18:48:11)

Interesting. I got a LG eNv, which has a full QWERTY keyboard, so I could type up ideas on the go and send myself cut and pastable notes. I've done some composing on the run and come up with good ideas, but I need to work on my peripheral vision so I don't end up as a brilliant pancake.

pdf23ds (2007-10-01 19:18:13)

To do the voice recognition thing, you'd have to wear a wireless headset. Any room microphone would have to be quite expensive to have a low enough self-noise, and even then the background noise would be very confusing to modern speech-to-text algorithms.

## 2.10 October

### Tayster Continues SLD (2007-10-01 22:22)

It's been almost two weeks since I started The Shangri-La Diet. I am down about ten pounds total. . . I'm all of a sudden some sort of health guru to the ladies at my office. As of this morning, there are six co-workers that are participating in the SLD in one way or another.

All they heard me say was, "I lost weight by drinking oil" and they all ran out and bought a bottle of oil to start losing weight.

I should've told them that I was drinking my own urine.

From [1]Tayster's World. [2]After one week.

1. <http://tayster.blogspot.com/2007/10/diet-continues.html>
2. <http://www.blog.sethroberts.net/2007/09/25/the-sld-way/>

---

Blaise Pascal (2007-10-02 05:16:41)

Hmmm, without experimentation, I can only speculate. I would assume that urine has too much flavor and too few calories to be effective for the SLD.

Tayster (2007-10-02 11:04:51)

First of all, Seth, thanks for the link...again. And Blaise, you owe me a new keyboard. I opened the comments just to see what was being said about me and I wasn't expecting a continuation of my urine remark. I laughed (and shot water out my nose onto my keyboard) after reading your urine speculation.

### **What Causes Heart Attacks? (2007-10-02 04:54)**

On the latest episode of the excellent TV show *Mad Men*, which takes place in 1960, a man who has just had a heart attack says, "Did everything they told me. Drank the cream. Ate the butter." A humorous comment on how ideas change. Now, of course, many people – possibly including the screenwriter – think eating cream and butter causes heart attacks. After a year studying omega-3s, I'm sure it wasn't the amount of fat that caused the high-fat diet/heart attack correlation, it was the type of fat (low in omega-3). Cream and butter would have been fine if the cows' food contained plenty of omega-3.

For decades we've been told that cream and butter and other animal fats "clog your arteries". It's like a well-known experiment with split-brain patients. The patient chooses a card based on what he sees on a screen. The two hemispheres see different things. In one particular trial, the right hemisphere saw a picture of snow on the screen and picked out a card with a picture of a shovel. The left hemisphere saw a chicken claw. The left hemisphere controls speech. When the patient was asked to explain the choice, he said, "You need a shovel to clean out the chicken coop." This happened again and again: The left hemisphere did not know why a card had been chosen but rather than saying "I don't know" it confidently made up an explanation. Keep this in mind the next time you hear an explanation.

Studies to see if omega-3 supplementation reduces heart attacks have had ambiguous results, as Marion Nestle [1]said. Why am I so sure that lack of omega-3 is the problem? (So sure that I no longer worry about my cholesterol.) 1. There is lots of evidence that heart attacks are due to inflammation. 2. There is lots of evidence that omega-3 fats are anti-inflammatory. 3. Eskimos had very low rates of heart disease and ate a diet high in omega-3 fats. 4. Many studies have correlated heart attack risk with gum disease. 5. My [2]self-experimentation showed beyond any doubt that omega-3 supplementation makes the brain work better. It also showed what effective dosages are. 6. When Tyler Cowen took an effective dose, his gum disease [3]quickly disappeared. Everyone – everyone who thinks about this stuff – knows #1- #4. It is #5 and #6 that are new and complete the chain of reasoning. I believe #6 is as meaningful as the observation that scurvy is quickly cured by lime juice.

In the 1930s, a dentist named [4]Weston Price went all over the world looking at people's gums. He wanted to compare modern diets with traditional diets. When his subjects ate a modern diet, he found gum disease. When they ate a traditional diet, their gums were fine even when they never brushed their teeth. In a few cases, such as an isolated group of Swiss mountain people, the traditional diets contained lots of butter and cream – from grass-fed cows. My gums vastly improved after I started taking good amounts of omega-3 (via flaxseed oil). After I reread Weston Price recently, I stopped being so careful about flossing and brushing. It hasn't made a difference. In the past,

my gums would bleed when I flossed unless I flossed daily. Now I floss rarely but they don't bleed. I'm sure my whole circulatory system is in better shape.

1. <http://www.blog.sethroberts.net/2007/09/05/marion-nestle-on-omega-3s/>
2. <http://www.blog.sethroberts.net/2007/02/24/omega-3-greatest-hits/>
3. <http://www.blog.sethroberts.net/2007/07/06/omega-3-and-dental-health-surgery-commuted/>
4. <http://www.westonaprice.org/>

---

peter (2007-10-02 14:47:43)  
do you know the cholesterol level and hdl/ldl ratios of the Eskimos?

seth (2007-10-02 19:26:11)  
very good question. but I don't know the answer.

andy (2007-10-02 19:34:46)  
In that episode, he thought it was the ulcer that was going to kill him. I believe that was why he was eating the cream and butter.

asoff eracchi (2007-10-02 20:57:37)  
Seth - how can the antioxidants rich Omega- 5 oil help in this situation? would you recommend that we consume pomegranate seed oil to boost the system and protect the body against heart attacks. There is some research out there that shows that Omega - oil has interesting cardio elements, I'd suggest you check it out. The Omega- 5 oil is sold in gel caps as well as in bottles. From my experience, people prefer the soft gel caps. Asoff

seth (2007-10-02 21:07:11)  
I don't know the effects of omega-5. I hope to eventually study its effects on the brain.

Dwight Lundell (2007-10-03 06:57:17)  
You are on the right track. Omega 3 is critical in preventing heart attack. The low fat diet is a failed experiment which has caused us to be overloaded with Omega 6 from vegetable oils (mostly soy). Omega 6 promotes inflammation, Omega 3 reduces inflammation. Inflammation causes heart attack! Having been a heart surgeon for 30 years I have seen it and touched it. My new book The Cure for Heart Disease gives all the details.

Tom (2007-10-03 12:03:00)  
Omega 3s reduce inflammation, but carbs increase inflammation. Seth, you've got to read Gary Taubes' new book, an analysis of diet propaganda over the last fifty years. You will love it, and it would be fantastic to hear your take on it.

seth (2007-10-03 14:10:53)  
Yes, I am going to read Taubes' new book.

lasser11 (2007-10-03 21:53:49)  
So I guess it might be beneficial for those on the SLD to switch to flaxseed oil and plug their nose. I currently take both canola oil (for the SLD) and flaxseed oil (for general health purposes). Because Canola oil has a poor ratio between omega 3 and 6, could it be diminishing the results from my flaxseed intake? Flaxseed oil appears to hit 2 birds with one stone.

Tom (2007-10-04 12:22:59)

I've been doing 2T decaffeinated coconut oil during the day, and 2T flax (non-lignans, holding my nose) at night. Seth, do you now prefer the version with lignans? Seems to me there was some issue with the lignans...something estrogenic about them, perhaps? I might be confusing that with soy...

seth (2007-10-04 21:23:38)

I don't know if lignans are better or worse than nothing.

peter (2007-10-04 21:29:10)

lignans are good for you; <http://en.wikipedia.org/wiki/Lignan>. i've read that flax seed lignans bind to testosterone, which results in a lower risk of prostate cancer.

Tom (2007-10-05 00:36:06)

That was it; thanks. But I'll keep my testosterone, and pass on the breast tissue. BTW, prostate cancer is one of the slowest-developing cancers there is; many elderly men have it (undiagnosed) for years before dying of other causes. The ones who have it treated (prostates removed) will often have worse outcomes (impotence, incontinence.)

asoff eracchi (2007-10-12 18:54:06)

Yes, and the omega 5 oil [ pomegranate seed oil ] has been researched in the context of prostate cancer. You ought to review the research in the areas of antioxidants, anti-inflammation, prostate cancer, and breast cancer to name a few. The other day, I was told that Omega 5 could be helpful in minor cases of skin cancer. Have you had any experience with pomegranate seed oil? The ladies are excited because it is a natural SPF and helps as an anti-aging / cellulite agent, I do not think that fish oil can do that, but again, I am not a scientist or physician. You may want to look into Omega -5 oil. I am taking a daily dose of Omega 5, it is boosting my system and my skin looks younger. Asoff

DAvid Marcus (2007-12-01 01:41:50)

It's a myth that eskimos have low-rates of heart disease. Actually, recent studies have shown they have high rates of cardiovascular disease (50 % higher than western populations) despite diets that are very high in fatty fish.

Droque effects (2011-03-29 19:27:23)

I didn't know it was a myth, anyway just posting to say i take omega pill too and except the awful taste of fish i indeed look younger too! But the main benefit is that i have cardiovascular problems from weed and i m pretty sure (all the doctors i've seen told so) that it benefits the heart of healthy people, and those at high risk of cardiovascular disease.

### **Joyce Cohen Gets Her Teeth Cleaned (2007-10-03 03:23)**

A few months ago, Joyce Cohen, who writes The Hunt column for the NY Times Real Estate section, started drinking 2 tablespoons of flaxseed oil every day. She began after talking with me and because of stuff posted here. Yesterday she went to the dentist for the first time since she started drinking it.

"Jane the hygienist said my gums were in great shape - better than ever," she wrote me. Meaning the best they'd ever been.

"What's funny is you can't FEEL good gums from inside your mouth, but I take her word for it." The hygienist said that although she was scraping and scraping, there was no bleeding.

Joyce started with Spectrum Organic flaxseed oil without lignans but later switched to the oil with lignans. She despises the taste but finds it is most palatable mixed with yogurt.

[1]My dental story. [2]Tyler Cowen's story.

Timothy Beneke (2007-10-03 08:17:28)

I've been doing 3-4 tablespoons a day and my gums are better as well according to my dentist. Barlean's has the most palatable taste of the ones I've tried. Also, if you put the oil in a small clean glass with some water, then bring the glass to your mouth, and open your mouth wide, and then stick your tongue way out, OUTSIDE of the bottom of the glass, and against the bottom, and then gulp it down, you get very little taste, because it bypasses your tongue and enters the back of your mouth. Then I gulp down some water and then take a big swig of green tea and hold it in my mouth to mask any taste. I don't want any taste, in part because I don't much care for the taste, but also because I always go tasteless in the morning anyway, and lately have been going tasteless all day, but that's another story...

### **In Class or In Prison? (2007-10-03 10:23)**

College students are often bored by lectures. With their laptops open in front of them, and WiFi, they can express this boredom in a new way. Professors are unhappy. I got an email about this problem from someone who tries to improve teaching at UC Berkeley. It included what he called "excellent suggestions":

Tell students to keep their laptops closed unless they are doing an online task that you assigned.

Set specific objectives for them to accomplish in their in-class laptop assignments, and hold them accountable-e.g., randomly ask students or teams to report their progress to the entire class.

Set tight time limits for these assignments.

Design these assignments for pairs, triads, or quads. Aside from the likely learning benefits, group work will help keep the students on task, as students will not be able to agree on a renegade web site.

Walk around the room and stand in the back to monitor their screens during these assignments.

Have students bring their laptops to class only on certain days, and tell them explicitly not to bring them the other days.

Mark students absent for the day if you catch them at a renegade site. "Will not be able to agree on a renegade web site" – from an ancient Chinese book of maxims, I suppose. An [1]article in the Chronicle of Higher Education shows that the problem is widespread. Addendum: In response to this email, a professor replied:

Today one of my GSIs informed me that several students were looking at internet porn during lecture. This not only proved a distraction but made several people uncomfortable. The GSI warned the student to close the site immediately and tried to get the names of the students. Of course, the students declined to give their names and one even just simply left class rather than be reprimanded further. Now I am left with the unpleasant, but necessary, task of trying to track down these students.

---

Bob (2007-10-03 11:16:49)

As a student I have a couple suggestions for lecturers who wish to increase attentiveness in science classes. 1) Do not hand out copies of the notes. When I already know what a professor is going to cover it's easy to take a superficial glance at the material and convince myself that I already know what they're going to say. Also, a student who needs to record the material themselves won't have time to devote to other distractions. 2) Do not present from PowerPoint. Slides allow too much information to be thrown at a student at once and they won't know what to pay attention to. Figures are almost always too complex to reproduce in notes, and slides are too verbose. If it's not possible for the instructor to draw or write out a concept in the time allotted to it, the student won't be able to either. 3) Show partial derivations, including algebra. It's often obvious to an expert in the field what simplifying assumptions can be made for a problem, but when it's first introduced to a student these can be huge road blocks in their understanding. A lecture I can follow is much more interesting than one where I become lost. 4) Finally, take a hard line from the beginning. Confront students who have open laptops or other distractions as soon as they're noticed. Lectures should be attended voluntarily, if students don't want to pay attention they shouldn't be present.

michael vassar (2007-10-03 22:10:22)

Public school basically sets a precedent for our whole society defining universal prison as what we should all aspire to.

### **Jane Jacobs Updated (2007-10-04 06:59)**

Chris Matthews' latest book is *Life's A Campaign*. "A recipe for sadness," Jon Stewart called it in an interview that Matthews called the worst of his life:

[EMBED] In [1]*Systems of Survival* (1992), Jane Jacobs described two ethical systems: guardian (= government) and commercial. Each system consists of rules of conduct (e.g., "be honest" is a commercial value but not a guardian one). Matthews's book says you should use guardian principles in everyday life; Stewart said that's a mistake – commercial principles work better. Jacobs said there is a tendency to think that the principles that work well in your system work everywhere. Maybe this is why Matthews seemed stunned by Stewart's objections. To Jacobs' two systems, [2]Chris Phoenix, a nanotechnology expert, has added a third: the "[3]information system". It is about appropriate behavior – what is seen as appropriate behavior – in the world of open source software and similar goods. Phoenix argues persuasively that a different set of values applies. This is why I asked Aaron Swartz [4]what's wrong with Wikipedia: It's not so obvious what the appropriate values are. Long before open source software [5]there were books: books share expertise. Long before books – at the [6]dawn of humanity, I believe – there were hobbies: hobbyists share their expertise. The ethical system that Phoenix describes is much older and more important than he says. Phoenix acted within that system when he posted his essay on the Web; Jacobs did, too, when she wrote a book. Just as I do by blogging.

michael vassar (2007-10-04 07:36:18)

Personally, I think that guardian encompasses Chris Phoenix's "information" system under the category "make rich use of leisure" and "treasure honor". I have been arguing with him about this, off and on, for years though. It seems to me that only the "richest", in some sense that I don't fully understand, of history's guardian groups demand that one "make rich use of leisure", and in the 20th century all high status Guardian classes abandoned it, which is why "information" looks like something new. Really though, who could be more "information", or more "guardian" than Eric Raymond, for instance?

michael vassar (2007-10-04 07:48:29)

I don't think that the Matthews/Steward debate is one of guardian vs. commercial principles. Matthews is certainly not saying to 'rely on force', the core guardian precept. He's also not saying to be fatalistic, shun trading, be obedient and disciplined, revere tradition, etc. For a true devotee of guardian virtues, look to Robert Green. I think that ultimately his difference with Stewart is that Matthews admires and wants to be like Bill Clinton and thinks his readers should want to be like Clinton, while Stewart wants to be himself and thinks his readers should want to be themselves. Personally, as TV hosts, both are solidly within the information system, which, as I have said, makes them a part of the guardian system just like the priests of ancient times.

seth (2007-10-04 10:28:57)

The surprising feature of the interview I think is that Stewart was honest (commercial virtue) rather than loyal (guardian virtue). He told Matthews his actual reaction to the book. Which I suspect is rare in such interviews. I think that what hobbyists and open-source participants consider good behavior is quite different than what policeman consider good behavior – so I don't think that what Phoenix calls the "information system" (terrible name – I'd call it the hobbyist system) falls under the guardian system. Policeman don't make a big deal of giving stuff away.

lasser11 (2007-10-04 14:11:14)

Even though Stewart was on the attack, he was also on the defense. He appeared almost shaken. Out of his element. Instead of allowing Chris Matthew to respond, he continually made some outrageous comment (your book is fascist) to get the crowd laughing. Shouldn't the guardian and commercial virtue engage in a more fruitful debate? I would love to read Jane Jacobs on the matter. Did she just advocate a separation and protection of the various ethical systems? or did she also encourage some sort of debate between the ethical systems?

seth (2007-10-04 21:27:31)

Jacobs specifically criticized books that treated business as if it were war. She felt each system had its place; using the values of a system in a different place, as Matthews is advocating, led to trouble.

michael vassar (2007-10-05 04:43:05)

Guns for toys? Anyway, churches make a big deal of giving stuff away. The government makes a big deal of giving stuff away. Nobles give stuff to both the poor and to each other. You have to focus on the whole list. Jacobs includes "give largess" on the guardian list for a good reason.

seth (2007-10-05 05:48:12)

I don't think any government program resembles open-source software. Nor any church program. Nor any police program. Nor anything that Henry III gave any of his subjects. The larger point is that the people who participate in open-source software programs act quite differently than government officials.

michael vassar (2007-10-06 09:56:49)

I would suggest law and academia as examples of "government programs" at least as much like one another and like open source as any one government program is like another.

## **Fuzzy Logic and Self-Experimentation (part 1) (2007-10-05 09:35)**

Fuzzy logic, which started with a 1965 paper by Lotfi Zadeh, a professor of computer science, is an advanced form of engineering; self-experimentation is a kind of primitive science. They seem to be at opposite ends of a continuum. As science advances – as knowledge becomes wider and more accurate – it becomes more and more useful, gradually becoming engineering. Fuzzy logic is an especially useful form of engineering.

A few years ago I attended a talk by Zadeh in the Berkeley Physics Department colloquium series. He showed a little movie of a platform moving back and forth to balance three linked poles. It was staggering that this was possible. It is a classic problem in control theory. Here is an example with two linked poles:

[EMBED] Fuzzy logic has proved especially useful in building control systems. An early example was furnace control; one of the first real-life examples was a Japanese subway system. Many consumer electronic products, especially those from Japan, use fuzzy logic. One of my Omron blood pressure meters uses fuzzy logic, says the box. (Omron now uses the term [1]IntelliSense instead.) When an engineer builds a control system, he doesn't start from scratch, choosing from among all possibilities. Rather, he tries to embody in a computer program what a person would do. The program embodies a series of rules. Fuzzy logic provided a new and better language for describing those rules. It "bring[s] the reasoning used by computers closer to that used by people," Zadeh has said. People use "vague" rules: If you are near a corner, slow down. Now it was easy to add such rules to control systems.

## **What Causes Heart Attacks? (continued) (2007-10-06 11:19)**

Uffe Ravnskov, a Swedish doctor, wrote a paper titled "Is atherosclerosis caused by high cholesterol?" (An admirably clear title.) His answer was no. He submitted it to a medical journal. One of his empirical points was that there was no relationship between cholesterol level and atherosclerosis growth. One reviewer commented:

Lack of relationship can be explained by more factors than only absence of it: small numbers, incorrect or indirect measurements of variables of interest, imprecision in measurement, confounding factors, etc.

To which Ravnskov replied:

If it is impossible to find exposure-response between changes of blood cholesterol and atherosclerosis growth in 22 studies including almost 2500 individuals a relationship between the two, if any, must be trivial.

Which sounds reasonable. But an even larger number of clinical trials failed to find clear evidence that omega-3 supplementation reduces heart disease. Yet I am sure that, with a large enough dose, it does.

Most people believe clinical trials, which are usually double-blind when possible and placebo-controlled. "The gold standard," they are called. Science writer Gary Taubes, for example, believes them: When the results of a clinical trial

contradicted a survey result, he believed the clinical trial. His recent NY Times magazine article was based on the assumption that clinical trials are trustworthy. This is such an article of faith that he gave no evidence for it.

That the heart disease clinical trials failed to clearly show benefits of omega-3 supplementation had large and unfortunate consequences. Not only because heart disease is the leading cause of death in many places, including America, but also because I am sure proper omega-3 supplementation would reduce many other problems, including falls, memory loss, gum disease, and other diseases of too much inflammation.

I don't know why the big clinical trials failed to point clearly in the right direction. I can think of several possibilities:

1. Too large. Hard to control quality – verify data, for example. People near the bottom doing the work have little stake in accuracy of the outcome.
2. Poor compliance. If you are taking the placebo, why bother? And the odds are fifty-fifty you are. Lots of people have trouble following SLD, which obviously works.
3. Degradation. My belief that omega-3 is powerful comes from experiments (mine) and examples involving flaxseed oil. Flax grows at room temperature. The heart disease studies used fish oil; fish live in cold water. The omega-3 fats in fish oil may degrade at room temperature. The omega-3 fat in flaxseed oil may be far more stable at room temperature.
4. Wrong dose. Self-experimentation made it easy for me to figure out the correct dosage. People studying heart disease had no similar data to guide them. They could not realistically expect people to consume as much fish oil as the Eskimos whose rate of heart disease was so low.
5. Too sure. Self-experimentation encourages skepticism about one's results because new experiments are easy to do. If I can think of reasons to doubt my results so far, that's a good excuse for a new experiment. The more experiments the better. Each one is easy; I just need a good story line, a good reason for each one. Whereas if you are doing an experiment that cannot be repeated, any skepticism about it – e.g., about accuracy of measurements – is discouraged: It would cast doubt on the whole enterprise.

---

Dennis Mangan (2007-10-06 12:47:10)

There's lots of evidence for the link between cholesterol and heart attacks. For example, heart attacks are virtually unknown in those people with a cholesterol level of 150 or below. Epidemiological evidence is strong: Third World nations that eat a traditional diet have low cholesterol levels and no heart attacks. And I wouldn't think that all of them necessarily have lots of omega-3 in their diets; the common factor is that they eat little fat, especially saturated fat.

Dave Lull (2007-10-07 07:53:36)

Malcolm Kendrick reviews briefly some data from the WHO MONICA (Multinational MONItoring of trends and determinants in Cardiovascular disease) Project\* here: <http://www.youtube.com/watch?v=i8SSCNaaDcE> These figures don't seem to support the conclusion that high cholesterol is linked to cardiovascular disease. === \* <http://www.ktl.fi/monica/index.html>

Dennis Mangan (2007-10-07 16:51:46)

Interesting video. However, "The Framingham Heart Study established that high blood cholesterol is a risk factor for coronary heart disease (CHD). Results of the Framingham study showed that the higher the cholesterol level, the greater the CHD risk. On the other end of the spectrum, CHD is uncommon at total cholesterol levels below 150 milligrams per deciliter (mg/dL). A direct link between high blood cholesterol and CHD has been confirmed by the Lipid Research Clinics-Coronary Primary Prevention Trial (1984) which showed that lowering total and LDL ("bad") cholesterol levels significantly reduces CHD. A series of more recent trials of cholesterol lowering using statin drugs have demonstrated conclusively that lowering total cholesterol and LDL-cholesterol reduces the chance of having a heart attack, needing bypass surgery or angioplasty, and dying of CHD-related causes." <http://www.nhlbisupport.com/chd1/why.htm>

seth (2007-10-07 18:07:09)

Dennis, thanks for the additional info. I don't have an opinion on this. However, the cross-country epidemiology certainly doesn't support the idea that high cholesterol causes heart attacks. In the MONICA study, two countries - China and Japan - had very low values of both heart disease and cholesterol. The other countries had higher values of both measures; but within this group there appears to be no correlation. So essentially you have a two-point scatter plot. Such plots of course tell you nothing about strength of correlation.

Tom (2007-10-07 18:47:35)

Dennis, the Framingham study proves nothing of the kind. Here is an ACTUAL QUOTE from the study: \_\_\_\_\_  
\_\_\_\_\_ There is no indication of a relationship between dietary cholesterol and serum cholesterol level. If the intake on animal fat is held constant there is still no relation of cholesterol intake to serum cholesterol level. If (further) a multiple regression is calculated [using animal fat and dietary cholesterol] there is also little suggestion of an association between this pair of variables and serum cholesterol level. \_\_\_\_\_

Tom (2007-10-07 18:50:15)

In the period between the taking of the diet interviews and the end of the 16-year follow-up, 47 cases of de novo CHD developed in the Diet Study group. The means for all the diet variables measured were practically the same for these cases as for the original cohort at risk. There is, in short, no suggestion of any relation between diet and the subsequent development of CHD in the study group.

seth (2007-10-07 19:43:30)

Very interesting, Tom.

Dennis Mangan (2007-10-07 19:46:47)

Tom: You could at least provide a link. Anyway, your first post says that dietary cholesterol doesn't correlate with serum cholesterol, and that animal fat doesn't either, which I have a hard time believing. In any case, it's serum cholesterol (and other things too) that causes heart disease. Your second post says that diet wasn't a factor in the development of heart disease. However, all the study participants were very likely eating very similar diets, with none of them eating an actual low-fat (10 % of calories), high-fiber diet. People who eat these latter type of diet, whether here or in Third World countries, don't get heart disease.

Dennis Mangan (2007-10-07 19:55:43)

Here are a few items from the Framingham Heart Study homepage. <http://www.nhlbi.nih.gov/about/framingham/timeline.htm>  
"1961 Cholesterol level, blood pressure, and electrocardiogram abnormalities found to increase the risk of heart disease  
1987 High blood cholesterol levels found to correlate directly with risk of death in young men  
1988 High levels of HDL cholesterol found to reduce risk of death  
1990 Homocysteine (an amino acid) found as possible risk factor for heart disease [The significance of this is that homocysteine levels are diet-related; specifically, eating meat raises serum homocysteine.]  
1997 Report on the cumulative effects of smoking and high cholesterol on the risk for atherosclerosis" Obviously, research is ongoing. But to dismiss diet and cholesterol as causes of heart disease goes against everything we know.

seth (2007-10-07 23:07:50)

Well, the MONICA data I described show that cholesterol levels – at the population level – predict nothing. China and Japan are obviously different from European countries in dozens of ways; that they have lower heart disease AND lower cholesterol means almost nothing. Then there are all the other countries where there is no correlation. As I said I haven't studied the matter enough to have an opinion. But the data I do know about imply that the answer is not obvious and that the effect, if any, must be small relative to other causes. One view is that high cholesterol is caused by inflammation, which also causes heart disease.

Jill (2007-10-08 17:30:57)

The Framingham Heart Study originally showed a strong but non-significant trend. I can't speak to any results after the early 1960's, but I remember being struck by the graphs showing lowest overall mortality for women with cholesterol between 220 and 260.

Varangy (2007-10-08 19:41:45)

*But to dismiss diet and cholesterol as causes of heart disease goes against everything we know.* Exactly. [1] Paul Ewald, for one, has been challenging the medical status quo as to the root causes of various diseases and ailments. I strongly recommend his book **Plague Time: The New Germ Theory of Disease**.

1. [http://en.wikipedia.org/wiki/Paul\\_W.\\_Ewald](http://en.wikipedia.org/wiki/Paul_W._Ewald)

Varangy (2007-10-08 19:51:53)

Something to think about - infection as a [1] root cause of heart disease, not cholesterol:

Some researchers have also found tentative links between *H. pylori* and heart disease, the No. 1 killer in the United States. Others think the villain might be either cytomegalovirus, a herpes virus, or even the bacteria in dental plaque. But the strongest evidence implicates another bug, called *Chlamydia pneumoniae*, in heart disease. Discovered in the 1980s, *C. pneumoniae* is now known to be widespread in the environment, causing, for example, at least 10 % of all cases of pneumonia. It is also a close relative of *Chlamydia trachomatis*, the most common cause of sexually transmitted disease in this country. The idea that bacteria and viruses can damage the heart is not farfetched. The streptococcal bacteria that cause rheumatic fever also attack the heart, causing lingering damage. Several viruses attack the heart directly, causing myocarditis, which is often fatal.

1. <http://www.anapsid.org/cnd/diffdx/bacterialink.html>

Tom (2007-10-09 19:34:33)

Infection is a key source of inflammation, hence the association between heart and periodontal disease. Another important reason to keep drinking your flax oil! :-)

Melissa (2007-10-09 22:33:56)

Also the omega-3 studies didn't lower omega-6 consumption, which is important since omega-6 competes with omega-3 in the body. Too much 6 will drown the three out. The letters following the omega-3 studies have a lot of interesting info about this problem.

### **The Secret and Self-Experimentation (2007-10-07 11:04)**

The Secret, of course, is the huge best seller that makes a claim that on its face sounds delusional: You can get what you want by thinking about it. Years ago I stayed in a bed-and-breakfast room rented by a woman whose refrigerator had a collage with pictures and words showing money and prosperity. Clearly she believed that imagining these things would help achieve them.

Previously I described [1]a cable-TV experiment that shows there is something to this. Here, in addition, is some self-experimentation:

Back in the 80's when I first started work as a nurse, I decided to spend one week using only superlatives & compliments when dealing with my co-workers and patients. I 1st wanted to see if they would 'call' me on it & just tell me to stop the silliness. Then I wanted to see if it made a difference in my life, &/or theirs. . . . I freely complimented the docs, nurses, ancillary help, etc. At the end of the week, I had people telling me, 'I don't know what it is about you, but I just love spending time around you.'

My mom tells a similar story. In seventh grade she went to a new school where she didn't know anyone. It was very bad year in terms of making friends. The night before the first day of eighth grade she had a dream. In the dream she was at school and it was just as terrible as seventh grade. She woke up and thought, "No, I can't go through that again, it was too awful." She wondered what she could possibly do to change things. Well, she thought, I could smile at everyone "like a damn fool" – whether she felt like smiling or not. In fact, this worked. Not much later a girl she admired said to her, "People say you're a lot more friendly this year." Eighth grade turned out a lot better than seventh grade.

1. <http://www.blog.sethroberts.net/2007/04/02/how-bad-is-the-secret/>

---

evelyn (2007-10-07 14:52:06)

The Buddhist meditation practice of metta, is a lot like this. In it, you wish to be free of suffering and the causes of suffering, and you wish to be happy and healthy. Then you wish the same for your family, friends, close neighbors, strangers, enemies, and finally all sentient beings. I suspect, if you're going around wishing all the best to everyone, then people would notice your positive affect, and return it, thus creating a good result for yourself. I haven't read The Secret. I have tried smiling a lot at people. There's a huge positive difference between living in a world where people don't make eye contact and smile at you, and one where they do. And all you have to do to live in the second world is to make eye contact and smile.

dgm (2007-10-07 18:10:22)

Maybe this is my secret. (I haven't read the book.) I've always been one of those people that everyone says "hi" to and attempts to engage in conversation. When I was younger it used to really baffle me because I was mostly not initiating these

conversations. I've concluded that there must be something in my "default face" that triggers this in others. I don't think I smile all the time, but I do make eye contact with people when I pass them.

Pearl (2007-10-07 18:58:59)

The only way I can make friends with some women, or even get them to talk to me after being introduced to them in some cases, is to compliment their clothing or accessories. Works like a charm. I don't think a man could use that trick however. Men should compliment their intellect or reasoning, perhaps; works on me.

Timothy Beneke (2007-10-08 08:10:01)

Dacher Keltner (<http://psychology.berkeley.edu/faculty/profiles/dkeltner.html>) did a study where he looked at yearbook photos of Mills college graduates from 1959 and 1960; they were a group that has been studied repeatedly over the years with personality inventories and such periodically. Keltner controlled for attractiveness and a couple of other things and found that women who showed Duchenne smiles – big broad smiles where your eyes crinkle that are hard to fake – had in the next 40 years lived far happier lives than women who showed polite smiles or no smile at all. This is the thinnest slice of behavior imaginable, the split second of a photo, and it was strongly predictive of psychological well being in life. Also, there are people who because of some muscular defect in their faces cannot smile, so when someone smiles at them, they cannot smile back; this is painful for others – it feels bad to smile and not have you smile returned. But it is devastating for their relationships. A way was found for them to clench hard on their back molars to produce a little smile. Bob Levenson of the Berkeley psych dept worked with them, so they could do this. It changed their lives – they could share positive emotions with others in a facial way. I find that smiling at people socially creates a friendlier environment. I've learned not to be offended if people don't smile back; women smile back more than men. In fact women smile socially more than men. I think that as I get older – I'm 57 – people seem a little more willing to smile at me...

knackeredhack (2007-10-08 11:09:48)

Seth, I think this is really one of your best posts. The use of italics and hyperlinks was highly effective. And I especially like the way the individual commenters added something special of their own. I'm going to try this too :) :) Tim

### **Memorial University Continues to Destroy Its Reputation (continued) (2007-10-08 06:38)**

In 2003, Saul Sternberg and I published an [1]article that claimed that some work by Ranjit Chandra, an Order-of-Canada-winning scientist, was unbelievable. You can learn more about the Chandra story [2]here. In February, someone named Peter S. Morris made [3]a long list of additions to the [4]Ranjit Chandra entry in Wikipedia. The additions make Memorial University of Newfoundland, Chandra's employer, look better. They include:

The vice-presidents [investigating a charge that Chandra had fabricated data] were unable to secure the data, and, as a consequence, were unable to verify research fraud conclusively.

What a statement. Not being able to "secure the data" is what you would expect if data were fabricated. Either the vice presidents were mentally retarded or this is false. The whistle blower who reported Chandra to Memorial, a nurse named Marilyn Harvey who had worked for Chandra, did so at considerable risk. That Memorial did a travesty of an investigation and failed to protect her is horrible – and now someone is lying about it.

A [5]Peter Morris is Director of Public Affairs in the Division of Marketing and Communications at Memorial University.

### **What Causes Heart Attacks? (the Framingham Study) (2007-10-09 05:07)**

The Framingham Study is a famous long-term health survey. According to an NIH [1]webpage, its goal was "to identify the common factors or characteristics that contribute to CVD by following its development over a long period of time in a large group of participants who had not yet developed overt symptoms of CVD or suffered a heart attack or stroke."

That is not quite right. It was originally called the Framingham Diet Study. Now it is called the Framingham Heart Study. Why the change? Well, Michael Eades, the author of Protein Power, found an early report on the findings of this study and wrote a [2]fascinating post about it. One of his excerpts from the report:

In undertaking the diet study at Framingham the primary interest was, of course, in the relation of diet to the development of coronary heart disease (CHD). It was felt, however, that any such relationship would be an indirect one, diet influencing serum cholesterol level and serum cholesterol level influencing the risk of CHD. However, no relationship could be discerned within the study cohort between food intake and serum cholesterol level.

In the period between the taking of the diet interviews and the end of the 16-year follow-up, 47 cases of de novo CHD developed in the Diet Study group. The means for all the diet variables measured were practically the same for these cases as for the original cohort at risk. There is, in short, no suggestion of any relation between diet and the subsequent development of CHD in the study group.

That is, the findings of the study completely contradicted what the researchers believed (as indicated in the name Framingham Diet Study). This is what [3]Leonard Syme taught his introductory epidemiology students on topic after topic: Well-known conclusions are far less certain than you think.

Thanks to Tom.

Dennis Mangan (2007-10-09 09:42:18)

"Burr & Butland (1988) found vegetarians to suffer significantly lower mortality from heart disease than health conscious non-vegetarians. Mortality from ischaemic heart disease was 57 % lower in vegetarians than the general population, and 18 % lower than in non-vegetarians following a healthy lifestyle. Deaths due to cerebrovascular disease was 43 % lower in the vegetarians compared with the general population. A study of nearly 28,000 Seventh Day Adventists in California noted a clear trend of increasing incidence of heart disease with rising frequency of meat consumption (Snowdon, 1988). [...] The protective effect of a vegetarian diet is believed to be related to the lower blood cholesterol levels seen in vegetarians. Repeated studies have demonstrated the low blood cholesterol levels of vegetarians (Resnicow, 1991)." <http://www.vegsoc.org/info/health2.html> Obviously, diet has nothing to do with either cholesterol levels or heart disease.

Lancaster (2007-10-09 11:50:00)

As John Tierney points out in his review of "Good Calories, Bad Calories: Challenging the Conventional Wisdom on Diet, Weight Control, and Disease," by Gary Taubes, "To bolster his [low fat] theory, Dr. Keys in 1953 compared diets and heart disease rates in the United States, Japan and four other countries. Sure enough, more fat correlated with more disease. But critics at the time noted that if Dr. Keys had analyzed all 22 countries for which data were available, he would not have found a correlation." <http://www.nytimes.com/2007/10/09/science/09tier.html> When it comes to longevity, the one variable that empirically makes the biggest difference in all animal studies is caloric intake: the lower (to a point), the better. So when people talk about low-fat, high-fiber "Third World" and vegetarian diets, the critical intervening variable may well be low caloric intake. Epidemiological studies involving countries like Japan and Korea should factor in the twenty-year span during the middle of the 20th century when caloric consumption fell drastically. At any rate, the incidence of heart disease or cancer in any population is meaningless unless paired with actual life expectancy. In Japan, death from stroke over the past 50 years has fallen dramatically. Death from heart disease has climbed. Each generation of children has been bigger than their parents. Longevity has steadily increased, despite the fact that Japanese men still smoke like crazy. Studies have pointed to a strong inverse relationship between consumption of animal fat and stroke. <http://www.bmj.com/cgi/content/full/333/7559/148-b> Everybody dies of something. What matters is when, and the quality of life up to that point.

## **Where We Went Wrong about Diet and Health (2007-10-09 15:24)**

John Tierney has an interesting [1]column in the NY Times today about how many Americans – including the Surgeon General and the McGovern Commission – came to mistakenly believe that low-fat diets were better than diets with more fat.

Thanks to Dave Lull.

1. <http://www.nytimes.com/2007/10/09/science/09tier.html?ei=5070&en=c8e3a7abe072462c&ex=1192593600&emc=eta1&pagewanted=all>

---

Dennis Mangan (2007-10-10 06:54:00)

Seth, the ideas you're propagating in this post and the others are not only mistaken, but dangerous. Tierney's article cites one source, Taubes' new book. As I've indicated in my previous responses, abundant evidence, both epidemiological and experimental, exists that shows that a high fat diet is bad for health and promotes not only heart disease, but cancer, diabetes, kidney disease, and a host of other degenerative diseases which are the plague of the Western world. But people want to believe good news about their bad habits (which is why the news in recent years that alcohol may be good for health has had such an enthusiastic reception). When Taubes and others claim that low fat diets show no benefit, they are talking about diets that are 30 % fat, as recommended by the American Heart Association, and this diet is indeed not beneficial, because it isn't really low fat. This new meme about high fat diets is going to cause a world of suffering.

Tom (2007-10-10 07:43:29)

Dennis, Taubes (and Tierney, in the NY Times) discuss at length why that "abundant evidence" cannot be trusted...at all. Further, it would be appropriate if you revealed in your posts that you don't think humans have the moral right to eat animal flesh. It would enable readers to put your opinions in context.

Dennis Mangan (2007-10-10 08:54:04)

It would be nice if you'd address the issue rather than citing "authority" and making ad hominem arguments. You certainly haven't "revealed" anything about yourself. I stated the evidence clearly. The fact, and it is indeed a fact, that the populations of many other countries have far lower rates of heart disease (cancer, etc.) than the U.S., along with other lines of evidence, such as that high fat diets cause atherosclerosis, points to diet as the explanation. The biggest and best epidemiological study of diet, The China Study, concluded that diet profoundly affects disease rates, especially cardiovascular disease and cancer.

seth (2007-10-10 09:08:59)

I hope to interview Taubes. Dennis, do you have some questions you would like me to ask him?

Tom (2007-10-10 09:46:08)

Dennis, it's not an "ad hominem" argument; I'm simply referring your Animal Rights agenda which you clearly set out on your blog but never here. And the "China Study" has been amply debunked elsewhere, but Seth might ask Gary Taubes to address it. Another possible question to ask Taubes to elaborate on how he's adjusted his own diet in the light of his research, and has he made further adjustments since publication?

Dennis Mangan (2007-10-10 09:49:11)

Seth: Sure. What is his explanation of cross-country mortality in heart disease and cancer? Why does he think experimental animals, such as rabbits and monkeys, develop atherosclerosis when fed a high fat diet? Why have we seen regressions in atherosclerosis when people go on a low fat diet such as Ornish or McDougall? Why is there an epidemic of heart disease in the Western world, and why is heart disease on the rise in places like China? Why do statins decrease the risk of heart attack? Why do high fiber diets lower serum cholesterol? That's more than enough, and thanks Seth for allowing me to comment here.

Dennis Mangan (2007-10-10 09:54:43)

By the way, Seth, I read your book and think your discovery of the ability to change one's set point to be brilliant. Your research into omega-3 is also compelling, and convinced me to start taking flax seed oil. And your blog is always interesting. So

all the more reason for me to dispute with you and your readers on this topic which has so much consequence for life and health.

Lancaster (2007-10-10 11:08:53)

Dennis, I fear you are missing the bigger point. Dying of some things is preferable to dying of other things. Morality is the issue, not the specific disease, since in the long term we shall all be dead. As medical science stands now, for example, CHD is much preferable to stroke. Replumbing and rewiring the heart is fairly straightforward; replumbing the brain is not. This is why longevity in Japan has increased even while the diet has become more "westernized" and CHD has climbed accordingly. But longevity for Japanese living in the U.S. has increased more: "Asian women in the United States—many of whom are second-generation and have spent their whole lives here—have a life expectancy that is three years longer than Japanese women . . . . Previous research suggested that Asians lose their 'survival advantage' after they are in the United States for a long time and have adopted an American diet and habits, but the new study suggests that is not happening with Asian women." [http://seattletimes.nwsources.com/html/nationworld/2003254679\\_longevity12.html](http://seattletimes.nwsources.com/html/nationworld/2003254679_longevity12.html) My own educated belief is that mortality (rather than the incidence of specific diseases) will in the final analysis correlate strongest to public health and hygiene, general nutrition, and caloric intake. The biggest problem with high-fat diets is that it's so easy to consume a lot of calories at once. I suspect that the interaction of genes, along with the intake of fish and soy (much higher in Asia), will prove significant as well.

seth (2007-10-10 12:34:38)

Thanks for the praise, Dennis, thanks for your questions for Taubes, and thanks for your comments here. And if you think the flaxseed oil is affecting you, please let us know!

Bix (2007-10-10 13:43:24)

Hello! I've been enjoying reading the comments here :) What Taubes has succeeded in doing for me is to carve out my niche on the fence even deeper. I'm really torn at the moment. For instance, he has been defending the impotence of exercise in weight loss: "Expending more energy than we consume does not lead to long-term weight loss; it leads to hunger." and ... "Obesity is a disorder of excess fat accumulation, not overeating, and not sedentary behavior." Any light you can shed on this would be welcome :)

seth (2007-10-10 17:57:08)

Taubes is much closer to the truth than what you usually hear. If you are sedentary, exercise indeed causes weight loss. If you sit all day every day, you may lose 10 pounds by walking to work every day, for example. But after you have lost those 10 pounds it becomes very difficult to lose much more. You have to practically train for a marathon to lose a lot of weight by exercise. That is of course impractical so exercise is not a good way to lose a lot of weight.

[sysrick.com](http://sysrick.com) » links for 2007-10-11 (2007-10-10 18:23:37)  
[...] Where We Went Wrong about Diet and Health [...]

Bix (2007-10-11 09:51:07)

Thank you for your reply, Seth. As I understood Taubes, he says that exercise does not lead to weight loss, even if you are sedentary. That our body compensates for increased activity such that there is a negligible effect on weight. It's quite a proposal, in the current climate.

Lancaster (2007-10-11 12:06:00)

One emerging theory I find compelling is that aerobic exercise is what our predatory ancestors did before killing something and eating it. And the more of it the better. Look at a pride of lions. They'll sit around all day, get hungry, run down an antelope and eat it, and then go back to sitting around doing nothing. We really are carrot and stick creatures, and when we run around a lot without getting the carrot, we'll stop at McDonald's and buy one (with fries and a shake). This theory argues that when it comes to weight control, it's muscle mass that matters—that which keeps on burning calories when you're sitting around doing nothing. In other words, don't exercise to burn calories, exercise to build muscle.

Dave Lull (2007-10-11 13:24:47)

Gina Kolata, author of *Ultimate Fitness: The Quest for Truth About Exercise and Fitness*, said in an interview\*: "The too-good-to-be-true myth is one that I had believed. I had thought, and so did many people, that if you build muscle that muscle will burn more calories and fat and therefore throughout the day, even if you do nothing, even if you just sit still, you will automatically be burning more calories, your metabolism will be higher. Unfortunately, that's not true. I asked an exercise physiologist to do a calculation for me. If a man goes to a gym and lifts weights seriously for four months he might build about four pounds of muscle, which is a lot; a woman would build much less. That four pounds of muscle would burn an extra 24 calories a day. That's like a bite of a cookie." ==== \* <http://www.medicinenet.com/script/main/art.asp?articlekey=54516>

Lancaster (2007-10-11 14:50:04)

On the other hand, these things are cumulative. The man who wakes up on his 40th birthday and steps on the bathroom scale and realizes he's carrying an extra 50 pounds around the middle since graduating from high school did not put it all on since his 39th birthday. More likely that he's been adding 24 extra calories or so a day for the past 22 years.

Bix (2007-10-12 04:00:09)

Dave Lull, Just wanted to say I just read that Gina Kolata interview. Loved it!

## **The Twilight of Expertise (part 12: Super Crunchers) (2007-10-10 03:48)**

Ian Ayres' interesting new book, [1]*Super Crunchers*, has a chapter about expert prediction versus predictions from math models. Almost always, the math models do better than the experts. I learned about this in graduate school when I read stuff by Paul Meehl, a psychology professor who compared the predictions of clinicians and regression equations in the 1950s. The idea has gathered strength since then and now the persons in some jobs – such as loan officers – are required to follow an algorithm for making decisions. Their expertise is ignored. Obviously they no longer derive as much self-worth from their job, Ayres points out.

It's like the beginning of agriculture. Lots has been written about [2]the physical problems caused by the change to agriculture. Stature decreased, tooth decay increased, and so on. I've never read about the mental problems it must have caused. I can only speculate, of course, but here's an possible example: Hunters derived self-worth from bringing meat to their families. Taking that away caused problems. (*Watching Once Were Warriors*, a terrific movie, should make this more plausible.)

I have never read anything about how to reintroduce into everyday jobs crucial mental elements that hunting had and farming lacked. Nutrition education, vitamin supplements, dietary fortification, and other nutrition programs push us toward a pre-agricultural diet, which was far more diverse and better balanced. There is no similar set of things that move us closer to pre-agricultural ways of making a living. My self-experimental research is all about the value stuff that ancient life had but modern life lacks – such as seeing lots of faces in the morning – but I have never figured out how to simulate elements of hunting, beyond being on one's feet a lot.

1. <http://www.amazon.com/Super-Crunchers-Thinking-Numbers-Smart/dp/0553805401>

2. <http://books.google.com/books?id=SXpGhERTtOEC&dq=health+and+the+rise+of+civilization&pg=PP1&ots=e5MwU32kvq&sig=U30M0wj0Aj1scZjNtC-RlYdb1Gg&prev=http://www.google.com/search%3Fhl%3Den%26safe%3Doff%26client%3Dfirefox-a%26rls%3Dorg.mozilla%253Aen-US%253Aofficial%26hs%3D2Lt%26q%3Dhealth%2Band%2Bthe%2Brise%2Bof%2Bcivilization%26btnG%3DSearch&sa=X&oi=print&ct=title>

Andrew Gelman (2007-10-10 03:58:17)

Sure, but what you call "the math models" (I would call them "statistical models" since I think when you fit a mathematical model to data, it's a statistical model) need experts to run them well. A good algorithm doesn't come from nowhere.

michael vassar (2007-10-10 05:23:48)

You get some of the elements of hunting-gathering, at least of the gathering part, by shopping, hence, presumably, its popularity. Other elements can come from frantically running around to do small one-shot freelance jobs and tasks, such as being a taxi driver searching for fares. Video games presumably satisfy other elements of the faux-hunter lifestyle, or certain physical recreations such as hide-and-seek.

Timothy Beneke (2007-10-10 08:19:12)

Philip Tetlock's book on expert political prediction "Expert Political Judgment: How Good Is It? How Can We Know?" found ([http://www.newyorker.com/archive/2005/12/05/051205crbo\\_books1](http://www.newyorker.com/archive/2005/12/05/051205crbo_books1)) it to be largely bogus, as I understand it. The New Yorker summarized his findings. Even rats made better predictions than Yale students at a particular task. From Louis Menand's New Yorker article: "It is the somewhat gratifying lesson of Philip Tetlock's new book, "Expert Political Judgment: How Good Is It? How Can We Know?" (Princeton; \$35), that people who make prediction their business—people who appear as experts on television, get quoted in newspaper articles, advise governments and businesses, and participate in punditry roundtables—are no better than the rest of us. When they're wrong, they're rarely held accountable, and they rarely admit it, either. They insist that they were just off on timing, or blindsided by an improbable event, or almost right, or wrong for the right reasons. They have the same repertoire of self-justifications that everyone has, and are no more inclined than anyone else to revise their beliefs about the way the world works, or ought to work, just because they made a mistake. No one is paying you for your gratuitous opinions about other people, but the experts are being paid, and Tetlock claims that the better known and more frequently quoted they are, the less reliable their guesses about the future are likely to be. The accuracy of an expert's predictions actually has an inverse relationship to his or her self-confidence, renown, and, beyond a certain point, depth of knowledge. People who follow current events by reading the papers and newsmagazines regularly can guess what is likely to happen about as accurately as the specialists whom the papers quote. Our system of expertise is completely inside out: it rewards bad judgments over good ones." Why am I not surprised?

Tom Myers (2007-10-10 08:23:08)

You're linking two transitions: (A) from hunter-gatherer to agricultural economics, and (B) from expert to math-model decision-making. Okay, each involves a replacement of creativity/expertise by a routine. We might throw in (C) the industrial revolution, where Adam Smith's pin factory replaces craftsmanship by assembly-line production. However, the "Super-Cruncher" transition (B) seems to me to be fundamentally different in that the routine is to be carried out by a computer. The expert is upset at losing status, but the resulting society is not one of increased drudgery; it's simply a society in which people (patients, sports teams, investors, customers, governments) depend less on human experts and more on their "own" (computer) resources, as fed by their own intuitions and web-collected data from all over the world. See page 124: "The most important thing that is left to humans is to use our minds and our intuitions to guess at what variables should and should not be included in statistical analysis." This may be intrinsically closer to a hunter-gatherer structure after all; there's no hierarchy of experts, perhaps no hierarchy of authority at all. Of course we will need Gelmans for a while, but in the end perhaps we can breed good modeling algorithms via genetic algorithms; if experts are replaced by algorithms, meta-experts may be replaced by meta-algorithms. And then the Singularity? Well, maybe. It is a step in that direction, whether the journey continues or not.

[...] The Twilight of Expertise (part 12: Super Crunchers) [...]

Heather (2009-01-18 23:56:17)

I don't know what's keeping Dr. Consorti so busy. She obviously doesn't spend her time making sure her patients are receiving the quality care they deserve. If she would've taken the other 30 minutes required for my surgery, maybe the skin from both sides of my incision would match up. Thanks to her, I'll probably be having another surgery down the road to remove scar tissue from her horrific attempt at stitching. Maybe she should've taken HomeEc before going to med school.

### SLD Nation (ghee) (2007-10-10 12:43)

I drink 4 tablespoons of flaxseed oil per day. But perhaps I could go higher:

Anjum always cooks with safflower oil (similar to sunflower oil), but admits that "butter goes really well with lentils" and even, unfashionably, puts in a good word for ghee (clarified butter). "I think modern science has it wrong and soon they're going to say ghee is healthy." At an Ayurvedic spa in Malta last summer she was put on a ghee detox. "I was like: Are you crazy? I wanted to lose the baby weight." Given increasing doses for breakfast, by the last day she could happily swallow nine tablespoons of pure fat. "I looked, like, six years younger."

From [1]here.

Thanks to Evelyn Mitchell.

1. [http://www.timesonline.co.uk/tol/life\\_and\\_style/food\\_and\\_drink/article2005749.ece](http://www.timesonline.co.uk/tol/life_and_style/food_and_drink/article2005749.ece)

---

peter (2007-10-10 21:25:35)

there are a number of articles on quackwatch.org that deal with ghee, as well as studies. here's one. <http://www.quackwatch.org/01QuackeryRelatedTopics/PhonyAds/ghee.html> Can Fit in a Bottle of Ghee? Stephen Barrett, M.D. Ghee is a semiliquid form of butter from which the water and milk solids have been removed by heating and straining. Since ghee is 100 % fat (approximately 14 grams per tablespoon), and since high-fat diets are known to increase the risk of coronary heart disease, I was surprised to see an ad promoting ghee as a health food. The ad pictured below was distributed in 1998 by Maharishi Ayur-Ved Products International, a prominent marketer of ayurvedic products. The ad states that, "For thousands of years, Ghee has been used for its many healthful values." That statement is literally true because ghee is an Indian folk remedy. But whether eating it promotes health is another story. The product retails for \$7.95 for 13 ounces or \$12.95 for 28 ounces, which is much more than the cost of ordinary butter. To investigate, I used PaperChase to perform a Medline search for the word "ghee." This yielded 45 citations, 30 of which were accompanied by abstracts that could be read online. Four studies noted an association between the use of ghee and increased prevalence of coronary artery disease [1-4]. Another report – from 1978 – stated that when food is well chewed and the diet contains plenty of vegetable fibres and fermented milk products such as ghee and yogurt, the amount of salivary mucus that is swallowed will increase, which can help protect against peptic ulcers. However, with modern ulcer treatment available, there is no reason to believe this potential benefit outweighs the increased risk of cardiovascular disease. The rest of the studies did not appear relevant to the claims in the ad.

Tom (2007-10-11 00:15:59)

The hypothesis that high-fat diets increase the risk of CHD is anything but proven.

Josh M (2007-10-11 11:00:20)

Wonder what the omega-3 content of milk and then ghee is, especially from a Maltese cow. I couldn't get the original study but this mentions that organic milk has more of it. <http://www.vetscite.org/publish/items/001719/index.html>

Anonymous (2007-10-15 12:16:41)

Seth, I am curious, since you state you drink four tablespoons of flaxseed oil per day now, how do you get over the taste? I've been taking two tablespoons a day for a month now, and the aftertaste is just awful. Thanks.

seth (2007-10-15 15:07:42)

Anonymous, my solution has 2 parts: 1. add the oil to water. 2. hold my nose closed while I drink it.

Redondo Beach Day Spa (2008-11-05 14:06:49)

I understand that flaxseed oil is the next best thing to having a multi-vitamin a day. The reasoning for actually ingesting this oil in it's purest form per day: Is this a viable way to consume this because it absorbs into the system faster than if it were in pill form? Assuming the answer is yes, would it be a good idea that instead of holding my nose before taking it in, would I be able to mix it with something like Kool-Aid or Gatorade mix? If the answer to that is yes, would it be even a better idea to mix it with something creamy like chocolate or strawberry milk mix and milk? Thank you in advance.

## **Once Were Warriors (2007-10-11 05:32)**

In a [1]recent post I mentioned [2]Once Were Warriors, a movie about Maoris in New Zealand. Yesterday I met someone from Australia who said that the Maoris had/have an exceptionally war-like culture. They are not the same as other "native" groups, such as the American Indians or the Australian aborigines. They came to New Zealand relatively recently – from Samoa, maybe – and flourished by killing everyone who was already there. The Wikipedia entry for [3]Maori doesn't make this clear but doesn't contradict it, either.

1. <http://www.blog.sethroberts.net/2007/10/10/the-twilight-of-expertise-part-12-super-crunchers/>

2. [http://en.wikipedia.org/wiki/Once\\_Were\\_Warriors](http://en.wikipedia.org/wiki/Once_Were_Warriors)

3. <http://en.wikipedia.org/wiki/M%C4%81ori>

---

Andrew S. (2007-10-11 10:07:10)

Yeah, that's been my understanding too (though I'm no closer to New Zealand than you are—well, actually, I live in Sunnyvale, so I guess I'm a *little* closer...) I think that's a big part of the subtext of OWW—that the abusive husband comes from native group which had been conquered and enslaved by the Maori, and he feels inferior to his Maori wife and overcompensates violently.

jeremy (2007-10-11 20:50:27)

jeez. In oww both are Maori. Maori arrived around 1200 and they are the native people of New Zealand, there wasn't anyone there before them. They had war rituals that are pretty similar to most small tribal groups anywhere in the world, old european tribes included. The difference between the european blooded New Zealander and the european blooded Australian is the unique influence of the Maori race on the NZ culture ; and the slow realisation of its citizens, that white nzers are just late

arriving "islanders", the proud reject great great grandsons and daughters of a wave of 'low class' european immigrants . NZ has the potential to be a great state

### Why We Need Enough Cholesterol (2007-10-11 05:36)

Another [1]excellent post from Michael Eades discusses a new study that found elderly people with lower cholesterol had faster cognitive decline than those with higher cholesterol. Suggesting that cholesterol protects your brain.

There are several reasons to think this association reflects cause and effect. First, earlier studies found the same thing. Second, an earlier study found that people whose cholesterol was lowered had higher rates of violent death – an unexpected side effect that implies brain dysfunction. Third, as Eades points out, the brain contains lots of cholesterol.

Thanks to Tom.

www.topcholesteroladvice.info » Why We Need Enough Cholesterol (2007-10-11 19:44:13)

[...] seth wrote a fantastic post today on "Why We Need Enough Cholesterol" Here's ONLY a quick extract Another excellent post from Michael Eades discusses a new study that found elderly people with lower cholesterol had faster cognitive decline than those with higher cholesterol. Suggesting that cholesterol protects your brain. ... [...]

A. Way (2007-10-11 23:06:27)

The suicide rate study was flawed. And I hope so. My cholesterol is measured in double digits. The same as many Chinese studied back in the 70's and 80's and in whom you could not find heart disease. See the book, "The China Study".

Tom (2007-10-11 23:33:35)

That blog is fascinating...it's some site in India that is aggregating by machine. There is clearly no human involved.

seth (2007-10-12 04:23:59)

A. Way, there was a mistake in my post. It was violent deaths in general, not just suicides, that went up. Here is a description:

With the combined data the researchers could study the experience of nearly 25,000 male subjects followed for an average of 4.8 years. Half of the 25,000 had been given treatment to lower their cholesterol. Although members of this group had 28 fewer heart-attack deaths than the controls, they had 29 more violent deaths (from accidents, suicide, or homicide).

What was the flaw in the study?

Dennis Mangan (2007-10-12 06:48:47)

I see one flaw: though low cholesterol, if it did indeed have the brain effects that are claimed, might influence accidents and homicide - in the sense of "he was asking for it" - it's not clear that that is the case, and it's highly doubtful that it could account for many of them. The theory that low cholesterol turns one into a murder victim seems a classic case of confusing correlation with causation. I would imagine that the sort of people who take statins don't often get involved in violent street

confrontations. Also note that the group had fewer heart attacks.

seth (2007-10-12 08:57:00)

"The theory that low cholesterol turns one into a murder victim seems a classic case of confusing correlation with causation." The data are from experiments. They imply causation.

### **What Do Bulimia and Working for the U.N. Have in Common? (2007-10-11 23:00)**

Twice in my life – in Denmark and Hong Kong – I have started chatting with women who ended up telling me about their bulimia, which they kept secret from almost everyone, including their friends. A few days ago, in San Francisco, I met a woman who works on water engineering projects for the U.N. "What I do in my job is connect people," she told me. For example, she went to Haiti and brought the people who needed help together with the people (in Haiti) who could help them. She never tells her bosses what she does. To her bosses, the focus is on some sort of technology. Were she to tell her bosses what she does, she said, the focus would shift away from the technology. There would be attempts to institutionalize what she does – and institutions would be terrible at it.

What other jobs are like this (where your boss doesn't know what you do)?

Shirley Hazzard's *Defeat of an Ideal: A Study of the Self-destruction of the United Nations* (1973) is excellent. It's *Devil Wears Prada* about a whole institution.

### **A Vivid Description of SLD (2007-10-12 15:49)**

[1] Michael Blowhard has an especially vivid description of Life With SLD:

It took about a week for the appetite-suppression part of the Shangri-La experience to kick in. . . . It was a funny and bewildering moment when it did. I reached out for the usual additional forkful – and my hand stopped in midair. Nope, didn't feel like it – and back my fork came, empty. My brain was thinking "What the hell?" but my body was saying "Had enough." My instincts were speaking – only they were saying something different ("Enough") than they usually do ("More! More!").

### **Insanity at MIT (2007-10-13 03:49)**

[1]Predictably Irrational, a forthcoming book by Dan Ariely, a behavioral economist at MIT, tells about an experiment done to learn how sexual arousal influences decision making. The experiment involved showing pornography to male undergraduates while they masturbated.

Before allowing the research to begin, Dean Richard Schmalensee assigned a committee, consisting mostly of women [professors], to examine the project. This committee had several concerns. What if a participant uncovered repressed memories of sexual abuse? Suppose a participant found that he or she was a sex addict?

Pale Fire by Vladimir Nabokov quotes a psychoanalytic textbook by Erich Fromm "used in American colleges, repeat, used in American colleges":

The little cap of red velvet in the German edition of Little Red Riding Hood is a symbol of menstruation.

The narrator comments: "Do these clowns really believe what they teach?" Did the MIT professors really believe those outcomes were serious dangers?

For similar stories, see [2]IRB Watch.

1. <http://www.predictablyirrational.com/>
2. <http://home.earthlink.net/~irbwatch/>

---

Dan Ariely (2008-01-10 08:22:56)

I personally think that they just wanted to prevent us from doing this research – so they were trying every excuse they could come up with. In grad school no one tells you about these research "challenges" Dan

### **What is Flaxseed Oil Good For? (2007-10-13 12:24)**

According to the latest Newsweek (October 15), "flaxseed oil is . . . an over-the-counter nutritional supplement that helps with heart disease and menopausal symptoms. It's also a common wood finish."

losing-it (2007-10-13 14:07:32)

Funny. You can eat it on your salads and use it to polish the floors or protect your tools from rusting. But let's not overlook its use in the arts (as linseed oil for painting). "It is one of the oldest commercial oils and solvent-processed flax seed oil has been used for centuries as a drying oil in painting and varnishing." I use it topically for softening my dry, rosacea problem skin :^D  
<http://en.wikipedia.org/wiki/Flax>

## **Interview with Andy Maul about Test Development (part 1) (2007-10-14 04:58)**

Andy Maul, who took introductory psychology with me, is a graduate student in Educational Psychology at UC Berkeley.

### **1. What is your research about?**

I'm taking a closer look at tests recently developed to measure the construct of emotional intelligence (EI). In particular, I'm looking at the Multifactor Emotional Intelligence Scale (MEIS) and the Mayer-Salovey-Caruso Emotional Intelligence Test (MSCEIT), which were both developed in the past decade and evaluated using traditional methods (confirmatory factor analysis [CFA] and classical test statistics such as alpha coefficients, along with correlations with other tests and hypothesized outcomes). I'm looking at these tests again, both through the traditional lens of CFA and through the newer lens of Item Response Theory (IRT). In the end, I hope to make points both for the development of EI tests, and for psychological measurement in general, by highlighting how newer methods can improve the construct- and test-building process.

### **2. How did you get interested in this line of research?**

I became interested in emotions by working with Professor Dacher Keltner. At some point in graduate school my interests shifted to the more quantitative side of research, and I've since been working with Professor Mark Wilson on test theory and statistical measurement. I thought combining the two interests, by evaluating tests of emotional intelligence through a quantitative lens, would be a good idea.

### **3. What's an example of research that shows the value of measuring emotional intelligence?**

The MSCEIT appears to predict some life outcomes (such as grades, prosocial behavior, and self-reported life satisfaction), even controlling for IQ and personality. Other researchers have challenged these claims as being premature and based on insufficient evidence. There are multiple problems with the validity of existing EI tests that make them difficult to interpret, and make claims based on them highly suspect.

Some researchers feel that defining and measuring emotional intelligence could clarify and expand our definitions of intelligence and cognitive abilities in general, and provide information about an area of human functioning that could predict important personal and interpersonal outcomes (such as life satisfaction and the quality of one's relationships) above and beyond traditionally-measured intelligence and personality. In today's era of high-stakes testing, with so much riding on what many feel to be tests with limited utility, a new, well-validated test of emotional intelligence could provide insight into what makes students successful in schools and in life.

Seth's blog » Blog Archive » Interview with Andy Maul about Test Development (part 2) (2007-10-15 03:33:41)  
[...] Interview with Andy Maul about Test Development (part 1) [...]

Chuck Wolfe (2007-10-16 07:18:32)

Hello, I found the comments about emotional intelligence to be very interesting but not entirely accurate. For a period of time I published the MEIS for Mayer-Salovey-Caruso and actually co-authored the certification training for others to use the test. At a later time my certification program was used to introduce the newer version of their test, the MSCEIT. I now certify people to use the MSCEIT and distribute both the MSCEIT and the BarOn EQi. My reason for commenting is that the MSCEIT actually is based on a sample of 5000 people from a variety of countries and ethnicities. It is scored in two ways, one as Andy suggests, general consensus and the second is based on emotions experts. For a detailed explanation I refer people to the MSCEIT User's Manual. This is not to say that the MSCEIT is a perfect test, I just want your readers to have accurate information. I actually have found that the MSCEIT is incredibly useful, powerful and compelling. The actual report you get leaves much to be desired but when people are trained in how to interpret it the results are very meaningful.

### **Rent-Seeking in Higher Education (2007-10-14 18:11)**

A [1]nice essay by Paul Graham about the effects of making start-ups easier says that one effect will be changes in our education system:

Performance is always the ultimate test, but there are so many kinks in the plumbing now that most people are insulated from it most of the time. So you end up with a world in which high school students think they need to get good grades to get into elite colleges, and college students think [correctly] they need to get good grades to impress employers.

A world in which lawyers are forever judged by the law school they attended, which greatly surprised a lawyer friend of mine. If you can leave college to start a company, your professors have less power over you. One more way the Web is like the printing press, which led to a vast reduction in the power of the Catholic Church. The printing press made it much easier to start new religions.

[2]For whom do colleges exist?

---

## Interview with Andy Maul about Test Development (part 2) (2007-10-15 03:33)

4. You write "There are multiple problems with the validity of existing EI tests that make them difficult to interpret, and make claims based on them highly suspect." What are the main problems?

Many early tests designed to measure emotional intelligence, and some still in use today (including one developed in part by the journalist Daniel Goleman, who popularized the term emotional intelligence in his 1995 book), used self-report methods and treated the construct as a conglomerate of various desirable personality and motivational factors, such as optimism, contentiousness, happiness, and friendliness. Tests of this nature may be interesting and may predict important outcomes, but emotional intelligence, defined in this way, is really just a repackaging of old ideas. These tests are so highly correlated with traditional measures of personality as to be operationally indistinct from them. Additionally, calling this construct emotional \*intelligence\* is suspect: personality and intelligence are generally regarded as very different things, and assessing intelligence through self-report is generally considered inadequate.

The MEIS and the MSCEIT, to which I referred earlier, are, to my knowledge, the only two currently published tests that assess emotional intelligence as an intelligence. These tests ask respondents to engage in a variety of tasks, such as looking at pictures of people's faces and reading stories about human interactions, and then make judgments about the emotional content of those stimuli. These tests are a step in the right direction, but have their own problems.

The test developers have a rather odd way to score the responses people give to the stimuli on the tests. The tests were administered to a large (N=2000+) standardization sample, and the scores people are now given on the items are the percentage of people from that standardization sample who chose that alternative. In other words, if you select choice "A" on an item, and 67 % of people from the standardization sample also chose "A", then you get a .67 for that item. If you chose "B", and only 11 % of people chose "B", then you only get .11 for that item. Your total score is simply the sum of the weighted scores from each item.

As odd as this method of scoring may sound, it has been used in other situations where the underlying theory

is not well understood (see Legree, below, for an exposition of this). However, it presents difficulties here: it defines correctness as, essentially, conformity of opinion with the standardization sample. In other words, what is actually being measured may not be "intelligence", but rather, simply, normality or popularity of opinion: the highest-scoring respondents will simply be those who most consistently choose the responses most other people also select. Additionally, this prohibits the existence of items so difficult that most people get them wrong, such as a very subtle facial expression that only the most emotionally astute could correctly parse: if there were any such items, the astute minority would be penalized for choosing the less-popular but more-correct alternative. This is a serious challenge to the construct validity of the test.

Additionally, the internal structure of the test itself is suspect. The test developers posit a four-factor model of emotional intelligence (the four factors being the ability to perceive emotions, the ability to allow emotions to facilitate thought, understanding emotions, and managing emotions) and have branches of the tests designed to measure all four of those factors. They have published confirmatory factor analyses that they claim support their theory; however, re-analyses of their tests, and new analyses (including one that I am conducting now) have not been able to replicate their results, calling into question the internal validity and reliability of the tests.

In my dissertation, which I can make available early next spring, I discuss all these points in greater detail.

[1]Part 1.

michael vassar (2007-10-15 04:51:55)

"Additionally, this prohibits the existence of items so difficult that most people get them wrong, such as a very subtle facial expression that only the most emotionally astute could correctly" The solution to this is with recursive scoring. After the first round of allocating points to answers, take people's total scores and then apply these as multipliers to the answers they select, then sum up the scores again. Repeat a few times if desired.

### **Omega-3 and Plagiarism (2007-10-15 05:11)**

The [1]news page of Linköping University, in Sweden, has two articles that greatly interest me. One is about a surprising effect of omega-3 supplements:

One-year-olds whose mothers had ingested fish oil during pregnancy and breastfeeding had considerably fewer allergic reactions than children whose mothers did not take this supplement.

The other is about a case of extreme plagiarism: An entire material-science paper was copied, almost word for word, from PNAS. [2]Into Madness has a nice comment:

Regarding the main authors, there seems to be a Nepali element involved! Sounds like a case for Father Brown. . . . Some Engineering students at Anna University [where two of the four authors of the paper that is a copy came from] who I talked to were not aware of this until they read the blogs. There have been no newspaper reports in India (as far as I know). How and when Anna University will react to this incident will be interesting to watch.

I agree. In the 1990s, when (a) Ranjit Chandra's research assistant came forward and said "this research couldn't have been done" and (b) Chandra could not produce the data, it was obvious that something was seriously wrong. Yet Memorial University, Chandra's employer, gave Chandra a tap on the wrist.

A curious feature of this case is that two co-authors [3]claim they are innocent:

Tom Mathews, doctor at the Indira Gandhi center for nuclear research in India and one of the four researchers named as authors, distances himself from the article in an email to DN [= Swedish newspaper]. So does Roshan Bokalawela, graduate student at the University of Oklahoma in the USA.

fascinated (2007-10-19 17:07:22)

The study connecting fish oil and allergies is indeed fascinating. It also makes me wonder if omega-3 consumption during pregnancy might also help prevent autism. There is a well-documented strong association between autism and allergies. Also, both phenomena have grown during a time when fish consumption during pregnancy has declined due to concerns about mercury in fish.

seth (2007-10-19 20:00:06)

Very interesting idea – that omega-3 consumption during pregnancy might be related to autism.

Dennis (2007-10-21 21:01:53)

Have you considered testing your balance or cognition with fish or cod liver oil against flax seed oil? According to Wikipedia [http://en.wikipedia.org/wiki/Omega-3\\_fatty\\_acid](http://en.wikipedia.org/wiki/Omega-3_fatty_acid) flax seed oil has higher levels of ALA, but conversion of ALA to EPA and DHA is limited in humans. It would be interesting to know if fish oils were better or worse than flax seed oil.

seth (2007-10-21 23:23:48)

Yes, I will try fish oil and other sources of omega-3. I have some fish oil capsules in my refrigerator.

## **The Apparent Spread of SLD (2007-10-16 06:37)**

The number of visitors to the Shangri-La Diet forums has been growing. This graph shows, for each day, the maximum number of people accessing the forums at one time. (When you load a page, I guess you are considered "at" the forums for some length of time.)

"Most online" has steadily increased since January. These values are closely correlated with the number of visitors in a day, for which I have less data.

Here is another way to look at the most-online data. Each most-online value is divided by the value from one week earlier.

Perhaps the rate of increase is increasing but it isn't clear.

[1]Will it live?

1. <http://www.blog.sethroberts.net/2006/06/02/will-it-live/>

Pearl (2007-10-16 08:17:08)  
Yay! :)

### **Marilyn Harvey's Complaint (2007-10-16 20:34)**

In 1993, Marilyn Harvey, a nurse, complained to Memorial University that her boss, world-famous Order-of-Canada scientist [1]Dr. Ranjit Chandra, could not have done the research he claimed. A very courageous thing to do. After an

investigation, Memorial did not agree. Harvey recently sued Memorial. From [2]her complaint:

The Plaintiff [Harvey] says that the Defendant [Memorial] defamed her by taking actions which . . . caused her to be isolated, shunned, and humiliated through the following:

- (a) representing to the community that her complaint was unjustified;
- (b) misconducting the investigation of the complaint;
- (c) misleading the research community as to the reasons for discontinuing the investigation;
- (d) choosing not to conduct another investigation;
- (e) misleading the Plaintiff as to the reasons for discontinuing the investigation;
- (f) acquiescing in and adopting [?] the actions of Dr. Chandra when he sued her for theft of research data; and by its conduct giving the Plaintiff and the public the impression that it believed the allegations of theft to be true;
- (g) treating the Plaintiff in a manner as to imply to her and the university and the healthcare communities, and the public, that her complaint was unjustified;
- (h) acquiescing in and adopting statements of Dr. Chandra which impugned the Plaintiff's motives and integrity.

The overall effect of the conduct of the Defendant was to constitute a communication to the community, and to the research and hospital community in particular, that was profoundly defamatory. . . It expose[d] her to contempt, ridicule and marginalization and [caused her] to be viewed by co-workers as a troublemaker and a pariah who could have a detrimental effect on one's career if she were not avoided.

[3]Memorial's defense.

### **Interview with Andy Maul about Test Development (part 3) (2007-10-17 22:23)**

5. What are you doing to develop a better test?

Not being a content expert in either emotions or intelligence myself, I have no plans at the moment to create a test of emotional intelligence. Instead, my goal is to explore and discuss, firstly, better ways of engaging in the iterative process of construct exploration and test development, and secondly, better methods of test analysis. These are, of course, interrelated.

The "classical" method of test construction in psychology goes like this: a) decide what you want to measure (formally or informally); b) write items to measure it; c) pilot those items; d) run basic statistical analyses, such as

Cronbach's alpha e) remove the items from the test that are the least reliable with the other items, thus improving the reliability of the test, and f) publish.

This process usually yields a reasonably reliable test. A problem with this approach is that nowhere did we allow the process of test construction to inform our theory development. Test construction can be as much a process of construct exploration as anything else, if we allow it. For instance, think-alouds and exit interviews can help us understand what subjects are actually thinking as they take the test, and whether the variation in the ways people approach the items truly reflects variation in the construct we think we're measuring. The exercise of construct mapping can turn a murky idea of what we're measuring into a much clearer one, by laying out a priori theories about what kinds of items measure what levels of the construct, and those ideas can then be empirically tested later, which makes the analysis phase much more informative than it traditionally is. And, of course, I would be remiss if I didn't mention the analysis itself: item response modeling often affords valuable information missed by classical analysis, such as information on person and item  $\alpha$  (which, to be interpretable, requires going back to the theory of the link between the items and the construct itself, which once again benefits from thoughtful construct mapping) and information about dimensionality at the item level (as opposed to the branch level, which is where confirmatory factor models—such as the ones used to investigate the structure of the emotional intelligence tests I'm working with—traditionally concentrate).

Doing things in this manner usually takes more than one iteration, which is one reason people might not like it. So far, the MSCEIT has been developed and evaluated, and the test developers have spent a good deal of time debating other authors in the literature concerning the value of the test, but the analyses have not yet led to test revision (except in the manner I described above: that items with poor reliability were dropped, without any particular theory about *why* they were unreliable).

So, in other words: I won't claim to be a substance expert enough to be able to write a new test of emotional intelligence on my own, but I would like to use the measurement efforts in this field as a way to discuss construct exploration and instrument development in psychological research.

## Exit Wounds (2007-10-18 22:40)

Tonight, by accident, I attended a talk by the Israeli artist [1]Rutu Modan about her graphic novel [2]Exit Wounds. I learned:

1. One day in 1914, Franz Kafka wrote in his diary, "Germany invaded Russia. Swimming lessons in the afternoon."
2. Browsing at a flea market, she found an album of pictures of her dead father. Her family had given it away by mistake. When she told the seller about this, he raised the price from \$4 to \$150.
3. She wrote Exit Wounds in Hebrew but drew it in English. No kidding. She wrote the text in Hebrew and had it translated into English. The balloons where the words go were arranged to read from left to right. For a forthcoming Hebrew edition, she made mirror images of everything. There was just one problem: Cars were on the wrong side of the road. 150 panels (the hero is a taxi driver) have this problem. She has been forced to do some redrawing.

Varangy (2007-10-19 09:23:18)

2. Browsing at a flea market, she found an album of pictures of her dead father. Her family had given it away by mistake. When she told the seller about this, he raised the price from \$4 to \$150. That is some creepy, albeit fortuitous, coincidence.

Ruth (2007-10-19 14:22:47)

How did you attend a talk by accident?

seth (2007-10-19 14:52:13)

This talk was in the Cartoon Art Museum in San Francisco. I went there to attend another talk.

losing-it (2007-10-21 07:07:04)

"1. One day in 1914, Franz Kafka wrote in his diary, Germany invaded Russia. Swimming lessons in the afternoon." Franz Kafka's diary entry is all haiku to me (text divided into a modern two-line-haiku format). A wonderful juxtaposition...

losing-it (2007-10-21 07:28:46)

"2. Browsing at a flea market, she found an album of pictures of her dead father. Her family had given it away by mistake. When she told the seller about this, he raised the price from \$4 to \$150." And Rutu Modan's experience with the flea market vendor could be fodder for senryu: the lost heirloom found at a flea fair..."mine," I claim and the price goes up :^D

losing-it (2007-10-21 08:20:29)

And then there is the primary "accidental tourist" haply experiencing synchronistic life as [cartoon] art:^D... How fun. A little senryu... cartoon museum" I've arrived for the event on next week's schedule

seth (2007-10-21 08:51:09)

Very nice, losing-it. The last one should be like this: cartoon museum - I've arrived for the event in the other room.

## Memorial University Defends the Indefensible (2007-10-19 12:34)

In 1993, Marilyn Harvey, who at the time was Ranjit Chandra's research assistant, came forward to say that a paper by Chandra reported research that didn't happen. Memorial University conducted an investigation that failed to confirm her (very courageous) allegation. About that investigation, Ranjit Chandra's [1]Wikipedia entry says the following:

The vice-presidents were unable to secure the data, and, as a consequence, were unable to verify re-search fraud conclusively.

Huh? Harvey's claim was that the data didn't exist!

This sentence was written by Peter S. Morris, Director of Public Affairs at Memorial. I emailed Morris to try to find out how it could make sense. Presumably it made sense to Morris. Alas, Morris would not explain it. He did say that to prove research fraud – in Chandra's case, the fraud of making up data – you need the data. You read that correctly: To prove that someone has made up data you need to have the data, Morris asserted. He wouldn't explain that, either.

Memorial's behavior did great harm to Marilyn Harvey, as you can read in [2]the complaint filed with her lawsuit.

1. [http://en.wikipedia.org/wiki/Ranjit\\_Chandra](http://en.wikipedia.org/wiki/Ranjit_Chandra)

2. <http://www.blog.sethroberts.net/2007/10/16/marilyn-harveys-complaint/>

---

Andrew Gelman (2007-10-19 16:47:22)

Seth, I defer to you entirely on the merits of the case, but surely you can't be surprised that the public information officer, when encountering a hostile question from someone he doesn't even know, will respond guardedly. Consider the alternative: do you really think he's gonna say: "D'oh! You're right—Chandra is a fraud and my bosses are incompetent." Making judgments like this isn't really part of his job description. I might also say that it's hardly worth your time to be pursuing this, but I won't say that, because then I'd have to conclude it's hardly worth my time to write this comment, etc etc. I guess I will suggest that we talk on the phone more often since that's probably more efficient than blog commenting as a way of communicating!

Tom (2007-10-19 18:52:25)

Respectfully, it's worth it. An innocent person got reamed. The media will call the university's PIO (Morris) to "find out what happened." Morris will talk up Chandra's resume, limn Harvey as a crackpot out for money, and that will be what the reporter runs with. Unless the reporter actually decides to spend another 30 seconds on the story and run it through Google...then he'll get the real story from Seth. What's right is right.

seth (2007-10-19 19:48:17)

Harvey was not only innocent, she was trying to make the world a better place in a very difficult way – it was obviously dangerous going up against someone as powerful as Chandra. Who was also her boss. Because of the Memorial administration's horrible behavior, she paid a huge price. The Memorial administration could have decided that they made a mistake; they have chosen not to. I was curious to see if there was anything reasonable to be said in their defense. I gave Morris the opportunity to defend Memorial; he failed to say anything reasonable.

## How Interesting is Good Calories, Bad Calories? (2007-10-19 22:48)

Very.

The single most striking result in the history of the cholesterol controversy . . . passed without comment by the authorities: those Framingham residents whose cholesterol declined over the first fourteen years of observation were more likely to die prematurely than those whose cholesterol remained the same or increased. They died of cardiovascular disease more frequently as well.

Around 1990, nineteen studies found that both women and men had higher total mortality at the lowest cholesterol levels (< 160). The increase came from more "cancer, respiratory and digestive diseases, and trauma." From Gary Taubes' fascinating new book *Good Calories, Bad Calories*.

I expect these results are corrected for income but I'm not sure. A friend of mine is very poor. "You have the cholesterol level of a Chinese peasant [i.e., very low]," his doctor once told him.

[1]Interview with Taubes (October 9).

1. <http://wor710.com/pages/48794.php>

---

Timothy Beneke (2007-10-20 09:14:38)

I find this all very confusing. The big question, or several questions: How seriously should we take the plethora of correlational studies about all kinds of stuff? Most nutritional claims are basically grounded in such studies. Since you can't ethically do double blind controlled studies that may well hurt people; and it's so hard to do such studies over a 10 or 20 or 30 year etc. period that might tell us something, we're left with these correlational observations, plus scientific causal research and theory. After watching my girlfriend and other women feel seriously betrayed by science and the HRT debacle, where they were assured by their doctors that the good effects of HRT mostly outweighed the bad, and then told, "Sorry, oops, we got it all wrong," it's all very confusing. Or take vitamins; my impression is that the attempts to give specific vitamins to people to help them with specific risks are largely a failure. I want to see good intellectual work that tells me when to trust correlational research and when not to. Is there an algorithm or a heuristic that helps? How do we ever really know that we have controlled for all of the relevant confounds? My guess is that it will take more centuries of experience with this kind of science before we can answer this. When we can make effective prescriptions based on correlational research that clearly have the intended effect then we know the conclusions we draw from such research were more or less correct, or at least useful. I don't really know how to think critically about this. But I welcome enlightenment of any kind...

Trina (2007-10-20 09:16:05)

A fascinating though frustrating interchange last night on Larry King Live between Taubes, Mehmet Oz and Dr. Weil (the frustrating part being the "moderator's" maddening irrelevant interruptions). Dr. Weil was barely restraining his annoyance with Mehmet Oz's closed-minded, convention-wisdom, know-it-all, inside-the-box thinking. I had recently purchased the book and am still reading it. This is important, leading-edge stuff, and we all need to pay attention. That's all Gary Taubes wants.

Paradigm (2007-10-20 09:26:25)

I hope you invite your friend for dinner once in a while ; )

Chi (2007-10-20 12:31:16)

He's a science \*journalist\*. He corrects for nothing, except for intrigue. I mean, come on, he left in "trauma". Like anyone cares if a fatty diet makes a compound fracture more deadly. Timothy, for every correlational study there will be someone waving their hands and screaming that some huge bias is selected for or uncorrected. The only way to know for sure is to A) test it yourself, a la Seth [not so great an idea as far as heart attacks go] or B) make sure a ton of money has been thrown at the study by people concerned enough about their scholarship and reputation to care about the results.

Dennis Mangan (2007-10-20 14:26:54)

People with "cancer, respiratory and digestive diseases" are more likely to have low cholesterol as a consequence of their illnesses, because they cause wasting. Likewise, the people in the Framingham Study whose cholesterol declined could have experienced the decline as part of their illnesses, which are often hidden until they become major problems.

Tom (2007-10-20 16:02:49)

Citations, Dennis?

Dennis Mangan (2007-10-20 16:41:32)

"Cancer patients often die with a serum cholesterol between 100 and 150. The same holds true for many other chronic illnesses, especially those associated with bodily wasting (cachexia). It is as though, in the wasting process, as all the fat is "burned," so too is the cholesterol." From one of your favorite sites: <http://www.westonaprice.org/askdoctor/lowcholesterol.html>

seth (2007-10-20 18:05:35)

That makes a lot of sense, Dennis.

Chris (2007-10-20 21:36:29)

Doesn't taking flax oil/fish oil lower your cholesterol as well? Mine's gone down to 170 from 190 since doing the SLD for 3 months.

## **Why Do We Like Warm Food? (2007-10-21 12:56)**

Yesterday I cooked some chicken. Today I reheated the leftovers. While eating them, I had a gruesome thought: Warm food is more pleasant than food at room temperature. Could the evolutionary reason be that it is better to eat freshly-killed meat (warm) than meat killed yesterday (room temperature)? Or did a preference for warm food evolve because it caused us to prefer cooked food (sterilized) to uncooked food (unsterilized)?

Sure, thermoregulation is involved. We like warm food more when we're cold; we like cold food more when we're hot. Michel Cabanac has done [1]brilliant experiments about our changing preference for hot and cold environments. But there is an overall preference for warm food. We like warm food even when we're not cold.

In spite of thousands of books and articles promoting this or that "natural" diet, it has been incredibly hard to determine what our ancient ancestors ate, the diet that presumably fits us best. One way has been to ask what modern-day hunter-gatherers eat. Not only do their diets vary widely but also they are clearly not typical: They live in meager environments. So that is hopeless, although [2]Weston Price showed that there was a lot to be learned by studying earlier foodways. Price was surprised to find how much those ancient foodways differed from each other yet all produced good health.

The most basic questions about our ancient diet remain unanswered. Did our ancestors eat lots of meat (savannah evolution) or lots of fish (aquatic ape theory) or neither (vegetarian proponents)? In spite of looking, Price never found a group that ate little meat that was in the best health, so I doubt the vegetarians. I suspect ancient peoples ate lots of fish at first and then started eating lots of meat as they spread away from the coasts. My main evidence for the fish is my [3]omega-3 results that imply our brains work best with lots of omega-3. My main evidence for the meat is the huge popularity among boys of video games that contain elements of hunting. It's hardly great evidence, of course, since the popularity of those games, and of actual hunting, has other plausible explanations.

This is why my omega-3 self-experimentation interests me so much. It is a way to figure out the best diet for our brain. It relies on fast simple cheap easy-to-control experiments that anyone can do, rather than on epidemiology (correlations) or expensive slow hard-to-control clinical trials that often involve unusual people.

david (2007-10-21 14:30:04)

Perhaps warming food releases more flavor.

Jen (2007-10-21 16:12:26)

Fish aren't the only rich source of long-chain omega-3 fats; our less squeamish paleolithic forebears could have obtained plentiful amounts from the brains of hunted or scavenged animals.

Robert Blandford (2007-10-21 16:29:19)

I believe that there are a number of foods that are easier to digest, and a number that release nutrients when they are cooked. I can't come up with good examples right now, how about consulting a nutritionist?

KenF (2007-10-22 10:54:14)

This sounds like a Quiznos ad. ;-)

Bob (2007-10-22 15:44:53)

This is an article copied from the September 13th edition of Nature (vol 449 pp. 155). I think you'd find it interesting. EVOLUTIONARY GENETICS: You are what you ate by Sadaf Shadan It is hard to think of anyone who doesn't like starchy foods such as pasta, chips, rice or bread. But certain populations, for example hunter-gatherers living in the rainforests or near the Arctic circle, have historically existed on a diet rich in protein and low in starch. George Perry and colleagues conclude that such differences in the amount of dietary starch have moulded the human genome over time (G. H. Perry et al. Nature Genet. doi:10.1038/ng2123; 2007). Dietary shifts "whether driven by the development of stone tools, by controlling fire or by domesticating plants and animals" have had a major role in human evolution. Perry and colleagues specifically looked at the effect of dietary starch on the number of copies of AMY1, the gene that encodes the salivary amylase enzyme, which breaks down starch. AMY1 is one of the few genes in the human genome that show extensive copy-number variation between individuals. So the authors first looked at whether additional AMY1 copies are functional. They found that extra AMY1 copies do indeed endow the individuals carrying them with the capacity to produce more salivary amylase. The question then was whether the starch content of past diets dictates the present levels of amylase and, thus, AMY1 copy number. Perry et al. studied two groups: one consisted of four populations with a low-starch diet and the other of three populations from

agricultural societies and hunter-gatherers in arid environments, who traditionally eat high-starch food. Strikingly, twice as many members of the high-starch-diet group had at least six copies of AMY1. This difference could not be explained by geographical factors because both groups contained people of Asian and African origin. Instead, the authors propose that variations in AMY1 copy number are more likely to have been influenced by positive natural selection. So what is the advantage of having more salivary amylase? Significant digestion of starch occurs during chewing. This is crucial, and probably vital, in people likely to suffer from diarrhoeal diseases. Moreover, after being swallowed, salivary amylase is carried to the stomach and intestines, where it aids other digestive enzymes. Of the three copies of the AMY1 gene registered in the reference sequence of the human genome, variations in nucleotide sequences are small. This suggests that the duplication of these genes may have occurred relatively recently, possibly even since the evolution of modern humans about 200,000 years ago. So Perry and colleagues' results, and elucidation of copy-number variations in other human genes, could provide insight into our ecological and evolutionary history.

Larry (2009-04-02 22:58:09)

I was wondering the same thing today. It just popped into my mind while microwaving some meat. Your idea of our ancestors eating freshly killed meat is interesting. It might be because we like food that matches our body temperature?

Kat (2010-05-08 21:53:04)

Or maybe it was a type of trial and error/natural selection thing - more people might have died from diseased meat (especially if it was scavenged) than cooked meat. So they learned, and kept cooking...

Emilie (2010-06-25 11:19:25)

I was wondering about this over chicken pot pie. I think Larry's hypothesis is interesting and makes sense. Our bodies want to get the most energy out of the food we eat, so the closer to our body temperature food is, the less energy is wasted by being lost to colder food.

del rashid (2010-10-19 09:47:28)

We eat warm food for fetal comfort. Our mothers amniotic fluid temperature is about 37 degrees celcius. The human fetus can taste and breathe the mothers amniotic fluid. This is the primary reason we have to heat a newborn baby's bottle, a newborn will always refuse a cold bottle. We never lose our fetal knowledge

Dan (2010-10-23 18:03:10)

We discussed a similar topic in my Ancient Engineering course recently, and I came up with an answer to this question based on what we talked about (see below): It takes less energy to consume warm food. You chew less if the meat is tender, and it digests easier. From a thermodynamic standpoint, the molecules are moving around faster and therefore bonds are broken more easily. In class we compared our gut size to an ape's gut size (relative to the body). They have a much larger gut because they eat leaves. This requires a lot of chewing (hence larger teeth) and they get less energy per quantity. Therefore, they have to eat more, meaning a larger gut. Since a lot of the consumed energy goes towards digestion, their brains were not able to evolve like ours. We are able to allocate more energy to brain functions since we have a much better diet. More about the relationship between diet, brain size, and gut size can be found at <http://www.beyondveg.com/billings-t/comp-anat/comp-anat-4b.shtml> What I said is based on what I remember in class, but hopefully it is consistent with the article. I don't think it mentions warm food, but I believe warm food falls under "better diet."

del rashid (2010-10-26 07:52:43)

I am researching natural health and wellbeing, hence my interest in why we eat warm food. Dans views of mechanical thermodynamics, are also important in biological thermodynamics. Basically all life is exothermic ("cold blooded") but mammals, birds and some PLANTS have the ability to produce heat energy and are called endothermic life, (ie "warm blooded"). Biologically we have got to remember that digestion is on an evolutionary point a chemical process that involves enzymes and various reactions. Exothermic animals such as snakes, crocodiles, only have to eat once a month, or once every 2 years in the case of crocodiles, for nutrition rather than for energy. Carnivorous plants also have enzymes, digesting captured animals and insects

to provide valuable nutrition rather than energy. Which brings me to the point that teeth evolved as a form of defense against predators, canine teeth in humans are quite small but in chimps and gorillas they are extremely large for animals that are mainly plant eaters. So my point is why do we like to eat warm food, or drink warm coffee or tea, or even take a warm bath, (water dries your skin so moisturise before you have a bath and shower), and the answer is that oxytocin is released in our brain. Oxytocin is the feel good chemical that gives us that comforting, and relaxing feeling

del rashid (2010-10-26 08:28:18)

Sorry, I ended abruptly earlier, Oxytocin is found in the mother's amniotic fluid, it also encourages the mother's breasts to produce and release milk, i.e. lactation. So our brains are conditioned to experience warmth and comfort by the release of Oxytocin. I have discovered that Mother Nature does not create LIFE so it can be eaten as food source, and that plants and animals don't exist so that they can taste good. I believe we have to learn to eat for nutrition and health, and not for good taste, it is unjustifiable to Mother Nature that we kill and cause suffering to animals so that we can satisfy our taste buds.

Jordan C. (2011-06-27 19:16:21)

You mentioned in the Original Post that you believe the fish diet to be the most compelling because of the high amount of Omega-3 present in fish. You are being partially misled by the way our present society works. Omega-3 and Omega-6 are two major fatty acids that promote brain function. In many plants Omega-6 is found in the seed portion of the plant primarily, whereas Omega-3 is largely found in the plant body. We tend to lack Omega-3 because of the fact that we have moved to feeding our livestock (meat which previously would have had a better balance of Omega-3 and Omega-6) with corn (a seed, higher in omega-6). On top of that we are adding high fructose corn syrup, xanthan Gum, maltodextrin, citric acid, and many other products derived from corn into our processed foods. Some scientists (I'm not sure of the proportion) believe that it's not just the lack of omega-3 in our diet that is the problem, but more so that the imbalance is a problem. With this in mind, I believe that ancient fish and ancient land-based wildlife were at least closer with each other with regards to omega-3 content, and that the mostly fish diet and the mostly meat diet are equally as valid.

doc (2011-09-07 07:57:34)

Still want to know if eating warm food is better for you than lukewarm food

Oooooooooohhhhhh!! I was SO going to blog about this! How dare you!! ;)

## **The Silent Spring of Marching Bands (2007-10-21 19:57)**

Rachel Carson's Silent Spring, about the damage done by pollution, "is widely credited with launching the environmental movement in the West" ([1]Wikipedia). Along similar but narrower lines, last week's USA Today had an [2]article by [3]Joyce Cohen about hearing damage caused by being in a marching band. It begins:

There's no bigger booster of his marching band than Mark Claffey. "I am a total band nerd!" declares Claffey, a drummer for the Golden Falcons at Franklin Heights High School in Columbus, Ohio.

There's just one downside. At age 17, he has painful ear damage.

He says that, after indoor rehearsals, his ears started hurting, then ringing.

Now, he's abnormally sensitive to sound. If someone cranks the car radio, "I get a sharp shooting pain in my right ear," says Claffey. . . .

It's the dirty little secret of the halftime show: Marching band . . . can cause irreparable hearing damage, according to Brian Fligor, director of diagnostic audiology at Children's Hospital in Boston.

The director of a professional group of music teachers claimed that knowledge of this problem is fairly new. That's absurd, Joyce said. Stories about hearing problems among musicians have been published in medical and professional journals for at least two decades. Music teachers don't acknowledge their own hearing problems, several experts told her, because doing so could endanger their livelihoods. Band parents, known for their fanaticism, were sometimes dismissive. They claimed that pain and ringing in the ears are normal.

The Indianapolis Star, published by Gannett, which also owns USA Today, reprinted the article. On the newspaper's forums, readers started [4]a debate about whether there should be laws to protect students' hearing.

david (2007-10-21 20:11:51)

When I was in middle school (late 70's/early 80's), my band (not marching) teacher commented that drummers were always deaf. Her husband was a drummer.

Pearl (2007-10-21 20:16:41)

I totally agree with this; there ought to be more awareness of what it does to kids hearing. When I played in band in high school a few times as a bassist, I always tried to wear earplugs during rehearsal or performance because it actually felt physically painful, it was so loud. My years of orchestral playing hadn't conditioned my ears to be used to it. I had no idea how they could tolerate it; some of the kids have the bells of the brass instruments pointed directly at their ears.

Joyce (2007-10-21 21:10:06)

Pearl, years of playing don't toughen up your ears. It's not possible to condition yourself to withstand noise. If anything, that orchestral playing made your ears more susceptible, not less. Noise exposure causes damage that is cumulative, irreversible

and untreatable.

Pearl (2007-10-22 00:35:05)

I had gained the impression that it was possible, sustaining years of exposure to noise, to develop a tolerance for noise levels. After repeatedly being exposed to a certain level of sound at a certain frequency, the part of your ear that receives that sound gets damaged and needs a stronger volume. It's why we lose our hearing and need people to shout at us as we get older, if I'm not mistaken. Using a personal example, I once determined I was building a tolerance to noise when I noticed that I kept turning my Walkman up higher and higher as an adolescent. I needed to turn it up to maximum level 10 to get the same satisfaction I once got from level 5. I've known several musicians who could tolerate higher noise levels than I could; orchestral playing for a string section member has a far lower decibel level because we aren't in close contact with the noisemakers, namely brass and percussion.

Pearl (2007-10-22 00:36:59)

I suppose hearing loss due to aging would not be quite the same as losing it to noise exposure, but perhaps could be a factor, I should have said.

Nansen (2007-10-22 12:54:58)

Good luck trying to sell safe sax.

Seth's blog » Blog Archive » News You Can Use: Hearing Protection (2007-10-25 09:15:37)

[...] The Silent Spring of Marching Bands [...]

Mark Claffey (2007-10-31 16:14:23)

Well, I am the Mark Claffey interviewed in this article. My hearing isn't really damaged, I just have an abnormal sensitivity to loud and high pitched sounds. Drumming over 2 or 3 years without earplugs has caused a ringing in my right ear. I now wear ear plugs to prevent any further damage in my ears. Thankfully marching band is coming to an end, which means putting away the loud marching drums, and bringing out some of the quieter, (not really), drums. I plan to go into college for music, and plan to wear earplugs when I am practicing. Anyone interested in talking to me about hearing loss from marching band please e-mail me at mclaffey12489@yahoo.com.

## **Is It Time to Revise Ancient Philosophical Questions? (2007-10-22 06:04)**

If I didn't blog it, I didn't think it. Nonsense, right? Well, let's rephrase the ancient question "if a tree falls in a forest and no one hears it, did it make a sound?" Of course this is true:

tree makes sound → someone hears

where → indicates causality. X → Y means X causes Y.

But what about

someone hears → tree makes sound?

This had always struck me as boring. Who cares? But I am noticing that while this is obvious

I think of something → I blog about it

this is not so obvious, but true:

I blog about it -> I think of something

Because I blog about my thoughts, I have more of them. I blog, therefore I think.

This post and others about blogging, for example. Posts about the twilight of expertise in areas other than science. I'd be doing omega-3 self-experimentation blog or no blog but blogging about it divides the research into small and more doable parts (making the graphs, for example). It is encouraging to get feedback and have others, such as [1]Tim Lundeen, contribute their observations. Blogging is a kind of tinder. It doesn't create the initial spark but it amplifies it.

In terms of book and scientific-paper writing, blogging plays the [2]role I give art in the growth of technology: It provides a slope in place of a step. It divides a big task into tiny tasks.

Sam (2007-10-22 07:51:57)

The more logical rephrase of "if a tree falls in a forest and no one hears it, did it make a sound?" is "if a tree falls in a forest and no one hears it, does the tree even exist?" or maybe, the web version: Does it exist if google does not find it?

seth (2007-11-11 21:35:18)

Shortly after you wrote that, Sam, I discovered that Google was no longer indexing all of my blog posts. Terrible!

## **Gary Taubes Interview (2007-10-22 07:20)**

From the [1]Los Angeles Times:

What is the evidence that the low-carb Atkins diet is healthy?

First, all you're doing is not eating foods that none of us ate up until a few hundred or thousand years ago.

That's a good way to put it. However, I wonder about processing: What about a food eaten thousands of years ago processed in a new way that increases speed of digestion? E.g., applesauce, orange juice. I believe fruit juice that tastes the same each time is very fattening, for example. Taubes says he lost about 12 pounds doing Atkins that he has kept it off. I lost and kept off the same amount of weight by reducing how much my food was processed. Oranges instead of orange juice. The whole interview is a summary of Taubes' new book Good Calories, Bad Calories.

More [2]Taubes links. Taubes on [3]Larry King Live. [4]Radio interview with Taubes about epidemiology. In this interview, around the 22:00 mark, Taubes makes some very interesting comments about the evidence against trans fats. He says all the evidence against trans fats comes from a data set (the Nurses Health Study) in which trans fat

intake is completely confounded with processed-food intake.

Thanks to Dave Lull.

---

James (2007-10-22 08:21:34)

Taubes said he lost 12 pounds avoiding refined carbs and potatoes, \*not\* by following Atkins. On the processing issue, I think it's really a matter of quantity and availability over processing. Our pre-agricultural ancestors would have had access to relatively small quantities of climate-appropriate seasonal fruit. It's doubtful that they would have access to anything as sweet and fructose-filled as an orange, or even modern apples. I agree that processing does make it easier to overeat such foods, and Taubes does lay out how fructose leads to bad lipid mojo, but I don't think overeating unsweetened applesauce or drinking too much orange juice are major contributors to obesity on the whole.

Chi (2007-10-22 08:39:51)

I don't see this as a very clean justification, seeing as how for those same thousands of years (except for Methuselah), we didn't live so long either. Now, you can say that's because of predators, illnesses, or violence, sure. But I don't think anyone can say for sure. In addition, now we have modern research data into the longevity of different cultures, and you'd think we'd have gained a glimmering of wisdom from examining huge variations between diets. And to me, that wisdom says: vegetables, fruit, more fish, and whole grains. Anyone who trades that wisdom for the Atkins diet is either foolish or lazy in my book.

seth (2007-10-22 10:10:51)

It's clear enough that eating ancient diets is much healthier. That is the evidence in Taubes's book, in fact, that I found most persuasive: that when groups suddenly shift their foodways from ancient to modern their health suddenly goes downward. I think this evidence is why Taubes describes the Atkins diet like that.

Timothy Beneke (2007-10-22 13:26:50)

Shouldn't Taubes' ideas about weight loss be reformulated in terms of Seth's theory? Carbs tend to be strong tasting. I've only read the interview, but is he saying that other things being equal, a less "nutritious" calorie will be more fattening than a more nutritious one? Does a nutritious calorie assuage hunger more than a less nutritious one?

seth (2007-10-22 15:45:16)

I think the carbs that Taubes dislikes – bread, mashed potatoes, pasta – are digested quickly. They tend to be eaten with strong flavors so they are bad both ways: strong flavor, digested quickly. Taubes is saying that certain carbohydrates are more fattening than fat & protein, calorie for calorie.

lasser11 (2007-10-22 19:47:29)

Our farming subsidies can't help the situation. This country produces massive amounts of cheap corn syrup and enriched flour due to subsidies. No domestic government policy frustrates me more than farming subsidies.

Tom (2007-10-23 07:45:24)

A calorie is only a calorie when burned in a calorimeter. The idea that a bomb calorimeter is a good proxy for human metabolism is bizarre – but not as bizarre as the fact that no "dietary expert" ever seems to question it! Unlike in a calorimeter, in the body, CHO calories behave very differently from protein and fat calories. Dietary carbohydrate spikes insulin, causing a metabolic cascade that not only makes us store fat, it eventually makes us sick. But with paleo diets, carb levels (and insulin) remain low, and there is little fat stored, and fat is actually burned. Taubes: "When insulin levels fall, we release fat from our fat tissue and burn it as fuel." But if we're eating carbs, insulin levels never fall.

### **SLD Side Effects (2007-10-22 15:42)**

On the SLD forums, you can read about many positive side effects of drinking oil. (One of them – better sleep – caused me to start studying the effects of omega-3.) Today three people [1]posted some more:

I used to get those little cracks in the sides of my mouth. After just a few days on the diet, those are gone! I can open my mouth as far as it will go and no cracks!

My feet/heels don't seem to be getting hard/cracked like they were

My skin feels softer

I haven't had an asthma attack since starting in March.

Mental calmness. Situations that used to bother me now just slide away. It is hard to describe, but the peacefulness is wonderful. I conclude that a big nutritional deficiency has been corrected. What fraction of people with (a) dry or cracked skin, (b) asthma, and (c) irritability have been told to consume more fat, I wonder? Zero? In the case of the asthma and irritability, I expect the improvement comes from a fat high in omega-3.

### **A Modern Microscope (2007-10-22 22:50)**

Reading this [1]legal complaint – suing a florist who gave the plaintiffs far less than agreed-upon at a very expensive wedding – I feel I am peering into a kind of microscope. Something far away and very small in the big scheme of things – the plaintiffs' frustration – is made very clear. It reminds me of *The Devil Wears Prada* (no art but lots of emotion) but the legal complaint is even more evocative.

## Games and Self-Experimentation (2007-10-23 03:26)

On Friday I had tea with [1]Greg Niemeyer, a Berkeley art professor whose medium is games. I wanted to "gamify" the task I have been using to measure brain function. It is a letter-counting task: I see 4 letters and respond as fast as possible how many are A, B, C, or D. This takes about 600 msec – I've gotten a lot faster. Each session has 4 blocks of 50 trials and lasts a few minutes. From each session I get an average reaction time. I have been doing experiments to measure the effect of flaxseed oil (high in omega-3) on this task.

The task is quick, portable (requires only a laptop) and provides 200 fine-grained measurements (reaction times) per session. Flaxseed oil, I have found, not only produces long-lasting improvement in brain function (lasting weeks) but also a short-lived improvement that starts an hour or two after ingestion and lasts several hours. I developed the letter-counting task to measure the time course of the short-lived improvement. To measure the time course, I do the task every half-hour or so. The task has also turned out to be good for discovering other everyday events, such as exercise, that affect brain function. So far I have data from about 450 sessions.

It hasn't been hard. It could be more fun. The more fun, the easier the research and the more likely other people will do it. Games are fun. Can I make the task more fun by making it more like a game? I asked Greg what makes games enjoyable. In rough order of importance (most important first), he mentioned four things:

1. The right amount of difficulty. Too easy we get bored; too difficult we get frustrated. [2]Mihaly Csikszentmihalyi has made this point.
2. Lots of feedback.
3. Varying problems to solve.
4. Color and sound.

I will try adding these to the letter-counting task. I made a simple RT task with elements of #2 (feedback) and #4 (color & sound). It was much too easy but I am sure that #2 and #4 made it more pleasant.

A London Times article about [3]medical self-experimentation.

---

Timothy Beneke (2007-10-23 09:56:56)

Question: I started at 4 tablespoons of flax seed oil a day, a few months ago, and while I haven't done any scientific self measurements, I'd say my brain is doing very well lately. I've gone down to about 2 and a half tablespoons in the last couple of months – do you think doing 4 has substantially greater effect than doing 2?

seth (2007-10-23 10:33:37)

Tim, I think 3 is better than 2. So the answer is yes, probably.

Pearl (2007-10-23 18:13:36)

God, that article practically sounds like a preface to an article about SLD. And one of the guys' names was even Seth! (albeit last name...)

peter (2007-10-23 21:02:35)

do you still plan to study the effects of DHA? (a gentle reminder) I'm especially interested since the oil doesn't seem to work for me, but i'd still like the benefit of taking DHA and omega-3, but without all the calories, assume there is a benefit.

seth (2007-10-23 21:24:31)

Yes, I will certainly study fish oil, including DHA. I have some in the refrigerator. But I'm giving a talk on flaxseed oil in the middle of November so it won't be before then.

### **Culture Shock! Palo Alto (2007-10-23 21:55)**

Please, I want to read Culture Shock! Palo Alto. Michelle Nguyen, who does healthcare software consulting, recently moved to Palo Alto from the East Coast.

On the East Coast, she said, one of the first questions she was asked was about her education. If you have a Ph.D., they take you seriously.

In Palo Alto, among the first questions are (a) where did you go to school? and (b) do you have a blog? It doesn't help to have a Ph.D. It does help to have gone to Stanford or an Ivy League school. And – most encouragingly – it helps to have a blog. Having a blog, said Michelle, shows that you think and have ideas. Yes, it does.

[1]Michelle's new blog is "a place for thinking about all things tech, web, and gadget." Her first entry reviews Microsoft's HealthVault, which allows you to store your health info online.

The [2]Culture Shock! series.

### **Science in Action: Omega-3 (simple reaction time) (2007-10-25 05:12)**

A friend who has known me for years said I became more talkative recently – around the time I started taking flaxseed oil. In the letter-counting task I have been using, there is an increase in error rate at the same time that flaxseed oil is reducing reaction time – I become more "jumpy". It is as if flaxseed oil lowers a threshold for action.

Maybe I could measure this. Following some of [1]Greg's principles, I devised what experimental psychologists call

a simple reaction time task: I see colored circles on my laptop screen and press a key on the keyboard as quickly as possible when a circle appears. The computer beeps 0-4 times depending on how fast I respond.

With the letter-counting task, I kept improving for at least 100 sessions. With this task, I stopped improving (getting faster) after about 2 sessions. I took 4 T flaxseed oil around 2 pm and measured my reaction time before and after. Here are the results.

My reaction time decreased with roughly the time course I'd seen in [2] other tests. The percentage decrease was unsurprisingly small but it was quite clear. It was hard to tell how long it lasted.

I was impressed how easy the whole thing was. It only took about an hour to write the experiment-running program (because I could modify something I already had) and the necessary pretraining (learning the task) was trivial (a few minutes, in contrast to weeks with the letter-counting task). I'm unsure how much follow-up of this I will do but it was reassuring to find similar results (flaxseed oil improves performance) in another task.

---

Joanna (2007-10-25 07:39:36)

Dr. Roberts, Are you really taking 4T of Flax seed oil? It seems a lot. I take about 1 T-2T (12 -24 oil capsules) a day. I wonder what the most optimal dose would be?

Timothy Beneke (2007-10-25 09:55:49)

For what it's worth: I always take about 2-2 and a half tablespoons of flax seed oil in the morning, around 8-8:30. The one very striking thing I've noticed has to do with notetaking work. I take notes for 2 classes on Monday and Wednesday. I take notes from 10-11, come home and write up the notes from about 11:45-1:05 and return to take notes from 2-3; then come home again to write those up and finish the first batch, if I haven't already. What is striking is that I seem faster, more efficient, in taking and writing up the notes at 11:45 than I have ever been. There is a rapid flow from the notes onto the page as I write them that is faster than I have ever experienced – and I have been doing this for 15 years. I suppose I could try not doing the flax seed oil in the morning and see if I am still so fast, but I really don't want to... In the afternoon, I always experience a drop in energy, but I may do some flax seed oil then to see if that affects my mental functioning. Subjectively, it seems to be an issue of mental energy. I hope somebody does standard double blind studies of this soon – the broader community won't buy it until we have that...

seth (2007-10-25 10:21:22)

Johanna, yes, I am. I found that 3 T worked better than 2 T. I haven't yet compared 3 T and 4 T.

lasser11 (2007-10-25 21:54:01)

"It is as if flaxseed oil lowers a threshold for action." I noticed this phenomenon. I think its a good thing. Flaxseed oil appears to decrease my overall laziness. Is there any negative aspect of using Flaxseed oil instead of Canola oil for the SLD (using the plug your nose method)? I don't think so. Maybe cost.

seth (2007-10-25 22:04:54)

I don't think so either.

Kragen Sitaker (2007-10-29 11:48:42)

Well, I don't know much about statistics, but maybe you should take a bigger sample. Did I apply the T test here correctly? (I'm eyeballing the sample numbers off your graph.) kragen@thrifty: \$ R R version 2.4.0 Patched (2006-11-25 r39997) Copyright (C) 2006 The R Foundation for Statistical Computing ... > before <- c(271, 278, 283, 272, 273, 272) > after <- c(269, 265, 267, 266, 267, 261, 270, 271, 263, 295) > t.test(before, after) Welch Two Sample t-test data: before and after t = 1.5234, df = 13.734, p-value = 0.1504 alternative hypothesis: true difference in means is not equal to 0 95 percent confidence interval: -2.230346 13.097013 sample estimates: mean of x mean of y 274.8333 269.4000

seth (2007-10-29 11:57:54)

1. do a one-tailed test. you did a two-tailed test. I predicted the direction of the effect. 2. omit the first and last "after" values (269 & 295). I believed that the effect would take about an hour or more to develop and would wear off after 4 hours or so. then you get t = 3.8, highly significant

Kragen Sitaker (2007-10-30 11:36:52)

I think both of your suggested modifications are plausible but questionable. I have creepy feelings about one-tailed tests (lots of actual statisticians have them too but they usually dress them up in fancier language) and you say in the post that it "was hard to tell how long it lasted," so perhaps your choice of which points to reject may have been influenced by having seen the data values, especially the rather extreme outlier. I'm guessing that the data values on the chart represent averages over N reaction times in a session? Maybe you could get more information about the distribution of your reaction times if you used

the raw reaction times instead of per-session averages. For example, it would be hard to plot the ones you have here on a Q-Q plot. It might also give you more information that could be valuable for significance analysis.

seth (2007-10-30 12:06:23)

"Creepy feelings about one-tailed tests" – in this particular case, why?

Kragen Sitaker (2007-10-30 17:26:46)

Well, what would you have done if your post-flaxseed-oil reaction times had clustered around 320ms? Would you have concluded that this was logically impossible and clearly you'd screwed up the experimental technique somehow? Would you have thought it was logically impossible for this to actually represent the real effect of the oil? Would you have thought it was uninteresting? If I were in your place in that case, I would have thought that the result at least suggested that there was an effect in the opposite direction than I'd originally thought, and perhaps warranted some more trials — maybe at different times of day, for example — rather than that the result was uninteresting. If there's a possibility you might have reacted the same way and been induced to apply a two-tailed test *in extremis*, rather than merely dismissing the apparent difference out-of-hand, then perhaps a two-tailed test is the right thing to apply in the first place? That's where my creepy feeling comes from. But I'm pretty ignorant about statistics, so there could easily be a hole in my reasoning.

seth (2007-10-30 21:37:51)

Hmm. Thanks for the explanation. When lots of previous results lead one to expect an effect in a certain direction, I'm afraid I still don't see the problem with using a one-tailed test. But it hardly matters, since the effect was so strong. That's the nice thing about self-experimentation; you can usually do the experiment again.

## News You Can Use: Hearing Protection (2007-10-25 09:15)

[1]Joyce Cohen on hearing protection beyond earplugs. I often wear noise-cancelling headphones on BART; now I will wear them more often. Does the New York subway damage hearing?

[2]The trouble with marching bands. [3]New York noise.

1. <http://huntgrunt.blogspot.com/2007/10/on-beyond-earplugs.html>

2. <http://www.blog.sethroberts.net/2007/10/21/the-silent-spring-of-marching-bands/>

3. <http://nymag.com/nymetro/urban/features/noise/9456/>

---

Peter (2007-10-25 11:18:16)

I prefer my Etymotic isolation earbuds to the noise-cancelling headphones. Smaller, cheaper, and I think they sound better. Some people don't like things in their ears, however. I wonder how much hearing gets damaged on airplanes. The small jets are really loud if you're sitting in the back. Fortunately at least some airlines are now letting people keep earbuds in (unplugged) during takeoff and landing, when it's loudest.

Chris (2007-10-25 19:54:55)

While noise cancelling headphones would help you feel more at peace by reducing the variation in noise, wouldn't they still hurt your physical hearing since the overall decible level is actually higher? I thought noise cancellation works by adding more noise so a 60 decible noise becomes unnoticable but you get that effect by adding 20db's of cancelling noise. I guess if the goal

is to make the world quieter in the long term even when you're not wearing noise cancelling headsets, it's working :)

### Should Mark Twain Have Won a Nobel Prize? (2007-10-25 21:24)

Of course. He didn't. And dozens of writers you have never heard of, much less read, much less quoted in everyday conversation, have. These wrongs are corrected in an alternative universe described [1]here. The Biology/Medicine Prize has also been fairly ridiculous, although at least [2]Robert Gallo hasn't gotten one:

Mistakes of commission: 1. Frontal lobotomies. 2. Eric Kandel. If you think he deserved it, read [3]Explorers of the Black Box.

Mistakes of omission: 1. The scientists who discovered that smoking causes lung cancer. 2. The scientists who discovered that folate deficiency causes birth defects.

Several years ago, at a big Thanksgiving dinner in an Oakland loft, I told the woman sitting next to me, a genetic counselor, what a travesty the Biology prizes were. The discovery that smoking causes lung cancer had improved the lives of millions of people, I said; the discovery of so-called oncogenes hadn't improved the life of even one person. She replied that she was the sister of one of the oncogene discoverers. The next day I learned she complained I had been rude!

1. <http://www.greatbooksguide.com/nobel2.html>

2. <http://www.virusmyth.net/aids/data/srlabrat.htm>

3. [http://www.amazon.com/Explorers-Black-Box-Search-Cellular/dp/0595189628/ref=sr\\_1\\_1/103-3675802-8345458?ie=UTF8&s=books&qid=1193372979&sr=1-1](http://www.amazon.com/Explorers-Black-Box-Search-Cellular/dp/0595189628/ref=sr_1_1/103-3675802-8345458?ie=UTF8&s=books&qid=1193372979&sr=1-1)

---

Tom (2007-10-26 00:05:20)  
The truth is unfailingly rude.

Willy (2007-10-26 03:39:26)  
The book "Explorers of the Black Box" gives reasons against Kandel?. I thought his work was very important and he seems very intelligent to me. I went to Amazon but there are no reviews yet.

seth (2007-10-26 04:13:34)  
Explorers of the Black Box describes Kandel's attempts to get more credit than he deserved.

michael vassar (2007-10-26 08:59:59)  
Every famous scientist gets more credit that he deserves, but I don't see why Kandel's work is of significantly less than typical Nobel (medicine) caliber. As for the Nobel in Literature, think maybe the issue is that we are native English speakers, not native speakers of some other language, so English Language authors loom large?

seth (2007-10-26 10:29:41)

The situation described in Explorers of the Black Box is extraordinary. I don't know if English writers get the Literature prize more or less than they deserve. Twain deserved it more than all other English writers who have won it.

Alex Chernavsky (2010-07-30 04:59:59)

I had dinner with Eric Kandel at a conference once, when I was a graduate student in the late 1980s (this was before Kandel won the Prize). He got into an argument (a civil one) with a fellow graduate student about some fine point of neurotransmitter receptor structure. Later, we looked it up – and Kandel was wrong. That still amuses me.

## **Why Blog? Interview with Janet Ruhl (2007-10-27 03:59)**

Janet Ruhl [1]blogs about diabetes and maintains a website called "[2]How to get your blood sugar under control." Thanks to Dave Lull, I came across her [3]critique of Good Calories, Bad Calories ("some of the densest writing I've encountered in a long life of reading popular science . . . its core message is VERY important" – I agree with both) and noticed a comment by her that blogging turned out to be a good idea. Ah, blogging. She kindly agreed to answer a few questions.

Why did blogging turn out to be a good thing to do?

Blogging introduced me to a new group of younger people who have been a pleasure to interact with. I was accustomed to the more traditional web information exchange venues, having been active in online forums since I joined Compuserve in 1987. But many of the bloggers are younger and don't appear to be familiar with the newsgroups or even the larger discussion forums dedicated to my topic. Once I started blogging and syndicating my blog [via RSS], these bloggers introduced themselves [by commenting on her blog]. I really like the positive supportive atmosphere that they bring to interaction.

What have you learned from blogging?

In the health community, at least, the younger people whose online communication is confined to blogging seem to be more positive and supportive and less likely to use internet communication to indulge the kinds of flaming and obsessional nuttiness that seems to have destroyed the newsgroups as a viable place for intelligent discourse. They also make very good use of multimedia when making their points.

You seem to be saying blogging brings out a better side of human nature.

Not really. It is just that the structure of blogging allows each person to be heard, and leaves it to the audience to vote with their attention for content. Stridency and conflict are minimized because comments are moderated. A person can, of course, contradict another person, in their own blog, but they have to attract readers and conflict alone is not a strong attraction.

### **Autism Linked to Mood Disorders (2007-10-28 06:25)**

Mood disorders appear to be much more common among the relatives of autistic children than among the relatives of other children. A [1]survey article about this appeared in 2004. Here is a bit of the data:

In North Carolina, between 1988 and 1990, we studied 40 autistic individuals (20 attributable to known neurological disease and 20 idiopathic). Family histories, using the family history method, without knowledge of the neurological status, showed a low incidence of major mood disorder in the neurological patients (only two had family members with major depression, none with bipolar disorder). In the idiopathic autistic patients, by contrast, major depression was found in 14 and bipolar disorder in 8 of twenty families.
